  - F. Grab Sample: A grab sample is collected from one particular location at a specific time. This sample, when analyzed, represents the composition of the source soil at that location and time only.
  - G. Composite Sample: A composite sample is comprised of grab samples which are initially collected from within a grid area and then combined into a single sample. This sample is representative of the entire grid area from which the grab samples were collected.
  - H. Split Sample: The Contractor shall provide the Commissioner with random (at least 10 percent) split samples of soils. Split samples are to be used to verify waste characterization for off-site disposal.

## 1.05 SUBMITTALS

- A. The Contractor shall provide all submittals, including the following, as specified in Section 01330 - Shop Drawings.

1. Field Sampling Plan (FSP): An FSP shall be submitted for approval 30 days following notice to proceed. The FSP shall include protocols for the collection and analysis of representative samples from the soil based on the receiving disposal facilities' protocols including sampling frequency and analysis requirements as described in Article 1.10. The Commissioner will approve the FSP only if it clearly provides the information to allow for classification of all material proposed for excavation. No sampling shall be conducted until the Commissioner has reviewed and formally approved the FSP in writing. The FSP shall include the following at a minimum:
  - a. A detailed outline of the disposal facility requirements. The information, including analytical requirements and sampling frequency specified by the disposal facilities shall be submitted to the Commissioner and used by the Contractor in preparing the site-specific FSP.
  - b. The FSP shall include an indication of the specific frequency of in-situ samples per unit volume as required by the approved disposal facility chosen by the Contractor, but not fewer than one composite sample for each 500 cubic yards of material to be excavated. Parameters analyzed shall be at a minimum full RCRA Characteristics including ignitability, corrosivity, reactivity, and full Toxicity Characteristic Leachate Procedure (TCLP) for volatiles, semi-volatiles, metals, pesticides and herbicides, and as required by the disposal facility. The area to be excavated shall be divided into distinct vertical and horizontal segments, identifying the volume of soil or fill that each sample will represent. The FSP shall include vertically continuous sampling to allow for compositing of samples for proper classification of soils. The Contractor shall analyze each composite sample for PCBs also.
  - c. A scaled map of the site showing existing fixed landmarks and the proposed excavation limits. The map shall contain specific sampling locations that will conform to the disposal facilities' sampling frequency requirements.
  - d. Identification numbers of the sample grids, relative depth, sampling intervals, and volumes reflective of the Contractor's excavation method shall be shown on the scaled site map. Sampling intervals shall account for existing subsurface data, historic sampling information, including: descriptions, depths, orientation, and location of material of potentially different classifications, and shall minimize undue mixing of varied native soil and fill material.

- e. Description of sampling procedures and equipment to be used.
  - f. Name and address of Analytical Laboratory, copy of laboratory certification, Quality Assurance Manual, and Standard Operating Procedures for the analyses to be performed.
  - g. Description of QA/QC samples required by the disposal facilities.
  - h. Description of additional disposal facility requirements.
2. In-situ Soil Sampling and Analysis Plan: The primary objective of this plan is to characterize on-site soils for transport and disposal off-site. An In-situ Soil Sampling and Analysis Plan (ISSAP) includes a detailed description of techniques used to select sampling sites, thoroughly addresses procedures to be used to obtain representative samples of the media to be sampled, and describes sampling parameters and methods, as required by the disposal facility, sampling equipment, containers, sample number and volume, preservation, and holding times. This plan will also include QA/QC procedures and a quality management (QM) plan. The ISSAP shall address all requirements of these specifications and all requirements of New York State, EPA and OSHA and the selected disposal facility. If any conflicts arise between different agency procedures, the Commissioner will determine which method is to be used. The Contractor shall submit the ISSAP for review and approval a minimum of 30 calendar days prior to the scheduled commencement of excavation activities. No excavation work will be allowed until all changes required by the Engineer are made and the ISSAP is accepted in writing by the Engineer. The ISSAP shall include at a minimum the following elements:
- a. The organizational structure of the Contractor's and all subcontractors' quality management (QM) personnel, including their:
    - (1) Names
    - (2) Resumes
    - (3) Responsibilities
    - (4) Authorities
    - (5) Qualifications
  - b. A copy of a letter signed by a responsible officer of the Contractor describing the authority and responsibilities of the Sampling and Analysis Manager.
  - c. Laboratory Requirements and Qualifications. The laboratory's name, certifications, Quality Assurance Manual, and Standard Operating Procedures (SOPs) for the analyses to be performed shall be submitted to the Engineer and the City for review and approval.

- d. Proposed sampling, handling, preservation, and storage of equipment and procedures, including transfer procedures, and sampling equipment decontamination procedures.
  - e. Analytical Methods. Proposed analytical methods shall be in accordance with SW-846, latest edition. If an SW-846 Method is not available, then EPA 600/4-79-020 shall be used.
  - f. Data Quality Objectives. Procedures for assessing precision, accuracy, degree of representation, comparability and completeness of samples and data, including performance audits and proposed protocols for corrective measures where problems are identified shall be defined.
  - g. Schedule of field and laboratory inspections.
  - h. Planned preparation of daily and project summary quality control reports.
  - i. A statement that the sampling program is in accordance with the Contract requirements.
  - j. Precise number and approximate location of samples to be collected and the specific analyses to be performed on each sample, presented in a Microsoft Excel table, and on a working drawing that is keyed to the Contract Drawings.
  - k. Manufacturer, catalog data and calibration records of all analytical equipment to be used on-site.
3. Field Sampling Summary Report: The field sampling summary report shall contain all laboratory analytical results obtained from the field sampling event. A detailed account of any field procedures used which deviated from those established in the FSP shall be included, as well as a complete set of field notes. Detailed field notes shall be maintained by the Contractor during sampling and excavation to allow identification of sample analysis results with the respective grids that the data represent, and to verify quantities of materials to be disposed of as hazardous waste, industrial waste, petroleum-contaminated waste or C&D debris. The field notes shall be made available to the Commissioner during the sampling program, and shall consist of:
- a. Boring or probe logs from each sampling location containing a continuous stratigraphic description of all material encountered to the excavation depth required. Descriptions of material shall include, but not be limited to, color, odor, staining, relative grain size distribution, material composition, moisture content, and cohesive properties.
  - b. The location of each sampling point on a scaled map.

- c. Depth intervals for each sample, whether a grab or composite, and any special notes, which are included on the laboratory chain-of-custody forms.
  - d. Copies of all laboratory chain-of-custody forms for samples that are collected for analysis.
4. Analytical Results: Contractor shall submit analytical results for sampled soil material to the Commissioner within 3 calendar days of receipt of such data from the laboratory.

#### 1.06 QUALITY ASSURANCE

A. Laboratory Requirements: Laboratory facilities shall meet, at a minimum, the requirements and procedures of this specification. The laboratory is subject to inspection and prior approval by the Engineer.

- 1. Provide and coordinate the services of a laboratory(ies) to perform specified services and analyses. Laboratory services shall be provided for the duration of the work.
- 2. The laboratory shall maintain, throughout the duration of the work, the appropriate New York State Department of Health ELAP Certifications for the analyses to be performed.

#### B. Permits and Regulations

- 1. The Contractor shall obtain all necessary permits and perform all work in compliance with applicable requirements of OSHA and other governing authorities having jurisdiction.
- 2. Codes and Standards: State and City laws and regulatory requirements shall govern the transport and disposal of trees, shrubs, stumps, roots, rubbish, debris and other matter.

#### C. Laboratory Qualifications

- 1. Analytical Methods and Procedures: Fully describe and provide references (SOPs) for the specific analytical methods and procedures which will be used to perform all soil chemical analyses associated with this project. The analytical methods and procedures shall be used to determine sample characterization and suitability for transportation and disposal.
- 2. Quality Control Checks and Data Acceptance: Provide a system of internal quality control checks designed to establish technically sound criteria for each measurement parameter, which will serve to accept or reject data in a uniform and systematic manner. A minimum of ten percent of the total number of a

given type of sample shall be devoted to internal QC checks, or more, as specified in the laboratory SOP. These checks are designed to ensure accuracy in the sampling procedure and the analytical methods and include blanks, duplicates, matrix spikes, reference standards and performance evaluation samples.

- D. Data Management: Manage the analytical data by utilizing a computer spreadsheet or database program as approved by the Engineer. Data shall be organized in such a way that all samples may be tracked from collection through analysis.
1. The analytical results generated for a ten (10) day turn-around time deliverable shall include a Form I (or equivalent) showing compounds analyzed for, and concentrations detected, and associated chain-of-custody reports to the Engineer.
  2. The final data package generated by the laboratory shall include the following information:
    - a. A Form I showing pertinent physical data presented in concise, easy to follow formats (i.e., sample number, laboratory ID, client, date of sample preparation, date analyzed, percent moisture, dilution factor, sample matrix, units, undetected and detected compounds, etc.)
    - b. Reference to analytical methodology used.
    - c. General discussion including a description of sample types, tests performed, any problems encountered, and any general comments (case narrative)
    - d. Data from each discrete sample reported using cross-referencing between site samples and quality control samples and including all pertinent dates, information and reporting limits
    - e. Associated quality control samples such as blanks, spikes and spike duplicates, laboratory duplicates, laboratory control samples, field duplicates and appropriate check standards
    - f. Copies of chain-of-custody sheets
    - g. The analytical results shall be provided in a tabular Microsoft Excel 97 format, delivered on 3-1/2 inch diskettes or via electronic mail to the Engineer. All electronic data shall be certified to be virus-free.

- E. In-situ Sampling: All material shall be in-situ sampled and analyzed in accordance with the disposal facility requirements and as specified herein.
  - 1. Field duplicate samples shall be collected for a minimum of 10 percent of the samples spaced throughout the sample program.
  - 2. The number of samples required for a quantity of soil shall meet all disposal facility requirements, and the approval of the Engineer.
- F. Sample Turn-Around: The Contractor shall provide for prompt sampling and turn-around of analysis so as not to delay the project. If a turn-around time of less than 10 days is required due to delays in construction scheduling or other constraints, Contractor shall provide for such at no additional cost to the City.
- G. Disposal Facility Selection: If the approved disposal facility is not available when disposal operation begins, the Contractor shall be fully responsible for procuring approved disposal facilities at no additional cost to the City. Any additional sampling and analysis required and labor involved in submitting new disposal facilities after the initial disposal facilities are accepted shall be the responsibility of the Contractor.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Sample Identification: All samples shall be identified with a sample label in addition to an entry on a chain-of-custody record. The label shall be identified upon receipt by the laboratory and cross-referenced to the chain-of-custody record. Any inconsistencies shall be noted on the custody record. Laboratory personnel shall notify the Sampling and Analysis Manager immediately if any inconsistencies exist in the paper work associated with the samples, and Contractor shall collect new samples to replace those with inconsistencies which cannot be rectified.
- B. Sample Labels: The field team shall complete the following information on a sample label for each sample bottle:
  - 1. Site Name
  - 2. Job Number
  - 3. Sample Number
  - 4. Sample Description
  - 5. Sampling Company Name
  - 6. Parameters to be Analyzed
  - 7. Date
  - 8. Time
  - 9. Preservation Technique Employed
  - 10. Sample labels shall be attached to the sample bottles

**C. Completion of Chain-of-Custody Record:**

1. Maintain a chain-of-custody record on all samples. A chain-of-custody record is a printed multi-part form that accompanies a sample or group of samples as custody is transferred from person to person. A chain-of-custody record is a controlled document.
2. As soon as is practical after sample collection, preferably after decontamination, the following information shall be entered on the chain-of-custody form. All information shall be recorded in ink.
  - a. Project number: Enter the alphanumeric designation assigned by the field team that uniquely identifies the project site.
  - b. Project name: Enter the site name.
  - c. Samplers: Sign the name(s) of the sampler(s).
  - d. Station number: Enter the sample number for each sample in the shipment. This number appears on the sample identification label.
  - e. Date: Enter a six-digit number indicating the year, month, and day of sample collection.
  - f. Time: Enter a four-digit number indicating the time of collection in 24-hour time; for example, 1354.
  - g. Composite or grab: Indicate the type and matrix of sample.
  - h. Station location: Describe the location where the sample was collected.
  - i. Number of containers: For each sample number, enter the number of sample bottles that are contained in the shipment.
  - j. Remarks: Enter any appropriate remarks.

**D. Sample Shipment**

1. Custody of samples shall be maintained through the shipment of samples to the selected laboratory(ies). All samples shall be packaged and shipped daily to ensure that no sample is held at the site more than 24 hours. Samples shall be delivered directly to the laboratory using the following procedures:
  - a. Use waterproof high-strength plastic ice chests or coolers only.
  - b. After filling out the pertinent information on the sample label and tag, put the sample in the bottle or vial and screw on the lid. For bottles

other than VOA sample bottles, secure the lid with tape. (Tape on VOA bottles may cause contamination.)

- c. Place inert cushioning material such as vermiculite or "bubble-wrap" in the bottom of the cooler.
  - d. Enclose the bottles in clear plastic bags through which sample labels are visible, and seal the bag. Place bottles upright in the cooler in such a way that they do not touch and will not touch during shipment.
  - e. Put in additional inert packing material to partially cover sample bottles (more than half-way). Place double-bagged crushed ice around, among, and on top of the sample bottles.
  - f. Fill cooler with cushioning material.
  - g. Put paperwork (chain-of-custody record) in a waterproof plastic bag and tape it with packing tape to the inside lid of the cooler.
  - h. Tape the drain shut.
  - i. Secure lid by taping. Wrap the cooler completely with strapping tape at a minimum of two locations. Do not cover any labels.
  - j. Attach completed shipping label to top of the cooler.
  - k. Put "This Side Up" labels on all four sides and "Fragile" labels on at least two sides of coolers containing glass containers.
  - l. Ship the cooler overnight by commercial carrier (e.g., Federal Express, UPS), laboratory carrier or field personnel to the respective laboratory.
2. Custody forms for the samples shall be signed by the Contractor's designated representative who is relinquishing custody. The custody form shall include the air bill number, method of shipment, and time and date of the transfer of custody.
  3. Custody seals shall be applied to the front and back of the sample coolers. A shipping label with return address shall be applied as well as the air express bill and any U.S. Department of Transportation (DOT) required labels or markings.
- E. Transferring Custody of Samples to Shipper, if applicable: Contractor shall transfer custody of samples to a shipper as follows:
1. Sign, date, and enter time on the chain-of-custody report under "Relinquished by."

2. Make certain that shipper signs the "Received by" entry.
  3. Enter name of the carrier under next "Relinquished by" category. Receiving laboratory shall sign "Received for Laboratory by" on lower line and enter date and time.
- F. Transferring Custody from Sampler or Shipper to Common Carrier:
1. The shipper or Contractor shall transfer custody of samples to a common carrier as follows:
    - a. Sign, date, and enter time under "Relinquished by" entry.
    - b. Enter name of carrier (e.g., UPS, Federal Express) under "Received by."
    - c. Enter bill-of-lading or Federal Express airbill number under "Remarks."
    - d. Place the original of the chain-of-custody form in the appropriate sample shipping package. Retain a copy with field records.
    - e. Sign and date the custody seal. The custody seal is part of the chain-of-custody process and is used to prevent tampering with samples after they have been collected in the field.
    - f. Wrap the seal across filament tape which has been wrapped around the hinges of the shipping package at least twice.
    - g. Fold the custody seal over on itself so that it sticks together.
    - h. Complete other carrier-required shipping papers.
  2. In instances when the Common Carrier will not accept responsibility for handling chain-of-custody forms, the Contractor shall ensure that the record is packed within the sample package.
- G. Laboratory Custody Procedures: Once the samples arrive at the laboratory, the Contractor shall ensure that custody of the samples is maintained by laboratory personnel. The laboratory shall, at a minimum, document the chain of custody through each stage of analysis from receipt to final reporting.

## 1.08 PROJECT CONDITIONS

- A. Decontamination of Sampling Equipment: All sampling equipment shall be certified clean or precleaned, prior to collection of each sample, by the following method:
1. Wash all sampling equipment, secondary containers (e.g., mixing bowls for composite sampling) and aluminum foil with non-phosphate laboratory grade detergent and tap water.
  2. Triple rinse with tap water.
  3. Rinse with isopropyl alcohol, or if samples are visibly contaminated with petroleum use a solvent, such as hexane.
  4. Triple rinse with analyte-free water.
- B. Disposal of Decontamination Solutions: Collect all decontamination solution and dispose of it through a licensed chemical waste disposal service if it is unsuitable for treatment on-site by incorporation into existing on-site treatment processes as defined in Section 02240 - Dewatering.
- C. No stockpiling of excavated material or stripped topsoil shall be allowed on site unless a written letter of approval is obtained from the Commissioner. Contractor shall use in-situ sampling methods for all materials to be excavated or requiring sampling for characterization. The Contractor shall assume that all subsurface areas are potentially contaminated, and excavated material shall be classified as a regulated non-hazardous, industrial waste or petroleum-contaminated waste.

## 1.09 ANALYSES

- A. The services of a New York State Department of Health certified laboratory shall be engaged to perform testing and chemical analyses. The laboratory shall be acceptable to the Commissioner. Testing and Chemical analyses shall include full RCRA Characteristics, at a minimum, and the following:
1. In-Situ Soil Testing: The in-situ soil sampling and testing protocols required by the disposal facility. The analytical requirements of the disposal facilities are subject to change and it shall be the Contractor's responsibility to confirm and comply with all requirements of the chosen disposal facility.
  2. All analytical results shall be submitted to the Resident Engineer for review within 10 calendar days of date of collection. Classification of soils for disposal shall be carried out by the Resident Engineer.

## 1.10 DISPOSAL FACILITY REQUIREMENTS

- A. Non-hazardous contaminated material: The Contractor shall submit the name of the selected disposal facility and its location to the Commissioner for approval. Note that companies have numerous disposal facility locations each with differing requirements regarding types of material accepted and analytical and frequency requirements.
1. Regardless of the disposal facility chosen, the Resident Engineer will confirm the permit status, types of materials accepted, as well as check for outstanding violations and enforcement actions of the facility prior to approval.
  2. For bidding purposes, the Contractor shall verify location of the chosen facility(ies), parameters and frequencies to be tested, and types of material accepted at each facility location. The analytical and frequency requirements of these facilities are subject to change and it shall be the Contractor's responsibility to confirm and comply with all requirements of the chosen facility.
  3. The Contractor shall submit comparison tables in Excel format with highlighted exceedances for TAGM, TCLP, applicable State allowable limits, and all facility permitted limits including any alternate acceptance criteria as part of all Field Sampling Summary Reports and Disposal Facility application packages submitted to the Commissioner for review and approval.
- B. Hazardous Waste: Material found to be a characteristic hazardous waste shall be disposed of at an approved hazardous waste disposal facility.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 IN-SITU TESTING

- A. Conduct testing in accordance with the Specifications and the approved Field Sampling Plan.
- B. Field sampling shall be completed in ample time to prevent delay of the excavation work or the work of any other contractor.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02106**  
**EX-SITU SOIL SAMPLING, TESTING AND LABORATORY ANALYSIS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Temporary stockpiling of excavated material shall NOT be allowed on-site, unless a written letter of approval is obtained from the Commissioner. Excavated material shall NOT be used as backfill due to unsuitability of onsite soils, unless written approval is received from the Commissioner. The preferred method of characterizing soils for disposal is in-situ sampling; however, if stockpiled soils have not been previously sampled during the in-situ sampling program, ex-situ sampling shall be required prior to offsite disposal. The Contractor shall provide all labor, materials, tools, and equipment to perform all operations necessary to determine the ex-situ classification, handling and disposal requirements of soils and fill material.
- B. The Contractor shall develop and implement an Ex-situ Soil Sampling and Analysis Plan required for sampling, quality assurance, quality control (QA/QC) of work. Work includes, but is not limited to, stockpile sampling and analysis to determine if material is Hazardous Waste, Industrial Waste, Petroleum-contaminated Waste or Construction and Demolition Debris.
- C. The Contractor shall provide the services of a laboratory, certified by New York State Department of Health, to perform testing and chemical analyses.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 – Shop Drawings
- B. Section 02105 - In-situ Soil Sampling, Testing and Laboratory Analysis
- C. Section 02225 – Impacted Soil Handling
- D. Section 02371 - Dust, Soil Erosion and Sedimentation Control
- E. Section 02316 – Excavation

**1.03 REFERENCES**

- A. All references shall be in accordance with the requirements of Section 02105.

**1.04 DEFINITIONS**

- A. All definitions shall be in accordance with the requirements of Section 02105 except as modified herein.
- B. Ex-situ Soil Sampling: The number of samples required for an excavated pile will be related to the quantity of soil stockpiled. Samples shall consist of grab samples and composite samples. Samples shall be collected in accordance with the proper

sample collection techniques as detailed in the Field Sampling Plan. Samples shall be collected from within the pile. Surface soil should not be used as sampling material.

- C. Composite Sample: A composite sample is comprised of grab samples which are initially collected from within a stockpile and then combined into a single sample. This sample is representative of the entire stockpile from which the grab samples were collected.

#### 1.05 SUBMITTALS

- A. The Contractor shall provide all submittals, including the following, as specified in Section 01330 – Shop Drawings.

1. Field Sampling Plan (FSP): An FSP shall be submitted for approval 30 days following Notice to Proceed. The FSP shall include protocols for the collection and analysis of representative samples from the soil based on the receiving disposal facilities' protocols including sampling frequency and analysis requirements as described in Article 1.10. The Commissioner will approve the FSP only if it clearly provides the information to allow for classification of all material proposed for excavation. No sampling shall be conducted until the Commissioner has reviewed and formally approved the FSP in writing. The FSP shall include the following at a minimum:
  - a. A detailed outline of the disposal facility requirements. The information, including analytical requirements and sampling frequency specified by the disposal facilities shall be submitted to the Commissioner and used by the Contractor in preparing the site-specific FSP.
  - b. The FSP shall include an indication of the specific frequency of ex-situ samples per unit volume as required by the approved disposal facility chosen by the Contractor, but not fewer than one composite sample for each 500 cubic yards of material to be excavated. Parameters analyzed shall be at a minimum full RCRA Characteristics including ignitability, corrosivity, reactivity, and full Toxicity Characteristic Leachate Procedure (TCLP) for volatiles, semi-volatiles, metals, pesticides and herbicides, and PCBs, and as required by the disposal facility. This shall be done through the collection of discrete soil grab samples from within the soil stockpile. Ten (10) grab samples shall be taken from within each 500 cubic yard stockpile. Each grab sample will therefore be associated with approximately 50 cubic yards of material to be excavated. The Contractor shall note that the selected disposal facility may require more frequent sampling than that specified here. If so, the Contractor shall be required to satisfy the sampling requirements of the disposal facility.

- c. Upon collection of each grab sample, a portion of the collected soil shall be segregated for volatile analysis. The remainder of each grab sample will be homogenized and composited with the remainder of the other nine (9) discrete grab samples associated with the same 500 cubic yard portion to form one sample representative of the 500 cubic yard portion. Each representative sample shall be analyzed for parameters listed, except for volatiles. The contactor shall analyze each composite sample for PCBs also.
- d. The Contractor shall segregate approximately 12 ounces from each grab sample for volatile analysis. Fill and immediately seal one 125 ml VOA vial and place the remaining soil into a sealable plastic bag. Agitate the soil in the bag to break up the soil matrix, allow to sit for approximately 15 minutes so that the soil gases within the sample can volatilize and collect in the head space of the bag. The Contractor shall insert a photoionization detector (PID) probe inside the bag and record the organic vapor concentration. This shall be repeated for each of the 10 grab samples collected for each 500 cubic yard portion. For each 500 cubic yard portion, the discrete 125 ml sample that corresponds to the soil in the bag with the highest PID measured organic vapor concentration shall be sent to the laboratory for volatile analysis. The remaining 4 jarred samples and 5 bags of soil shall be emptied back onto the ground and the jars/bags disposed of properly. At no time shall samples to be sent for volatile analysis be homogenized.
- e. All grab samples, except for volatile analysis samples, shall be homogenized in a stainless steel bowl following EPA CLP guidelines.
- f. During excavation, the Commissioner may identify quantities within each 500 cubic yard portion that differ in appearance from the bulk of the material. In this case, the Commissioner will direct the Contractor to segregate these variable materials for stockpiling onsite.
- g. Proposed sampling, handling, preservation, and storage of equipment and procedures, including transfer procedures, and sampling equipment decontamination procedures, and manufacturer, catalog data and calibration records of all analytical equipment to be used on-site.
- h. Name and address of Analytical Laboratory, copy of laboratory certification, Quality Assurance Manual, and Standard Operating Procedures for the analyses to be performed.
- i. Analytical Methods. Proposed analytical methods shall be in accordance with SW-846, latest edition. If an SW-846 Method is not available, then EPA 600/4-79-020 shall be used.

- j. Data Quality Objectives. Procedures for assessing precision, accuracy, degree of representation, comparability and completeness of samples and data, including performance audits and proposed protocols for corrective measures where problems are identified shall be defined.
  - k. Description of QA/QC samples required by the disposal facilities.
  - l. Precise number and approximate location of samples to be collected and the specific analyses to be performed on each sample, presented in a Microsoft Excel table, and on a working drawing that is keyed to the Contract Drawings.
  - m. Description of additional disposal facility requirements.
2. Ex-situ Soil Sampling and Analysis Plan (ESSAP): The primary objective of this plan is to characterize on-site soils for transport and disposal off-site. This plan will also include QA/QC procedures and a quality management (QM) plan. The ESSAP shall address all requirements of these specifications and all requirements of New York State, EPA and OSHA and the selected disposal facility. If any conflicts arise between different agency procedures, the Commissioner will determine which method is to be used. The Contractor shall submit the ESSAP for review and approval a minimum of 30 calendar days prior to the scheduled commencement of excavation activities. No soil removal and disposal work will be allowed until all changes required by the Commissioner are made and the ESSAP is accepted in writing by the Commissioner. The ESSAP shall include at a minimum the following elements:
- a. The organizational structure of the Contractor's and all subcontractors' quality management (QM) personnel, including their:
    - (1) Names
    - (2) Resumes
    - (3) Responsibilities
    - (4) Authorities
    - (5) Qualifications
  - b. A copy of a letter signed by a responsible officer of the Contractor describing the authority and responsibilities of the Sampling and Analysis Manager
  - c. Schedule of field and laboratory inspections
  - d. Planned preparation of daily and project summary quality control reports
  - e. A statement that the sampling program is in accordance with the Contract requirements

3. Field Sampling Summary Report: The field sampling summary report shall contain all laboratory analytical results obtained from the field sampling event. A detailed account of any field procedures used which deviated from those established in the FSP shall be included, as well as a complete set of field notes. Detailed field notes shall be maintained by the Contractor during sampling to allow identification of sample analysis results with the respective stockpiles that the data represent, and to verify quantities of materials to be disposed of as hazardous waste, industrial waste, petroleum-contaminated waste or C&D debris. The field notes shall be made available to the Commissioner during the sampling program, and shall consist of:
  - a. A map showing which samples are associated with which stockpile, and where individual grab samples were collected within the stockpile. If multiple composite samples are collected from one stockpile, the map should provide sufficient detail to ensure that the specific area represented by each individual composite sample can be distinguished, if necessary.
  - b. Whether each sample is a grab or composite, and any special notes, which are included on the laboratory chain-of-custody forms.
  - c. Copies of all laboratory chain-of-custody forms for samples that are collected for analysis.
4. Analytical Results: Contractor shall submit analytical results for sampled soil material to the Commissioner within 3 calendar days of receipt of such data from the laboratory.

#### 1.06 QUALITY ASSURANCE

- A. All quality assurance requirements shall be in accordance with the requirements of Section 02105 – In-Situ Soil Sampling, Testing and Laboratory Analysis.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. All delivery, storage and handling requirements shall be in accordance with the requirements of Section 02105 – In-Situ Soil Sampling, Testing and Laboratory Analysis.

#### 1.08 PROJECT CONDITIONS

- A. All project conditions shall be in accordance with the requirements of Section 02105 – In-Situ Soil Sampling, Testing and Laboratory Analysis.

1.09 ANALYSES

- A. All analytical requirements shall be in accordance with the requirements of Section 02105 – In-Situ Soil Sampling, Testing and Laboratory Analysis.

1.10 DISPOSAL FACILITY REQUIREMENTS

- A. All disposal facility requirements shall be in accordance with the requirements of Section 02105 – In-Situ Soil Sampling, Testing and Laboratory Analysis.

PART 2 PRODUCTS (Not Used)

PART 3 EXECUTION

3.01 EX-SITU TESTING

- A. Conduct testing in accordance with this Section and the approved Field Sampling Plan.
- B. Ex-situ sampling shall be completed in ample time to prevent delay of the excavation work.

-END OF SECTION-

**Section 02222**  
**DEMOLITION AND REMOVALS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Contractor shall provide all labor, materials, equipment and incidentals as shown on the Contract Drawings, specified and required to complete the demolition and removals work and properly dispose of all demolition and removals waste materials from the site.
- B. Included, without limitation, are demolition and removals of existing materials, structures, equipment, and other work necessary to install the new Work as shown and specified and to connect the same with existing work to remain in an approved manner. Demolition and removals include existing marine piles, structural concrete, foundations, walls, doors, windows, structural steel, metals, roofs, masonry, attachments, appurtenances, piping, utilities, electrical and mechanical equipment, paving, curbs, walks, fencing, and similar existing facilities.
- C. Demolition and removals that may be specified under other Sections shall conform to requirements of this Section.
- D. The removal of all equipment, piping, pumps, and all other materials from the demolition of buildings and structures shall, when released by the Commissioner, become Contractor's property, unless otherwise noted. These materials and debris shall be disposed of off-site as required by the Contract Documents.
- E. Contractor shall obtain all required permits for the demolition and removals work from the City and other agencies having jurisdiction.
- F. Contractor is responsible for the transportation, handling, removal and proper disposal of regulated solid and hazardous wastes.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 - Regulated Materials Control
- B. Section 01733 - Construction Waste Management
- C. Section 02224 - Removal of Arsenic Impacted Wood - Environmental Requirements
- D. Section 02225 - Impacted Soil Handling
- E. Section 02291 - Air Monitoring Program

- F. Section 02316 - Excavation
- G. Section 02371 - Dust, Soil Erosion and Sedimentation Control
- H. Section 13287 - Environmental Waste Transportation and Disposition

#### 1.03 REFERENCES

- A. Reference Standards: Regarding closure of underground storage tanks, Contractor shall comply with the applicable provisions and recommendations of the following, unless otherwise shown or specified.
  - 1. 29 CFR 1518 - Safety and Health Regulations for Construction
  - 2. 29 CFR 1910 - Occupational Safety and Health Standards
  - 3. ANSI A10.2 - Safety Code for Building Construction
  - 4. AWS D12.1 - Reinforcing Steel Welding Code

#### 1.04 SUBMITTALS

- A. Provide all submittals in accordance with Section 01330 - Shop Drawings.
- B. Working drawings and shop drawings shall include, but not be limited to proposed methods, equipment and operating sequences to be used in performance of the demolition and removals work.

#### 1.05 JOB CONDITIONS

- A. Protection
  - 1. Demolition and removals work shall be performed by competent workmen experienced in the various types of demolition and removals work required, and it shall be carried through to completion with the prevention of damage or injury to structures and facilities to remain, City employees, workers on the site, the public and adjacent features which might result from falling debris or other causes, and so as not to interfere with the use of, and free and safe passage to and from, adjacent structures and facilities.
  - 2. Contractor shall provide, erect and maintain catch platforms, lights, barriers, weather protection, warning signs and other items as required for proper protection of the public, occupants of the building, workers engaged in demolition operations, and adjacent construction.
  - 3. Contractor shall provide and maintain temporary protection of existing structures and facilities designated to remain where demolition and removals work is being done, connections made, materials handled or equipment moved. Contractor shall be responsible for any damage to such existing

structures and facilities to remain or contents by reason of providing insufficient protection.

4. Contractor shall take necessary precautions to control dust as required by Section 02371 - Dust, Soil Erosion and Sedimentation Control. Dust shall be prevented from rising by wetting demolished masonry, concrete, plaster and similar debris, as applicable.
  5. Contractor shall provide adequate fire protection in accordance with local Fire Department requirements.
  6. Contractor shall be solely responsible for making all necessary arrangements and for performing all necessary work involving the discontinuance or interruption of all utilities or services.
  7. Closing or obstructing of roadways, sidewalks, and passageways adjacent to the Work by the placement or storage of materials will not be permitted, and all operations shall be conducted with minimum interference to traffic.
  8. Contractor shall repair damage caused by its operations to facilities to remain, or to any property belonging to the City.
  9. The work shall comply with the applicable provisions and recommendations of ANSI A10.2, Safety Code for Building Construction, all governing codes and as specified in Division 1.
  10. Contractor shall make such investigations, explorations and probes as are necessary to ascertain any required protective measures before proceeding with demolition and removals.
  11. Demolition and removal of hazardous materials shall be in accordance with applicable Federal, State and Local regulations and Sections 01355 - Regulated Materials Control, 02223 - Demolition of Building Components Coated with Lead and Cadmium Containing Paint - Environmental Requirements and 02224 - Removal of Arsenic Impacted Wood - Environmental Requirements. See Division 13 specifications regarding environmental remediation work to be carried out prior to commencement of the demolition and removals work.
  12. Handling and disposal of waste demolition and removals materials shall conform to requirements of Section 01733 - Construction Waste Management or Section 13287 - Environmental Waste Transportation and Disposition, as applicable.
- B. Permits: Obtain all permits required for closing or obstructing streets and sidewalks.

**C. Condition of Buildings, Structures and Equipment**

1. The City does not assume responsibility for the actual condition of buildings, structures and equipment to be demolished and removed.
2. Conditions existing at the time of inspection for bidding purposes will be maintained by the City so far as practicable. However, there is no guarantee by the City that the number of fixtures, amount of equipment or any other material of value existing at bidding time in the buildings and structures to be demolished will be present in the structures when they are demolished. Contractor shall have no claim against the City because of the absence of such fixtures and materials.
3. The information regarding the existing structures and equipment shown on the Contract Drawings is based on a compilation of past project drawings, visual inspections and a walk-through survey. Neither the Commissioner nor the City will be responsible for interpretations or conclusions drawn therefrom by Contractor.

- D. Notification: At least 48 hours prior to commencement of demolition and removals, Contractor shall notify the Resident Engineer in writing of its proposed schedule. The City of New York will inspect the existing equipment or facilities and review with the Contractor those items that are to remain the property of the City of New York. No demolition or removals shall be started without the permission of the Commissioner.

- E. The use of explosives will not be permitted.

**PART 2 PRODUCTS (Not Used)****PART 3 EXECUTION****3.01 GENERAL**

- A. The work required shall be performed with care, and shall include all necessary shoring, bracing, and support to prevent movement, settlement, or collapse of existing structures or facilities. Contractor shall be responsible for any damage that may be caused by demolition and removal work to any part or parts of existing structures or items designated for reuse or to remain, and shall repair the same at no additional costs to the City.
- B. Pollution Controls: Use water sprinkling, temporary enclosures, and other suitable methods to limit the amount of dust and dirt rising and scattering in the air to the lowest practical level. Comply with Section 02371 - Dust, Soil Erosion and Sedimentation Control and all governing regulations pertaining to environmental protection.

1. Do not use water when it may create hazardous or objectionable conditions such as ice, flooding, and pollution.
  2. Clean adjacent structures, facilities, existing facilities to remain and improvements of dust, dirt, and debris caused by demolition operations. Return adjacent areas to conditions existing prior to the start of the work unless otherwise shown, specified or required.
  3. The use of calcium chloride for dust control will not be allowed.
- C. Any materials or items designated to remain the property of the City of New York shall be removed with care and stored at locations designated by the City of New York.
- D. Where equipment is shown or specified to be removed and relocated, Contractor shall not proceed with removal of this equipment without specific prior approval of the Commissioner. Upon approval, and prior to commencing removal operations, the equipment shall be operated in the presence of representatives of Contractor and the Commissioner. Such items shall be removed with care and shall be protected and stored until required. Material or equipment damaged during removal shall be replaced with similar new material or equipment. Any equipment that is removed without proper authorization shall be replaced at no cost to the City of New York.
- E. Wherever piping is to be removed for disposal, the piping shall be drained by Contractor, and adjacent pipe and headers that are to remain in service shall be blanked off or plugged and then anchored in an approved manner.
- F. Where alterations occur, or new and old work join, Contractor shall cut, remove, patch, repair or refinish the adjacent surfaces to the extent required by the construction conditions, so as to leave the altered work in as good a condition as existed prior to the start of the work. The materials and workmanship employed in the alterations shall be of the same quality as required for new work of the same type.
- G. Contractor shall remove temporary work, such as enclosures, signs, guards, and the like when such temporary work is no longer required or when directed at the completion of the work.
- H. Contractor shall dispose of all demolition materials, equipment debris, and all other items not marked or specified by the City of New York to remain as property of the City of New York, off site and in conformance with all existing applicable laws and regulations.
- I. Backfill to grade all open areas caused as a result of the demolition except for areas where new Work will proceed within 30 days and the nature of the new Work dictates otherwise.

**J. Building Demolition**

1. Break up and remove foundations and slabs-on-grade, unless otherwise shown to remain.
2. Locate equipment used for demolition work, and remove demolished materials, so as not to impose excessive loads on structures and facilities to remain.
3. Regrade in accordance with Section 02316 - Excavation, where appropriate.

**3.02 STRUCTURAL REMOVALS**

- A. Contractor shall remove existing marine piles, foundations, concrete, structures and sub-structures to the lines and grades shown or noted unless otherwise directed by the Commissioner. Where no limits are shown or noted, the limits shall be 4 feet below final finished grade or 2 feet below underside of structure, unless otherwise approved by the Commissioner. The removal and replacement of materials beyond these limits shall be at Contractor's expense.
- B. Determine the thickness of existing concrete to be removed and the extent to which it is reinforced. No additional compensation will be made because of variations from the thickness shown or for variations in the amount of reinforcement.
- C. All concrete, stone, masonry, roofing materials, reinforcement, structural or miscellaneous metals, plaster, wire mesh and other items contained in or upon the structure shall be removed and taken from the site and disposed of at a permitted facility. Demolished items shall not be used in backfill.

**3.03 MECHANICAL REMOVALS**

- A. Mechanical removals shall consist of dismantling and removing existing pipes, pumps, motors and other facilities as specified, shown, or required for the completion of the work. It shall include cutting, capping, draining, and plugging as required, except that the cutting of existing piping for the purpose of making connections thereto will be included under Division 15 of the Specifications.
- B. Existing process, water, chemical, and other piping shall be removed and capped where shown on the Contract Drawings. Piping shall be purged and made safe by the Contractor prior to removal or capping. Disposal of any chemicals or other purged material shall be the responsibility of the Contractor. Where piping that is to be removed passes through existing walls, it shall be cut off and properly capped on each side of the wall.
- C. When underground piping is to be altered or removed, the remaining piping shall be properly capped. Abandoned underground piping may be left in place unless it interferes with new work or is shown or specified to be removed.

- D. Any required demolition or changes to potable water piping and other plumbing system work shall be made in conformance with all applicable codes. Portions of the potable water system that may have been altered or opened shall be pressure tested and disinfected in accordance with the Specifications for Division 15 and local codes.
- E. Provide all caps, plugs, blind flanges, shut-off valves and other work and materials required to remove from service existing piping and necessary to keep existing piping in service where shown or required.

### 3.04 PAVEMENT, CURB AND SIDEWALK REMOVALS

- A. Remove existing pavement, including base and surface courses, stabilized sub-bases, curbs, and gutters as required to construct new facilities or as shown. When removing sections next to sections that are to remain, sawcut the full depth of the concrete and asphalt. Cut pavements, curbs and sidewalks with non-impact tools or other equipment approved by the Commissioner. Breaking of pavements, curbs and sidewalks by impact, such as with the use of a ball, is not permitted. Curbs and gutters shall be removed to the nearest construction joint beyond the limit of demolition shown on the Drawings.
- B. Provide for satisfactory transition between replaced pavement and sidewalks and the portions remaining in place.

### 3.05 ELECTRICAL REMOVALS

- A. Electrical removals shall consist of the removal of existing generators, transformers, distribution switchboards, control panels, motors, conduits and wires, and miscellaneous electrical equipment all as shown, specified, or required to perform the work.
- B. All existing electrical equipment and fixtures to be removed shall be removed with such care as may be required to maintain the integrity of the grounding systems.
- C. Motors shall be disconnected and removed where shown or specified. Motors not marked or designated by the City of New York to be salvaged shall be removed from the site. Motors or other electrical gear designated for reuse shall be stored in enclosed, heated storage.
- D. Conduits and wires shall be abandoned or removed where shown.
- E. Electrical Contractor is responsible for de-energizing the existing electrical service.

### 3.06 MISCELLANEOUS REMOVALS

- A. Contractor shall remove miscellaneous items where shown on the Contract Drawings or where necessary for the construction of new structures or modification of existing structures.

### 3.07 MODIFICATIONS AND CLOSURES

- A. Modifications shall conform with all applicable Specifications, Contract Drawings, and the directions and approvals of the Commissioner.
- B. Where alterations require cutting or drilling into existing floors, walls, and roofs, the holes shall be repaired in an approved manner. Contractor shall repair such openings with the same or matching materials as the existing floor, wall, or roof, or as otherwise approved by the Commissioner. All repairs shall be smoothly finished unless otherwise approved by the Commissioner.
- C. Openings in existing concrete slabs, ceilings, roofs, masonry walls, floors and partitions which are not to be used in the new work shall be closed and sealed as shown or otherwise directed by the Commissioner.
- D. Where parts of existing structures are to remain in service, demolish the portions to be removed, repair damage, and leave the structure in proper condition for the intended use. Remove concrete and masonry to the lines designated by drilling, chipping, and other suitable methods. Leave the resulting surfaces true and even, with sharp straight corners that will result in neat joints with new construction or be satisfactory for the purpose intended. Where existing reinforcing rods are to extend into new construction, remove the concrete so that the reinforcing is clean and undamaged. Cut off other reinforcing flush with the surface.
- E. New work shall be keyed into the existing in an acceptable manner. New reinforcing steel shall be welded to the existing reinforcing. Welding shall conform to AWS D12.1, Reinforcing Steel Welding Code. In general, the same or matching materials as the existing adjacent surface shall be used. The finished closure shall be a smooth, tight, sealed, permanent closure with all exposed surfaces smooth finished and acceptable to the Commissioner.

### 3.08 MAINTENANCE AND CLEAN UP

- A. Contractor shall maintain all buildings, structures, and other City properties free from accumulations of waste, debris, and rubbish caused by the demolition and removal operations.
- B. Contractor shall provide on-site dump containers for collection of waste materials, debris and rubbish, and shall wet down dry materials to prevent blowing dust.

- C. At reasonable intervals during the progress of the demolition and removal work or as directed by the Commissioner, Contractor shall clean the Site and dispose of waste materials, debris, and rubbish.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02224**  
**REMOVAL OF ARSENIC-IMPACTED WOOD - ENVIRONMENTAL**  
**REQUIREMENTS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements for removal and handling of wood that failed the Toxicity Characteristic Leaching Procedure (TCLP) test for arsenic.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 – Regulated Materials Control
- B. Section 01356 – Safe and Healthful Working Conditions
- C. Section 02222 – Demolition and Removals
- D. Section 02291 – Air Monitoring Program

**1.03 PAYMENT**

- A. The cost for all work described in this section shall be included in the Contractor's lump sum bid price for Bid Item 1, except as indicated in Paragraph B below.
- B. In the event that wood materials of the existing fendering system fail the TCLP test for arsenic, the additional costs incurred for removing, handling and disposal of such wood materials shall be paid out of the Hazardous Materials Remediation allowance as described in Section 01355 – Regulated Materials Control.

**1.04 DEFINITIONS**

- A. Arsenic-impacted wood shall be defined as wood that failed the TCLP test for arsenic (i.e., arsenic was detected in leachate extracted from a wood sample at a concentration equal to or greater than 5 milligrams per liter [mg/L]).

**1.05 WORK SPECIFIED**

- A. The Contractor shall provide all training, labor, equipment, materials, and services necessary to comply with the environmental and worker protection requirements during removal and handling of arsenic-impacted wood, as required by applicable laws and regulations and as specified in this Section.
- B. The Contractor shall prepare and submit a written compliance program as required in Article 1.06 of this Section.

## 1.06 SUBMITTALS

- A. At least 90 calendar days prior to the commencement of the arsenic-impacted wood removal and handling work, the Contractor shall submit the following items in accordance with the requirements specified in Section 01355 – Regulated Materials Control:
1. Written compliance program prepared in accordance with 29 CFR Part 1910.1018(g) and 1926.1118(g).
  2. The names of all proposed subcontractors to be used on the project, including their qualifications, locations of origin, and descriptions of their project assignments.
  3. A list of equipment and materials to be used for the removal and handling of arsenic-impacted wood, along with the catalog sheets.
  4. A description of engineering controls, physical barriers, and other measures that the Contractor proposes to use to mitigate the discharge of dust or other material from the work area and to prevent the release of arsenic-impacted wood and/or sawdust or other material to adjacent water bodies.
- B. Within 2 weeks of completion of the arsenic-impacted wood removal and handling, the Contractor shall submit the following in accordance with the requirements specified in Section 01355 – Regulated Materials Control:
1. Copies of all project records, as required under 29 CFR 1910.1018(q).

## 1.07 QUALIFICATIONS

- A. All onsite personnel directly involved in removal and/or handling of arsenic-impacted wood (or wood assumed to be arsenic-impacted, as required in this Section) must have Occupational Safety and Health Administration (OSHA) 40-hour hazardous waste training (29 CFR 1910.120 and 1926.65) and the corresponding 8-hour refresher course update.

## 1.08 EXISTING CONDITIONS

- A. Wood samples collected from wooden components of the Southwest Brooklyn Marine Transfer Station fendering system located along the bulkhead were not sampled for arsenic.
- B. Due to access limitations wood piles, framework, fendering system components and bracing materials located along the bulkhead were not sampled or analyzed for Resource Conservation and Recovery Act (RCRA) hazardous waste characteristics. In order to determine proper disposal requirements for wood piles, framework,

fendering system components and bracing located along the bulkhead, these components shall be sampled and analyzed by the Contractor.

- C. For bidding purposes, the Contractor shall assume that the wood materials located below the transfer station's barge slip floor level do not fail the TCLP test for arsenic and will not require removal, handling, and disposal in accordance with this Section. This assumption is for bidding purposes only: actual handling and disposal shall be performed in the manner required by the results of the sampling and analysis.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 ARSENIC-IMPACTED WOOD REMOVAL

- A. The Contractor shall implement a written compliance program (to be prepared by the Contractor) in accordance with Paragraph 1.06A.1 above.
- B. The Contractor shall assume that these materials (all wooden framework, bracing, and pile components) are arsenic-impacted and are subject to the requirements specified in this Section, until and unless the laboratory analytical results indicate otherwise.
- C. At the Contractor's discretion, the Contractor may elect to adjourn the removal/demolition of the wood components currently located along the bulkhead until the wood sampling analytical results are available, and then proceed with the removal/demolition activities as warranted based on the analytical results (e.g., address the wood components located below the barge slip floor level as "arsenic-impacted" or "non-arsenic-impacted," as appropriate), or the Contractor may perform the removal/demolition of these wood components prior to receipt of the wood sampling analytical results, subject to the provisions of this Section. If the Contractor elects to remove/demolish currently uncharacterized wood components located along the bulkhead prior to receipt of the wood sampling laboratory analytical results, such removal/demolition shall be conducted as if the wood is arsenic-impacted and in accordance with the requirements of this Section and at the Contractor's sole risk. Payment for removal, handling, and disposal of the currently uncharacterized wood as "arsenic-impacted" will be made to the Contractor only if the laboratory analytical results for the wood samples indicate that the wood sample(s) failed the TCLP test for arsenic. No payments under the Hazardous Material Remediation allowance will be made if the wood samples do not fail the TCLP test for arsenic.
- D. The Contractor shall conduct the arsenic-impacted wood removal and handling activities in a manner that minimizes generation of airborne dust and/or sawdust (e.g., saws, if used, shall be equipped with dust collection devices, such as high-

efficiency particulate air [HEPA] filtered vacuum attachments). Additional dust control requirements are presented in Article 3.02 of this Section.

- E. Following completion of the arsenic-impacted wood removal activities, the remaining surfaces that contain sawdust and/or remnant pieces of wood debris shall be cleaned to the satisfaction of the Resident Engineer. The cleaning shall be accomplished by vacuuming the surfaces with vacuums equipped with HEPA filters. Shoveling and brushing may be used, in a manner that does not generate dust, only where vacuuming has been tried and found not to be effective (based on the Resident Engineer's judgment). The use of compressed air for cleaning purposes will not be allowed. Remnant pieces of wood and sawdust shall be placed into United States Department of Transportation- (USDOT-) approved containers for subsequent transportation and offsite disposal.
- F. All used disposable equipment, including disposable clothing, filters, polyethylene sheeting, etc., that contacts the arsenic-impacted wood debris shall be collected and placed into USDOT-approved containers for subsequent transportation and offsite disposal with the arsenic-impacted wood debris.
- G. The Contractor shall implement engineering controls, as necessary, to mitigate the discharge of dust or other material from the work areas and prevent the release of arsenic-impacted wood debris, sawdust, or other material to adjacent water bodies and outside the work area. The engineering controls may include, but are not limited to, installation of tarps, barriers, etc.

### 3.02 DUST CONTROL

- A. If the Contractor elects to use vacuum equipment, the vacuum equipment shall be equipped with a HEPA filtration system.
- B. Air monitoring and fugitive dust suppression activities shall be performed in accordance with applicable regulations and provisions specified in Section 02291 – Air Monitoring Program. If any of the particulate action level concentrations specified in Section 02291 – Air Monitoring Program are exceeded, the Contractor shall immediately undertake appropriate action to reduce the concentration of airborne dust to the acceptable level specified in Section 02291.
- C. In addition to the requirements of Paragraph 3.02B of this Section, if a significant amount of visible dust is generated during the demolition, removal, and/or handling of arsenic-impacted wood (based on the Resident Engineer's judgment), the Contractor shall take all appropriate measures to reduce the concentration of airborne dust to the satisfaction of the Resident Engineer.
- D. All dust and debris generated during the dust control activities shall be placed into USDOT-approved containers for subsequent transportation and off-site disposal.

3.03 HEALTH AND SAFETY PROTOCOLS

- A. The Contractor shall comply with all applicable federal, state, and local regulations (including, but not limited to, OSHA regulations) during the implementation of the work. The work described in this Section shall be conducted in accordance with the Contractor's site-specific health and safety plan, which is described Section 01356 – Safe and Healthful Working Conditions.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02225**  
**IMPACTED SOIL HANDLING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for identifying, classifying, handling, and staging of impacted soil generated as a result of demolition and construction activities.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 - Regulated Materials Control
- B. Section 01356 - Safe and Healthful Working Conditions
- C. Section 02105 - In-situ Soil Sampling, Testing and Laboratory Analysis
- D. Section 02106 - Ex-situ Soil Sampling, Testing and Laboratory Analysis
- E. Section 02240 - Dewatering
- F. Section 02291 - Air Monitoring Program
- G. Section 02316 - Excavation
- H. Section 02317 - Backfilling
- I. Section 02360 - Excavation Support and Protection
- J. Section 02371 - Dust, Soil Erosion and Sedimentation Control
- K. Section 13287 - Environmental Waste Transportation and Disposition

**1.03 PAYMENT**

- A. All costs for work specified in this Section shall be included in the lump sum bid for Bid Items 1, 2 and 3, except as described below in Part 1.03.B
- B. Additional costs for handling, transportation and disposal of soils classified as unforeseen soil conditions as described in Part 3.02 below shall be paid for out of the Hazardous Materials Allowance subject to the requirements of Section 01355 – Regulated Materials Control.

**1.04 DEFINITIONS**

- A. Impacted soil – Soil that meets one or more of the following criteria:
  - 1. Soil containing constituents at concentrations greater than their respective numerical values for protection of human health and water quality presented in New York State Department of Environmental Conservation's (NYSDEC's) document entitled, *Technical and Administrative Guidance Memorandum (TAGM) 4046: Determination of Soil Cleanup Objectives and Cleanup Levels*;

2. Soil identified as "impacted" in the Supplemental Environmental Information Package (SEIP). The SEIP is provided for informational purposes only and is not part of the Contract;
  3. Soil impacted by oil or otherwise grossly impacted (e.g., staining, sheens, odors, elevated photoionization detector [PID] readings, etc.), as determined by the Commissioner at his/her sole discretion; and
  4. Soil identified by the Contractor to be impacted based on the protocol presented in Section 01355 – Regulated Materials Control, and/or as defined in this or other applicable Sections.
- B. All excavated soil shall be classified as impacted soil, unless otherwise specified or directed by the Commissioner.

#### 1.05 WORK SPECIFIED

- A. The Contractor shall provide all labor, equipment, materials, and services necessary for identifying, classifying, handling, and staging of impacted soil present at the work site.

#### 1.06 SUBMITTALS

- A. At least 30 calendar days prior to the commencement of the impacted soil handling work, the Contractor shall submit the following items for review in accordance with the requirements specified in Section 01355 – Regulated Materials Control:
1. Impacted Soil Excavation Plan containing the Contractor-proposed procedures for handling and staging impacted soil.
  2. A description of proposed impacted soil staging areas.

### PART 2 PRODUCTS (Not Used)

### PART 3 EXECUTION

#### 3.01 SOIL CLASSIFICATIONS

- A. Nonhazardous Suitable Soil – Impacted soil (as defined in Paragraph 1.04A of this Section) that meets the requirements for one or more of the backfill material categories (i.e., drainage fill, select fill, etc.) presented in Section 02317 – Backfilling. If screening and/or crushing is required to meet the backfill material category requirements, the soil shall be deemed unsuitable soil.

B. Nonhazardous Unsuitable Soil – Contains either of the following:

1. Does not meet the backfill material category (i.e., drainage fill, select fill, etc.) requirements presented in Section 02317 – Backfilling.
2. Impacted by oil or otherwise grossly impacted (e.g., sheens, odors, elevated PID readings) as determined by the Commissioner.

C. Hazardous Material – Meets one or more of the criteria for determination of a hazardous waste presented in Part 371 of Title 6 of New York Codes, Rules, and Regulations (6 NYCRR Part 371) and Part 261 of Title 40 of the Code of Federal Regulations (40 CFR 261).

D. The Contractor shall assume that all soil requiring excavation is impacted and meets the description set forth in Paragraphs 3.01A and 3.01B.1 of this Section.

3.02 UNFORESEEN SOIL CONDITIONS

A. Impacted soil that meets the description set forth in Paragraphs 3.01B.2 and 3.01C of this Section (e.g., is impacted by oil or otherwise grossly impacted [e.g., sheens, odors, elevated PID readings] or is hazardous) shall be characterized and handled in accordance with Section 01355 – Regulated Materials Control.

B. The Contractor shall notify the Commissioner if unforeseen soil conditions are encountered.

3.03 WASTE HANDLING, STAGING, AND DISPOSAL

A. Handling and Staging

1. Impacted soil shall be segregated into the three soil classifications listed in Article 3.01 of this Section.
2. Excavated material shall be characterized for transportation and disposal in accordance with the following:
  - a. Section 02105 and Section 02106;
  - b. Applicable federal, state, and local regulations and permits; and
  - c. Paragraph 3.03C of this Section
3. Moving impacted soil off of the project site (except for disposal at a reviewed facility) is strictly prohibited unless authorized by the Commissioner.
4. In accordance with Section 02106, temporary stockpiling of excavated material shall NOT be allowed on-site, unless a written letter of approval is obtained from the Commissioner. If a letter of approval is granted, comply with the requirements below.

The Contractor shall construct an onsite soil staging area(s) to properly contain impacted soil until receipt of waste characterization and transportation for off-site disposal. The soil staging area(s) shall be of suitable size to contain the anticipated quantities of soil generated during construction activities. The soil staging area(s) shall be placed within the construction limits of the Project, at designated areas as established by the Contractor prior to construction and reviewed and approved by the Commissioner. The soil staging area(s) shall be constructed to meet the following minimum requirements:

- a. The impacted soil shall be placed by the Contractor onto an impermeable liner (e.g., 40-mil high density polyethylene [HDPE]) that is of sufficient strength and thickness to prevent puncture during use. The placement of impacted soils into the staging area shall be performed such that it does not involve any equipment or procedures that may jeopardize the integrity of the underlying impermeable liner.
- b. An 18-inch high gravel berm shall be constructed around the perimeter of the staging area to provide for containment of liquids that have drained from the impacted soils, and to divert runoff around the staging area. The impermeable liner shall be placed within and extend up and over the berm and shall be anchored beyond the outside perimeter of the berm to prevent displacement. Soil or other waste materials shall not be utilized to anchor the cover.
- c. The staging area shall be sloped (where practical) and equipped with a sump (if possible based upon site conditions) to collect liquids that have drained from the impacted soils or resulting from a precipitation event. The Contractor shall pump all liquids that accumulate within the staging area to a Contractor-provided temporary storage tank(s). Following collection, liquids shall be containerized by the Contractor and disposed of in accordance with the requirements of Section 02240 – Dewatering.
- d. The staging area shall be continuously covered with 10-mil polyethylene sheeting, except while soils are being actively placed within or removed from the staging area. The polyethylene sheeting shall be maintained watertight by the Contractor for the duration of the soil staging activities and shall be securely anchored to prevent displacement.
- e. The Contractor shall inspect the staging area(s) daily and shall promptly correct any deficiencies.
- f. Impacted soil located in the staging area shall not exceed 8 feet in height unless authorized by the Commissioner.
- g. Impacted soil located in the staging area shall be protected by the use of erosion and sediment control features, including silt fencing, in

accordance with Section 02371 – Dust, Soil Erosion and Sedimentation Control. Such features shall be removed and disposed of appropriately at the end of construction.

- B. Soil Reuse: The Contractor shall not reuse soil for on-site backfill or for any other on-site use. The Contractor shall not reuse soil off-site.
- C. Transportation and Disposal: Soil shall be transported and disposed of in accordance with Section 13287 – Environmental Waste Transportation and Disposal and all current applicable federal, state, and local regulations and permits.

### 3.04 EXCAVATION DEWATERING

- A. The Contractor shall remove water that accumulates within active excavation areas to assist in dewatering soil and to facilitate implementation of the soil excavation activities. All water collected as a result of dewatering activities shall be collected, containerized, and handled in accordance with Section 02240 – Dewatering.

### 3.05 DECONTAMINATION OF EQUIPMENT

- A. The Contractor shall perform decontamination of equipment that comes in contact with impacted soil in accordance with the following:
  - 1. The Contractor shall provide a personnel decontamination area as specified in the Contractor's Health and Safety Plan (HASP).
  - 2. Equipment decontamination shall be in accordance with provisions specified in Section 01355 – Regulated Materials Control and Section 02371 – Dust, Soil Erosion and Sedimentation Control.
  - 3. The equipment decontamination area shall be placed within the contamination reduction zone as identified in the Contractor's HASP. Precautions shall be taken to limit contact between the equipment, decontamination personnel, and any cleaning liquids that may accumulate in the decontamination area.
  - 4. The Contractor shall dismantle and properly dispose of all materials associated with the equipment decontamination area and shall restore the area to its original conditions, and as required by the new transfer station construction design requirements at the end of construction.
  - 5. Wash water generated as a result of equipment decontamination activities shall be collected, containerized, and handled in accordance with Section 02240 – Dewatering.
  - 6. Solids and other materials generated during equipment decontamination shall not contact native soils and existing facilities, and shall be collected,

characterized, and disposed of by the Contractor in accordance with Section 13287 – Environmental Waste Transportation and Disposal.

7. Personnel engaged in equipment decontamination activities shall use personal protective equipment (PPE) in accordance with the Contractor's HASP.

### 3.06 AIR SAMPLING

- A. The Contractor shall conduct air monitoring in accordance with Section 02291 – Air Monitoring Program, Section 01356 – Safe and Healthful Working Conditions, and the Contractor's HASP.
- B. The Commissioner will conduct perimeter air monitoring in accordance with Section 02291 – Air Monitoring Program.

### 3.07 HEALTH AND SAFETY PROTOCOLS

- A. The Contractor shall comply with all applicable federal, state, and local regulations, including, but not limited to, Occupational Safety and Health Administration regulations, during the implementation of the work. The work described in this Section shall be conducted in accordance with the Contractor's site-specific HASP, which is described in Section 01356 – Safe and Healthful Working Conditions

-END OF SECTION-

**Section 02230  
SITE CLEARING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, tools, equipment, materials and incidental items required to perform site clearing and grubbing of areas within the limits of construction and other areas shown on the Contract Drawings, including work designated in permits and other agreements, in accordance with the requirements of Division 1.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02317 - Backfilling
- C. Section 02371 - Dust, Soil Erosion and Sedimentation Control

**1.03 DEFINITIONS**

- A. Clearing: Clearing is the removal from the ground surface and disposal of trees, brush, shrubs, down timber, decayed wood, other vegetation, rubbish, trash, scrap, metal, debris and miscellaneous other structures required to permit construction of the new Work.
- B. Grubbing: Grubbing is the removal and disposal of all stumps, buried logs, roots larger than 2 inches, matted roots and organic materials.

**1.04 QUALITY ASSURANCE**

- A. Codes and Standards: State and local laws and code requirements shall govern the hauling and disposal of trees, shrubs, stumps, roots, rubbish, debris and other matter.

**1.05 PROJECT/SITE CONDITIONS**

- A. Streets, roads, adjacent property and other works and structures shall be protected throughout the entire project. Contractor shall return to original condition, satisfactory to the Commissioner, facilities damaged by the Contractor's operations.

**1.06 GUARANTEE**

- A. The Contractor shall guarantee that work performed under this Section will not permanently damage trees, shrubs, turf or plants to remain, or other adjacent work or facilities. If damage resulting from Contractor's operations appears during the

period up to 12 months after completion of the project, he shall replace damaged items at no expense to the City.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 TREE AND SHRUB REMOVAL

#### A. Tree Removal Within Property Limits

1. Trees and shrubs within the limits of construction shall be removed unless otherwise indicated. Trees and shrubs to remain shall be trimmed when doing so will avoid removal or damage. Trimmed or damaged trees shall be treated and repaired by persons with experience in this specialty who are approved by the Commissioner.
2. Tree and shrub removal shall be conducted in a manner so as to avoid damage to those trees and shrubs that will remain.
3. Do not cut or damage trees or shrubs outside of the limits of construction. Damage outside the limits of construction, caused by the Contractor's operations, shall be corrected at the Contractor's expense.

- B. Tree Removal Outside Property Limits: The Contractor shall not cut or damage trees outside the property limits unless shown on the Contract Drawings to be removed or unless written permission has been obtained from the property owner. Furnish three copies of the written permission before removal operations commence. Damage outside the property limits caused by the Contractor's operations shall be corrected at the Contractor's expense.

### 3.02 CLEARING AND GRUBBING

- A. Clearing: The Contractor shall clear all items specified to the limits of construction shown by the Contract Drawings and shall remove cleared and grubbed materials from the site to an authorized disposal site.
1. Do not start earthwork operations in areas where clearing and grubbing is not complete, except that stumps and large roots may be removed concurrent with excavation.
  2. Comply with erosion, sediment control and storm management measures as specified in Section 02371 - Dust, Soil Erosion and Sedimentation Control.

- B. Grubbing: The Contractor shall clear and grub areas to be excavated, areas receiving less than 3 feet of fill and areas upon which structures are to be constructed.
  - 1. Stumps and root mats in these areas shall be removed to a depth of not less than 1 foot below the subgrade of sloped surfaces.
  - 2. All depressions made by the removal of stumps or roots shall be filled with material suitable for backfill as specified in Section 02317 - Backfilling.
- C. Limited Clearing: The Contractor shall clear areas receiving more than 3 feet of fill by cutting trees and shrubs as close as practical to the existing ground. Grubbing will not be required.
- D. Burning
  - 1. Burning of cleared and grubbed materials is not allowed within the property limits.
  - 2. All burning off-site shall be in complete accordance with rules and regulations of local authorities having jurisdiction.
- E. Explosives shall not be used.
- F. No cleared or grubbed material may be used in backfills or structural embankments.
- G. Cleared and grubbed items shall become property of the Contractor and shall be removed from the site and satisfactorily disposed.
- H. Air pollution caused by dust and dirt shall be controlled, complying with governing regulations. Dust control shall be as specified in Section 02371 - Dust, Soil Erosion and Sedimentation Control.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02240  
DEWATERING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall furnish, install, operate and maintain dewatering equipment and systems as shown, specified and required.
- B. The Contractor shall provide standby equipment and power supply for maintaining uninterrupted construction dewatering.
- C. The Contractor shall install, measure, record and report water levels in groundwater observation wells.
- D. The Contractor shall obtain all necessary permits from State and local agencies for operation of the dewatering system and disposal of the dewatering effluent.
- E. The Contractor shall provide a Dewatering Sampling and Analysis Plan (DSAP) and arrange for the services of a New York State certified laboratory, for the collection and analyses of dewatering effluent to determine the quality of dewatering effluent prior to disposal.
- F. The Contractor shall dispose of dewatering effluent as specified herein.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02225 - Impacted Soil Handling
- B. Section 02316 - Excavation

**1.03 REFERENCES**

- A. State of New York DEC General Discharge Permit
- B. State of New York DEC Long Island Well Permit
- C. NYC DEP Division of Pollution Prevention and Control
- D. NYC DEP Division of Connections and Permitting
- E. New York City Construction Codes
- F. ASTM standards applicable to piping, equipment and other items required for a complete dewatering system

## 1.04 DEFINITIONS

- A. Dewatering System: System of wells, well points, sumps, ejectors, pumps, power supply, effluent treatment equipment and other equipment designed by Contractor, submitted to and approved by the Commissioner prior to dewatering, that will effectively dewater the site as required. Adequate observation wells shall be included in the dewatering system to verify drawdown levels inside the excavation area and monitor groundwater levels outside the limits of the excavation near adjacent structures.
- B. Construction Dewatering: Controlling groundwater levels, hydrostatic pressures and controlling surface water, such that excavation required on the Contract Drawings can be performed to required depths in substantially dry and stable conditions.

## 1.05 SUBMITTALS

- A. Provide all submittals in accordance with Section 01330 - Shop Drawings.
  - 1. Pre-construction Submittals: Approval of the dewatering system by the Commissioner shall not in any way relieve the Contractor from full responsibility for the complete and adequate design and performance of the dewatering system to provide the necessary construction dewatering. A Dewatering Excavation Plan shall be submitted to the Commissioner and the NYSDEC at least 30 calendar days prior to the commencement of the dewatering work and, at a minimum, shall include the following:
    - a. Design calculations demonstrating the adequacy of the proposed dewatering system, including depth to groundwater at excavation limits.
    - b. Calculations and requisite technical data on well screens and filter materials and gradations to demonstrate the adequacy of proposed systems to prevent the pumping of fines.
    - c. Working drawings showing proposed types and plan locations of surface water control and the dewatering system to be used.
    - d. Working drawings shall include the arrangements, locations and depths of the dewatering system, a complete description of equipment and materials to be used and the procedure to be followed in installation, operation and maintenance in relation to the proposed sequence of excavation, foundation construction and backfilling.
    - e. The standby equipment and standby power supply.
    - f. The proposed locations of points of effluent treatment equipment, effluent flow equalization tanks and discharge of water.

- g. Location and size of sumps, ditches and water discharge lines, including their relation to water disposal points.
  - h. Submittals shall also include discharge details, metering, and reading schedules and the details of the settling tank and oil/water separator.
  - i. Methods to be used for drilling, construction, and development of wells and piezometers.
- 2. As-built Submittals: During installation of the dewatering system and prior to the start of construction dewatering, submit as-built conditions of the dewatering system. As-built data are to include but are not limited to:
  - a. Plans and sections showing as-built locations, and surveyed elevations of the dewatering system and its components.
  - b. Drawings to indicate changes made to the original working drawings to accommodate field conditions and to comply with design standards.
  - c. Details of installation including dimensions and materials used, description and drawings of all installations, all procedures, soil strata encountered and logs of soil samples.
- 3. Dewatering Sampling and Analysis Plan: The Dewatering Sampling and Analysis Plan shall include descriptions of sampling methods, storage of dewatering effluent and laboratory qualifications.
- 4. Submit a report comparing site groundwater quality data with effluent limits (Table 1).
- 5. Submit a Waste Water Quality Control Application and subsequent Letter of Approval (NYC DEP Division of Pollution Prevention and Control).
- 6. Submit a Sewer Use Application and subsequent Letter of Approval (NYC DEP Division of Connections and Permitting), if applicable.
- 7. Submit a Long Island Well Permit, if applicable.
- 8. The Contractor shall be responsible for compliance with all dewatering permit requirements once construction dewatering begins.

#### 1.06 QUALIFICATIONS

- A. The dewatering work shall be performed by a general contractor or a specialty subcontractor specializing in and having experience installing and operating dewatering systems in similar subsurface conditions for at least three (3) years.

- B. Dewatering system shall be designed by a Registered Professional Engineer having experience in successfully designing a system in similar site conditions.
- C. Well drillers shall be licensed in the State of New York.

#### 1.07 DEWATERING SYSTEM DESIGN REQUIREMENTS

- A. The Contractor shall design, provide, install, operate, maintain and remove the dewatering system as necessary to:
  - 1. Lower and maintain groundwater levels and hydrostatic pressures to 2 feet below the prevailing excavation level or to a point no higher than 2 feet above the top of an impermeable stratum, if the subgrade is in the impermeable stratum. Groundwater levels shall be lowered for a time period as deemed necessary by the Commissioner to ensure adequate factor of safety for the constructed structure.
  - 2. Maintain stable slopes and subgrade.
  - 3. Control and remove seepage and surface water into excavations.
  - 4. Allow subsequent work to be safely performed and not result in damage to adjacent properties, buildings, structures, utilities and other work.
  - 5. The Contractor shall provide primary and standby power, including all costs for installation, energy and fuel.
  - 6. The Resident Engineer will perform inspections and witnessing of:
    - a. Testing of sand and silt from dewatering wells.
    - b. Drawdown and performance testing of dewatering system.
    - c. Performance testing of standby power source and backup dewatering system.
- B. The method of dewatering and control of water both inside and outside the excavation shall be selected by the Contractor who shall be solely responsible for the location, arrangement and depth of any system(s) selected to accomplish the work. The Contractor shall construct protective works as necessary to dewater, cut off porous zones of fill and direct the flow of water from whatever source away from the excavations and adjacent areas. Protective works shall include slurry methods, grouting, clay seepage plugs, toe drains with appropriate filters, deep wells, wellpoints, sumps, dikes, ditches and all supporting features as required, but not specifically shown on the Contract Drawings, to permit construction in the dry.

## 1.08 DISPOSAL OF GROUNDWATER AND DEWATERING EFFLUENT

- A. The Contractor shall manage and dispose of groundwater generated during dewatering activities in accordance with the New York State Pollutant Discharge Elimination System (SPDES) standards set by the New York State DEC for discharge to surface water, and New York City DEP Sewer Discharge Criteria for discharge to the City wastewater collection system, as applicable. The Contractor shall acquire all necessary permits and/or applications for disposal of dewatering effluent.
- B. For discharge to the City wastewater collection system, a comparison of the site groundwater quality data with the Limitations for Effluent to Sanitary or Combined Sewers, June 2000, shall be required prior to the start of lowering of the water table.
- C. The following table lists these effluent limits:

<b>Table 1:</b> <b>New York City Department of</b> <b>Environmental Protection</b> <b>Bureau of Wastewater Treatment</b> <b>Limitations for Effluent to Sanitary or Combined Sewers</b> <b>June 2000</b>			
Parameter	Limitations	Units	Note
Temperature	<150	degrees F	
Total Petroleum Hydrocarbons	<50	mg/l	
PH	5-11	SU's	
Cadmium	2	mg/l	Daily average 0.69 mg/l
Chromium (total)	5	mg/l	
Copper	5	mg/l	
Lead	2	mg/l	
Mercury	0.05	mg/l	
Nickel	3	mg/l	
Zinc	5	mg/l	
Flash Point	>140	degrees F	
Benzene	134	ppb	
Ethylbenzene	380	ppb	
Toluene	74	ppb	
Xylenes (Total)	74	ppb	
PCBs (Total) *	1000	ppt	Method 608 by EPA only with MDL = 65 ppt
Total Suspended Solids	No Limit		
Perc	164		

<b>Table 1:</b> <b>New York City Department of</b> <b>Environmental Protection</b> <b>Bureau of Wastewater Treatment</b> <b>Limitations for Effluent to Sanitary or Combined Sewers</b> <b>June 2000</b>			
<b>Parameter</b>	<b>Limitations</b>	<b>Units</b>	<b>Note</b>
MTBE			
Napthalene	47		
Other			As appropriate
*Analysis for PCBs are requested only if both conditions listed below are met:			
1) if proposed discharge >10,000 gpd;			
2) if duration of a discharge >10 days.			

- D. The Contractor shall provide appropriately sized settling tanks to collect and store dewatering effluent commensurate with dewatering discharge rates to allow for settlement of suspended solids and sampling as required by disposal/discharge criteria. The tanks shall be equipped with an overflow collection system to prevent accidental release of dewatering effluent. Routine inspection of the tanks shall be carried out daily to ensure that tank integrity is being maintained, and that all valves or tank openings are properly locked out to avoid accidental discharge. Settling tanks shall be cleaned frequently to prevent excess deposition of solids that could overflow from the tank. Removed solids shall be classified and disposed of in accordance with applicable Section 02225 - Impacted Soil Handling and Section 02316 - Excavation requirements for manifests and material transport and disposal.
1. The settling tank shall be concrete or steel as manufactured by Rockford, HyrdoFlow Technologies Inc., Ecologix Environmental Systems or approved equal, and sized based upon the maximum groundwater flow times a 1.5 safety factor.
- E. The Contractor shall provide appropriately sized oil/water separators to prevent discharge of hydrocarbons, grease and other floatable materials to surface water or the sewer system. Oil/water separators shall be cleaned frequently and collected materials classified and disposed of in accordance with applicable Section 02225 - Impacted Soil Handling and Section 02316 - Excavation requirements for manifests and material transport and disposal.
1. The oil/water separator shall be concrete or steel as manufactured by Rockford, Pan America Environmental, Inc., Hydro Flow Technologies, Inc or approved equal, and sized based upon the maximum groundwater flow times a 1.5 safety factor.
- F. The Contractor shall provide treatment for, or remove from the site to an approved disposal facility, all dewatering effluent or groundwater which exceeds any limit set for surface water or sewer discharge, whichever is applicable. Classification and disposal shall conform to applicable Section 02225 - Impacted Soil Handling and

Section 02316 - Excavation requirements for manifests and material transport and disposal. No separate payment will be made for treatment or disposal of such effluent or groundwater.

## PART 2 PRODUCTS

### 2.01 GENERAL

- A. Materials and equipment used in the dewatering system shall adhere to accepted industry standards and be in good operating condition and able to perform satisfactorily over the required duration of construction dewatering.
- B. Back up equipment for the dewatering system shall be identical to the primary equipment and shall be available in operating condition at all times.

## PART 3 EXECUTION

### 3.01 GENERAL REQUIREMENTS

- A. Construction dewatering is required to protect foundation subgrades and to maintain dry conditions for construction. The Contractor shall maintain a continuous and completely effective dewatering system for the required time as specified in Section 02316 - Excavation.
- B. The Contractor shall contact the NYSDEC a minimum of two (2) weeks in advance of dewatering system startup.
- C. The Contractor shall coordinate the operation of its dewatering system with existing and proposed construction.
- D. The Contractor shall be prepared to modify the dewatering system and methods as required by actual field conditions encountered during construction, at no additional cost to the City of New York.
- E. The Contractor shall measure water levels periodically in observation wells installed adjacent to nearby structures to ensure drawdown outside the excavation is within permissible limits specified.
- F. Surface areas adjacent to the excavation shall be graded and/or curbed to prevent flow of surface water into the excavation.

### 3.02 TESTING

- A. The Contractor is responsible for monitoring his dewatering efforts to determine if the project requirements are being met. The Contractor shall provide observation wells and other means to monitor the dewatering as detailed in the Dewatering Plan.

- B. Readings to determine the quantity of fines in the pumped water shall be made in accordance with permit requirements or once every two weeks, whichever is more stringent.

### 3.03 INSTALLATION AND OPERATION

- A. The dewatering system shall provide for an uninterrupted flow of pumped water and shall be maintained and pumped as necessary to drawdown and maintain the groundwater levels as specified. Unless otherwise specified, pumping shall maintain those depressed levels until the permanent under drainage system has been installed, tested, accepted and is operational or until the permanent structure is capable of withstanding hydrostatic pressures as determined by the Commissioner.
- B. The Contractor shall furnish, operate and maintain sufficient drainage and pumping facilities to dewater the site and its underlying soil. Dewatering operations shall operate in such a manner so that the excavation can proceed while maintaining stable slopes and the designed lateral support for the perimeter support of excavation walls, without disturbing the bearing subgrades for the structure. The ground water level as measured in observation wells shall be lowered and maintained at least two feet below the prevailing excavation level, or it shall be lowered to a point no higher than 2 feet above the top of impermeable stratum if the subgrade is in the impermeable stratum.
- C. The dewatering system shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground below the bearing level and shall not influence the stability of surrounding areas. Well points and deep wells shall be properly sanded in and sumps shall be sheeted and provided with proper filter material.
- D. A sufficient number of observation wells shall be installed and water levels read by the Contractor, at least weekly, to demonstrate that the goals of the dewatering system are being met. Water level readings shall be submitted within 24 hours to the Commissioner. If applicable, the Contractor may make use of existing observation wells as shown on the Contract Drawings.
- E. Open pumping with sumps and ditches resulting in boils, loss of fines, softening of the ground or instability of slopes will not be permitted.

### 3.04 SURFACE WATER

- A. Surface water on and around the site shall be collected into local sumps by means of trenches, pipes, or other means. The Contractor shall discharge the water into the City of New York wastewater collection system. Direct surface water to minimize surface erosion, ponding and softening of slopes and berms, including haul roads and equipment working stations. Slope protection by means of polyethylene sheets, held in place by tires or otherwise, shall be provided locally as required. At the perimeter of the excavation, surface water is to be directed into the sewer system

and not permitted to enter the excavation. Curbs shall be maintained and, where necessary, extended across intersections, curb cuts and defective curb sections. Surface cracks in the adjacent streets are to be sealed and re-sealed as necessary. Should adjacent settlement occur during the work, curbs shall be raised or watertight mounds shall be installed as directed by the Commissioner to prevent flow into the site.

### 3.05 DISPOSAL OF DEWATERING EFFLUENT

- A. Dewatering effluent discharge to the City of New York wastewater collection system may be affected by rainfall. The Contractor shall provide adequate equalization and holding tanks to allow work to proceed in the case of restricted discharge capability during rain events.
- B. The Contractor shall provide sufficient clean water to flush all sewers and drains when necessary. If any sewer, drain, catch basin, or inlet becomes filled or partially filled with sediment or debris, the Contractor shall promptly and satisfactorily remove such deposits.
- C. The Contractor shall collect one dewatering effluent sample per discharge point, to be submitted as part of the Wastewater Quality Control Application, in order to complete analyses for parameters listed in Table 1. If pretreatment, other than oil/water separators and settling tanks, is required, the Contractor shall continue to collect effluent samples during dewatering operations, and analyze for all listed parameters at intervals based on dewatering discharge volume as a verification of discharge compliance. Intervals will be as required. A copy of all analytical results shall be submitted for review and approval, no later than one day after receipt of such data. The Contractor shall provide for prompt sampling and turn-around times so as not to delay the project, but in no case shall turn-around time be longer than 5 calendar days.
- D. The Contractor shall obtain and pay for all permits, applications and licenses required by law that are associated with the disposal of dewatering effluent, including NYSDEC SPDES Permit, if applicable.
- E. The Contractor shall submit a Wastewater Quality Control (WQC) Application for combined sewer use to the NYC DEP Division of Pollution Prevention and Control - Compliance Engineering Section. The initial effluent sampling results shall be submitted as part of the application. These samples may be collected either from representative nearby groundwater monitoring wells, which shall be purged (3 well volumes) prior to sampling, or from each known dewatering well following well development.
- F. If discharge to the combined sewer system is greater than 10,000 gallons per day (GPD) and/or a new sewer connection is needed, the Contractor shall submit a Sewer Use Letter of Approval to the NYC DEP Division of Connections and Permitting. The Sewer Use Letter of Approval, signed by a Professional Engineer in

the State of New York, must include the Dewatering Plan and the WQC Application Letter of Approval. If pretreatment, other than oil/water separators and settling tanks, is necessary, treatment train effluent must be held in settlement tanks until analytical sample results verifying compliance with all criteria, as listed in Table 1, are sent to the NYC DEP Division of Pollution Prevention and Control for final approval. Once approval is received, the Contractor shall discharge effluent via gravity flow to the sewer system at allowable discharge rates.

- G. The Contractor shall allow 60 days for NYC DEP WQC permitting and Sewer Use Letter of Approval processing.
- H. The Contractor shall select and supply Personal Protective Equipment (PPE) in accordance with the Contractor's site-specific Health and Safety Plan required in Section 01356 - Safe and Healthful Working Conditions.
- I. All portions of the dewatering system shall be removed by the Contractor immediately after completion of dewatering activities.

-END OF SECTION-

**Section 02291**  
**AIR MONITORING PROGRAM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for the Contractor to implement a work area air monitoring program during building demolition, soil removal/handling/backfilling activities, and other activities that could potentially generate impacted airborne particulates or volatile organic vapors under this Contract.
- B. Requirements for the Resident Engineer to implement a perimeter air monitoring program (airborne particulates and volatile organic vapors) during building demolition, soil removal/handling activities, and other activities that could potentially generate impacted airborne particulates (e.g., lead, arsenic, etc.) or volatile organic vapors under this Contract.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 - Regulated Materials Control
- B. Section 01356 - Safe and Healthful Working Conditions
- C. Section 02222 - Demolition and Removal
- D. Section 02223 - Demolition of Building Components Coated with Lead- and Cadmium-Containing Paint - Environmental Requirements
- E. Section 02224 - Removal of Arsenic-Impacted Wood - Environmental Requirements
- F. Section 02225 - Impacted Soil Handling
- G. Section 02316 - Excavation
- H. Section 02317 - Backfilling
- I. Section 13210 - Closure of Aboveground Petroleum Storage Tank
- J. Section 13284 - Removal of Asbestos-Containing Materials
- K. Section 13285 - Removal of Loose Paint
- L. Section 13286 - Removal of Bird Excrement

**1.03 WORK SPECIFIED FOR CONTRACTOR**

- A. The Contractor shall provide all labor, equipment, materials, and services necessary to perform air monitoring in accordance with the Contractor's site-specific Health and Safety Plan (HASP) (required in Section 01356 - Safe and Healthful Working Conditions), applicable Occupational Health and Safety Administration (OSHA) regulations, and in accordance with the requirements of this Section. The HASP shall address air monitoring and air sampling to determine the proper level of personal protective equipment (PPE) and determine the extent of safety requirements for confined space entry (if needed).

- B. The Contractor shall provide all labor, equipment, materials, and services necessary to install and maintain a temporary meteorological station in accordance with the manufacturer's specifications and the protocols specified in this Section. The temporary meteorological station shall continuously monitor ambient air temperature, wind direction, and wind speed.
- C. The Contractor shall implement the appropriate corrective action as required in Article 3.03 of this Section and in the Contractor's site-specific HASP if any of the action levels in the work area are exceeded.
- D. The Contractor may conduct perimeter air monitoring (outside the immediate work area) to evaluate the effectiveness of engineering controls and/or dust vapor suppression methods at no additional cost to the City. However, decisions regarding corrective actions to be implemented by the Contractor will be made by the Resident Engineer.

#### 1.04 WORK PERFORMED BY ENGINEER

- A. The Resident Engineer will establish the background concentrations for airborne particulates and volatile organic vapors in the vicinity of the site as described in Article 3.02 of this Section prior to construction activities.
- B. The Resident Engineer will perform real-time perimeter air monitoring (outside the immediate work area) to evaluate and document the effectiveness of engineering controls and/or dust/vapor suppression methods implemented by the Contractor. The perimeter air monitoring program will include monitoring for potentially impacted airborne particulates and volatile organic vapors as described in this Section. The determination as to what activities could generate potentially impacted particulates will be made by the Resident Engineer. Air monitoring activities conducted by the Resident Engineer do not alleviate any of the Contractor's air monitoring responsibilities.
- C. The Resident Engineer will compare real-time perimeter readings during the demolition and construction activities to the action levels presented in Article 3.03 of this Section and will notify the Contractor if the levels are exceeded.

#### 1.05 SUBMITTALS

- A. Within 30 calendar days prior to the commencement of mobilization activities, the successful Contractor shall submit the following items for review in accordance with the requirements specified in Section 01355 – Regulated Materials Control:
  - 1. A Dust Control Plan including a description of controls and actions that the Contractor proposes to utilize to respond to potential migration of elevated levels of airborne particulates or volatile organic vapors beyond work area limits.

2. A detailed manufacturer's specification for the proposed meteorological station and a map indicating the proposed general location of the meteorological station.

## PART 2 PRODUCTS

### 2.01 MATERIALS AND EQUIPMENT PROVIDED BY THE CONTRACTOR

- A. The Contractor shall provide a meteorological station that will continuously monitor ambient air temperature, wind direction, and wind speed. The meteorological station shall be a Met One meteorological system (or approved equal).
- B. The Contractor shall provide materials and equipment necessary to perform air monitoring within the work area in accordance with the Contractor's HASP and applicable OSHA regulations.
- C. The Contractor shall provide labor, equipment, and materials for implementing corrective action activities (i.e., dust and volatile organic vapor suppression, modifying work procedures, etc.). The Contractor shall implement corrective actions if the action levels presented in Article 3.03 of this Section are exceeded or if deemed necessary by the Resident Engineer.

### 2.02 MATERIALS AND EQUIPMENT PROVIDED BY THE ENGINEER

- A. The Resident Engineer will provide its own air monitoring equipment to conduct real-time perimeter air monitoring.

## PART 3 EXECUTION

### 3.01 CONTRACTOR

- A. The Contractor shall provide all labor, equipment, materials and services necessary to install and maintain the meteorological station in accordance with the manufacturer's specifications and the protocols specified in this Section. The meteorological station shall be installed at a location proposed by the Contractor and reviewed by the Resident Engineer that allows the Resident Engineer continuous and unrestricted access to the meteorological station. The Contractor shall protect the meteorological station against theft and vandalism.
- B. If relocation of the meteorological station is required to accommodate the work, the Contractor shall provide all equipment, materials, and labor to relocate the meteorological system at no additional cost to the City. The new location shall comply with requirements discussed in Paragraph 3.01A of this Section.
- C. Air monitoring shall be performed by the Contractor within active work area limits in accordance with the Contractor's HASP and applicable OSHA regulations. Air

monitoring shall be performed by the Contractor within active work areas during building demolition, soil removal/handling activities, and other activities that could potentially generate airborne impacted particulates or volatile organic vapors.

- D. The air monitoring data shall be recorded on an air monitoring log and shall be maintained in an onsite project file. Real-time air quality monitoring data shall be provided to the Resident Engineer for review/evaluation on a daily or as-requested basis.
- E. The Contractor shall implement corrective actions if airborne particulates and/or volatile organic vapors detected at the perimeter exceed action levels outlined in Article 3.03 of this Section.
- F. At least two days prior to the commencement of building demolition, soil removal/handling/backfilling, and other activities that could potentially generate airborne impacted particulates or volatile organic vapors, the Contractor shall inform the Resident Engineer of the work activities scheduled. If the schedule changes, the Contractor shall notify the Resident Engineer.

### 3.02 ENGINEER

- A. Real-time airborne particulate monitoring and real-time volatile organic vapor monitoring (if applicable) will be performed by the Resident Engineer at the perimeter to evaluate and document the effectiveness of the engineering controls and/or dust/vapor suppression methods implemented by the Contractor. The perimeter air monitoring activities will be conducted a minimum of four times per day during building demolition, soil removal/handling activities and other activities that could potentially generate impacted airborne particulates or volatile organic vapors. If an exceedence is measured, or if potentially impacted visible dust is observed leaving the work area, perimeter air monitoring activities will be conducted at a minimum frequency of twice an hour (or as determined by the Resident Engineer). The perimeter monitoring data will be compared to the action levels presented in Article 3.03 of this Section indicating the need for the Contractor to implement additional control measures and/or to stop work.
- B. Perimeter air monitoring will be conducted at four perimeter monitoring locations (two upwind locations and two downwind locations, such that a rectangle is formed around the perimeter of the work area). The perimeter monitoring locations will be adjusted if the wind direction changes more than 45 degrees. The perimeter monitoring locations will be determined by the Resident Engineer and will be based on wind speed, wind direction, and type of work activities being conducted.
- C. The Resident Engineer will establish the airborne dust and volatile organic vapors background concentrations at the site as described below.
  - 1. Within three weeks prior to Contractor's mobilization to the site, a background particulate and volatile organic vapor study will be performed by

the Resident Engineer to measure background concentrations of airborne particulates and volatile organic vapors at the site.

2. Airborne particulate levels will be measured during normal work hours (e.g., 7:00 a.m. to 5:00 p.m.) every 30 minutes on three separate days. The arithmetic average of the background particulate concentrations from the background study will be used to establish the background concentrations for airborne particulates and volatile organic vapors for use in the monitoring activities specified in this Section.
3. Concentrations of volatile organic vapors will be measured using a photoionization detector during normal work hours (e.g., 7:00 a.m. to 5:00 p.m.) every 30 minutes on three separate days. The arithmetic average of the volatile organic vapor concentrations from the background study will be used to establish the background ambient air concentration for use in the monitoring activities specified in this Section.

### 3.03 PERIMETER AIR MONITORING ACTION LEVELS

- A. The airborne constituent action levels for the real-time perimeter air monitoring conducted during building demolition, soil removal/handling/backfilling activities and other activities that could potentially generate impacted airborne particulates are presented in the following table.

Parameter	Site Perimeter Action Level	Action
Airborne Particulates	0 to 100 $\mu\text{g}/\text{m}^3$ (above predetermined background) and no visible dust leaving work area	Contractor shall continue normal operations.
	100 to 150 $\mu\text{g}/\text{m}^3$ (above predetermined background) and/or visible dust leaving work area	Contractor shall implement dust suppression/engineering control measures as outlined in the Dust Control Plan (prepared by the Contractor and reviewed by the Resident Engineer).
	> 150 $\mu\text{g}/\text{m}^3$ (above predetermined background)	Contractor shall stop all work activities, identify the source of the particulates, and implement measures outlined in the Dust Control Plan (prepared by the Contractor and reviewed by the Resident Engineer) at no additional cost to the City of New York. After these steps are performed to the satisfaction of the Resident Engineer, work activities can resume provided that the particulate level (measured by the Resident Engineer) 200 feet downwind of the work area or half the distance to the nearest potential receptor, whichever is less or as determined by the Engineer, is below 100 $\mu\text{g}/\text{m}^3$ (above background).
Volatile Organic Vapors	0 to 5 ppm (above predetermined background)	Contractor shall continue normal operations.

Parameter	Site Perimeter Action Level	Action
	> 5 ppm (above predetermined background)	Contractor shall stop work activities, identify the source of vapors, and implement corrective actions to abate emissions at no additional cost to the City of New York. After these steps are performed to the satisfaction of the Resident Engineer, work activities can resume provided that the total organic vapor level (measured by the Resident Engineer) 200 feet downwind of the work area or half the distance to the nearest potential receptor, whichever is less or as determined by the Resident Engineer, is below 5 ppm (above background).

### 3.04 HEALTH AND SAFETY PROTOCOLS

- A. The Contractor shall comply with all applicable federal, state, and local regulations (including, but not limited to, OSHA regulations codified at 29 CFR 1926) during the implementation of the work. The work described in this Section shall be conducted in accordance with the Contractor's site-specific HASP, which is described in Section 01356 – Safe and Healthful Working Conditions.

-END OF SECTION-

**Section 02316  
EXCAVATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This specification describes excavation and disposal of all material as specified herein, shown on the Contract Drawings or required, for the purpose of building structures, conduits, pipelines and other structures as well as grading and completing the work in every respect.
- B. Excavation work includes sheeting and bracing, excavation over the site, excavation for roads, pipelines and structures, control of water, segregation and stockpiling of excavated material, disposal of unsuitable and excess excavated material, and trimming, shaping and grading of excavations, all complete and in place as shown on the Contract Drawings, specified, required and directed. The work includes the excavation of any material that, in the opinion of the Engineer, is necessary to be excavated for any purpose pertinent to the construction of the work. The requirements for clearing and grubbing are set forth in Section 02230 - Site Clearing.
- C. All excavated soil shall be considered impacted soil unless otherwise specified or directed by the Engineer. Impacted soil is to be handled in accordance with the requirements of Section 02225 - Impacted Soil Handling

**1.02 RELATED SPECIFICATIONS**

- A. Section 01120 - Contract Summary
- B. Section 01330 - Shop Drawings
- C. Section 01355 - Regulated Materials Control
- D. Section 02222 - Demolition and Removals
- E. Section 02225 - Impacted Soil Handling
- F. Section 02230 - Site Clearing
- G. Section 02240 - Dewatering
- H. Section 02317 - Backfilling
- I. Section 02371 - Dust, Soil Erosion and Sedimentation Control
- J. Section 02821 - Metal Fence
- K. Section 13287 - Environmental Waste Transportation and Disposal

**1.03 PAYMENT**

- A. The cost of all excavation shown on the Contract Drawings and necessary to complete the work shown shall be included in the lump sum prices bid for Bid Items 1, 2 and 3.

- B. The cost of additional earth excavation shall be paid as described in Section 01270 – Measurement and Payment.
- C. If any soils are encountered meeting the definition of unforeseen soil conditions per Section 02225 – Impacted Soil Handling, the additional costs associated with handling, transportation and disposal of such unforeseen regulated material shall be addressed as described in Section 01355 – Regulated Materials Control.

#### 1.04 REFERENCES

- A. ASTM D1557 - Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft<sup>3</sup>)
- B. Occupational Safety and Health Administration, U.S. Department of Labor
- C. Board of Standards and Appeals, N.Y.S. Department of Labor
- D. New York City Rules and Regulations
- E. New York State Department of Transportation, Standard Specification, 2002
- F. New York State Department of Environmental Conservation
- G. U.S. Department of Transportation, Federal Highway Administration
- H. U.S. Environmental Protection Agency
- I. National Bureau of Standards Building Science Series 127 "Recommended Technical Provisions for Construction Practice in Shoring and Sloping Trenches and Excavations."
- J. Guide Design Specifications for Bridge Temporary Works, AASHTO, Latest Edition.

#### 1.05 DEFINITIONS

- A. The term "excavation" shall mean the excavation of all material regardless of its nature.
- B. Topsoil: Topsoil is friable clay loam surface soil found in a depth of not less than 4 inches, and is substantially free of subsoil, clay lumps, stones, and other objects over 2 inches in diameter, and without weeds, roots, and other objectionable material.

## 1.06 DESIGN REQUIREMENTS

- A. In designing the sheeting, take note of the minimum load diagram requirements shown in Attachments A and B at the end of this Section, unless otherwise shown on the Contract Drawings. However, when it is anticipated that heavier crane or equipment loads will fall within the influence line of the excavation, increase design loads accordingly.

## 1.07 SUBMITTALS

- A. Provide all submittals in accordance with Section 01330 - Shop Drawings.
- B. A Dewatering Excavation Plan shall be submitted in accordance with requirements of Section 02240 - Dewatering.
- C. Sheeting and Bracing: Submit a certificate (only), signed and sealed by a Licensed Professional Engineer experienced in Structural Engineering and registered in the State of New York that certifies that the Licensed Professional Engineer has evaluated and approved the Contractor's excavation plan and has prepared complete design calculations and working drawings for the shoring, sheeting and bracing, not specifically shown on the Contract Drawings, which will be used for excavation support. Provide a separate certificate for each excavation before starting the excavation. Where commercially manufactured trench boxes are to be used, provide a certificate from the Contractor's Licensed Professional Engineer stating the conditions under which the trench boxes will be used.
- D. Soil Excavation, Transport and Disposal Plan: Submit a Soil Excavation, Transport and Disposal Plan to the Commissioner for approval at least 30 calendar days prior to the start of excavation. This plan shall include excavation methods and transportation and disposal protocols to be used for impacted soil (as defined in Section 02225 - Impacted Soil Handling) in accordance with all applicable Federal, State and local hauling and disposal codes and regulations.
  - 1. Excavation Plans shall include, but not be limited to, the following:
    - a. Limits of excavation
    - b. Protection methods:
      - (1) Sheeting and bracing
      - (2) Fencing, bridging and decking
  - 2. Excavated soil shall be handled, transported and disposed of in accordance with Section 02225- Impacted Soil Handling, Section 13287 - Environmental Waste Transportation and Disposal and all current applicable federal, state, and local regulations.

**1.08 REGULATORY REQUIREMENTS**

- A. General: Before proceeding with any excavation, obtain all necessary permits required by City Departments having jurisdiction, or consents from owners of private property where their interests may be affected by the work, such as for temporary or permanent occupation, for disposal or storage of materials, or other encroachment except where temporary easements may have been obtained by the City in connection with permanent easements or otherwise.
- B. During the course of the excavation operations and related work, strictly follow the applicable sections of "Excavation" as outlined in Rule No. 23 of the Industrial Code (Board of Standards and Appeals, N.Y.S. Department of Labor) latest edition.
- C. In the period of 2 to 10 days prior to starting excavation, notify all utilities of intended work locations and have utility locations marked.

**1.09 SITE CONDITIONS**

- A. Actual Conditions: Make any geotechnical investigations deemed necessary to determine actual site conditions. Geotechnical data reports are available as described in Section 01120 - Contract Summary.
- B. Underground Utilities: Locate and identify all existing underground utilities prior to the commencement of work.
- C. Quality and Quantity: Make any other investigations and determinations necessary to determine the quality and quantities of earth and the methods to be used to excavate these materials.

**1.10 DUST, SOIL EROSION AND SEDIMENTATION CONTROL**

- A. The Contractor's operations shall conform to the requirements of Section 02371 - Dust, Soil Erosion and Sedimentation Control.

**PART 2 PRODUCTS****2.01 MANUFACTURERS AND MATERIALS**

- A. Use manufacturers and materials for shoring, sheeting and bracing as recommended by the Contractor's Licensed Professional Engineer who designed the shoring, sheeting, and bracing. Where wood lagging is to be left in place, use oak or treated fir or treated pine. Use only environmentally safe treatment for wood lagging.

## PART 3 EXECUTION

## 3.01 GENERAL

- A. No excavation work shall begin before the Dewatering Excavation Plan is approved, as specified in Section 02240 - Dewatering.
- B. Clearing and Grubbing: Clear and grub the site of all open cut excavations and all areas shown on the Contract Drawings and specified. The Contractor shall comply with the requirements of Section 02230 - Site Clearing.
- C. Sheeting and Bracing: Provide safe working conditions, prevent shifting of material, prevent damage to structures or other work, and avoid delay to the work, all in accordance with applicable laws and regulations. Properly shore, sheet, and brace all excavations that are not cut back to the proper slope, as determined by the Contractor's Licensed Professional Engineer.
  - 1. Take sole responsibility for the design and adequacy of shoring, sheeting and bracing not shown on the Contract Drawings.
  - 2. Take sole responsibility for the methods of installation of the shoring, sheeting and bracing.
- D. Structure Excavation
  - 1. Excavations shall be of sufficient size to permit the work to be economically and properly constructed in the manner and of the size specified, except where limits of excavation are provided on the Contract Drawings. The bottom of the excavation in earth and rock shall have the shape and dimensions of the underside of the structure with allowance for the concrete workmat or compacted aggregate base layer.
  - 2. Exercise care to prevent disturbing or loosening of the soil in the excavation. Densify the bearing surface for all structures with an approved type vibratory compactor to 95 percent of the maximum dry density obtainable by ASTM D1557 before the construction of any foundations. Where the depth of disturbed or loosened soils is greater than 12 inches or as determined by the Commissioner that it will require special compaction, the Contractor shall propose the appropriate method of compaction and submit to the Commissioner for approval. All disturbed or loosened soils as determined by the Commissioner that should be removed shall be replaced in accordance with the requirements of Paragraph 3.01I "Unauthorized Excavation".
  - 3. Whenever abandoned existing piles are encountered during excavation, they shall be cut off at least 18 inches below the bottom of new footings, unless otherwise indicated on the Contract Drawings, and shall not be pulled.

- E. Site Excavation: Excavate over the site within the limits of site grading to conform to finished site grades. Arrange the excavation work to permit continuous surface drainage, eliminate low spots and surface ponding, and prevent runoff from flowing into the surrounding areas.
- F. Protection of Plants and Structures: Before starting excavation, clear away all obstructions that are to be removed or relocated. Comply with the requirements of Section 02230 - Site Clearing.
- G. Trench Excavation
  - 1. Maintain the minimum trench width adequate to place, joint and backfill the pipe or conduit properly. The clear width of the trench at the level of the top of the pipe shall not exceed the sum of the outside diameter of the pipe barrel plus 20 inches for pipe 4 through 24 inches in diameter nor the outside diameter of the pipe barrel plus 2 feet for pipe more than 24 inches in diameter, unless otherwise approved by the Commissioner. The banks of pipe trenches shall be as near to vertical as practicable.
  - 2. Length of Excavation: Make excavation for the sewers, drains, ducts, conduits or pipe lines only a reasonable distance in advance of pipe laying, at the discretion of the Resident Engineer, and as may be indicated by the supply of materials on hand.
  - 3. In sheeted trenches, measure the clear width of the trench at the level of the top of the pipe to the inside of the sheeting.
    - a. Pipes placed in trenches wider than specified above shall be provided with concrete cradle or encasement as directed by the Resident Engineer. No separate payment will be made for such cradles or encasement.
    - b. The bottom of trenches shall be graded accurately to provide uniform base for pipe bedding.
    - c. Remove stones as necessary to avoid point bearing. Except as hereinafter specified for wet or otherwise unstable material, backfill overdepths with materials specified for backfilling the lower portion of trenches. Whenever wet or otherwise unstable material that is incapable of properly supporting the pipe is encountered in the bottom of the trench, over excavate such material (a minimum of 2 feet below pipe) to a depth to allow for construction of stable pipe bedding. Backfill the trench to the proper grade with suitable approved materials.
    - d. If unstable material is exposed at the level of the bottom of the trench excavation, it shall be excavated in accordance with Paragraph 3.01H "Authorized Additional Excavation". When the Resident Engineer

judges that the unstable material extends to an excessive depth, he may advise the Contractor, in writing, to stabilize the trench bottom with additional select fill or pipe bedding material or to ensure firm support for the pipe or electrical duct by other suitable methods.

- e. The open, excavated trench preceding the pipe laying operation and the unfilled trench with pipe in place shall be kept to a minimum length, causing the least possible disturbance. Ladders shall provide means of exit from the trench without more than 25 feet of lateral travel. Ladders shall extend a minimum of 36 inches above the top of the sheeting or be tied down.
  - f. No water shall be allowed to rise in the trench excavation until sufficient backfill has been placed to prevent pipe flotation.
- H. Authorized Additional Excavation: In case the materials encountered at the elevations shown on the Contract Drawings are not suitable, or in case it is found desirable or necessary to go to an additional depth or to an additional depth and width, carry the excavation to such additional depth and width as the Resident Engineer may direct in writing. Refill such excavated space with either 2,500 psi concrete or compacted select fill materials, as ordered. Where necessary, compact fill materials to avoid future settlement. Use select fill materials meeting the requirements of Section 02317 and compact to attain a minimum degree of compaction of 95 percent of the maximum dry density as determined by ASTM D1557. Place backfill in lifts not exceeding 9 inches in loose thickness.
- I. Unauthorized Excavation: Wherever the excavation is carried beyond or below the lines and grades shown on the Contract Drawings or given by the Resident Engineer, except as specified in Paragraph 3.01H "Authorized Additional Excavation", refill all such excavated space with such material and in such a manner as may be directed by the Commissioner in order to ensure the stability of the various structures. Areas excavated beneath all manholes, structures, pipelines or conduits without authority shall be refilled by the Contractor at its own expense with 2,500 psi concrete or compacted select fill material and properly compacted as ordered by the Resident Engineer.
- J. Explosives: Do not use explosives for any clearing, grubbing or excavation work.
- K. Contaminated and/or hazardous materials shall be handled in accordance with Section 01355 - Regulated Materials Control and all applicable Federal, State and Local Regulations.

### 3.02 LINES AND GRADES

- A. General: Excavate for sewers, drains, conduits, pipe lines, walls, foundations, footings, and other structures, including any excavating indicated on the Contract

Drawings or necessary, to the lines and grades shown on the Contract Drawings, specified or required.

- B. Demolition: Cut pavements, curbs and sidewalks in compliance with Section 02222 – Demolition and Removals.
- C. Adequate Space: Perform all trimming, grading and other incidental work to the grades and slopes shown on the Contract Drawings, specified or required as approved by the Commissioner. Perform all excavations of sufficient size for the proper execution and inspection of the work. Keep excavation in good condition at all times and fill all voids that may endanger existing structures to the satisfaction of the Resident Engineer.

### 3.03 SUBGRADE CONSOLIDATION

- A. Consolidating Suitable Materials: Materials used in the bottom of excavation to replace boggy and other yielding or unsound materials for providing solid and firm foundations for the structures to be built thereon, where approved in writing, may be either select fill or lean concrete.

### 3.04 FROST PREVENTION

- A. Protection shall be provided against the penetration of frost into material below the bearing level during work in the winter months. This protection shall consist of a temporary blanket of straw or salt hay covered with a plastic membrane or other approved means.

### 3.05 SEGREGATION, STORAGE AND DISPOSAL OF MATERIALS

- A. Excavated soil shall be handled, transported and disposed of in accordance with Section 02225 - Impacted Soil Handling, Section 13287 – Environmental Waste Transportation and Disposal and all current applicable federal, state, and local regulations.

### 3.06 SHEETING AND BRACING

- A. Arrange shoring, sheeting and bracing so as not to place any strain on portions of completed work until the general construction has proceeded far enough to provide ample strength.
- B. If the Contractor or its Licensed Professional Engineer is of the opinion that at any time the Contractor's excavation plan, shoring, sheeting or bracing is inadequate or unsuited for the purpose, take immediate and appropriate action. Provide a new certificate if the Contractor's excavation plans, shoring, sheeting or bracing require modifications.

- C. Monitoring: Periodically monitor horizontal and vertical deflections of sheeting, shoring and bracing.
- D. Accurately locate all underground utilities and take the required measures necessary to protect them from damage. All underground utilities shall be kept in service at all times as specified in Division 1.
- E. Removal of Sheeting
  - 1. When the sheeting and bracing for the vertical sides of such trench excavations is not required to be left in place, such sheeting and bracing shall be removed, and backfill shall be placed and compacted to an elevation at least 1'-6" above the top of the pipe or conduit. Any exception to this requirement will be shown on the Contract Drawings.
  - 2. Where sheeting and bracing is removed, it shall be done as the excavation is refilled in a manner to avoid the caving in of the bank or disturbance to adjacent areas or structures, except as otherwise shown on the Contract Drawings or directed. Carefully fill voids left by the withdrawal of the sheeting by ramming or otherwise as directed by the Resident Engineer.
  - 3. Obtain permission of the Resident Engineer before the removal of any shoring, sheeting or bracing. Such permission by the Resident Engineer shall not relieve the Contractor of responsibility for injury to structures or to other property or persons resulting from failure to leave such sheeting and bracing in place.
  - 4. Load from rakers, struts and corner braces shall be released in a controlled fashion by cutting kickers and removing wedges and shims, as approved by the Resident Engineer.
- F. Permission for Removal: Obtain permission from the Contractor's Licensed Professional Engineer before the removal of any shoring, sheeting or bracing. Retain the responsibility for injury to structures or to other property or persons for failure to leave such shoring, sheeting and bracing in place even though permission for removal has been obtained.
- G. Credit: Sheeting and bracing required to be provided by the Contract Drawings or the Specifications and subsequently allowed or ordered in writing by the Engineer to be omitted shall be subject to suitable credit to the City. Measurement of sheeting and bracing limits subject to suitable credit shall extend from the subgrade to within 18 inches of the ground surface in the case of vertical sides, regardless of stages; and shall extend from the subgrade to 12 inches above the junction of the vertical and sloping sides in the case of excavations with sloped sides above and vertical sides below. Sheeting and bracing indicated to be omitted on the Contract Drawings or in the Specifications will not be subject to credit.

### 3.07 SHEETING AND BRACING LEFT IN PLACE

- A. All sheeting and bracing in excavation for sewer pipe lines, including manholes and chambers, shall be left in place except where otherwise shown on the Contract Drawings, specified or ordered in writing by the Engineer. Sheeting left in place shall be cut off at the elevation shown on the Contract Drawings, or at least 18 inches below final grade. Bracing remaining in place shall be driven up tight.
- B. Where it is necessary to remove cross braces to make way for sewer pipe, manholes, and chambers, rebrace the sheeting in a manner approved by the Engineer, but in no case shall sheeting be braced against the sides of pipe or structures, unless approved in writing by the Engineer.
- C. Leave sheeting and bracing in place in excavations for structures other than pipe lines where shown on the Contract Drawings, specified or ordered in writing by the Engineer to be left in place. Where such sheeting is to be left in place, the original braces shall not be removed and the sheeting shall not be rebraced against the structure unless it is approved by the Engineer.
- D. Sheeting and bracing to be left in place shall include all elements of the sheeting and bracing regardless of the type used, except such braces required to be removed to make way for the structure or pipe line being constructed. Where lagging and "soldier" beams are used, the "soldier" beams shall also be left in place.
- E. In excavations with vertical sides for the full depth, cut off sheeting left in place at the elevations provided in writing by the Engineer, but in general, such cutoffs shall not be less than 18 inches below the existing ground surface. In excavations with sloped sides above and vertical sides below, cut off sheeting at the top of the vertical sides of the excavation. Cut off timber sheeting by sawing, and steel sheeting or "soldier" beams by burning. Breaking off sheeting will not be permitted.
- F. Do not remove sheeting and bracing not shown on the Contract Drawings or specified to be left in place without first obtaining a statement in writing from the Engineer that such sheeting may be removed.
- G. No separate payment will be made for sheeting and bracing left in place, the cost thereof shall be included in the lump sum bid for Bid Item 1 under this Contract.

### 3.08 REMOVAL OF WATER

- A. Conform to the requirements of Sections 02240 - Dewatering and 02371 - Dust, Soil Erosion and Sedimentation Control and Section 02225 - Impacted Soil Handling.
- B. Care of Water: At all times during construction of the work and at its completion for final inspection, provide and maintain ample means and suitable equipment with

which to promptly remove and properly dispose of all water and sewage entering excavations or other parts of the work. Keep all excavations dry at all times until the structures to be built therein are completed and backfilled to approximately final grades except where otherwise approved by the Resident Engineer in writing. Do not permit sewage from existing sewers and house connections to flow into excavations.

- C. To prevent flotation or uplift of the structure or portions of the structure under construction, provide approved dewatering or freezing methods which shall operate under supervision 24 hours per day, including holidays and weekends. Maintain this dewatering or other system in continuous operation until the structure or portions of the structure are substantially completed to a gravity load 10 percent greater than the upward load caused by the ground water uplift pressure measured and computed from the original ground water level. Place backfill and mechanically compact it to approximately final grade after the structure has achieved the required strength, except where otherwise approved by the Engineer in writing. In addition, provide and have available at the work site suitable standby equipment for prompt replacement during breakdowns of operating equipment.
- D. The dewatering system shall be maintained in operation until the backfill is completed to a minimum of one foot above normal ground water level.
- E. Obtain written approval from the Resident Engineer before discontinuing the dewatering or other groundwater control system.
- F. Where water or sewage has accumulated or is flowing in the completed or partly completed structures, remove and dispose of such water or sewage during the time covered by the Contract, unless otherwise directed by the Resident Engineer.
- G. The Contractor shall take care of all sewer drainage interfered with by its operations to the satisfaction of the Resident Engineer. Drainage into trench excavations is expressly prohibited.

### 3.09 FENCING, BRIDGING AND DECKING

- A. All excavations or openings made under this Contract in any public street, park or place, or in any adjoining property, shall be immediately enclosed by a guard fence constructed in a neat and workmanlike manner in accordance with the requirements of Section 02821 - Metal Fence.
- B. Wherever a driveway occurs, construct a bridge of adequate strength and width and provide with side railings to span the excavation.
- C. Wherever the distance between available crossings over the excavation is, in the opinion of the Resident Engineer, excessive, he may order a temporary footbridge with side rails to be constructed.

- D. At all street intersections, excavations made from the surface shall be decked over in a substantial manner so that traffic can be maintained at all times except as herein provided for. The removal of the pavement and the placing of the decking shall be done during the hours of a day or night that will cause the least inconvenience to adjoining property owners and to public traffic in general. During certain designated hours of the day or night, sections of planking not more than ten feet in length may be temporarily removed for the purpose of removing excavated material, receiving materials of construction or for backfilling.

-END OF SECTION-

**Section 02317  
BACKFILLING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Backfilling work includes furnishing, placing and compacting all fill material necessary to bring excavations and site work to final grade as shown, specified or required.
- B. Materials from on-site excavation shall not be used for fill of any type. All fill material shall be imported at no additional cost to the City.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02371 - Dust, Soil Erosion and Sedimentation Control
- C. Section 02741 - Asphaltic Concrete Pavements
- D. Section 03300 - Cast-in-Place Concrete

**1.03 PAYMENT**

- A. The cost of all backfilling shown on the Contract Drawings and necessary to complete the work shown and specified shall be included in the lump sum prices bid for Bid Items 1, 2, and 3.
- B. The cost of additional select fill material and additional common fill material shall be paid as described in Section 01270 - Measurement and Payment.

**1.04 REFERENCES**

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with Section 01330 - Shop Drawings.
- B. Name and location of all suppliers.
- C. Certificate of compliance with standard specified for each source of material.
- D. Prior to stockpiling or placing of select fill materials at the job site, submit for approval approximately 100-pound samples representative of the fill at the proposed borrow source. In addition, submit documentation of the availability of the required fill quantities at any proposed borrow source.
- E. Submit optimum moisture - maximum density curves and reports for all fill material before placement of fill.
- F. Results of all compaction tests for fill placement.
- G. Certification by the lightweight fill producer of the gradation, dry loose unit weight, dry compacted unit weight and Los Angeles Abrasion Test loss for the proposed lightweight fill source.

#### 1.06 QUALITY CONTROL

- A. Testing: The Contractor shall retain the services of an independent materials testing laboratory to perform the following laboratory and field tests.

- B. All materials used in construction shall be tested for optimum moisture-maximum density curve, and reports of the test results for each source shall be submitted promptly. The tests shall be as follows:

Test	ASTM Standard	Tests Per Volume Delivered
Gradation	D422	1 per 200 C.Y.
Compaction or Density	D1557	1 per 200 C.Y.

- C. Acceptability of completed compaction shall be demonstrated by tests performed by the Contractor and accepted by the Resident Engineer. The minimum number of tests shall be determined by quantity of material placed, and reports of the test results shall be submitted promptly. The Contractor shall perform either of the following tests subject to the approval of the Resident Engineer:

Test	ASTM Standard	Tests Per Volume Placed
In-Place Density	D2167 D2922	1 per 200 cy delivered

#### 1.07 DELIVERY AND STORAGE

- A. Materials delivered to the site shall be stored in a manner to prevent contamination and segregation. Segregated or contaminated material will not be permitted to be placed as backfill.

### PART 2 PRODUCTS

#### 2.01 BACKFILL MATERIAL - GENERAL

- A. Backfill with sound materials, free from waste, organic matter, rubbish, boggy or other unsuitable materials.
- B. Materials Requirements: Follow common fill requirements whenever drainage or select fill is not specified. Determine and obtain the approval of the Resident Engineer for the appropriate test method where more than one compaction test method is specified.
- C. Wet and Frozen Materials: Do not use wet or frozen material for backfilling.

#### 2.02 DRAINAGE FILL

- A. Materials for Drainage Fill: Use clean gravel, crushed stone, or other suitable material conforming to the gradation specified for drainage fill. Clay and fine particles are unacceptable in drainage fill. Provide drainage fill that complies with the following gradation limits:

U.S. Standard Sieve	Percent Passing By Weight
1-1/2 inch	100
1 inch	95-100
1/2 inch	45-65
#4	5-15
#16	0-4

### 2.03 SELECT FILL

- A. Materials for Select Fill: Use gravel, crushed stone, limestone screenings or other granular or similar material as approved which can be readily and thoroughly compacted to not less than 95 percent of the maximum dry density obtainable by ASTM D1557.

1. Provide select fill that complies with the following gradation limits:

U.S. Standard Sieve	Percent Passing By Weight
2 inch	100
1-1/2 inch	90-100
1 inch	75-95
1/2 inch	45-70
#4	25-50
#10	15-40
#200	5-15

2. Very fine sand, uniformly graded sands and gravels, or other materials that have a tendency to flow under pressure when wet are unacceptable as select fill.

### 2.04 COMMON FILL

- A. Material for Common Fill

1. Material from on-site excavation shall not be used as common fill. Import whatever fill material is required which conforms to the specifications, at no additional cost to the City.
2. Provide fill material that can be readily compacted to not less than 90 percent of the maximum dry density obtainable by ASTM D 1557 and that does not contain any unsuitable material. Select fill may be used as common fill at no change in the Contract Price.

- B. Granular Materials: Granular material that complies with the following gradation limits may be used as granular common fill:

U.S. Standard Sieve	Percent Passing By Weight
3 inch	100
#10	50-100
#60	20-90
#200	0-20

- C. Cohesive Materials: Cohesive material may be used as common fill as follows:

1. The gradation requirements do not apply to cohesive common fill.
2. Use material having a liquid limit less than or equal to 40 and a plasticity index less than or equal to 20, as determined by ASTM D4318.

- D. Material Approval: All material used as common fill is subject to approval by the Resident Engineer.

## 2.05 PIPE BEDDING

- A. Gradation for All Piping: Use a well graded material of which 90 percent will be retained on a No. 8 sieve, 100 percent will pass a 1-inch sieve, and will be well graded between those limits.

## 2.06 LIGHTWEIGHT FILL

- A. Lightweight fill shall be a lightweight aggregate produced by the rotary kiln method and meeting the requirements of ASTM C330. No byproduct slags or cinders are permitted.
- B. The material shall meet the grading requirements of ASTM C330, Table 1, Coarse Aggregate: 3/4 inch to No. 4.
- C. Dry loose unit weight shall be a maximum of 55 pcf. Dry compacted unit weight shall be a maximum of 60 pcf when measured by a one-point test performed in accordance with ASTM D698.
- D. Maximum Los Angeles Abrasion Test loss of 50 percent when tested in accordance with ASTM C131 (B grading).

## PART 3 EXECUTION

## 3.01 GENERAL

- A. Backfill all excavations to the original surface of the ground or to such other grades as may be shown or required. Obtain approval for the time elapsing before backfilling against recently constructed masonry structures. Remove from all backfill, and from the space being backfilled, any compressible, putrescible, or destructible rubbish and refuse and all lumber and braces before backfilling is started. Leave sheeting and bracing in place or remove as the work progresses, while conforming to Section 02316.
- B. Equipment Limitations: Do not permit construction equipment used to backfill to travel against and over cast-in-place concrete structures until the specified concrete strength has been obtained, as verified by concrete test cylinders. In special cases where conditions warrant, the above restriction may be modified provided the concrete has gained sufficient strength, as determined from test cylinders, to satisfy design requirements for the removal of forms and the application of load.
- C. Dust, Soil Erosion and Sedimentation Control: The Contractor's operations shall conform to the requirements of Section 02371 - Dust, Soil Erosion and Sedimentation Control.
- D. Testing: No material shall be placed until satisfactory test reports for material type and compaction requirements have been approved by the Resident Engineer.

## 3.02 ELECTRICAL DUCT AND STRUCTURE BEDDING

- A. Bedding Placement and Compaction: All electrical ducts and precast manhole bases shall be bedded in well graded, compacted, select fill material. Select fill shall be placed in uniform layers not greater than 9 inches in loose thickness and compacted in place with suitable mechanical or pneumatic tools to not less than 95 percent of the maximum dry density as determined by ASTM D1557. Bedding thickness shall be not less than 6 inches after compaction. Bedding below electrical ducts shall extend the full width of the trench.
- B. Bedding of Existing Facilities: Bed existing underground structures, tunnels, conduits and pipes crossing the excavation with compacted select fill material. Place bedding material under and around each existing underground structure, tunnel, conduit or pipe and extend underneath and on each side to a distance equal to the depth of the trench below the structure, tunnel, conduit or pipe.
- C. Concrete Work Mats: Cast-in-place manhole bases and other foundations for structures shall be cast against a concrete work mat in clean and dry excavations, unless otherwise shown, specified or required.

### 3.03 PIPE BEDDING AND INITIAL BACKFILL

- A. Hand Placement: Place select fill by hand for initial pipe backfill from top of bedding to 1 foot over top of pipes in uniform layers not greater than 6 inches in loose thickness. Tamp under pipe haunches and thoroughly compact in place the select fill with suitable mechanical or pneumatic tools to not less than 95 percent of the maximum dry density as determined by ASTM D1557.
- B. Stone Placement: Do not place stone fragments larger than 2-inch size in the pipe bedding or in the backfill to 1 foot over the top of pipes, nor any stone fragments larger than 3-inch size nearer than 2 feet from any pipe, conduit or concrete wall.
- C. Disallowed Materials: Pipe bedding containing very fine sand, uniformly graded sands and gravels, or other materials that have a tendency to flow under pressure when wet, is unacceptable.

### 3.04 BEDDING PLACEMENT AND BACKFILL FOR PIPE IN SHORT TUNNEL

- A. Bed pipelines or electrical ducts placed in short tunnels in select fill or 2500 psi concrete. Completely fill the remainder of the annular space between the outside of the pipe wall and the tunnel wall with select fill, suitable material, or 2500 psi concrete, as approved. Pipes and ducts in short tunnels shall be supported to permit placing and compaction of backfill.

### 3.05 TRENCH BACKFILL

- A. General: Backfill trenches from 1 foot over the top of the pipe, from the top of electrical duct bedding or as shown to the bottom of pavement base course, subgrade for lawns or lawn replacement, to the top of the existing ground surface or to such other grades as may be shown or required. Backfill trenches as soon as, in the opinion of the Resident Engineer, it can be done without injury to the concrete or pipelines.
- B. Materials: Provide select fill, or other suitable material, as specified and as approved for trench backfill.
- C. Depth of Placement
  - 1. Except under pavements, walkways, railroad tracks, and street or highway appurtenances, or as otherwise specified, place trench backfill in uniform layers not greater than 9 inches in loose thickness and thoroughly compact in place using suitable mechanical or pneumatic equipment. Compact backfill to not less than 90 percent of the maximum dry density as determined by ASTM D1557.
  - 2. Traffic Areas and Under Utilities: Where pavements, walkways, railroad tracks and street or highway appurtenances are to be placed over trenches and

under utilities or utility services crossing the trench, provide trench backfill using select fill placed in uniform layers not greater than 9 inches in loose thickness and thoroughly compacted in place with equipment as specified above. Compact backfill to not less than 95 percent of the maximum dry density as determined by ASTM D1557.

3. Undeveloped Areas: In undeveloped areas and where select fill material or hand-placed backfill are not specified or required, place suitable backfill material in lifts not exceeding 12 inches in loose thickness. When the trench is full, consolidate the backfill by jetting, spading, tamping or puddling to ensure complete filling of the excavation. Mound the top of the trench approximately 12 inches to allow for consolidation of backfill.
- D. Dropping of Material on Work: Backfill trenches in such a way as to prevent dropping material directly on top of any conduit or pipe through any great vertical distance. Do not allow backfilling material from a bucket to fall directly on a structure or pipe and, in all cases, lower the bucket so that the shock of falling earth will not cause damage.
- E. Distribution of Large Materials: Break up lumps and distribute any stones, pieces of crushed rock or lumps that cannot readily be broken up, throughout the mass so that all interstices are solidly filled with fine material.
- F. Temporary Bulkhead for Trenches: Retain backfill in trenches by temporary bulkheads only and remove them as the backfilling progresses. Do not make bulkheads of stone.
- G. Sewers Not to be Covered: Do not cover sewers, drains, basin connections, ends of sewers and branches until the Resident Engineer orders or gives permission to backfill.
- H. Temporary Pavement: After completion of backfilling in City streets, remove all surplus material, and regrade and leave free, clear, and in good order all roadways and sidewalks. Deposit and compact a temporary surface of asphalt, or other equivalent and suitable material to a depth of six inches on all backfilled areas where ordered by the Resident Engineer in writing. Until areas are restored to their original condition, maintain the surface of the temporary pavement in good and safe condition and promptly fill all depressions caused by settlement of the backfill with the temporary surfacing materials and compact the same. Wet the temporary surface by spraying with water when necessary to prevent a dust nuisance.

### 3.06 STRUCTURE BACKFILL

- A. General: Backfill excavations as soon as, in the opinion of the Engineer, it can be done without injury to the concrete or structures.

- B. Use of Select Fill: Use select fill underneath all structures, and adjacent to structures where pipes, connections, electrical ducts and structural foundations are to be located within this fill. Use select fill beneath all pavements, walkways, and railroad tracks, and extend to the bottom of pavement base course or ballast.
1. Place backfill in uniform layers not greater than 8 inches in loose thickness and thoroughly compact in place with suitable approved mechanical or pneumatic equipment.
  2. Compact backfill to not less than 95 percent of the maximum dry density as determined by ASTM D1557.
- C. Use of Lightweight Fill: When specified, shown on the Contract Drawings, or approved by the Engineer, lightweight fill shall be used to raise the grade in areas that are to support pavements, walkways, railroad tracks and other structures.
1. Place lightweight fill in uniform horizontal layers not greater than 12 inches in loose thickness.
  2. Lightweight fill shall be compacted by four complete coverages with an approved smooth drum vibratory roller having a minimum static weight of 14,000 pounds, a minimum dynamic force of 23,000 pounds, and a total force not less than 5,500 pounds per foot of compactor drum width.
- D. Use of Common Fill: Use common granular fill adjacent to structures in all areas not specified above, unless otherwise shown or specified. Select fill may be used in place of common granular fill at no additional cost.
1. Extend such backfill from the bottom of the excavation or top of bedding to the underside of the lawn mix for seeded, sodded or hydroseeded areas, the top of previously existing ground surface or to such other grades as may be shown or required.
  2. Place backfill in uniform layers not greater than 8 inches in loose thickness and thoroughly compact in place with suitable equipment, as specified above.
  3. Compact backfill to not less than 90 percent of the maximum dry density as determined by ASTM D1557.
- E. Use of Cohesive Material: In unpaved areas adjacent to structures, for the top 1 foot of fill directly under the lawn mix, use cohesive backfill conforming to Paragraph 2.04C, placed in 6-inch lifts. The cohesive backfill shall extend to the limits of the excavated area. Compact to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

- F. Backfilling Around Sheet piling: When sheet piling is withdrawn, solidly fill all cavities in or adjoining the trench or other excavation. When sheet piling is left in place, solidly fill all cavities behind such sheet piling.

### 3.07 DRAINAGE BLANKET

- A. Provide a drainage blanket consisting of drainage fill where shown, specified, or required. Place drainage fill in uniform layers not greater than 8 inches in loose thickness.
- B. Where drainage fill is required underneath structures or adjacent to structures where pipes, connections, electrical ducts and structural foundations will be located within the fill, compact the fill with suitable mechanical or pneumatic equipment to not less than 95 percent of the maximum dry density as determined by ASTM D1557.
- C. Where drainage fill is required in areas not specified in Paragraph 3.07B, compact with suitable mechanical or pneumatic equipment to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

### 3.08 EARTH EMBANKMENTS

- A. Make all earth embankments of approved cohesive common fill material.
- B. Place fill in uniform layers not greater than 10 inches in loose thickness. Compact in place with suitable approved mechanical equipment.
- C. Compact earth embankments to not less than 90 percent of the maximum dry density as determined by ASTM D1557.
- D. Do not use cohesionless, granular material as earth embankment backfill, unless otherwise shown or required.

### 3.09 COMPACTION EQUIPMENT

- A. Equipment and Methods: Perform all compaction with suitable approved equipment and methods.
- B. Compact clay and other cohesive material with sheep's-foot rollers or similar equipment where practicable. Use hand held pneumatic tampers elsewhere for compaction of cohesive fill material.
- C. Compact low cohesive soils with pneumatic-tire rollers or large vibratory equipment where practicable. Use small vibratory equipment elsewhere for compaction of cohesionless fill material.
- D. Do not use heavy compaction equipment over pipelines or other structures, unless the depth of fill is sufficient to adequately distribute the load.

### 3.10 FINISH GRADING

- A. Final Contours: Perform finish grading in accordance with the completed contour elevations and grades shown on the Contract Drawings and blend into conformation with remaining natural ground surfaces.
  - 1. Leave all finished grading surfaces smooth and firm to drain. Areas shall be finished to the degree obtainable by either blade or scraper operations and suitable for application of topsoil.
  - 2. Bring finish grades to elevations within plus or minus 0.10 foot of elevations or contours shown.
  - 3. Areas which are anticipated to be undisturbed for a period of more than 30 days shall receive temporary seeding of rye grass at a rate of three bushels per acre, weather and season permitting. This seeding shall be repeated as necessary to maintain a continuing ground cover.
- B. Surface Drainage: Grade outside of building or structure lines in a manner to prevent accumulation of water within the area. Where necessary or where shown, extend finish grading to ensure that water will be carried to drainage ditches, and the site area left smooth and free from depressions holding water.

### 3.11 INSPECTION AND TESTING OF BACKFILLING

- A. Provide sampling, testing, and laboratory methods in accordance with ASTM D1556 or other method as determined by the Resident Engineer for select fill and common fill. Lightweight fill shall be tested as described in Paragraph 2.06C in accordance with ASTM D698. Subject all backfill to these tests to the satisfaction of the Resident Engineer. These tests shall be the basis for acceptance or rejection by the Resident Engineer of the compaction. Failure to achieve the specified densities shall require the Contractor to recompact or remove the material as required.

### 3.12 CORRECTION OF WORK

- A. Correction of Work: Correct any areas of unsatisfactory compaction by removal and replacement, or by scarifying, aerating or sprinkling as needed and recompaction in place prior to placement of a new lift. The Contractor shall, if necessary, increase its compactive effort by increasing the number of passes, using heavier or more suitable compaction equipment, or by reducing the lift thickness. The Contractor shall adjust the moisture content of the soil to bring it to the optimum range by drying or adding water, as required.
- B. Responsibility for Aftersettlement: Correct any depression that may develop from settlement in backfilled areas within one year after the work is fully completed. Provide, as needed, backfill material, pavement base replacement, permanent

pavement, sidewalk, curb and driveway repair or replacement, and lawn replacement, and perform the necessary reconditioning and restoration work to bring such depressed areas to proper grade as approved.

-END OF SECTION-

**Section 02325**  
**DREDGING AND DREDGED MATERIAL DISPOSAL**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Character of Materials
- B. Dredge and Dredged Material Disposal Plan
- C. Dredging Procedure
- D. Dredge Equipment
- E. Dredge Areas
- F. Dredging of Contaminated Material
- G. Hydrographic Surveys
- H. Examination and Acceptance

**1.02 RELATED SPECIFICATIONS**

- A. Section 02222 – Demolition and Removals
- B. Section 02224 – Removal of Arsenic Impacted Wood-Environmental Requirements

**1.03 MEASUREMENT AND PAYMENT**

- A. The total estimated amount of material to be removed from within the specified limits, including side slopes, including over-depth and additional allowance, is shown on the Bid Form. The quantity listed is only an estimate. The Contractor shall complete the work specified whether the quantities involved are greater or less than those estimated. No separate payment will be made for disposal of debris encountered with the dredge material.
- B. Measurements for payment will be by comparison of pre- and post dredge surveys in accordance with Article 3.07, "Pre-Dredge and Post-Dredge Surveys" and Article 3.10, "Final Examination and Acceptance". To cover unavoidable inaccuracies of dredging processes, material actually removed to a maximum depth of 2 feet below the depth specified and within the dredging limits will be measured and paid for at full contractual unit price. Material dredged beyond the allowable overdepth will not be estimated and will not be included in the measurement of work.
- C. Units of measurement for dredging work specified will be cubic yards.
- D. Material actually removed within limits approved by the Commissioner shall provide for final side slopes not flatter than those indicated on the plans and will be estimated and paid for. Do not dredge outside the pay slope defined on the Contract Drawings. In computing the limiting amount of side slope dredging, net dimension without allowance for overdepth will be used. Side slopes are given for pay purposes only and are not necessarily the angle of repose of the sediment. Sloughing side slopes will not be the basis for claims against the City of New York.

End slopes, where indicated on the plans shall be treated in the same manner as side slopes.

- E. The Contractor shall pay dredged material disposal and debris disposal charges and include them in his corresponding price bid for dredging. Submit to the City of New York proof of release of liability of the dredge material. No separate payment will be made for disposal costs.
- F. Payment for all work performed under this Section will be determined by the actual measured quantity of acceptable dredging performed under this Contract. The basis for payment shall be the actual measured quantity of acceptable dredging, delineated by the specified unit of measurement, multiplied by the corresponding contractual unit price shown on the Bid Form.
- G. Dredging conditions described herein and indicated on the Contract Drawings describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to conditions recognized in the dredging business as usual in dredging activities such as those required under this Contract.

#### 1.04 GENERAL REQUIREMENTS

- A. Furnish all labor, materials, equipment and incidentals required to perform the pre-dredge survey, the sediment sampling, sediment testing, the sediment analysis, the dredging dredged material transportation, dredged material disposal, and post-dredge survey as shown and specified in the Contract Plans and Specifications.
- B. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- C. Comply with all applicable Federal, State and Local laws and regulations.

#### 1.05 DEFINITIONS

- A. Hard Material: Material requiring special equipment for economical removal, and includes boulders or fragments too large to be removed in one piece by the dredge.
- B. Contaminated Material: Material unsuitable for open water disposal. For a description of the contamination levels in this dredge material, refer to Summary of Sediment Sampling at Department of Sanitation, MTS Conversion Program Sites, dated May 2004 as submitted to NYSDEC by HydroQual, Inc. Based on the environmental reports developed to date, it is estimated that the dredge material will be classified as type C. In addition, it can be expected that the dredge equipment will recover creosote pile remnants.

- C. Debris: Any non-sediment material such as wooden pile remnants, revetment stone (riprap), logs, driftwood, wire, cable, anchors, lumber, trash, etc.
- D. Maximum Pay Depth: The required dredge depth plus the overdredge allowance for this project. All material actually removed within the required dredge prism plus any material removed within the 2-foot allowable overdredge zone will be paid for. No over-depth dredging will be paid for material removed below the required dredge prism side slopes. Dredging beyond the maximum pay depth will not be paid.
- E. Overdepth Allowance: An additional increment of depth below the required dredging depth to account for dredging inaccuracies of the dredging operation. A 2-foot overdepth allowance has been established for this project to ensure the removal of all the material within the required dredge prisms. The 2-foot overdepth is shown on the Contract Drawings.

#### 1.06 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 – Shop Drawings:
  - 1. The Contractor shall submit three (3) copies of a Dredge and Disposal Plan to the Commissioner within ten (10) days after Notice to Proceed, for approval. The plan shall detail the order and dates for completion and/or removal of each dredge area, disposal of dredged material and debris, and the plan shall include the following:
    - a. The proposed methods, equipment and schedule to dredge, transport and dispose of the dredged materials from the dredge area.
    - b. The proposed methods, equipment and schedule for removal, transport and disposal of debris from each dredge areas.
    - c. The proposed hydrographic survey equipment, methods and personnel for progress surveys.
    - d. Special procedures for dredging near structures.
    - e. Layout site locations, equipment laydown areas and equipment storage areas.
    - f. Silt curtain configuration and details.
  - 2. Shop Drawings
    - a. Soundings or Sweepings: Submit drawings of surveys by soundings or sweepings during progress of work.

- b. Dredge and Auxiliary Floating Plant layout shall be in accordance with Paragraph 3.02A.
- 3. Certificates: Protection plan, submit a plan for protection of surrounding structures, equipment, and vessels.
- 4. At least 75 calendar days prior to the start of dredging, submit three (3) copies of documentation required by the Special Conditions of the permit, including:
  - a. Pre-dredge and post-dredge survey plans and results.
  - b. Sediment sampling plan, analysis plan, results and existing sediment sampling data.
  - c. Sampling results:
    - (1) Bulk sediment chemistry and grain size analysis
    - (2) Testing required for dredge deposition at an upland location
  - d. Estimate of amount of material to be dredged based on pre-dredge survey.
  - e. Site plan and cross sections showing and clearly labeling mud lines, proposed dredge line and all other pertinent information.
  - f. Name and address of dredged material placement location, and letter of acceptance from the named facility certifying that all requirements have been met to allow the facility to accept material dredged from project site. List of all sampling, testing and analysis requirements for the named location.
- B. Submit an Environmental Protection Plan describing proposed methods, schedules and materials for implementing the environmental protection requirements. The Environmental Protection Plan shall be submitted at least 30 calendar days prior to starting the dredging operations.
- C. Daily Report of Operations: Submit in accordance with the requirements of Paragraph 3.09A.

#### 1.07 SITE CONDITIONS

- A. Surveys shown in the Plans were conducted on the date indicated therein. The City of New York will perform a preconstruction sounding survey of the site to establish pre-dredging depths for the purpose of measuring quantities for payment.
- B. In formulating his bid, the Contractor shall examine the subsurface exploration logs and reports listed in Article 1.08, "Character of Materials", herein and evaluate the

character of the materials as they may affect his operations and the means and methods available to accomplish the work.

- C. In formulating his bid, the Contractor shall examine the site of the work, including the disposal sites, and evaluate all site conditions as they may affect his operations and the means and methods available to accomplish the work. Seasonal environmental conditions exist that could influence the work. The Contractor shall examine information contained herein and evaluate the environmental conditions as they may affect his operations and the means and methods available to accomplish the work

## 1.08 CHARACTER OF MATERIALS

### A. General

1. It is the Contractor's responsibility to evaluate and establish the consistency of the materials to be dredged. The City of New York and the Commissioner shall not at any stage be held responsible for any of the information provided and/or for the interpretation of the data provided. It is the Contractor's responsibility to satisfy itself to the nature of the work and the quality of the material to be dredged.
2. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available as described in Section 01120 – Contract Summary. The Contractor may use this report to establish the quality of materials expected to be present at the project site. The Contractor shall satisfy itself whether the investigations are sufficient to determine the nature of the work and the quality of the material to be dredged. If the Contractor finds that the investigations are not sufficient to determine the nature of the work and the quality of the material to be dredged, he can undertake his own investigations before submission of his bid at his own expense.
3. Typical soils to be dredged include, but are not limited to, sands, silts, and clays. Unified Soil Classification System classifications include SP-SM, SM, CL, CH, ML, MH, OL, OH. Other types of soils may also be encountered.

### B. Available Geotechnical Reports

Title	By	For
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

## 1.09 ARTIFICIAL OBSTRUCTIONS

- A. The City of New York has knowledge of debris such as, but not limited to, metal bands, pallets, pieces of broken cable, rope, fire hose, and broken piles (creosote). The City of New York has no knowledge of existing wrecks, wreckage, or other material of such size or character as to require the use of explosives or special or additional plant for its economical removal. Debris removed from the dredged area shall be removed from the water. Disposal shall be the responsibility of the Contractor and disposal shall be outside the limits of City of New York property. Refer to Section 01733 – Construction Waste Management, Section 02224 – Removal of Arsenic Impacted Wood – Environmental Requirements and Paragraph 3.01J for disposal requirements of creosoted wood.
- B. There are several areas where dredging is required in close proximity to existing wharf structures and piers. Dredging shall also be performed adjacent to the new king pile bulkhead which must be constructed under this Contract prior to the dredging. The Contractor shall conduct dredging operations in the dredge area in such a manner to prevent undermining or endangerment of the existing and new adjacent structures. Excessive or unnecessary dredging may result in an unstable condition at the toe of the structures. It shall be the Contractor's responsibility to avoid damage to existing structures and to improvements made under this Contract. The Contractor shall strictly adhere to the indicated dredging template when working near any structures, and shall be responsible for repairing any damage which may result from failure to comply with the requirements of these specifications, at no additional cost to the City of New York.

## 1.10 PERMITS

- A. The Contractor shall comply with conditions and requirements of the Corps of Engineers Permit and other Local, State or Federal permits. The Commissioner will secure the permit for dredging of dredged material as indicated. The Contractor shall make his/her own arrangements for disposal of dredged materials and debris. The Contractor shall undertake all required debris removal, dredging, handling, transportation and disposal in accordance with the permit requirements.
- B. The Contractor shall comply with the permit issued by the New York State Department of Environmental Conservation (NYSDEC) and the Army Corps of Engineers. These permit conditions can be different (more stringent) than the requirements listed in this Section. The Contractor shall base his price bid on the most stringent requirements.

## 1.11 ENVIRONMENTAL PROTECTION REQUIREMENTS

- A. Provide and maintain during the life of the contract, environmental protective measures. At all times, provide environmental protective measures required to correct conditions, such as spills of oil, fuel, bituminous materials, calcium chloride, salts, acids, bases or other harmful materials. or debris that occur during

the dredging operations. Comply with Federal, State, and local regulations pertaining to water, air, and noise pollution. Seasonal restrictions for dredging (blackout periods) are applicable to dredging at the project site. It is the responsibility of the Contractor to investigate and comply with all applicable local and national laws concerning pollution of the water. All Work performed under this Contract shall be performed in such a manner that objectionable conditions will not be created in the water at or adjacent to the Project area.

- B. It is the Contractor's responsibility to assess if he requires specialized equipment, protective clothing, etc. in addition to the requirements listed in the specifications for handling contaminated dredge materials. Refer to Section 01355 – Regulated Materials Control and Section 01356 – Safe and Healthful Working Conditions

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 GENERAL DREDGING PROCEDURE

- A. The overall purpose of the dredging is to deepen the areas in front of the new Marine Transfer Station to provide access to this new station for a range of barges and tow tugs.
- B. The Contractor shall adhere to the overall construction schedule and complete the dredge area in accordance with the milestone dates. The Contractor shall adhere to seasonal restrictions for dredging periods in accordance with the permits.
- C. Dredging shall be carried to lines, depths, and tolerances as indicated on the Contract Drawings and as directed by the Commissioner. The Commissioner may change the lines and depths shown in the Contract Drawings. If such changes increase or decrease quantity of dredging, such revised quantities will be used as basis for payment under unit price for dredging element involved. Dredging work carried out beyond the maximum overdepth allowance given shall be considered excessive dredging and, if required by the Commissioner, the Contractor shall, at his/her own expense, be responsible for back filling these areas to elevations and with materials specified by the Commissioner.
- D. The Contractor shall establish a minimum of two (2) survey control points along the shore to provide horizontal and vertical survey control. Survey control points that are damaged by the Contractor's activities shall be re-established at the cost of the Contractor.
- E. Dredging shall be done with a mechanical clamshell dredge, using an environmental bucket. Barge overflow will not be allowed. However, the Contractor may leave the material on site in the barges and have it settle over time and then pump out the decant water into the surrounding water body, provided the Contractor obtains all applicable permits and approvals for discharging the decant

water. This will require the Contractor to provide additional barges for settlement of the dredge material.

- F. Any material that escapes or is lost at any time while dredging, loading, transporting, or which is deposited other than in an area designated on the Contract Drawings, or change approved in writing by the Commissioner, shall be re-dredged, and material shall be re-deposited where directed by the Commissioner, at the Contractor's expense.
- G. The Contractor shall provide for the safe transportation and disposal of dredged materials. Transport and dispose of dredged materials at an approved disposal area. The Contractor shall verify the availability of the selected disposal site to accept dredged material at the time the work is performed and comply with any sampling, testing, analysis or other requirements of the disposal facility. Disposal at locations in New Jersey requires the Contractor to obtain an Acceptable Use Determination (AUD) from the New Jersey Department of Environmental Protection.
- H. The Contractor shall meet all local, state and federal laws, regulations and permit requirements applicable to dredging and disposal operations. The Contractor shall prepare and submit the materials listed in paragraph 1.06A.4 in accordance with the permit documents, which include a sediment sampling plan. The Contractor shall implement the plan and submit the results to the Commissioner for review by NYSDEC. If the results differ significantly from those of the sampling report cited in paragraph 1.05B, dredging, transportation and disposal operations may be impacted. Should this occur, such findings may be considered as Changed Conditions.
- I. Excessive loss of water, sediment or both from the time the bucket breaks the water's surface to the time it crosses the barge gunwale is not permitted. This means the environmental bucket should be in good working order throughout construction.
- J. Creosote piles are considered "hazardous waste" and shall be disposed off at a Land Disposal Restrictions (LDR) facility landfill that is approved to accept RCRA hazardous waste.
- K. The Contractor shall use silt curtains in conformance with permit requirements. Silt curtains shall be deployed to enclose the area being dredged and the bucket swing area. Also, silt curtains shall be inspected daily to ensure proper alignment and function. If silt curtain is damaged, dredging operations shall cease until necessary repairs are completed.

L. Dredging operations shall be conducted in such a manner as to minimize water quality impacts:

1. Bucket hoist speed limited to approximately 2 ft/second.
2. Bucket lowered to level of barge gunwales prior to release of load.
3. No barge overflow is allowed. See Paragraph 3.01E.

### 3.02 EQUIPMENT

- A. The Contractor shall, at all times during the progress of the works, provide, operate and maintain in proper working conditions the necessary dredges and plant, barges, tugs and other floating craft and boats, surveying equipment and sounding equipment necessary for the execution and completion of the works. The capacity of the dredging plant shall be such as to allow completion of the dredging work within the Construction Schedule with reasonable margins for downtime due to breakdowns, bad weather and interruptions arising from plant movements. The Contractor shall submit three (3) copies of the Dredge and Auxiliary Floating Plant Layout describing the plan layout of the dredge and major auxiliary floating plants, and Dredge and Disposal Plan to the Commissioner for approval. The plan shall include locations of engines and fuel storage, engine types, power ratings, electrical rooms, transformer rooms, emergency generating equipment, and vertical and horizontal access. Upon approval, the plan shall be furnished to the local police, Port Police, Federal Aviation Authority, U.S. Coast Guard and local fire departments by the Contractor.
- B. The Contractor's equipment shall be of sufficient size and quantity to meet productivity requirements of the Work and shall meet regulatory emission standards, and shall be kept in good working order to efficiently perform the Work. Promptly detect and repair leaks or breaks on haul barges or other dredged material conveyances. Remove dredged material placed due to leaks and breaks.
- C. Display System: The Contractor shall install and maintain sensors and related instrumentation to measure and display depth of dredge(s) to be used for excavation work. A display system capable of displaying to the operator in real-time the cross section on which dredge is working, including original ground line, design depth, and position of bucket, shall be installed and maintained.
- D. The Contractor shall make all arrangements and pay all costs associated with meeting applicable regulations and permit requirements of all City, State and Federal authorities.
- E. The Contractor shall install and maintain a positioning system with capability of providing horizontal and vertical control for dredging and surveying operations. Survey system shall be compatible with system employed by the City of New York.

- F. The Contractor will be required to use settlement basins or other devices or construction methods to maintain compliance with regulatory requirements per the permit conditions for dredging and rock armor and underlayer placement activities.
- G. The Contractor shall use an environmental clamshell bucket per the permit conditions except for dredging hard material. The environmental bucket is defined as a bucket constructed with sealing gaskets or overlapping sealed design at the jaws. The bucket shall be equipped with a signal light in the control station, to verify bucket closure and seal.
- H. Use of the environmental bucket shall be done to the point of refusal to meet grade. If native dredge material cannot be removed with an environmental bucket, a suitable open clamshell capable of removing hard material shall be employed after reaching refusal on the environmental bucket. Application of a bucket other than an environmental bucket requires approval of NYSDEC.
- I. The material shall be placed and transported in solid hull scows or concrete sealed scows.

### 3.03 ENVIRONMENTAL DREDGE WINDOWS

- A. The following table provides an overview of the seasonal dredge restrictions (black-out dates), no dredging allowed during the periods listed below:

**Table – Environmental windows**

<b>NYS DEC</b>	<b>US ACE</b>
November 15 – April 15 (Striped Bass/Winter Flounder)	November 15 – April 15 (Striped Bass/Winter Flounder)

### 3.04 COORDINATION AND NOTICES

- A. Prior to starting dredging the Contractor shall sent notices to:
  1. U.S. Army Corps of Engineers, New York District.
  2. New York State Department of Environmental Conservation.
  3. Pipeline, cable and utility companies in the vicinity of the dredge areas.
  4. U.S. Coast Guard
  5. City of New York
  6. Adjacent Property Owners

Copies of the letters shall be provided to the Commissioner.

- B. It shall be the responsibility of the Contractor to fully coordinate all work with all other contractors, the Port Authority of New York & New Jersey, New York City and all other personnel working in the project vicinity. If there is a coordination

problem arises, the Commissioner shall be immediately notified and a meeting between all parties involved shall be held to resolve the coordination problem.

- C. If required by the Commissioner, the Contractor shall attend a meeting prior to start of construction activities with the City of New York, the Commissioner, U.S. Coast Guard, Port Pilots and the Port Police to outline the organization for prevention/elimination of traffic conflicts.
- D. When required, the Contractor shall provide transportation for the City of New York's Representative and inspectors and, as appropriate, personnel from authorities having jurisdiction, to and from the dredging plant.

### 3.05 NAVIGATION

- A. The Contractor's operations shall adhere to the U.S. Coast Guard publication "Navigation Rules, International-Inland", COMDTINST M16672.2D, latest edition available at [www.navcen.uscg.gov/mwv/navrules/download.htm](http://www.navcen.uscg.gov/mwv/navrules/download.htm).
- B. Minimize interference with the use of navigation channels and passages. The Contractor shall be required to conduct the work in such a manner as to obstruct navigation as little as possible, and in case the Contractor's plant or other floating plant so obstructs a navigation channel as to make difficult or endanger the passage of vessels, said plant shall be promptly moved on the approach of any vessel to such an extent as may be necessary to afford a practicable passage.
- C. No adjustment in the contract price or in time for completion will be made if dredging operations are interrupted due to the movement of vessels or floating equipment.
- D. Each night, between sunset and sunrise and during periods of restricted visibility, provide lights for floating plants, pipelines, ranges, and markers. Also, provide lighted buoys to safeguard navigation. When night work is in progress, maintain lights from sunset to sunrise for the observation of dredging operations. Lighting shall conform to United States Coast Guard requirements for visibility and color.
- E. Furnish, set, and maintain ranges, buoys, and markers needed to define the work and to facilitate inspection. Establish and maintain gages in locations observable from each part of the work so that the depth may be determined. Suspend dredging when the gages or ranges cannot be seen or followed.

### 3.06 DREDGING

- A. Purpose: Excavate river bottom sediments, organic soil, silt, and sand. The materials are unsuitable for open water disposal. Dispose of the materials at an approved disposal site.
- B. Depth and Extent of Dredging: To stations, lines, and depths as shown on plans.

- C. Sequence of Work: Material shall be removed after completion of the new east king pile bulkhead and at least 3 months prior to project completion.
- D. Restrictions: Excavation of soils shall be performed by clamshell dredge.

### 3.07 PRE-DREDGE AND POST-DREDGE SURVEYS

- A. The Contractor shall perform one pre-dredge survey for each dredge area after the award of contract and as close to commencement of dredging for each dredge area as possible, but not more than 14 calendar days prior to commencement of work.
- B. The Contractor shall notify the Commissioner not less than fourteen (14) calendar days prior to completion of the entire dredging work. The Contractor shall perform the post-dredge survey as soon as practicable after completion of the work for each complete dredge area, preferably within seven (7) calendar days after completion of the entire dredge area work.
- C. All areas found to be in compliance with the contract requirements will be measured for payment in accordance with Section 01270 - Measurement and Payment. Preliminary hydrographic survey data shall be made available to the Commissioner within ten (10) calendar days after the Contractor's survey is performed. If the preliminary survey data indicates that the dredged area is not at the required depth (within the overdredge allowance), the Contractor will be directed to resume dredging and to complete the work to project depth.
- D. The material removed will be measured by cubic yard in place, by means of soundings taken before and after dredging. Soundings shall be conducted using commercially available Automated Range-Azimuth Positioning System or Differential Global Positioning System (DGPS), in the New York State Plane Coordinate system based on NAD 83. Soundings shall be taken by dual frequency single-beam acoustic surveys (nominally 24-38 kHz and 200 kHz), with a maximum line spacing of 25 feet. Other methods such as lead line, trigonometric leveling (total station)/differential leveling, or single-beam acoustic survey methods, may be used if multi-beam method is not warranted as determined by the Commissioner. Results of soundings by any of these methods, singularly or in combination, will be the basis for payment. The Commissioner shall be notified at least seven (7) calendar days prior to conducting each pre-dredge and post-dredge survey and shall be given the option of having his representative present when such soundings are made.

### 3.08 SHOALING

- A. If, before the contract is completed, additional shoaling occurs in any dredge area, because of the natural sloughing of the side slopes or from sediments transported inside the project area, re-dredging at the contract unit price may be required as directed by the Commissioner.

### 3.09 REPORTING REQUIREMENT

- A. The Contractor will be required to prepare and maintain a Daily Report of Operations and furnish six copies thereof to the Commissioner. The daily reports shall document dredging and disposal operations for all shifts in a 24-hour period. During the performance of all dredging and disposal operations, equipment operators shall fill out a Daily Dredging Report and Leverman's Shift Log for each calendar day's activity on each dredge being operated. Forms and reporting format to be used shall be submitted to the Commissioner for approval prior to use. Forms shall be filled out completely and legibly; including signatures, using black ink. Original forms shall be given to the Commissioner by 12:00 noon on the day following date shown on reports. Daily Dredging Report shall be filled out for every calendar day and every dredge on site, even when equipment is not working.

### 3.10 FINAL EXAMINATION AND ACCEPTANCE

- A. As soon as practicable after the completion of the entire work, a final examination of the work will be conducted by the Commissioner. Should any shoals, lumps, or other lack of contract depth be disclosed by this examination, the Contractor will be required to remove same by mechanical dredge. However, if the bottom is soft and the shoal areas are small and form no material obstruction to navigation, the removal of such shoal may be waived by the discretion of the Commissioner. The Contractor or his authorized representative will be notified when hydrographic surveying will be performed, and will be permitted to accompany the survey. When the area is found to be at the required depth(s) and slope(s) within the overdredge allowances, it will be accepted finally. Should more than two sounding operations by the City of New York over an area be necessary by reason of work for the removal of shoals disclosed at a prior sounding, the cost of such third and any subsequent sounding operations will be charged against the Contractor at the rate of five thousand dollars (\$5,000.00) per day for each day in which the City of New York plant is engaged in sounding and/or is enroute to or from the site or held at or near the said site for such operations. Final acceptance of the whole or a part of the work and the deductions or corrections of deductions made thereon will not be reopened after having once been made, except on evidence of collusion, fraud, or obvious error; and the acceptance of a completed section shall not change the time of payment of the retained percentages of the whole or any part of the work.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02360**  
**EXCAVATION SUPPORT AND PROTECTION**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to design, furnish, fabricate and install excavation support and protection systems complete in place where shown on the Contract Drawings, as specified herein, and as required to adequately protect structures and utilities from damage during construction of foundations, substructures, abutments, piers, retaining walls, bulkheads and cofferdams. The work also includes the removal of temporary excavation support and protection systems and restoration of structures and utilities to a condition equivalent to that prior to the start of the work.
- B. The work includes, but is not limited to, the following items:
  - 1. Temporary sheeting required to prevent soil erosion under existing pile-supported structures as a result of excavation operations.
  - 2. The use of tight sheeting, at the Contractor's discretion, around the general excavation perimeter to limit the quantity of water that may flow into the excavation area due to high groundwater levels that may be encountered.
- C. The Contractor shall be required to maintain the excavation support and protection system in place, and remove it from the job site only after its function has been accomplished or when directed by the Commissioner. Excavation support and protection systems may be left in place only where specifically indicated on the Contract Drawings or with the written permission of the Commissioner.
- D. This Section includes, but is not limited to, the following items:
  - 1. Unbraced sheet pile walls.
  - 2. Braced sheet pile walls.
  - 3. Soldier pile and lagging walls.
  - 4. Timber sheeting and bracing.
  - 5. Shoring and underpinning.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 – Excavation
- B. Section 02317 – Backfilling
- C. Section 05120 – Structural Steel

### 1.03 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
1. American Society for Testing and Materials (ASTM):
    - a. ASTM A36, Carbon Structural Steel.
    - b. ASTM A153, Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
    - c. ASTM A307, Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength.
    - d. ASTM A328, Steel Sheet Piling.
  2. American National Standards Institute/American Welding Society (ANSI/AWS):
    - a. ANSI/AWS D1.1, Structural Welding Code – Steel.
  3. Southern Pine Inspection Bureau (SPIB):
    - a. SPIB Grading Rules.
  4. Western Wood Products Association (WWPA):
    - a. WWPA Catalog A - Product Use Manual.
  5. City of New York:
    - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
    - b. New York City Board of Standards and Appeals, latest edition and amendments or supplements thereto.

### 1.04 DEFINITIONS

- A. Protection of Structures is defined as the provision of all necessary construction to securely support the structure being protected. Structural settlements shall be limited to the displacements specified. Protection shall include restoration of the structure upon completion of such work.
- B. Excavation support is the support system installed prior to, during and immediately following excavation, to minimize ground movement and slippage, and to maintain the stability of the excavation while constructing the structure.
- C. Restoration is defined as the correction, by repair or replacement, of portions of a structure damaged or altered as a result of the Contractor's operations. Restore to

the equivalent condition existing prior to the start of work and to the satisfaction of the Commissioner.

- D. Structures are defined as buildings, surface and underground structures, including pavements and underground pipelines and utilities that may be affected by the Contractor's operations.
- E. Displacements are defined as vertical and/or horizontal movements measured at either the exposed surface of a structure or within the soil overburden within five feet of the structure. Movements may occur as a result of the Contractor's operations prior to, during, or after installation of the excavation support system.

#### 1.05 DESIGN AND PERFORMANCE REQUIREMENTS

- A. Design, furnish, place, maintain and remove excavation support and protection system at locations required to have open excavations in operation without danger to workers or adjacent structures or facilities.
  - 1. Base design of excavation support systems on existing loads and construction conditions. Existing loads to be considered include, but are not limited to, those caused by soil pressure, hydrostatic pressure, existing structures, stored material, and moving and stationary vehicles and equipment. Design excavation supports in a manner that will permit construction to proceed, enable supports to present no threat to public safety, and protect completed work and other property from damage that would result from ground movement.
  - 2. Obtain any additional information necessary for the design including, but not limited, to soil test borings and foundation plans.
- B. The Contractor is solely responsible for the design and construction of excavation support and protection systems necessary to protect personnel, structures or utilities whether or not indicated on the Contract Drawings. The Contractor shall retain a licensed Professional Engineer registered in the State of New York to prepare, sign and seal structural design calculations and to supervise, sign and seal design drawings for each excavation support system proposed for this project for review and approval by the Commissioner.
- C. Sequence of construction, including any required excavation, filling or backfilling, shall conform to the requirements shown on the Contract Drawings and as specified in Section 02316 - Excavation and Section 02317 - Backfilling.

- D. When concrete is less than 7 days old, do not drive sheet piles closer to the concrete than the distance computed by the formula below:

$$D = 1/7 \sqrt{E}$$

Where:

E = Energy of pile hammer in foot-pounds

D = Distance in feet

- E. Conform to applicable local, State and Federal regulations for the erection of excavation support systems.
- F. Sheet piles shall not be installed until the Commissioner has approved the method of installation and the sequence of driving.
- G. Excavation support systems may be left in place only where indicated on the Contract Drawings or with the written permission of the Commissioner. Excavation support systems that retain earth on which the support or stability of existing structures or utilities is dependent or where required for safety or by governing laws, shall be left in place at the completion of work. Protect existing structures, including overhead and buried utility lines, to the satisfaction of the Commissioner.
- H. Alignment and Tolerances
1. Unless otherwise shown on the Contract Drawings, after installation, the slope of steel sheet piling shall not deviate from vertical by more than one percent.
  2. Sheet and soldier piles at cut-off elevation shall not deviate laterally from required location as required to ensure complete protection for the excavation.

#### 1.06 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
1. Shop Drawings for excavation support systems showing all proposed materials, erection details and methods of installation, including length of member, elevations of sheeting, cut-off elevations, and locations of handling holes, and proposed methods of cutting through supports where supports will be penetrated by utilities.
  2. Structural design calculations prepared for each proposed excavation support system. Calculations shall be signed and sealed by a licensed Professional Engineer registered in the State of New York.

3. Product Data: Manufacturer's descriptive product data, current specifications and installation instructions for materials or systems proposed for the work of this Section.
4. Certified mill test reports for steel sheet piles.
5. A complete description of the hammer and driving equipment including caps and guides for steel sheet piling and soldier piles.
6. Verification of welder qualifications.
7. The proposed procedure for installing the sheet piling including the sequence for driving all piles.

#### 1.07 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Provide for the protection of the public, employees and property, in accordance with applicable requirements of 29 CFR Part 1926, Subpart P, "Excavation, Trenching and Shoring", Construction Safety and Health Regulations (OSHA), which, by reference, is made a part of this specification, including sections relative to protection of the public; sheeting, shoring and bracing; and trenches and excavating.
- C. Assume all risks for the protection of overhead or underground public utility and private lines, pipes, conduits and support work, existing structures, fencing, pavements, sidewalks, and property of whatever nature.
- D. Damage to such structures or to any persons or property associated with such structures, where such structure are or are not shown on the Contract Drawings, is the responsibility of the Contractor.
- E. Pay for restoration of such damaged structures back to equivalent original condition at no expense to the City of New York.

#### 1.08 DELIVERY, STORAGE AND HANDLING

- A. Exercise care to avoid bending, scraping and overstressing the sheet piling and soldier piles. Block with wood or otherwise protect the sheeting and soldier piles from being bent or injured.
- B. Load, transport, unload and store sheet piling and soldier piles in such a manner that the metal is kept clean and free from injury. Store materials above ground on platforms, skids or other supports and cover and protect it from corrosion.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Steel Sheet Piling: ASTM A328/A328M, unless otherwise shown on the Contract Drawings.
- B. Sheet Piling Corners, Tees, Wyes and Crosses: ASTM A328/A328M, unless otherwise shown on the Contract Drawings.
- C. Steel Wales, Plates and Bracing: ASTM A36, unless otherwise shown on the Contract Drawings.
- D. Soldier Piles: ASTM A36, unless otherwise shown on the Contract Drawings.
- E. Bolts, Nuts and Washers: ASTM A307, galvanized to 2 oz. per square foot, in accordance with ASTM A153, unless otherwise shown on the Contract Drawings.
- F. Timber: No. 2 (No. 1 Mining) Coastal Douglas Fir, Long-leaf Southern Yellow Pine or approved equal, conforming to WWPA Catalog A or SPIB Grading Rules.
- G. Steel sheeting, waling and bracing may consist of new or used material but shall be in satisfactory condition and approved by the Commissioner. These materials shall be suitable for the intended use. The Commissioner may disapprove and reject used materials regarded to be unsatisfactory at no additional cost to the City of New York.

### 2.02 EQUIPMENT

- A. Pile Driving Equipment
  - 1. Use an approved driving head designed to properly fit a pair of piles to prevent damage to the top of the piles during driving.
  - 2. Use an approved impact or vibratory pile hammer of sufficient size to drive the sheet piles to the required depth without causing stresses in excess of 90 percent of the yield strength ( $F_y$ ) of the pile material due to driving.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Hand dig exploratory trenches where underground utility installations are known or suspected prior to placing and driving temporary sheeting.
- B. Install all necessary excavation support systems prior to commencing excavation.

- C. Shoring systems that retain earth on which the support or stability of existing structures or utilities is dependent shall be left in place at completion of work. Where required for safety or by governing regulations, and when so directed in writing by the Commissioner, leave sheeting in place. In such instances, remove original braces and re-brace sheeting against the structure in a manner approved by the Commissioner. Cut off sheeting at elevations directed by the Commissioner.
- D. Do not place bracing where it will be cast into or included in permanent concrete work, except as otherwise acceptable to the Commissioner.
- E. Install internal bracing, if required, to prevent spreading or distortion to braced frames.
- F. Remove excavation support in stages to avoid disturbance to underlying soils and damage to structures, tracks, pavement, facilities and utilities.
- G. Repair or replace, as directed by the Commissioner, adjacent work damaged or displaced through the installation or removal of shoring and bracing work.
- H. Welding and Splicing
  - 1. Perform all welding in accordance with requirements for shielded metal arc welding in accordance with ANSI/AWS D1.1 for buildings and other structures.
  - 2. Only use welders qualified by tests prescribed in ANSI/AWS D1.1, as applicable.
  - 3. Reinforce pile tips, if required due to field conditions and as approved by the Commissioner.
  - 4. Except where directed by the Commissioner, splicing of sheet piles will not be permitted.
- I. Sheet Pile Driving
  - 1. Use an approved guide frame or template to set sheet piles in proper position and alignment and to provide adequate lateral support to maintain vertical alignment during driving. Where field conditions require, use two levels of guide wales to maintain vertical alignment during driving.
  - 2. Steel sheet piles shall be properly set and "shaken out" prior to driving. After placing a pair of sheets within their interlocks, they shall be lowered as far as possible. Should the sheets bind or hang up in their interlocks before bearing on the ground, adjacent sheets shall be picked up in pairs and shaken out as required, until the sheets ride smoothly within their interlocks and simultaneously bear on the ground. For cellular cofferdams, the entire cell shall be assembled prior to driving.

3. Top of sheet pile shall be normal to the driving force.
4. Drive sheet piles to the elevation(s) required to adequately support the retained earth as derived by the Contractor's licensed Professional Engineer. Each pair of sheet piles shall not be driven more than five feet ahead of the adjacent sections.
5. Sheet piles shall be driven in such a manner as to prevent piles from leaning in the direction of driving and to provide a continuous closure of sheet piles, where closure is required. Where possible, drive sheet piling with the ball end leading. If an open socket is leading, provide a bolt or similar object in the bottom of the interlock to keep the interlock free of soil material.
6. At the completion of the driving operation on a sheet pile, the installed sheet pile shall be undamaged, free of defects and in compliance with the requirements of this Section.
7. No jetting will be permitted without the specific approval of the Commissioner.

### 3.02 FIELD QUALITY CONTROL

- A. Before starting work, check and verify governing dimensions and elevations.
- B. Survey adjacent structures and improvements, establishing exact elevations at fixed points to act as benchmarks. Clearly identify and record locations of benchmarks and reference to the bench marks.
- C. Construct excavation support systems in accordance with approved Shop Drawings.
- D. Maintain at all times the safety, stability and integrity of any structures and utilities of whatever nature regardless of location that might be affected.
- E. Monitoring of Adjacent Structures
  1. Perform monitoring at the beginning and end of every work shift during all phases of demolition and construction activities.
  2. Measure vertical and horizontal displacement to the nearest 0.01 feet.
  3. Monitoring of Structure Elevations and Alignments:
    - a. The displacement limits and the required action to be taken in the event a limit is reached are defined as follows:
      - (1) Displacement Limit: Zero for structures and 0.25 inches for others.

- (2) Required Action: If settlement or displacement is detected, modify or change methods of protection to cease further settlement or displacement. If settlement or displacement exceeds 0.10 inches, cease excavation and/or other construction operations that result in further settlement. Undertake appropriate measures to ensure that the integrity of the structure is maintained.
- F. Assume full responsibility for the stability of all excavation support systems and related operations.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02364**  
**STEEL PIPE PILES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, install, drive and cut off steel pipe piles and fill with concrete where indicated, complete in place in conformity with the lines, grades, dimensions and locations shown on the Contract Drawings, the procedures and tolerances specified herein, and as required for a complete installation. The work also includes Pile Driving Analyzer (PDA) setup and testing.
- B. For the 150 ton pile only, the Contractor may elect to use an alternate type pile in lieu of the Basis of Design 20 inch diameter steel pipe pile. The alternate pile shall be a tapered pile such as Monotube, Tapertube, step-taper, or approved equivalent. This specification section shall be used if the Contractor chooses to utilize the Basis of Design 20 inch diameter steel pipe pile. If the Contractor opts to bid on the Contractor's Option composite tapered pile please refer to Section 02365 – Composite Tapered Piles, this specification section shall not apply.
- C. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- D. This Section includes, but is not limited to, the following items:
  - 1. Steel pipe piles for building, ramps, and other structures.
  - 2. Pile Driving Analyzer (PDA) setup and testing including during restrikes as specified by the Commissioner.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02456 - Pile Load Tests
- B. Section 03200 - Concrete Reinforcement
- C. Section 03300 - Cast-in-Place Concrete

**1.03 MEASUREMENT AND PAYMENT**

- A. Measurement
  - 1. Steel Pipe Piles: The quantity of steel pipe piles to be measured for payment at the unit price bid will be the actual length of piles, in linear feet, including both production and test piles incorporated in the work, driven or installed and

left in place in conformity with the Contract Drawings and the Specifications or as directed by the Commissioner.

2. The approved quantity of steel pipe piles actually incorporated in the work, delineated by the specified unit of measurement, will be the basis for payment. The linear footage of pile to be measured for payment shall be the length in place below the cutoff elevation measured to the pile tip. Any part of the pile remaining above the cutoff elevation specified or otherwise directed will not be measured for payment.
3. Pile Driving Analyzer (PDA) Load Tests: The approved quantity of PDA pile load tests actually conducted on various pipe pile sizes which are completed, documented and accepted will be the basis for payment. PDA pile load tests conducted during initial drive and conducted during redrive/restrike will be measured as separate tests.
4. Units of measurement for the work specified in this Section shall be as follows:
  - a. Steel Pipe Piles – 16-inch diameter – linear feet
  - b. Steel Pipe Piles – 20-inch diameter – linear feet
  - c. Steel Pipe Piles – 36-inch diameter – linear feet
  - d. Pile Driving Analyzer Load Tests – per each.

**B. Payment**

**1. Steel Pipe Piles**

- a. The unit price per linear foot of steel pipe pile incorporated in the work shall include the cost of furnishing, fabrication, coating, delivery, storage and handling, installation, equipment, maintaining in proper condition, removal, re-installation, obstruction removal, shoes, shop and field splices, furnishing and placement of reinforcement, furnishing and placement of concrete, and other incidentals necessary to properly perform the work complete and in place as detailed on the Contract Drawings and accepted by the Commissioner. The unit price bid for this item shall apply to both production and test piles incorporated into the work.
- b. The basis for payment shall be the aggregate measured length of approved steel pipe piling, as defined in Paragraph 1.03.A.2, for each steel pipe pile diameter actually incorporated in the work, delineated by the specified unit of measurement, multiplied by the corresponding contractual unit price shown on the Bid Form.
- c. Steel pipe piles may be added or deleted as directed in writing by the Commissioner and paid for at the contractual unit price per linear foot for the appropriate steel pipe pile diameter.

- d. No separate payment will be made for inspection of steel pipe piles, pile tips, test or index piles, removing damaged or misdriven piles, piles driven for the temporary use or for the convenience of the Contractor, pre-drilling, removal of obstructions, jetting, spudding, pile surveys and related drawings, pile cutoffs and their disposal off-site. The costs thereof shall be included in the unit price bid for steel pipe piles.
- 2. Pile Driving Analyzer Load Tests: The unit price bid per PDA load test shall include all materials, equipment, tools and labor incidental thereto, including the cost of engineering and analysis in preparation for the tests. The costs of furnishing and driving the drive-test piles will be paid under other unit price bid items as defined above.
- 3. Unacceptable Piles
  - a. Unacceptable steel pipe piles are addressed in Article 3.07.
  - b. If the Commissioner deems that the deficiency of a pile is due to Contractor operations, all costs for replacement piles or design, analysis and construction of alternative designs shall be at the expense of the Contractor.
  - c. If the Commissioner deems that the deficiency of a pile is due to unavoidable field conditions, the costs for replacement or additional piles will be paid at the contractual unit price for the appropriate steel pipe pile diameter. Pile driving and removal of partially installed piles deemed to be obstructed and abandoned by the Commissioner will also be paid at the contractual unit price for the appropriate steel pipe pile diameter.

#### 1.04 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Society for Testing and Materials (ASTM):
    - a. ASTM A27, Steel Castings, Carbon, for General Application.
    - b. ASTM A53, Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
    - c. ASTM A252, Welded and Seamless Steel Pipe Piles.
    - d. ASTM D4945, Test Method for High-Strain Dynamic Testing of Piles.

2. American National Standards Institute/American Welding Society (ANSI/AWS):
  - a. ANSI/AWS D1.1, Structural Welding Code – Steel.
3. City of New York
  - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
  - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

#### 1.05 SUBMITTALS

- A. Prepare and submit the following in accordance with the provisions of the General Conditions and Section 01330 - Shop Drawings:
  1. Qualifications Compliance: Submit references and project information to demonstrate the specialized experience of the proposed pile driving contractor, Contractor's Engineer, Contractor's Surveyor and the PDA testing firm on similar projects of comparable scope and complexity for a minimum of three years in accordance with the applicable paragraphs of Article 1.06.
  2. Shop Drawings
    - a. As-built survey showing locations of all existing piles, performed after demolition of the existing floor slab. Production piles shall not begin until after this survey is received by the Commissioner.
    - b. Pile Identification Plan: Prior to pile driving, submit a pile identification plan showing location of piles, pile cut-off elevations and a numbering system for the piles.
    - c. Drawings: Indicate details and schedules of pile installation to suit design requirements, pile driving shoes and splicing procedures.
  3. Quality Control Submittals
    - a. Work/Procedure Plans
      - (1) Descriptions of proposed methods, installation procedure, and equipment to be used for installing piles, including but not limited to, leads, driving frame and/or template and pile hammers, including associated appurtenances such as hammer cushions. Include manufacturer's literature for proposed equipment. Include

equipment and procedures for predrilling and proposed methods to remove obstructions if encountered.

- (2) Descriptions of proposed welding procedures and materials for all welded joints.
  - (3) Description of proposed method and equipment to be used in measuring placement tolerances of piles.
- b. Wave Equation Analysis results completed and signed by a licensed Professional Engineer registered in the State of New York with complete Hammer Equipment Data. Any changes to equipment shall be submitted in writing and subject to approval of the Commissioner. If the equipment is approved for change, the Contractor shall be required to submit a new Wave Equation Analysis with the appropriate equipment data revisions.
- c. Certificates
- (1) Manufacturer's mill certificates for steel piles, driving shoes and all welded attachments.
  - (2) Welders Certificates: Certify welders employed on the Work, verifying ANSI/AWS qualification within the previous 12 months.

#### 4. Record Documents

- a. Location plan with location and identification of each new pile installed with reference to existing piles previously installed within the site boundaries.
- b. Field Quality Control Records: Pile-driving records as specified and as may be otherwise requested by the Commissioner. Records shall include at a minimum pile driving records for each test and production pile including project name and number, name of contractor, pile location and number, computed pile capacity, type and size of hammer used, type of pile driving cap used, rate of operation of pile driving equipment, pile dimensions, elevation of point, elevation of butt before and after cut-off, elevations of splices, continuous record of number of blows for each foot of penetration and any unusual occurrences during pile driving. These records shall be compiled and attested to by a licensed Professional Engineer registered in the State of New York.
- c. PDA test reports and Case Pile Wave Analysis Program (CAPWAP) analysis for each drive test.

- d. Surveyed as-built locations of the piles, including out-of-place dimensions and direction measured at pile cut-off and out-of-plumb slope and direction for each pile.

## 1.06 QUALITY ASSURANCE

- A. Furnishing and installation of steel pipe piles shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto. Adhere to the provisions of the Specifications where the requirements are more stringent.

### B. Testing and Inspection

1. The installation of steel pipe piles, structural concrete and welding operations shall be subject to controlled inspection in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the provisions of the General Conditions. Controlled inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
2. Special Inspections
  - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
  - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
  - c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or

certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

- C. Provide the services of a general contractor or a specialty subcontractor that specializes in the installation of steel pipe piles and can demonstrate at least three (3) years of documented relevant experience in the installation of steel pipe piles under similar conditions to the work of this contract.
- D. Provide the services of a PDA testing firm with a minimum of three (3) years of documented experience in work of this nature. All PDA testing and reporting work shall be performed under the direct supervision of a licensed Professional Engineer (Contractor's Engineer) registered in the State of New York.
- E. Select pile components under the direct supervision of a licensed Professional Engineer (Contractor's Engineer) registered in the State of New York with documented experience in design of this work. Selection of pile driving equipment shall be under the direction of a licensed Professional Engineer registered in the State of New York with documented experience and proficiency in Geotechnical Engineering.
- F. Provide the services of an independent licensed surveyor to perform surveys and layouts and to determine vertical and horizontal alignments. Conform to the requirements of the General Conditions.
- G. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- H. Safety: Accept total responsibility for steel pipe pile installation procedures and health and safety of the work force. Comply fully with OSHA workplace safety requirements and regulations and those of other authorities having jurisdiction.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Except for piles to be used for test purposes, materials ordered or delivered to project site prior to completion and acceptance of all pile testing and verification of assumed pile length will be at the Contractor's risk.
- B. Handle piling using handling holes or lifting devices. Handle long length piles with care to prevent damage. Support on level blocks or racks spaced not more than 10 feet apart and not more than 2 feet from the ends. Supports between multiple lifts shall be in a vertical plane. Protect piling to prevent damage to coatings, where applicable, and to prevent corrosion prior to installation.
- C. After pile lengths are verified, deliver materials to project site in such quantities and at such times to assure continuity of pile driving operations to project schedule.

- D. Store piles in orderly groups above ground and blocked during storage to minimize possible distortion of members. Piles exhibiting variations beyond tolerance limits will be considered distorted and shall not be used in the work.

#### 1.08 PROJECT CONDITIONS

- A. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available as described in Section 01120 – Contract Summary. The Contractor may use this report to establish the quality of materials expected to be present at the project site and determine the proper length of piles. The Contractor is advised that all available samples and information relating to boring records and subsurface conditions are expressly excluded from and are not a part of the Contract, but are available for information purposes only.
- B. The Contractor is responsible for any conclusions it may draw from this information, including the character of the materials that may be encountered and the degree of difficulty to be expected in the performance of the Work. Neither the City of New York nor the Commissioner guarantees that materials other than those disclosed by the geotechnical report will not be encountered, or that proportions and character of the various materials will not vary from those indicated in the boring logs.
- C. Data on indicated subsurface conditions is not intended as a representation or warranty of continuity of such conditions. It is expressly understood that neither the City of New York nor the Commissioner will be responsible for interpretations or conclusions drawn therefrom by the Contractor.
- D. If the Contractor finds that the investigations are not sufficient to determine the nature of the work, the Contractor can undertake its own investigations before or after submission of its bid at its own expense.
- E. Available Geotechnical Reports

Title	By	For
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

- F. Prior to bidding this project, the Contractor shall thoroughly explore the conditions at the site to be fully informed about the existing piles and construction debris left in the ground after demolition of the previous structure in the area where the piles will be driven. Bidders are invited to perform explorations of the site to acquaint themselves with these conditions at no additional cost to the City of New York. No additional compensation will be made after award of contract for any claim related to the pile remnants and construction debris left in the ground. The Contractor is

also encouraged to review the Geotechnical Investigation Report, which may be obtained from the City of New York-Contract Summary.

- G. Protect structures, underground utilities, and other construction as necessary from damage caused by pile driving operations.

## PART 2 PRODUCTS

### 2.01 STEEL PIPE PILES

- A. Pipe piles shall conform to ASTM A252 Grade 3 modified with minimum  $F_y = 50$  ksi. Diameter and wall thickness shall be as shown on the Contract Drawings.
- B. Pipe piles that do not exceed 18 inches in diameter may be either seamless pipe or full penetration electric resistance butt welded with straight or spiral seams. Pipe piles that exceed 18 inch in diameter shall be double submerged arc butt welded pipe with straight seams; spiral weld will not be accepted for these larger sizes. Pipe shall be welded in a manner that welding shall not crack or fail when the pile is subjected to its intended use, including during driving operations. The weld seam of each length of the pile shall be tested for acceptance by Ultrasonic Testing and Eddy Current Examination in accordance with the provisions for Nondestructive Electric Test of Weld Seam of ASTM A53.
- C. For pipe with filler metal welds having specified wall thickness of 0.500 inch and less, the radial offset (misalignment) of plate edges in the weld seams shall not be greater than 1/16 inch. For pipe with filler metal welds having specified wall thickness over 0.500 inch, the radial offset shall not be greater than 0.125 times the wall thickness or 1/8 inch, whichever is smaller. For electric welded pipe, the radial offset of plate edges plus flash trim shall be no more than 0.06 inch. For laser welded pipe, the radial offset of plate edges plus weld reinforcement trim shall be no greater than 0.06 inch.
- D. Pile driving shoes shall conform to ASTM A27 90/60 cast steel, heat treated. The Contractor shall propose and submit for approval driving shoe required to assure protection to the pile tip from damage. The Contractor shall be solely responsible for the sufficiency of such shoes.
- E. Welding electrodes for pile splices shall be E70XX minimum. Welding electrodes for driving shoe to pile welds shall be at low hydrogen E90XX.

### 2.02 CONCRETE

- A. Concrete shall be of class indicated on the Contract Drawings. Concrete mix and placement shall conform to the provisions of Section 03300 – Cast-in-Place Concrete.

### 2.03 REINFORCING STEEL

- A. Concrete reinforcement shall conform to Section 03200 – Concrete Reinforcement.

### 2.04 PILE COATING

- A. Concrete-filled steel pipe piles installed in on-shore applications to support land-based structures shall not be coated. An additional, sacrificial pipe wall thickness of 1/16" has been considered to account for section loss due to corrosion.

### 2.05 DRIVING EQUIPMENT

- A. Provide pile driving equipment of type generally used in standard driving practice, operated at manufacturer's specified rate, to develop required rated energy per blow. The minimum rated energy of the hammer shall be based upon the diameter of the pipe pile as follows:
  - 1. 15,000 ft-lbs for 16-inch diameter pipe pile
  - 2. 40,000 ft-lbs for 20-inch diameter pipe pile
  - 3. 80,000 ft-lbs for 36-inch diameter pipe pile
- B. Provide driving hammer of sufficient capacity, size and type to deliver consistently effective dynamic energy. The hammer energy shall be suitable to drive the piles to the ordered length or lengths necessary to obtain the required ultimate pile capacity without damage. The Contractor shall submit to the Commissioner the manufacturer's data regarding the hammer efficiency to be used for Wave Equation Analysis and throughout the job.
- C. Equip hammer with cast steel or structural steel driving cap, with grooved base conforming to pile shape. Keep bearing surfaces of grooves true and smooth.
- D. Use fixed or rigid type pile driver leads that will hold pile firmly in position and alignment, and in axial alignment of hammer. Unless otherwise approved by the Commissioner, leads shall be of sufficient length so that use of a follower will not be necessary.
- E. Provide a driving frame of sufficient size and rigidity to assist in keeping piles at planned location and plumbness.
- F. No variation of approved equipment will be allowed without written approval of the Engineer.

### 2.06 FABRICATION

- A. Shop fabricate and deliver to the site piles for the required installation length to minimize field welding. All shop-fabricated piles shall be spliced using fabrication

rolls and dog guides so that misalignment will not exceed 1" in any direction relative to a straight line connecting the ends of a pile.

B. Welding and Splicing

1. Splicing of piles will be permitted at no additional cost to the City of New York as required for installation. Splices shall develop the full strength of the pile section in compression, tension and bending.
2. Unless stricter requirements are shown on the Contract Drawing, splice sections of pipe with approved full penetration butt weld. Use an approved jig or alignment device during welding to maintain the required straightness of pipe specified herein. For splices made during pile installation, rigid frame pile leads may be used as a jig in a manner approved by the Commissioner.
3. Equip pile tips with driving shoes continuously welded to pipe.
4. All welding shall be performed by ANSI/AWS certified welders under the immediate supervision of a representative of the Commissioner. Cooperate with and assist the Commissioner in the performance of its duties.
5. All welding shall conform to the requirements of the ANSI/AWS D1.1. Submit details of groove preparation and welding procedures for approval prior to commencing welding operations. Acceptable welding processes are FCAW, GMAW, SMAW and SAW for shop welding and SMAW for field welding.
6. Shop splices of piles shall be located below the ground line. Field splices may be located above the ground line. Only one field splice is permitted per pile. Out-of-straightness for shop and field splices shall not exceed 0.25" per 10'-0" of pile length.
7. If welding procedure is interrupted once started, preheat temperatures shall be re-established prior to restarting of welding.

2.07 SOURCE QUALITY CONTROL

- A. All shop and field welds for structural steel will be visually inspected by an ANSI/AWS qualified welding inspector under the direction of the Commissioner. The on-site inspector will be an ANSI/AWS Certified Welding Inspector in accordance with the requirements specified in Section 6 of ANSI/AWS D1.1.

PART 3 EXECUTION

3.01 PREPARATION

- A. Verify site conditions.

- B. Submit for approval proposed installation procedures and equipment to be used.
- C. Use driving procedure, which will not cause damage to nearby structures.
- D. Protect structures near the Work from damage.

### 3.02 FIELD FABRICATION

- A. Conform to the requirements of Article 2.06.

### 3.03 TEST PILES

#### A. Drive-Test Piles

1. Drive test piles, identical to production piles, as shown on the Contract Drawings, and install with the same equipment and in the manner proposed for production piles.
2. Prior to driving test piles, the Contractor shall submit a wave equation analysis performed by a licensed Professional Engineer registered in the State of New York, using the proposed driving system. Based on this analysis, the Contractor shall determine order lengths and driving criteria for the test piles.
3. Install drive-test piles in the locations shown on the Contract Drawings unless otherwise directed by the Commissioner.
4. Driving of these piles shall be witnessed by the Special Inspector.
5. Static load tests for axial and lateral load capacity shall be performed on certain test piles at the locations shown on the Contract Drawings and in accordance with the requirements of Section 02456 – Pile Load Tests.
6. The results of the drive and load tests shall be submitted to the Commissioner at the completion of testing. Upon completion of all pile testing at the site, the Commissioner will use the results with other information to establish the required driving resistance criteria and, where applicable, minimum tip elevation criteria for the placing of production piles consistent with the placement procedures and equipment used. Pile order lengths shall be determined by the Contractor based on these criteria.
7. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.
8. Subsequent to the test program, test piles can be used as production piles if they meet all acceptance criteria thereof.

9. The Contractor shall accommodate the Special Inspector and shall not impede the progress or affect the results of the test. This may include but not be limited to providing a safe work area, allowing for the installation of gauges, inspection and performance of restrikes, and ceasing driving operations while testing adjacent piles if necessary.

**B. Dynamic Pile Tests**

1. Selected drive-load test piles shall be dynamically tested using electronic monitoring equipment to obtain information on pile hammer performance, driving stresses and bearing capacities. The locations of the Pile Dynamic Analysis (PDA) load tests are indicated on the Contract Drawings. The test will also be used to monitor driving of a production pile during a re-strike. If the Commissioner determines that a re-strike is required, it shall be performed after a waiting period of 48 hours (minimum) or up to 2 weeks (as determined by the Commissioner) after completion of the initial driving.
2. Perform Dynamic Testing only when the Special Inspector is present for witnessing. Notify the Commissioner of the schedule for testing at least 14 calendar days before starting the tests.
3. Drill the necessary holes in the pile and fasten a pair of transducers and a pair of accelerometers in place, then drive the pile while testing. Remove the transducers and accelerometers after the dynamic testing is completed.
4. Depending on the type of pile being driven, use a hammer and a capblock which will produce an acceptable driving stress within the piles. The equipment shall conform to the requirements of ASTM D4945. Use the same hammer and equipment as proposed to install the production piles.
5. Using the data obtained from the pile driving analyzer, the Contractor shall have a Case Pile Wave Analysis Program (CAPWAP) analysis performed and submitted to the Commissioner. The Contractor shall also have the hammer system efficiency and pile structural damage/integrity evaluated and reported to the Commissioner. Submit complete report to the Commissioner within five (5) business days of testing. Upon the completion of all Test Piles and the subsequent receipt of the aforementioned reports, the Commissioner will determine minimum pile tip elevations and driving resistance criteria for production piles based on the reports.
6. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.

**3.04 PILE INSTALLATION**

- A. The Contractor shall drive all piles using a positioning template.**

- B. In developing pile installation procedures and selecting equipment, the Contractor shall consider and be prepared to respond to local soil conditions, including the presence of a dense bearing stratum containing cobbles and boulders and construction debris as encountered in site explorations at the Southwest Brooklyn facility. It shall be the responsibility of the Contractor to select methods and equipment which will result in satisfactory installation of the piles.
- C. The installation and testing of all Test Piles shall be completed and analyzed prior to the installation of the production piles. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.
- D. All piles shall be driven to a tip elevation in conjunction with driving criteria determined from the wave equation analysis and the Pile Driving Analyzer (PDA) testing program.
- E. Piles shall be marked at 1-foot intervals along the entire pile length. In addition, the footage shall be marked and designated at 5-foot intervals starting from the tip of the pile.
- F. Deliver hammer blows to central axis of pile. Pile driving shall be continuous and without interruption for the final 20 feet of penetration. The average hammer blows per inch of penetration for the final 6 inches shall be as determined by the Commissioner. If an abrupt increase in driving resistance is encountered, the driving shall be terminated when the pile penetration is less than 0.5 inches in 10 successive blows. If the minimum tip elevation is not achieved prior to terminating driving due to excessive blow counts, the Contractor shall employ approved means and methods to advance the pile to the minimum tip elevation. Do not damage piles during driving operations.
- G. Jetting, pre-drilling or pre-augering is not permitted unless approved by the Commissioner.
- H. Re-drive piles which have lifted or moved due to driving adjacent piles, or by soil heave. A pile with heave greater than 1/4 inch as measured by the Commissioner will be considered a heaved pile and shall be re-driven.
- I. Inspect each pile within one (1) day after driving to check for leakage, intrusion of soil, and signs of damage. Report to the Commissioner immediately if these or other deleterious conditions are observed.
- J. Cut off each pile in accordance with the provisions of the Contract Drawings after approval by the Commissioner. Prevent foreign matter from entering the interior of the pipe pile prior to concreting.

## K. Placement Tolerances

1. Out-of-place and out-of-plumb measurements shall be made and reported to the Commissioner for each pile within (5) five days of driving.
2. Maximum out-of-place deviation, measured from centerline of pipe pile at the cut-off elevation shall be 3 inches in any direction.
3. In addition, maximum out-of-plumb deviation measured in any direction shall be 2%.
4. Maximum deviation from theoretical cut-off elevation: 1/2"

- L. Driving of piles shall not take place within 50 feet of concrete placed within 3 days unless otherwise approved by the Commissioner.

## 3.05 PILE OBSTRUCTIONS

- A. Boring logs for boreholes previously drilled at the project site indicate the presence of boulders and obstructions, such as pile remnants and construction debris. If such obstructions are encountered, and piles reach premature refusal during pile driving, the Contractor shall notify the Commissioner immediately.
- B. The Contractor shall probe to locate the extent of the obstruction and propose a method of passing or removing the obstruction, including the use of a chisel beam, spud, by drilling or by other suitable means.
- C. If the Contractor demonstrates, to the satisfaction of the Commissioner, after diligently attempting to remove or penetrate through an obstruction for a minimum period of four hours, that removal or penetration of the obstruction is deemed to be impractical using appropriate methods, tools and equipment, the Contractor will be requested to stop pile driving operations and await further instructions from the Commissioner. The costs incurred by the Contractor to attempt to remove or penetrate obstructions for the prescribed minimum duration, whether or not the efforts are successful, shall be included in the unit price bid for steel pipe piles and no separate payment will be made therefor.
- D. If the Commissioner declares the obstruction to be an unavoidable field condition, the Contractor will be directed to remove the partially installed pile and make changes in the design or alignment of the piling structure as required by the Commissioner to insure the adequacy and stability of the structure.
- E. Payment for installing and removing the obstructed pile and for installing replacement or additional piles will be made at the contractual unit price for the appropriate steel pipe pile diameter.

- F. Payment for additional labor and materials necessitated by changes in the design or alignment of the piling structure will be made at applicable contractual unit prices or by Change Order in accordance with the General Requirements.

### 3.06 CONCRETING

- A. Concrete Fill: Placement of concrete fill shall conform to Section 03300 – Cast-in-Place Concrete for the class of concrete indicated. Concrete shall not be placed within a pile until the pile and all other piles within a 20 foot radius have been checked for heave, redriven as necessary, and accepted by the Commissioner. The interior of the pile shall be cleaned to remove all solid matter from the inside wall before inserting reinforcing and placing concrete.
- B. Concrete Reinforcement: Furnish and install reinforcing steel in the pipe pile in accordance with the details indicated on the Contract Drawings and the materials and workmanship provisions of Section 03200 – Concrete Reinforcement.

### 3.07 UNACCEPTABLE PILES

- A. Unacceptable piles are defined as piles that fail penetration requirements, capacity requirements, are placed or cut off in positions beyond specified tolerances, or are damaged, including filling fully or partially with soil or groundwater.
- B. Replace unacceptable piles with piles that conform to specified requirements at no additional cost to the City of New York.
- C. Alternatively, in lieu of replacing unacceptable piles, additional piles may be placed in locations other than those shown on the Contract Drawings. This alternative may be used only with prior approval of the Commissioner for each individual location of use. All costs for design, analysis and construction of such alternative designs shall be at the expense of the Contractor.
- D. The Commissioner will determine if the deficiency of a pile is due to unavoidable field conditions, such as an immovable or impenetrable obstruction, or due to Contractor operations. See provisions of Paragraph 1.03.B for payment provisions.

### 3.08 FIELD QUALITY CONTROL

- A. All steel pipe pile inspections will be performed by the Special Inspector. The Contractor shall assist and provide access to the work area for field inspection by the Special Inspector. The Contractor shall cooperate with the Special Inspector in determining the minimum tip elevation required and shall mark each pile before driving as required.
- B. The driving of each pile shall be performed in the presence of the Special Inspector unless otherwise directed.

- C. When inspections result in pile rejection by the Special Inspector, the Contractor shall promptly segregate and remove rejected pile from the premises.
- D. Welding Inspections: Provisions of Article 2.07 shall apply.
- E. Inspection of Driven Piling: The Special Inspector will perform continuous inspection during pile driving and certify that piles are installed in accordance with requirements herein. Piles will be inspected for compliance with tolerance requirements. Bring any unusual problems which may occur to the attention of the Special Inspector.
- F. Installation Records: Driving records will be maintained by the Special Inspector and include the following as a minimum:
  - 1. Project name and number
  - 2. Name of Contractor and Installer
  - 3. Pile size and dimensions
  - 4. Elevation of point, elevation of butt before and after cut-off
  - 5. Continuous record of number of blows for each foot of penetration and final driving resistance in blows for final 6 inches
  - 6. Installation dates and times
  - 7. Driving equipment used including type and size of hammer, rate of operation, total driving time, dimensions of driving helmet and cap used
  - 8. Pile number and locations, tip elevations, ground elevations, cut-off elevations
  - 9. Length of driven pile from final tip elevation to cut-off elevation
  - 10. Any reheading or cutting of piles
  - 11. Alignment and plumbness checks
  - 12. Locations and depths where difficulty in driving was encountered
  - 13. Any unusual pile driving problems.
  - 14. Results of pile inspection after installation, checking for leakage, soil intrusion, and/or other signs of damage.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02365**  
**COMPOSITE TAPERED PILES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. For the 150 ton pile only, the Contractor may elect to use an alternate type pile in lieu of the Basis of Design 20 inch diameter steel pipe pile. The alternate pile shall be a tapered pile such as Monotube, Tapertube, step-taper, or approved equivalent. This specification section shall be used for the Contractor's Option composite taper pile only. If the Contractor opts to bid on the Basis of Design 20 inch steel pipe pile, please refer to Section 02364 – Steel Pipe Piles; this specification section (02365 – Composite Tapered Piles) shall not apply.
- B. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, install, drive and cut off composite tapered piles and fill with concrete, complete in place in conformity with the lines, grades, dimensions and locations shown on the Contract Drawings, the procedures and tolerances specified herein, and as required for a complete installation. The work also includes Pile Driving Analyzer (PDA) setup and testing.
- C. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- D. This Section includes, but is not limited to, the following items:
  - 1. Composite tapered piles for building, in lieu of the Basis of Design 20 inch steel pipe piles.
  - 2. Pile Driving Analyzer (PDA) setup and testing including during restrikes as specified by the Commissioner.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02456 - Pile Load Tests
- B. Section 03200 - Concrete Reinforcement
- C. Section 03300 - Cast-in-Place Concrete

**1.03 MEASUREMENT AND PAYMENT**

- A. Measurement
  - 1. Composite Tapered Piles: The quantity of composite tapered piles to be measured for payment at the unit price bid will be the actual number of piles, including both production and test piles incorporated in the work, driven or

installed and left in place in conformity with the Contract Drawings and the Specifications or as directed by the Commissioner.

2. The approved quantity of composite tapered piles actually incorporated in the work, delineated by the specified unit of measurement, will be the basis for payment. The number of piles to be measured for payment shall include the length in place below the cutoff elevation measured to the pile tip.
3. Pile Driving Analyzer (PDA) Load Tests: The approved quantity of PDA pile load tests actually conducted on composite tapered piles which are completed, documented and accepted will be the basis for payment. PDA pile load tests conducted during initial drive and conducted during redrive/restrike will be measured as separate tests.
4. Units of measurement for the work specified in this Section shall be as follows:
  - a. Composite Tapered Piles – 20-inch diameter – per each
  - b. Pile Driving Analyzer Load Tests – per each.

#### B. Payment

##### 1. Composite Tapered Piles

- a. The unit price per composite tapered pile incorporated in the work shall include the cost of furnishing, fabrication, coating, delivery, storage and handling, installation, equipment, maintaining in proper condition, removal, re-installation, obstruction removal, shoes, shop and field splices, furnishing and placement of reinforcement, furnishing and placement of concrete, and other incidentals necessary to properly perform the work complete and in place as detailed on the Contract Drawings and accepted by the Commissioner. The unit price bid for this item shall apply to both production and test piles incorporated into the work.
- b. The basis for payment shall be the aggregate measured number of approved composite tapered piles, as defined in Paragraph 1.03.A.2, delineated by the specified unit of measurement, multiplied by the corresponding contractual unit price shown on the Bid Form.
- c. Composite tapered piles may be added or deleted as directed in writing by the Commissioner and paid for at the contractual unit price per each composite tapered pile.
- d. No separate payment will be made for inspection of composite tapered piles, pile tips, test or index piles, removing damaged or misdriven piles, piles driven for the temporary use or for the convenience of the Contractor, pre-drilling, removal of obstructions, jetting, spudding, pile

surveys and related drawings, pile cutoffs and their disposal off-site. The costs thereof shall be included in the unit price bid for composite tapered piles.

2. Pile Driving Analyzer Load Tests: The unit price bid per PDA load test shall include all materials, equipment, tools and labor incidental thereto, including the cost of engineering and analysis in preparation for the tests. The costs of furnishing and driving the drive-test piles will be paid under other unit price bid items as defined above.
3. Unacceptable Piles
  - a. Unacceptable composite tapered piles are addressed in Article 3.07.
  - b. If the Commissioner deems that the deficiency of a pile is due to Contractor operations, all costs for replacement piles or design, analysis and construction of alternative designs shall be at the expense of the Contractor.
  - c. If the Commissioner deems that the deficiency of a pile is due to unavoidable field conditions, the costs for replacement or additional piles will be paid at the contractual unit price. Pile driving and removal of partially installed piles deemed to be obstructed and abandoned by the Commissioner will also be paid at the contractual unit price.

#### 1.04 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  1. American Society for Testing and Materials (ASTM):
    - a. ASTM A27, Steel Castings, Carbon, for General Application.
    - b. ASTM A53, Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
    - c. ASTM A252, Welded and Seamless Steel Pipe Piles.
    - d. ASTM D4945, Test Method for High-Strain Dynamic Testing of Piles.
  2. American National Standards Institute/American Welding Society (ANSI/AWS):
    - a. ANSI/AWS D1.1, Structural Welding Code – Steel.

## 3. City of New York

- a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
- b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

## 1.05 PERFORMANCE DESIGN CRITERIA

## A. The contractor's composite tapered pile design shall:

1. Consist of a tapered type, closed-end, displacement pile that achieves the required minimum axial and lateral capacity as indicated on the Contract Drawings.
2. Consider steel section loss due to corrosion as shown on the Contract Drawings. Pile coatings or other protection systems to reduce corrosion loss allowance shall not be allowed.
3. Provide a 20 inch diameter and minimum stiffness of  $EI=60,970,000 \text{ k-in}^2$  (roughly equal to that of the basis-of-design concrete-filled 20-inch diameter steel pipe pile specified in Section 02364) for the top 35 ft (measured from cutoff elevation).
4. Achieve the minimum lateral capacity and stiffness in each cross-sectional direction.

## 1.06 SUBMITTALS

## A. Prepare and submit the following in accordance with the provisions of the General Conditions and Section 01330 - Shop Drawings:

1. Qualifications Compliance: Submit references and project information to demonstrate the specialized experience of the proposed pile driving contractor, Contractor's Engineer, Contractor's Surveyor and the PDA testing firm on similar projects of comparable scope and complexity for a minimum of three (3) years in accordance with the applicable paragraphs of Article 1.06.
2. Composite Tapered Pile Design: For each pile type and design capacity submit the following for review:
  - a. Details of the design, including calculations and drawings. Submit calculations for at least two design sections: one based on conditions in Region A shown on the Contract Drawings, and the other based on conditions in Region B.

- b. Details of proposed concrete mix design including estimated setting time, strength properties, temperature-set time curve, and recommended installation procedures.
- c. Literature from the pile manufacturer showing the recommended installation procedures, yield and ultimate strength of the steel, and the minimum cross sectional area.
- d. Literature describing the proposed equipment to pump concrete into piles.
- e. The design shall be signed and sealed by a licensed Professional Engineer registered in the State of New York.

3. Shop Drawings:

- a. As-built survey showing locations of all existing piles, performed after demolition of the existing floor slab. Production piles shall not begin until after this survey is received by the Commissioner.
- b. Pile Identification Plan: Prior to pile driving, submit a pile identification plan showing location of piles, pile cut-off elevations and a numbering system for the piles.
- c. Drawings: Indicate details and schedules of pile installation to suit design requirements, pile driving shoes and splicing procedures.

4. Quality Control Submittals:

a. Work/Procedure Plans:

- (1) Descriptions of proposed methods, installation procedure, and equipment to be used for installing piles, including but not limited to, leads, driving frame and/or template and pile hammers, including associated appurtenances such as hammer cushions. Include manufacturer's literature for proposed equipment. Include equipment and procedures for predrilling and proposed methods to remove obstructions if encountered.
- (2) Descriptions of proposed welding procedures and materials for all welded joints.
- (3) Description of proposed method and equipment to be used in measuring placement tolerances of piles.

- b. Wave Equation Analysis results completed and signed by a licensed Professional Engineer registered in the State of New York with complete

Hammer Equipment Data. Any changes to equipment shall be submitted in writing and subject to approval of the Commissioner. If the equipment is approved for change, the Contractor shall be required to submit a new Wave Equation Analysis with the appropriate equipment data revisions.

c. Certificates

- (1) Manufacturer's mill certificates for steel piles, driving shoes and all welded attachments.
- (2) Welders Certificates: Certify welders employed on the Work, verifying ANSI/AWS qualification within the previous 12 months.

5. Record Documents:

- a. Location plan with location and identification of each new pile installed with reference to existing piles previously installed within the site boundaries.
- b. Field Quality Control Records: Pile-driving records as specified and as may be otherwise requested by the Commissioner. Records shall include at a minimum pile driving records for each test and production pile including project name and number, name of contractor, pile location and number, computed pile capacity, type and size of hammer used, type of pile driving cap used, rate of operation of pile driving equipment, pile dimensions, elevation of point, elevation of butt before and after cut-off, elevations of splices, continuous record of number of blows for each foot of penetration and any unusual occurrences during pile driving. These records shall be compiled and attested to by a licensed Professional Engineer registered in the State of New York.
- c. PDA test reports and Case Pile Wave Analysis Program (CAPWAP) analysis for each drive test.
- d. Surveyed as-built locations of the piles, including out-of-place dimensions and direction measured at pile cut-off and out-of-plumb slope and direction for each pile.

1.07 QUALITY ASSURANCE

- A. Furnishing and installation of composite tapered piles shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto. Adhere to the provisions of the Specifications where the requirements are more stringent.

**B. Testing and Inspection**

1. The installation of composite tapered piles, structural concrete and welding operations shall be subject to special inspection in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the provisions of the General Conditions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
2. Special Inspections
  - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
  - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
  - c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- C. Provide the services of a general contractor or a specialty subcontractor that specializes in the installation of composite tapered piles and can demonstrate at least three years of documented relevant experience in the installation of composite tapered piles under similar conditions to the work of this contract.
- D. Provide the services of a PDA testing firm with a minimum of three years of documented experience in work of this nature. All PDA testing and reporting work

shall be performed under the direct supervision of a licensed Professional Engineer (Contractor's Engineer) registered in the State of New York.

- E. Select pile components under the direct supervision of a licensed Professional Engineer (Contractor's Engineer) registered in the State of New York with documented experience in design of this work. Selection of pile driving equipment shall be under the direction of a licensed Professional Engineer registered in the State of New York with documented experience and proficiency in Geotechnical Engineering.
- F. Provide the services of an independent licensed surveyor to perform surveys and layouts and to determine vertical and horizontal alignments. Conform to the requirements of the General Conditions.
- G. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- H. Safety: Accept total responsibility for composite tapered pile installation procedures and health and safety of the work force. Comply fully with OSHA workplace safety requirements and regulations and those of other authorities having jurisdiction.

#### 1.08 DELIVERY, STORAGE AND HANDLING

- A. Handle piling using handling holes or lifting devices. Handle long length piles with care to prevent damage. Support on level blocks or racks spaced not more than 10 feet apart and not more than 2 feet from the ends. Supports between multiple lifts shall be in a vertical plane. Protect piling to prevent damage to coatings, where applicable, and to prevent corrosion prior to installation.
- B. After pile lengths are verified, deliver materials to project site in such quantities and at such times to assure continuity of pile driving operations to project schedule.
- C. Store piles in orderly groups above ground and blocked during storage to minimize possible distortion of members. Piles exhibiting variations beyond tolerance limits will be considered distorted and shall not be used in the work.

#### 1.09 PROJECT CONDITIONS

- A. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available as described in Section 01120 – Contract Summary. The Contractor may use this report to establish the quality of materials expected to be present at the project site and determine the proper length of piles. The Contractor is advised that all available samples and information relating to boring records and subsurface conditions are expressly excluded from and are not a part of the Contract, but are available for information purposes only.

- B. The Contractor is responsible for any conclusions it may draw from this information, including the character of the materials that may be encountered and the degree of difficulty to be expected in the performance of the Work. Neither the City of New York nor the Commissioner guarantees that materials other than those disclosed by the geotechnical report will not be encountered, or that proportions and character of the various materials will not vary from those indicated in the boring logs.
- C. Data on indicated subsurface conditions is not intended as a representation or warranty of continuity of such conditions. It is expressly understood that neither the City of New York nor the Commissioner will be responsible for interpretations or conclusions drawn therefrom by the Contractor.
- D. If the Contractor finds that the investigations are not sufficient to determine the nature of the work, the Contractor can undertake its own investigations before or after submission of its bid at its own expense.

E. Available Geotechnical Reports

Title	By	For
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

- F. Prior to bidding this project, the Contractor shall thoroughly explore the conditions at the site to be fully informed about the existing piles and construction debris left in the ground after demolition of the previous structure in the area where the piles will be driven. Bidders are invited to perform explorations of the site to acquaint themselves with these conditions at no additional cost to the City of New York. No additional compensation will be made after award of contract for any claim related to the pile remnants and construction debris left in the ground. The Contractor is also encouraged to review the Geotechnical Investigation Report, which may be obtained from the City of New York.
- G. Protect structures, underground utilities, and other construction as necessary from damage caused by pile driving operations.

## PART 2 PRODUCTS

### 2.01 COMPOSITE TAPERED PILES

- A. Composite tapered piles shall have minimum  $F_y = 50$  ksi.
- B. Pipe pile portions of composite tapered piles that exceed 18 inch in diameter shall be double submerged arc butt welded pipe with straight seams; spiral weld will not be accepted for these larger sizes. Pipe shall be welded in a manner that welding

shall not crack or fail when the pile is subjected to its intended use, including during driving operations. The weld seam of each length of the pile shall be tested for acceptance by Ultrasonic Testing and Eddy Current Examination in accordance with the provisions for Nondestructive Electric Test of Weld Seam of ASTM A53.

- C. For pipe with filler metal welds having specified wall thickness of 0.500 inch and less, the radial offset (misalignment) of plate edges in the weld seams shall not be greater than 1/16 inch. For pipe with filler metal welds having specified wall thickness over 0.500 inch, the radial offset shall not be greater than 0.125 times the wall thickness or 1/8 inch, whichever is smaller. For electric welded pipe, the radial offset of plate edges plus flash trim shall be no more than 0.06 inch. For laser welded pipe, the radial offset of plate edges plus weld reinforcement trim shall be no greater than 0.06 inch.
- D. Pile driving shoes, if used, shall conform to ASTM A27 90/60 cast steel, heat treated. The Contractor shall propose and submit for approval driving shoe required to assure protection to the pile tip from damage. The Contractor shall be solely responsible for the sufficiency of such shoes.
- E. Welding electrodes for pile splices shall be E70XX minimum. Welding electrodes for driving shoe to pile welds shall be at low hydrogen E90XX.

## 2.02 CONCRETE

- A. Concrete shall be of class indicated on the Contract Drawings. Concrete mix and placement shall conform to the provisions of Section 03300 – Cast-in-Place Concrete.

## 2.03 REINFORCING STEEL

- A. Concrete reinforcement shall conform to Section 03200 – Concrete Reinforcement.

## 2.04 PILE COATING

- A. Concrete-filled composite tapered piles installed in on-shore applications to support land-based structures shall not be coated. Design of composite tapered piles shall consider steel shell section loss due to corrosion.

## 2.05 DRIVING EQUIPMENT

- A. Provide pile driving equipment of type generally used in standard driving practice, operated at manufacturer's specified rate, to develop required rated energy per blow.
- B. Provide driving hammer of sufficient capacity, size and type to deliver consistently effective dynamic energy. The hammer energy shall be suitable to drive the piles to the ordered length or lengths necessary to obtain the required ultimate pile capacity

without damage. The Contractor shall submit to the Commissioner the manufacturer's data regarding the hammer efficiency to be used for Wave Equation Analysis and throughout the job.

- C. Use fixed or rigid type pile driver leads that will hold pile firmly in position and alignment, and in axial alignment of hammer. Unless otherwise approved by the Commissioner, leads shall be of sufficient length so that use of a follower will not be necessary.
- D. Provide a driving frame of sufficient size and rigidity to assist in keeping piles at planned location and plumbness.
- E. No variation of approved equipment will be allowed without written approval of the Commissioner.

## 2.06 FABRICATION

- A. Shop fabricate and deliver to the site piles for the required installation length to minimize field welding. All shop-fabricated piles shall be spliced using fabrication rolls and dog guides so that misalignment will not exceed 1" in any direction relative to a straight line connecting the ends of a pile.
- B. Welding and Splicing
  - 1. Splicing of piles will be permitted at no additional cost to the City of New York as required for installation. Splices shall develop the full strength of the pile section in compression, tension and bending.
  - 2. Unless stricter requirements are shown on the Contract Drawing, splice sections of pipe with approved full penetration butt weld. Use an approved jig or alignment device during welding to maintain the required straightness of pipe specified herein. For splices made during pile installation, rigid frame pile leads may be used as a jig in a manner approved by the Commissioner.
  - 3. Equip pile tips with driving shoes continuously welded to pipe.
  - 4. All welding shall be performed by ANSI/AWS certified welders under the immediate supervision of a representative of the Commissioner. Cooperate with and assist the Commissioner in the performance of its duties.
  - 5. All welding shall conform to the requirements of the ANSI/AWS D1.1. Submit details of groove preparation and welding procedures for approval prior to commencing welding operations. Acceptable welding processes are FCAW, GMAW, SMAW and SAW for shop welding and SMAW for field welding.

6. Shop splices of piles shall be located below the ground line. Field splices may be located above the ground line. Only one field splice is permitted per pile. Out-of-straightness for shop and field splices shall not exceed 0.25" per 10'-0" of pile length.
7. If welding procedure is interrupted once started, preheat temperatures shall be re-established prior to restarting of welding.

## 2.07 SOURCE QUALITY CONTROL

- A. All shop and field welds for structural steel will be visually inspected by an ANSI/AWS qualified welding inspector under the direction of the Commissioner. The on-site inspector will be an ANSI/AWS Certified Welding Inspector in accordance with the requirements specified in Section 6 of ANSI/AWS D1.1.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Verify site conditions.
- B. Submit for approval proposed design, installation procedures and equipment to be used.
- C. Use driving procedure, which will not cause damage to nearby structures.
- D. Protect structures near the Work from damage.

### 3.02 FIELD FABRICATION

- A. Conform to the requirements of Article 2.06.

### 3.03 TEST PILES

- A. Drive-Test Piles
  1. Drive test piles, identical to production piles, as shown on the Contract Drawings, and install with the same equipment and in the manner proposed for production piles.
  2. Prior to driving test piles, the Contractor shall submit a wave equation analysis performed by a licensed Professional Engineer registered in the State of New York, using the proposed driving system. Based on this analysis, the Contractor shall determine order lengths and driving criteria for the test piles.
  3. Install drive-test piles in the locations shown on the Contract Drawings unless otherwise directed by the Commissioner.

4. Driving of these piles shall be witnessed by the Special Inspector.
5. Static load tests for axial and lateral load capacity shall be performed on certain test piles at the locations shown on the Contract Drawings and in accordance with the requirements of Section 02456 – Pile Load Tests.
6. The results of the drive and load tests shall be submitted to the Commissioner at the completion of testing. Upon completion of all pile testing at the site, the Contractor shall submit for the Commissioner's approval the required driving resistance criteria and, where applicable, minimum tip elevation criteria for the placing of production piles consistent with the placement procedures and equipment used. Pile order lengths shall be determined by the Contractor based on these criteria.
7. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.
8. Subsequent to the test program, test piles can be used as production piles if they meet all acceptance criteria thereof.
9. The Contractor shall accommodate the Special Inspector and shall not impede the progress or affect the results of the test. This may include but not be limited to providing a safe work area, allowing for the installation of gauges, inspection and performance of restrikes, and ceasing driving operations while testing adjacent piles if necessary.

**B. Dynamic Pile Tests**

1. Selected drive-load test piles shall be dynamically tested using electronic monitoring equipment to obtain information on pile hammer performance, driving stresses and bearing capacities. The locations of the Pile Dynamic Analysis (PDA) load tests are indicated on the Contract Drawings. The test will also be used to monitor driving of a production pile during a re-strike. The need for re-strike and the waiting period required shall be determined by the Contractor based on his design.
2. Perform Dynamic Testing only when the Special Inspector is present for witnessing. Notify the Commissioner of the schedule for testing at least 14 calendar days before starting the tests.
3. Drill the necessary holes in the pile and fasten a pair of transducers and a pair of accelerometers in place, then drive the pile while testing. Remove the transducers and accelerometers after the dynamic testing is completed.
4. Depending on the type of pile being driven, use a hammer and a capblock which will produce an acceptable driving stress within the piles. The

equipment shall conform to the requirements of ASTM D4945. Use the same hammer and equipment as proposed to install the production piles.

5. Using the data obtained from the pile driving analyzer, the Contractor shall have a Case Pile Wave Analysis Program (CAPWAP) analysis performed and submitted to the Commissioner. The Contractor shall also have the hammer system efficiency and pile structural damage/integrity evaluated and reported to the Commissioner. Submit complete report, including Contractor's proposed driving resistance criteria, to the Commissioner within five (5) business days of testing. Upon the completion of all Test Piles and the subsequent receipt of the aforementioned reports, the Commissioner will approve driving resistance criteria for production piles based on the report.
6. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.

### 3.04 PILE INSTALLATION

- A. The Contractor shall drive all piles using a positioning template.
- B. In developing pile installation procedures and selecting equipment, the Contractor shall consider and be prepared to respond to local soil conditions, including the presence of a dense bearing stratum containing cobbles and boulders and construction debris as encountered in site explorations at the Southwest Brooklyn facility, and the presence of existing piles. It shall be the responsibility of the Contractor to select methods and equipment which will result in satisfactory installation of the piles.
- C. The installation and testing of all Test Piles shall be completed and analyzed prior to the installation of the production piles. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.
- D. All piles shall be driven to a tip elevation in conjunction with driving criteria determined from the wave equation analysis and the Pile Driving Analyzer (PDA) testing program.
- E. Piles shall be marked at 1-foot intervals along the entire pile length. In addition, the footage shall be marked and designated at 5-foot intervals starting from the tip of the pile.
- F. Deliver hammer blows to central axis of pile. Pile driving shall be continuous and without interruption for the final 20 feet of penetration. The average hammer blows per inch of penetration for the final 6 inches shall be as determined by the Commissioner. If an abrupt increase in driving resistance is encountered, the driving shall be terminated when the pile penetration is less than 0.5 inches in 10 successive blows. If the minimum tip elevation is not achieved prior to terminating

driving due to excessive blow counts, the Contractor shall employ approved means and methods to advance the pile to the minimum tip elevation. Do not damage piles during driving operations.

- G. Jetting, pre-drilling or pre-augering is not permitted unless approved by the Commissioner.
- H. Re-drive piles which have lifted or moved due to driving adjacent piles, or by soil heave. A pile with heave greater than 1/4 inch as measured by the Commissioner will be considered a heaved pile and shall be re-driven.
- I. Inspect each pile within one (1) day after driving to check for leakage, intrusion of soil, and signs of damage. Report to the Commissioner immediately if these or other deleterious conditions are observed.
- J. Cut off each pile in accordance with the provisions of the Contract Drawings after approval by the Commissioner. Prevent foreign matter from entering the interior of the pile prior to concreting.
- K. Placement Tolerances
  - 1. Out-of-place and out-of-plumb measurements shall be made and reported to the Commissioner for each pile within (5) five days of driving.
  - 2. Maximum out-of-place deviation, measured from centerline of each composite tapered pile at the cut-off elevation shall be 3 inches in any direction.
  - 3. In addition, maximum out-of-plumb deviation measured in any direction shall be 2%.
  - 4. Maximum deviation from theoretical cut-off elevation: 1/2".
- L. Driving of piles shall not take place within 50 feet of concrete placed within 3 days unless otherwise approved by the Commissioner.

### 3.05 PILE OBSTRUCTIONS

- A. Boring logs for boreholes previously drilled at the project site indicate the presence of boulders and obstructions, such as pile remnants and construction debris. If such obstructions are encountered, and piles reach premature refusal during pile driving, the Contractor shall notify the Commissioner immediately.
- B. The Contractor shall probe to locate the extent of the obstruction and propose a method of passing or removing the obstruction, including the use of a chisel beam, spud, by drilling or by other suitable means.

- C. If the Contractor demonstrates, to the satisfaction of the Commissioner, after diligently attempting to remove or penetrate through an obstruction for a minimum period of four hours, that removal or penetration of the obstruction is deemed to be impractical using appropriate methods, tools and equipment, the Contractor will be requested to stop pile driving operations and await further instructions from the Commissioner. The costs incurred by the Contractor to attempt to remove or penetrate obstructions for the prescribed minimum duration, whether or not the efforts are successful, shall be included in the unit price bid for composite tapered piles and no separate payment will be made therefor.
- D. If the Commissioner declares the obstruction to be an unavoidable field condition, the Contractor will be directed to remove the partially installed pile and make changes in the design or alignment of the piling structure as required by the Commissioner to insure the adequacy and stability of the structure.
- E. Payment for installing and removing the obstructed pile and for installing replacement or additional piles will be made at the contractual unit price for the composite tapered pile.
- F. Payment for additional labor and materials necessitated by changes in the design or alignment of the piling structure will be made at applicable contractual unit prices or by Change Order in accordance with the General Requirements.

### 3.06 CONCRETING

- A. Concrete Fill: Placement of concrete fill shall conform to Section 03300 – Cast-in-Place Concrete for the class of concrete indicated. Concrete shall not be placed within a pile until the pile and all other piles within a 20 foot radius have been checked for heave, redriven as necessary, and accepted by the Commissioner. The interior of the pile shall be cleaned to remove all solid matter from the inside wall before inserting reinforcing and placing concrete.
- B. Concrete Reinforcement: Furnish and install reinforcing steel in the composite tapered pile in accordance with the details indicated on the Contract Drawings and the materials and workmanship provisions of Section 03200 – Concrete Reinforcement.

### 3.07 UNACCEPTABLE PILES

- A. Unacceptable piles are defined as piles that fail penetration requirements, capacity requirements, are placed or cut off in positions beyond specified tolerances, or are damaged, including filling fully or partially with soil or groundwater.
- B. Replace unacceptable piles with piles that conform to specified requirements at no additional cost to the City of New York.

- C. Alternatively, in lieu of replacing unacceptable piles, additional piles may be placed in locations other than those shown on the Contract Drawings. This alternative may be used only with prior approval of the Commissioner for each individual location of use. All costs for design, analysis and construction of such alternative designs shall be at the expense of the Contractor.
- D. The Commissioner will determine if the deficiency of a pile is due to unavoidable field conditions, such as an immovable or impenetrable obstruction, or due to Contractor operations. See provisions of Paragraph 1.03.B for payment provisions.

### 3.08 FIELD QUALITY CONTROL

- A. All composite tapered pile inspections will be performed by the Special Inspector. The Contractor shall assist and provide access to the work area for field inspection by the Special Inspector. The Contractor shall cooperate with the Special Inspector in determining the minimum tip elevation required and shall mark each pile before driving as required.
- B. The driving of each pile shall be performed in the presence of the Special Inspector unless otherwise directed.
- C. When inspections result in pile rejection by the Special Inspector, the Contractor shall promptly segregate and remove rejected pile from the premises.
- D. Welding Inspections: Provisions of Article 2.07 shall apply.
- E. Inspection of Driven Piling: The Special Inspector will perform continuous inspection during pile driving and certify that piles are installed in accordance with requirements herein. Piles will be inspected for compliance with tolerance requirements. Bring any unusual problems which may occur to the attention of the Special Inspector.
- F. Installation Records: Driving records will be maintained by the Special Inspector and include the following as a minimum:
  - 1. Project name and number
  - 2. Name of Contractor and Installer
  - 3. Pile size and dimensions
  - 4. Elevation of point, elevation of butt before and after cut-off
  - 5. Continuous record of number of blows for each foot of penetration and final driving resistance in blows for final 6 inches
  - 6. Installation dates and times

7. Driving equipment used including type and size of hammer, rate of operation, total driving time, dimensions of driving helmet and cap used
8. Pile number and locations, tip elevations, ground elevations, cut-off elevations
9. Length of driven pile from final tip elevation to cut-off elevation
10. Any reheading or cutting of piles
11. Alignment and plumbness checks
12. Locations and depths where difficulty in driving was encountered
13. Any unusual pile driving problems.
14. Results of pile inspection after installation, checking for leakage, soil intrusion, and/or other signs of damage.

-END OF SECTION-

**Section 02371**  
**DUST, SOIL EROSION AND SEDIMENTATION CONTROL**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, tools, equipment, and incidentals required to assure adequate environmental protection including implementation of all erosion and sediment control measures and maintenance of storage areas as directed by the Resident Engineer.
- B. The Contractor shall provide a Sedimentation, Storm Water and Soil Erosion Control Plan in compliance with the NYS DEC approved Storm Water Pollution Prevention Plan (SWPPP) that addresses measures to prevent migration of contaminated storm water and sediment and to prevent erosion of features of the Work.
- C. The Contractor shall prevent discharge of sediment or erosion to watercourses, public streets or private property from dewatering operations. The Contractor shall provide methods to prevent demolition and construction debris from contaminating storm water runoff.
- D. The Contractor shall comply with all applicable regulatory requirements and all Federal, State, or local laws, codes, ordinances and regulations that govern the control of sediment, erosion and storm water during excavation.
- E. The Contractor shall provide silt fences, catch basins sediment traps, stabilized construction entrances or other approved means as a temporary structural practice to minimize erosion and sediment runoff.
- F. The Contractor shall provide and implement storm water pollution prevention in accordance with the Federal National Pollution Discharge Elimination System (NPDES) and State Pollution Discharge Elimination System (SPDES).
- G. The Contractor shall control dust and noise caused by operation and movement of vehicles and equipment in accordance with the latest NYC DEP, and OSHA standards, and all other applicable Federal, State and local regulations.
- H. The Contractor shall comply with the requirements given in the NYS DEC approved Stormwater Pollution Prevention Plan (SWPPP) for the project. Any changes intended to be made to the SWPPP recommendations should be submitted in conformance with Article 1.06.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02240 - Dewatering

17. New York State Stormwater Management Design Manual
18. New York Standards and Specifications for Erosion and Sediment Controls
19. SWPPP approved by the NYS DEC

#### 1.04 DEFINITIONS

- A. Primary System: Consists of one or more of the following components: silt fence, sediment traps, stabilized construction entrances, sumps, pumps, piping, or other means determined by the Contract Documents. Components shall be of sufficient size to handle the temporary sediment, storm water and erosion control as required by the Contract Documents.
- B. Backup Components: Components such as backup pumps, piping and other components which shall be sufficiently sized and prepared to incorporate them into the system if there is potential for the failure of a primary system component. (i.e., if generators are part of the primary system, have generators readily available in the event of a power failure).

#### 1.05 SYSTEM DESCRIPTION

- A. Silt Fences: The Contractor shall provide silt fences as a temporary structural practice to minimize erosion and sediment runoff. Silt fences shall be properly installed to effectively retain sediment immediately after completing each phase of work where erosion would occur in the form of sheet and rill erosion (i.e. clearing and grubbing, excavation, embankment, and grading). Silt fences shall be installed in the locations required and shown on the approved working drawings. Final removal of silt fence barriers shall be upon approval by the Resident Engineer.
- B. Sediment Traps: Sediment trap basins shall be provided around the catch basins to intercept sediment laden runoff and retain the sediment. Proposed locations of sediment traps are shown in the SWPPP. In addition, the Contractor shall provide sediment traps around any other temporary stormwater outlets from the construction site. Upon approval by the Resident Engineer, the sediment trap shall be removed and the area stabilized when the constructed drainage area has been properly stabilized.
- C. Stabilized Construction Entrances: The Contractor shall provide a stabilized pad of aggregates underlain with geotextile at all construction vehicle ingress and egress locations to eliminate tracking of sediments onto public rights of way. Representative locations of the stabilized constructions are shown in the SWPPP.

## 1.06 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Working Drawings: The Contractor shall submit to the Resident Engineer for approval Working Drawings and other documentation required to show conformance with the requirements specified and shown on the Contract Drawings.
  - 1. Working drawings shall show details of the Sediment and Storm Water Control System. The working drawings shall include, at a minimum, the following:
    - a. Plan locations of all components of the Sediment/Storm water Control System.
    - b. Detail of silt fence, sediment traps, stabilized construction entrances, and other installations.
  - 2. The Contractor shall submit manufacturer's descriptive literature and installation instructions for stockpile liner and cover material.
- C. Sedimentation and Storm Water Control Plan (SSCP): The Contractor shall develop and submit for approval, 30 days following Notice to Proceed, an SSCP, in accordance with the SWPPP. The SSCP shall address schedules and measures that will be taken to prevent migration of contaminated storm water/sediment, and to prevent erosion of features of the Work. The SSCP shall include the following at a minimum:
  - 1. Storm water runoff, noise, odor control and air pollution prevention.
  - 2. Provisions for silt fences, sediment traps, stabilized construction entrances and other measures to limit migration of sediments
  - 3. Diversion of storm water: The Contractor shall include provisions for controlling storm water runoff in and around excavation areas.
  - 4. Soil Storage Area: All details of temporary soil storage to be implemented as specified in this section.
  - 5. Soil Stabilization practices: All details of soil stabilization practices to be implemented, as specified in this section.
- D. Inspection Reports: Contractor shall submit SSCP inspection reports at the beginning of each month.

## 1.07 PERMITS AND REGULATIONS

- A. The Contractor shall obtain all necessary permits and be responsible for implementing the terms and requirements of these permits as needed and for payment of all fees.
- B. Handle all material in compliance with applicable requirements of OSHA and other governing authorities having jurisdiction.
- C. Codes and Standards: State and City laws and code requirements shall govern the hauling and disposal of trees, shrubs, stumps, roots, rubbish, debris and other matter.

## 1.08 ENVIRONMENTAL REQUIREMENTS

- A. Soil Stabilization: The stabilization practices to be implemented shall include one or a combination of the following: temporary seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, erosion control mats, protection of trees, preservation of mature vegetation. Stabilization practices shall be as approved by the Engineer. The Contractor shall record the dates when the major grading activities occur (i.e., clearing and grubbing, excavation, embankment and grading); when construction activities temporarily or permanently cease on a portion of the site; and when stabilization practices are initiated. Except as provided in Paragraphs 1.08A.1 and 1.08A.2, stabilization practices shall be initiated as soon as practicable, but no more than 14 days after construction activities have temporarily or permanently ceased.
  - 1. Unsuitable Conditions: Where the initiation of stabilization measures by the fourteenth day after construction activity temporarily or permanently ceases is precluded by unsuitable conditions caused by the weather, stabilization practices shall be initiated as soon as practicable after conditions become suitable.
  - 2. Temporary Inactivity Less than 21 Days: Where construction activity will resume on a portion of the site within 21 days after it temporarily ceases, no stabilization practices will be required.
- B. Sediment and Storm Water Control: Sediment and storm water control components shall be operational at all times during the Work, specifically during excavation, backfilling and restoration, and decontamination operations. The sediment and storm water control system shall be capable of handling Storm water during construction. Damage to excavation slopes and the migration of contaminated soil to downstream areas resulting from storm events shall be repaired or remediated by the Contractor, at the Contractor's expense.
- C. Storm water: At no time shall the Contractor allow storm water from soil stockpiling operations, or water from decontamination operations to migrate off of,

or percolate into, the ground below the temporary stockpile area or decontamination area, so as to impact non-contaminated areas. The Resident Engineer will monitor any overflow or leakage that occurs, and may, at his discretion, require the Contractor to perform soil sampling within non-contaminated areas affected by such overflow. Any soils that have been contaminated by such overflow shall be removed, treated and disposed of by the Contractor. All sampling, analyses, treatment and disposal of soils required as a result of overflow on formerly non-contaminated soil shall be performed by the Contractor at no additional cost to the City.

- D. Disposal of Water: Water collected from decontamination areas, dewatering operations and soil stockpiles shall be handled in accordance with Section 02240 - Dewatering.

#### 1.09 PROJECT CONDITIONS

- A. Existing Work: All silt fences, sediment traps, construction entrances, sumps, pumps, piping, and other sediment/storm water controls shall be installed such that other aspects of the Work are not adversely impacted or endangered. The sediment traps should be installed avoiding any interference with the construction traffic. All installations shall be subject to the approval of the Resident Engineer.
- B. Dust Control: The Contractor shall be responsible for controlling visible dust caused by Work operations and the moving of vehicles and equipment. Dust control shall be implemented when soils are exposed, before, during and after Work activity ceases. Dust control will also be required on the weekends. The Contractor shall apply water or use other methods, subject to the Resident Engineer's approval, when visible dust is present on-site, in accordance with the Health and Safety Plan. The use of chemicals, including calcium chloride for dust control, will not be permitted.
  - 1. All excavation, loading and transport of materials shall minimize the formation of dust. To prevent dust generation, application of water to roadways and active work areas shall be utilized as required. The Contractor's operations shall include air monitoring and dust minimization measures, consistent with the Health and Safety Plan (HASP) required by Section 01356 - Safe and Healthful Working Conditions.
- C. Silt and Sediment Disposal: All silt and sediment which accumulates behind silt fences or other erosion control structures shall be removed and disposed of off-site in accordance with all applicable Federal, State and local regulations.

#### 1.10 STORAGE, HANDLING AND REMOVAL

- A. Filter fabric shall be identified, stored and handled in accordance with ASTM D 4873.

**PART 2 PRODUCTS****2.01 MATERIALS****A. Components for Silt Fences**

1. **Filter Fabric:** Geotextile fabric that consists of a woven pervious sheet of plastic yarn as defined by ASTM D 123-90 and ASTM D 4439. The geotextile fabric shall be one that is recommended for such use by the manufacturer. The geotextile fiber shall consist of a long-chain synthetic polymer composed of at least 85 percent by weight of propylene, ethylene, ester, amide and shall contain stabilizers and inhibitors added to the base plastic, if necessary, to make the filament resistant to deterioration due to ultraviolet and heat exposure. The edges of the geotextile fabric shall be finished to prevent the outer fiber from pulling away.
2. **Seams:** The seams of the geotextile fabric shall be sewn with thread of material compatible with the fabric given above for geotextile yarn. Factory seams shall be tested in accordance with Method ASTM D1683-90, using 1-inch square jaws and 12 inches per minute constant rate of traverse. The strengths shall be not less than 90 percent of the required tensile strength of the geotextile fabric in any direction.

<b>Filter Fabric Physical Requirements</b>		
<b>Physical Property</b>	<b>Test Procedure</b>	<b>Acceptable Values</b>
Weight	ASTM D3776	5.6 oz/sy
Thickness	ASTM D1777	24 mils
Grab Tensile Strength Elongation (%)	ASTM D 4632	10 lbs./ %
Burst Strength	ASTM D3786	500+ psi
Trapezoid Tear Strength	ASTM D4533	115 x 90 lb.

3. **Silt Fence Stakes and Posts:** Provide wooden stakes or steel posts for fence construction. Wooden stakes utilized for silt fence construction, shall have a minimum cross section of 2 inches by 2 inches when oak is used and 4 inches by 4 inches when pine is used, and shall have a minimum length of 5 feet. Steel posts (standard "U" or "T" section) utilized for silt fence construction, shall have a minimum mass of 1.33 pounds per linear foot and a minimum length of 5 feet.

**B. Components for Stabilized Construction Entrances**

1. **Aggregates:** The aggregates to be used shall be a matrix of 1-4 inch stone, or reclaimed or recycled concrete equivalent.

2. The geotextile shall be woven or nonwoven fabric consisting only of continuous chain polymeric filaments or yarns of polyester. The fabric shall be inert to commonly encountered chemicals, hydro-carbons, mildew, rot resistant, and conform to the fabric properties as shown:

<b>Fabric Properties</b>	<b>Test Procedure</b>	<b>Acceptable Values</b>
Grab Tensile Strength (lbs)	ASTM D1682	220
Elongation at Failure(%)	ASTM D1682	60
Mullen Burst (lbs)	ASTM D3786	430
Puncture Strength (lbs)	ASTM D751 modified	125
Equivalent Opening Size	Us Std Sieve CW-02215	40-80
Aggregate Depth	-	10

- C. Mill Certificate: A mill certificate or affidavit shall be provided attesting that the fabric and factory seams meet chemical, physical, and manufacturing requirements specified above. The mill certificate shall specify the actual Minimum Average Roll Values and shall identify the fabric supplied by roll identification numbers. The Contractor shall submit a mill certificate signed by an authorized official from the company manufacturing the filter fabric.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Silt Fences: Silt fences shall extend a minimum of 16 inches to a maximum of 34 inches above the ground surface. Filter fabric shall be from a continuous roll cut to the length of the barrier to avoid the use of joints. When joints are unavoidable, filter fabric shall be spliced together at a support post, with a minimum 6-inch overlap, and securely sealed. A trench shall be excavated, approximately 4 inches wide and 4 inches deep, on the up slope side of the location of the silt fence. The 4-inch by 4-inch trench shall be backfilled and the soil compacted over the filter fabric. Silt fences may only be removed upon approval by the Engineer.
- B. Sediment Traps: The volume of sediment storage of the traps shall be 3600 cubic feet per acre of contributory drainage. All excavations for the trap shall be carried in such a way that the erosion and water pollution shall be minimal. All cut slopes of the basin shall be 1:1 or flatter.
- C. Stabilized Construction Entrances; Stabilized Construction Entrances shall have a minimum thickness of six inches. The width shall be at least 12 foot but not less than the full width of points where ingress or egress occurs. However, the width shall be a minimum of 24-foot if there is only one access to the site. Stabilized Construction Entrances shall be at least 50 feet long. Geotextile shall be placed over the entire area to be covered with aggregate. Piping of surface water under

entrance shall be provided if required. If piping is impossible, a mountable berm with 5:1 slopes will be permitted.

D. Maintenance: The Contractor shall maintain the temporary and permanent vegetation, erosion and sediment control measures, and other protective measures in good and effective operating condition by performing routine inspections to determine condition and effectiveness, by restoration of destroyed vegetative cover, and by repair of erosion and sediment control measures and other protective measures. The following procedures shall be followed to maintain the protective measures.

1. Silt Fence Maintenance: Silt fences shall be inspected in accordance with Article 3.02 of this Section. Any required repairs shall be made promptly. Close attention shall be paid to the repair of damaged silt fence resulting from end runs and undercutting. Should the fabric on a silt fence decompose or become ineffective, and the barrier is still necessary, the fabric shall be replaced promptly. Sediment deposits shall be removed and disposed of off-site when deposits reach one-third of the height of the barrier. When a silt fence is no longer required, it shall be removed. The immediate area occupied by the fence shall be shaped to an acceptable grade and stabilized.
2. Sediment Trap maintenance: Sediment traps shall be inspected after each rain and repairs made as needed. Sediments from sediment traps shall be removed and the trap restored to its original dimensions when the sediment has accumulated to half the design depth of the trap. Removed sediment shall be deposited in a suitable area and stabilized in such a manner that it will not erode.
3. Stabilized Construction Entrance maintenance: The entrances shall be maintained in a condition which will prevent tracking or flowing of sediment onto public rights-of-way. Periodic top dressing with additional aggregate shall be done as needed. All sediment spilled, dropped or washed onto the public area must be removed immediately. When necessary, wheels must be cleaned to remove sediment prior to entrance onto public right-of-ways. All sediment shall be prevented from entering storm drains, ditches or watercourses. Periodic inspection and needed maintenance shall be provided after each rain. When washing is required, it shall be done on an area stabilized with stone and which drains into an approved sediment trapping device.

### 3.02 FIELD QUALITY CONTROL

- A. Inspections: The Contractor shall inspect disturbed areas of the construction site, areas used for storage of materials that are exposed to precipitation that have not been finally stabilized, stabilization practices, structural practices, other controls, and areas where vehicles exit the site daily and within 24 hours of the end of any storm that produces 1/2 inch (13 mm) or more rainfall at the site. Where sites have

been finally stabilized, such inspection shall be conducted at least once every month.

1. Inspections Details: Disturbed areas and areas used for material storage that are exposed to precipitation shall be inspected by the Contractor for evidence of, or the potential for, pollutants entering the local drainage system. Erosion and sediment control measures identified in the SSCP shall be observed to ensure that they are operating correctly. Discharge locations or points shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters. Locations where vehicles exit the site shall be inspected for evidence of offsite sediment tracking.
2. Inspection Reports: For each inspection conducted, the Contractor shall prepare a report summarizing the scope of the inspection, name(s) and qualifications of personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the SSCP, maintenance performed, and actions taken. The report shall be furnished to the Resident Engineer. A copy of the inspection report shall be maintained on the job site.

### 3.03 CLEANING

- A. Clean all silt and sediment from sumps during and at the conclusion of the Work. Interim cleaning shall be such that the performance of the sump, pumps and piping, used in the performance of work, is not hindered, or at the direction of the Resident Engineer.

-END OF SECTION-

**Section 02380  
ROCK WORKS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work of this section consists of furnishing all transportation, labor, materials, equipment, and incidentals necessary to construct graded stone material for scour backfill, in accordance with the Contract Documents.
- B. This Section includes, but is not limited to, the following items:
  - 1. Gradation of Armor Stone
  - 2. Gradation of Underlayer
  - 3. Testing of Rock
  - 4. Placement of Rock

**1.02 RELATED SPECIFICATIONS**

- A. Section 01356 – Safe and Healthful Working Conditions
- B. Section 02325 – Dredging

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Society for Testing and Materials (ASTM):
    - a. ASTM C88 Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
    - b. ASTM C97 Absorption and Bulk Specific Gravity of Natural Building Stone
    - c. ASTM C127 Density, Relative Density (Specific Gravity) and Absorption of Coarse Aggregate
    - d. ASTM C136 Sieve Analysis of Fine and Coarse Aggregate
    - e. ASTM C170 Compressive Strength of Dimension Stone
    - f. ASTM C295 Petrographic Examination of Aggregates for Concrete

- g. ASTM C535 Resistance to Degradation of Large Size Coarse Aggregate by Abrasion and impact in the Los Angeles Machine
  - h. ASTM D3740 Minimum Requirements for Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction
  - i. ASTM D4791 Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate
  - j. ASTM D4992 Evaluation of Rock to be Used for Erosion Control
  - k. ASTM D5312 Evaluation of Durability of Rock for Erosion Control Under Freezing and Thawing Conditions
  - l. ASTM D5313 Evaluation of Durability of Rock for Erosion Control Under Wetting and Drying Conditions
- 2. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
  - 3. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

#### 1.04 DEFINITION

- A. The words "rock" and "stone" used in this Section are interchangeable.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with Article 4 of the General Conditions and Section 01330 - Shop Drawings:
  - 1. Methods and sequences planned to be used in rock placement for review by the Commissioner prior to the shipment of rock.
  - 2. Fifteen days prior to shipment of rock, test samples of rock to be furnished for approval. These samples shall weigh not less than 20 pounds each and shall be delivered in a suitable container.
  - 3. Within 15 days after Notice to Proceed, the source or sources from which the rock will be furnished.

#### 4. Qualifications Submittals

- a. Testing Technicians and Testing Agency: Submit data on qualifications of Contractor's proposed testing agency and technicians for approval by the Commissioner prior to performing any work. Comply with related requirements in paragraph 1.06 herein and Section 01451 - Contractor's Quality Control.

#### 5. Test Reports

- a. Gradation Test: Submit the gradation tests using the GRADATION TEST DATA SHEET enclosed at end of this section.
- b. Evaluation Testing of Stone: Quality test on the stone in accordance with Part 2 article entitled "Source Quality Control". Prior to delivery of such material to the worksite, submit a copy of the laboratory inspection report along with actions taken to correct deficiencies. Submit a copy of the test reports.
- c. Material: Submit test reports attesting that the materials meet specified requirements.
- d. Bulk Specific Gravity: At least 30 calendar days in advance of shipment of stone to the work site, submit a copy of bulk specific gravity test results for each gradation range of stone proposed to be furnished. The information shall be furnished prior to preparation of pre-production demonstration stockpiles.

#### 6. Certificates

- a. Submit certificates of compliance attesting that the materials meet specification requirements.
- b. Laboratory: Submit a copy of the documents that validate that the laboratory can perform the required tests. The individual tests shall be listed for which the validation covers along with the date of the inspection.
- c. Weigh Scale Certification: Submit a copy of the certification from the regulation agency attesting to the scale's accuracy.
- d. Certified Weight Scale Tickets: Submit a copy of each certified weight scale ticket within five working day(s) after weighing.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Comply with all applicable Federal, state and local laws and regulations.
- C. Make all arrangements, pay all royalties, and secure all permits for the procurement, furnishing and transporting of rock. The Contractor shall vary quarrying, processing, loading and placing operations to produce sizes and quality of stone specified. If stone being furnished by the Contractor does not fully meet all requirements of these Specifications, the Contractor shall furnish, at no additional cost to the City of New York, other stone meeting requirements of these specifications and remove and dispose of unacceptable rock from the site in accordance with Federal, state and local regulations.
- D. Testing Agency/Laboratory: Engage the services of an independent testing laboratory approved by the Commissioner to perform testing specified to be performed by the Contractor. Testing shall be performed by an approved accredited laboratory. The laboratory to perform the required testing shall be validated based on relevant paragraphs of ASTM D3740, and no work requiring testing shall be permitted until the laboratory has been inspected and validated. The first inspection of the facilities shall be at the expense of the City of New York and any subsequent inspections required because of failure of the first inspection shall be at the expense of the Contractor.

## PART 2 PRODUCTS

### 2.01 GENERAL

- A. All rock shall be durable material as approved by the Commissioner. Rock used shall be quarry rock, not rounded or sub-rounded river run and shall be close-grained, hard, sound, clean, and shall not disintegrate from the action of the atmosphere, sea water, handling or placing. The rock shall be free of cracks, blast fractures, bedding, seams and thin layers of soft decomposed or soluble water material and other defects that would tend to increase its deterioration from natural causes. Inspections for cracks, fractures, seams and defects shall be made by visual examination. If, by visual examination, it is determined that 10 percent or more of the stone produced contains hairline cracks, then all stone produced by the means and measures which caused the fractures shall be rejected. A hairline crack that is defined as being detrimental shall have a minimum width of 4 mils and shall be continuous for one-third the dimension of at least two sides of the stone. The stone shall be clean and free from all foreign matter. Remove any foreign material adhering to or combined with the stone as a result of stockpiling prior to placement.

- B. Tests and service records shall be used to determine the acceptability of sample rock materials submitted. The rock may be subjected to the following tests: petrographic analysis, specific gravity, abrasion, absorption/porosity, weatherability, soundness, compressive strength, wetting, and drying to demonstrate the material is acceptable for the use intended. Test requirements are specified in Article 2.04.
- C. Rock which does not conform to specific gravity, structure, and other characteristics specified shall be rejected. The presence of unsatisfactory rock or objectionable foreign material shall be sufficient reason for rejection of the entire load of rock. Such load of rock shall be removed from the work and disposed of at the Contractor's expense.
- D. Sources: Furnish stone from a source designated by the Contractor and accepted by the Commissioner, subject to the conditions herein stated. Satisfactory service records on other work may be acceptable proof of suitability. Approval of a stone source shall not be construed as a waiver of the right of the Commissioner to require the Contractor to furnish stone which complies with these Specifications. Materials produced from localized areas, zones or strata of an approved quarry will be rejected when such materials do not comply with these Specifications. In order for stone to be acceptable on the basis of service records, stone of a similar size must have been placed in a similar thickness and exposed to weathering under similar conditions as are anticipated for this Contract, and must have satisfactorily withstood such weathering for a minimum of 20 years. In addition to an acceptable 20 year service record, the Commissioner has the option to elect to have representative samples taken and tested.
  - 1. Selection of Source: The Contractor shall designate in writing only one source or one combination of sources from which he proposes to furnish stone. It is the Contractor's responsibility to determine that the stone source or combination of sources selected is capable of providing the quality, quantities and gradation needed and at the rate needed to maintain the scheduled progress of the work.
  - 2. Acceptance of Materials
    - a. Acceptance of a source of stone is not to be construed as acceptance of all material from that source. The right is reserved to reject materials from certain localized areas, zones, strata, or channels, when such materials are unsuitable for stone as determined by the Commissioner.
    - b. The Commissioner also reserves the right to reject individual units of produced specified materials in stockpiles at the quarry, all transfer points, and at the project construction site when such materials are determined to be unsuitable.

- c. During the course of the work, the stone may be tested by the Commissioner, if he/she determines that testing is necessary. If such tests are determined necessary, the testing will be done in a commercial laboratory selected by the Commissioner.
  - d. Materials produced shall meet all the requirements herein. The cost of testing will be at the Contractor's expense. During the contract period, both prior to and after materials are delivered to the job site, visual inspections and measurements of the stone materials may be performed by the Commissioner. If the Commissioner, finds that the stone quality, gradation or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing by the Contractor shall be required.
  - e. Sampling of the delivered stone for testing and the manner in which the testing is to be performed shall be as directed by the Commissioner. This additional sampling and testing shall be performed at the Contractor's expense when test results indicate that the materials do not meet specified requirements. When test results indicate that materials meet specified requirements, an equitable adjustment in the contract price will be made for the sampling and testing. Any material rejected shall be removed or disposed of as specified and at the Contractor's expense.
- E. Quarry Operations: Quarry operations shall be conducted in a manner that will produce stone conforming to the requirements specified and may involve selective quarrying, handling, processing, blending, and loading as necessary, all of which shall be as specified in Section 01451, "Contractor Quality Control".
- 1. Blasting and handling of rock shall be controlled to produce rock of the size ranges and quality specified. Techniques such as the use of proper hole diameter, hole depth, hole angle, burden and spacing distances, types and distribution of explosives, blast delay intervals and sequence, removal of muck piles between each shot, and special handling techniques are required as necessary to produce the specified materials. All aspects of blasting operations shall be specifically designed so that the end-product is not damaged from the blasting technique and that the stone is suitable for the intended purpose.
  - 2. Curing Stone: Conduct curing operations on freshly quarried stone to allow it to release stored energy and moisture and to allow the stone to demonstrate that it will not fracture during the energy release and drying-out phase. Temporarily stockpile stones of sizes which are individually picked at the quarry site a minimum of 90 calendar days before being shipped to the project site, unless this requirement is waived by the Commissioner. Such waiver will be granted only if the stone has characteristics that make curing unnecessary.

3. Temporary Storage at Quarry: Storage of stone materials subsequent to shipment from the quarry and prior to permanent placement in the required work shall be subject to approval of the Commissioner. Underwater storage of stone materials is prohibited.
4. Proportional Dimension Limitations: Stone in size ranges which are not graded with a screen or grizzly shall have ratios of their dimensions limited as follows:

Definitions:

L = largest dimension (length),

G = largest dimension measured perpendicular to the direction of L

E = largest dimension perpendicular to plane LG < G

Requirements:

$(L+G)/2E \leq 3$  and  $L/E < 3$  for 95% of stone by weight

$(L+G)/2E \leq 2.5$  and  $L/E < 2.5$  for 75% of stone by weight

- F. Rock Armor Material Stockpiles: Storage of Rock Armor material at the worksite is not to be confused with off-site stockpiling of Rock Armor material. If the Contractor elects to provide off-site stockpiling areas, the Commissioner shall be notified by the Contractor of all such areas. The Contractor's stockpile shall be a maximum of 12 feet high and formed by a series of layers of truckload dumps, where the rock essentially remains where it is placed. Subsequent layers shall be started 10 feet from the edge of the previous layer so that the rock will not roll down the edges of the previous layers. The first layer shall be a maximum of 6 feet high. After being stockpiled, Rock Armor material which has become contaminated with soil or refuse shall not be put into the work unless the contaminating material has been removed prior to placement.
1. Worksite Stockpile: Rock Armor material delivered to the work site, which requires temporary storage landward of top of slope, shall be placed in a container suitable for storing the Rock Armor material without waste, or a sand-clay-gravel or crushed stone pad may be constructed for the storage area and removed upon completion of the work. If the sand-clay-gravel or crushed stone pad method is used, the pad shall have a minimum thickness of at least 6 inches. The container or sand-clay-gravel or crushed stone pad method shall be subject to approval prior to delivery of the Rock Armor material. Upon completion of the work, the storage areas shall be cleaned of all storage residues and returned to their natural condition. Temporary storage of material at the worksite will be allowed, provided the amount does not exceed 200 tons unless otherwise approved.
  2. Off-site Stockpile: In areas where Rock Armor material is stockpiled for placement, the area shall have excess rock removed prior to completion of work. All rock and spalls greater than 3 inches in diameter shall be removed. Where rocks may have become buried due to soft ground or

operation of the equipment, the rock shall be put in a disposal area. After the rock has been removed, the storage area shall be graded, dressed and filled to return the ground surface as near as practical to the condition that existed prior to construction, unless otherwise approved in writing by the site owner.

## 2.02 GRADATION OF UNDERLAYER

- A. Each load of underlayer shall have uniform grading from fine to coarse particles to achieve the grading identified in this Section.
- B. Underlayer shall consist of material conforming to the following gradation by weight; typical sizes listed are approximate and are provided for guidance only:

Weight of Pieces (lbs)	Typical Size (inches)	Percent smaller than by weight
4.6	3.6	97%
2.8	3.0	75% to 90%
0.7 to 0.9	2.0	50%
0.2	1.4	0 to 15%
0.1	1.2	2%

## 2.03 GRADATION OF ARMOR STONE

- A. Armor stone shall be select, angular, quarried rock that is reasonably well-graded with grading by weight as tabulated below. Typical sizes listed are approximate and are provided for guidance only.

Armor Stone Type I		
Weight of Pieces (lbs)	Typical Size (inches)	Percent smaller than by weight
60	9	97%
50	8	75 to 90%
20 to 30	6	50%
10	5	0 to 15%
5	4	2%

Armor Stone Type II		
Weight of Pieces (lbs)	Typical Size (inches)	Percent smaller than by weight
600	19	97%
500	17	70% to 100%
360 to 440	16	50%
200	13	0 to 10%
120	11	2%

Armor Stone Type III		
Weight of Pieces (lbs)	Typical Size (inches)	Percent smaller than by weight
1050	22	97%
875	21	70% to 100%
630 to 770	19	50%
350	15	0 to 10%
210	13	2%

## 2.04 SOURCE QUALITY CONTROL

- A. General: Source inspection will be performed by the Commissioner. The Contractor shall assist and provide access for inspection by the Commissioner. Testing as specified herein shall be performed by the Contractor's approved testing laboratory. Testing and associated costs, including shipping of test samples, shall be at the Contractor's Expense and at no additional cost to the City of New York. Any test not meeting the requirements specified shall be re-performed at the Contractor's Expense. Test results shall be submitted for approval at least 30 days before stone will be required for installation in the work.
- B. Pre-Production
1. Material Quality: Before selecting a source for preparation of a demonstration stockpile, the Contractor shall be reasonably certain that the source is capable of meeting the quality and source requirements specified herein.
  2. Borderline Material Quality: If the Commissioner's evaluation of a demonstration stockpile results in his/her not being able to determine by visual examination whether the material is acceptable, the Commissioner will select at least one, but not more than three, representative stones from the demonstration stockpile to be prepared for shipment to the Commissioner's laboratory for testing in accordance with paragraph 2.04C. For specified stone sizes more than 500 lbs, individual samples shall be the size of the largest stone specified for the size range. Samples of stone groupings with a maximum size less than 500 lbs shall contain at least two (2) stones representative of the higher limit of the stone weights specified. In addition, the sample shall be representative of the gradation specified and the minimum weight of the total sample shall be not less than 500 lbs. The sampling and testing procedures shall be repeated for each strata being quarried. The Contractor shall ship the samples to the laboratory as specified in paragraph 2.04C. If the laboratory testing reveals the materials are unacceptable, the Contractor shall submit a replacement source for approval and proceed with the demonstration stockpile procedures anew.

3. **Demonstration Stockpile at Source:** Following submittal of the Contractor's Quality Control (CQC) Plan and the Contractor's selection of a source, but prior to the Commissioner's approval of a source and the CQC Plan, the Contractor shall arrange to provide a pre-production demonstration stockpile for each of the stone size ranges for the project. The stockpiles shall be located at the source of the stone and be shaped in windrow fashion. Stones shall not be stacked higher than 4 feet. The stones placed in the demonstration stockpiles shall be representative of the overall quality of materials in the source. The stones shall not consist of the best specimens unless it is reasonable to determine that the source will provide the required amount of stone of the applicable size range with a degree of quality no less than that existent in the demonstration stockpile. The quantity of stone in each demonstration stockpile shall be dependent upon the gradation size range to be produced for the project.
4. The stones placed in the stockpile shall have been preselected by the Contractor's Quality Control Plan (CQCP) inspector or supervisor and acceptable stones over 500 lbs in size shall have been marked with spray paint on three mutually perpendicular sides with a coded mark to denote acceptability for a certain size range. A stockpile of representative reject stones marked with a red "X" shall also be maintained at the site as examples of unacceptable materials or shapes.
5. **Evaluation of Demonstration Stockpile at Source**
  - a. The Contractor shall notify the Commissioner when stockpiles are ready for evaluation.
  - b. The Contractor's approved Quality Control Plan (QCP) supervisor and all QCP inspectors shall accompany the Commissioner during his/her evaluation of the demonstration stockpiles.
  - c. The Contractor shall arrange to have individual stones turned as necessary to accommodate the Commissioner's evaluation.
  - d. The Commissioner will mark rejected stones with a red "X" and such stones shall be removed to the reject stockpile or to a crusher if one is available.
    - (1) If more than two (2) unacceptable stones are found within a stockpile, the entire stockpile will be rejected by the Commissioner and a replacement stockpile shall be created for re-evaluation.
    - (2) If the replacement stockpile is rejected, the Contractor shall revise and resubmit its Quality Control Plan (QCP) and shall

create another replacement demonstration stockpile for evaluation.

- (3) If the third demonstration stockpile for a particular size range at a single source is found unacceptable, the source will be disapproved for such size range and a new source shall be submitted for approval. In addition, the Contractor shall submit the name and qualifications for a person to replace the QCP supervisor.
  - (4) The Contractor may choose a replacement source at the time a first or second demonstration stockpile is found unacceptable.
  - (5) The replacement of demonstration stockpiles or stone sources shall be at no additional cost to the City of New York and with no change in the time of completion.
6. Approval of Demonstration Stockpile at Source: At the time the Commissioner finds the contents of a demonstration stockpile to be acceptable, either through visual examination or through laboratory testing, the Contractor will be notified in writing that the source, the QCP plan and QCP staff are approved. Upon approval, the Contractor may proceed with production of materials for the project provided they are consistent with demonstration stockpiles.
7. Duration of Demonstration Stockpile at Source: Other than for being shipped as the final quantities of materials to be placed in the work, each demonstration stockpile shall remain unchanged at the source until all other required material of the size range represented by the stockpile has been shipped from the source.

C. Evaluation Testing of Stone

1. Samples: Take samples of stone from by a representative of the quarry under the supervision of the Commissioner for testing and acceptance prior to delivery of any stone from this source to the site of the work. Information provided with the samples shall include the location within the quarry from which the sample was taken along with a field examination of the quarry. The field examination shall include the information outline in ASTM D4992, paragraph 7. Samples shall consist of at least three pieces of stone, roughly cubical in shape, from each unit that shall be used in the production of the required stone. For smaller size gradations, the sample stones shall be of the maximum size; for large size gradations, the sample stones shall weigh not less than 150 lbs. each. If the source is an undeveloped quarry, or if the operation has been dormant for more than one year such that fresh samples are not available, the quarry shall expose fresh rock for 20 feet horizontally and for the full

height of the face proposed for production, prior to the field evaluation. The Commissioner may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether sufficient reserves are available. The samples shall be shipped at the Contractor's expense to a laboratory validated by the Commissioner to perform the required tests.

2. The tests shall be conducted by the Contractor in accordance with applicable ASTM methods, and shall be performed at a laboratory approved by the Commissioner. The cost of testing shall be borne by the Contractor.
3. Perform evaluation tests on stone samples collected from the proposed source. Perform the quarry investigation by a registered geologist or registered Commissioner. The tests to which the stone shall be subjected include petrographic examination (ASTM C295), absorption (ASTM C127), resistance of stone to freezing and thawing (ASTM D5312), and resistance to wetting and drying (ASTM D5313).
4. Each load of rock shall meet the requirements of testing methods specified. The Commissioner reserves the right to test any loads of rock at any time.
5. The following tests shall be performed and test results shall meet the requirements stated:
  - a. Abrasion Resistance (Los Angeles): ASTM C535 - Maximum abrasion loss by this method using Grading 1 shall not exceed 9 percent after 100 revolutions and 38 percent after 500 revolutions.
  - b. Specific Gravity: ASTM C97 with the following modifications:
    - (1) Sample rocks shall be selected for testing by the Commissioner. If, in the judgment of the Commissioner, a sample rock is too large to be handled conveniently, it may be broken into two or more pieces and one or more of these selected for testing. The sample rocks shall be dried 24 hours or more at 220 degree F. to 230 degree F. Soil or loose material shall be removed with a stiff brush. Immediately upon cooling, the rocks shall be weighed to an accuracy of  $\pm 1$  percent. After weighing, the specimens shall be completely immersed in clean tap water for a minimum period of 48 hours and then weighed in clean tap water to an accuracy of  $\pm 1$  percent. The specimens shall then be surface dried with a towel to remove excess surface moisture, and immediately weighed in air to an accuracy of  $\pm 1$  percent.

- (2) Quantity determinations are contingent upon the range of bulk specific gravity (saturated surface dry (SSD) basis) of stone to be supplied. Therefore, during the process of selecting a source or sources of stone for the project, the Contractor shall make an investigation to determine the lowest and highest bulk specific gravity (SSD) of stone available at the source or sources he proposes to utilize for each gradation range of stone. Test results that display an extraordinarily wide range of values may necessitate additional testing to determine whether the source contains strata with stones of an acceptable range of bulk specific gravity.

- (3) Specific Gravity shall be calculated (oven-dry basis) as follows:

$$SG = A \div (B - C)$$

Where:

A = weight of oven-dry sample in air.

B = weight of soaked and surface dried sample in air.

C = weight of soaked sample in water.

- (4) The average (arithmetic mean) of all values obtained from tests performed on any load of rocks shall equal or exceed 2.6.

- c. Absorption: Tests for absorption shall be in accordance with ASTM C127 except the unit weight shall be calculated in accordance with Note No. 5 using bulk specific gravity, saturated surface dry, with an acceptable limit of two percent, unless other tests and service records show that the stone is satisfactory.
- d. Sulphate Soundness: When subjected to five cycles of the soundness test specified in ASTM C88 using magnesium sulphate solution, the rock shall not have a loss greater than 12 percent.
- e. Petrographic Analysis: Stone shall be subjected to petrographic and X-ray diffraction analysis in accordance with ASTM C295 which shall include information required by ASTM D4992, paragraph 10. Stone shall not contain expansive clays.
- f. Resistance of Rock to Wetting and Drying: Stone shall have a maximum loss of 1 percent when determining the durability of stone when subject to wetting and drying in accordance with ASTM D5313.
- g. Drop Test: A drop test provides an immediate evaluation of the durability of very large stone during handling of the stone including placement into a structure. For comparability, the test stone(s) shall

be dropped from a bucket or by other means from a height of not less than half the average diameter of the stone onto a rigid surface or second stone of comparable size. Dumping from a truck is not acceptable. The stone shall be examined carefully before as well as after the completion of the test. Failure criteria are the development of new cracks, opening of old cracks, and the loss of a piece from the surface of the stone. Each stone shall be dropped a total of five times for evaluation purposes with examination after each drop. The Contractor shall provide all necessary equipment and operating personnel to help perform the testing.

- h. Unconfined compression test (ASTM C170), measured on cubes with 2-inch edges:  $\geq 5000$  psi for underlayer;  $\geq 7000$  psi for armor stone
- i. Gradation Tests of Underlayer and Rock Armor material:
  - (1) The sample shall be taken by the Contractor in the presence of the Commissioner. The Contractor shall notify the Commissioner not less than 3 days in advance of each test. In the event of unavailability of the Commissioner, the Contractor shall perform the tests and certify to the Commissioner that the Underlayer and Rock Armor material shipped complies with the specifications.
  - (2) At least one gradation test(s) shall be performed per 5,000 tons of each size of Underlayer and Rock Armor material placed, but not less than one test shall be performed.
  - (3) The gradation tests shall be reported using the forms GRADATION TEST DATA SHEET and RIPRAP GRADATION CURVES, attached at end of this Section. The Contractor shall designate on the test form that portion in tons of the lot tested that is applicable to this contract. Any deviation from the reported tonnage shall be corrected and recorded on a revised GRADATION TEST DATA SHEET.
  - (4) Sampling and gradation testing for underlayer stone shall conform to ASTM C136.
  - (5) For each type of armor stone, the sample shall consist of not less than 40 pieces of stone, and shall be collected in a random manner that will provide a sample that accurately reflects the actual gradation arriving at the jobsite.
    - (a) The weight of the individual pieces of armor stone, representing the minimum, maximum and 50 percent

greater than sizes for the specified armor stone gradation, shall be printed on each stone and be placed at the quarry to provide visual comparison during production at the quarry. They shall be placed in a location adjacent to the work site in order to provide a basis for visual comparison during placement of the armor stone. These stones shall be used as the last order of work. Failure of the test on the initial sample and on an additional sample will be considered cause for rejection of the quarry and/or quarry process, and all Underlayer and Rock Armor material represented by the failed tests shall be set aside and not incorporated into the work. Any additional tests required because of the failure of an initial test sample will not be considered as one of the other required tests.

- (b) If collected by the truckload, each truckload shall be representative of the gradation requirements. The Commissioner may direct additional testing of the Underlayer and Rock Armor material at the project site if the Underlayer and Rock Armor material appears, by visual inspection, to be out of gradation. The additional tests shall be performed on random loads selected by the Commissioner.
- (c) If the gradation test fails, additional gradation tests will be required at the Contractor's expense to delineate the limits of unacceptable stone. The additional gradation tests shall not count as part of the minimum number of gradation tests required. Either the unacceptable stone shall be reworked to bring the stone within the specified gradation or the stone shall be removed from the project site as determined by the Commissioner. The Commissioner may direct this testing.
- (d) The Contractor shall provide all necessary screens, scales and other equipment, and operating personnel, and shall grade the sample. Certification and test results shall represent Underlayer and Rock Armor material shipped from the quarry.
- (e) Certification and tests results must be received by the Commissioner at the jobsite before the Underlayer and Rock Armor material is used in the work.

- D. Test Quarry Samples: Samples for testing, shall be submitted a minimum of 30 days in advance of the time when the stone will be required in the work. Stone from the proposed source shall be tested for quality compliance at the

Contractor's expense by a laboratory approved by the Commissioner. Test samples (500 pounds minimum) shall be representative of the respective stone sources and shall be obtained by the Contractor under the supervision of the Commissioner and delivered at the Contractor's expense to an approved testing laboratory.

- E. Re-certification and Testing: Sampling and testing of any load of material delivered to the project site shall be at the Commissioner's discretion, randomly chosen up to a maximum of five tests. Costs for testing shall be at the Contractor's expense and included in the unit prices for rock.
- F. Random Testing By Commissioner: The Commissioner reserves the right to require, at random, additional rock samples to be tested at the Commissioner's discretion. Rock samples may be taken at the quarry site or from deliveries at the worksite. This testing will be performed at the City of New York's expense. The Commissioner reserves the right to have a representative at the quarry site to observe the work. At any time, during the progress of the work, the Commissioner may undertake tests on any rock material intended for shipment and use on the project.

### PART 3 EXECUTION

#### 3.01 GENERAL

- A. Depth and extent of rock work shall be within limits shown on the Contract Drawings. Slopes and elevations indicated on the Contract Drawings are to be interpreted as irregular surfaces. Comply with the following:
  - 1. Rock materials shall be placed by a method selected by the Contractor and reviewed by the Commissioner.
  - 2. Care shall be exercised when placing rock materials near adjacent structures. Damage shall be repaired at the Contractor's expense.
  - 3. Rock materials shall be placed on the slope of the underlying surface as soon as possible after it is dredged, but not later than 7 days after approval of dredging survey.

#### 3.02 PREPARATION

- A. Prior to placing each type of rock material, the Contractor shall verify that the underlying surface has been surveyed and approved by the Commissioner.
- B. Debris: Remove any timbers, unsatisfactory material and debris within the reaches for construction except as otherwise directed by the Commissioner. Upon removal, debris shall become the property of the Contractor. All materials shall be properly disposed of in accordance with the requirements of

Section 02222 – Demolition and Removals and Section 02224 – Removal of Arsenic-Impacted Wood, Environmental Requirements, as applicable.

### 3.03 TOLERANCES

- A. Rock work shall be carried to lines, grades and with minimum layer thicknesses as shown on the Contract Drawings and as directed by the Commissioner. Layer thicknesses may locally exceed those shown by up to 25%. Final surface of each finished course shall follow with reasonable variation the indicated lines and grades without continuous under or overbuilding.

### 3.04 MISPLACED MATERIAL

- A. Any material that escapes or is lost at any time while loading, transporting or placing rock, or which is deposited other than in an area designated on the Contract Drawings, or change approved in writing by the Commissioner, shall be removed and re-deposited where directed by the Commissioner, at the Contractor's expense.

### 3.05 MAINTENANCE OF UNDERLAYER

- A. Exposed underlayer surfaces are vulnerable to damage until all stone has been placed and rock work has been accepted. The Contractor shall be responsible for care and maintenance of these slopes until final acceptance by the Commissioner. Damage to rock slopes due to any cause prior to acceptance shall be repaired, at the Contractor's expense.

### 3.06 ROCK PLACEMENT PROCEDURE

- A. The armor stone and underlayer shall be placed so that a reasonably well-graded mass is produced with a minimum practicable percentage of voids. Rock layers shall be constructed to lines and grades indicated on the Contract Drawings. Armor stone shall be placed to its full course thickness in one operation and in a manner which will avoid displacing underlayer stone. Stone shall be allowed to fall no more than three feet from bottom of clam or other bucket and top surface of rockwork for work three feet below water surface or above.
- B. Placing Underlayer Stone: Place the underlayer stone in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method that is likely to cause segregation of the various sizes will not be permitted. Lower un-segregated stone in a bucket or container and placed in a systematic manner directly on the underlying material. Begin placement at the bottom of the slope and proceed upward. Moving the stone by drifting and manipulating down the slope will not be permitted. Final finish of the slope shall be performed as the material is placed

**C. Placing Armor Stone**

1. Perform final shaping of the slope concurrently with the initial placement of the stone.
  2. Randomly select stones and set in contact with each other so that the interstices between adjacent stones are as small as the character of the stone will permit.
  3. Place the face of stone having the largest area against the surface of the underlying material. Begin placement at the bottom of the slope. Place the heaviest stones as toe stones.
  4. Place stones in a manner to avoid displacing underlying materials or placing undue impact force on underlying material that would cause the breaking of stones.
  5. Use suitable equipment in placing the stone for handling materials of the sizes required including the ability to place the stone over its final position before release and if necessary pick up and reposition the stone. Dragline buckets and skips shall not be used in placement. Moving stone by drifting or manipulating down the slope will not be permitted.
  6. The finished work shall be a well-distributed mass, free of pockets of either smaller or larger stone, having a minimum of voids and with the maximum of interlocking of stones.
  7. It should be anticipated that re-handling of individual stones after initial placement will be required to achieve the above requirements. Stones placed within 10 feet adjacent to existing marina wall shall not be dropped, but gently lowered and placed in their final position by material handling equipment.
- D. For underwater work, where work surface is more than five feet below water level, maximum drop shall be five feet. That notwithstanding, an otherwise allowable height using the Contractor's approved placement method will not be permitted if it is shown to cause segregation of rock sizes, or breakage of individual stones. In those cases, allowable drop heights will be developed on-site, between the Commissioner and the Contractor, based on actual performance.
- E. The Contractor shall maintain armor layer until accepted and any material displaced, or with damage to surface by any cause, shall be replaced to indicated lines and grades, at the Contractor's expense.
- F. Self propelled equipment shall not be used on slopes. Placing armor stone by dumping into chutes or similar methods will not be permitted.

- G. Slides: In the event of the sliding or failure of any part of the structure during its construction, or after its completion, but prior to its acceptance, the Contractor shall, upon written order of the Commissioner, cut out and remove the slide from the structure. The Contractor shall then rebuild that portion of the structure with new materials or reuse the displaced materials for rebuilding if deemed appropriate. The Commissioner will determine the nature and cause of the slide. In case the slide is caused through fault of the Contractor, the foregoing operations shall be performed without additional cost to the City of New York.

### 3.07 WORKING AROUND STRUCTURES

- A. The Contractor shall exercise great care in when working around existing and newly constructed structures. The installation of underlayer and top armor rock shall be completed prior to installation of the fender units. Any damage to fender units and pilings as a consequence of the Contractor's rock placement works shall be repaired by the Contractor at the Contractor's expense.

### 3.08 ADJUSTING AND CLEANING

- A. Surveys will be conducted by the Commissioner before and after placing each layer of rock in the work. Surveyed sections will be taken at a spacing not greater than 50 feet along the long axis of active work face, plus a longitudinal centerline profile. Each section will define sufficient points to accurately represent rock in place.
- B. If, in the opinion of the Commissioner, additional rock is required to conform to the sections shown on the Contract Drawings, the Contractor shall, when directed by the Commissioner, return to the areas requiring such additional rock and place same without additional compensation.
- C. Rock or material misplaced and judged objectionable by the Commissioner shall be removed at the Contractor's expense prior to acceptance of the job. Misplaced material not judged objectionable may remain.

### 3.09 FIELD QUALITY CONTROL

- A. General: Field inspection will be performed by the Commissioner. Contractor shall assist and provide access to the work area for field inspection by the Commissioner.
- B. Placement Control
  - 1. Quality Control Measures: Establish and maintain quality control for all work performed at the job site under this section to assure compliance with contract requirements. Maintain records of his quality control tests, inspections and corrective actions. Quality control measures shall cover all

construction operations including, but not limited to, the placement of all materials to the slope and grade lines shown and in accordance with this section.

2. Check Surveys: Surveys made by the Contractor are required on each material placed for determining that the materials are acceptably placed in the work. Make checks as the work progresses to verify lines, grades and thicknesses established for completed work. Make at least one (1) check survey as specified below for each 25 foot section as soon as practicable after completion. Following placement of each type of material, the cross section of each step of the work shall be approved by the Commissioner before proceeding with the next step of the work. Approval of cross sections based upon check surveys shall not constitute final acceptance of the work. Cross sections shall be taken on lines 30 feet apart, measured along the structure baseline, with readings at 5 foot intervals and at breaks along the lines. However, other cross section spacing and reading intervals may be used if determined appropriate by the Commissioner. Take additional elevations and soundings as the Commissioner may deem necessary or advisable. Conduct the surveys in the presence of the Commissioner, unless this requirement is waived by the Commissioner.
  - a. Above Water: Determine the elevation of stone above the water surface by the use of a leveling instrument and a rod having a base 12 inches in diameter. If approved by the Commissioner, other means may be used.
  - b. Below Water: For portions of the work that are under water, perform sounding surveys either by means of a sounding pole or a sounding basket weighing about 10 lbs, each of which has a base measuring 12 inches in diameter.
  - c. Gage Board: Install a gage board to measure tides at the project site. Check the gage prior to any survey.
  - d. Electronic Depth Recorder Method: When using an electronic depth recorder, conform to the following requirements:
    - (1) The survey depth recorder used must be a standard model acceptable to the Commissioner using a sounding chart that can be read directly to the nearest foot and estimated to the nearest inch. Accuracy shall be better than 1/2 of 1 percent.
    - (2) Calibrate the depth recorder to adjust for tide level every 30 minutes.

- (3) Perform further calibrations whenever there is any malfunction within the depth recorder or transducer that might affect the soundings, or when there is a lengthy disruption.
- (4) Calibrate the depth recorder every 2 hours by comparison to a manual sounding using a check bar. Obtain the check bar reading at approximately the deepest location in the area to be sounded.
- (5) Calibrate the depth recorder to read at project datum.
- (6) Under no circumstances shall the setting of the depth recorder be changed between calibrations.
- (7) Speed of the Sounding Boat: When sounding, the speed of the sounding boat shall be as constant as possible, preferably between 2 to 2.5 mph.
- (8) Record calibrations on the sounding chart or in the field notes.

### 3.10 ACCEPTANCE

- A. Underlayer: Acceptance of underlayer work will be for the completed lift of underlayer rock material when constructed to lines and grades shown on the Contract Drawings. Smaller sections may be allowed by the Commissioner based on geometry, length or other factors related to work. Each section of work will be accepted when constructed to lines and grades shown on the Contract Drawings with due allowances for specified tolerances.
- B. Armor Stone: Work will be accepted when all stone of a particular gradation has been placed to lines and grades shown on the Contract Drawings with due allowances for specified tolerances.

NO TEXT ON THIS PAGE

**Section 02390**  
**FENDER PILES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of providing all labor, materials, equipment, plant and incidentals required to complete all fender piling work to the limits as shown on the Contract Drawings or as directed by the Commissioner to provide the required support for the fender system. Work includes, but shall not be limited to, steel fender piles as indicated on the Contract Drawings.
- B. Timber fender piles are not included in this Section but shall conform to the requirements of Section 02464 – Marine Timber Piles.
- C. Steel fender piles shall be installed in the field in accordance with the Contract Drawings and within the specified tolerances.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02464 - Marine Timber Piles
- B. Section 02396 - Marine Fendering
- C. Section 05500 - Metal Fabrications
- D. Section 05120 - Structural Steel
- E. Section 09967 - Coatings for Steel Waterfront Structures

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Society for Testing and Materials (ASTM)
    - a. ASTM A6, General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.
    - b. ASTM A27, Steel Castings, Carbon, for General Application.
    - c. ASTM A123, Zinc (Hot Dip Galvanized) Coatings on Iron and Steel Products.
    - d. ASTM A153, Zinc Coatings (Hot Dip) on Iron and Steel Hardware.

- e. ASTM A193, Alloy-Steel and Stainless Steel Bolting Material for High Temperature or High Pressure Service and Other Special Purpose Applications.
  - f. ASTM A194, Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.
  - g. ASTM A572, High Strength Low-Alloy Columbium-Vanadium Structural Steel.
2. American Welding Society (AWS)
- a. AWS D1.1, Structural Welding Code.

#### 1.04 SUBMITTALS

- A. The Contractor shall submit, under the provisions of Section 01330, Shop Drawings, the following information at least 2 weeks prior to the start of work:
- 1. Shop Drawings: Indicate details and schedules of pile installation to suit design requirements, including pile driving shoes and splicing procedures.
  - 2. Manufacturer's mill certificates for steel piles, driving shoes (if used) and all welded attachments.
  - 3. Descriptions of proposed methods and equipment to be used for pile installation, including but not limited to, leads, driving frame and/or template and pile hammers, including associated appurtenances such as pile cushions.
  - 4. Descriptions of proposed welding procedures and materials for all welded joints.
  - 5. Welders Certificates for welders employed on the Work, verifying AWS qualification within the previous 12 months.
  - 6. Manufacturer's material safety data sheets for coatings, solvents, and other potentially hazardous materials.
  - 7. For each type of coating furnished, submit the manufacturer's or supplier's certifications that products meet specified requirements.

8. Qualifications Submittals: Submit evidence of qualifications including a list of similar projects Contractor or his/her specialty Subcontractors has completed, along with the Owner's contact persons for those projects demonstrating experience meeting the requirements of Article 1.05 for:
  - a. Installer
  - b. Coating applicator
  - c. Contractor's Professional Engineer
  - d. Contractor's Professional Geotechnical Engineer
9. Submit items required by related Sections.
10. Description of proposed method and equipment to be used in measuring placement tolerances of piles.
11. In addition, the Contractor shall submit the following items as work progresses:
  - a. Submit copies of pile driving records for each pile to the City of New York within 2 days after driving. Include information as noted in Article 3.07.

#### 1.05 QUALITY ASSURANCE

- A. Provide the services of a general contractor or a specialty subcontractor that specializes in the installation of steel fender piles and can demonstrate at least three years of relevant experience in the installation of steel fender piles under similar conditions.
- B. Design and select pile components under direct supervision of a Professional Engineer experienced in design of this work and licensed in the State of New York.
- C. Selection of pile driving equipment and installation of piles shall be under the direction of an experienced Professional Geotechnical Engineer licensed in the State of New York.

#### 1.06 DRIVING EQUIPMENT

- A. Provide pile driving equipment of type generally used in standard driving practice, operated at manufacturer's specified rate, to develop required rated energy per blow.
- B. Provide driving hammers of sufficient capacity, size and type to deliver consistently effective dynamic energy, suitable to piles to be driven and to subgrade material into which they are to be driven, when operating at not less than 75% efficiency of rated driving energy.

- C. Equip hammer with cast steel or structural steel driving cap, with grooved base conforming to pile shape. Keep bearing surfaces of grooves true and smooth.
- D. Use fixed or rigid type pile driver leads that will hold pile firmly in position and alignment, and in axial alignment of hammer.
- E. Provide a driving frame of sufficient size and rigidity to assist in keeping piles at planned location and plumbness. The driving frame shall have a minimum of two levels of support located a minimum of 15 feet apart.

#### 1.07 PILE DELIVERY, STORAGE AND HANDLING

- A. Ship, handle, and store piles without distortion or damage. Store piles in orderly groups in a clean, properly drained location above ground and block them. Support on level blocks or racks spaced not more than 10 feet apart and not more than 2 feet from the ends. Protect piling to prevent damage to coatings and to prevent corrosion prior to installation. Piles bent during storage beyond tolerance limits will be considered distorted and may not be used in the work.
- B. Handle piling using handling holes or lifting devices. Handle piles with slings and sufficient pick up points to prevent excessive deformations which could result in overstress or coating damage.
- C. Configuration of piling storage should facilitate required inspection activities.
- D. Any damage to steel shall be repaired to the satisfaction of the Commissioner at no additional cost to the City of New York.

#### 1.08 PROJECT CONDITIONS

- A. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available as described in Section 01120 –Contract Summary. The Contractor may use this report to establish the quality of materials expected to be present at the project site.
- B. The Contractor is responsible for any conclusions it may draw from this information, including the character of the materials that may be encountered and the degree of difficulty to be expected in the performance of the Work. Neither the City of New York nor the Commissioner guarantees that materials other than those disclosed by the geotechnical report will not be encountered, or that proportions and character of the various materials will not vary from those indicated in the available geotechnical reports or boring logs.
- C. Data on indicated subsurface conditions is not intended as a representation or warranty of continuity of such conditions. It is expressly understood that neither the City of New York nor the Commissioner will be responsible for interpretations or conclusions drawn therefrom by the Contractor.

- D. If the Contractor finds that the available investigations and reports are not sufficient to determine the nature of the work, the Contractor may undertake its own investigations before or after submission of its bid at its own expense.
- E. Available Geotechnical Reports

Title	By	For
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

- F. Prior to bidding this project, the Contractor shall thoroughly explore the underwater conditions at the site to be fully informed about the piles left in the ground after demolition of the previous pier in the area where the fender piles will be driven. Bidders are invited to perform underwater explorations of the site to acquaint themselves with these conditions at no additional cost to the City of New York. No additional compensation will be made after award of contract for any claim related to the pile remnants in the ground. The Contractor is also encouraged to review the Geotechnical Investigation Report, which may be obtained from the City of New York in accordance with Section 01120.
- G. Protect structures, underground utilities, and other construction as necessary from damage caused by pile driving operations.

## PART 2 PRODUCTS

### 2.01 H-PILES

- A. H-piles shall conform to ASTM A572 Grade 50. Out-of-straightness shall not exceed 0.125" per 10'-0" of pile length.
- B. Piles shall be prepared and coated in accordance with Section 09967 – Coatings for Steel Waterfront Structures.
- C. Pile driving shoes may be provided at the option of the Contractor. Shoes shall be heat-treated cast steel, conforming to ASTM A27 90/60. The Contractor shall be solely responsible for the sufficiency of such shoes.
- D. Welding electrodes for pile splices shall be E70XX minimum. Welding electrodes for driving shoe to pile welds shall be at low hydrogen E90XX.

### 2.02 APPURTENANT METAL MATERIALS

- A. Metal plates, shapes, bolts, nuts, rivets, welded studs, and other appurtenant fabrication and installation materials shall conform to manufacturer's standards and

to the requirements specified in Sections 05120 – Structural Steel and Section 05500 – Metal Fabrications, as applicable.

## 2.03 SOURCE QUALITY CONTROL

- A. Requirements for material tests, workmanship and other measures for quality assurance shall be as specified in Section 05120 – Structural Steel.
- B. Piling shall be tested and certified by the manufacturer to meet the specified chemical, mechanical, and section property requirements prior to delivery to the site. Testing of piling for mechanical properties shall be performed after the completion of all rolling and forming operations. Testing of piling shall meet the requirements of ASTM A6. The Contractor shall submit mill test reports showing numerical values of chemical and mechanical properties of piling and structural steel, in accordance with the applicable material specifications.

## 2.04 FABRICATION

- A. Shop fabricate and deliver to the site steel piles for the required installation length, to minimize field welding. All shop fabricated steel piles shall be spliced using fabrication rolls and dog guides so that misalignment will not exceed 1 inch in any direction relative to a straight line connecting the ends of a pile.
- B. Where steel piles are to be driven to rock, the Contractor shall probe each pile location to determine rock elevation prior to fabricating piles. The length of each pile shall be determined based on these measurements. The Contractor shall provide identification markings on each pile as necessary to assure that each pile is installed in its designated location to the prescribed depth.
- C. Blast preparation and coating system and application shall comply with the applicable requirements of Section 09967 - Coatings for Steel Waterfront Structures.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Verify site conditions prior to installation of fender piles.
- B. Submit for approval proposed installation procedures and equipment to be used. Both vibratory and impact hammers may be used for driving of fender piles. Rated energy for impact hammer shall be at the discretion of the Contractor.
- C. Use driving procedures which will not cause damage to nearby structures.
- D. Mark each pile's length with a horizontal line at 5-foot intervals starting from 10 feet from the pile tip.

## 3.02 FIELD TOUCH-UP OF PILE COATING

- A. Provide a compatible touch-up system for repair of coating defects, in accordance with the coating manufacturer's recommendations and as approved by the Commissioner.
- B. Perform all touch-up work and coating materials in accordance with the provisions of Section 09967 - Coatings for Steel Waterfront Structures.
- C. Before and after driving, touch up all abraded surfaces in the coating and clean and touch up all field welds in accordance with the coating manufacturer's recommendations and as approved by the Commissioner.

## 3.03 INSTALLATION OF PILES

- A. Drive all piles with a positioning template. Deliver hammer blows to central axis of pile. Do not damage piles during driving operations.
- B. In developing proposed pile installation procedures and selecting equipment, the Contractor shall consider and be prepared to respond to local conditions. It shall be the responsibility of the Contractor to select methods and equipment which will result in satisfactory installation of the piles.
- C. All steel fender piles shall be driven to minimum tip elevations indicated on the Contract Drawings or bedrock.
- D. Jetting, pre-drilling or pre-augering is not permitted unless approved by the Commissioner.
- E. Re-drive piles, which have lifted or moved due to driving adjacent piles, or by soil heave.
- F. Cut off the pile in accordance with the Contract Drawings. Cut holes in pilings for bolts, rods, drains or utilities as shown or as directed. Perform all cutting in a neat and workmanlike manner. Use a straight edge in cuts made by burning to avoid abrupt nicks. Drill or burn and ream bolt holes in steel piling by approved methods which will not damage the surrounding metal. Holes other than bolt holes shall be reasonably smooth and the proper size for rods and other items to be inserted. Do not use explosives for cutting.
- G. Placement Tolerances
  - 1. Out-of-place and out-of-plumb measurements shall be made and reported to the Commissioner for each pile.
  - 2. Maximum out-of-place deviation, measured in any direction from centerline of pile at the cut-off elevation shall be 2 inches. Piles within these tolerances

shall be pulled into position. Piles outside of these tolerances shall be withdrawn and redriven at no additional cost to the City of New York.

3. Maximum out-of-plumb deviation measured in any direction shall be 2%.
4. Maximum deviation from theoretical cut-off elevation: 1/2 inch
- H. Driving of piles shall not take place within 100 feet of concrete placed within 7 days unless otherwise approved by the Commissioner.
- I. Splicing of piles is permitted at no additional cost to the City of New York as required for installation. Splices shall develop the full strength of the pile section.
- J. Pile splices, cut-offs and other regions of coating damage shall be recoated in a manner similar to that specified for the pile.

#### 3.04 PILE OBSTRUCTIONS

- A. Boring logs for boreholes previously drilled at the project site indicate the presence of boulders and obstructions, such as pile remnants and construction debris. If such obstructions are encountered, and piles reach premature refusal during pile driving, the Contractor shall notify the Commissioner immediately.
- B. The Contractor shall probe to locate the extent of the obstruction and propose a method of passing or removing the obstruction, including the use of a chisel beam, spud, by drilling or by other suitable means.
- C. If the Contractor demonstrates, to the satisfaction of the Commissioner, after diligently attempting to remove or penetrate through an obstruction for a minimum period of four hours, that removal or penetration of the obstruction is deemed to be impractical using appropriate methods, tools and equipment, the Contractor will be requested to stop pile driving operations and await further instructions from the Commissioner. The costs incurred by the Contractor to attempt to remove or penetrate obstructions for the prescribed minimum duration, whether or not the efforts are successful, shall be included in the lump sum price bid and no separate payment will be made therefore.
- D. If the Commissioner declares the obstruction to be an unavoidable field condition, the Contractor will be directed to remove the partially installed pile and make changes in the design or alignment of the piling structure as required by the Commissioner to insure the adequacy and stability of the structure.
- E. Payment for additional labor and materials necessitated by changes in the design or alignment of the piling structure will be made by Change Order in accordance with the General Requirements.

### 3.05 WELDING

- A. All welding shall conform to the requirements of the AWS D1.1. The Contractor shall submit for approval details of groove preparation and welding procedures. Acceptable welding processes are: FCAW, GMAW, SMAW and SAW. Out-of-straightness of welded pile shall not exceed 0.25" per 10'-0" of pile length. Splices shall be coated as specified for piles.
- B. Field splices of piles are not permitted.
- C. If welding procedure is interrupted once started, preheat temperatures shall be reestablished prior to restarting of welding.
- D. Furnish the services of AWS-certified welding inspectors to visually inspect and verify all welding.

### 3.06 UNACCEPTABLE PILES

- A. Unacceptable piles are defined as piles that fail penetration requirements are placed or cut off in positions beyond specified tolerances, or are damaged.
- B. Replace unacceptable piles with piles that conform to specified requirements.
- C. Adding piles lieu of replacing unacceptable piles is generally not an acceptable solution due to the modular layout of fender piles in relation to the entire fender system. Such an alternative would require reframing of the fender system. The Contractor may propose this solution for approval by the Commissioner for each individual location of use. All costs for design, analysis and construction of such alternative designs shall be at the expense of the Contractor.

### 3.07 FIELD QUALITY CONTROL

- A. Inspection of Driven Piling: The Contractor's registered Professional Engineer shall perform continuous inspection during pile driving and certify piles are installed in accordance with requirements herein. Inspect all piles for compliance with tolerance requirements. Bring any unusual problems which may occur to the attention of the Commissioner.
  - 1. The driving of each pile shall be performed in the presence of the Commissioner unless otherwise directed.
  - 2. Field inspection may be also be performed by the Commissioner's representative. The Contractor shall assist and provide access to the work area for field inspection by the Commissioner's representative.
  - 3. When inspections result in pile rejection by the Commissioner, the Contractor shall promptly segregate and remove rejected pile from the premises.

B. Installation Records: Maintain a pile driving record for each pile. These records shall be compiled and attested to by the Contractor's registered Professional Engineer. Driving records shall include:

1. Project name and number
2. Name of Contractor and Installer
3. Pile size and dimensions
4. Elevation of point, elevation of butt before and after cut-off
5. Continuous record of number of blows for each foot of penetration and final driving resistance in blows for final 6 inches
6. Installation dates and times
7. Driving equipment used including type and size of hammer, rate of operation, total driving time, dimensions of driving helmet and cap used
8. Pile number and locations, tip elevations, ground elevations, cut-off elevations
9. Length of driven pile from final tip elevation to cut-off elevation.
10. Any reheading or cutting of piles.
11. Alignment and plumbness checks
12. Locations and depths where difficulty in driving was encountered
13. Any unusual pile driving problems.

-END OF SECTION-

**Section 02396  
MARINE FENDERING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install all fender work to the limits as shown on the Contract Drawings, as specified herein, or as directed by the Commissioner to provide a fully operational fender system. Work includes, but shall not be limited to, steel framing, timber framing, elastomeric fender units, connections to piling, and connection to pier or wharf.
- B. Fender system shall be installed as indicated on the Contract Drawings and in accordance with the elastomeric fender unit manufacturers' guidelines.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02390 - Fender Piles
- B. Section 02398 - Marine Timberwork
- C. Section 05120 - Structural Steel
- D. Section 09967 - Coatings for Steel Waterfront Structures

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

- 1. American Society for Testing and Materials (ASTM):

- a. ASTM A123, Zinc (Hot Dip Galvanized) Coatings on Iron and Steel Products
- b. ASTM A153, Zinc Coatings (Hot Dip) on Iron and Steel Hardware
- c. ASTM A193, Alloy Steel and Stainless Steel Bolting Materials for High Temperature
- d. ASTM A194, Carbon and Alloy Steel Nuts for High Pressure and High Temperature
- e. ASTM A307, Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength
- f. ASTM A325, Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

- g. ASTM A391, Grade 80 Alloy Steel Chain.
- h. ASTM A563, Carbon and Alloy Steel Nuts
- i. ASTM A572, High-Strength Low-Alloy Columbium-Vanadium Structural Steel
- j. ASTM A952, Forged Grade 80 and Grade 100 Steel Lifting Components and Welded Attachment Links
- k. ASTM A992, Structural Steel Shapes.
- l. ASTM D395, Rubber Property – Compression Set.
- m. ASTM D412, Vulcanized Rubber and Thermoplastic Elastomers – Tension.
- n. ASTM D429, Test Methods for Rubber Property—Adhesion to Rigid Substrates.
- o. ASTM D471, Rubber Property-Effect of Liquids.
- p. ASTM D 573, Rubber – Deterioration in an Air Oven
- q. ASTM D624, Tear Strength Conventional Vulcanized Rubber and Thermoplastic Elastomers.
- r. ASTM D1149, Rubber Deterioration - Surface Ozone Cracking in a Chamber.
- s. ASTM D 1171, Rubber Deterioration – Surface Ozone Cracking Outdoors or Chamber (Tri-angular Specimens)
- t. ASTM D2000, Rubber Products in Automotive Applications.

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings, the following information at least 2 weeks prior to the start of work:
  - 1. For Steel Fabrication
    - a. Shop Drawings
    - b. Descriptions of proposed welding procedures for all welded joints
    - c. Welders Certificates for welders employed on the Work, verifying AWS qualification within the previous 12 months
    - d. Certificates of Compliance: For each type of steel, bolt, welding rod and electrode, or other product furnished, submit the manufacturer's or supplier's certifications, that the products meet the specified requirements.
  - 2. For Elastomeric Fenders
    - a. Manufacturer's Qualifications: Submit evidence of qualifications including a list of similar projects manufacturer has supplied, along with the Owner's contact persons for those projects demonstrating experience meeting the requirements of Article 1.06.

- b. Product data on fender units and accessories, including rated performance data and published performance curves in accordance with PIANC 2002 Appendix A.
  - c. Manufacturer's Test Reports in accordance with requirements of Paragraphs 1.06F, 2.03B.4 and 2.03C. Submit either a "Type Approval" certificate per PIANC 2002 or documentation of past fender testing which was performed subject to inspection and witnessing by an accredited third party agency certifying that fender performance and physical property tests conform to this Specification.
    - (1) Submit certified test reports on production units demonstrating compliance with Article 2.03. Include all testing specified in Appendix A of PIANC 2002. Testing shall be performed by the Engineer approved testing laboratory and signed and sealed by a professional engineer licensed in any State.
    - (2) For fenders with a PIANC 2002 "Type Approval" and/or fenders produced by manufacturers listed in Article 2.03.B.2, "Acceptable Manufacturers", in lieu of tests on production units, manufacturer may submit test reports performed within three years of submittal and accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, quality, manufacture and make as that proposed to be supplied.
  - d. Shop Drawings showing details of fender impact panel, chains and accessories.
  - e. Shop Drawings showing modifications required to pier or wharf detailing shown on the Contract Drawings for compatibility with fender unit selected.
  - f. Analysis of anchor bolt groups, using proposed bolts and considering interaction among bolts and their proximity to free edges of concrete, demonstrating adequacy of bolt groups to safely sustain design loads indicated. See also requirements of Paragraph 2.01D.1.
  - g. Manufacturer's Warranty: Furnish the manufacturers warranty. The warranty shall be issued directly to the City of New York and shall not be limited in dollar value. The warranty period shall not be less than 10 years from the date of issue of Final Completion.
3. For Timber: Provide certificates for timber, preservative treatment, and galvanized hardware.

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. Handle lumber and timber in conformance with Section 02398 - Marine Timberwork.
- B. Fender system elements shall be shipped, handled, and stored without distortion or damage. Deliver fenders undamaged and handle and store to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight. Store in a clean, properly drained location off the ground.
  - 1. Rejection: Fenders delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Replace any rejected materials to the satisfaction of the Commissioner at the no expense to the City of New York.

**1.06 QUALITY ASSURANCE**

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Welding of structural steel shall be subject to controlled inspection in accordance with the requirements of the New York City Building Code and the provisions of the General Conditions. Controlled inspection and testing services required by the New York City Building Code will be provided by the Commissioner. The Contractor shall cooperate with the Commissioner in the performance of its duties for controlled inspection. Failure of a controlled inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- C. Testing and Inspection: Material and fabrication procedures are subject to inspection and tests in the mill, shop and field under the direction of the Commissioner. Such inspection and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- D. Install elastomeric fender units in accordance with recommendations of the manufacturer.

- E. The elastomeric fender units and their accessories shall be manufactured by a company regularly engaged in the manufacture and production of fenders similar in material, design, and extent to that indicated for this Project, with at least 3 years of successful documented experience producing fender units of the type to be used on this project.
  - 1. The manufacturer must have produced fender units, of the type(s) specified.
  - 2. The Fender Manufacturer shall apply a system of Quality Management which conforms to ISO 9000/9001 or a recognized equivalent. This system must be certified by an acknowledged and accredited organization, and proof of adherence to this system must be submitted.
  - 3. A list of at least [3] similar fender installations shall be submitted to the Engineer.
- F. Manufacturer Performance Testing for Fenders: All manufacturer's testing shall be performed using full size fenders in accordance with ASTM F2192 and as specified herein:
  - 1. All fender units shall be given a unique serial number which can be traced to manufacturing and testing records.
  - 2. Fenders shall be tested under direct (vertical) compression.
  - 3. Compression speed shall be 2-8 cm/min.
  - 4. Test temperature shall be 23° C  $\pm$ 5°C. Where the ambient temperature is outside this range, fenders shall be normalized to this temperature range in a conditioning room for an appropriate period dependent upon fender size, or performance values may be corrected according to temperature correction factor tables.
- G. Conform to all applicable codes for design, fabrication, and erection of structural steel framing.

## PART 2 MATERIALS

### 2.01 STEEL FRAMED IMPACT PANEL

- A. Conform to the provisions of Section 05120 - Structural Steel unless otherwise indicated herein.
- B. Unless otherwise noted on the Contract Drawings, structural steel shall conform to ASTM A572, Grade 50, or ASTM A992. All exposed surfaces of steel framing shall be coated in accordance with Section 09967 - Coatings for Steel Waterfront Structures.

- C. High strength bolted connections: Bolts - ASTM A325; nuts - ASTM A563 Grade DH; washers ASTM F436. Bolts, nuts and washers shall be galvanized in accordance with ASTM F2329.
- D. Anchor Bolts, Nuts, Washers: ASTM A193 Grade B7; nuts ASTM A563 Grade DH and compatible steel washers conforming to ASTM F436, all galvanized in conformance with ASTM F2329.
  - 1. Fender Anchors/Concrete Embedments: Concrete embedments (anchor bolt inserts) shall be no closer than 10 inches to an edge of the supporting concrete element, and designed to resist a pullout, assuming 4,500 psi concrete, 1.25 times greater than the breaking strength of the attached steel rods.
- E. Anti-seize Compound: DOD MIL-PRF-907.
- F. Welding Of Structural Steel
  - 1. General: Conform to the more stringent of the requirements herein or as specified in Section 05120 – Structural Steel.
  - 2. All welding shall conform to the requirements of the AWS D1.1.
  - 3. All groove welds shall be complete penetration welds unless otherwise shown on the Contract Drawings.
  - 4. All welds shall be AWS pre-qualified welds and approved for execution by the Commissioner.
  - 5. If welding procedure is interrupted once started, preheat temperatures shall be reestablished prior to restarting of welding.
  - 6. The Commissioner will provide the services of AWS certified welding inspectors to visually inspect and verify all field welding and to conduct NDT welding inspections.
  - 7. All welded connections shall be seal welded in addition to the required structural welds indicated.
  - 8. Minimum fillet weld size shall be 3/16 inch unless otherwise indicated.
  - 9. Filler metal shall conform to the following:
    - a. Electrodes for manual metal-arc welding shall conform to the requirements of AWS D1.1, classification E70XX welding electrodes.
    - b. The bare electrodes and flux used in combination for submerged arc welding shall conform to the requirements of the AWS Code.

- G. The impact panels shall be delivered fully coated in accordance with Section 09967, "Coating of Steel Waterfront Structures". Coating materials shall be provided for recoating the areas affected by the field connections and areas damaged in shipment, storage and installation.

## 2.02 TIMBER FRAMING AND FACING

- A. Timber Materials: Conform to Section 02398 - Marine Timberwork. Cap plate shall be composed of steel conforming to ASTM A572 Grade 50, galvanized in conformance with ASTM A123.

## 2.03 ELASTOMERIC FENDER UNITS

- A. Performance criteria for maximum reaction and minimum impact energy at each unit shall be as indicated on the Contract Drawings.
- B. Fender element rubber shall be natural or synthetic conforming to ASTM D2000 with defined characteristics equal to that in the following:
  - 1. Provide PIANC "Type Approval" Fenders or fenders tested in accordance with PIANC 2002, Appendix A, "Procedure to Determine and Report the Performance of Marine Fenders".
  - 2. Acceptable Manufacturers
    - a. FenderTeam Americas Inc., 44084 Riverside Parkway Suite 170, Lansdowne, VA 20176, Tel. (571) 281-3770, [www.fenderteam.com](http://www.fenderteam.com)
    - b. Trelleborg, Virginia Harbour Services Inc., P.O. Box 98, Clearbrook, VA 22624, Tel. (540) 667 5191, [www.trelleborg.com/marine](http://www.trelleborg.com/marine)
    - c. Quay-Quip Pem, 9517 Laa La Way, Diamondhead, MS 39525 (337) 501-2201 <http://www.quayquip-pem.com>
  - 3. "V" type fender units shall be Trelleborg AN/ANP units of the size and rubber grade indicated on the Contract Drawings or approved equal, conforming to the requirements herein.
  - 4. The rubber fender units shall be molded rubber with encapsulated/bonded steel plates to provide adequate strength for connection to the dock structure and fender panel and for the operation of the fender system. Plates shall be fully encased in rubber to a minimum thickness of 1/16 inch. The rubber fender shall be of vulcanized natural or synthetic rubber or a mixture thereof, which is compounded to provide satisfactory resistance to aging, seawater, fatigue and abrasion. These shall be reinforced with carbon black and resistant to aging, seawater, abrasion, and ultraviolet rays. The rubber shall be homogenous in quality and free from foreign materials, bubbles, injuries,

cracks and other harmful defects that could be detrimental to the usefulness or performance of the fender. The embedded fixing steel plates shall be firmly bonded into the rubber body through the process of vulcanization, and completely encapsulated so that no steel is exposed. The rubber material from which the fender unit is molded shall meet the following requirements:

Test Item & Sampling Frequency	Property Tested	Test Method	Requirements
Rubber Material (1 set from each lot of manufacture of the supplied fenders)	Tensile Strength (before aging)	ASTM D 412 Die C	2,300 psi min.
	Tensile Strength (after aging)	ASTM D 573 (96 hrs @158±2°F)	Not less than 80% of before aging
	Ultimate Elongation (before aging)	ASTM D 412 Die C	300% min.
	Ultimate Elongation (after aging)	ASTM D 573 (96 hrs @158±2°F)	Not less than 80% of original value
	Hardness (before aging)	ASTM D 2240, Shore A	75±5° max
	Hardness (after aging)	ASTM D 573 (96 hrs @158±2°F)	Original +10° max
	Ozone Resistance	ASTM D1171, Method A, 38°C, 72hrs exposure	No Visible Cracking
	Tear Resistance	ASTM D 624, Die B	4,800 lbs/ft Min.
	Low Temperature Resistance	ASTM D 2137, Method A, 9.3.2 non-brittle after 3 min. @ -40°F	pass
Durability (10% of fenders)	Durability	PIANC 2002 Appendix A	No cracks or defects visible to naked eye after 3,000 cycles

C. Fender Marking: Unless otherwise specified or indicated, provide identification markings or tags in readable characters at least 1 inch high, either directly on units or on corrosion- and sunlight-resistant permanently attached tags. The markings shall include the following:

1. full or abbreviated manufacturer name,
2. fender size model or part number designation,
3. fender serial number, and
4. rated performance (energy and reaction).

D. Color: Black throughout the entire thickness.

E. Source Quality Assurance

1. Maintain an inspection and record system to verify that all materials, workmanship and completed work conform to the specified requirements. The specimens for testing and inspection of the materials, dimensions, and performance shall be sampled as specified below. The specimens to be used for the material tests shall be taken directly from the products or from the rubber prepared in the same lot, under the same conditions and in the same vulcanization process as the products.

Test Item	Number of Sampling
Rubber Material	See table above
Dimensions	All fenders
Performance	10% of fenders

F. Manufacturer/ Installation Tolerances

1. For all molded fender elements all dimensions shall be within  $\pm 3\%$  or  $\pm 0.25$ -inch of the specified lengths, and all bolt hole spacing shall be within  $\pm 0.08$ -inch of the specified distances as shown on the Contract Drawings.
2. All molded fender elements shall have reaction, energy and deflection performances within  $\pm 10\%$  of the theoretical design performance ratings.
3. All individual units installed shall be plumbed, leveled and aligned to within 1 inch of the dimensions as specified on the Contract Drawings.
4. Tolerances shall not be cumulative.

## 2.04 ACCESSORIES

- A. Chains shall be alloy Grade 80 chains conforming to ASTM A391, with accessories of matching or greater strength conforming to ASTM A952 or other approved standard. Chain assemblies shall have minimum safe working load capacities, proof test loads and breaking forces as indicated on the Contract Drawings. Tensioner shaft shall conform to ASTM A193 Grade B7; plate components of tensioner assembly shall conform to A572 Grade 50. Chains, chain connection fixtures and tensioner assembly components shall be hot dipped galvanized in accordance with ASTM A123, ASTM A153 or ASTM F2329 as applicable, with a minimum of 4 mils thickness of zinc coating.
- B. Where shown on the drawing, bolts used in fender attachment shall be ASTM A307, with matching nuts conforming to ASTM A563 Grade A, heavy hex, and

washers conforming to ASTM F436, all galvanized in conformance with ASTM F2329.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Before commencing work, examine the condition of all existing structural elements and other work on which this work is in any way dependent for its sufficiency according to the intent of these specifications. No claims of "Waiver of Responsibility" for such defective structural elements and other work will be considered unless filed in writing and acceded to in writing before the work is begun.

#### 3.02 FIELD INSTALLATION OF STEEL FRAMED IMPACT PANELS

- A. Impact panels shall be set at elevations indicated. Connections between the piles and impact panels shall be welded or bolted as indicated. Install and connect components in accordance with the requirements of Section 05120 – Structural Steel.
- B. Impact panels shall be stabilized by chain connections to the pier or wharf structure.
- C. Unless otherwise shown on the Contract Drawings, chain anchorages in concrete shall be placed by drilling holes for anchor bolts equal to diameter of the bolt plus 1/8" and bolt set in epoxy grout. Length and size of the anchor bolts shall be at least of the dimensions indicated unless larger sizes are determined in accordance with force analysis performed by the fender manufacturer, and approved by the Commissioner.
- D. Connections: Coat threads of bolts with anti-seize compound prior to installing washers and nuts. Recoat bolt thread projection beyond nut after tightening.
- E. Field Touch-Up
  - 1. For Epoxy Coated Assemblies: After assembly or erection, clean, prime and coat the field bolt heads and nuts, field welds, and any abrasions in the shop coat with paint of the same quality and dry film thickness as that used for the shop coat in accordance with the provisions of Section 09967, "Coatings for Steel Waterfront Structures".
  - 2. For Galvanized Assemblies: If galvanized steel surfaces are damaged by handling, transporting, cutting, welding, or bolting, repair surfaces in accordance using galvanized repair paint in accordance with provisions of Section 05120, "Structural Steel". Do not heat surfaces to which repair paint has been applied

### 3.03 FIELD INSTALLATION OF ELASTOMERIC FENDERS

#### A. Condition of Surfaces

1. Prior to commencing with the erection and/or installation of fender units of this Section, inspect the job site and verify that the fender units can be erected in accordance with the Contract Drawings and Specifications.
2. Obtain field measurements required for proper and adequate installation of the work covered in this Section. Assume responsibility for exact measurements.
3. Furnish templates, if required, for exact locations of items to be embedded in concrete and any setting instructions required for installation.
4. Check the alignment and elevation of all anchor bolts and other installation conditions with transit and level instruments before starting erection / installation of units.
5. Discrepancies
  - a. In the event of discrepancy, immediately notify the Commissioner.
  - b. Construction shall not commence in regions of discrepancy until the discrepancy or discrepancies have been resolved.

#### B. Install fender units as indicated on approved Shop Drawings and in accordance with manufacturer's instructions.

1. Care shall be taken to protect work already installed from damages resulting from docking fender system installation.
2. Set assemblies and members to the lines and elevations indicated. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
3. Remove any oil, grease or other substances harmful to the fender units after installation.
4. All touch-up concrete work shall be performed in accordance with the provisions of Section 03300 - Cast-in-Place Concrete.

### 3.04 FIELD INSTALLATION OF PILES AND TIMBER FRAMING

#### A. Installation of steel fender piles shall conform to Section 02390 - Fender Piles.

- B. Construction and field treatment of timber framing and facing shall conform to Section 02398 - Marine Timberwork.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02398**  
**MARINE TIMBERWORK**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install timber facing boards and blocking for timber pile dolphin, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. This Section includes, but is not limited to, the following items:
  - 1. Lumber and Timber
  - 2. Hardware
  - 3. Galvanizing Repair Paint
  - 4. Field Treatment

**1.02 RELATED SPECIFICATIONS**

- A. Section 02464 – Marine Timber Piles
- B. Section 02396 – Marine Fendering

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
    - a. ANSI/ASME B18.2.1, Square and Hex Bolts and Screws (inch series).
  - 2. American Society for Testing and Materials (ASTM)
    - a. ASTM A123, Zinc (Hot-Galvanized) Coatings on Product Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars and Strip.
    - b. ASTM A153, Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
    - c. ASTM A307, Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
    - d. ASTM A563, Carbon and Alloy Steel Nuts.

- e. ASTM D 5893, Cold Applied, Single Component, Chemically Curing Silicone Joint Sealant for Portland Cement Concrete Pavements
  - f. ASTM F 2329, Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners
- 3. American Wood Preservers Association (AWPA)
  - a. AWP M4, Care of Preservative - Treated Wood Products.
  - b. AWP M6, Brands Used on Forest Products
  - c. AWP P5, Water Borne Preservatives.
  - d. AWP U1, Use Category System: User Specification for Treated Wood
- 4. American Lumber Standards Committee (ALSC)
  - a. ALSC, Softwood Lumber Standards.
- 5. Western Wood Preservers Institute (WWPI)
  - a. WWPI BMP, Best Management Practices for the Use of Treated Wood in Aquatic Environments - Joint Publication with Canadian Institute of Treated Wood.
- 6. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
- 7. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.
- 8. U.S. Department of Defense (DOD)
  - a. MIL-P-21035, Paint, High Zinc Dust Content, Galvanizing Repair (Metric).

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  - 1. Certificates: Provide certificates for timber, preservative treatment, and galvanized hardware. Identify materials, sizes, treatment, and sources. Submit certification with inspection report of an independent inspection agency that preservative treatment of timber for this Project complies with this specification as a minimum and applicable AWP and WWPI BMP's

standards in accordance with Article "Quality Assurance" herein. Submit example of identifying mark that will be exhibited on each timber as specified in Paragraph 1.05B.2 herein.

2. Materials and Safety Data Sheets (MSDS) and Consumer Information Sheets (CIS) for Treated Timber: Submit MSDS and CIS associated with timber preservative treatment. The Contractor shall comply with all safety precautions indicated on MSDS and CIS.

#### 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Timber Preservative Treatment:
  1. The Contractor shall be responsible for the quality of treated wood products.
  2. Identify treatment on each piece by the quality mark of an agency accredited by the Board of Review of the ALSC.
  3. Inspect all preservative treated wood visually to ensure there are no excessive residual materials or preservative deposits. Unless treated piles have aged at least six (6) months prior to installation, treatment shall conform to WWPI BMP to avoid leaching of preservative chemicals into the waterway.
  4. The Contractor shall submit inspection report(s) of an independent inspection agency, approved by the Commissioner that offered products (each timber) comply with applicable AWPAs standards and WWPI BMP's. Materials shall be clean and dry or the report(s) will be rejected because of environmental concerns.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Stack lumber and timber off the ground on skids and under cover in a manner that prevents warping and allows shedding of water. Handle timber with rope or chain slings without dropping, breaking outer fibers, bruising, or penetrating the surface with tools. Do not use cant dogs, peaveys, hooks, or pike poles. Protect timber and hardware from damage.

## PART 2 PRODUCTS

## 2.01 LUMBER AND TIMBER

- A. Timber Facing for Fender Panels: Demerara Greenheart timbers having the following characteristics:

1. Modulus of elasticity	3,100,000 psi
2. Bending working stress	3,300 psi
3. Compression parallel to grain working stress	3,000 psi
4. Shear parallel to grain working stress	400 psi

- B. Blocking for timber pile cluster: Solid-sawn Dense Structural stress-rated Southern Pine or Douglas Fir-Larch (No. 2) with minimum  $f_b = 1750$  psi. Lumber shall be grade marked by and identified by the grade mark of a recognized association or independent inspection agency using the specific grading requirements of an association recognized as covering the species used. The association or independent inspection agency shall be certified by the Board of Review, American Lumber Standards Committee, to grade the species used. Preservative treatment shall be waterborne preservative conforming to AWWA Specification P5. Treatment shall conform to AWWA U1, Use Category UC5A Marine Use Northern Waters, with waterborne preservatives. Each piece of treated lumber or timber shall be branded by the producer in accordance with AWWA M6 that identifies the treatment by the quality mark of an agency accredited by the Board of Review of the American Lumber Standard Committee.

## 2.02 HARDWARE AND ACCESSORIES

- A. Hot dip galvanize all steel items according to ASTM F 2329 for bolts, nuts, screws and washers, and ASTM A123 or A153 as applicable for other materials with a minimum of 4 mils of zinc coating. Provide bolts with nuts and washers as indicated. Bolts shall be ASTM A307, Grade A with ASTM A563 nuts. Bolt heads and nuts shall be square. Lag screws and bolts shall be ANSI/ASME B18.2.1. Washers shall be plate or cut washers as indicated. Provide bolts with washers under nut and head.
- B. Galvanizing Repair Paint: High zinc-dust/zinc oxide content paint conforming to MIL-P-21035 for repair of damaged galvanized surfaces. Compound paint with a suitable vehicle in a ratio of one part zinc oxide to four parts zinc dust by weight.
- C. Silicone Sealant
1. One-part silicone formulation ASTM D 5893, Type NS except use Type SL for horizontal applications. Acetic acid cure sealants will not be permitted.

## 2. Acceptable Products – Type SL, Self Leveling

- a. Crafcro Roadsaver Silicone SL by Crafcro Inc., Chandler (Phoenix), AZ
- b. CSL 315 by CSL Silicones, Guelph, Ontario
- c. Dow Corning 890SL by Dow Corning Corp., Midland, MI
- d. Pecora 300SL by Pecora Corporation, Harleyville, PA
- e. Spectrem 900SL by Tremco Incorporated, Beachwood, OH
- f. Or approved equal

## 3. Acceptable Products – Type NS, Non-Sag

- a. Crafcro Roadsaver Silicone by Crafcro Inc., Chandler (Phoenix), AZ
- b. CSL 342 by CSL Silicones, Guelph, Ontario
- c. Dow Corning 888 by Dow Corning Corp., Midland, MI
- d. Flexseal 310 by Roadseal Technology, Inc., Tucson, AZ
- e. Pecora 301 NS by Pecora Corporation, Harleyville, PA
- f. Spectrem 800 by Tremco Incorporated, Beachwood, OH
- g. Or approved equal

## PART 3 EXECUTION

## 3.01 CONSTRUCTION

- A. Cutting and Boring: Cut timber so joints fit over contact surfaces. Bore holes for bolts with a bit 1/16-inch larger in diameter than the rod or bolt. Bore hole for lag screws in two parts. Make lead hole for the shank the same diameter as the shank. Make lead hole for the threaded portion equal to 2/3 of the shank diameter. Counter-bore for countersinking where smooth faces are shown on the Contract Drawings or as specified.
- B. Fastening: Use washers under all bolt heads and nuts in contact with wood. Burr threads of all bolts after nuts have been finally tightened. Where bolts are used to fasten timber to timber or timber to steel, bolt members together when they are installed and re-tighten immediately before final acceptance of the contract. Bolts shall have additional threading to provide at least 3/8-inch per foot thickness of timber for future re-tightening. Minimum bolt size shall be 3/4 inch. .

## 3.02 FIELD TREATMENT

- A. Lumber and Timber: Field treat cuts, bevels, notches, refacings, and abrasions according to AWP A M4. Trim cuts and abrasions before treating. Paint depressions and openings around bolt holes, joints, and gaps, including recesses formed by counterboring, with the same preservative used in the pressure treatment. After bolt or screw is in place, fill depression with silicone sealant.
- B. Galvanized Surfaces: Repair and recoat galvanized coating which has been field or shop cut, burned by welding, abraded, or otherwise damaged to the point that the

base metal is exposed. Thoroughly clean the damaged area by wire brushing and remove all traces of welding flux and loose or cracked galvanized coating before painting. Paint cleaned area with two coats of galvanizing repair paint for a minimum 2.0 mil dry coating thickness.

-END OF SECTION-

**Section 02456**  
**PILE LOAD TESTS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of pile load testing of selected test piles to determine the allowable axial compression and lateral pile load capacities of production foundation steel pipe or composite tapered piles with documented results.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02364 - Steel Pipe Piles
- B. Section 02365 - Composite Tapered Piles
- C. Section 02371 - Dust, Soil Erosion and Sedimentation Control

**1.03 MEASUREMENT AND PAYMENT**

**A. Measurement**

- 1. The number of pile load tests measured for payment will be the actual number of completed and accepted pile load tests performed as directed by the Commissioner to determine the allowable axial compression or lateral pile load capacity of selected test piles.
- 2. Units of measurement for pile load tests shall be as follows:
  - a. Compression Pile Load Tests - Steel Pipe Piles or Composite Tapered Pile, 20-inch Diameter: per each
  - b. Compression Pile Load Tests - Steel Pipe Piles, 36-inch Diameter: per each
  - c. Lateral Pile Load Test - Steel Pipe Pile or Composite Tapered Pile, 20-inch Diameter: per each
  - d. Lateral Pile Load Test - Steel Pipe Pile, 36-inch Diameter: per each

**B. Payment**

- 1. Compression Pile Load Test: The contract unit price shall include the cost of all labor, materials and equipment associated with the setup and dismantling of the load test frame and jacks, test procedure, monitoring, documentation, and submittal of test method and results for each test.

2. Lateral Pile Load Test: The contract unit price shall include the cost of all labor, materials and equipment associated with the setup and dismantling of the load test frame and jacks, test procedure, monitoring, documentation, and submittal of test method and results for each test.
3. Pile load tests conforming to the specified requirements will be paid for at the unit price bid per pile load test. The unit price bid shall include the cost of furnishing all labor, materials and equipment necessary to complete the pile load test in conformance with the specified requirements.
4. Installation of test piles and reaction piles at production pile locations will not be paid for under the Contract Bid Item for Pile Load Tests but will be paid for under the Unit Price shown on the Bid Form for steel pipe piles in accordance with Section 02364 - Steel Pipe Piles, or composite tapered piles in accordance with Section 02365 - Composite Tapered Piles.
5. No separate payment will be made for costs associated with installing test piles and reaction piles at non-production pile locations. Such costs shall be included in the unit price bid for Pile Load Tests.

#### 1.04 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  1. American Society for Testing and Materials (ASTM)
    - a. D1143, Standard Test Method for Piles Under Static Axial Compression Load.
    - b. D3966, Standard Test Methods for Deep Foundations Under Lateral Loads.
  2. City of New York
    - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
    - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

## 1.05 SUBMITTALS

- A. Prepare and submit the following in accordance with the provisions of the General Conditions and Section 01330 - Shop Drawings:
  - 1. Pile Load Test Program: Submit complete details of proposed pile load test program, including qualifications of proposed subcontractor retained to perform required load tests; proposed test method, equipment, instruments, and other accessories and appurtenances required for the tests; data and calibration curves for all instruments used in the tests; and detailed working drawings showing the proposed pile load test setup and procedure describing how the tests will be performed.
  - 2. Load Test Report upon completion of test. The Report shall be signed by a licensed Professional Engineer currently registered in the State of New York. Submit Professional Engineer's qualifications regarding pile installation and load testing for review and approval.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Testing and Inspection
  - 1. All pile load tests shall be subject to special inspection in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the provisions of the General Conditions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
  - 2. Special Inspections
    - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.

- b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
  - c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- C. Furnish all labor, materials, equipment and incidentals required to assure adequate environmental protection including implementation of all control measures as directed by the Commissioner and specified herein.
  - D. Comply with all applicable Federal, state and local laws and regulations concerning environmental protection, restoration and erosion and sediment control.
  - E. Axial Compression Load Test: Perform work in accordance with the provisions of ASTM D1143 and the New York City Building Code, Local Law 76/2008. The more stringent criteria of which shall govern.
  - F. Lateral Load Test: Perform work in accordance with the provisions of ASTM D3966, and the New York City Building Code, Local Law 76/2008. The more stringent criteria of which shall govern.
  - G. Monitor load test procedures and record load-movement readings under direct supervision of a licensed Professional Engineer registered in the State of New York and experienced in this work.
  - H. Coordinate work of this Section with the work of other trades so that construction and production pile driving are not delayed.
  - I. Sequence work to allow other piling operations and adjacent work during load testing.

#### 1.07 PROJECT CONDITIONS

- A. Comply with the requirements of Section 02371 - Dust, Soil Erosion and Sedimentation Control.

#### PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Review available subsurface information and visit the site prior to submitting bid to determine existing site conditions, assess the site geometry, equipment access conditions, and location of existing structures and utilities.
- B. Verify that site conditions will support cribbing and imposed load for testing purposes.

### 3.02 PREPARATION

- A. Establish stable working surface for test equipment.
- B. Provide three (3) telltales in each pile. Telltales shall be installed in accordance with ASTM D1143 and positioned in a manner approved by the Commissioner to measure the deflection at the following points:
  - 1. Pile tip
  - 2. Bottom of organics layer
  - 3. Half-way between the pile tip and the bottom of organics layer
- C. Provide one test crib for each pile load test.

### 3.03 LOAD TESTING

- A. Prior to any production pile driving, a number of selected piles, as indicated on the Contract Drawings, shall be load tested to determine the allowable axial compression or the allowable lateral pile load capacity and establish pile driving criteria for production piles. Production piles shall not begin until all pile test data (compression, lateral, and dynamic, including restrikes if applicable) are submitted to and approved by the Commissioner.
- B. Notify the Commissioner at least 48 hours in advance of performing load tests. Testing shall be performed in the presence of an authorized, qualified representative of the Commissioner.
- C. For Axial Compression Load Tests: Subject each load test pile to the ultimate driven capacity load indicated on the Contract Drawings in accordance with the load and time sequencing specified in ASTM D1143 and the New York City Building Code, Local Law 76/2008, the more stringent criteria of which shall govern.
- D. For Lateral Load Tests: Subject each load test pile to two times the allowable design load indicated on the Contract Drawings in accordance with the load and

time sequencing specified in ASTM D3966 and the New York City Building Code, Local Law 76/2008, the more stringent criteria of which shall govern.

#### 3.04 FIELD QUALITY CONTROL

- A. All pile load tests will be inspected and monitored by the Special Inspector. The Special Inspector will be responsible to document equipment used, method of calibration and recording, test results, recommendations or modification of piling installation method.
- B. Cooperate with and assist the Special Inspector in the performance of its duties for special inspection.
- C. Accurately record actual dimensions and locations of tested piles and movement or distortion caused by testing.

#### 3.05 EQUIPMENT REMOVAL

- A. Dismantle the load test frame and jacks and remove test apparatus from site at completion of load tests.

-END OF SECTION-

**Section 02457  
STEEL SHEET PILES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The Work of this Section includes all labor, materials, equipment and services necessary to furnish, fabricate and install a new steel sheet pile wall system, including king piles, Z piles, and connectors, in front of the existing marina wall, complete in place as shown on the Contract Drawings and/or specified herein and as required for a complete installation.

**1.02 RELATED SPECIFICATIONS**

- 1. Section 01435 – Monitoring Survey
- 2. Section 02396 – Marine Fendering
- 3. Section 05120 - Structural Steel
- 4. Section 09967 - Coating for Steel Waterfront Structures

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and the latest addenda thereto of the following standards to the extent referenced. The publications are referred to in the text by basic designation only.
  - 1. American Society for Testing and Materials (ASTM)
    - a. ASTM A6, General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.
    - b. ASTM A328, Steel Sheet Piling.
    - c. ASTM A572, High-Strength, Low-Alloy Columbium-Vanadium Structural Steel
  - 2. American Welding Society (AWS)
    - a. AWS D1.1, Structural Welding Code – Steel.
  - 3. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
  - 4. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

#### 1.04 SUBMITTALS

A. Submit the following in accordance with the General Conditions and Section 01330  
- Shop Drawings:

1. Qualification Submittals

- a. Contractor's Engineer: Submit qualifications of the Contractor's licensed Professional Engineer registered in the State of New York demonstrating experience monitoring and certifying sheet pile installations of similar type and capacity to those of this project and in performing precondition surveys of the type specified herein. Comply with requirements of Paragraph 1.05B.
- b. Sheet Pile Installation Subcontractor: Submit a list of similar projects that the Contractor or the installation Subcontractor has completed, along with the Owner's contact persons for those projects demonstrating experience required by this Section.
- c. Contractor's Surveyor: Submit qualifications of the Contractor's Surveyor demonstrating experience in movement monitoring surveys of existing structures and in surveying sheet piles over water similar to the requirements of this Project.
- d. Contractor's Vibration Monitoring Specialist(s): Submit name and qualifications of Contractor's Vibration Monitoring Specialist(s) in conformance with Section 01435.
- e. Sheet Pile Manufacturer: Evidence of manufacturer's quality control program as specified in Paragraph 1.05E.
- f. Welders
  - (1) Prior to welding, submit certification for each welder stating the type of welding and positions qualified for, the code and procedure qualified under, date qualified, and the firm and individual certifying the qualification tests. If the qualification date of the welding operator is more than one year old, the welding operator's qualification certificate shall be accompanied by a current certificate by the welder attesting to the fact that he/she has been engaged in welding since the date of certification, with no break in welding service greater than 6 months.
  - (2) Submit certified copies of welder qualifications test records showing qualification in accordance with AWS D1.1.

2. Shop Drawings

- a. Pile Identification Plan: Prior to pile driving, submit a pile identification plan showing pile locations, cut-off elevations and king and intermediate sheet pile numbering system.
- b. Sheet Pile Driving Template: Submit drawings or a detailed description of a sheet pile driving template showing conformance with provisions of Paragraph 3.04C.
- c. Steel Sheet Piles: Submit drawings for approval prior to start of the work or ordering materials. Include details of king piles, Z piles, interlock connectors, top protection, special reinforcing tips, tip protection, lagging, splices, fabricated additions to plain piles and driving, cut-off method, and corrosion protection. Drawings for sheet piling including fabricated sections shall show complete dimensions including minimum section properties, details of piling and the driving sequence and location of piling. Include details and dimensions of templates and other temporary guide structures for installing the king piles. Provide details of the method of handling king and sheet piling to prevent permanent deflection, distortion or damage to piling interlocks.
- d. Description of vibration monitoring and movement monitoring procedures.
- e. Pre-construction background vibration and condition surveys in conformance with Section 01435, with documentation as noted in Article 3.02.
- f. Description of marina wall movement monitoring procedures, equipment and reporting details.

3. Quality Control Submittals

- a. Certificates
  - (1) Pile pulling method
  - (2) Material Certificates: Submit Material Certificates for each shipment identified with specific lots prior to installing sheet piling. Identification data should include piling type, dimensions, chemical composition, mechanical properties, section properties, heat number, and mill identification mark.
- b. Sheet Pile Driving Equipment: Submit descriptions of sheet pile driving equipment to be employed in the work. Descriptive information shall include manufacturer's name, model numbers, capacity, rated energy, hammer details, cushion material, helmet and templates. Include

documentation that driving procedure proposed will not exceed vibration limits or marina wall movement limits specified herein. The documentation should include but not be limited to: chart(s) and/or graph(s) relating vibration transmission to distance from source, the specifications of the equipments that were used to generate the chart(s) or graph(s), the soil conditions if the chart(s) or graph(s) were derived from vibration test(s) and/or measurements from similar project(s). The equipment data pertinent to the chart(s) shall be consistent with that of proposed procedure and method.

4. Contract Closeout Submittals

- a. Sheet pile installation records: Submit as specified in Paragraph 3.06C.
- b. "As-built" Record Drawings showing pile locations and plumbness. The concrete facing and cap shall not be formed or placed until the as-built drawings have been approved.
- c. Vibration and movement monitoring final reports.

1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. The Contractor, in accordance with the provisions of Section 01451 - Contractor's Quality Control, shall engage the services of a licensed Professional Engineer registered in the State of New York (Contractor's Engineer) to sign and seal design calculations prepared for temporary bracing systems and perform the preconstruction condition survey. The same Engineer need not perform both of these tasks.
- C. Provide the services of an independent surveyor, licensed in the State of New York and approved by the Commissioner, to monitor marina wall movement, to perform surveys and layouts for the driving template and piles, and to determine vertical and horizontal alignments.
  1. The installed location of each pile shall be established and verified by survey.
  2. Survey information may be submitted on several drawings, each covering a partial area only, as the job progresses, to expedite the approval of the pile work. Upon completion of all pile driving, the Contractor shall submit to the Commissioner, AutoCAD drawings having the same locations of all the piles, including obstructed, damaged and compensating piles, percentage out of plumb and the cut-off elevation and length below cut-off elevation for each pile.

3. Conform to the requirements of the General Conditions.

- D. Sheet Piling Lengths: The Contractor shall propose order lengths for king and sheet piles based on subsurface information furnished. Do not order piles until the Commissioner approves order lengths.
- E. The sheet piling shall be installed by a firm having a minimum of three (3) years experience in the installation of similar type units. All installation shall be supervised by Contractor's personnel with previous satisfactory experience in the installation of at least two similar wall systems. The sheet pile supplier shall have in place a quality control program for the manufacture of the wall system components.
- F. Coordinate work of this Section with the work of other trades so that construction is not delayed.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Pile materials shall be shipped, handled, and stored without distortion or damage. Store in a clean, properly drained location off the ground.
- B. Handle sheet piling using handling holes or lifting devices. Handle long length sheet piles with care to prevent damage. Support on level blocks or racks spaced not more than 10 feet apart and not more than 2 feet from the ends. Supports between multiple lifts shall be in a vertical plane. Protect piling to prevent damage to coatings and to prevent corrosion prior to installation. Any damage to steel or coatings shall be repaired to the satisfaction of the Commissioner and at no cost to the City of New York.
- C. Configure sheet piling storage to facilitate required inspection activities.

1.07 SITE CONDITIONS

- A. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available upon written request as described in Section 01120 -Contract Summary. The Contractor may use this report to establish the quality of subsurface materials expected to be present at the project site. The Contractor may use this report to establish the quality of materials expected to be present at the project site and determine the proper length of sheet piles. The Contractor is advised that all available samples and information relating to boring records and subsurface conditions are expressly excluded from and are not a part of the Contract, but are available for information purposes only.
- B. The Contractor is responsible for any conclusions it may draw from this information, including the character of the materials that may be encountered and the degree of difficulty to be expected in the performance of the Work. Neither the City of New York nor the Commissioner guarantees that materials other than those disclosed by the geotechnical report will not be encountered, or that proportions and

character of the various materials will not vary from those indicated in the boring logs.

- C. Data on indicated subsurface conditions is not intended as a representation or warranty of continuity of such conditions. It is expressly understood that neither the City of New York nor the Commissioner will be responsible for interpretations or conclusions drawn therefrom by the Contractor.
- D. If the Contractor finds that the investigations are not sufficient to determine the nature of the work, he/she can undertake his/her own investigations before or after submission of his bid at his/her own expense.
- E. Prior to bidding this project, the Contractor shall thoroughly explore the underwater conditions at the site to be fully informed about the piles left in the ground after demolition of the previous pier and in the area where the piles will be driven. Bidders are invited to perform underwater explorations of the site to acquaint themselves with these conditions at no additional cost to the City of New York. No additional compensation will be made after award of contract for any claim related to the pile remnants in the ground. The Contractor is also encouraged to review the Geotechnical Investigation Report, which may be obtained from the City of New York in accordance with Section 01120.
- F. Available Geotechnical Reports

Title	By	For
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

- G. Protect structures, underground utilities, and other construction as necessary from damage caused by pile driving operations.

## PART 2 PRODUCTS

### 2.01 STEEL SHEET PILES AND KING PILES

- A. Sheet piles and king piles shall be heavy gauge hot-rolled sections. Sheet piles shall be fabricated of steel conforming to ASTM A328. King piles shall be fabricated of steel conforming to A572 Grade 50 or approved equivalent of similar or greater strength. Use of cold rolled sheet piling is prohibited. Interlocks shall be free-sliding, allowing a swing angle of at least 5 degrees when threaded and maintain continuous interlocking when installed. Sheet piling, including fabricated sections, shall be full-length sections of the dimensions shown. Provide sheet piling with standard pulling holes. The manufacturer's logo and mill identification mark shall be provided on the sheet piling as required by the referenced specifications.

B. Fabricated Sections

1. Conform to the piling manufacturer's recommendations for fabricated sections.
  2. Metalwork fabrication for sheet piling sections shall conform to the requirements of Section 05120 - Structural Steel.
- C. Cast Steel Shoes: Model X-09800 Hard-Bite Shoes by Associated Pile and Fitting Corporation, Clifton, NJ or approved equal, may be used if hard driving is anticipated or encountered.
- D. Coat steel sheet piles with coal tar epoxy in accordance with the provisions of Section 09967 - Coating for Steel Waterfront Structures.

2.02 SOURCE QUALITY CONTROL

- A. Requirements for material tests, workmanship and other measures for quality assurance shall be as specified and in Section 05120 - Structural Steel.
- B. Piling shall be tested and certified by the manufacturer to meet the specified chemical, mechanical, and section property requirements prior to delivery to the site. Testing of piling for mechanical properties shall be performed after the completion of all rolling and forming operations. Testing of piling shall meet the requirements of ASTM A6. The Contractor shall submit mill test reports showing numerical values of chemical and mechanical properties of piling and structural steel, in accordance with the applicable material specifications.

PART 3 EXECUTION

3.01 FIELD TOUCH-UP OF PILE COATING

- A. A compatible touch-up system shall be provided for repair of coating defects, in accordance with the coating manufacturer's recommendations and as approved by the Commissioner.
- B. All touch-up work and coating materials shall be performed in accordance with the provisions of Section 09967 - Coating for Steel Waterfront Structures.
- C. Before and after driving, touch up all abraded surfaces in the coating and clean and touch up all field welds, in accordance with the coating manufacturer's recommendations and as approved by the Commissioner.

3.02 PRECONSTRUCTION SURVEY

- A. Provide general photography and video equipment, analog or digital, capable of superimposing the date and time on all images.

- B. Engage the services of a New York State licensed Professional Engineer to conduct a condition survey of the existing marina seawall.
- C. Provide, as a minimum, the following information:
  - 1. Photographic and videotape documentation of the condition of the seawall.
  - 2. Extent and location of existing signs of distress such as cracks, spalling, signs of settlement, and similar deficiencies.
- D. The Commissioner may accompany the Contractor's Engineer on the condition survey for verification of the data recorded.

### 3.03 VIBRATION AND MOVEMENT MONITORING

- A. Monitor vibration and movement of adjacent existing structures in conformance with Section 01435 and in accordance with the following additional requirements.
- B. Monitor the vibration and movement of the existing concrete block marina wall, located south of the work area approximately 40 feet behind the king pile wall being installed, by use of seismograph instrumentation and position survey.
- C. Establish horizontal and vertical surface monitoring points on the top of the marina wall to be monitored by position surveying methods, located at intervals not exceeding 50 ft along the existing marina wall, extending for a minimum of 100 ft beyond the new king pile sheeting.
- D. Prior to commencement of pile installation, provide and install vibration recorders using 3-component seismographs. The sensors shall be installed on top of the marina wall at points nearest to the pile driving operation, providing coverage for the full length of wall within at least 100 feet of the pile driving operation, relocated as necessary to follow the advancing operation.
- E. Seismograph sensors and accessories shall be maintained and monitored under direction of the qualified specialist. Protect all seismograph equipment from damage.
- F. Connect the seismograph sensors to an automated data acquisition system that continuously monitors vibrations and can trigger alarms when it detects a vibration level that exceeds threshold values stipulated below. Vibration recordings shall be conducted continuously in histogram mode. A real-time display and printing capability is required.
- G. Prior to commencement of the pile installation, conduct measurements of ambient vibration of all installed seismograph sensors. Results in terms of peak particle velocities shall be submitted to the Commissioner before the start of the pile installation.

- H. During pile driving, vibration monitoring shall be conducted continuously on the all seismograph sensors within 100' of the pile being driven, with careful attention the sensor closest to where pile is being driven.
- I. During pile driving, monitor the horizontal and vertical movement of reference points on the marina walls at intervals not exceeding 2 hours for the first five (5) days of pile driving and not exceeding 4 hours thereafter. Obtain and report monitor readings for all points at the conclusion of sheet pile wall installation. Provide measurements and cumulative summary graphs to an accuracy of 0.005 feet. If horizontal or vertical movement at any monitoring point exceeds a limiting value of 0.02 feet from initial position, cease pile driving operations, notify Commissioner and await his direction.
- J. The vibration of the wall caused by the pile installation operations must not exceed the limiting target values indicated in Section 01435. If marina wall movement or other conditions caused by pile driving or other construction activities exceed specified limiting values, the target vibration value will be subject to reduction by the Commissioner.
- K. The Contractor shall inform the Commissioner immediately each time measured particle velocities exceed 85% of the allowable peak particle velocity. Wall movement monitoring readings shall be immediately taken and checked for exceedance of specified limiting values. The Contractor shall make equipment or procedural modifications as required to avoid exceeding the allowable vibration intensity.
- L. If the peak particle velocity recorded at any location exceeds the value specified above, pile installation shall stop immediately. Notify the Commissioner. Propose changes in the pile installation equipment/method that would reduce the vibration on the piers. Pile installation shall not resume until approved by the Commissioner.
- M. Provide certification that the seismographs have been factory calibrated within the past three (3) months. This calibration shall be traced to the National Bureau of Standards. If at anytime during period of the work, the Commissioner determines that the internal calibration indicates errors in the instrument calibration, factory re-calibration or replacement will be required. If the seismographs show any indication of damage or vandalism, as determined by the Commissioner, the seismograph shall immediately be re-calibrated or replaced.
- N. The Contractor shall be in communication with its monitoring firm's personnel during vibration monitoring at all locations to verify the data recorded.
- O. The Contractor shall provide the Commissioner with the results of daily vibration monitoring, one work day after the readings are taken. Upon completion of the construction operations at locations requiring vibration monitoring, the daily submittals shall be synthesized into a final report.

### 3.04 PILE DRIVING EQUIPMENT

- A. Pile Hammer: Use a pile hammer having a delivered force or energy suitable for the total weight of the pile and the character of subsurface material to be encountered. Operate hammer at the rate(s) recommended by the manufacturer throughout the entire driving period. Repair damage to piling caused by use of a pile hammer with excess delivered force or energy.
- B. Pile Protection: Use a protecting cap during driving to prevent damage to the top of the king piles and sheet piling.
- C. Templates: Prior to driving, provide template or driving frame suitable for aligning, supporting, and maintaining king piles in their correct position during setting and driving. Provide a stable, heavy, adequately rigid and straight pile driving frame adapted to suit the length and weight of the piles is provided and sufficiently rigid to resist lateral and driving forces and to adequately support the sheet piling until design tip elevation is achieved. Templates shall not move when supporting king piles. Fit welded bracket guides which take into account width tolerances to hold the king piles at the design location alignment. Provide outer template straps or other restraints as necessary to prevent the king piles from warping or wandering from the alignment. Mark template for the location of the leading edge of each king pile. If in view, also mark the second level to assure that the piles are vertical and in position. If two guide marks cannot be seen, other means shall be used to keep the king piles vertical.

### 3.05 PILE DRIVING

- A. Maintain piling vertical during driving. Drive piles in such a manner as to prevent damage to both the king piles and intermediate piles and to provide a continuous closure.
  - 1. Drive piles to tip elevation as shown on the Contract Drawings.
    - a. If refusal is reached within 5 feet of estimated tip, driving may be discontinued.
    - b. If refusal is reached higher than this elevation, and in the opinion of the Commissioner, an obstruction has been encountered, withdraw the king pile, sheet (or pair of sheets), and take appropriate measures to penetrate the obstruction, such as spudding, then continue driving.

2. Locate the king piles in position in the template frame and drive the king piles with extreme care such that they are embedded straight and vertical, ensuring that they are parallel to each other and at the required spacing. The driving sequence of the king piles must ensure that the pile toe encounters compacted soil uniformly on its total circumference and never on one side only. To achieve this, the recommended driving sequence for each set of seven (7) adjacent king piles is as follows:

1 - 5 - 3 - 6 - 4 - 7 - 2

3. In general, drive each king pile in the above sequence to full penetration without interruption. Following successful completion, drive the intermediate Z pile sections. During the setting and driving operations of the king piles constantly check their alignment using theodolites along and normal to the wall.
4. When the template frames have been removed, make a final survey to ensure the deviations in the distance between the king piles are within acceptable tolerances, so as to allow installation of the intermediate sheet piles. If deviations are outside acceptable tolerances, either adjust the intermediate piles or extract and re-drive the king piles.
5. Place a bolt or similar object in the bottom of the king pile connector interlock to minimize packing material into it and ease driving of the intermediate sheets. Remove and replace piles driven out of interlock with adjacent piles.
6. Obstructions
  - a. If boulders or other obstructions restrict driving a king pile or sheet pile to the specified tip elevation, remove the obstructions or penetrate through them with a chisel beam or spud.
  - b. If the Contractor demonstrates, to the satisfaction of the Commissioner, after diligently attempting to remove or penetrate through an obstruction for a minimum period of four hours, that removal or penetration is deemed to be impractical using appropriate methods, tools and equipment, the Contractor will be requested to stop pile driving and request further instructions from the Commissioner. The costs incurred by the Contractor to attempt to remove or penetrate obstructions for the prescribed minimum duration, whether or not the efforts are successful, shall be included in the cost of installing sheet piling and no separate payment will be made therefor.
  - c. Make changes in the design or alignment of the piling as required and directed by the Commissioner to insure the adequacy and stability of the structure.

7. Drive pilings to depths shown and extend up to the elevation indicated for the top of pilings.
  8. Pilings shall not be driven within 50 feet of concrete less than 3 days old.
  9. Excavation inside king pile pairs will be permitted to overcome difficult driving conditions or to meet vibration and marina wall movement limits specified. Jetting, pre-augering or spudding of piles may be considered on a limited basis, but will not be permitted unless approved by the Commissioner.
  10. Remove and replace pilings damaged during driving or driven out of interlock when directed by the Commissioner at no additional cost to the City of New York.
  11. Additional costs induced in modifying pile cap, as a result of piles driven out of tolerances, including design costs, shall be at the Contractor's expense.
- B. Tolerances in Driving: Drive all piles with a variation from vertical of not more than 1/4 inch per foot. Place the pile so the face will not be more than 6 inches from vertical alignment at any point. Top of pile at elevation of cut-off shall be within 2 inches horizontally and 2 inches vertically of the location indicated. Manipulation of piles to force them into position will not be permitted. Check all piles for heave. Redrive all heaved piles to the required tip elevation.
- C. Cutting Off and Splicing
1. After piling has been driven to the required depth and piling extends above the top elevation indicated on the Drawings, cut off at indicated elevation after approval by the Commissioner. Trim the tops of sheet piles damaged to an extent that would prevent proper additional driving, or that would detrimentally affect appearance if exposed in the finished Work.
  2. Pilings driven to refusal or to the point where additional penetration cannot be attained and extend above the required top elevation in excess of the specified tolerance shall be cut off to the required elevation.
  3. Pilings driven below the required top elevation and pilings damaged by driving and cut off to permit further driving shall be extended as required to reach the top elevation by splicing when directed by the Commissioner at no additional cost to the City of New York. If so directed, pilings shall be spliced as required to drive them to depths greater than shown and extend them up to the required top elevation.
  4. Pilings adjoining spliced pilings shall be full length unless otherwise approved. Splicing of pilings, where permitted, shall use full penetration butt welds. Ends of pilings to be spliced shall be squared off before splicing to eliminate dips or camber. Splice pilings together with concentric alignment of

the interlocks so that there are no discontinuities, dips or camber at the abutting interlocks. Spliced pilings shall be free sliding and able to obtain the maximum swing with contiguous pilings. Welding of splices shall conform to the requirements of Section 05120 - Structural Steel. Shop and field welding, qualification of welding procedures, welders, and welding operators shall be in accordance with AWS D1.1.

5. Trim the tops of pilings excessively damaged during driving when directed by the Commissioner, at no cost to the City of New York. Pile cut-offs shall become the property of the Contractor and shall be removed from the site.
6. Cut holes in pilings for elastomeric fender units as shown or as directed by the Commissioner. Perform all cutting in a neat and workmanlike manner. Use a straight edge in cuts made by burning to avoid abrupt nicks. Drill or burn and ream bolt holes in piling by approved methods that will not damage the surrounding metal. Holes other than bolt holes shall be reasonably smooth and the proper size for rods and other items to be inserted.
7. Do not use explosives for cutting.

- D. Fender Installation: Furnish and install elastomeric fender units on king piles in accordance with the requirements of Section 02396.

### 3.06 FIELD QUALITY CONTROL

- A. Perform continuous inspection during pile driving. Inspect all piles for compliance with tolerance requirements. Bring any unusual problems that may occur to the attention of the Commissioner.
- B. Inspection of Driven Piling: The Contractor shall inspect the interlocks of the portion of driven piles that extend above ground. Remove and replace piles found to be out of interlock.
- C. Installation Records: Maintain a pile driving record for each king and sheet pile. Indicate on the installation record installation dates and times, type and size of hammer, rate of operation, total driving time, dimensions of driving helmet and cap used, blows required per foot for each foot of penetration, final driving resistance in blows for final 6 inches, pile locations, pile plumbness, tip elevations, ground elevations, cut-off elevations, and any reheading or cutting of piles. Record any unusual pile driving problems during driving. Submit complete records to the Commissioner.

-END OF SECTION-

**Southwest Brooklyn Marine Transfer Station**

**FMS No. S216-399A**

NO TEXT ON THIS PAGE

**B. Payment****1. Marine Timber Piles**

- a. The unit price per linear foot of marine timber pile incorporated in the work shall include the cost of furnishing, fabrication, delivery, storage and handling, installation, equipment, maintaining in proper condition, removal, re-installation, obstruction removal, shoes, shop and field splices, and other incidentals necessary to properly perform the work complete and in place as detailed on the Contract Drawings and accepted by the Commissioner.
- b. The basis for payment shall be the aggregate measured length of approved marine timber piles actually incorporated in the work, delineated by the specified unit of measurement, multiplied by the corresponding contractual unit price shown on the Bid Form.
- c. Timber piles may be added or deleted as directed in writing by the Commissioner and paid for at the contractual unit price per linear foot.
- d. No separate payment will be made for inspection of marine timber piles, pile tips, removing damaged or misdriven piles, piles driven for the temporary use or for the convenience of the Contractor, pre-drilling, removal of obstructions, jetting, spudding, pile surveys and related drawings, pile cutoffs and their disposal off-site. The costs thereof shall be included in the unit price bid for marine timber piles.

**2. Unacceptable Piles**

- a. Unacceptable timber piles are defined as piles that fail minimum penetration requirements, are placed or cut off in positions beyond specified tolerances, or are damaged.
- b. Unacceptable timber piles shall be replaced with piles that conform to specified requirements. Alternatively, in lieu of replacing unacceptable piles, additional timber piles may be placed in locations other than those shown on the Contract Drawings. This alternative may be used only with prior approval of the Commissioner for each individual location of use.
- c. The Commissioner will determine if pile deficiency is due to unavoidable field conditions, such as an immovable or impenetrable obstruction, or due to Contractor operations.
- d. If the Commissioner deems that the deficiency of a pile is due to Contractor operations, all costs for replacement piles or design, analysis and construction of alternative designs shall be at the expense of the Contractor.

**Section 02464**  
**MARINE TIMBER PILES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install a new timber fender pile cluster including blocking, wire rope wrappings and appurtenant items, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. This Section includes, but is not limited to, the following items:
  - 1. Timber Fender Piles
  - 2. Galvanized Hardware
  - 3. Wire Rope and Fittings
  - 4. Pile Caps
  - 5. Pile Driving Equipment

**1.02 RELATED SPECIFICATIONS**

- A. Section 02398 – Marine Timberwork
- B. Section 02457 – Steel Sheet Piles

**1.03 MEASUREMENT AND PAYMENT**

- A. Measurement
  - 1. Marine Timber Piles: The quantity of marine timber piles to be measured for payment at the unit price bid will be the actual length of piles, in linear feet, driven or installed and left in place in conformity with the Contract Drawings and the Specifications or as directed by the Commissioner.
  - 2. The approved quantity of piles actually incorporated in the work, delineated by the specified unit of measurement, will be the basis for payment. The linear footage of pile to be measured for payment shall be the length in place below the cutoff elevation measured to the pile tip. Any part of the pile remaining above the cutoff elevation specified or otherwise directed will not be measured for payment.
  - 3. Units of measurement for the work specified in this Section shall be as follows:
    - a. Marine Timber Piles – linear feet.

- e. If the Commissioner deems that the deficiency of a pile is due to unavoidable field conditions, the costs for replacement or additional piles will be paid for at the contractual unit price for marine timber piles. Pile driving and removal of partially installed piles deemed to be obstructed and abandoned by the Commissioner will also be paid at the contractual unit price for marine timber piles.

#### 1.04 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and the latest addenda thereto of the following standards to the extent referenced. The publications are referred to in the text by the basic designation only.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  1. Qualification Submittals: Submit qualifications demonstrating compliance with Articles 1.06B and 1.06C as applicable.
    - a. Installer: Submit qualifications of the Contractor's installer demonstrating experience monitoring and certifying pile installations of similar type and capacity to those of this Project.
    - b. Contractor's Surveyor: Submit qualifications of the Contractor's Surveyor demonstrating experience in surveying pier piles over water similar to those of this Project.
    - c. Vibration Monitoring Specialist, Movement Monitoring Surveyor and Commissioner to perform preconstruction survey: Conform to Section 02457 – Steel Sheet Piles.
  2. Product Data
    - a. Timber Piles: Identify material, size(s), treatment, and source.
    - b. Materials and Safety Data Sheets (MSDS) and Consumer Information Sheets (CIS): Submit Materials and Safety Data Sheets (MSDS) and

Consumer Information Sheets (CIS) associated with timber pile preservative treatment. The Contractor shall comply with all safety precautions indicated on MSDS and CIS.

c. Hardware

d. Equipment Data – For Information: Include to identify as a minimum:

- (1) Driving equipment
- (2) Driving helmet and cushion blocks
- (3) Cushion block

3. Quality Control Submittals

a. Certificates of Compliance

- (1) Driving hammer
- (2) Treated Timber Piles: Submit certification with inspection report of an independent inspection agency that preservative treatment of timber (wood) piles for this Project complies with this specification as a minimum and applicable AWWA and WWPI BMP's standards in accordance with Article entitled "Quality Assurance" herein. Submit example of identifying mark that will be exhibited on each timber pile as specified in Article entitled "Quality Assurance" herein.
- (3) Provide documentation that driving procedure proposed will not exceed vibration limits or marina wall movement limits specified herein. The documentation should include but not be limited to: chart(s) and/or graph(s) relating vibration transmission to distance from source, the specifications of the equipments that were used to generate the chart(s) or graph(s), the soil conditions if the chart(s) or graph(s) were derived from vibration test(s) and/or measurements from similar project(s). The equipment data pertinent to the chart(s) shall be consistent with that of proposed procedure and method.

4. Record Documents: Submit the following:

a. Field Quality Control Records: Submit pile-driving records as specified and as may be otherwise requested by the Commissioner.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Provide the services of a general contractor or a specialty subcontractor that specializes in the installation of marine timber piles and can demonstrate at least three years of relevant experience in the installation of marine timber piles under similar conditions.
- C. Provide the services of an independent surveyor, licensed in the State of New York and approved by the Commissioner, to perform surveys and layouts and to determine vertical and horizontal alignments.
  - 1. The installed location of each pile shall be established and verified by survey.
  - 2. Survey information may be submitted on several drawings, each covering a partial area only, as the job progresses, to expedite the approval of the pile work. Upon completion of all pile driving, the Contractor shall submit to the Commissioner AutoCAD drawings having the same locations of all the piles, including obstructed, damaged and compensating piles, percentage out of plumb and the cut-off elevation and length below cut-off elevation for each pile.
  - 3. Conform to the requirements of the General Conditions.
- D. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- E. Timber Piles Preservative Treatment
  - 1. The Contractor shall be responsible for the quality of treated wood products.
  - 2. Identify treatment on each piece by the quality mark of an agency accredited by the Board of Review of the American Lumber Standard Committee.
  - 3. Inspect all preservative treated wood visually to ensure there are no excessive residual materials or preservative deposits. Unless treated piles have aged at least six (6) months prior to installation, treatment shall conform to WWPI BMP to avoid leaching of preservative chemicals into the waterway.
  - 4. The Contractor shall submit inspection report(s) of an independent inspection agency, approved by the Commissioner that offered products (each pile) that comply with applicable AWWA standards and WWPI BMP's. Materials shall be clean and dry or it will be rejected because of environmental concerns.

**1.07 DELIVERY, STORAGE, AND HANDLING**

- A. Store and handle piles in accordance with industry accepted methods to avoid damage or deformation of the piles.
- B. Special care shall be taken to avoid damaging the surface of timber piles. Hooks or tongs shall not be used; slings and lines shall be non-abrasive. Use of steel cable and chain will not be permitted.

**1.08 SITE CONDITIONS**

- A. Geotechnical investigations have been undertaken at the site and a Geotechnical Report is available as described in Section 01120 –Contract Summary. The Contractor may use this report to establish the quality of materials expected to be present at the project site and determine the proper length of piles. The Contractor is advised that all available samples and information relating to boring records and subsurface conditions are expressly excluded from and are not a part of the Contract, but are available for information purposes only.
- B. The Contractor is responsible for any conclusions it may draw from this information, including the character of the materials that may be encountered and the degree of difficulty to be expected in the performance of the Work. Neither the City of New York nor the Commissioner guarantees that materials other than those disclosed by the geotechnical report will not be encountered, or that proportions and character of the various materials will not vary from those indicated in the boring logs.
- C. Data on indicated subsurface conditions is not intended as a representation or warranty of continuity of such conditions. It is expressly understood that neither the City of New York nor the Commissioner will be responsible for interpretations or conclusions drawn wherefrom by the Contractor.
- D. If the Contractor finds that the investigations are not sufficient to determine the nature of the work, the Contractor can undertake its own investigations before or after submission of its bid at its own expense.
- E. Available Geotechnical Reports

<b>Title</b>	<b>By</b>	<b>For</b>
Report on Geotechnical Investigation – Southwest Brooklyn, Marine Transfer Station Conversions, New York City Department of Sanitation	Haley & Aldrich of New York	Greeley & Hansen, LLC

- F. Prior to bidding this project, the Contractor shall thoroughly explore the underwater conditions at the site to be fully informed about the piles left in the ground after demolition of the previous pier and in the area where the piles will be driven.

Bidders are invited to perform underwater explorations of the site to acquaint themselves with these conditions at no additional cost to the City of New York. No additional compensation will be made after award of contract for any claim related to the pile remnants in the ground. The Contractor is also encouraged to review the Geotechnical Investigation Report, which may be obtained from the City of New York in accordance with Section 01120.

- G. Protect structures, underground utilities, and other construction as necessary from damage caused by pile driving operations.

## PART 2 PRODUCTS

### 2.01 PILES

- A. Timber Piles: Provide Douglas Fir or Southern Pine clean peeled piles conforming to ASTM D25. The producer shall brand each treated pile in accordance with AWP A M6.
  - 1. Pile shall be fresh cut stock. Use of warehouse material stored over 90 days is prohibited.
  - 2. Treat piles with waterborne preservative conforming to AWP A Specification P5. Treatment shall conform to AWP A U1, Use Category UC5A Marine Use Northern Waters, with waterborne preservatives. Each treated pile shall be branded by the producer in accordance with AWP A M6 that identifies the treatment by the quality mark of an agency accredited by the Board of Review of the American Lumber Standard Committee.
- B. Piles shall be in one piece. Splices will not be permitted. Pile butt circumference shall be not less than 44 inches as measured 3 feet from the butt. Piles shall be driven to the minimum pile tip elevation shown on the Contract Drawings, or deeper if needed to reach a minimum bearing capacity of 15 tons as determined by Table 11-5 of the Building Code of the City of New York. Cut-off elevation shall be as indicated on the Contract Drawings. Ordered lengths shall be sufficient to allow a minimum one-foot cut-off should the butt be damaged during installation, and a minimum of ten (10) feet deeper tip elevation than shown on the Contract Drawings if needed to reach the minimum bearing capacity. The first pile driven shall be one of the vertical piles, and shall be used as an indicator pile to determine the necessary tip elevation for subsequent piles. Driving records for the first pile shall be submitted to the Commissioner for evaluation prior to driving subsequent piles. Subsequently driven piles shall be shortened as directed by the Commissioner by cutting off unnecessary length from the pile tips prior to driving.
- C. Pile Quality
  - 1. All timber piles shall be of sound timber suitable for driving, cut above the ground swell, free from decay, unsound knots, knots in groups or clusters,

windshakes and short or reversed bends. The maximum diameter of any sound knot shall be one-third the diameter of the pile section where the knot occurs, but not more than four (4) inches in the lower half of pile length nor more than five (5) inches otherwise. All knots shall be trimmed flush with the body of the pile and ends shall be squared with the axis.

2. Timber piles shall have reasonably uniform taper throughout their length and shall be so straight that a line joining the centers of point and butt shall not depart from the body of the pile. No bark or wane shall be measured in required dimensions. The diameter at any pile section is the average of the maximum and minimum dimensions at that section.
3. Inspection of Timber Piles: With every delivery and before the material is accepted, the Contractor shall furnish a certificate of satisfactory inspection issued by the lumber association or agency of the material furnished. This certificate shall certify that the material furnished complies with the requirements of the specifications.

## 2.02 HARDWARE AND ACCESSORIES

- A. Hot dip galvanize all steel items according to ASTM F 2329 for bolts, nuts, screws and washers, and ASTM A123 or A153 as applicable for other materials, with a minimum of 4 mils of zinc coating. Provide bolts with nuts and washers, screws, spikes, and other metal fastenings. Bolts shall be ASTM A307, Grade A with ASTM A563 nuts. Bolt heads and nuts shall be square. Washers shall be plate or cut washers as indicated. Provide bolts with washers under nut and head.
- B. Wire Rope And Fitting: FS RR-W-410, Type III, Class 2, zinc coated or FS RR-W-410, Type I, Class 2. Provide 0.38-inch diameter zinc-coated steel staples not less than 5 inches in length. Provide clips or clamps of zinc-coated steel.
- C. Pile Caps: Provide 0.040-inch aluminum alloy sheet, Alclad 3003, 3004, or 3005 in accordance with ASTM B209. Form fit to pile butt with 2-inch minimum turndown around circumference.
- D. Pile Shoes: ASTM A1011/A1011M. Steel boot or welded-plate point shoe especially fabricated for pile driving. Shoes shall be the product of a manufacturer regularly engaged in the manufacture of pile fittings. Welding procedures shall be in accordance with a nationally recognized welding code. Provide size to fit pile tip. Fabricate boot type of 3/16 inch carbon steel fully welded, with at least three straps, each with three 3/16 inch nail holes. Fabricate welded-plate point type of four 3/16 inch or 1/4 inch steel plates, fully welded and sized to adequately cover full pointed area of pile; provide each plate with one 3/16 inch or one 1/4 inch nail hole. The length of the joints formed by the intersection of the sides shall not be less than one half of the height of the shoe. Shoes may be furnished without painted finish. Provide on the point of each softwood pile.

## E. Silicone Sealant

1. One-part silicone formulation ASTM D 5893, Type NS except use Type SL for horizontal applications. Acetic acid cure sealants will not be permitted.
2. Acceptable Products – Type SL, Self Leveling
  - a. Crafcro Roadsaver Silicone SL by Crafcro Inc., Chandler (Phoenix), AZ
  - b. CSL 315 by CSL Silicones, Guelph, Ontario
  - c. Dow Corning 890SL by Dow Corning Corp., Midland, MI
  - d. Pecora 300SL by Pecora Corporation, Harleyville, PA
  - e. Spectrem 900SL by Tremco Incorporated, Beachwood, OH
  - f. Or approved equal
3. Acceptable Products – Type NS, Non-Sag
  - a. Crafcro Roadsaver Silicone by Crafcro Inc., Chandler (Phoenix), AZ
  - b. CSL 342 by CSL Silicones, Guelph, Ontario
  - c. Dow Corning 888 by Dow Corning Corp., Midland, MI
  - d. Flexseal 310 by Roadseal Technology, Inc., Tucson, AZ
  - e. Pecora 301 NS by Pecora Corporation, Harleyville, PA
  - f. Spectrem 800 by Tremco Incorporated, Beachwood, OH
  - g. Or approved equal

F. Wood Preservative (For Field Treatment Applications): Comply with the requirements of AWWA M4.

G. Galvanized Repair Coating: Conform to MIL-P-21035 and to requirements specified for Field Treatment herein.

## 2.03 PILE DRIVING EQUIPMENT

- A. Select driving equipment and driving procedure which will not exceed vibration and marina wall movement limits specified herein.
- B. Capacity: Pile driving hammers shall be of sufficient weight and energy to install the specified pile without damage into the soils expected to be encountered. If, in the opinion of the Commissioner, satisfactory results are not obtained with the hammer furnished by the Contractor, a hammer meeting the approval of the Commissioner shall be furnished and used, but at no time shall a striking energy of 13,500 ft.-lbs per blow be exceeded.
- C. Operating Speed: Sufficient boiler or compressor capacity shall be provided at all times to maintain the rated speed of hammer during the full time of driving a pile. The valve mechanism and other parts of the hammer shall be maintained in first class condition so that the length of stroke, for a single acting hammer, and the number of blows per minute, for a double acting hammer, for which the hammer is

designed, will be obtained. Any double acting hammer not operating at the rated hammer speed specified in the manufacturer's catalogue, for the particular hammer being used, shall be deemed unsatisfactory and shall be removed from the site.

- D. Diesel Hammers: All Diesel hammers shall be provided with an acceptable means of measuring hammer energy. When pressure gages are included as normal equipment, they shall be furnished and maintained in operable condition. Manufacturer's charts and graphs, required to calibrate hammer energy, shall be furnished to the Commissioner by the Contractor. The Contractor shall also arrange easy access to the pressure gages so that readings may be conveniently taken by the Commissioner.
- E. Leads: Pile driver leads shall be constructed in such a manner as to afford freedom of movement of the hammer. The use of either swinging or hanging leads will be permitted provided the pile is properly supported during driving and the desired final position and batter of pile is achieved. In the event the Commissioner determines that the use of swinging or hanging leads is producing unsatisfactory results, he may require the Contractor to hold the leads in position with guys or stiff braces to give the required support. The Contractor may, as an alternative, replace the unsatisfactory equipment with new equipment having fixed leads. Pile driving leads shall be of sufficient length so that the use of a follower will not be necessary. The driving of piles with followers shall be avoided if practicable and shall be done only with written permission of the Commissioner and at the direction of the Commissioner.
- F. Driving Helmets and Cushion Blocks
  - 1. A driving helmet or cap including a cushion block or cap block of a design acceptable to the Commissioner shall be used between the top of the pile and the ram to prevent impact damage to the pile. The driving helmet or cap and cushion block combination shall be capable of protecting the head of the pile, minimize energy absorption and dissipation, and transmit hammer energy uniformly and consistently during the entire driving period.
  - 2. The driving helmet or cap shall fit loosely around the top of the pile may rotate slightly without binding within the driving head.
  - 3. The cushion block shall be a solid or laminated softwood block with the grain Parallel to the end of the pile enclosed in a close-fitting steel housing. The thickness of block shall be suitable for the length of pile to be driven and the character of subsurface material to be encountered. Generally, thicker blocks shall be provided for longer piles and softer subsurface material. Helmet or block shall uniformly transmit energy to pile with a minimum loss of energy.
  - 4. The cushion block shall be replaced if it has been damaged, split, highly compressed, charred or burned, or has become spongy or deteriorated in any manner.

5. Under no circumstances will the use of small wood blocks, wood chips, rope or other material permitting excessive loss of hammer energy be permitted.
6. Prior to the start of pile driving operations, the Contractor shall submit detail drawings of the cushion block, including records of successful use where the block is other than that specified above.

### PART 3 EXECUTION

#### 3.01 PREPARATION

- A. Layout and Field Survey Work: Conform to the requirements described in the General Conditions.

#### 3.02 PRECONSTRUCTION SURVEY, VIBRATION MONITORING AND WALL MOVEMENT MONITORING

- A. Conform to the requirements of Section 02457 – Steel Sheet Piles, including vibration limits and wall movement limits specified therein.

#### 3.03 PILE INSTALLATION

- A. Inspect piles when delivered and when in the leads immediately before driving.
- B. In developing proposed pile installation procedures and selecting equipment, the Contractor shall consider and be prepared to respond to local conditions. It shall be the responsibility of the Contractor to select methods and equipment which will result in satisfactory installation of the piles.
- C. Driving Piles: Operate hammer at manufacturer's rated speed, and drive piles without interruption to a minimum pile tip elevation as shown on the Contract Drawings for cluster piles unless refusal at bedrock is encountered at a higher elevation. Refusal at bedrock is defined as 5 blows per 1/4-inch of penetration for 10 consecutive blows under the action of the approved hammer. The driving of piles shall be done with the steam, diesel or pneumatic hammer and in the order approved by the Commissioner.
  1. Drive all piles with a positioning template.
  2. Tolerances in Driving: Piles shall be driven in the locations indicated on the Contract Drawings. Piles may be manipulated a maximum of 1 inch per 10 foot of pile length above mud line. Remove and replace with new piles those damaged, mislocated, driven below the design cutoff, or driven out of alignment.
  3. Protection of Piles: Square the heads and tips of piles to the driving axis. Laterally support piles during driving, but do not unduly restrain piles from

rotation in the leads. Where pile orientation is essential, take precautionary measures to maintain the orientation during driving.

- D. Piles shall be installed with due consideration for the safety of adjacent structures and subsurface construction, by a method which leaves their strength unimpaired. If conditions at the site are such that the tip, the body or the butt of the pile is likely to suffer damage during driving, special precautions shall be taken to avoid such damage.
- E. Broken or damaged piles shall not be used in the work.
- F. Any pile which is raised or heaved during driving of adjacent piles shall be redriven to at least the original required tip elevation or as otherwise directed by the Commissioner.
- G. Loose and displaced material forced up around piles during driving shall be removed.
- H. Piling shall be restrained from lateral movement at intervals not exceeding 20 feet over the length between the driving head and the ground surface.
- I. Jetting, pre-drilling or pre-augering is not permitted unless approved by the Commissioner.
- J. The pile driver lead shall be marked legibly with paint at intervals of one foot, fixing the zero point at the deck of the pile driver scow. Tide staffs or other elevation controls shall be installed.
- K. The piles shall be supported and braced during installation until they are fixed in the permanent work as required to assure proper location of the piles. The supports, braces and guides shall be frequently verified to insure that they are holding the piles to line and slope. Supports, braces and guides shall be removed only upon approval of the Commissioner.
- L. The correct relative position of piles in clusters shall be maintained.
- M. Piles which, in the opinion of the Commissioner, have been disturbed shall be re-driven.
- N. After the piles are driven and accepted, they shall be cut off to true planes at the required elevation. No shims of any description will be permitted.
- O. Driving of piles shall not take place within 50 feet of concrete placed within 3 days unless otherwise approved by the Commissioner.

## 3.04 PILE OBSTRUCTIONS

- A. Boring logs for boreholes previously drilled at the project site indicate the presence of boulders and obstructions, such as pile remnants and construction debris. If such obstructions are encountered, and piles reach premature refusal during pile driving, the Contractor shall notify the Commissioner immediately.
- B. The Contractor shall probe to locate the extent of the obstruction and propose a method of passing or removing the obstruction, including the use of a chisel beam, spud, by drilling or by other suitable means.
- C. If the Contractor demonstrates, to the satisfaction of the Commissioner, after diligently attempting to remove or penetrate through an obstruction for a minimum period of four hours, that removal or penetration of the obstruction is deemed to be impractical using appropriate methods, tools and equipment, the Contractor will be requested to stop pile driving operations and await further instructions from the Commissioner. The costs incurred by the Contractor to attempt to remove or penetrate obstructions for the prescribed minimum duration, whether or not the efforts are successful, shall be included in the unit price bid for marine timber piles and no separate payment will be made therefore.
- D. If the Commissioner declares the obstruction to be an unavoidable field condition, the Contractor will be directed to remove the partially installed pile and make changes in the design or alignment of the piling structure as required by the Commissioner to insure the adequacy and stability of the structure.
- E. Payment for installing and removing the obstructed pile and for installing replacement or additional piles will be made at the contractual unit price for marine timber piles.
- F. Payment for additional labor and materials necessitated by changes in the design or alignment of the piling structure will be made at applicable contractual unit prices or by Change Order in accordance with the General Requirements.

## 3.05 REJECTION OF PILES

- A. The following shall be cause(s) for rejection of a pile:
  - 1. Pile location or batter is incorrect.
  - 2. Pile damaged from any cause whatsoever.
  - 3. Pile is determined by the Commissioner to be unserviceable for other reasons related to the furnishing and installing of the pile.
  - 4. Piles which are driven so that, when cut off, the tops are below the elevation fixed by the Contract Drawings or as established by the Commissioner, shall

be withdrawn and replaced by new and, if necessary, longer piles at the expense of the Contractor.

5. Piles that are split, splintered or broomed from driving operations are not acceptable. Any pile broken by reason of internal defects (even though the Commissioner permitted it to be put in the leads), or by improper driving shall be rejected.
- B. The Contractor shall remove and replace such rejected piles. No additional payment will be made for removal, replacement or repair of rejected piles. No additional payment will be made for backfilling of cavities left by the extraction of rejected piles or from augur holes or soil deformations necessary to place pile. No additional payment will be made for re-driving piles that are forced up by any cause.
- C. If the Contractor removes any piles driven in the permanent work for his convenience, for the prosecution of the work, or for any other reason, except at the direction of the Commissioner, the Contractor shall replace such piles at no additional cost to the City of New York.

### 3.06 FIELD FABRICATION

- A. Cut piles at cutoff grade with pneumatic tools by sawing. Pile heads at cutoff shall be sound. Piles cut off lower than required shall be removed and replaced with a new pile at no additional cost to the City of New York. If piles are cut off higher than required, they shall be re-cut. Secure piles in their proper alignment and cut piles at cutoff grade with pneumatic tools by sawing or other approved method. Fabricate and install wood blocking in accordance with the provisions of Section 02398 – Marine Timberwork. Counter-bore holes for bolts where indicated for countersinking bolt heads and washers. After installation of bolts, fill counter-bored holes with an approved bituminous material. Drill holes for through bolts 1/16 inch larger than diameter of bolt shank. Drill holes for lag bolts not larger than body of bolt at base of tread. Piles shall have tops beveled outboard as indicated and fitted with specified pile caps. Do not dap piles for blocking; dap the blocks or use beveled blocks.
- B. Fastening: Use washers of the size and type specified under bolt heads and nuts which would otherwise come in contact with wood.
- C. Wrapping Piles: Notch outboard faces of piles to be in contact with wire rope so that when wrapped the rope shall be flush with face of the pile. Notch only those piles which will be exposed to contact during berthing. Draw piles tightly together with wire rope. Fasten each turn of the wire rope with a staple to each pile with which it is in contact. Fasten ends of wire rope with two clips or clamps. Number of turns shall be as indicated on the Contract Drawings. Through bolts shall be in place and drawn up before wrapping is finally secured.

**D. Field Treatment**

1. **Piles:** Fill notches for wire rope with hot pitch or a bitumastic compound before placing wire rope. Field treat cuts, drilled holes, bevels, notches, re-facings, and abrasions made in the field in accordance with AWWA M4, MSDS and CIS. Wood preservatives are restricted-use pesticides and shall be applied according to applicable standards. Trim cuts and abrasions before field treatment. Apply field treatment to depressions or openings around bolt holes, joints, or gaps including recesses formed by counterboring, with preservative treatment used for piles or timber. After bolt or screw is in place and treatment applied, fill depressions and openings with silicone sealant.
2. **Galvanized Surfaces:** Repair and recoat zinc coating which has been field or shop cut, burned by welding, abraded, or otherwise damaged to such an extent as to expose the base metal. Thoroughly clean the damaged area by wire brushing and remove traces of welding flux and loose or cracked zinc coating prior to painting. Paint cleaned area with two coats of galvanizing repair paint. Compound paint with a suitable vehicle in a ratio of one part zinc oxide to four parts zinc dust by weight.

**3.07 FIELD QUALITY CONTROL**

- A. All marine timber pile inspections will be performed by the Commissioner or designated representative. The Contractor shall assist and provide access to the work area for field inspection by the Commissioner. The Contractor shall cooperate with the Commissioner in determining the minimum tip elevation required and shall mark each pile before driving as required.
- B. The driving of each pile shall be performed in the presence of the Commissioner unless otherwise directed.
- C. When inspections result in pile rejection by the Commissioner, the Contractor shall promptly segregate and remove rejected pile from the premises.
- D. **Inspection of Driven Piling:** The Contractor's Professional Engineer shall perform continuous inspection during pile driving and certify piles are installed in accordance with requirements herein. Inspect all piles for compliance with tolerance requirements. Bring any unusual problems which may occur to the attention of the Commissioner.
- E. **Installation Records:** Maintain a pile driving record for each pile. These records shall be compiled and attested to by the Contractor's registered Professional Engineer. Driving records shall include:
  1. Project name and number
  2. Name of Contractor and Installer

3. Pile size and dimensions
4. Elevation of point, elevation of butt before and after cut-off
5. Continuous record of number of blows for each foot of penetration and final driving resistance in blows for final 6 inches
6. Installation dates and times
7. Driving equipment used including type and size of hammer, rate of operation, total driving time, dimensions of driving helmet and cap used
8. Pile number and locations, tip elevations, ground elevations, cut-off elevations
9. Length of driven pile from final tip elevation to cut-off elevation.
10. Any reheading or cutting of piles.
11. Alignment and plumbness checks
12. Locations and depths where difficulty in driving was encountered
13. Any unusual pile driving problems.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02501**  
**REINFORCED CONCRETE SEWER PIPE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall furnish and install reinforced concrete sewer pipe, fittings and specials.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 02503 - Installation of Buried Pipelines
- C. Section 02505 - Leakage Tests

**1.03 REFERENCES**

- A. ASTM B127 - Nickel-Copper Alloy (UNS N04400) Plate, Sheet, and Strip
- B. ASTM C31 - Making and Curing Concrete Test Specimens in the Field
- C. ASTM C39 - Compressive Strength of Cylindrical Concrete Specimens
- D. ASTM C76 - Reinforced Concrete Culvert, Storm Drain and Sewer Pipe
- E. ASTM C361 - Reinforced Concrete Low-Head Pressure Pipe
- F. ASTM C443 - Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets (Metric)
- G. ASTM C497 - Testing Concrete Pipe and Tile

**1.04 DESIGN REQUIREMENTS**

- A. Design: Provide the classes of reinforced concrete sewer pipe as shown or specified in Section 02503 – Installation of Buried Pipelines. Conform pipe designs with the following requirements.
  - 1. Use diameter, wall thickness, compressive strength of concrete and area of circumferential reinforcement as prescribed for Classes I to IV in Tables 1 to 5 in ASTM C76, except do not use Wall A thickness, elliptical reinforcing cages or quadrant reinforcing mats. Do not substitute modified designs for designs shown in the tables.
  - 2. Provide special designs only for pipe with diameters and loads beyond those shown in Tables 1 to 5, pipe diameters that do not have steel reinforcement

areas shown in the tables and pipe subject to thrust forces encountered in jacking operations. Conform special designs with the requirements of Section 7.2.2 of ASTM C 76, except do not use Wall A thickness, elliptical reinforcing cages or quadrant reinforcing mats without prior approval. Retain a Registered Professional Engineer, licensed in the State of New York, to prepare, sign and seal all special designs for pipe.

- B. Precast reinforced concrete pipe shall conform to the requirements of ASTM C76 for circular steel reinforcement and the three-edge bearing strength test requirements for the load to produce the 0.01 inch crack and for the ultimate load. When the strength test requirements specified in the piping schedule are greater than the strength test requirements of ASTM C76, the thickness of the pipe wall may be increased, the area of circular steel reinforcement increased, or a combination of these, all as approved by the Engineer.

C. Joints

1. Provide joints for pipe, fittings and specials in gravity sewer and drain lines meeting the requirements of ASTM C443 and this Specification.
2. Provide joints for pipe, fittings and specials in low pressure concrete lines with test pressures of 125 ft. or less meeting the requirements of ASTM C361 and these specifications.

1.05 SUBMITTALS

- A. Provide all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Shop Drawings: Submit complete shop drawings for all diameters and classes of reinforced concrete pipe, fittings and specials and for concrete sills showing dimensions, strength and materials specifications and standards, joint details and reinforcement position for approval prior to manufacture. Include the following information on the shop drawings.
1. Diameter of pipe
  2. Area of all cages of reinforcing steel
  3. A minimum clearance of one inch for each cage of circumferential reinforcing steel shown
  4. Angle of the joint
  5. Length and thickness of bell and spigot
  6. Length and thickness of joint

7. Manufacturer, size and type of gasket
  8. Manufacturer's recommendations for gap dimension and tolerance for a properly installed pipe joint
  9. Signature and title of authorized representative of the manufacturer
- C. Materials Compliance: Submit notarized affidavits of all materials compliance with ASTM C 76.
- D. Product Compliance: Submit notarized affidavit of pipe compliance with ASTM C 76 and these specifications.
- E. Joint Compliance: Submit notarized affidavit of joint compliance with ASTM C443 and these specifications for each pipe size. The statement shall include date of test.
- F. Quality Control: Submit certified results of all shop tests for approval.

#### 1.06 QUALITY ASSURANCE

- A. General: Provide concrete pipe, fittings and specials that are precast or machine made and are the product of a company that can demonstrate by tests and installation records satisfactory experience in manufacturing concrete pipe of the quality and type specified.
- B. Reinforced Concrete Pipe: Provide reinforced concrete pipe meeting the requirements of ASTM C 76 and these specifications.
- C. Joints: Provide joints for pipe, fittings and specials meeting the requirements of ASTM C 443 and these specifications.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Do not ship pipe to the site of the work until the pipe test results are certified by the Engineer.

### PART 2 PRODUCTS

#### 2.01 REINFORCED CONCRETE PIPE

- A. Manufacture
1. Do not use admixtures or blends in concrete without prior approval.
  2. The manufacturer shall maintain a satisfactory manufacturing schedule and shall have adequate storage facilities so that the work will not be delayed.

3. Cast pipe in steel forms to the exact dimensions shown, specified or required. Unless otherwise shown or specified, the inner and outer rings of reinforcement shall be concentric. Provide chairs and spacers to insure and maintain the proper position of reinforcement steel with respect to the protective concrete covering. Pipes in which reinforcing steel is placed beyond the tolerances allowed by ASTM C76 will be rejected. Use metal spacers at the top between the inner and outer forms to maintain uniform wall thickness in casting pipe. Where reinforcement mesh is used in the pipe, curve such reinforcement to shape on rolls having grooves for the longitudinal wires. In casting pipe, do not cut wires for form spacers or for other purposes. Provide continuous internal vibration of concrete during the pouring operation.
  4. The Contractor will be responsible for meeting all requirements for the manufacture of precast pipe and checking at regular intervals all of such requirements.
- B. Lengths: Manufacture all reinforced concrete pipe in lengths of not more than 16 feet and not less than 8 feet as follows, except where shorter lengths are required and approved for pipeline curves or at junctions with structures.
1. Furnish subaqueous pressure pipe in lengths of not less than 16 feet for pipe up to and including 84 inches in diameter. Pipe larger than 84 inches in diameter may be of lengths less than 16 feet, decreased on a sliding scale in accordance with the manufacturer's recommendations and as approved by the Engineer.
  2. Furnish pressure pipe to be installed inland in lengths not less than 12 feet, except that pipe to be laid in sheeted trench shall be furnished in lengths not less than 8 feet.
- C. Labeling: Immediately after the stripping of forms, all pipe manufactured for the DSNY as required under this contract shall be marked and identified with the following data: DSNY, contract name and number, class and diameter of pipe, number of pipe, date of manufacture and the name of the manufacturer. The numbering of the pipe shall be consecutive for each diameter of pipe. Brass lettering templates designed to stencil this information on each pipe shall be provided by the pipe manufacturer. The aforementioned data shall be stenciled on the inside and outside of each length of pipe with waterproof ink or paint. Any pipe arriving at the location of the work without this information stenciled thereon will be rejected. At the end of each day of casting of the pipe, the manufacturer shall forward to the Engineer three copies of a report giving the diameters and the respective numbers of pipe cast that day.

#### D. Monolithic Sewers

1. Forms for monolithic concrete sewers shall be smooth, regular and true to shape. Forms which do not meet these requirements or which result in interior surfaces or thicknesses inferior to commercial precast concrete pipe shall not be used. Forms shall be thoroughly cleaned and approved by the Engineer before re-use. Sheeting shall not be used as exterior forms for monolithic concrete sewers.
2. Concreting, unless otherwise approved by the Engineer, shall proceed in lengths of not less than 12 feet.
3. Construction joints both longitudinal and transverse in monolithic concrete sewers shall have fabricated nickel-copper roofing sheet water stops conforming to the requirements of ASTM B127.

### 2.02 REINFORCED CONCRETE FITTINGS AND SPECIALS

- A. General: Provide reinforced concrete fittings and specials where shown, specified or required, and manufactured in accordance with the applicable sections of the respective standard for the adjoining pipe. Provide joints the same as in the adjoining pipe. Provide the interior surface of bends of the same smoothness and diameter as the adjoining pipe. Provide the centerline radius of curvature of bends to be equal, in dimension, to the inside diameter of the pipe.
- B. Strength: Design all reinforced concrete fittings and specials to have the same strength as the class of the adjoining pipe. Retain a Registered Professional Engineer, licensed in the State of New York to prepare, sign and seal all designs for fittings and specials.
- C. Standard fitting such as bends, tees, wyes and reducers shall be formed of steel, cut, shaped and welded to the proper form. Interior and exterior concrete or mortar shall be placed in approved manner.
- D. Special pieces and openings in standard pipe such as closures, wall fittings, adapters, manholes, air valve outlets, blow-offs and branches shall conform to details approved by the Engineer.

### 2.03 JOINTS

- A. General: Rubber gaskets shall be stored in as cool a location as practicable, preferably at 70 degrees F or less. In no case shall gaskets be exposed to the direct rays of the sun for a total of more than 24 hours.

**B. Gravity Sewer and Drain Lines**

1. Manufacture all gravity sewer and drain pipe, fittings and specials with watertight joints using rubber gaskets in accordance with the requirements of ASTM C443. Provide a preformed groove in the tongue or spigot of sufficient depth to hold the gasket securely in place and produce the proper gasket compression. Reinforced concrete pipe joints shall be optional as to shape, except that no joint shall have a groove in which the wall thickness of the pipe is reduced to less than one-half, other than by a slight draw or taper, unless approved by the Engineer in writing.
2. Manufacture the pipe with perfectly machined castings for forming the bells and spigots so that they will be true circles and when laid together the annular space for the rubber gasket will be perfectly uniform. The diameters of the bell and spigot surfaces, depended upon to compress the gasket, shall not vary from the theoretical diameters by more than 1/16 inch. The joint shall not project beyond the body of the pipe.
3. Reinforce the bells of the pipe with a single cage of steel in which the circumferential members are the same gauge as those in the body of the pipe, but spaced on no more than 1-inch centers.
4. The type and the manufacturer of the flexible rubber gaskets to be used shall be submitted for approval before pipe laying begins.

**2.04 CURING**

- A. Cure all pipe, fittings and specials by steam or membrane curing. Water curing is not permitted.
- B. Cure pipe 28 days prior to laying.

**2.05 SHOP TESTING**

- A. Test concrete sewer pipe in accordance with the applicable provisions of ASTM C497, as required by the ASTM Specification for the pipe and as specified herein.
- B. Test cylinders: Each day the Contractor shall prepare two test cylinders made from the concrete used for manufacturing the pipe under this contract.
  1. Make test cylinders in accordance with the requirements of ASTM C31 and cure and store them under identical conditions with the pipe. Test cylinders shall be properly marked for identification and dated.
  2. The Engineer will have the cylinders tested to determine whether the concrete complies with the strength requirements. Of each pair of test cylinders, one

cylinder will be tested at 7 days, and the other test cylinder will be tested at 28 days.

C. Test Pipe Sections

1. When lengths of pipe are 8 feet or less, the Engineer will select one length from every fifty lengths of each diameter and class.
2. When lengths of pipe are more than 8 feet, the Contractor shall provide a pipe test specimen four feet long for every 50 lengths of each diameter and class. Each test specimen shall be manufactured, marked for identification and shall meet the strength test requirements as specified for the pipe it represents. The manufacturing and marking of the pipe test specimen shall be witnessed by the Engineer.
3. Where less than 50 lengths are required for any pipe diameter, one eight-foot length of pipe will be selected by the Engineer or one pipe test specimen shall be provided for testing purposes; however, the Engineer may waive this requirement at his discretion.
4. Age of Pipe: Pipe selected or pipe tested specimens provided as specified for testing purposes shall be at least twenty-eight days old but shall not be over thirty days old at the time of testing.
  - a. Due to unforeseen conditions beyond the control of the Engineer and the manufacturer, special permission will be given in writing by the Engineer to delay a test beyond the thirty-day aging period.
  - b. The three-edge load bearing strength at 0.01-inch crack and the ultimate load strength of pipe tested after twenty-eight days will be corrected to the twenty-eight day strength by deducting 1/2 of one percent of the recorded strength for each day beyond the twenty-eight day age.
  - c. The Contractor may request tests to be made on pipe which has aged at least fourteen days and not more than 28 days but the tests must meet the 28 day strength test requirement in order to be accepted by the Engineer for installation in the work.

D. Basis of Acceptance: Conform the basis of acceptance for reinforced concrete pipe to Section 5.1.1 of ASTM C76 and this Specification.

1. The Engineer will reject all pipe of the lot which the tested length of pipe represents if the actual or corrected strength of the pipe tested fails to meet the three-edge load bearing strength test requirements. However, if the eight-foot length of pipe selected by the Engineer fails to meet the three-edge loading bearing strength test requirements, the Contractor may request that tests be made on two other eight-foot lengths of pipe representing that lot from which

the original pipe tested was selected. The Engineer will select these two lengths of pipe. Should the tests on these two lengths of pipe prove satisfactory, the lot represented by these lengths of pipe will be accepted. Should the tests on one or two of these lengths of pipe prove unsatisfactory, no further tests on any other lengths of pipe from this lot will be made, and all the pipe in this particular lot will be rejected.

2. The Engineer may accept precast pipe which meets the 0.01-inch crack strength test requirements but does not meet the ultimate load strength test requirements; however, the City will deduct 1/2 of one percent of the price bid per linear foot for that item which covers that particular pipe diameter and test strength requirements, for each one percent by which the ultimate load is below the required ultimate load. This deduction will be made on all pipe represented by the test specimen.
- E. Proof-of-Adequacy Tests for Special Designs: Prior to manufacturing production run pipe of special design, test one pipe of at least four feet in length of each diameter and class by the three-edge-bearing method to confirm that the pipe meets both the 0.01-inch crack and ultimate load requirements for which it is designed.
- F. Joint Adequacy Tests
1. Prior to manufacturing production run pipe, fittings and specials, conduct all tests required by Sections 9 and 10 of ASTM C443 for each diameter of pipe.
  2. Give two weeks' notice in writing, before the day of testing, to both the Engineer and the approved laboratory, to witness the tests. The DSNY reserves the right to have an inspector or authorized representative present at the time of the tests.
  3. All manufacturers supplying reinforced concrete pipe to the DSNY shall, for each size of pipe and gasket combination submitted for approval, have on file with the Department a Certified Statement attested thereto by the City inspector or representative that the hydrostatic test on pipe and on rubber gasket was performed in accordance with the above-mentioned ASTM designation and passed.
- G. Location of Tests: The pipe selected or the pipe test specimen provided for test shall be delivered by the Contractor to an approved testing laboratory and removed by the Contractor after the test has been made. The Contractor may request that tests be made at the manufacturer's plant; however, the pipe manufacturer shall provide an approved and certified testing machine with a hydraulically-operated jack and direct-reading gauges requiring no calibration.
- H. Test Witnessing: Strength tests will be witnessed by the Engineer, if requested.

- I. Costs of Tests: The Contractor shall pay all costs associated with tests and test witnessing.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install all reinforced concrete sewer pipe, fittings and specials in accordance with the manufacturer's recommendations, approved shop drawings and Section 02503 – Installation of Buried Pipelines.

#### 3.02 LEAKAGE TESTS

- A. Test the reinforced concrete sewers for leakage after completion in accordance with Section 02505 – Leakage Tests.

#### 3.03 SCHEDULES

- A. Refer to the schedule contained in the Section 02503 – Installation of Buried Pipelines for information on the piping that is to be constructed using the pipe materials and methods specified herein.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02503**  
**INSTALLATION OF BURIED PIPELINES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Installation of all underground pipelines as shown on the Contract Drawings. Provide pipeline materials, coatings and linings as specified and pipe of the types, sizes and classes shown or specified. Furnish and install connections, including adapters and closure pieces as required, to connect pipelines to existing pipelines or buried structures.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02317 - Backfilling
- C. Section 02501 - Reinforced Concrete Pipe
- D. Section 02505 - Leakage Tests
- E. Section 03300 - Cast-In-Place Concrete
- F. Section 15051 - Ductile Iron Pipe
- G. Section 15052 - Steel and Stainless Steel Pipe
- H. Section 15141 - Disinfection

**1.03 REFERENCES**

- A. ASTM D 2774 - Practice for Underground Installation of Thermoplastic Pressure Piping
- B. AWWA C600 - Installation of Ductile-Iron Water Mains and Their Appurtenances
- C. ASTM C 361 - Specification for Reinforced Concrete Low-Head Pressure Pipe
- D. ASTM A 307 - Specification for Carbon Steel Bolts and Studs, 60000 psi Tensile
- E. ASME B16.1 - Cast Iron Pipe Flanges and Flanged Fittings, C25, 125, 250, 800
- F. ASME B16.21 - Nonmetallic Flat Gaskets for Pipe Flanges
- G. ASME B31.8 - Gas Transmission and Distribution Systems
- H. AWWA C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings

- I. ASTM A 139 - Electric-Fusion (Arc)-Welded Steel Pipe (NPS 4 and Over)
- J. AWWA C115 - Flanged Ductile-Iron Pipe With Threaded Flanges
- K. AWWA C206 - Field Welding of Steel Water Pipe
- L. ASTM E 165 - Practice for Liquid Penetrant Examination
- M. ASTM E 709 - Practice for Magnetic Particle Examination
- N. New York City Building Code
- O. City of New York Department of Environmental Protection (NYCDEP) Sewer Design Standards
- P. NYCDEP Bureau of Water Supply Standard Water Main Specifications
- Q. NFPA 54 - National Fuel Gas Code

1.04 DESIGN REQUIREMENTS

- A. All reinforced concrete pipe shall conform to the requirements of Section 02501 – Reinforced Concrete Pipe.
- B. All ductile and cast iron pipe and fittings shall conform to the requirements of Section 15051 – Ductile Iron Pipe.
- C. All steel pipe and fittings shall conform to the requirements of Section 15052 – Steel and Stainless Steel Pipe.
- D. Pipeline installations for storm and sanitary drainage shall conform to NYCDEP Sewer Design Standards and NYC Building Code Sections P110.0 – Storm Drainage Piping and P108.0 – Sanitary Drainage Piping, respectively.
- E. Pipeline installations for city water shall conform to NYCDEP Bureau of Water Supply Standard Water Main Specifications and NYC Building Code Section P107.0 – Water Supply and Distribution.
- F. Pipeline installations for natural gas distribution shall conform to NYC Building Code Section P115.0 - Gas Piping and NFPA-54. The complete gas installation including service piping, valves, meters and regulators shall comply with the rules and regulations of the natural gas supplier (Consolidated Edison).

1.05 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.

- B. Transportation and Delivery: Take every precaution to prevent injury to the pipe during transportation and delivery to the site.
- C. Loading and Unloading: Take extreme care in loading and unloading the pipe and fittings.
  - 1. Work slowly with skids or suitable power equipment, and keep pipe under perfect control at all times.
  - 2. Under no condition is the pipe to be dropped, bumped, dragged, pushed, or moved in any way that will cause damage to the pipe or coating.
- D. Sling: When handling the pipe with a crane, use a suitable sling around the pipe.
  - 1. Under no condition pass the sling through the pipe.
  - 2. Use a nylon canvas type sling or other material designed to prevent damage to the pipe and coating.
  - 3. When handling reinforced concrete pipe or uncoated steel or ductile iron pipe, steel cables, chain or like slings are acceptable.
- E. Damaged Piping: If in the process of transportation, handling, or laying, any pipe or fitting is damaged, replace or repair such pipe or fittings at the Contractor's expense.
- F. Blocking and Stakes: Provide suitable blocking and stakes installed to prevent pipe from rolling.
  - 1. Obtain approval for the type of blocking and stakes, and the method of installation.
- G. Storage for Gaskets: Store gaskets for pipe joints in a cool place and protect gaskets from light, sunlight, heat, oil, or grease until installed.
  - 1. Do not use any gaskets showing signs of checking, weathering or other deterioration.
  - 2. Do not use gasket material stored in excess of six months without approval.

#### 1.06 FIELD CONDITIONS

- A. Repair of Existing Piping to be Maintained: Rebed, in compacted select fill material, existing pipes which cross over the new pipe or which cross under the new pipe with less than 12 inches clear vertical separation. Compact the bedding to densities required for new pipeline construction and extend bedding below the sewer to undisturbed earth. Reconstruct sewers damaged by pipeline construction.

1. Furnish and install all materials and do all work necessary for the reconstruction or repairs of sanitary sewers and services.
2. Provide pipe for reconstruction of existing pipe meeting the appropriate specification requirements.
3. Provide pipe of the same size as the existing sewer or when the same size is not available, use the next larger size of pipe. Obtain approval of joints made between new pipe and existing pipe.

PART 2 PRODUCTS (Not Used)

PART 3 EXECUTION

3.01 INSTALLATION

- A. General: Install all piping in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1 and the Buried Piping Schedule.
  1. Arrange miscellaneous pipelines, which are shown in diagram form on the Plans, clear of other pipelines and equipment.
- B. Earthwork: The Contractor shall perform all earthwork including excavation, backfill, dewatering, bedding, compaction, shoring and bracing, grading, and restoration of surfaces, and seeded areas disturbed under his contract in accordance with Division 2 – Site Construction.
- C. Pipe Laying - General
  1. Proper and suitable tools and appliances for the safe, convenient handling and laying of pipe shall be used and shall agree with manufacturer's recommendations. At the time of laying, the pipe shall be examined carefully for defects, and should any pipe be discovered to be defective after being laid, it shall be removed and replaced with sound pipe.
  2. For pipelines intended for gravity flow, begin pipeline laying at the low end of a run and proceed upgrade.
  3. Generally, lay all pipe with bells pointing ahead.
  4. Carefully place each pipe and check for alignment and grade.
  5. Make adjustments to bring pipe to line and grade by scraping away or filling in select fill material under the body of the pipe.
  6. Wedging or blocking up the pipe barrel shall not be permitted.

7. Bring the faces of the spigot ends and the bells of pipes into fair contact and firmly and completely shove the pipe home.
8. As the work progresses, clean the interior of pipelines of all dirt and superfluous materials of every description.
9. Keep all lines absolutely clean during construction.
10. Lay pipelines accurately to line and grade. The interior surface shall be smooth and uniform.
11. Use suitable fittings where shown and at connections or where grade or alignment changes require offsets greater than those recommended and approved.
12. Close off all lines with bulkheads when pipe laying is not in progress.
13. Furnish and install connections, including adapters and closure pieces as required, to connect pipelines to existing pipelines or pipelines provided under the Plumbing Contract.

D. Pipe Laying - Trenches

1. Trench excavation and backfill shall be performed as specified in Section 02316 - Excavation and Section 02317 - Backfill.
2. Lay all pipelines in trench excavations on select fill bedding, Class 25 concrete cradle or other foundations as shown, specified or ordered in writing.
3. Properly secure the pipe against movement and make the pipe joints in the excavation as required.
4. Carefully grade and compact pipe bedding.
5. Bell Holes
  - a. Cut out bell holes for each joint as required to permit the joint to be properly made and allow the barrel of the pipe to have full bearing throughout its length.
  - b. Thoroughly tamp bell holes full of select fill material following the making of each joint.
6. Dry Trench Bottoms: Lay pipe only in dry trenches having a stable bottom.
  - a. Where groundwater is encountered, make every effort to obtain a dry trench bottom.

- b. If a dry trench bottom has not been obtained despite the use of all known methods of trench dewatering, then excavate below grade and place sufficient select fill material, crushed stone, or Class D concrete over the trench bottom.
- E. Other Foundations: Install pipelines laid on other types of foundations as specified for such other foundations or as ordered in writing.
- F. Jointing Concrete Pipe with Rubber Gaskets
  - 1. Preparation of Joint Surfaces: Before joining concrete pipe using flexible rubber gaskets, wipe clean the joint surfaces of both the bell and spigot ends. Repair any lumps, projections, burrs, or chips which would interfere with the proper compression of the gasket.
  - 2. In making O-ring rubber gasketed joints, lubricate the gasket and the pipe socket with an approved rubber gasket lubricant, and stretch the gasket over the spigot and place gasket accurately in position.
  - 3. The position and condition of the gasket shall be examined from the inside of the pipe before successive pipe lengths are installed. If an unsatisfactory condition is located, the pipe shall be taken out and the operation of drawing the pipe together repeated with a new gasket.
  - 4. Carefully center the spigot end in the socket of the preceding pipe to avoid displacement of the gasket and draw the pipe home fully compressing the gasket with an approved tackle and apparatus. Prior to the use of such apparatus and method, demonstrate to the Engineer for approval the effectiveness and practicability of the proposed method of drawing the joints home.
  - 5. Make adjustments to line and grade in such a manner that the compressed rubber gasket will not be disturbed.
  - 6. Curve Offset: Construct curves for reinforced concrete pipelines with standard pipe where the opening of the joint on the outside of the curve is less than 1/2 inch.
  - 7. Curve Fittings: Where greater opening of the joint would be required, construct curves using beveled or radius pipe with standard joints, short lengths of pipe, or plain end radius pipe with cast concrete collar joints, or continuous concrete encasement; or by monolithic construction.

## G. Jointing Concrete Pipe at Structures

1. At manholes and other structures in precast concrete pipelines, the construction may be of monolithic concrete. Submit details of such joints to the Engineer for approval.
2. Where provisions for future connections are required, provide similar joints and coat with an approved asphaltic compound for protection. If necessary, in the opinion of the Engineer, place a suitable collar entirely around the pipe at all such joints.

## H. Concrete Pipeline Joint Finishing: Provide the following finished joints for steel end ring concrete pipelines with rubber gaskets:

1. Exterior Joint Grouting:
  - a. Grout joints for concrete pipelines using rubber gaskets and steel end rings on the outside with cement mortar composed of 1 part Type II portland cement to 1 part sand by volume.
  - b. Thoroughly mix the materials to produce a uniform mortar with all aggregate particles well coated.
  - c. In grouting the exterior joint, use a cloth diaper to encase the outside diameter of the bell of the pipe and adequately straddle the joint recess to keep out dirt and to serve as a form for grouting.
  - d. Fill the joint space with cement mortar which is just thin enough to run around the joint.
  - e. Leave the diaper in place permanently.
  - f. Before the mortar has taken its initial set, examine the diaper, and if not completely filled, force additional mortar into the joint.
2. Interior Joint Grouting
  - a. Place cement grout in the interior annular joint opening of all steel end ring concrete pipe for pipe sizes 30 inches and larger in diameter.
  - b. Perform interior joint grouting in two phases.
    - (1) Immediately following pipe laying.
    - (2) After backfilling the entire pipeline is complete.

3. Joints for Concrete Pipelines with all-concrete pipe ends:
  - a. Do not grout joints on the outside of the joint for concrete pipelines using rubber gaskets with all-concrete pipe ends.
  - b. Fill the interior annular joint opening with cement mortar and trowel smooth for all pipe 30 inches and larger.
4. Alternative to Grouting
  - a. In place of grouting, use a joint filler consisting of a preformed loop of urethane foam impregnated with unhydrated Portland cement to fill the outside joint recess in prestressed lined cylinder pipe.
  - b. Place the loop, sized to fit the spigot end of the pipe, around the spigot ring behind the gasket groove.
  - c. Draw the pipe joined as described herein home, compressing the rubber gasket and forcing the urethane foam loop to fill the outside annular joint recess.

I. Ductile Iron Pipe Mechanical Joints

1. Assembly: In making up mechanical joints, center the spigot in the bell.
  - a. Thoroughly brush the surfaces with which the rubber gasket comes in contact with a wire brush just prior to assembly of the joint.
  - b. Brush lubricant over the gasket just prior to installation.
  - c. Place the gasket and gland in position, bolts inserted, and the nuts tightened fingertight.
  - d. Tighten the nuts with a torque wrench so that the gland is brought up toward the pipe evenly.
  - e. Prime all bolts by dipping with a bituminous coating, except the threads. Coat threads immediately prior to installation of nuts.

2. Torques: Apply the following range of bolt torques:

<u>Size Inches</u>	<u>Range of Torque - ft. lbs</u>
5/8	45 - 60
3/4	75 - 90
1	85 - 100
1-1/4	105 - 120

3. Remaking of Joints: If effective sealing is not obtained at the maximum torque listed above, disassemble and reassemble the joint after thorough cleaning.

J. Ductile Iron Pipe Rubber Gasket Joints

1. Assembly: In making up the rubber gasket joint, brush the gasket seat in the socket thoroughly with a wire brush and wipe the gasket with a cloth.
  - a. Place the gasket in the socket with the large round end entering first so that the groove fits over the bead in the seat.
  - b. Apply a thin film of lubricant to the inside surface of the gasket that will come in contact with the entering pipe.
  - c. Brush the plain end of the pipe to be entered thoroughly with a wire brush and place it in alignment with the bell of the pipe to which it is to be joined.
  - d. Exert sufficient force on the entering pipe so that its plain end is moved past the gasket until it makes contact with the base of the socket to make the joint.
2. Positioning: Before proceeding with backfilling, feel completely around the joint using a feeler gauge to confirm that the gasket is in its proper position.
  - a. If the gasket can be felt out of position, withdraw the pipe and examine the gasket for cuts or breaks.
  - b. If the gasket has been damaged, replace it with a new one before re-installing the pipe.

**K. Steel Pipe Bell and Spigot Rubber Gasket Joints**

1. Assembly: Thoroughly clean the joint surfaces of both the bell and spigot ends before jointing steel pipe with bell and spigot rubber gasket joints.
  - a. Stretch a clean rubber gasket, lubricated with an approved rubber gasket lubricant, over the spigot and place accurately in position in the spigot groove.
  - b. After the gasket is placed in the spigot groove, adjust the gasket so the tension in the rubber is uniform around the circumference of the joint.
  - c. Clean and lubricate the joint surface of the bell end.
  - d. Center the spigot end in the bell, being careful to avoid dragging the spigot or displacing the gasket, and draw the pipe home, fully compressing the gasket.
  - e. Assemble the joint with the longitudinal axis of the pipe lengths in straight alignment. Deflect joints to make adjustments to line and grade after the joint has been completely assembled. Do not disturb the compressed rubber gasket when deflecting joints.
2. Positioning: Prior to backfilling, feel completely around the joint using a feeler gauge to determine whether the gasket is in its proper position.
  - a. If the gasket can be felt out of position, withdraw the pipe and examine the gasket for cuts or breaks.
  - b. If the gasket has been damaged, replace it with a new one before re-installing the pipe.

**L. Steel Pipe Field Welded Lap Joints:** Perform all welding and testing of welded in accordance with the requirements of Section 15052 – Steel and Stainless Steel Pipe.

**M. Ductile Iron Pipe and Steel Pipe Joint Lining:** For cement mortar lined ductile iron pipe greater than 30 inches in diameter, fill all interior joint recesses with mortar and make recesses smooth and flush with adjacent pipe interior walls in accordance with AWWA C205, Appendix A.2. For cement mortar lined steel pipe 8 inches in diameter and larger, except sleeve type coupling joints, fill all interior joint recesses with mortar and make recesses smooth and flush with adjacent pipe interior walls in accordance with AWWA C205, Appendix A.2. Use Type II portland cement in mortar for interior joint finishing of wastewater pipelines.

N. Water Main Connections

1. Arrange connections to existing city water mains with the NYCDEP Bureau of Water and Sewer Operations.
2. Provide connections of size and in locations as indicated on the Contract Drawings.
3. The cuts in the mains for services requiring wet connections will be made by the NYCDEP or will be performed under the supervision of the NYCDEP. All other work, including the setting of the wet connection sleeves and valves, shall be done by the Contractor.
4. Provide connections and materials meeting the requirement of the NYCDEP Bureau of Water Supply Standard Water Main Specifications.

O. Connections to Existing Sewers and Manholes

1. Arrange connections to existing city sewers and manholes with the NYCDEP Bureau of Water and Sewer Operations.
2. Provide connections of size and in locations as indicated on the Contract Drawings.
3. Provide connections and materials meeting the requirements of the NYCDEP

P. Gas Main Connections

1. Arrange for connection to gas mains with the natural gas supplier (Consolidated Edison).
2. The natural gas supplier will install service piping from the nearest gas main to up to the main service shut-off valve. Installation of the remaining gas piping, including the gas regulator assembly, will be the responsibility of the Contractor. The gas meter will be installed and activated by the natural gas supplier once the natural gas piping has been tested and accepted.
3. Comply with NYC Building Code, NFPA 54, and all rules and regulations of the natural gas supplier.

Q. Temporary Bulkheads: Provide temporary bulkheads at the ends of sections where adjoining pipelines have not been completed, and in connections built into pipelines where adjoining pipelines or structures have not been completed and are not ready to be connected.

1. Remove bulkheads encountered in connecting sewers or structures included in this Contract, or in pipelines or structures previously built, when they are no longer needed or when ordered.
- R. Sleeve Type Couplings: For sleeve type couplings, equally tighten diametrically opposite bolts on the connection so that the gaskets will be brought up evenly all around the pipe.
1. Torque Wrenches: Do the final tightening with torque wrenches set for the torque recommended by the coupling manufacturer.
- S. Concrete Cradle
1. General: When a concrete cradle is shown, specified, or ordered in writing, lay the pipe to grade by supporting each section on concrete blocks located near each end.
    - a. Shape the tops of the blocks to fit the outside diameter of the pipe.
    - b. Set the blocks approximately 3/8 inch low.
    - c. Place the pipe on the blocks on a layer of stiff mortar of sufficient thickness to bring the pipes to exact grade.
    - d. Timber blocking, of a type approved, may be employed in place of concrete blocks.
  2. Cradle: Place Class 25 concrete cradle, on one side only, until it has risen above the invert on the other side, after which deposit the remainder of the concrete on both sides to the pipe spring line.
    - a. Prevent movement of the pipe during concrete placement.
    - b. Conform concrete to Section 03300 – Cast-In-Place Concrete
  3. Backfill: Placing of the pipe on supports or cradles under the pipe does not relieve the Contractor from the work of providing a firm and continuous bed for the pipe by compacting select fill bedding under and around the pipe and between the cradles.
- T. Concrete Encasement: When concrete encasement is to be provided, as shown, specified, or ordered in writing, lay and block the pipeline and place concrete as specified for concrete cradle.
1. Continue the placing of concrete to provide complete encasement to the dimensions shown, specified, or ordered.
  2. Conform concrete to Section 03300 – Cast-In-Place Concrete.

- U. Coatings and Linings: Provide coatings and linings as specified on the Buried Pipe Schedule in this section and in accordance with the requirements of Section 15051 – Ductile Iron Pipe, Section 15052 - Steel and Stainless Steel Pipe.
- V. Valve Box Setting: Install valve boxes vertical and concentric with the valve stem.
  - 1. Satisfactorily reset any valve box which is moved from its original position, preventing the operation of the extension valve stem.
  - 2. Replace any extension valve stem which has been damaged so that it can be operated.
  - 3. Install new valve boxes in accordance with NYCDEP Bureau of Water Supply Standard Water Main Specifications.
- W. Jacking
  - 1. General: Perform jacking as shown. After jacking is completed, seal the ends of the casing pipe with brick masonry.
  - 2. Jacking Pit: Provide jacking pit of adequate length to provide room for the jacking frame, the jacking head, reaction block, the jacks, rig, and jacking pipe.
    - a. Construct the pit to be sufficiently wide to allow ample working space on each side of the jacking frame and sufficiently deep so that the invert of the pipe will be at the elevation desired for the completed line when placed on the guide frame.
    - b. Tightly sheet the pit and keep it dry at all times.
    - c. Provide adequate protective railings at the top of the pit at all times.
  - 3. Jacking Frame: Design the jacking frame so that it applies a uniform pressure over the entire pipe wall area of the pipe to be jacked.
  - 4. Reaction Blocks: Adequately design the reaction blocks to carry the thrust of the jacks to the soil without excessive soil deflection in a manner which avoids any disturbance of adjacent structures or utilities.
  - 5. Hydraulic Jacks: Use hydraulic jacks in the jacking operation, and take extreme care to hold the casing pipe to exact line and grade.
  - 6. Advance Excavation: Advance excavation by augering.

7. Casing Pipe: Furnish steel casing pipe, unless otherwise specified, conforming to ASTM A 139 with wall thicknesses and pipe diameters shown on the Plans. Provide full penetration butt welded pipe joints.
8. Fill Material: Use fill material, consisting of 1-1/4 pounds of Bentonite per gallon of water, during jacking to fill any voids between the casing pipe and the earth.

X. Erection

1. Anchorage: Place anchorage of pipelines and appurtenances as shown or as ordered.
  - a. Accomplish anchorage by placing concrete to the dimensions shown between undisturbed earth and the fitting to be anchored.
2. Valve Setting: Erect valves carefully in their proper positions, free from all distortion and strain, with flanged, mechanical or push-on joints, and pack and leave in satisfactory operating condition.
3. Short Tunnel Construction: Joint pipes to be placed in short tunnels prior to being placed into position.
  - a. Place the pipe into position in a manner which keeps joints tight.

- Y. Restoration and Temporary Pavement Work: All restoration and temporary pavement work shall be completed within 30 working days after the installation of underground piping is completed.

3.02 FIELD QUALITY CONTROL

- A. Testing: Test pipelines in accordance with Section 02505 – Leakage Tests.

1. Test valves in place, as far as practicable, and correct any defects in valves or connections.

B. Pressure Testing for Natural Gas Piping

1. The natural gas supplier requires an inspection of prior to trench backfill of any below-grade customer-owned gas piping that meets the definition of a gas service, such as piping from a remote meter location to the building. Contractor shall notify the supplier at least 48 hours prior to the time the piping is expected to be ready for this inspection.
2. For below-grade customer owned gas piping installations, the Contractor must perform an acceptance test to verify the conditions of the cathodic protection measures installed. This test, which shall be performed after the installation of the pipe and prior to the setting of the meter, only indicates the

condition of the cathodic protection at the time of testing. Any corrective action required by virtue of test results shall be the contractor's responsibility. The natural gas supplier reserves the right to perform a cathodic protection acceptance test on any given installation.

3. All piping shall be pressure tested according to the requirements of the natural gas supplier, New York City Building Code, and NFPA 54.
  4. The Contractor shall notify the office of the New York City Fire Marshall of all field tests of natural gas piping 15 days prior to the date of testing. The Fire Marshall shall witness all testing.
  5. The gas meter will not be installed and the service will not be activated until the natural gas supplier has accepted the installation.
- C. Inspection: Clean, inspect, and examine each piece of pipe and each fitting and special for defects before it is installed.
1. Cut away any lumps or projections on the face of the spigot end or the shoulder.
  2. Do not use any cracked, broken, or defective pieces in the work.
  3. If any defective piece should be discovered after having been installed, remove and replace this piece with a sound piece in a satisfactory manner at no increase in Contract Amount.

### 3.03 CLEANING

- A. General: Thoroughly clean all pipe before it is laid and keep it clean until it is accepted in the completed work.
- B. Removal of Materials: Exercise special care to avoid leaving bits of wood, dirt, and other foreign particles in the pipe. If any particles are discovered before the final acceptance of the work, remove and clean the pipe.

### 3.04 DISINFECTION

- A. Disinfect all pipelines that are to carry potable water in accordance with Section 15141 - Disinfection.

## 3.05 SCHEDULE

## A. Definitions: Abbreviations used in the schedule are:

## 1. Pipe Materials

a.	Al	Aluminum
b.	Br	Brass
c.	C	Concrete
d.	CPVC	Chlorinated Polyvinyl Chloride
e.	CU	Copper
f.	DI	Ductile Iron
g.	PCCP	Prestressed Concrete Cylinder Pipe
h.	PE	Polyethylene
i.	PVC	Polyvinyl Chloride
j.	RCP	Reinforced Concrete Pipe
k.	RCPP	Reinforced Concrete Pressure Pipe
l.	SS	Stainless Steel
m.	St	Steel

## 2. Joints

a.	B	Bituminous
b.	B&S	Bell and Spigot
c.	F	Flanged
d.	G	Grooved End
e.	H	Harnessed
f.	HSC	Hub and Spigot - Compression Gasket
g.	MJ	Mechanical Joint
h.	PO	Push-on Joint
i.	RPOJ	Restrained Push-on Joint
j.	RRG	Restrained Retainer Gland
k.	RS	Rubber and Steel
l.	Sd	Soldered
m.	Sl	Sleeve Type Coupling
n.	SW	Solvent Welded
o.	Thd	Threaded
p.	W	Welded

## 3. Coatings and Linings

a.	BC	Bituminous - Cold Application
b.	CE	Concrete Encased
c.	CL	Cement-Mortar Lined
d.	E	Epoxy
e.	G	Galvanized
f.	GL	Glass Lined
g.	I	Insulated

h.	KL	Polyvinylidene Fluoride (PVDF or KYNAR®)
i.	P	Painted
j.	PEW	Polyethylene Wrapped
k.	PPL	Polypropylene Lined
l.	RC	Rubber Coated
m.	RL	Rubber Lined
n.	SL	Polyvinylidene Chloride (PVDC or SARAN ®)
o.	TC	Tape Coated
p.	W	Wrapped

B. Schedule: Provide products as listed in the following schedule:

-END OF SECTION-

BURIED PIPING SCHEDULE								
Service	Size (inches)	Pipe Material	Protective Coatings		Joints	Test Pressure (psig)	Pipe Class/ Wall Thickness/ Schedule	Remarks
			Interior	Exterior				
City Water, Siamese and Fire Protection	4 to 10	DI	CL	PEW	RPOJ	150	56	
Storm and Sanitary Sewer	12 to 30	RCP	--	--	B&S	--	V	See Note 2
	6 to 10	DI	CL	PEW	RPOJ	--	56	See Note 2
Sanitary Sewer Force Main	4 to 12	DI	CL	PEW	RPOJ	150	56	
Natural Gas	1.5 to 4	ST	--	W/TC	W	95	Sch 40	See Note 4
Diesel Fuel Piping	2/4	304LSS/ FRP	--	--	WLD/SW	150	Sch 50	See Note 5
Vapor Return Piping	2/4	304LSS/ FRP	--	--	WLD/SW	150	Sch 50	See Note 5

## Notes:

1. Encase all piping below concrete structures with concrete. Provide concrete encasement where shown on Contract Drawings. No exterior coating is required on portion of pipe encased in concrete.
2. Pressure and leakage testing requirements and procedures are specified in Section 02505 - Leakage Tests.
3. All connections to valves and equipment shall be made with flanged joints.
4. Install and test natural gas piping in accordance with NYC Building Code, NFPA 54, and all rules and regulations of the natural gas supplier.
5. Diesel fuel and vapor return piping shall be double wall containment piping with 2 inch type 304 L stainless steel carrier and 4 inch FRP containment pipe as specified in Section 15191 - Diesel Fuel Piping. Diesel fuel piping shall also be incased in concrete when passing through the building. No other pipe lines shall be incased in the same concrete encasement.

**Section 02504**  
**SANITARY AND STORM SEWER STRUCTURES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for furnishing and installing precast and cast-in-place concrete drainage structures including, but are not limited to: manholes, inlets, catch basins, trench drains, area drains, pipe cradles and encasements, splash pads and other structures in sanitary sewers and storm sewers including all appurtenances. Section also includes requirements for fiberglass trench drains and appurtenances.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 02316 - Excavation
- C. Section 02317 - Backfilling
- D. Section 03200 - Concrete Reinforcement
- E. Section 03300 - Cast-in-Place Concrete

- K. ASTM C923 - Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes and Laterals
- L. AWWA C302 - Reinforced Concrete Pressure Pipe, Non-Cylinder Type
- M. New York City Department of Environmental Protection (NYCDEP) Sewer Design Standards

#### 1.04 DESIGN REQUIREMENTS

- A. Except as otherwise shown or specified, construct sewer manholes and catch basins of precast reinforced concrete sections conforming to ASTM C478.
- B. Unless otherwise shown, manholes and catch basins shall be built in accordance with the Sewer Design Standards of the NYCDEP, except that they shall be constructed without steps.
- C. Trench drains shall be constructed of precast, interlocking modular components.
- D. Fiberglass trench drains shall be constructed of resin vinylester suitable for 15% sodium hypochlorite at 100°F with a resin of Hetron 922 or approved equal.

#### 1.05 SUBMITTALS

- A. Contractor shall submit working drawings and material specifications for the approval of the Engineer in accordance with the requirements of Section 01330 – Shop Drawings.
- B. Contractor shall submit shop and field test reports of concrete samples tested in an approved laboratory.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Take every precaution to prevent injury to the structures during transportation and unloading. Unload manhole sections and other precast items using skids, pipe hooks, rope slings, or suitable power equipment, if necessary, and keep the items under control at all times. Do not allow the items to be dropped, dumped or dragged under any conditions.
- B. Damaged Section: If any precast manhole section or other structural unit is damaged in the process of transportation or handling, reject and immediately remove the item from the site, and replace it at no increase in Contract Amount.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

#### A. Precast Manholes

1. Monarch Precast Concrete Corp.
2. Precast Concrete Sales Company
3. Long Island Precast, Inc.
4. Or approved equal

#### B. Precast Inlets

1. Monarch Precast Concrete Corp.
2. Rotondo/Penn-Cast Products, Inc.
3. Precast Concrete Sales Company
4. Or approved equal

#### C. Precast Catch Basins

1. Monarch Precast Concrete Corp.
2. Rotondo/Penn-Cast Products, Inc.
3. Long Island Precast, Inc.
4. Precast Concrete Sales Company
5. Or approved equal

#### D. Polymer Concrete Trench Drains

1. ABT, Inc.
2. ACO Polymer Products, Inc.
3. Or approved equal

#### E. Fiberglass Trench Drains

1. ACO Polymer Products, Inc.
2. Aquaduct, Inc., Monroe, NC
3. Or approved equal

### 2.02 MATERIALS

- A. Concrete, Steel Reinforcement and Aggregates: For precast manholes, catch basins, inlets, and other sanitary and storm sewer structures, reinforced concrete, cementitious materials, aggregates and steel reinforcement shall conform to the requirements of ASTM C478. If concrete rings are used for adjusting manhole frames to grade, they shall conform to the requirements of ASTM C139. For cast-in-place structures, these materials shall conform to Section 03200 – Concrete Reinforcement and Section 03300 – Cast-In-Place Concrete.

- B. Brick: If brick is used for adjusting manhole and catch basin frames to grade, it shall conform to ASTM C32, Grade MS, with minimum dimensions of 2¼ by 3½ by 7½ inches. Brick shall be new, solid, sound, hard burned throughout and uniform in size and quality.
- C. Mortar: Provide mortar that is composed of one part Type II Portland cement or Portland pozzolan cement to two parts sand. Sand shall be natural sand that conforms to the requirements of ASTM C144.
- D. Frames and Covers: Frames, covers, gratings and miscellaneous metal castings shown in the NYCDEP Sewer Design Standards or on the Contract Drawings for installation on manholes, catch basins, trench drains and other sanitary structures shall be gray iron and shall meet the requirements of Section 05561 – Miscellaneous Metal Castings. Grating for trench drains shall be compatible with the trench drain manufacturer's systems and recommendations.
- E. O-Ring Rubber Gaskets: Provide O-ring rubber gaskets conforming to ASTM C443 for joining manhole sections.
- F. Pipe Connections: Provide resilient connectors conforming to ASTM C923 for making connections between manholes and sewer pipes.
- G. Polymer Concrete Trench Drains
1. The trench drain shall be formed from high strength, durable polymer concrete, meeting or exceeding the following requirements:

Property	ASTM Designation	Polymer Concrete
Compressive Strength	C39	14,000 psi
Tensile Strength	C78	1,500 psi
Freeze Thaw	C666	1,700 cycles (no weight loss)
Chemical Resistance	C279	Resistant to most acids and alkali
Absorption of Moisture	C140	Less than 0.2 (surface wetting only)

2. Sealant for Polymer Concrete Trench Drains. Joints between channel sections shall be sealed during installation with a material recommended by manufacturer.

H. Fiberglass Trench Drains

1. Fiberglass trench drains shall be manufactured from fiberglass reinforced plastic utilizing vinylester. FRP fabrication shall be of the hand lay-up type.

The trench drain systems utilizing polymer resins with aggregate or sand are not acceptable. To reduce air entrapment, no pigment shall be used on the resin system. A double synthetic veil shall be provided on the inner trench surfaces and an ultraviolet inhibitor shall be provided. Cobalt compounds shall not be used in any way.

2. The trench drains shall have a built-in slope of not less than 1%, and shall be furnished in modular lengths of 6 feet. Modules shall have a bottom radius of not less than 2 inches expanding to a nominal inlet opening of 8 inches. Modules shall be joined together with a lap joint not less than 2 inches to provide a positive seal, and joint shall be designed so as to minimize disturbance of flow. Joints between channel sections shall be sealed during installation with a material recommended by manufacturer.
  3. Channel modules shall incorporate flanges predrilled to accept the appropriate grate frame, as specified. Frames shall be of all welded construction with welded stainless steel concrete anchors and threaded for grate lockdown.
  4. Written certification from the manufacturer is required for each of the specified materials and fabrication techniques.
- I. Trench Drain Inlet and Outlets. Size and arrangement shall be as shown on Contract Drawings.

## 2.03 CONSTRUCTION OF MANHOLES

- A. Manhole Base Section: Unless otherwise shown, provide manhole base sections consisting of a base riser section with an integral floor. When benches are made at the manufacturing site, provide concrete used for benched inverts conforming to the requirements for concrete used for precast sections. When benches are made in the field, Class 45 concrete may be used. Benches shall be float finished and sloped to drain.
- B. O-ring Joints: Join riser, cone and flat slab top sections with O-ring rubber gasket joints or self-sealing butyl gaskets, as shown in the NYCDEP Sewer Design Standards. Fill voids in the joints completely with mortar after assembly of the sections.

## 2.04 SOURCE QUALITY CONTROL

- A. Concrete Strength: Manhole sections will be inspected and tested by an independent, certified testing laboratory, retained by the Construction Manager, to establish the strength of the concrete and the adequacy of curing, to certify the date that the sections were cast and to confirm that the reinforcing steel has been properly placed. This inspection and testing will be performed by the laboratory at the manufacturing plant prior to shipment.

1. A minimum of one set of three cylinders will be taken each day that manhole sections are cast, with batch samples to be designated by the laboratory representative. At least one set of cylinders will be taken from each 9 cubic yards of concrete used in manhole section construction. These samples will be tested for strength. If the samples fail to meet specified minimum concrete strength requirements, all manhole sections manufactured from the concrete from which the cylinders were made will be rejected.
  2. The City reserves the right to core manholes either at the job site or point of delivery to validate strength of concrete and placement of steel. If cores fail to demonstrate the required strength or indicate incorrect placement of reinforcing steel, all sections not previously tested will be considered rejected until sufficient additional cores are tested, at no increase in Contract Amount, to substantiate conformance to these requirements.
- B. Acceptance of flat slab tops will be based on the tops passing a proof-of-design test in accordance with ASTM C478. One flat slab top for each design shall be tested.

## 2.05 PRECAST PRODUCTS

- A. Unless otherwise shown or specified, precast concrete products shall be used for sanitary and storm sewer structures.
- B. The number of joints in manhole and catch basin riser sections shall be kept to a minimum by using sections 8'-0" long in so far as possible. Joints shall be tongue and groove type conforming to AWWA C302, with continuous steel reinforcement in the tongue and bell.
- C. Wet-cast methods only shall be used. Forms shall leave the surfaces smooth and free of irregularities or honeycombing.
- D. Unless otherwise shown or specified, the following design loadings shall be used with 30 percent impact allowance in roads and 15 percent elsewhere.
1. Earth = 130 PC
  2. Wheel = H-20
- E. Unless otherwise shown or specified, wall thickness for manholes and catch basins shall be not less than:
1. 5 inches for walls
  2. 8 inches for top slab
- F. No more than two (2) tapered lifting holes shall be provided per section of manhole or lifting holes shall be filled with tapered rubber plugs.

- G. The point of intersection (P.I.) of pipes shall be marked with a pin in the manhole floor.
- H. The date of manufacture and the manufacturer's trademark shall be marked inside each manhole and catch basin barrel.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Excavation and Backfill: Perform excavation and backfill in accordance with Section 02316 – Excavation and Section 02317 - Backfilling.
- B. Precast Items
  - 1. Place structure on select fill bed or concrete pile cap and set level as shown:
    - a. Where pile supports are required, set structure on the pile cap as shown on the Contract Drawings.
    - b. Where pile supports are not required, set on six inches of compacted select fill in accordance with Section 02317 – Backfilling.
  - 2. Backfill the area that is excavated adjacent to the structure and under the pipe with select fill to prevent settlement and provide for support for the pipe from the manhole edge to the regular trench excavation.
  - 3. Place backfill in even lifts on all sides to prevent overturning loads.
  - 4. Set structures at the proper grade and alignment to provide a smooth transition from the incoming pipe(s) to the outgoing pipe.
- C. Connections to Sewers: Provide connections to sewer pipes in accordance with NYCDEP Sewer Design Standards:
  - 1. Manufacture riser sections with openings properly located for making connections to sewers. The minimum distance between a joint in a manhole section and the nearest edge of an opening for a connecting sewer and the diameter of such openings shall be as shown in the NYCDEP Sewer Design Standards.
  - 2. Provide a connection between the structure and the pipe that is watertight and an invert that is smooth and continuous as it enters and exits the manhole. Sewer pipe shall not protrude into the trough of the manhole.
  - 3. Join inlet and outlet pipes to the structure with a flexible watertight connection. Seal pipe in the structure openings with a resilient connector

meeting the requirements of ASTM C923. Resilient connector shall be cast integrally into the wall of the manhole section at time of manufacture, or, shall be installed by mechanical means in openings cut into manhole wall per ASTM C 923.

D. Coatings: Precast structures below grade shall be coated with coal tar epoxy applied in two (2) coats, eight (8) mils each.

E. Laying Masonry

1. Bricks shall be wetted before applying mortar.
2. Full bed, end and side joints shall be formed in one operation.
3. Horizontal joints shall be 3/8 inch maximum and radial joints shall be 1/4 inch maximum.
4. Keyways shall be completely filled with mortar.
5. The total amount of adjustment by bricks or concrete rings shall not exceed 12 inches.

F. Stubs for Future Connections: Where shown, provide stubs or bells cast in walls and provide approved plugs or caps.

G. Trench Drains: Follow manufacturer's recommendations for installation methods. Forming system for fiberglass trench drains shall be designed so that no portion of fiberglass form is exposed to traffic upon completion of installation.

H. Grading

1. Manholes and catch basins shall be installed such that covers will be at final grade.
2. Structures shall not project above finished pavements.
3. Structures in areas with temporary working grades shall be initially installed to match the temporary grade, and adjusted later to final grade prior to regrading.
4. Contractor shall be responsible for setting structures to the proper grade. The Engineer's review will be general and will apply to components only.

### 3.02 LEAKAGE TESTS

A. Test the structures for leakage after installation in accordance with Section 02505 – Leakage Tests.

3.03 MANUFACTURER'S SERVICES

- A. The Contractor shall furnish the services of an accredited representative of the fiberglass trench drain system manufacturer for a period of 2 days to supervise the installation.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02505**  
**LEAKAGE TESTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Leakage testing for all pipelines and structures required to be watertight or airtight.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 15120 - Interior and Exposed Piping Schedule
- C. Section 02503 - Installation of Buried Pipelines

**1.03 REFERENCES**

- A. ACI 350.1R - Testing Reinforced Concrete Structures for Watertightness
- B. ASTM C361 - Reinforced Concrete Low-Head Pressure Pipe
- C. AWWA C600 - Installation of Ductile-Iron Water Mains and Their Appurtenances
- D. New York City Building Code
- E. New York City Department of Environmental Protection (NYCDEP), Bureau of Water Supply Standard Water Main Specifications

**1.04 PERFORMANCE REQUIREMENTS**

- A. Written Notification of Testing: Provide written notice at least two weeks prior to date of testing.
- B. No tests shall be conducted without an approved written procedure.
- C. All leakage tests shall be conducted in the presence of the Engineer. The tests shall be repeated in the presence of local authorities having jurisdiction if required by them.
- D. The Contractor shall furnish all labor, equipment, air, water and materials, including meters, gauges, blower, pumps, compressors, fuel, water, bulkheads, temporary weirs, valves, plugs and accessory equipment.

## 1.05 SUBMITTALS

- A. All submittals, including the following, shall be provided as specified in Section 01330 – Shop Drawings.
- B. Testing procedures shall be submitted for approval at least 30 days prior to the test.
- C. Testing Report: Prior to placing the piping system or structure in service, submit for review and approval a detailed bound report summarizing the leakage test data, describing the test procedure and showing the calculations on which the leakage test data is based.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

## 3.01 GENERAL

- A. All pipelines and structures required to be watertight or airtight shall be tested for leakage. Piping and structures which fail the leakage test shall be repaired or replaced to the satisfaction of the Engineer and retested until leakage test results are acceptable.
- B. Operation of Existing Facilities: Conduct all tests in a manner to minimize as much as possible any interference with the day-to-day operations of existing facilities or other contractors working on the site.
- C. Test gravity sewers and drain lines by an Infiltration Test as specified.
- D. Test air and gas lines with compressed air.
- E. Test water mains with water under the specified pressure and in accordance with NYCDEP Standard Water Main Specifications.
- F. Test all other pipelines with water under the specified pressures.
- G. Test vents and drains in plumbing systems and all cast iron soil pipe lines in accordance with Section C26-1606.0 of the New York City Building Code unless otherwise specified. Unless specified otherwise, test all vents and drains on process piping as for plumbing systems.
- H. Leakage in pipelines of other than circular section shall not exceed an amount based on a circular section having an equivalent inner perimeter.

### 3.02 PRESSURE TESTS OF EXPOSED PIPING

- A. Testing: Pressure test exposed pipelines for leakage by maintaining the fluid in the pipe at the specified pressure for a period of 60 minutes. Examine all accessible joints during the test. Stop all visible leakage and provide repairs as specified in 3.06 – Repair of Leaking Pipes.
- B. Test Pressures: Test the various pipelines at the test pressures specified in Section 02503 - Installation of Buried Pipelines and Section 15120 – Interior and Exposed Piping Schedule.
- C. Backfill: Do not backfill the trench until all visible leaks or other defects have been repaired to the satisfaction of the Engineer.

### 3.03 PRESSURE TESTS OF BURIED OR CONCEALED DUCTILE-IRON PIPELINES AND FORCE MAINS

- A. Testing
  - 1. Completely backfill all harnessed sections of buried piping before such sections are tested. Non-harnessed sections of buried piping shall be tested before backfilling.
  - 2. Pressure test buried or concealed pipelines for leakage by maintaining the fluid in the pipe at the specified pressure for a minimum period of 4 hours.
  - 3. Pressure test the piping for leakage as a whole or in sections, valved or bulkheaded at the ends. Apply the specified pressure to the piping through a tap in the pipe by means of a hand pump or other approved method. Do not use air for testing.
  - 4. Test the piping at the test pressures specified in Section 02503 – Installation of Buried Pipelines.
- B. Allowable Leakage: Stop all visible leakage. Do not allow leakage for any piping, as determined by the above test, to exceed the allowable leakage for ductile iron water mains as given by the following formula in Section 4 of AWWA C600 in which L is the allowable leakage in gallons per hour, S is the length of water main tested in feet, D is the nominal diameter of the pipe in inches and P is the average test pressure in psi gauge:

$$L = \frac{S \times D \times (P)^{1/2}}{133,200}$$

### 3.04 VALVE TESTING

- A. Testing: Operate valves in the section under test through several complete cycles of closing and opening. In addition, have the test pressure for each valve, when in the closed position, applied to one side of the valve only. Test each end of the valve in this manner.
- B. Test Pressure: Test each valve at the same test pressure as that specified for the pipe in which the valve is installed.
- C. Leakage: Stop all external and internal leakage through the valves.
- D. Movement: Stop all valve movement or structural distress.

### 3.05 LEAKAGE TESTS FOR GRAVITY SEWERS

- A. Submerged Testing Procedure: When the groundwater level is above the sewer, test sewers for infiltration as follows:
  - 1. Measure the infiltrated flow of water by means of a weir set up in the invert of the sewer at a known distance from a temporary bulkhead or other limiting point of infiltration.
  - 2. Test after the sewer or sewers have been pumped out, if necessary.
  - 3. Do not start testing until normal infiltration conditions are established in the work to be tested.
    - a. Inspect gravity sewer visually for infiltration.
    - b. Pump the sewers dry and make sure the groundwater level is above the crown of the sewer.
    - c. Inspect the sewer on the inside and seal all visible leaks completely.
- B. Non-Submerged Testing Procedure: If the groundwater level is below the top of the sewer, test for leakage as follows:
  - 1. Construct a bulkhead in the sewer at the manhole at the lower end of the section under test.
  - 2. Fill the section being tested with water until the level of water is four feet above the crown of the sewer in the manhole at the upper end of the test section. For concrete sewers, allow the water to remain in the piping for at least 12 hours before conducting the tests.

3. Leakage will be the measured amount of water added to maintain the water at that level.
- C. Carry on tests for a minimum of eight hours with readings at 60-minute intervals.
- D. In computing the length of sewer contributing infiltration or leakage, include the length of house connections tested, if any, in the total length.
- E. The quantity of infiltration or leakage for sewers shall not exceed 200 gallons per inch of diameter per mile per 24 hours for sewers up to and including 24 inches in diameter, and shall not exceed 5,000 gallons per mile per 24 hours for all sizes larger than 24 inches in diameter.

### 3.06 REPAIR OF PIPING LEAKS

- A. Procedures: Repair leaks as follows:
  1. Replace broken pipe or joint assemblies found to leak. Regardless of the amount of infiltration or leakage measured, repair and seal all visible or detectable leaks in the piping, sewers, manholes, structures, and other appurtenances.
  2. When leakage occurs in excess of the specified amount, locate and repair defective manholes, valves, pipe, cleanouts or joints.
  3. If defective portions cannot be located, remove and reconstruct as much of the original work as necessary to obtain piping that meets the leakage or infiltration requirements specified herein and retest, all at no addition to the Contract Price.

### 3.07 LEAKAGE TESTS FOR CONCRETE STRUCTURES

- A. Leakage tests of wet wells, tanks, channels, containment areas, and other water retaining structures shall be performed following the requirements of ACI 350.1R and as specified herein. The Contractor shall supply all materials and labor needed to conduct the test as directed by the Engineer.
- B. Prior to start of leakage testing, the following requirements shall be met.
  1. All elements of the structure which resist any portion of the retained liquid pressure shall be in place and at specified strength levels. All concrete shall be fully cured.
  2. Structure walls shall not be backfilled prior to leakage testing.
  3. All valves, gates, blind flanges, and other non-concrete items which control the flow or otherwise retain the liquid contents of the structure, shall be

checked for watertightness. If not watertight, means shall be taken to assure watertightness during the period of the leakage test.

4. The portions of the structure to be tested shall be cleaned of all construction debris, standing water, soil, foreign materials and any other material which interferes with the exposed concrete surfaces of the structure.
5. Defective concrete shall be repaired.
6. The Contractor shall notify the Engineer a minimum of 24 hours prior to start of filling of structure for leakage testing. Leakage testing shall not start until the structure is inspected by the Engineer.

C. Filling the Structure with Water

1. The portion of the structure to be tested shall be filled at a rate not to exceed two feet per hour.
2. The structure shall be filled to the normal operating depth of the structure as indicated on the Contract Drawings. Where no operating depth is indicated or where operating depth is controlled by flowing over a weir, the structure shall be filled to a depth 6 inches below the weir or top of wall elevation, whichever is lower.
3. Water in the structure shall be maintained at the specified test elevation for a minimum of three days prior to the start of the leakage test.

D. After water has been brought to the test elevation, the exposed elements of the structure shall be inspected for leakage. All locations which exhibit any amount of leakage flow shall be repaired prior to the start of leakage testing.

E. The leakage test duration shall be determined by the Engineer based on ACI 350.1R but shall not be less than 3 days.

F. Leakage Allowance

1. For unlined concrete structures, the maximum allowable leakage rate shall be 0.075 percent of the volume per 24-hour period.
2. For concrete structures with walls lined by a waterproof material, the maximum allowable leakage rate shall be 0.050 percent of the volume per 24 hour period.

### G. Test Locations

1. Structure cells which are less than 1000 square feet in area shall have measurements of water level taken at two locations which are located approximately 180 degrees apart.
2. Structure cells which are greater than 1000 square feet in area shall have measurements of water level taken at four locations which are located approximately 90 degrees apart.
3. Each test location shall be marked and given a reference number. A reference point shall be marked on the face of the wall above the test water surface in a manner which will prevent its movement or deterioration during the period of the test.
4. Test locations must be approved by the Engineer.

### H. Evaporation and Precipitation Measuring

1. In open structures, a clear plastic calibrated open-top container not less than 18 inches in diameter and depth shall be partially filled, floated in the tank, and held in position near each measurement location.
2. The container shall be located so as not to be shaded by tank walls and away from any items passing over it such as beams or pipes.

### I. Test Measurements

1. Leakage tests shall not be started when periods of severe weather conditions or major changes in average daily temperature are predicted.
2. The following measurements shall be recorded at each test location at the start of the test period and at 24-hour intervals thereafter:
  - a. Distance from reference point to test water surface
  - b. Depth of water in the floating container
  - c. Temperature of the test water at 18 inches below water surface
  - d. Temperature of the water in the evaporation-precipitation container at mid-depth

### J. Leakage Determination

1. The change in water surface elevation at each test location shall be averaged and adjusted as follows.

2. The total change in test water surface elevation shall be adjusted by the average change in water surface elevation in the evaporation-precipitation containers.
3. Where averaged water temperature measurements vary by more than 3 degrees from start to completion of the test period, adjustment in tank volume shall be determined by change of water density resulting from the change in the average water temperature.

K. Retesting

1. The leakage test shall be considered as failed if the specified leakage allowance is exceeded or if any leakage is observed.
2. If the test becomes unreliable due to excessive precipitation or other external factors, it shall be restarted.
3. If a leakage test fails, it may be retested immediately without repairs if approved by the Engineer. If subsequent leakage tests fail, the Contractor shall repair all probable areas of leakage and the leakage test shall be repeated. The structure shall be retested until it meets the specified leakage criteria. Repairs shall be made to the probable leakage areas before each retest.

3.08 LEAKAGE TESTS FOR NON-CONCRETE STRUCTURES

- A. Steel, poly and fiberglass-reinforced plastic tanks and similar structures shall be tested for leakage by bulkheading the openings and filling the structure with water to 6 inches below the overflow water level. The tank shall be kept full until the water temperature has stabilized, but not less than 24 hours before the start of the leakage test. The leakage test shall consist of measuring the water surface elevation from a fixed point on the tank at two locations 180 degrees apart. Measurements shall be taken at the start of the test and 24 hours later.
- B. Testing shall be performed before the installation of mechanical equipment and before applying any waterproofing coatings to the outside surfaces.
- C. The exterior surface of the structure shall be inspected for leakage, especially in areas around joints.
- D. Where environmental conditions could lead to changes in water level due to evaporation or precipitation, measurement of these factors shall be made as specified for testing concrete structures.
- E. The leakage test shall be considered failed if there is any measurable drop in the water surface (after adjusting for evaporation and precipitation) during the 24-hour test period or if there is any visible leakage.

- F. If visible leaks appear or if leakage exceeds the allowable limit, the structure shall be repaired by removing and replacing the leaking portions of the structure, waterproofing the inside, or by other approved methods. After repairs are complete, the test shall be repeated.

#### 1.04 DEFINITIONS

- A. California Bearing Ratio (CBR): The ratio of (1) the force per unit area required to penetrate a soil mass with a 19 sq. cm (3 sq. in.) circular piston (approximately 51 mm (2 in.) diameter) at the rate of 1.3mm/min (.05 in/min) to (2) that required for corresponding penetration of a standard material.

- B. Minimum Average Roll Value (MARV): Property value calculated as typical minus two standard deviations. Statistically, it yields a 97.7 percent degree of confidence that any sample taken during quality assurance testing will exceed value reported.
- C. Typical Roll Value: Property value calculated from average or mean obtained from test data.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  - 1. The bituminous mix design for both the binder course and the wearing course, which shall include the sources of all ingredient materials, the penetration of the asphaltic cement and the percentages by weight and the number of pounds of each of the materials making up one batch.
  - 2. The laboratory analysis of the bituminous mix and the laboratory compacted density.
  - 3. Manufacturer's literature including physical, mechanical and chemical properties of the geotextile.
  - 4. Certification of geotextile's minimum average roll values and tests used to determine those properties.
  - 5. Certificate of Compliance stating that the geotextile conforms to the Specifications and the manufacturer is aware of and agrees with its intended use.
  - 6. Geotextile manufacturer's qualifications: ISO 9002 certified.
  - 7. Manufacturing quality control test results on geotextiles.

#### 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/1968, and the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Geotextile Manufacturer Qualifications: Manufacturer shall be ISO 9002 certified. Provide proof of certification or demonstrate that the standards and experience required for certification are possessed, all to the satisfaction of the Commissioner.

## 1.07 DELIVERY, STORAGE AND HANDLING

- A. Wrap geotextile in black protective wrap.
- B. The geotextile rolls shall be labeled as per ASTM D4873.
- C. Deliver, store and handle rolls in manner to prevent damage.
- D. After unloading, inspect rolls for defects and damage.
- E. Do not leave covered rolls exposed to elements for more than 30 days unless additional heavy-duty waterproof cover is provided. At no time shall the geotextile be exposed to ultraviolet light for a period exceeding 14 days.
- F. Store rolls off ground, protected from precipitation, ultraviolet radiation, strong chemicals, sparks and flames, temperatures in excess of 160°F and other environmental conditions that could cause damage to geotextile.
- G. Prevent damage to wrappings and geotextile.

## PART 2 PRODUCTS

## 2.01 GEOTEXTILE MANUFACTURERS

- A. Amoco Fabrics & Fibers Co./Amoco 2006
- B. Nicolon Mirafi Group/600X
- C. Synthetic Industries/Geotex315ST
- D. Or approved equal.

## 2.02 MATERIALS

- A. Geotextile: Provide geotextile fabric conforming to the requirements specified in this Section:
  - 1. Woven slit film polypropylene geotextile; individual slit films woven together in manner to provide dimensional stability relative to each other.
  - 2. Resistant to ultraviolet degradation and biological and chemical environments normally found in soils.
  - 3. Minimum Average Roll Values

Property	Test Method	Units	Results
Wide Width Tensile Strength	ASTM D4595	kN/m (lbs/in)	31x30.6 (175 x 175)
Grab Tensile Strength	ASTM D4632	N (lbs)	1335 x 1335

Property	Test Method	Units	Results
Grab Elongation	ASTM D4632	Percent	15 x 15
Puncture Strength	ASTM D4833	N (lbs)	555 (125)
Mullen Burst	ASTM D3786	KPa (psi)	4475 (650)
Trapezoidal Tear	ASTM D4533	N (lbs)	530 x 530
Apparent Opening Size	ASTM D4751	mm	0.212
Permittivity	ASTM D4491	sec-1	0.06
Water Flow Rate	ASTM D4491	1/min/m <sup>2</sup> (gpm/ft <sup>2</sup> )	200 (5)
UV Resistance (percent retained at 500 hours)	ASTM D4355	Percent	90

B. Roads: Provide asphaltic concrete pavement for roadways conforming to the requirements specified in this Section and to the following standards:

1. Bottom Course: Broken stone, NYCDOT, Bureau of Highway Operations Standard Specifications, Section 403-2.02, Aggregate-Coarse, Type 1, Grade B, Sizes No. 1, No. 2 and No. 4. Provide bottom course consisting of a uniform mixture of broken stone, Size Nos. 1 and 2, and add No. 4 as a filler after the coarser mixture has been rolled and compacted.
2. Tack Coat: Asphalt emulsion, NYSDOT Standard Specifications, material designation 702-9.
3. Binder Course: Binder mixture, NYSDOT Standard Specifications, Subsections 403-2.01 through 403.2.06, Table 403-1, Type 3.
4. Wearing Course: NYSDOT Standard Specifications, Subsections 403-2.01 through 403-2.06, Table 403-1, Type 6F2.
5. Treated Permeable Base: NYSTDOT Standard Specifications, Subsection 402.01 through 402.02, Table 402.1, Type 1 F9.
6. Select Granular Subgrade: NYSDOT Standard Specifications, Subsections 203-2.02-E.
7. Subbase Layer: NYSTDOT Standard Specifications, Subsections 403-2.01 through 403.2.06, Table 403-1, Type 2.
8. Surface Course: NYSDOT Standard Specification, Subsection 411-2.01.

- C. Walks: Provide asphaltic pavement for walks conforming to the requirements specified in this section and to the following standards:

1. Bottom Course: Asphaltic concrete mixture, NYSDOT Standard Specifications, Subsections 403-2.01 through 403-2.03, Table 403-1, Type 1.

## 2.03 QUALITY CONTROL

- A. Geotextile Manufacturing Quality Control: Testing shall be performed by the manufacturer at a laboratory accredited by GAI-LAP for tests required for the geotextile, at frequency exceeding provisions of ASTM D4354, with following minimum acceptable testing frequency:

Property	Test Method	Test Frequency sq m (sq ft)
Grab Tensile Strength	ASTM D4632	1/10,000 (100,000)
Grab Elongation	ASTM D4632	1/10,000 (100,000)
Trapezoidal Tear	ASTM D4533	1/10,000 (100,000)
Mullen Burst	ASTM D3786	1/10,000 (100,000)

- B. Geotextile Conformance Testing:

1. Upon delivery to site, the Construction Manager will remove samples of geotextile and send to laboratory for testing.
2. Testing will be performed at a laboratory accredited by GAI-LAP in accordance with ASTM D4759, Practice A.

## PART 3 EXECUTION

### 3.01 ROADS

- A. Asphaltic concrete pavement roads shall consist of Typical Heavy Duty Asphalt Pavement:
1. Preparation of compacted subgrade
  2. A select granular subgrade
  3. A layer of geotextile fabric laid over granular subgrade
  4. A subbase layer ( of broken stone)
  5. A layer of treated permeable base
  6. A layer of binder course
  7. A surface course

**B. Preparation of Subgrade**

1. Remove to a depth of 24 inches, top soil, boulders, muck, soft clay, spongy material and any other objectionable material. Replace removed material with approved compacted select fill material in conformance with Section 02317 – Backfilling to promote positive drainage.
2. On sites where it appears that there may be some areas containing objectionable materials, proof roll to locate the unsuitable materials.
3. Exercise care during stripping operations to prevent excessive disturbance to subgrade. Use lightweight dozers or grade-alls for low strength, saturated, non-cohesive and low cohesive soils.
4. For extremely soft ground such as peat bog areas, do not over excavate surface materials to take advantage of root mat strength.
5. If vegetation is present, remove stumps and roots extending above subgrade before grading and compaction.
6. Scrape and fill subgrades, as necessary, and thoroughly consolidate them to the required lines and grades. Consolidate subgrades for pavements by means of a smooth steel-wheel roller having a nominal gross weight of not less than 10 tons, and exerting a minimum force of not less than 300 pounds per inch of width on the compression roll faces, or approved equivalent.
7. Compact subgrade to not less than 75 percent relative density as determined by ASTM D2049, or not less than 95 percent of the maximum dry density as determined by ASTM D1557, as applicable.
8. In places where the use of a roller is impractical, compact subgrades with hand tampers weighing not less than 40 pounds and having a face not exceeding 80 square inches in area.
9. Subgrade shall be prepared not less than 100 feet in advance of the pavement to be immediately constructed.

**C. Install Granular Subgrade**

1. General: Remove all soil, rock, and other material, and utilize or dispose of these materials as required by the plans and specifications. All graded earth surfaces outside the roadway limits shall be smoothed and trimmed in reasonably close conformity (plus or minus 150 mm) of true grade. After trimming, the area shall be left in a compact and satisfactory condition, free of large stones or other objectionable materials, as determined by the Resident Engineer.

2. Where a subgrade area is defined, the material placed shall conform to 2.02 B.6 and placed and compacted in conformance with NY State DOT Section 203-3.10 and 203-3.12.

3. Compaction: See NYSDOT 203.-3.12.

**D. Installation of Geotextile**

1. After subgrade has been prepared, place geotextile in same direction as the new roadway aggregate is being laid down.
2. Do not drag geotextile across subgrade. Place entire roll on subgrade surface and roll out smoothly. Remove wrinkles and folds by stretching and holding down with sandbags as required.
3. Join parallel rolls of geotextile as follows:

<b>California Bearing Ratio (CBR)</b>	<b>Method of Joining</b>
Over 2	300-450 mm (12-18 in) overlap
1-2	600-900 mm (24-36 in) overlap
0.5-1	900 mm (36 in) overlap or sewn
Less than 0.5	Sewn
All roll ends	900 mm (36 in) overlap or sewn

4. If the CBR of the subgrade is not known, join parallel rolls by sewing them together.
5. For subgrades with CBR less than or equal to 1, where the geotextile is to provide reinforcement, the geotextile shall be pretensioned in the following manner:
  - a. Proof-roll with heavily loaded, rubber-tired vehicle. Wheel load of truck shall be equivalent to maximum expected for site. Vehicle to make at least four passes over first lift in each area of site.
  - b. Once design aggregate has been placed, use roadway prior to paving to prestress geotextile-aggregate system.
6. If required, the geotextile may be held in place prior to subbase placement with sandbags. The use of pins to anchor the geotextile will not be permitted, except at edges of existing pavement as specified below.

7. Do not place overlaps along anticipated primary wheel path locations. Place overlaps at end of rolls in direction of aggregate placement with previous roll on top.
8. When sewn seams are required, strength of seams shall be greater than or equal to 80 percent of tensile strength of unseamed geotextile as determined by same testing methods.
9. When placing woven geotextile on curves, fold or cut geotextile and overlap in direction of turn with previous fabric on top. Staple or pin folds in geotextile approximately 0.6 m (2 ft) on center.
10. When geotextile intersects an existing pavement area, extend geotextile to edge of old system and anchor it by trenching and covering the edge of the fabric with stone, or staple or pin the fabric to the ground. For widening or intersecting existing roads where geotextiles have been used, excavate edge of roadway down to existing geotextile and sew the new geotextile to the existing geotextile, or overlap and staple or pin the new fabric to the old and into the ground.
11. Prior to covering, inspect geotextile for excessive damage, including holes, rips and tears.
  - a. If excessive defects are observed, repair affected area by placing new layer of geotextile over damaged area.
  - b. Extend new layer beyond damaged area the same distance as required for overlap of adjacent rolls.
12. End-dump base aggregate on previously placed aggregate. End dumping or tailgate dumping of the aggregate directly on the geotextile will not be permitted.
  - a. For subgrades with CBR less than or equal to 1, limit pile heights to prevent possible subgrade failure.
  - b. Maximum placement thickness for subgrades with CBR less than or equal to 1 shall not exceed design thickness of road.
13. Spread and grade first lift of aggregate to 300 mm (12 in) or to design thickness if less than 300 mm (12 in) prior to compaction. Do not allow traffic on soft roadway with less than 200 mm (8 in) of aggregate over geotextile, except 150 mm (6 in) for CBR greater than or equal to 3.
14. Compact the bottom course as specified in Paragraph 3.01.D.2. Vibratory compaction shall not be used on the initial lift over the geotextile.

15. Perform construction parallel to road alignment.
16. Fill ruts formed during construction to maintain adequate cover over geotextile. Do not blade ruts down.
17. Place remaining base aggregate in lifts not exceeding 250 mm (10 in) in loose thickness and compact to specified density.
18. Equipment may operate on roadway without aggregate for geotextile installation under permeable bases if subgrade is of sufficient strength.
  - a. For soils with CBR less than or equal to 0.5, use lightweight construction vehicles for access on first lift.
  - b. Limit construction vehicles in size and weight to limit rutting in initial lift to 75 mm (3 in).
  - c. If rut depths exceed 75 mm (3 in), decrease construction vehicle size or weight or increase lift thickness.
19. Turning will not be permitted on first lift of base aggregate. Construct turn-outs at roadway edge to facilitate construction.

E. Bottom Course (Subbase layer of broken stone )

1. Spreading

- a. Spread the mixture of No. 1 and No. 2 broken stone uniformly on the geotextile with shovels from piles along the side of the roadway or from dumping boards or by means of vehicles of approved design constructed especially for this purpose, but in no case dump the material directly on the geotextile.
- b. The loose lift thickness shall be a minimum of 1.5 times the maximum particle size. The Contractor shall control the lift thickness, provided that the thickness shall not exceed the thickness limitations specified in Paragraph 3.01C, above, for installation of aggregate over geotextile, and shall not exceed the maximum allowed according to the equipment classifications in Subparagraph B of Subsection 203-3.12, Compaction, of New York State Department of Transportation Standard Specifications, and the equipment meets all specified class criteria of that Standard.
- c. Spread broken stone in sufficient quantity to provide the required thickness after rolling. The depth of stone shall be gauged by the use of cubical concrete blocks of the required thickness, or other approved means.

- d. Remove all segregated fine or coarse stone and replace it with well-graded stone.
- e. Do not spread the broken stone over wet geotextile.
- f. Do not place broken stone adjacent to manhole heads or other structures until such structures have been set to the required lines and grades.

2. Rolling and Filling

- a. After the No. 1 and No. 2 stone mixture has been laid loose, thoroughly roll it with an approved smooth steel-wheel roller having a nominal gross weight of not less than 10 tons and exerting a minimum force of 300 pounds per inch of width on the compression roll faces.
- b. Start rolling longitudinally at the sides and proceed toward the center, overlapping on successive trips by at least one half the width of a rear wheel. A minimum of 8 passes shall be applied over each lift with the roller operating at a speed not exceeding 6 feet per second. Rolling shall be continued until there is no movement of the stone ahead of the roller.
- c. After the bottom course is thoroughly compacted, as measured by the method described in Paragraph f, below, uniformly spread No. 4 stone over the compacted area from piles along the side of the roadway or from dumping boards. Broom the filler in and roll it dry until no more filler can be forced into the voids. Remove excess filler.
- d. Do not lay over 500 lineal feet of the bottom course without it being rolled and thoroughly filled.
- e. The maximum layer thickness prior to compaction shall be 300 mm (12 in.) as specified in Paragraph 3.01C, and the final compacted thickness shall be as shown on the Contract Drawings. In confined areas, as defined by the Construction Manager, the maximum compacted layer thickness shall be 6 inches.
- f. Do not allow the surface of the completed bottom course to deviate more than one-quarter inch in five feet from the nearest point of contact nor more than 3/8-inch in 18 feet when tested by means of an 18-foot straight-edge placed parallel to the centerline of the roadway.
- g. If any irregularities develop in the surface during or after rolling of the bottom course, remedy them by loosening the surface and removing or adding broken stone as may be required, and follow by rolling the entire area, including the surrounding surface, applying filler and continuing rolling until the course is compacted satisfactorily to a uniform surface.

**F. Tack Coat**

1. Before spreading the binder course, spray the bottom course with an asphalt emulsion tack coat in the amount of 0.25 gallon per square yard. Allow the tack coat to cure until sticky or tacky. Renew and repair or replace damaged coating.
2. Tack coat shall be applied evenly by means of a truck having appropriate spray nozzles. All nozzles shall be kept free of clogs.
3. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with the tack coat material.
4. Tack coat shall not be applied on a wet pavement surface or when the temperature is below 45°F.

**G. Binder Course**

1. Preparation: Clean the bottom course of all dirt and loose material, thoroughly dry it and obtain the Construction Manager's approval before laying the binder course.
2. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.
3. Forms: When side forms are required, accurately set them to line and grade and securely stake and brace them in place sufficiently to withstand all construction operations. Thoroughly clean and oil forms before use.
4. Spreading
  - a. Dump the binder course into the hopper of the spreader. Spread and screed it immediately to the full width required for the pavement and to such a depth that, when rolled, the required thickness is obtained. The maximum allowable compacted thickness shall be 4 inches.
  - b. When the mixture is to be spread by hand, dump it on approved steel dump sheets outside of the area on which it is to be spread and immediately distribute it into place and spread it in a uniformly loose layer.
  - c. Remove material from areas which show an excess or lack of bituminous material or an inconsistent mix and fill with new material. Respread or otherwise rectify areas which show segregation to obtain a uniform mixture in the course.

- d. Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250°F when spread.
- e. Do not lay over 500 lineal feet of binder material without it being rolled and properly compacted.

5. Compacting

- a. Rake the mixture after spreading and immediately compress it thoroughly and uniformly by either of the following methods:
  - (1) Option A - Three-roller Compaction Train: Under this option, the binder course shall be initially rolled with an approved steel-wheel roller. The roller shall overlap the previous roller pass by one-half the width of the roller.
    - (a) Immediately following the initial rolling, the course shall be rolled with an approved pneumatic rubber-tired roller. A minimum of three passes of the rubber-tired roller shall be made. One pass is defined as one movement of the roller over any point of the pavement in either direction.
    - (b) Immediately following the intermediate rolling, the course shall be finish rolled with a steel-wheel tandem roller. This final rolling shall be both longitudinal and diagonal as directed by the Construction Manager and shall remove all shallow ruts and ridges and other irregularities from the surface. Rolling shall be continued until all roller marks are eliminated.
    - (c) Under this option, the course shall not be compacted to a thickness in excess of 4 inches. No rollers shall move at speeds in excess of 3 miles per hour unless otherwise approved.
  - (2) Option B - Vibratory Compaction: Under this option, the Contractor shall use vibratory compaction equipment appearing on the current Approved List - Bituminous Concrete Vibratory Compaction Equipment in the NYSDOT Standard Specifications. The Contractor may substitute one vibratory roller in lieu of the initial roller and the pneumatic roller in the conventional three-roller compaction train stipulated under Option A. Under this option, the course shall be finish rolled with a steel-wheel tandem roller having a minimum weight of 8 tons. This finish roller shall add a minimum of two passes closely following the vibratory roller or as directed by the Resident Engineer.

- (a) One vibratory roller and one steel-wheel tandem roller shall be provided for each nominal 12-foot width of paving. Dual vibrating drum rollers meeting the requirements of a steel-wheel tandem roller and operating in the static mode may be used as the finish roller. However, this single vibratory roller shall not be used as both the initial roller and the finish roller.
- b. To prevent adhesion of the mixture to the roller, keep the drum properly moistened with water. Drums must have working water spray nozzles to keep drums moistened.
- c. Compact material thoroughly with hot irons or damp vibratory tampers along curbs, headers, manholes and similar structures and at all places not accessible to the roller.
- d. Remedy depressions which develop before the completion of the rolling by loosening the laid mixture and adding new mixture to bring such depressions to a true surface. Should any depressions remain after the final compaction has been obtained, remove the full depth of the mixture, replace it with new mixture, and reroll it to form a true and even surface. Correct all high spots, waves, bunches and honeycombing, to the satisfaction of the Resident Engineer.
- e. Remove and replace with new material areas that are unbonded after rolling, areas containing drippings, areas that are fat or lean, and areas evidencing defective construction of any description.
- f. Do not allow the surface of the completed binder course to deviate more than 1/16 inch per foot from the nearest point of contact nor more than 1/4 inch maximum when tested longitudinally with an 18-foot straight edge placed parallel to the centerline of the roadway.
- g. After final compression, the finished course shall at no point have a density less than 95 percent, as measured by a nuclear density meter, of the laboratory compacted density.

#### H. Treated Permeable Base

- 1. Weather Limitations: Do not place HMA plant mix on any wet surface or when the surface temperature is less than specified in NYSDOT Standard Specification 402 - Table 402-2, Temperature and Seasonal Requirements, or when weather conditions will prevent proper handling or finishing of the HMA mixtures.
- 2. Preparation: When specified in the contract, clean the surface of the existing pavement, fill joints and cracks, and level the surface to a uniform grade and cross slope prior to the application of a new HMA concrete course. Clean the

surface and fill the joints and cracks. Clean any foreign material resulting from construction operations from the pavement at no additional cost to the State. Leveling of the pavement surface prior to new HMA placement will be in conformance with the requirements stated below.

- a. Apply a thin, uniform tack coat as specified in NYSDOT Standard Specification Section 407, Tack Coat, to all contact surfaces of existing HMA and Portland Cement Concrete layers including such areas as adjacent pavement edges, curbing, gutters, manholes, and other structures, immediately prior to placing the HMA mixture against them.
- b. Fill depressions and wheel path ruts prior to the paving of the truing and leveling course, as directed by the Commissioner. For wheel path ruts with a depth of 7 mm, but less than 20 mm, use Shim Course. For ruts greater than 20 mm, use a 9.5 mm mixture.
- c. If a truing and leveling course is specified on the plans or in the itemized proposal, place the course(s) of a minimum variable thickness of proper plant mix necessary to bring the surface of the existing pavement to the same transverse slope and longitudinal grade required for the finished pavement surface. Test the surface of this course in the same manner prescribed in NYSDOT Specification 402-3.10, Surface Tolerance, except that the allowable variation from the true surface after compaction must not exceed 10 mm. Unless a mixture type is specified in the plans, use NYSDOT Specification 402 Table 402-3, Mixture Selection for T&L Course, to select the appropriate mix type such that dragging of stones is minimized during placement of the mixture.

3. Spreading: Follow NYSDOT Standards Section 402-06.
4. Compacting: Follow NYSDOT Standards Section 402-07

I. Wearing Course (Surface Course)

1. Preparation
  - a. Thoroughly clean the binder course of all loose and foreign material before the top mixture is delivered.
  - b. Apply a tack coat at a rate of 0.03 to 0.07 gallon per square yard as approved by the Construction Manager.
  - c. Do not lay mixture until the Construction Manager approves the binder course and determines in all cases whether the weather conditions are suitable to permit laying.
2. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface

on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

3. Forms: If at the time of laying the mixture, permanent side supports such as curbs, edgings or gutters have not been constructed, firmly fasten in place suitable side forms of wood or steel, true to line and grade. In all cases, adequately support the sides of roadways until final compaction has been obtained and the mixture has hardened by cooling.
4. Spreading and Compacting
  - a. Spread and compact the wearing course until it meets the compaction and surface requirements specified above for the binder course.
  - b. Exercise the same options for achieving the required compaction as given for the compaction of the binder course.
  - c. Do not lay over 500 lineal feet of wearing course material without it being rolled and properly compacted.
  - d. Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250°F when spread.
5. Joints: Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:
  - a. Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.
  - b. Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.
6. Shoulders: If temporary forms are used, protect the edges of the finished roadway by placing and thoroughly compacting approved material to form shoulders along the roadway as shown on the Contract Drawings. Construct finished shoulders 1/4 inch above the elevation of the finished roadway edges.
7. If weather conditions necessitate delaying the installation of the wearing course for more than two days, reapply the tack coat to the binder course at the rate of 0.03 to 0.07 gallon per square yard as approved by the Resident Engineer.

### 3.02 FIELD QUALITY CONTROL

#### A. Pavement Samples:

1. When required by the Commissioner, furnish 4-inch diameter test samples cored from the binder course and from the completed pavement. The Commissioner will choose the number of cores and the locations at which the cores shall be taken. Sample cores, when required, shall be taken for every 10,000 square feet of pavement and patch.
2. Density test shall show that the sample is within 90 percent of the laboratory specimen.
3. Replace with new mixture and refinish the areas of pavement so removed without additional compensation.

### 3.03 PATCHING

- #### A.
- As directed by the Resident Engineer, remove and replace defective areas. Cut such areas and replace with fresh asphaltic concrete and compact to required density.

### 3.04 CLEANING AND PROTECTION

- #### A.
- After paving, clear surfaces of excess asphaltic concrete and all foreign matter.
- #### B.
- Protect new pavement until fully hardened.
- #### C.
- Cover openings of drainage structures until permanent covers are placed.

### 3.05 PAVEMENT MARKING

- #### A.
- Clean with power and hand brooms.
- #### B.
- Mark edges straight and uniform. Use two coats and comply with manufacturer's recommendations.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02761**  
**THERMOPLASTIC REFLECTORIZED PAVEMENT MARKINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section specifies requirements for thermoplastic reflectORIZED pavement markings.

**1.02 REFERENCES**

- A. The following is a listing of the publications referenced in this Section:
1. American Association of State Highway and Transportation Officials (AASHTO)  
AASHTO T 250 Thermoplastic Traffic Line Material  
AASHTO M 247 Glass Beads Used in Traffic Paint
  2. American Society for Testing and Materials (ASTM)  
ASTM D 1155 Test Method for Roundness of Glass Spheres  
ASTM D 1213 Test Method for Crushing Resistance of Glass Spheres  
ASTM D 1214 Test Method for Sieve Analysis of Glass Spheres

**1.03 QUALITY ASSURANCE**

- A. The quality and workmanship of the completed marking installation shall conform to 3.02 C.4 of this Section.
- B. The completed marking installation shall be warranted to the City of New York from the date of issuance of the Certificate of Final Completion, against peeling, chipping, flaking, delamination, and shoving for a period of one year.

**1.04 SUBMITTALS**

- A. Submit detailed catalog cuts, manufacturer's specifications and test data of products proposed for use demonstrating conformance to the requirements of this Section.

## PART 2 PRODUCTS

## 2.01 MATERIALS

## A. White and Yellow Reflectorized Thermoplastic

1. Composition Requirements: The thermoplastic material composition shall be specifically formulated for application at temperatures greater than 400 degrees F true\* and shall show no significant break-down, or deterioration at a true temperature of 475 degrees F.

---

\* True temperature as referenced in 2.01 is measured with high precision laboratory grade equipment.

---

- a. The binder component shall be formulated as hydrocarbon resin or formulated as alkaloid base product as shown on the Contract Drawings. The pigment, beads, and filler shall be uniformly dispersed in the binder resin.
- b. The thermoplastic material shall be free from all skins, dirt and foreign objects and shall comply with the following requirements:

<u>Component</u>	<u>% by Weight</u>	
	<u>White</u>	<u>Yellow</u>
Binder	17.0 Min.	17.0 Min.
Titanium Dioxide	10.0 Min.	---
Glass Beads	20.0 Min.	20.0 Min.
Calcium Carbonate & Inert Fillers	49.0 Min.	**
Yellow Pigments	---	**

---

\*\*Amount and type of yellow pigment, calcium carbonate and inert fillers shall be at the option of the manufacturer, providing the other composition requirements of this specification are met.

---

## 2. Physical Properties of Composition

- a. Colors: White thermoplastic composition, as placed, shall be white, free from dirt or tint. Yellow thermoplastic composition, as placed, shall be yellow, free from dirt or tint, and shall be a reasonable visual match to Munsell book notation 10YR8/14 in accordance with ASTM D 1535.
- b. Drying Time: When installed on pavement at an air temperature of 70 degrees F true, and in a thickness between 1/8 inch and 3/16 inch, the thermoplastic material shall be completely solid and shall show no damaging effect from traffic after 10 minutes.

- c. Color Retention: The thermoplastic material shall not change color during the warranty period.
- d. Yellowness Index: White thermoplastic material shall not exceed a yellowness index of 0.12 when tested in accordance with AASHTO T 250.
- e. Softening Point: The thermoplastic material shall have a softening point of not less than 194 degrees F true when tested in accordance with ASTM E 28.
- f. Specific Gravity: The specific gravity of the thermoplastic material as determined by a water displacement method at 25 degrees C shall be between 1.8 and 2.2 (referred to water at 25 degrees Celsius true).
- g. Fumes: The thermoplastic material shall not exude fumes which are toxic, obnoxious and/or injurious to persons or property when it is heated during application.

B. Reflective Glass Spheres (Pre-Mix and Drop-On)

- 1. Reflective glass spheres for use in the composition and for drop-on shall conform to the following requirements:
  - a. The glass spheres shall be colorless; clean; transparent; free from milkiness or excessive air bubbles; and essentially clean from surface scarring or scratching. They shall be spherical in shape and at least 70 percent of the glass beads shall be true spheres when tested in accordance with ASTM D 1155.
  - b. The refractive index of the spheres shall be a minimum of 1.50 as determined by the liquid immersion method at 25 Degrees C true.
  - c. The silica content of the glass spheres shall not be less than 60 percent.
  - d. The crushing resistance of the spheres shall be the average resistance when tested in accordance with ASTM D 1213 for a 40 lb. dead weight for 20 to 30 mesh spheres.
  - e. The glass spheres shall have the following grading when tested in accordance with ASTM D 1214:

<u>U.S. Standard Sieve</u>	<u>Mass % Passing</u>
No. 20	100
No. 30	79-95
No. 50	15-60
No. 80	0-15

2. Glass spheres for drop-on shall be treated with a moisture-proof coating meeting the flow requirements of AASHTO M 247 Section 4.4.2, shall not absorb moisture during storage, shall remain free from clusters, and shall flow freely from dispensing equipment.
- C. Primer: Type III primer for use on both bituminous and Portland cement concretes shall be of the type recommended by the manufacturer of the thermoplastic material and shall be designed to dry track-free in under 5 minutes.

## 2.02 DELIVERY, STORAGE, AND HANDLING

- A. The thermoplastic material shall be manufactured in block form and packaged in suitable corrugated containers to which it will not adhere during shipment or storage. Each container shall weigh approximately 50 pounds and shall consist of blocks approximately 14 inches x 28 inches x 2 1/4 inch in size. Each container shall be sealed at the point of manufacture and plainly marked with the color, basic resin type (either hydrocarbon or alkaloid), manufacturer's name, batch number and date of manufacture, and a statement stating the contents meet the requirements of this Section. Each batch manufactured shall have its own separate number. The label shall warn the user that the material shall not be heated in excess of 440 degrees F gauge.
- B. The reflective glass spheres for drop-on application shall be shipped in strong moisture resistant bags containing approximately 50 lbs. Each bag shall be marked with the name and address of the manufacturer, and the name and weight of the material, a statement stating the contents meet the requirements of this Section, date of manufacture and batch number.
- C. Type III primer shall be shipped in pails, drums or other strong substantial containers. Each container shall be plainly marked with the brand name of the product, the name and address of the manufacturer, the date of manufacture, the quantity of material, the date of expiration or shelf life, and appropriate hazard warnings. Type III primers shall be shipped to the construction site with instructions for use affixed to each container.

## 2.03 BASIS OF ACCEPTANCE

- A. Thermoplastic material shall be accepted on the basis of sampling and inspection at the place of manufacture or in warehouse lots as determined by the Commissioner. In addition, all samples shall be accompanied with the manufacturer's certified identification of the binder formulation (e.g. "formulated as a hydrocarbon resin"). Any unauthorized tampering, opening, or breaking of seals on the containers between the time of sampling and delivery to the construction site shall be cause for rejection of the material.
- B. The minimum batch size of thermoplastic material when tested shall not be less than 3000 lbs., unless the total order is less than that amount.

- C. Reflective glass spheres may be approved at the construction site on the basis of the manufacturer's certification.
- D. Type III primers will be subject to approval by the Commissioner prior to use. Requests for approval shall be accompanied with technical data including brand name, instructions for use, hazard warnings, and 1 qt. sample of the primer material.
- E. Type III primer previously approved by the Commissioner may be accepted at the construction site on the basis of the brand name labeled on the container.
- F. Any rejected materials shall be immediately replaced with materials meeting the requirements of this Section.

### PART 3 EXECUTION

#### 3.01 APPLICATION EQUIPMENT

- A. General: Thermoplastic application equipment shall be approved by the Commissioner prior to the start of application.
  - 1. The equipment used for the placement of thermoplastic pavement markings shall be of two general types: mobile applicator and portable applicator.
  - 2. Unless otherwise approved by the Commissioner, all longitudinal pavement marking lines shall be striped using only mobile applicator equipment. Longitudinal pavement marking lines include broken lines (skipline), edge lines, barrier lines, and solid lines as defined by the MUTCD.
    - a. Portable applicator equipment will be acceptable for placing all other markings; and for longitudinal marking where use of mobile applicator equipment is impractical, as approved by the Commissioner.
  - 3. Thermoplastic material shall be applied to the primed pavement surface by the extrusion method, wherein one side of the shaping die is the pavement and the other three sides are contained by, or are part of, suitable equipment for maintaining the temperature and controlling the flow of material.
  - 4. Applicators shall be equipped and constructed in such a manner as to satisfy the requirements of the National Board of Fire Underwriters.
  - 5. For heating the thermoplastic material, the applicator equipment shall include melting kettle(s) of such capacity as to allow for continuous marking operations. The melting kettle(s) may be mounted on a separate "supply" vehicle or included as part of the application equipment. The kettle(s) shall be capable of automatically heating the thermoplastic material to, and maintaining it at an indicated gauge temperature of 420 degrees F to 430 degrees F. The heating mechanism shall be by means of thermostatically

controlled indirect heat transfer medium. Direct heating of the melting kettle by flame will not be permitted.

6. Thermoplastic material temperature gauges accurate to plus or minus 15 degrees F shall be provided at both ends of each kettle and reservoir, and in each extrusion shoe, in such a manner as to be visible and capable of monitoring the thermoplastic material temperature throughout the marking operation.
7. Applicator equipment including separate "supply" kettles shall be constructed to provide continuous mixing and agitation of the thermoplastic material. Conveying parts of the equipment between the main material reservoir and the extrusion shoe(s) shall be so constructed as to prevent accumulation and clogging. All parts of the equipment which come into contact with material shall be so constructed as to be easily accessible and exposable for cleaning and maintenance. The equipment shall be constructed so that mixing and conveying parts, up to and including the extrusion shoe(s), maintain the material at the required application temperature.
8. The applicator equipment shall be so constructed as to:
  - a. Insure continuous uniformity in the dimensions of the stripe;
  - b. Provide a means for cleanly cutting off stripe ends squarely;
  - c. Provide a method of applying "skip" lines; and
  - d. Be capable of applying various widths of traffic markings from 3 to 12 inches wide.
9. The applicator equipment shall be equipped with a drop-on type bead dispenser capable of uniformly dispensing reflective glass spheres at controlled rates of flow up to 10 lbs. per 100 sq. ft. of thermoplastic material. The bead dispenser shall be automatically operated in such a manner that it will only dispense beads while the thermoplastic material is being applied.
10. Applicator equipment shall be mobile and maneuverable to the extent that straight lines can be followed and normal curves can be made in a true arc.

#### B. Mobile Applicator Equipment

1. The mobile applicator shall be defined as a truck mounted, self-contained pavement marking machine that is capable of applying hot thermoplastic material by the extrusion method. The unit shall be equipped to maintain and apply the thermoplastic material at an indicated gauge temperature of 420 degrees F and at the widths and thicknesses specified in this Section. The

mobile unit shall be capable of operating continuously and of installing a minimum of 20,000 linear feet of longitudinal markings in 8 hours.

2. The mobile applicator shall be equipped with melting kettle(s) or materials storage reservoir(s) and a glass bead hopper of such capacity as to allow for continuous marking operations. The kettle(s) or reservoir(s) shall be capable of heating and/or holding the thermoplastic material at an indicated gauge temperature of 420 degrees F.
3. The mobile applicator shall be equipped with an extrusion shoe(s), and shall be capable of marking edge-line and center-line stripes. The extrusion shoe(s) shall be:
  - a. Closed, heat jacketed, or suitably insulated units;
  - b. Apply the molten thermoplastic at an indicated gauge temperature greater than 415 degrees F; and
  - c. Capable of extruding a uniform line pre-set at 3 to 12 inches wide at a thickness of not less than 1/8 inch or more than 3/16 inch.
4. The mobile applicator shall be equipped with an electronic and programmable line pattern control system, or mechanical control system, so as to be capable of applying skip or solid lines in any sequence, and through any extrusion shoe in any cycle length.

#### C. Portable Applicator Equipment

1. The portable applicator shall be defined as hand operated equipment, specifically designed for placing hot extruded thermoplastic installations such as crosswalks; stop bars; legends; arrows; and short lengths of lane, edge, and centerlines. The portable applicator reservoir shall be loaded with hot thermoplastic material from the supply vehicle melting kettle(s).
2. The portable applicator shall be equipped with all the necessary components, including the material storage reservoir, glass bead hopper, temperature gauges, bead dispenser, extrusion shoe, and heating accessories, so as to be capable of holding and applying the molten thermoplastic at indicated gauge temperatures greater than 415 degrees F; of extruding a line of generally uniform cross-section, pre-set at 3 to 12 inches in width, and at a thickness of not less than 1/8 inch nor more than 3/16 inch.

### 3.02 INSTALLATION

#### A. General

1. Pavement markings shall be applied at the locations and in accordance with the patterns and dimensions shown on the Contract Drawings and the MUTCD.
2. Before any pavement marking Work is begun, a schedule of operations shall be submitted to the Commissioner for approval.
3. When pavement markings are applied under traffic conditions, the Contractor shall provide all necessary qualified personnel, flags, markers, signs, etc. to maintain and protect traffic, and to protect marking operations and the new markings until thoroughly set.
4. The application of pavement markings shall be performed in the general direction of traffic. Striping against the direction of traffic flow will not be permitted.
5. The Contractor shall be responsible for removing, to the satisfaction of the Commissioner, all tracking marks, spilled thermoplastic, and thermoplastic applied in unauthorized areas.
6. When necessary, the Contractor shall establish marking alignment points at 25 ft. intervals throughout the length of the marking area or as otherwise approved by the Commissioner.
7. Thermoplastic pavement markings shall be placed upon dry pavement surfaces. At the time of installation the pavement surface temperature shall be a minimum of 55 degrees F and the ambient temperature shall be a minimum of 49 degrees F and rising.

#### B. Surface Cleaning and Preparation of Pavement

1. The Contractor shall clean the pavement surfaces to be marked to the satisfaction of the Commissioner immediately prior to priming and marking application. Surface cleaning and preparation shall be performed only in the area of the thermoplastic markings application.
2. At the time of application of the thermoplastic material, all pavement surfaces shall be dry, free of oil, dirt, dust, grease and similar foreign materials and the primer shall be tack free.

## C. Application

1. All pavement surfaces (new and existing) to be marked shall be primed with Type III primer applied to bituminous concrete and/or Portland Cement concrete pavements at the rates and in accordance with the recommendations of the manufacturer of the thermoplastic material. The primer shall dry tack-free in less than 5 minutes.
2. The thermoplastic material shall be applied at an indicated gauge temperature no lower than 415 degrees F at the point of deposition. As used in this Section, the point of deposition shall be defined as within the extrusion shoe.
3. Immediately following application, reflective glass spheres shall be dropped onto the molten thermoplastic marking at the rate of 5 lbs per 100 sq. ft. of composition.
4. Upon cooling to ambient pavement temperature, the resultant marking shall be an adherent reflectorized strip of a thickness not less than 1/18 inch or more than 3/16 inch, and of the width and dimensions shown on the Contract Drawings, capable of resisting deformation by traffic. The exposed marking surface shall be smooth, with no pockmarkers, blisters, or other surface blemishes evidencing improper application, temperature or equipment malfunction. The pavement markings shall show a smooth alignment with continuous uniformity of the required dimensions and widths.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02762**  
**TRAFFIC PAINT PAVEMENT AND PIER MARKINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section specifies requirements for the installation of new painted pavement markings and the removal of any related or conflicting pavement markings. The Contractor shall furnish and apply pavement marking paints, including glass beads thereto, at the locations and in accordance with patterns indicated on the Contract Drawings or as instructed by the Commissioner, and in conformance with these Specifications.

**1.02 REFERENCES**

- A. The following is a listing of the publications and specifications referenced in this Section:
1. Federal Highway Administration (FHWA) Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD)
  2. American Society for Testing and Materials (ASTM)  
ASTM D 1155 Test Method for Roundness of Glass Spheres  
ASTM D 1213 Test Method for Crushing Resistance of Glass Spheres  
ASTM D 1214 Test Method for Sieve Analysis of Glass Spheres  
ASTM D 1535 Method for Specifying Color by the Munsell System
  3. Federal Specification - (Reference specification for testing procedures only. See Part 2 of this Section for complete specification requirements.)
  4. TT-P-85e, September 15, 1977
  5. Federal Test Method Standard 141b, dated February 1, 1979 (or more recent) Paint, Vanish, Lacquer, and related materials
  6. Current ASTM tests

**1.03 QUALITY ASSURANCE**

- A. Warranty: The pavement markings shall be warranted by the Contractor against abrasion, bleeding, blistering, chipping, cracking, fading, flaking, loss of adhesion, peeling, softening, or other deterioration for a period of 6 months from the date of installation.

**B. Tolerances**

1. Width of Lines: Minus zero, plus 1/8 inch.
2. Length of skip or lane lines and unpainted surface between the skip lines shall be plus or minus 3 inches.
3. Location of Directional Arrows, Messages, and Stripes within 2 inches of locations shown on the Contract Drawings.
4. Size of Letters and Arrows: plus or minus 2 inches.

**1.04 SUBMITTALS**

- A. Submit detailed catalog cuts, manufacturer's specifications and test data of products proposed for use demonstrating conformance to the requirements of this Section.
- B. A schedule of pavement marking to be performed.
- C. Submit proposed means of cleaning, removing, or obliterating existing or unsatisfactory markings to the Commissioner for approval prior to commencing corrective work.

**PART 2 PRODUCTS****2.01 MATERIALS**

- A. Formulation and Manufacturing: The paint shall be formulated and manufactured from first-grade raw materials and shall be free from defects and imperfections that might adversely affect the serviceability of the finished product. The materials shall show no hard settling or gelling upon storage in the sealed containers as received that will affect the performance of the product. The paint shall be furnished ready for use. No additional thinner shall be added. Total volatile organic substances (VOC's) in the paint shall not exceed 2.08 lbs/gal. (250 grams/liter). The paint shall contain less than .06% lead or chromium in final composition.
- B. Directional Reflectance - The daylight directional reflectance of the white paint (without glass spheres) shall not be less than 84% and not less than 54% for yellow (relative to magnesium oxide), when tested in accordance with ASTM E-97. Furthermore, the yellow shall substantially match the "Light Limit V +" chip on the Highway Yellow Color Tolerance Chart (PR Color #1, June 1965). Yellow shall conform to the Federal Standard 595a No. 33538.
- C. Flexibility - The paint shall show no cracking or flaking when tested in accordance with Federal Specification TT-P-85e, Section 3.4.6.

- D. Bleeding - The paint shall have a minimum bleeding ratio of 0.94 when tested in accordance with Federal Specification TT-P-85e, Section 4.4.8. The asphalt saturated felt shall conform to Federal Specification HH-R-590.
- E. Weight/Gallon - The paint shall have a minimum weight per gallon of 14.5 yellow; 15.1 white.
- F. Viscosity - The consistency of the paint shall be not less than 75 or more than 100 Krebs Units at 25 C, when tested in accordance with ASTM D-562.
- G. Dry Opacity - ASTM D-2805 The film shall be applied with a .005 inch Bird Applicator. The minimum Contract Ratio of the white and yellow paint shall be 0.96.
- H. Water Resistance - The paint shall conform to Federal Specification TT-P-85e, Section 3.4.7. There shall be no blistering or appreciable loss of adhesion, softening or other deterioration after examination.
- I. Field Drying Time - The paint, when applied at 11 mils +/- 1 mil wet film thickness and 160 F at the gun and with a glass spheres at the rate of six pounds per gallon of paint, shall dry to no pickup under one minute when tested by simulated passing with a passenger car. A line showing no visual deposition of the paint to the pavement surface when viewed from a distance of fifty feet shall be considered non-tracking and conforming to the requirement of the field drying time.
- J. Lab No. Pickup - The paint when tested by Federal Specification TT-P-85e, Section 4.4.6 shall not be greater than 30 min.
- K. Fineness of Grind - The paint shall have a minimum fineness of grind of 3 Hegman.
- L. Total Non-Volatile - The paint shall have a total non-volatile content of not less than 85% by weight.
- M. Abrasion Resistance - No less than 35 Liters of sand shall be required for removal of the baked paint film. The abrasion resistance test shall be in accordance with TT-P-85e, Section 3.5.2.1 (10 Liters per mil of dried paint)
- N. Shelf Life - The paint shall have a usable shelf life of not less than 6 months. The paint shall have no hard settling, caking or separation. The paint shall be able to be mixed easily by means of mechanical stirrer. Paint is to be stored in inside structures at normal room temperature.
- O. The paint shall be lead and chromium free (less than .06%).
- P. The dried paint shall match Federal Color Standards -- White 595a and Yellow 33538.

- Q. Appropriate cleaning solvents are to be prescribed. These solvents are to be environmentally safe per NY & NJ Regulations.
- R. Material Safety Data Sheets (MSDS) are to be part of every shipment and test sample of paint and cleaning solvent.
- S. The beads for reflectorizing the paint shall be glass of a composition designed to be highly resistant to traffic wear and to the effects of weathering. The beads shall be colorless, clean, transparent, free from milkiness or excessive air bubbles, and essentially free from surface scarring or scratching. They shall be spherical in shape and at least 70% of the glass beads shall be true spheres.

1. The silica content of the glass beads shall not be less than 60%.
2. The beads shall have a refractive index between 1.50 and 1.65 when tested by the liquid immersion method at 25 degrees Celsius.
3. The spheres shall meet the following gradation:

<u>U.S. Standard Sieve</u>	<u>Min.</u>	<u>Max. Passing</u>
No. 20; Retained No. 30	5%	20% Passing
No. 30; Retained No. 50	30%	75% Passing
No. 50; Retained No. 80	9%	32% Passing
No. 80	0%	10%

4. The beads shall show no tendency to absorb moisture in storage and shall remain free of clusters and hard lumps. They shall flow freely and to the satisfaction of the Commissioner from the dispensing equipment at any time when surface and atmospheric conditions are satisfactory for painting.
  5. The glass beads shall be packed in waterproof, plastic lined burlap, or plastic lined paper bags. Each bag shall be marked with the name and address of the manufacturer and the name and net weight of the material.
- T. Testing of Glass Beads - The properties indicated above shall be determined in accordance with the following methods of test:
1. Sphericity: Irregularly shaped particles (out-of-round) shall be tested in accordance with ASTM D1155
  2. Gradation: Tested in accordance with ASTM D1214.

3. Moisture Resistance: The spheres shall pass the following moisture resistance test:
  - a. Place two pounds of spheres in a washed cotton bag, having a thread count of 50 per square inch (warp and woof) and immerse the bag in a container of water for 30 seconds. Remove the bag and force excess water from the sample by squeezing the bag. Suspend and allow to drain for two hours at room temperature (70-72 F). Then, mix the sample in the bag by shaking thoroughly. Transfer sample slowly to a clean, dry glass funnel having a stem 4" in length, with 3/8" inside diameter stem entrance opening and a minimum exit opening of 1/4". The entire sample shall flow freely through the funnel without stoppage. When first introduced into the funnel, if the spheres clog, it is permissible to lightly tap the funnel to initiate the flow.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

##### A. General

1. All final, interim, and temporary pavement markings and patterns shall be placed as shown on the Contract Drawings and in accordance with the Federal MUTCD.
2. Before any final pavement marking work is begun, a schedule of operations shall be submitted to the Commissioner for approval. A schedule for temporary markings and patterns for detours and other temporary traffic controls shall also be submitted to the Commissioner for approval prior to placement. At least 48 hours advance notice must be given to the Commissioner before performing any pavement marking work.
3. When pavement markings are applied under traffic, the Contractor shall provide all necessary flaggers, signs, and other traffic control devices to maintain and control traffic, and to protect the marking operation and the new markings until thoroughly dry. The application of pavement markings shall be done in the general direction of traffic; striping against traffic shall not be allowed. Short duration lane and work area closures shall be in accordance with the requirements of Section 01550 – Vehicular Access and Parking.
4. The Contractor shall be responsible for cleaning the pavement to the satisfaction of the Commissioner, of dust, dirt and other foreign material which may be detrimental to the adhesion of the paint film.
5. Detour and other temporary or conflicting markings shall be removed as soon as practicable as directed by and to the satisfaction of the Commissioner. If darkness or inclement weather interferes with the removal operations, such

operations shall be accomplished during the next daylight period or as soon thereafter as weather permits.

6. The method of removal is subject to the approval of the Commissioner. Painting out pavement markings is generally not permitted, and if approved will only be permitted for very short term use. Grinding, scraping, sandblasting, etc., must be conducted in such a manner that the finished pavement surface is not damaged or left in a pattern that will mislead or misdirect the motorist.
7. When necessary, the Contractor shall establish marking line points at 30 foot intervals throughout the length of the pavement, or as directed by the Commissioner.
8. The paint shall be applied in strict accordance with the manufacturer's recommendations for use. Further, at the time of application pavement surfaces shall be thoroughly dry.

**B. Application of Pavement Markings**

1. Except as noted herein, painted pavement markings shall be applied with atomizing spray type striping machines. The striping equipment may be either truck-mounted or hand-operated. All equipment shall be compatible with and suitable for the application of the type of paint being used.
2. Applied markings shall have clean-cut edges, true and smooth alignment and a minimum uniform wet film thickness of 15 mils. Glass beads shall be applied uniformly over and into the wet paint film at the rate of 6 lbs per gallon of paint. Glass bead dispensers shall be of a type that will mechanically and automatically give such performance.
3. Upon approval by the Commissioner, paint rollers or brushes may be used for marking cross-hatched and solid painted gore areas, letters, symbols, stop bars, short temporary detours or other such areas as directed by the Commissioner. When rollers and brushes are allowed, glass beads shall be applied to the wet paint film at the specified rate and in a manner suitable to the Commissioner.
4. The Contractor shall repaint, or remove and reapply, any pavement markings that fail to satisfy the requirements specified in this Section, at no cost to the City of New York.
5. The Contractor shall continuously monitor, maintain, and repair all installed pavement markings until completion of the Contract.

**-END OF SECTION-**

**Section 02771**  
**CONCRETE CURBS, HEADERS & SIDEWALKS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, and equipment required to provide concrete curbs, headers, and sidewalks, as shown, specified and required.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02317 - Backfilling
- C. Section 03100 - Concrete Forms and Accessories
- D. Section 03300 - Cast-in-Place Concrete
- E. Section 03350 - Concrete Finishes
- F. Section 09911 - Exterior Painting

**1.03 REFERENCES**

- A. ASTM A36 - Carbon Structural Steel
- B. New York City Department of Transportation (NYCDOT), Bureau of Highway Operations Standard Specifications

**1.04 DESIGN REQUIREMENTS**

- A. Concrete curbs, headers, and sidewalks which are outside the building line of the site and under jurisdiction of other City agencies, even though constructed as part of this Contract, shall be constructed in accordance with the Rules and Regulations, Standard Details and Standard Specifications of the governing agency in effect at the time of the award of this Contract and as further defined in the Contract Drawings and these Specifications.
- B. Concrete for curbs, headers, and sidewalks which are inside the building line of the site and not under the jurisdiction of other City agencies shall be stone concrete, proportioned, mixed, placed, cured and protected in accordance with the requirements of Section 03300 - Cast-In-Place Concrete.
- C. All concrete used in constructing curbs, headers, and sidewalks shall be Class 25 in accordance with Section 03300 - Cast-In-Place Concrete.

**1.05 SUBMITTALS**

- A. The Contractor shall furnish all working drawings and material specifications for the approval of the Engineer in accordance with the requirements of Section 01330

- Shop Drawings. Submittals shall include, but not be limited to those required in Section 03300 - Cast-In-Place Concrete.

- B. The Contractor shall submit marked-up drawings and shop drawings including shop and field test reports of concrete samples tested in an approved laboratory.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Coarse aggregate, unless otherwise specified, shall conform to the requirements of Section 03300 - Cast-In-Place Concrete.
- B. Concrete shall be air-entrained in accordance with Section 03300 - Cast-In-Place Concrete.
- C. Material for foundation of curbs, headers, and sidewalks shall consist of clean cinders complying with the requirements of Section 2.11, Class 2; NYC Department of Transportation Standard Specifications, or Size No. 3 broken stone or gravel complying with the requirements of Section 2.02, NYC Department of Transportation Standard Specifications, 100 percent of which passes a 2-1/2-inch square sieve; or other approved broken concrete, 100 percent of which passes a 2-1/2-inch square sieve; or other approved granular material containing not more than 5 percent material passing a No. 200 mesh sieve and not more than 5 percent retained on a 2-inch square sieve.
- D. Preformed expansion joint filler shall be Type IV as described in Section 2.15 of the Standard Specifications of the New York City Department of Transportation, Bureau of Highway Operations.
- E. Joint sealing compound for horizontal joints shall be asphaltic blown joint filler as described in Section 2.16 of the Standard Specifications of the New York City Department of Transportation.
- F. Structural steel shall be ASTM A36.

### 2.02 SOURCE QUALITY CONTROL

- A. Concrete shall be tested and evaluated for strength and acceptance in accordance with the requirements of Section 03300 - Cast-In-Place Concrete.

## PART 3 EXECUTION

## 3.01 SIDEWALK INSTALLATION

- A. Concrete sidewalk shall be of the width shown or otherwise specified and shall be laid on 6 inches thick compacted broken stone base, unless otherwise specified or shown on the Contract Drawings.
- B. Sidewalk shall consist of a single course of concrete 4 inches thick, unless otherwise shown on the Contract Drawings.
- C. Excavation and subgrade preparation shall be in accordance with the requirements of Section 02316 - Excavation. All existing material within the required 6 inches of foundation shall be removed in its entirety. Additional depth of foundation material for special conditions shall be placed as required by the Engineer.
- D. Materials: Foundation material shall be placed on the prepared subgrade and thoroughly compacted into a course not less than 6 inches thick. The top surface shall be parallel to the finished grade and at a distance below the grade equal to the specified thickness of concrete.
- E. Forms: Forms shall be in accordance with Section 03100 - Concrete Forms and Accessories.
- F. Slabs: Concrete sidewalk shall be built in approximately 20-foot lengths between expansion joints. The sidewalk shall be separated from adjoining structures by expansion joints. When directed, these joints shall be filled with dry sand. Expansion joints in sidewalk shall coincide with expansion joints in curb. Tooled control joints not less than 1/2 inch in depth shall be provided where at four foot intervals unless otherwise shown on the Contract Drawings.
- G. Expansion Joints: Transverse expansion joints shall be 1/2 inch in width and shall be filled with preformed joint filler to within 1 inch of the sidewalk surface. The top one inch shall be sealed with asphaltic blown joint filler complying with the requirements of Section 2.16 of the New York City Department of Transportation Standard Specifications.
- H. The foundation material shall be wetted immediately before concrete is placed. The concrete shall be placed within the forms and thoroughly tamped until the surface is at the finished grade.
- I. The top surfaces shall be finished in accordance with Section 03350 - Concrete Finishes. Each rectangular slab shall have all edges neatly rounded with proper tools and be bounded on all sides by a troweled border about 1 inch in width. Surface texture of pedestrian ramps shall be transverse grooves, 1/2 inch wide by 1/4 inch deep on 2-inch centers.

- J. Backfilling shall follow the removal of forms as soon as practicable and, unless otherwise permitted, shall be of clean earth, satisfactorily compacted. Backfilling shall conforming to the requirements of Section 02317 - Backfilling.
- K. Concrete sidewalk shall be cured according to Section 03300 - Cast-In-Place Concrete.

### 3.02 CURB AND HEADER INSTALLATION

- A. Concrete curbs, headers, and steel faced concrete curbs, except as otherwise detailed and specified, shall be constructed in accordance with the applicable provisions of Sections 4.08 and 4.09, Standard Specifications of the New York City Department of Transportation, Bureau of Highway Operations, except that concrete strength shall conform to Class 25 as indicated in Section 03300 - Cast-In-Place Concrete. Depressed curbs shall be provided where specified or shown on the Contract Drawings.
- B. Steel street curbs shall conform to ASTM A36 of the size indicated on the Contract Drawings. The length of straight runs shall be not less than 10 feet nor more than 20 feet. Curved curb angles shall be bent to the radius indicated, and provided with a straight tangent at each end, 3 feet in length. Special steel curb angles of approved type shall be provided at drop curbs. Where the length of the special drop curb exceeds 20 feet, it shall be spliced with an approved type butt welded joint. Anchors shall be welded to all steel curbing. The steel curbs shall be placed within the forms, upon suitable chairs, to the proper lines and grades. The joints between units of curbing shall be 1/8 inch. All surfaces of steel curbing, including anchors, shall be thoroughly cleaned of all rust, oil, grease, scale or other foreign matter before concrete is placed. All surfaces of steel curbing which are to remain exposed in the finished work shall be painted in the shop in accordance with Section 09911 - Exterior Painting. Finish coats shall be gray in color.
- C. Granite and bluestone street curbs and headers shall be Class A dressed curbs and headers conforming to the requirements of Section 2.12 of the City of New York Department of Transportation, Bureau of Highway Operations Standard Specifications. When specified, a concrete cradle shall be used conforming to the provisions of Section 4.07 of the Standard Specifications of the Department of Transportation, Bureau of Highway Operations, except that concrete strength shall conform to Class 25 as indicated in Section 03300 - Cast-In-Place Concrete.

-END OF SECTION-

**Section 02780**  
**CONCRETE PAVERS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish and install interlocking concrete paver units on sand setting bed, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

1. American Society for Testing and Materials (ASTM):

- a. ASTM C33, Concrete Aggregates.
- b. ASTM C140 Sampling and Testing Concrete Masonry Units and Related Units.
- c. ASTM C936, Solid Concrete Interlocking Paving Units.
- d. ASTM C1645 Test Method for Freeze-thaw and De-icing Salt Durability of Solid Concrete Interlocking Paving Units

2. National Concrete Masonry Association (NCMA)

- a. Shapes and Sizes Directory

3. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.

4. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

5. New York State Department of Transportation (NYSDOT), Standard Specifications

**1.04 SUBMITTALS**

- A. Prepare and submit the following in accordance with the provisions of the General Conditions and Section 01330 - Shop Drawings:
  - 1. Product data for paving units and filter material. Demonstrate conformance to performance and material criteria specified.
  - 2. Shop Drawings: Indicate dimensions of concrete paving units.
  - 3. Samples of concrete paving units to indicate color and shape selections. Samples shall be approved by the Commissioner.
  - 4. Samples of filter material.
  - 5. Sieve analysis for grading and bedding of joint sand.
  - 6. Test results for compliance of paving units to requirements of ASTM C936 from an independent testing laboratory.

**1.05 QUALITY ASSURANCE**

- A. All work shall comply with the provisions of the Building Code of the City of New York, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.

**1.06 MOCK-UPS**

- A. Furnish and install a 10 ft. x 10 ft. paver area as described in Article 3.02 of this Section and in accordance with the requirements of Section 01452 – Mock-Up Requirements, for approval of the joint sizes, laying pattern, color, and texture of the installed pavers. This area shall be the standard from which the work will be judged.

**1.07 DELIVERY, STORAGE AND HANDLING**

- A. Deliver concrete pavers to the site in steel banded, plastic banded or plastic wrapped cubes capable of transfer by fork lift or clamp lift. Unload pavers at job site in such a manner that no damage occurs to the product.
- B. Sand shall be covered with waterproof covering to prevent exposure to rainfall or snowfall or removal by wind. The covering shall be weighted to resist removal by wind.

## 1.08 ENVIRONMENTAL CONDITIONS

- A. Do not install sand or concrete pavers during rain or snowfall or on snow-covered or ice-covered surfaces.
- B. Do not install on frozen sand.

## PART 2 PRODUCTS

## 2.01 MANUFACTURED UNITS

- A. Concrete pavers shall meet the following requirements set forth in ASTM C936, with the following enhanced properties:
  - 1. Minimum average compressive strength of 10,000 psi, with no individual unit less than 9,000 psi.
  - 2. Average absorption of samples tested not greater than 4.0% with no unit greater than 5% when tested in accordance with ASTM C140.
  - 3. Freeze-thaw testing shall be performed in accordance with ASTM C1645 using the procedure which considers that the pavers will be exposed to deicing materials in service. Units shall also meet the freeze-thaw requirements of Material Specification 704-23 of the NYSDOT Standard Specifications..

## 2.02 BEDDING AND JOINT SAND

- A. Bedding layer and joint sand shall be clean, non-plastic, free from deleterious or foreign matter. Bedding layer shall be crushed stone meeting the coarse aggregate requirements of ASTM C33, #8 gradation. Joint sand shall be natural or manufactured from crushed rock. Grading of samples shall be done according to ASTM C33, meeting the requirements of in Table 1 below

Table 1  
GRADING REQUIREMENTS FOR BEDDING AND JOINT SAND

<u>Sieve Size</u>	<u>Percent Passing</u>
3/8 in.	100
No. 4	95 to 100
No. 8	80 to 100
No. 16	50 to 85
No. 30	25 to 60
No. 50	10 to 30
No. 100	2 to 10

## 2.03 FILTER FABRIC

- A. Filter fabric for covering drain holes beneath bedding sand shall be a non-woven polypropylene geotextile with an apparent opening size not exceeding 150µm.
- B. Acceptable products are:
  - 1. Mirafi 1100N, as manufactured by TenCate Geosynthetics North America, 365 South Holland Drive, Pendergrass, Georgia 30567; Tel: 706-693-2226, [www.tencate.com](http://www.tencate.com);
  - 2. Contech C-100NW, as manufactured by Contech Engineered Solutions LLC, 9025 Centre Pointe Drive, West Chester, OH 45069, Tel: 800-338-1122, [www.conteches.com](http://www.conteches.com);
  - 3. US 250NW, as manufactured by US Fabrics, Inc., 3904 Virginia Avenue, Cincinnati, OH 45227, Tel: 800-518-2290, [www.usfabricsinc.com](http://www.usfabricsinc.com);
  - 4. Or approved equal

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Verify that cast-in-place concrete slab is cured sufficiently in accordance with the requirements of Section 03300 – Cast-in-Place Concrete. Do not install concrete pavers until cast-in-place concrete slab is at least 28 days old.
- B. Verify that concrete substrate is dry and ready to support sand, pavers and imposed loads.
- C. Verify gradients and elevations of slab are correct.
- D. Verify location, type, installation and elevations of edge restraints around the perimeter area to be paved.
- E. Beginning of installation means acceptance of slab and edge restraints.

### 3.02 INSTALLATION

- A. Secure a 12"x12" patch of filter fabric over each drain hole in concrete slab by bonding the perimeter of the patch to the slab with a suitable adhesive.
- B. Spread the sand evenly over the cast-in-place concrete slab and screed to 1 in. thickness. The screeded sand should not be disturbed. Place sufficient sand to stay ahead of the laid pavers. Prior to spreading sand, install geotechnical textile filters at all weep holes in the cast-in-place concrete slab.

- C. Ensure that pavers are free of foreign materials before installation.
- D. Maintain straight pattern lines. Integrate pavers with adjacent pavers.
- E. Joints between the pavers shall be between 1/16 in. and 1/8 in. wide.
- F. Fill gaps at the edges of the paved area with cut pavers or edge units as shown on the Contract Drawings.
- G. Cut pavers to be placed along the edge with a double bladed splitter or masonry saw.
- H. Use a low-amplitude, high-frequency plate vibrator capable of 3,000 to 5,000 lbs. centrifugal compaction force to vibrate the pavers into the sand bed.
- I. Vibrate the pavers, sweeping dry sand into the joints and vibrating until they are full. This will require at least two or three passes with the vibrator. Do not vibrate within three feet of the unrestrained edges of the paving units.
- J. All work to within three feet of the laying face must be left fully compacted with sand-filled joints at the completion of each day. Cover the remaining un-compacted edge of the laying face and sand with waterproof covering.
- K. Sweep off excess sand when the job is complete.
- L. The surface elevation of pavers shall be 1/8 inch to 1/4 inch above adjacent drainage inlets, concrete collars or channels.

### 3.03 FIELD QUALITY CONTROL

- A. After removal of excess sand, check final elevations for conformance to the Contract Drawings.
- B. The final surface elevations shall not deviate more than 3/8 inch under a 10-foot long straightedge.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02821**  
**METAL FENCE**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section describes the specific requirements for metal fencing. Metal fencing shall be as specified herein and as shown on the Contract Drawings. The fence shall be all metal, constructed of wire fabric fastened to top, bottom and intermediate horizontal rails and to vertical line posts, corner posts and terminal posts and shall include all system components such as gates, fittings, fastenings and other accessories with polymer coating and other protective coatings as specified.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete  
B. Section 05081 - Galvanizing

- P. ASTM F 1184 - Industrial and Commercial Horizontal Slide Gates, Standard Specification for
- Q. CLF 2445 - Chain Link Fence Manufacturer's Institute: Product Manual

#### 1.04 QUALITY ASSURANCE

##### A. Installer Qualifications

1. Contractor shall select a single installer regularly engaged in the installation of metal fencing with successful experience in the erection of the type of metal fencing specified. Installer shall agree to employ only tradesmen with specific skill and experience in the erection of this type of work.
2. Contractor shall submit the name and experience record of the installer to Commissioner along with the names and telephone numbers of owners, architects or engineers responsible for the project and the approximate contract cost of the metal fencing and the amount of area installed.
3. Contractor shall submit evidence of approval of the installer by the metal fence manufacturer. Installers who have not had the type of experience required to perform the kinds of work required will not be approved.

##### B. Source Quality Control

1. Provide metal fencing system as a complete system with all gates, hardware, appurtenances and other components produced by a single manufacturer,

including custom erection accessories, fittings, clamps and fastenings as may be necessary or required.

2. Provide fence fabric imprinted with manufacturer's trade name, country of origin, core wire gauge, and finished outside diameter gauge. Material delivered to the Project site lacking this information will be rejected for use in the work and shall be immediately removed even if discovered after being incorporated in the work, at no additional expense to The City of New York.
3. Provide shipping list for materials used, endorsed with the manufacturer's voucher certifying that the material used in the metal fencing system complies with these Specifications.
4. Structural shapes of satisfactory sections and equal strengths may be substituted if approved by the Commissioner.

#### C. Performance Criteria

1. Comply with the standards of the Chain Link Fence Manufacturer's Institute for product and installation requirements and the requirements of ASTM F 567. These standards shall represent a minimum level of quality when additional information is not shown or specified in the Contract Documents.
2. The fabricator shall be responsible for providing structural calculations for the metal fence system to Contractor for submittal to Commissioner as part of Shop Drawing review. Structural analysis shall verify that all system components including, but not limited to, supports, gates, fasteners, fittings and connections meet the requirements of the New York City Building Code.
3. Member sizes, thicknesses and weights shown or specified shall be considered minimum. Where structural analysis indicates the need for additional members or increased member size, thickness or weight, these shall be provided at no additional expense to The City of New York.
4. Modifications may be made only as necessary to meet field conditions to ensure proper fitting and support of the work, and only upon submittal of Working Drawings and receipt of approval by the Commissioner.

#### D. Fabrication Tolerances

1. Fabric, posts, rails, and other supports shall be straight or uniformly curved to provide the profiles shown on the Contract Drawings, to a dimensional tolerance of 1/16 inch in 10 feet - 0 inches without warp or rack in the finished installation.

**1.05 SUBMITTALS**

- A. The Contractor shall submit the following in accordance with the requirements of Section 01330 – Shop Drawings.
- B. Samples: Submit for approval the following:
  - 1. Each component, fastener, post, rail, support, chain link fabric and other items labeled as to the use and location in the work.
  - 2. Samples approximately 6 inches long, and 6 inches square of all chain link fence fabric materials including framework members, and typical accessories. Commissioner's review will be for workmanship only. Compliance with all other requirements is the responsibility of Contractor.
- C. Shop Drawings: Submit for approval the following:
  - 1. Copies of manufacturer's technical product information, specifications and certified test reports on physical properties, and installation instructions for all metal fencing system components.
  - 2. All structural calculations verifying that all system components comply with the requirements of the New York City Building Code.
  - 3. Large scale details drawn at a scale of 3 inches equal to one foot for all connections and gate details. Drawings at a scale of 1/4 inch equal to one foot of typical metal fence assembly identifying all components, metal fence heights, locations, and sizes and weights of all rails, posts, braces, supports and footings.
  - 4. A list of all hardware and accessories.

**1.06 DELIVERY, STORAGE AND HANDLING**

- A. Deliver materials in manufacturer's original, unopened packaging with all tags, labels and other identifying information intact and legible.
- B. Store all materials under weatherproof cover, off the ground and away from other construction activities. Do not store material in a manner which would create a humidity chamber. Provide for free movement of air under protective cover and between components of the metal fence system.
- C. Handle material in a manner that is in compliance with product institute standards and that will prevent damaging coatings.

## 1.07 PROJECT CONDITIONS

- A. Field Measurements: Take field measurements and verify layout information and dimensions for metal fencing and gates in relation to property surveys and existing conditions.
- B. Do not begin installation and erection of the metal fencing system until final grading is completed.

## PART 2 PRODUCTS

## 2.01 MATERIALS

## A. General

- 1. All parts of the metal fence system shall be galvanized steel, except that chain link fence fabric shall be aluminum-coated steel and fittings may be galvanized malleable iron, or galvanized wrought iron.
- 2. Wire gauges shall conform to American Steel and Wire Company gauge.
- 3. Concrete for footings shall be Class 25 conforming to the requirements of Section 03300 – Cast-in-Place Concrete.
- 4. Pipe sizes shall be commercial pipe sizes complying with ASTM F 1083.
- 5. Tube sizes specified are nominal outside dimensions.
- 6. Roll-formed section sizes are the nominal outside dimensions.
- 7. Heat-form all arcs and chords before protective coatings are applied to metal.
- 8. All sizes specified are given for uncoated steel. All protective coatings are in addition to specified dimensions and sizes.
- 9. All galvanizing shall be done in accordance with Section 05081.

## B. Chain Link Fence Fabric

- 1. Fabric shall be in one-piece widths for fencing 12 feet - 0 inches and less in height to comply with Chain Link Fence Manufacturers Institute, Product Manual.
- 2. Wire mesh shall be 2-inch mesh woven throughout in the form of approximately uniform square mesh with parallel sides and horizontal and vertical diagonals using 6-gauge, ASTM A 817, Type 1, cold-drawn carbon steel wire with minimum breaking strength of 2,170 pounds and coated with

0.40 ounces of aluminum by the hot-dip process per square foot of wire surface. The fabric shall be recommended by the Chain Link Fence Manufacturer's Institute for heavy industrial usage.

3. Provide fabric knuckled on edges to prevent unraveling.

C. Framework

1. General: The following table is provided for the convenience of Contractor and provides actual OD and equivalent nominal NPS size and trade size of round members. Pipe shall be commercial grade, plain end steel pipe with standard weight walls. Steel strip used in the manufacture of pipe shall be in compliance with ASTM F 1083, Schedule 40 pipe with minimum yield strength of 25,000 psi and with 1.8 ounces of hot-dipped zinc coating per square foot of surface area. Type A coating shall be applied both inside and outside according to ASTM F 1043, as determined by ASTM A 90.

Actual OD	NPS Size	Trade Size
1.315	1	1-3/8
1.660	1-1/4	1-5/8
1.900	1-1/2	2
2.375	2	2-1/2
2.875	2-1/2	3
3.500	3	3-1/2
4.000	3-1/2	4
6.625	6	6-5/8
8.625	8	8-5/8

2. For maximum metal fence system height of 8 feet - 0 inches provide posts, gate frames and rails of the following nominal pipe sizes and minimum weights per linear foot:
  - a. Line Posts: 2-1/2 NPS @ 5.79 lbs per foot
  - b. End, Corner and Pull Posts: 3 NPS @ 7.58 lbs per foot
  - c. Gate Frames: 2 NPS @ 3.65 lbs per foot
  - d. Gate Posts
    - (1) For single gates 6 ft. wide or less, or double gates 12 ft. wide or less: 4 NPS @ 10.79 lbs per foot.

- (2) For single gates more than 6 ft. wide, or double gates more than 12 ft. wide: 5 NPS @ 14.62 lbs per foot.
- e. Top Rails, Intermediate Rails, Bottom Rails and Braces: 1-1/2 NPS @ 2.72 lbs per foot.
3. Provide manufacturer's longest length rails, with extra long expansion sleeves making firm connections but permitting expansion and contraction for each joint. Provide means for attaching the top rail securely to each gate, corner, pull and terminal post.
- D. Roll-Formed Steel: Rolled steel shapes shall be produced from structural-quality steel conforming to ASTM A 570, Grade 45, or ASTM A 446, Grade D, galvanized, with a minimum yield strength of 45,000 psi. Protective coating system shall conform to ASTM F 1043, Type A, hot-dipped galvanizing with a minimum of 4.0 ounces of zinc per square foot of surface area in accordance with the requirements of ASTM A 653.
- E. Fittings and Accessories: All fittings and accessories shall comply with ASTM F 626.
  1. Post Caps: Pressed steel, cast iron or cast aluminum alloy, fitting snugly over posts to exclude moisture; cone-type caps for terminal posts and loop-type caps for line posts.
  2. Rail and Brace Ends: Pressed steel, cast iron or cast aluminum alloy, cup-shaped to receive rail and brace ends.
  3. Rail Sleeves: Tubular steel, 0.051-inches thick by 7-inches long, expansion type.
  4. Tension Bars: Steel strip, 5/8-inch wide by 3/16-inches thick.
  5. Tension Wire: Marcellled 7 gauge steel wire with minimum coating of 0.40 ounces per square foot of wire surface in compliance with ASTM A 824.
  6. Tension Bands: Pressed steel, 12 gauge thick by 3/4-inch wide.
  7. Truss Rods: Steel rod, 3/8-inch diameter merchant quality with turnbuckle.
  8. Barbed Wire Arms: Pressed steel, cast iron or cast aluminum alloy fitted with clips or slots for attaching three strands of barbed wire - arms set outward on a 45 degree angle, or vertical, and capable of supporting a 250 pound load at outer barbed wire connecting point without causing permanent deflection.

## 9. Fence Latches

- a. Manufacturer's double latching bar latch devices with heavy mil polyvinyl chloride coating.
  - b. Padlock eye as integral part of latch.
10. Keeper: Provide a gate keeper for vehicle gates that automatically engages gate leaf and holds it in the open position until manually released.
  11. Gate Hinges: 180 degree offset heavy-industrial hinges; 1-1/2 pair per leaf.
  12. Tie Wire: Aluminum; 9 gauge, alloy 1100-H4; polyvinyl chloride coated to match fence fabric.
  13. Gate Stops: Provide gate stops for double gates consisting of mushroom-type flush plate with anchors, set in concrete, and designed to engage a center drop rod or plunger bar. A locking device and padlock eyes shall be included as integral parts of the latch, permitting both gate leaves to be locked with a single padlock.

## F. Gates

1. Swing gates shall comply with ASTM F 900.
2. Sliding gates shall comply with ASTM F 1184.

- G. Hog Rings: Steel wire, 11 gauge, with a minimum zinc coating of 0.80 ounces per square foot of wire surface.
- H. Barbed Wire: Commercial quality steel, two strand twisted, 12-1/2 gauge line wire with 14 gauge four point barbs at 5-inch spacing - coating shall consist of 0.40 ounces of aluminum per square foot of wire surface in compliance with ASTM A 585.
- I. Galvanizing: Zinc for galvanizing shall be of High Grade or Special High Grade conforming to ASTM B 6 with a maximum aluminum content of 0.01 percent. Material shall be galvanized by the "hot-dip" process in conformity with the following standards:

Class of Work	ASTM
Structural Iron and Steel Shapes	A 123
Fittings and Accessories	F 626
Pipe	A 53

## 2.02 FABRICATION

- A. Fabrication shall be in compliance with ASTM F 1083 for metal fencing, ASTM F 1184 for horizontal slide gates, and ASTM F 900 for swing gates.
- B. In addition to specified standards, fabrication shall be in compliance with Chain Link Fence Manufacturer's Institute Standard, CLF 2445 - Product Manual.
- C. Gates
  - 1. Gate hinges shall be of the double clamping offset type. To hold the gate in the open or closed positions, each gate frame shall be provided with a keeper which automatically engages a gate shoe set in concrete. Gates shall have a drop latch with provision for a padlock. Each gate shall be provided with a heavy-duty bronze padlock and shackle chain, No. 160DHM with 11/32-inch marine brass shackle by the Master Lock Company or equal, and three keys for each padlock. Where more than one gate is required for the same enclosure, padlocks shall be keyed the same.
  - 2. All gate frames shall have intermediate horizontal rails. Gate frames shall be of welded construction and shall be galvanized after fabrication. Single gates 6 feet wide or wider and double gates 12 feet wide or wider shall be provided with diagonal bracing in one direction, extending from top to bottom rail. The diagonal bracing shall be at least 1/2 inch in diameter and shall be provided with turnbuckles.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General
  - 1. Install metal fencing system in compliance with ASTM F 567.
  - 2. Apply fabric to outside of framework. Install fencing on boundary lines inside of property line established by survey.
  - 3. Do not begin metal fence installation and erection before the final grading has been completed, and finish elevations have been established.
- B. Excavation
  - 1. Drill or hand-excavate (using post-hole digger) holes for posts to diameters and spacings shown or specified, in firm, undisturbed or compacted soil.
  - 2. Unless otherwise indicated, excavate hole depths approximately 6 inches lower than post bottom.

3. Spread soil from excavations uniformly adjacent to the fence line, or on adjacent areas of the Project site, as directed.
4. When solid rock is encountered near the surface, drill into rock at least 12 inches for line posts and at least 18 inches for end, pull, corner and gate posts. Drill hole at least 1 inch greater in diameter than the largest dimension of the post to be placed. Remove rock cores from the Site.
5. If solid rock is below soil overburden, drill to full depth required, except penetration into rock need not exceed the minimum depths specified above.

C. Setting Posts

1. Remove loose and foreign materials from sides and bottoms of holes, and moisten soil prior to placing concrete.
2. Center and align posts in a continuous pour, and vibrate or tamp concrete for consolidation. Check each post for vertical and top alignment, and hold in position during placement and finishing operations.
3. Posts shall be set in concrete footings, except as otherwise shown or specified. Line posts shall extend at least three feet below finished grade, and gate posts shall extend at least four feet below finished grade. Concrete footings shall have a minimum diameter of 15 inches and shall extend at least 6 inches below the bottom of the posts. Tops of concrete footings shall receive a troweled finish. Top of footing shall be 2 inches above finish grade and sloped to direct water away from posts. The portion of posts embedded in concrete shall receive two coats of an approved coal tar paint before embedment.
4. Line posts shall be spaced not more than 10 feet on centers. Install caps on tops of all posts to exclude moisture and to receive the top rail unless equal protection is afforded by combination post top cap and barbed wire supporting arm, where barbed wire is required.
5. Keep exposed concrete surfaces moist for at least seven days after placement, or cure with membrane curing materials, or other acceptable curing method.
6. Grout posts when installed in sleeved holes, concrete constructions, and rock.
7. Allow concrete to attain at least 75 percent of its minimum 28-day compressive strength, but in no case sooner than seven days after placement, before rails, tension wire, or fabric is installed. Do not stretch and tension fabric or wires, and do not hang gates until the concrete has attained its full design strength.

**D. Chain Link Fence Fabric**

1. Pull fabric taut so that fabric remains in tension after force is released, with bottom edge 1 inch above grade. Fasten to terminal posts and gate posts with tension bars threaded through mesh and secured with tension bands at maximum intervals of 14 inches. Tie to line posts, gate frames and top and bottom rails with tie wires spaced at maximum 12 inches on posts and 24 inches on rails.
2. The tension bars shall be connected to posts and frames by means of adjustable bolts and bands spaced not more than 14 inches apart.

**E. Top Rails, Intermediate Center Rails and Bracing**

1. Install top rails through line post caps, bending to radius for curved runs, connecting sections with sleeves to form a continuous rail between terminal posts.
2. Install center rails only where shown or specified. Install center and bottom rails in one piece between posts and flush with the post on the fabric side, using rail ends and special offset fittings where necessary.
3. Install brace assemblies at end posts and at both sides of corner and pull post panels. Panels adjacent to gates shall have intermediate horizontal rails and diagonal bracing. The diagonal bracing shall run from the center of the first line post to the bottom of the terminal post.

**F. Tie Wire:** Use U-shaped wires conforming to diameter of pipe. Wire shall clasp pipe and fabric firmly, and each end of the wire shall be wrapped around the fabric at least two full turns and bent to minimize hazard to persons or clothing.

**G. Barbed Wire**

1. When barbed wire is shown or specified along the top of the fence, it shall be supported at the posts by arms inclined outward at an angle of 45 degrees.
2. The vertical members of gates shall be extended to receive the barbed wire which shall be fastened securely to prevent movement or displacement.

**H. Fasteners:** Install nuts for fittings, bands and hardware bolts on side of metal fence opposite fabric side. Peen ends of bolts or score threads to prevent removal of nuts.

**3.02 ADJUSTMENT**

**A. Gates:** After repeated operation of completed installation equivalent to three days' use by normal traffic, readjust gates for optimum operation and safety.

- B. Lubricate operating equipment and clean exposed surfaces.
- C. Repair and replace all broken or bent components. Repair coatings damaged in the shop or during field erection by recoating with manufacturer's recommended repair compound, applied in accordance with manufacturer's directions.
- D. Protect metal fencing system from construction traffic and all other damage until acceptance of the work.

-END OF SECTION-

**Section 02822**  
**ORNAMENTAL FENCE AND GATES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Open-grille fence panels and swing gates, as indicated.
- B. Screen-wall obscure fence panels as indicated.
- C. Steel picket fence panels and swing gates as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02827 - Swing Gate Operators
- B. Section 16751 - Access Control
- C. Division 17 - SCADA System requirements

**1.03 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical data for ornamental fences, gates, rails and operating hardware. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for ornamental fences rails and gates:
  - 1. Fence and gate posts, rails, and fittings
  - 2. Ornamental fence panels/infill, reinforcements, and attachments
  - 3. Gates and hardware
  - 4. Gate operators including operating instructions
- B. Samples: For each ornamental fence, gate and rail panel type selected, submit one representative sample approximately 8 inches by 10 inches, showing panel design, fabrication workmanship and selected coating color.
  - 1. Where materials/assemblies are indicated to receive a colored finish, provide the manufacturer's color charts or 6-inch lengths of actual units showing the full range of colors available for components with factory-applied color finishes.
- C. Shop Drawings: Shop drawings showing layout, dimensions, spacing of components, interface with electric gate operator, SCADA system, and anchorage and installation details. Show locations of each different ornamental fence, rail and gate; including posts, rails, details of posts, gate swing, or other operation, hardware, and accessories. Indicate materials, dimensions, sizes, weights, and finishes of components. Include plans, gate elevations, sections, details of post anchorage, attachment, bracing, and other required installation and operational clearances.

1. Gate Operator: Show locations and details for installing operator components, switches, and controls. Indicate motor size, electrical characteristics, drive arrangement, mounting, and grounding provisions.
  2. Wiring Diagrams: Refer to Section 02827 - Swing Gate Operators for power and control wiring and communication features.
  3. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- D. Coordination Drawings: Drawings of each gate drawn to scale and coordinating hardware. Show elevations of each gate type, showing dimensions, locations of hardware, and preparations for power, signal, and electrified control systems.

#### 1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed ornamental fences, rails and gates similar in material, design, and extent to those indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
1. Engineering Responsibility: Preparation of data for ornamental fences, rails and gates, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.
- B. Testing Agency Qualifications: An independent agency qualified according to ASTM E 329 for testing indicated, as documented according to ASTM E 548.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. UL Standard: Provide gate operators that comply with UL 325.
- E. Emergency Access Requirements: Comply with requirements of authorities having jurisdiction for automatic gate operators serving as a required means of access.
- F. Mockups: Build mockups of each different ornamental fence, rail and gate assembly to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation. Include 10-ft length of each assembly, complete with specified finishes and complying with requirements.
1. Approval of mockups is also for other material and construction qualities specifically approved by Commissioner in writing.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups, unless such deviations are specifically approved by Commissioner in writing.
- G. Source Limitations: Obtain each type of fence and gate through one source from a single manufacturer.
- H. Pre-Installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Coordination."
- I. Comply with NYC Building Code for ornamental fencing, railing and gates for structural performance criteria for lateral loading and wind loading.
- J. Welding: Qualify procedures and personnel according to the following:
  1. AWS D1.6, "Structural Welding Code--Steel."

#### 1.05 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of ornamental fences, rails and gates assemblies that fail in materials or workmanship within specified warranty period.
  1. Failures include, but are not limited to, the following:
    - a. Structural failures
    - b. Faulty operation of gate operators and controls
    - c. Deterioration of metals, metal finishes, and other materials beyond normal weathering
  2. Warranty Period: Two years from date of Substantial Completion.
- B. Special Warranty on Metal Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal assemblies that show evidence of deterioration of high-performance finishes within specified warranty period.
  1. Powder Coat and Polyurethane Finish: Deterioration includes, but is not limited to, the following:
    - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
    - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.

c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 10 years from date of Substantial Completion.

#### 1.06 PROJECT CONDITIONS

A. Field Measurements: Verify fence layout and gate openings by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish gate, fence and curb dimensions and proceed with fabricating gates and fences without field measurements. Coordinate curb construction to ensure that actual dimensions correspond to established dimensions.

#### 1.07 COORDINATION

A. Coordinate installation of anchorages for fence/rail posts and gates. Furnish setting drawings, templates, and directions for installing anchorages, concrete inserts, anchor bolts, and items with integral anchors that are to be embedded in concrete. Deliver such items to Project site in time for installation.

B. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Atlantis Products, Inc.
- B. Ametco Manufacturing Corporation
- C. Ameristar Fence Products
- D. Or approved equal.

#### 2.02 MATERIALS

- A. Steel Bar Stock: ASTM A36
- B. Steel Tubing: ASTM A500, Grade B
- C. Aluminum Bars: 6063-T5
- D. Aluminum tubing: 6061-T6

## 2.03 FASTENERS AND ACCESSORIES

- A. General: Provide fasteners and accessories fabricated from stainless steel, type 316 alloy, unless otherwise indicated.
- B. Fasteners for Anchoring Assemblies to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated. When the size, length, or load carrying capacity of an anchor bolt, concrete anchor, or concrete insert is not shown on the Drawings, provide the size, length, type and capacity required to carry four times (safety factor) the design load.
- C. Fasteners for Interconnecting Components
  - 1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method for railings indicated.
  - 2. Provide tamper-resistant flat-head machine screws for exposed fasteners, unless otherwise indicated.
- D. Anchors: Provide chemical or torque-controlled expansion anchors, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.
- E. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- F. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- G. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- H. Grounding Conductors: Bare, solid wire for No. 6 AWG and smaller; stranded wire for No. 4 AWG and larger.
  - 1. Material: Copper
- I. Grounding Bonding Jumpers: Braided copper tape, 1 inch wide, woven of No. 30 AWG bare copper wire, terminated with copper ferrules.
- J. Grounding Connectors and Grounding Rods: Listed in UL 467.
  - 1. Connectors for Below-Grade Use: Exothermic welded type

2. Grounding Rods: Copper-clad steel

- a. Size: 5/8 by 96 inches

2.04 FABRICATION, GENERAL

- A. General: Fabricate ornamental fences, rails and gates to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage.

1. Comply with the materials, designs, configurations and other aesthetic requirements indicated on the approved Shop Drawings.

- B. Assemble ornamental fence, rail and gate assemblies in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

- D. Form work true to line and level with accurate angles and surfaces.

- E. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

- F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

- G. Connections: Fabricate railings with welded connections, unless otherwise indicated.

- H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove flux immediately.
4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

5. Form changes in directions as indicated on the Drawings.
- I. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
- J. Close exposed ends of railing members with prefabricated end fittings; weld and grind smooth.
- K. Brackets, Flanges, Fittings, and Anchors: Provide brackets, flanges, miscellaneous fittings, and anchors to interconnect members to other work, unless otherwise indicated.
- L. Provide inserts and other anchorage devices for connecting assemblies to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
- M. Provide open grille fencing is indicated, fabricate panels from specified woven-wire mesh welded into metal channel frames. Make open mesh and frames from same metal as fence framing, unless otherwise indicated.
  1. Orient open mesh with wires horizontal and vertical, unless otherwise indicated on the approved Shop Drawing.
- N. Unless otherwise acceptable to the Commissioner, all ornamental fences, rails and gate assemblies specified herein shall be shop fabricated, cleaned and hot-dip galvanized after fabrication.

## 2.05 OPEN GRILLE FENCE SYSTEM

- A. Type: Provide ornamental steel fencing system as indicated on the drawings, consisting of modular open grille fencing panels fabricated by welding flat steel bars and rods, supported by steel posts and gates and gate hardware.
- B. Fence Panels: Fabricated from galvanized steel rods, flat bars, welded to form an open grille pattern; Lattice as manufactured by Ametco Manufacturing Corporation or approved equal.
  1. Vertical main bars: 1 by 1/8 inch flat bars spaced at 2-7/16 inches.
  2. Horizontal cross rods: 3/16 inch diameter rods spaced at 2-19/32 inches
  3. Top and bottom perimeter bars: 1 by 1/8 inch flat bars.
  4. Panel height: As indicated on drawings varies from 36 inches to 96 inches, some with tapered bottom.

5. Panel width: As indicated on drawings, 72 inches typical. Other as per manufacturer's recommendation

## 2.06 STEEL PICKET FENCE SYSTEM

- A. Type: Ornamental steel picket fencing system as indicated on the drawings, consisting of welded, galvanized steel frame and pickets formed into framed panels.
- B. Fence Panels: Fabricated from welded steel bar and tube stock, galvanized after fabrication.
  1. Horizontal Bars: 1 3/4" x 1/2" steel bar stock.
  2. Pickets: 1/2" x 1/2" steel bar stock.
  3. Posts: 2" x 2" steel tube or bar stock.
  4. Panel Height: Varies to max 144 inches. Provide ornamental configurations where indicated.
  5. Panel Width: As indicated or as per manufacture recommendations.

## 2.07 GATES

- A. Provide gates of type and size indicated on Drawings. Equip gates with manufacturer's standard hardware as required for complete functional operation unless otherwise specified in door schedule spec section 08110.
- B. Type: Provide framed hinged swinging single and double aluminum gates with a panel infill to match the "Lattice" panel as manufactured by Ametco manufacturing Corporation. or approved equal.
  1. Construction: Welded frame fabricated from aluminum bar or tubing as indicated on the drawings, with dimensions as recommended by manufacturer with aluminum open grille and aluminum picket infill panels as indicated on the drawings to match adjacent fencing.
  2. Nominal Size: As indicated on drawings.
  3. Hardware
    - a. Hinges: Stainless steel of size and type as determined by manufacturer. Provide 2 hinges for each leaf up to 4 feet high and 1 additional hinge for each additional 24 inches in height or fraction thereof.
    - b. Latch: 3/4-inch diameter slide bolt to accommodate padlock.

- c. For double gates provide pad-lockable, 5/8-inch diameter center cane bolt assembly and strike.
- 4. Fasteners: Stainless steel bolts of type, size, and spacing as recommended by fence manufacturer for specific condition
- 5. End caps: Provide aluminum caps for exposed open extruded aluminum sections and for attachment of components to posts..

## 2.08 ACCESSORIES

- A. For exposed locations, provide anti-intruder bolts consisting of cup head bolt and nut with clamping hexagon such that tightening shears hexagon and render bolt impossible to release.

## 2.09 FACTORY FINISH

- A. General: Ornamental fences, and gates shall be shop finished. All assemblies shall be factory finished with either a factory applied polyester powder coat system or a high performance epoxy/polyurethane coating system (over a hot-dip galvanized treatment), as specified herein.
- B. Steel assemblies including posts and framing shall be hot-dip galvanized to 1.25 ounces per square foot minimum zinc coating in accordance with ASTM A123.
  - 1. Unless otherwise indicated standard size components shall receive polyester powder coating; and large gate panels shall be coated with the specified high-performance epoxy/polyurethane coating system.
- C. Polyester Powder Coating: Manufacturer's standard electro-statically applied, colored polyester powder coat system acceptable to the Commissioner. Heating heat cured to chemically bond finish to metal substrate.
  - 1. Minimum hardness measured in accordance with ASTM D3363: 2H.
  - 2. Direct impact resistance tested in accordance with ASTM D2794: Withstand 160 inch-pounds.
  - 3. Salt spray resistance tested in accordance with ASTM B117: No undercutting, rusting, or blistering after 500 hours in 5 percent salt spray at 95 degrees F and 95 percent relative humidity and after 1000 hours less than 3/16 inch undercutting.
  - 4. Weatherability tested in accordance with ASTM D822: No film failure and 88 percent gloss retention after 1 year exposure in South Florida with test panels tilted at 45 degrees.

5. Color: As selected by the Commissioner.
- D. High Performance Epoxy/Polyurethane System: Where exterior hot-dip galvanized steel assemblies are indicated to receive a high performance paint finish; provide the manufacturer's standard, fast-curing, self-priming, lead-free, two-component, epoxy primer paint selected for resistance to exterior conditions/atmospheric corrosion, for compatibility with galvanized steel substrate and shop-applied polyurethane finish paints; and for capability to provide a sound foundation for topcoats despite prolonged exposure.
1. Paint surfaces indicated in accordance with manufacturer's written instructions and capable of receiving intermediate and topcoats specified.
  2. Stripe paint all edges, corners, crevices, bolts, welds, and sharp edges.
  3. Selected Materials: Provide the following:
    - a. Primer: Provide "Series 66 - High Build Epoxoline" as manufactured by Tnemec, "Diamtie Primer" as by MetalCrete, "Item # PC-149" as by Bowers Industrial, "Ultralane 5780" as by Specialty Polymers and Services, Inc. or approved equal. Apply so coating application will measure 4.0 to 5.0 mils (dft) in thickness. Color tinted different from finish coat.
    - b. Finish: Provide "Series 73 - Endura-Shield" as manufactured by Tnemec, Walter Wurdack Inc, "Item # CT-370" as by Bowers Industrial or approved equal. Apply so coating application will measure 3.0 to 5.0 mils (dft) in thickness. Color as selected by the Commissioner.

### PART 3 EXECUTION

#### 3.01 PREPARATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of gates and fence.
1. Coordinate vehicle entrance gate installation with provision of gate operator specified in Section 02827 – Swing Gate Operators to ensure proper power supply and that conduit and wiring are concealed.
  2. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
  3. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. Install ornamental fences and gates in accordance with manufacturer's recommendations and as specified herein.
- B. Post Setting: Set posts with mechanical anchors at indicated on the approved Shop Drawings.
  - 1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting mechanical devices.

### 3.03 FENCING

- A. Install fencing in accordance with manufacturer's installation instructions and approved shop drawings.
  - 1. Install fence posts plumb and level.
  - 2. Do not install bent, bowed, or otherwise damaged panels. Remove damaged components from site and replace.
  - 3. Secure fence panels with stainless steel anti-intruder bolts to fence posts. After posts have been anchored to base curb.
- B. Gates
  - 1. Install gates and adjust hardware for smooth operation
  - 2. Provide concrete center foundation depth and drop rod retainers at center of double swinging gate openings.
  - 3. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary
  - 4. After installation, test gate and operator. Open and close a minimum five times.
  - 5. Correct deficiencies and adjust.

### 3.04 GROUNDING AND BONDING

- A. Grounding: Install at maximum intervals of 1500 feet except as follows:
  - 1. Fences within 100 Feet of Buildings, Structures, Walkways, and Roadways: Ground at maximum intervals of 750 feet.

- a. Gates and Other Fence Openings: Ground fence on each side of opening.
    - (1) Bond metal gates to gate posts.
    - (2) Bond across openings, with and without gates, except openings indicated as intentional fence discontinuities. Use No. 2 AWG wire and bury it at least 18 inches below finished grade.
  - b. Grounding Method: At each grounding location, drive a grounding rod vertically until the top is 6 inches below finished grade. Connect rod to fence with No. 6 AWG conductor. Connect conductor to each fence component at the grounding location.
  - c. Connections: Make connections so possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.
  - d. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
  - e. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.
2. Bonding to Lightning Protection System: If fence terminates at lightning-protected building or structure, ground the fence and bond the fence grounding conductor to lightning protection down conductor or lightning protection grounding conductor complying with NFPA 780.

### 3.05 ADJUSTING AND REPAIR

- A. Adjust fence and gate assemblies to maintain proper alignment; adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that hardware functions properly and accurately without forcing or binding.
- B. Touch-up damaged finished with paints and coatings identical to those shop applied systems; touch-up and repairs are subject to the sole acceptance of the Commissioner.

-END OF SECTION-

**Section 02827**  
**SWING GATE OPERATORS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Provide hydraulic-powered gate operator for swing gates, hydraulic pump and control enclosure, all interconnecting wiring and hydraulic tubing, and appurtenances, including all attachments and mounting brackets.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02822 – Ornamental Fences and Gates
- B. Section 02891 - Aluminum Sign Panels and Aluminum Sign Posts
- C. Section 16751 - Access Control System
- D. Division 17 – SCADA System

**1.03 SUBMITTALS**

- A. Submit shop drawings in accordance with Section 01300 - Shop Drawings.
- B. Shop Drawings: Submit the following:

- 1. Product information for all equipment
  - a. Catalog data
  - b. Specification data
  - c. Performance and operation data
  - d. Service and calibration data
  - e. Schematic control diagram
  - f. Complete description of the control system
- 2. Arrangement and erection drawings for the equipment and controls, including:
  - a. Connections to adjacent construction
  - b. Range of travel
  - c. All electrical and mechanical connections
  - d. All underground runs of electrical and hydraulic lines
  - e. Show the size and location of the concrete mounting pad

**3. Installation instructions**

**C. Test Reports**

- 1. Submit affidavits from the manufacturer demonstrating that the gate mechanism has been tested to 200,000 cycles without breakdown.

2. Each operator shall bear a label indication that the operator mechanism has been tested for full power and pressure of all hydraulics, full stress tests of all mechanical components and electrical tests of all overload devices.
- D. Provide Operation and Maintenance manuals in accordance with Section 01831 – Operation and Maintenance Manuals.

#### 1.04 QUALITY ASSURANCE

- A. Manufacturer: A company specializing in the manufacture of security gate operators of the type specified, with a minimum of three (3) years experience and minimum of three (3) years experience with gate operators of this type and design.
- B. Installer: A firm acceptable to the Gate Operator manufacturer with a minimum of three (3) years experience installing similar equipment.
- C. Reference Standards
  1. The swing gate operator system shall be designed, built, and installed to UL325 standards and shall be listed by a NRTL testing laboratory.
  2. Complete all electrical work according to local codes and National Electrical Code.

#### 1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle products as described in Section 01651 - Transportation and Handling of Material and Equipment, and Section 01661 - Protection of Material and Equipment.
- B. Store products upright in the original shipping containers; products shall be covered, ventilated and protected from all weather conditions.

#### 1.06 WARRANTY

- A. Provide a five-year warranty against all defects in materials or workmanship. Defective materials shall be replaced with new materials furnished by the manufacturer at no cost to the City of New York.

#### 1.07 SPARE PARTS

- A. Provide spare parts in accordance with Section 01750 – Spare Parts and Maintenance Materials.
- B. Furnish and deliver spare parts as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification Section.

- C. The following shall constitute the minimum spare parts: all standard recommended spare parts, as indicated in the equipment manufacturer's instructions manual for each component of the system.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Hy-Security Gate Operators Model HRG 220 ST with Smart Touch Controller.
- B. Tymetal Corp
- C. Or approved equal.

### 2.02 SWING GATE OPERATOR

- A. The swing gate operator shall be of the post type, where the operator mechanism is completely contained within a steel post assembly.
- B. Operation shall be by means of a hydraulic cylinder acting upward in the post assembly to cause the post and the gate panel to rotate from zero to 90 degrees without the use of articulating arms, screw drives or mechanical devices.
- C. Rated for continuous duty.
- D. Swing arc: 90 degrees
- E. Gate shall rise 12 inches in a full 90-degree opening cycle, including a 4-inch rise at the start of the opening cycle. Gate rise shall first lift a locking pin from an embedded socket in the roadway. Gate closure shall be the reverse of gate opening; the end of the closure cycle will drop a locking pin into the embedded socket.
- F. Suitable for gate panels up to 16 feet wide.
- G. The opening and closing cycle times will vary depending on gate size and weight, from 14 to 30 seconds.
- H. The post assembly shall be fully enclosed and not offer any openings for foreign material to enter.
- I. Actuator assembly shall be supported on non-lubricated synthetic bearing surfaces. Bearings providing rotation and lift to the actuator assembly shall be permanently lubricated, 2-1/4", industrial quality sealed cam followers.
- J. Provide indexing arm to allow precise closing adjustment.

- K. Finish: Industrial galvanized metallic flame spray.
- L. Provide limit switches to limit travel in each direction.

2.03 CONTROL ENCLOSURE

- A. Provide a control enclosure to house the hydraulic pump, valves, control devices, and other required components for each gate.
- B. Enclosure: NEMA 4X stainless steel.
- C. Provide hydraulic hand pump for emergency operation.
- D. Pump motor: 460-volt, three-phase, 1 HP, 56C, TEFC, continuous duty with a minimum service factor of 1.15.
- E. All components shall have overload protection.
- F. Controls: Microprocessor based, with at least 128K of memory. Control functions available shall include, but not be limited to, the following:
  - 1. Inherent entrapment detection
  - 2. Built-in "warn before operate" system
  - 3. Built-in timer to close
  - 4. Liquid crystal display for reporting of functions
  - 5. 19 programmable output relay options
  - 6. Anti-tailgate mode
  - 7. Built-in power surge/lightening strike protection
  - 8. Capable, with optional software, of event logging EEPROM for troubleshooting diagnostics
  - 9. RS232 port for connection to laptop or other computer peripheral and RS485 connection of Master/Slave systems
- G. Seven-Day Timer
  - 1. Provide a seven-day programmable timer. Timer shall keep the gates open during normal operating hours.
  - 2. Mount timer in control enclosure.

3. Power timer from the control enclosure.
4. Provide battery backup.
5. Capable of programming each day individually, or a block of days.
6. Relay Rating: SPDT, 15A at 120 VAC
7. Temperature Range: -40 degrees F to 170 degrees F
8. Provide MOV surge protection
9. Manufacturers
  - a. EMX Industries, Inc. Model DTM-9
  - b. Or approved equal.

H. Control unit transformer: 75 VA, non-jumpered taps, for all common voltages.

I. Control unit power: 24VDC.

J. Provide heater with thermostat control for wintertime operation.

#### 2.04 HYDRAULIC HOSES AND FLUID

- A. Hoses shall be 1/4", rated to 2750 working psi.
- B. Hose fittings at valve block and at actuator post assembly shall be quick disconnect type.
- C. Hydraulic Fluid: High performance, with a viscosity index greater than 375.

#### 2.05 PHOTOCELLS

- A. Provide photocells as shown and required to meet UL325 requirements for Type B1 Protection category for Class III gates.
- B. Photocells shall comply with UL325.
- C. Maximum transmit distance: No less than 65 feet
- D. Power: 24 VDC
- E. Relay Contacts: 30V, 1 A
- F. Enclosure: NEMA 4X with protective hood.

G. Mounting

1. Provide mounting post for each photocell as required.
2. Provide mounting bracket and hardware for recess mounting in barrier where shown.

H. Operating Temperature: -40 degrees F to 170 degrees F

I. Manufacturer

1. EMX Industries, Inc., Model IRB-325
2. Or approved equal.

2.06 ACCESSORIES

A. Fire Department Key Switch Assembly

1. Provide a Fire Department key switch assembly at each entrance gate. The key switch assembly shall enable the Fire Dept. to open the entrance gate without any operator assistance from the facility, and bypassing any access control restrictions required by the access control system.
2. The Fire Department key switch assembly shall consist of a lock and cylinder, a corresponding electric switch, and a weatherproof enclosure.
3. The lock and cylinder shall be keyed to the NYC fireman's key, currently a 1620 cylinder.
4. The switch shall be close-coupled to the lock, so that turning the key activates the switch. The switch shall be suitable for, and shall interface with, the entrance gate controls as specified in this section.
5. Weatherproof enclosure
  - a. Steel construction, 14 gauge minimum
  - b. Bright red powder coat finish
  - c. Prominently mark "FIRE DEPT." in white letters
  - d. Mount as shown.

B. Field Installed Placards

1. Each gate operator shall be supplied with two placards, suitable for outdoor installation, meeting the requirements of UL 325 for vehicular gate operator systems.

2. Placards shall be aluminum, and meet the requirements of Specification Section 02891.
3. Placards shall be permanently installed in accordance with UL 325.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install gate operator in accordance with the manufacturer's instructions, current at the time of installation. Coordinate locations of operators with contract drawings; other trades and shop drawings.
- B. Interface with Other Work
  1. The gate operator shall fit in the space indicated. Coordinate to precisely locate and size the gate operator support.
  2. The gate operator system shall coordinate with the ornamental fencing specified in Section 02822 – Ornamental Fences and Gates.
  3. The gate operator system shall interface with the access control system specified in Section 16751 of the Electrical Specifications.
- C. Sequence of Operation
  1. Entrance Gate: The gate shall open when triggered by any of the following systems:
    - a. Open signal from the SCADA system
    - b. Open signal from the access controls system
    - c. Open signal from the Fire Dept. key switch
    - d. Open signal from the seven-day timer
  2. Entrance Gate: The gate shall be closed by any of the following systems:
    - a. Time out after the shadow area clears. See vehicle detection below.
    - b. Reset of the system from the Fire Dept. key switch operation
    - c. Removal of the open signal from the seven-day timer
  3. Exit Gate: The gate shall open when triggered by any of the following systems:
    - a. Open signal from the locally-mounted push button station
    - b. Open signal from the seven-day timer

4. Exit Gate: The gate shall be closed by any of the following systems:
  - a. Time out after the shadow area clears. See vehicle detection below.
  - b. Removal of the open signal from the seven-day timer
5. Vehicle Detection: Vehicle detection shall be by a magnetometer-based detection system as shown. System shall include sensor, wireless access point, and contact closure card as shown. Gate controller shall use the contact closure card output to determine absence of vehicle from shadow area. Detection system shall include all power supplies, interposing relays, enclosures and appurtenances to comprise a complete operating system.

### 3.02 FIELD QUALITY CONTROL

#### A. Field Testing

1. Provide field testing in accordance with Section 01811 – Preliminary and Final Field Tests.
2. System Checkout and Startup: The Contractor, under the supervision of the Supplier, and other suppliers as applicable, shall perform the following:
  - a. Check and approve the installation of all components and all hydraulic and electrical connections between the various system components prior to placing the equipment into operation.
  - b. Conduct a complete system checkout and adjustment, including calibration, tuning, checking, and testing. When there are future operational functions included in this work, they should be included in the system checkout. All problems encountered shall be promptly corrected to prevent any delays in start-up.
  - c. The Contractor shall provide all test equipment necessary to perform the testing during system checkout and start-up.
  - d. The Contractor shall furnish the Engineer an installation inspection report certifying that all equipment has been installed correctly and is operating properly. Authorized representatives of both Contractor and the Supplier shall sign the report.

- B. Manufacturer's Field Services: The Contractor shall retain the services of the Supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

**3.03 TRAINING**

- A. Provide a minimum of 4 hours of training as specified in Section 01821 – Training.

**-END OF SECTION-**

**Southwest Brooklyn Marine Transfer Station**

**FMS No. S216-399A**

**NO TEXT ON THIS PAGE**

**Section 02839**  
**MECHANICALLY STABILIZED EARTH (MSE) RETAINING WALLS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section specifies requirements for the design and construction of Mechanically Stabilized Earth Retaining Walls. The Contractor shall be responsible for both the design and construction of the wall. This work shall consist of furnishing materials and placements of mechanically stabilized earth walls constructed in accordance with these Specifications and in reasonably close conformity with the lines, grades, design, and dimensions shown on the Contract Drawings or otherwise established.
- B. The mechanically stabilized earth walls shall consist of a non-structural leveling pad, concrete-facing panels, and soil reinforcement elements mechanically connected to each facing panel. Soil reinforcement shall have sufficient length, strength, and frictional resistance as required by the design outlined in these Specifications. The face panels shall be cruciform in shape and shall have a smooth concrete finish to match the finish of the abutment.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

#### 1.04 DESIGN AND PERFORMANCE REQUIREMENTS

##### A. General Requirements

1. The Contract Drawings shall provide wall elevations to all bidders showing height of wall structure, length of wall, allowable bearing pressures, and estimated settlements that the wall must be capable of handling. If the wall supplier needs additional information to complete the design, the Commissioner shall be responsible for providing this information in a timely manner prior to bid.
2. All appurtenances behind, in front of, under, mounted upon, or passing through the wall such as drainage structures, utilities, or other appurtenances shown on the Contract Drawings shall be accounted for in the stability design of the wall.
3. The mechanically stabilized earth wall design shall follow the general dimensions of the wall envelope shown in the Contract Drawings. The top of leveling pad shall be located at or below the theoretical leveling pad elevation. The minimum wall embedment shall be four (4) feet as measured to the top of leveling pad. The top of the face panels shall be at or above the top of leveling pad. The top of the face panels shall be at or above the top of the panel elevation shown on the Contract Drawings. Where coping or barrier is utilized, the wall face panels shall extend up into the coping or barrier a minimum of two (2) inches. The top of the face panels may be level or sloped to meet the top of the wall line noted. Cast-in-place concrete will not be an acceptable replacement for panel areas noted by the wall envelope, except for minor grouting of pipe penetrations and leveling required for coping or traffic barrier.
4. Where walls or wall sections intersect with an angle of 130 degrees or less, a special vertical corner element panel shall be used. The corner element panel shall cover the joint of the panels that abut the corner, and allow for independent movement of the abutting panels.
5. Standard facing panels shall have at least two levels of earth reinforcements to stabilize the panels against rotation. Top and bottom half panels shall have at least one level of earth reinforcements. The wall facing shall be designed to accommodate differential settlement of one foot in 300 feet. The spacing between adjacent panels shall be designed to be 0.25 inches. Joints between panels shall have a shiplap configuration to protect the joint materials from vandalism. There shall be no openings through the wall facing except for

utilities. Where shown on the Contract Drawings, slip joints to accommodate excessive differential settlement shall be included.

- B. Design Requirements: The design by the wall system supplier shall consider the internal stability of the wall mass as outlined below. The external stability of the structure, including slope stability, bearing capacity safety, and total and differential settlement is the responsibility of the City of New York or the City of New York's geotechnical design consultant. External stability of the structure is not the responsibility of the wall system supplier.

1. Failure Plane: The reinforced soil mass shall be analyzed so that the soil stabilizing components extend sufficiently beyond the failure plane to stabilize the material. The mechanical height,  $H_1$ , of an MSE structure is defined as the effective height of the active zone (failure plane) that must be retained by the reinforcements. The mechanical height is measured from the top of the leveling pad to the elevation at which the potential failure plane intersects the ground surface. The long-accepted location of the failure plane envelope is defined by a line originating at the toe of wall, climbing at 0.6 horizontal to 1 vertical until it reaches 50% of the mechanical height of the structure. Then the potential failure plane becomes vertical and intercepts the ground surface at a distance of  $0.3H_1$  behind the facing. The mechanical height,  $H_1$ , can be calculated by the following equation:

$$H_1 = H + [(\tan \theta \times .3H)/(1 - .3 \tan \theta)]$$

where,  $H_1$  = mechanical height  
 $H$  = facing height  
 $\theta$  = Angle that the slope on top of the structure makes with the horizontal

When the ground surface is level, the angle of the slope equals zero and  $H_1$  equals  $H$ . In this case, the knee of the potential failure plane is at 50 percent of the facing height above the toe of wall. External loads which affect the internal stability such as those applied through piling, bridge footings, traffic, slope surcharge, hydrostatic and seismic loads, shall be accounted for in the design.

2. Hydrostatic Forces: Unless specified otherwise, when a design high-water surface is shown on the Contract Drawings at the face of wall, the design stresses calculated from that elevation to the bottom of wall must include a 3-foot minimum differential head of saturated backfill. In addition, the buoyant weight of saturated soil shall be used in the calculation of pullout resistance.
3. Backfill: Consider not less than 34 degrees friction angle of the select backfill used in the reinforced fill zone for the internal stability design of the wall. The friction angle shall be determined by the standard direct shear test, AASHTO T-236, utilizing a sample of the material compacted to 95 percent of AASHTO T-99, Methods C or D, at optimum moisture content. Before

construction begins, the borrow selected shall be subject to approval to show conformance with this frictional requirement. Compliance with the test requirements shall be the responsibility of the Contractor. The wall supplier shall furnish a copy of the test results for the backfill to the Commissioner prior to construction. The friction angle of the foundation soils and random backfill may be considered as 30 degrees.

4. Safety Factors: The minimum factors of safety shall be as follows:
  - a. 1.5 against pullout of the reinforcements based on pullout resistance at 0.5-inch deformation for a representative backfill. (i.e. the resulting deformation should not exceed 0.5 inch at 1.5 times the design load).
  - b. 1.5 against sliding of the mass
  - c. 2.0 against overturning of the mass
  - d. 2.0 against panel connection pullout or rupture, and
  - e. 1.5 against a panel connection deformation of 0.5 inch under the maximum allowable reinforcement tension (i.e. the resulting deformation should not exceed 0.5 inch at 1.5 times the design load).
5. Connections: All connections shall be positive, structural connections subject to the same metal loss rates and allowable tension requirements as outlined in Paragraphs 1.04.B.7.g & 1.04B.7.h below. Adequacy and capacity of panel connections shall be demonstrated by providing test data on connections if requested by the Commissioner.
6. Reinforcement Length: The soil reinforcement length shall be the same from top to bottom of each wall section. The reinforcement length defining the width of the entire reinforced soil mass may vary with wall height along the length of wall. For walls with level or sloped surcharge, the minimum length embedded in the soil shall be seventy percent of the facing height H, or 8 feet, whichever is greater.
7. State of Stress and Pullout Resistance
  - a. The lateral earth pressure to be resisted by the reinforcements shall be calculated using the appropriate coefficient of earth pressure,  $K$ , based on the type of reinforcement used times the vertical soil stress at each reinforcement layer. The vertical soil stress shall be calculated using the Meyerhof method. For ribbed or ladder reinforcing strips, the earth pressure shall vary from  $1.5 \times K_a$  at the top of the structure to  $1.0 \times K_a$  at a depth of 20 ft. For wire mesh and bar mat reinforcements, the earth pressure shall vary from  $2.0 \times K_a$  at the top of structure to  $1.5 \times K_a$  at a depth of 20 ft., and it will remain constant (at  $1.5 \times K_a$ ) below a depth of 20 ft.
  - b. The soil reinforcement length shall be sufficient to satisfy the above requirements, sliding, overturning and pullout factors of safety and the

minimum lengths required for external stability as recommended by the City of New York. Calculation of stresses and pullout factors of safety shall be in accordance with the 2002 AASHTO Specifications for Highway Bridges.

- c. For ribbed or ladder reinforcing strips, the maximum apparent coefficient of friction,  $f^*$ , shall be as follows:

Uniformity Coefficient ( $C_u$ ) of Select Granular Backfill	Maximum $f^*$
< 2	1.2
2 - 7	1.5
> 7	2.0

- d. This maximum may be used at the top of the structure and shall vary to a value not exceeding  $\tan \phi$  at a depth of 20 ft., and it will remain constant ( $\tan \phi$ ) below a depth of 20 ft. A maximum  $f^*$  value of 2.0 is justified when using crushed stone backfill with a uniformity coefficient less than 7.
- e. For wire mesh or bar mat reinforcement, the maximum anchorage factor,  $A_c$ , shall be 30 at the top of the structure and shall vary to 15 at a depth of 20 ft., and it will remain constant at 15 below a depth of 20 ft. The top of the structure is established as the elevation at the upper limit of the mechanical height,  $H_1$ .
- f. The actual applied bearing pressures under the stabilized mass for each reinforcement length shall be clearly indicated on the design drawings developed by wall manufacturer. Passive pressure in front of the wall mass shall be assumed to be zero for design purposes. Calculations for stresses and factors of safety shall be based on assumed conditions at the end of the design life. The design life shall be 75 years unless otherwise indicated on the Contract Drawings.
- g. Allowable Reinforcement Tension: For determination of the allowable reinforcement tension, the following metal loss rates shall be assumed:

Zinc (first 2 years):	15 microns/year/side
Zinc (subsequent years to depletion):	4 microns/year/side
Carbon Steel (after depletion of zinc):	12 microns/year/side
Carbon Steel (75 to 100 years):	7 microns/year/side
Stainless Steel, Grade 316L (first 10 years):	0.5 mil/year
Stainless Steel, Grade 316L (subsequent years):	0.5 mil/year

- h. The allowable tensile stress in steel reinforcements and connections including tie strips and loop inserts,  $F_t$ , at the end of the service life, shall conform to the following:

(1) Stainless steel soil reinforcement:

Reinforcing strips =  $0.55 f_y$  at the end of the design life and  $0.50 f_u$  at net section of bolted connection.

Reinforcing mesh =  $0.47 f_y$  at the end of design life.

(2) Systems with ribbed or ladder reinforcing strips (Not Stainless Steel):

$F_t = 0.55 F_y$  at the reduced gross section (minimum cross section)

$F_t = 0.50 F_u$  at the net section at bolt hole.

(3) Systems with bar mats or welded wire mesh (Not Stainless Steel):

$F_t = 0.48 F_y$  at all sections.

(4) For ladder strips, bar mats and welded wire mesh reinforcements, the gauge of the wires or bars shall be the same in both the longitudinal and transverse directions.

(5)  $F_y$  used for design shall not exceed 65 ksi. The maximum allowable tension in the reinforcements shall consider any reduction in cross sectional area of reinforcements due to punching, and corrosion losses, and shall not exceed 50% of the pullout capacity of the connection devices embedded in the facing panels.

## 1.05 SUBMITTALS

- A. The Contractor shall submit design computations and design drawings in accordance with the General Conditions and Section 1330 - Shop Drawings. Approval from the Commissioner shall be obtained prior to beginning construction.
- B. The design drawings shall include all details, dimensions, quantities and cross-sections necessary to construct the wall and shall include but shall not be limited to the following:
1. An elevation view for each wall shall include the top of wall elevation at all horizontal and vertical break points and at least every 50 feet along the face of wall, the elevation of all steps in the leveling pads, the designation as to the type of panel, the length of soil reinforcing elements, the distance along the face of the wall to where changes in length of the soil reinforcing elements

- occur; and an indication of the final ground line and maximum calculated bearing pressures.
2. A typical cross section or cross sections showing the elevation relationship between ground conditions and proposed grades.
  3. General notes pertaining to design criteria and wall construction.
  4. A listing of the summary of quantities for each wall.
- C. All panel details shall show all dimensions necessary to construct the element, all reinforcing steel in the element, and the location of soil reinforcing connection devices embedded in the panels.
- D. Clearly indicated details for construction of walls around drainage facilities.
- E. Details of the architectural treatment.
- F. The details for diverting soil reinforcements around obstructions such as piles, catch basins and other utilities.
- G. The details for connections between the concrete panel and the soil reinforcements.

## PART 2 PRODUCTS

### 2.01 RETAINING WALL SYSTEM

- A. The mechanically stabilized earth retaining wall system used shall be the product manufactured by the Reinforced Earth Company of North Reading, Massachusetts, or an approved equal.

### 2.02 MATERIALS

- A. The Contractor shall make his own arrangements to purchase the materials covered by this Section of the Specifications, including concrete facing panels, reinforcing mesh, grid or strips, attachment devices, fasteners, joint materials and all necessary incidentals from one of the approved wall system suppliers. The Contractor, or the supplier as his agent, shall furnish the Commissioner with a Certificate of Compliance certifying that the applicable materials comply with this Section of the Specifications. Materials not conforming to this Section of the Specifications shall not be used without the written consent of the Commissioner.
- B. Concrete facing panels shall have a minimum thickness of 5-1/2 inches and a minimum concrete cover on reinforcing steel of 1-1/2 inches. Cement shall be Types I, II or III and shall conform to the requirements of AASHTO M-85. Concrete shall have a compressive strength at 28 days in accordance with Section 2.01.I, Compressive Strength. Additives containing chloride shall not be used

without the approval of the Commissioner. Attachment devices and lifting devices shall be set in place to the dimensions and tolerances shown on the Contract Drawings and called out in these Specifications prior to casting.

- C. **Testing and Inspection:** Acceptability of the precast units shall be determined on the basis of compressive strength tests and visual inspection. The precast units shall be considered acceptable regardless of curing age when compressive strength test results indicate that the compressive strength will conform to the 28-day requirement. The Contractor, or his supplier, shall furnish facilities and perform all necessary sampling and testing in an expeditious and satisfactory manner. Panels utilizing Type I or II cement shall be considered acceptable for placement in the wall when the seven-day initial strength equals or exceeds 85 percent of the 28-day requirement.
- D. **Casting:** The panels shall be cast face down in level forms supported on a flat working surface. Guides shall be used to locate and support attachment devices set in the back face of the panel. The concrete in each panel unit shall be placed without interruption and shall be consolidated by the use of an approved vibrator, supplemented by such hand tamping as may be necessary to force the concrete into the corners of the forms and to prevent the formation of stone pockets or cleavage planes. Clear form oil or release agent shall be used throughout the casting operation.
- E. **Curing:** The units shall be cured for a sufficient length of time so that the concrete will develop the specified compressive strength. Any production lot that does not conform to the strength requirements of Section 2.01 I, Compressive Strength, shall be rejected.
- F. **Removal of Forms:** The forms shall remain in place until they can be removed without damage to the unit.
- G. **Concrete Finish:** Unless otherwise indicated on the Contract Drawings or elsewhere in the Specifications, the concrete surface for the front face shall have an ordinary steel form finish, and for the rear face an unformed finish. The rear face of the panel shall be free of open pockets of aggregate and surface distortions in excess of 1/4 inch.
- H. **Tolerances:** All units shall be manufactured within the following tolerances with respect to the dimensions shown on the shop drawings:
  - 1. **Attachment Device Locations and Alignment --** Lateral position of reinforcing strip attachment devices shall be within one inch. Embedment measured from the back face of the panel shall be within + 1/4 inch, - 2 inch. Bearing surfaces of multiple attachment points for a single soil reinforcing element shall align within 1/16".

2. Panel Dimensions -- All panel dimensions shall be within 1/4 inch. All hardware embedded in the panel with the exception of attachment devices shall be within 1/4 inch.
3. Panel Squareness -- Squareness, as determined by the difference between the two diagonals, shall not exceed 1/2 inch.
4. Panel Surface Finish -- Surface defects on smooth-formed finished surfaces, measured on a length of 5 feet, shall not exceed 5/16 inch.

I. Compressive Strength

1. Acceptance of the concrete panels, with respect to compressive strength, shall be determined on the basis of production lots. A production lot is defined as a group of panels that shall be represented by a single set of compressive strength samples and shall consist of not more than 80 panels or a single day's production, whichever is less.
2. Compressive strength tests shall be performed on 6-inch diameter by 12-inch cylinders prepared in accordance with AASHTO T-23. During the production of the concrete panels, the manufacturer shall randomly sample the concrete in accordance with AASHTO T-141. A single set of compressive strength samples, consisting of a minimum of four (4) cylinders, shall be made for every production lot.
3. For every compressive strength sample, a minimum of two cylinders shall be cured in the same manner as the panels and tested at seven (7) days or less. The average compressive strength of these cylinders, when tested in accordance with AASHTO T-22, will determine the initial strength of the concrete. In addition, a minimum of two cylinders shall be cured in accordance with AASHTO T-23 and tested at 28 days. The average compressive strength of these cylinders, when tested in accordance with AASHTO T-22, will determine the compressive strength of the production lot.
4. If the initial strength test result indicates a compressive strength greater than or equal to 4,000 pounds per square inch, then this test result will be utilized as the compressive strength test result for that production lot, and the requirement for testing at 28 days will be waived for that particular production lot.
5. Acceptance of a production lot will be made if the compressive strength test result is greater than or equal to 4,000 pounds per square inch. If the compressive strength test result is less than 4,000 pounds per square inch, the acceptance of the production lot will be based on its meeting the following acceptance criteria in its entirety:

- a. Ninety (90) percent of the compressive strength test results for the overall production shall exceed 4,150 pounds per square inch.
  - b. The average of any six (6) consecutive compressive strength test results, including the one in question, shall exceed 4,250 pounds per square inch.
  - c. No individual compressive strength test result shall fall below 3,600 pounds per square inch.
6. In the event that a production lot fails to meet the specified compressive strength requirements, the production lot shall be rejected. Such rejection shall prevail unless the manufacturer, at his own expense, obtains and submits evidence of a type acceptable to the Commissioner that the strength and quality of the concrete placed within the panels of the production lot is acceptable. If such evidence consists of tests made on cores taken from the panels within the production lot, the cores shall be obtained and tested in accordance with AASHTO T-24.

J. Acceptance Criteria

1. Precast panels shall be accepted for use in wall construction provided the concrete strength meets or exceeds the minimum compressive strength requirement, the soil reinforcement connection devices and the panel dimensions are within tolerances and any chipping, cracks, honeycomb or other defects are within acceptable standards for precast concrete as determined by the Commissioner.
2. It is recognized that certain cracks and surface defects are not detrimental to the structural integrity of the panel if properly repaired. The Commissioner shall determine the need for and proper method of such repair. All repairs shall be approved by the Commissioner prior to acceptance of the panel for use in wall construction.

K. Marking: The date of manufacture, the production lot number, and the piece-mark shall be clearly marked on the side of each panel.

L. Handling, Storage and Shipping: All units shall be handled, stored and shipped in such a manner as to minimize the danger of chipping, cracks, fractures and excessive bending stresses. Panels shall be stored and shipped in stacks, front face down. Firm blocking, of sufficient thickness to prevent the attachment devices from contacting the panel above, shall be located immediately adjacent to the attachment devices. Lifting inserts shall be installed on the top edge of the precast panels to permit lifting at the project site. Reinforcement connection inserts (tie strips or loop inserts) shall not be used for lifting or handling the panel.

## 2.03 SOIL REINFORCING AND ATTACHMENT DEVICES

- A. All reinforcing and attachment devices shall be carefully inspected to insure they are true to size and free from defects that may impair their strength and durability.
- B. The following criteria apply to wall panels, straps and connections below the 100-year flood elevation (EL. 11.50 feet).

## General:

- 1. All metal connections and metallic soil reinforcement shall be stainless steel.
- 2. If a panel is partially below the 100 year flood elevation, the entire panel and all connections and soil reinforcement shall comply with requirements of this section.
- 3. The proprietary wall company is to determine if different strap and connection sizes are required due to the substitution of stainless steel with black steel. However, the proposed sizes of stainless steel elements will not be less than the sizes of the pre-approved black steel.
- 4. Lifting inserts shall be stainless steel.
- 5. Cover to rebar shall be 3-inches. Thickness of panels will be sized accordingly.
- 6. Transition from thicker panels with the 3 inch cover to the panels with the 2 inch cover will be such that the outer face of the panel will be flush. The panel joints will be detailed accordingly.

## Materials:

- 1. The stainless steel reinforcing mesh shall be per ASTM A1022, Type 316.
  - 2. The stainless steel straps shall be per ASTM A240, Type 316.
  - 3. Connections shall be per ASTM A276, ASTM F593 and F594. Steel for all connections shall be Type 316.
- C. Ribbed Reinforcing Strips shall be hot rolled from bars to the required shape and dimensions. Their physical and mechanical properties shall conform to ASTM A572 grade 65 (AASHTO M-223) or equal. Galvanizing shall conform to the requirements of ASTM 123 (AASHTO M-111). The minimum coating thickness shall be 2 oz/SF.
  - D. Ladder Reinforcing Strips shall be shop fabricated of cold drawn steel wire conforming to the minimum requirements of ASTM A82 and welded into the finished strip configuration in accordance with ASTM A185. The longitudinal and transverse wires shall be of the same size. Galvanizing shall be applied after the ladder strips are fabricated and shall conform to the minimum requirements of ASTM A123 (AASHTO M-111). The minimum coating thickness shall be 2 oz/SF.

- E. Reinforcing Mesh and Bar Mats shall be shop fabricated of cold drawn steel wire conforming to the minimum requirements of ASTM A82 and welded into the finished mesh fabric in accordance with ASTM A185. The longitudinal and transverse wires shall be of the same size. Galvanizing shall be applied after the mesh is fabricated and shall conform to the minimum requirements of ASTM A123 (AASHTO M-111). The minimum coating thickness shall be 2 oz/SF.
- F. Tie Strips shall be shop fabricated of hot rolled steel conforming to the minimum requirements of ASTM A-570, Grade 50 or equivalent. Galvanizing shall conform to the minimum requirements of ASTM A-123 (AASHTO M-111), or ASTM A153 (AASHTO M-232). The minimum coating thickness shall be 2 oz/SF.
- G. Wire Tie Strips and loop inserts shall be shop fabricated of cold drawn steel wire conforming to the minimum requirements of ASTM A82. Galvanizing shall conform to the minimum requirements of ASTM A123 (AASHTO M-111). The minimum coating thickness shall be 2 oz/SF.
- H. Fasteners shall consist of hexagonal cap screw bolts and nuts conforming to the minimum requirements of ASTM A325 (AASHTO M-164) or equivalent. Galvanizing shall conform to the minimum requirements of ASTM A153 (AASHTO M-232).
- I. Connector Bars and Pins shall be fabricated from cold drawn steel wire conforming to the minimum requirements of ASTM A82 and shall be galvanized in accordance with the requirements of ASTM A123 (AASHTO M-111). The minimum coating thickness shall be 2 oz/SF.
- J. Structural Plate Connectors and fasteners used for yokes to connect reinforcements to wall panels around pile or utility conflicts shall conform to the material requirements of Tie Strips and Fasteners, Items 4 and 6, stated above.

#### 2.04 JOINT MATERIALS

- A. Installed to the dimensions and thickness in accordance with the Contract Drawings or approved shop drawings.
- B. Bearing pads shall be EPDM rubber pads conforming to ASTM D2000 M2AA 807, having a durometer hardness of 80±5.
- C. Joint Cover: Horizontal and vertical joints between panels shall be covered by a geotextile. The geotextile may be either a non-woven needle punched polyester geotextile or a woven monofilament polypropylene geotextile as approved by the wall supplier. Adhesive used to hold the geotextile filter fabric material to the rear of the facing panels prior to backfill placement shall be approved by the wall supplier.

## 2.05 SELECT GRANULAR BACKFILL MATERIAL

- A. Materials for Select Fill: Use gravel, crushed stone, limestone screenings or other granular or similar material as approved which can be readily and thoroughly compacted to not less than 95 percent of the maximum dry density obtainable by ASTM D1557.

1. Provide select fill that complies with the following gradation limits (Coarse Aggregate Size No. 57):

U.S. Standard Sieve	Percent Passing By Weight
1-1/2 inch	100
1 inch	95-100
1/2 inch	25-60
#4	0-10
#8	0-5

2. Very fine sand, uniformly graded sands and gravels, or other materials that have a tendency to flow under pressure when wet are unacceptable as select fill.

- B. In addition, the backfill shall conform to all of the following requirements where placed for the MSE Wall:

1. Plasticity Index: The Plasticity Index (P.I.), as determined by AASHTO T-90, shall not exceed 6.
2. Soundness: The material shall be substantially free of shale or other soft, poor durability particles. The material shall have a magnesium sulfate soundness loss of less than 30 percent after four (4) cycles, as determined by AASHTO T-104.
3. Electrochemical Requirements: The backfill material shall conform to the following electrochemical requirements:

Property	Requirement	Test Methods
Resistivity	Minimum 3000 ohm-cm, at 100% saturation	ASTM G-57-78 AASHTO T-288-91I
PH	Acceptable Range 5-10	ASTM G-51-77 AASHTO T-289-91I
Chlorides*	Maximum 100 ppm	ASTM D-512-88 AASHTO T-291-91I

Property	Requirement	Test Methods
Sulfates*	Maximum 200 ppm	ASTM D-516-88 AASHTO T-290-91I

\* If the minimum resistivity exceeds 5000 ohm-cm, at 100% saturation, the need for testing of chlorides and sulfates is waived.

- C. The Contractor shall furnish to the Commissioner a Certificate of Compliance certifying that the select granular backfill material complies with this Section of the Specifications. A copy of all test results performed by the Contractor, which are necessary to assure compliance with the Specifications, shall also be furnished to the Commissioner.
- D. Backfill not conforming to this Specification shall not be used without the written consent of both the Commissioner and the wall supplier.

### PART 3 EXECUTION

#### 3.01 CONSTRUCTION REQUIREMENTS

- A. The Contractor's method of construction shall closely follow the construction procedure outlined in the contract documents and these Specifications. Inspection of the method of construction will be provided by the Commissioner. Inspection is not the responsibility of the wall system supplier.
- B. Wall Excavation: Unclassified excavation shall be in accordance with the requirements of the Section 02316 – Excavation, and in reasonably close conformity with the limits shown on the Contract Drawings.
- C. Foundation Preparation
  - 1. The foundation for the structure shall be graded level for a width equal to or exceeding the length of the soil reinforcements, or as shown on the Contract Drawings. Prior to wall construction, the foundation, if not in rock, shall be compacted as directed by the Commissioner. Any foundation soils found to be unsuitable shall be removed and replaced as directed by the Commissioner.
  - 2. At each panel foundation level, an un-reinforced concrete leveling pad shall be provided as shown on the Contract Drawings. The leveling pad shall have nominal dimensions of 6-inch thickness and 12-inch width, and shall be cast using minimum 2,000 psi 28-day compressive strength concrete. The leveling pad shall be cast to the design elevations as shown on the Contract Drawings. Allowable elevation tolerances are +0.01 foot (1/8 inch), and -0.02 foot (1/4 inch), from the design elevation.
- D. Wall Erection: Precast concrete panels shall be placed vertically with the aid of a light crane. For erection, panels shall be handled by means of lifting devices set

Mechanically Stabilized Earth (MSE) Retaining Walls

into the upper edge of the panels. Panels shall be placed in successive horizontal lifts in the sequence shown on the Contract Drawings as backfill placement proceeds. As backfill material is placed behind the panels, the panels shall be maintained in a vertical position by means of shoulder clamps to adjacent panels and temporary wooden wedges placed in the joint at the junction of the two adjacent panels on the external side of the wall. External bracing is required for the initial lift. Vertical and horizontal alignment tolerances shall not exceed 3/4 inch in 10 feet. The overall vertical tolerance of the wall (plumbness from top to bottom) shall not exceed 3/4 inch per 10 feet of wall height.

E. Placement of Reinforcements: Prior to placing the first layer of reinforcements (strips, mats or grids), backfill shall be placed and compacted in accordance with Section 3.01F, Backfill Placement.

1. Bending of reinforcements in the horizontal plane that results in a kink in their alignment shall not be allowed. Gradual bending in the vertical direction that does not kink the reinforcements is allowable.
2. Connection of reinforcements to piles or bending of reinforcements around piles shall not be allowed. Cutting of reinforcement longitudinal bars shall not be allowed to avoid conflicts with piles or utility obstructions. A structural connection (yoke) from the wall panel to the reinforcement shall be used whenever it is necessary to avoid cutting or excessive skewing of reinforcements due to pile or utility conflicts.
3. Soil reinforcements shall be placed normal to the face of the wall, unless otherwise shown on the Contract Drawings or directed by the Commissioner. If skewing of the soil reinforcements is required due to obstructions in the reinforced fill, rotatable connections shall be used and the maximum skew angle shall not exceed 15 degrees from the normal position unless specifically addressed in design calculations that justify that the skewed reinforcements are adequate.

F. Backfill Placement

1. Backfill placement shall closely follow erection of each course of panels. Backfill shall be placed in such a manner as to avoid any damage or disturbance to the wall materials or misalignment of the facing panels. Any wall materials which become damaged or disturbed during backfill placement shall be either removed and replaced at the Contractor's expense or corrected, as directed by the Commissioner. Any backfill material placed within the reinforced soil mass which does not meet the requirements of this specification shall be corrected or removed and replaced at the Contractor's expense, as directed by the Commissioner.
  - a. Backfill shall be compacted to 95 percent of the maximum density as determined by AASHTO T-99, Method C or D.

2. The moisture content of the backfill material prior to and during compaction shall be uniform throughout each layer. Backfill material shall have a placement moisture content less than or equal to the optimum moisture content. Backfill material with a placement moisture content in excess of the optimum moisture content shall be removed and reworked until the moisture content is uniform and acceptable throughout the entire lift. The optimum moisture content shall be determined in accordance with AASHTO T-99, Method C or D.
3. The frequency of sampling of select granular backfill material, necessary to assure gradation control throughout construction, shall be as directed by the Commissioner.
4. The maximum lift thickness after compaction shall not exceed 10 inches, regardless of the vertical spacing between layers of soil reinforcements. The Contractor shall decrease this lift thickness, if necessary, to obtain the specified density. Prior to placement of the soil reinforcements, the backfill elevation, after compaction, shall be 2 inches above the attachment device elevation from a point approximately 12 inches behind the back face of the panels to the free end of the soil reinforcements, unless otherwise shown on the Contract Documents.
5. Compaction within 3 feet of the back face of the panels shall be achieved by at least three (3) passes of a lightweight mechanical tamper, roller or vibratory system. The specified lift thickness shall be adjusted as warranted by the type of compaction equipment actually used, but no soil density tests need be taken within this area. Care shall be exercised in the compaction process to avoid misalignment of the panels or damage to the attachment devices. Heavy compaction equipment shall not be used to compact backfill within 3 feet of the wall face.
6. At the end of each day's operation, the Contractor shall slope the last level of backfill away from the wall facing to direct runoff of rainwater away from the wall face. In addition, the Contractor shall not allow surface runoff from adjacent areas to enter the wall construction site.

-END OF SECTION-

**NO TEXT THIS PAGE**

**Section 02890**  
**TRAFFIC SIGNALS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Traffic signals shall consist of traffic lights, poles, base castings, base covers, and all mounting equipment and appurtenances. Traffic lights shall perform the following functions:
  - 1. Control traffic entering and exiting from the inbound scale in either direction.
  - 2. Control traffic entering and exiting from the outbound scale in either direction.
  - 3. Indicate open tipping bays.

**1.02 SYSTEM DESCRIPTION**

- A. Design Requirements: Traffic signals shall meet the requirements of the New York State Department of Transportation, Section 724 except as specified herein.

**1.03 SUBMITTALS**

- A. Contractor shall submit working drawings, shop drawings, and material specifications for approval in accordance with Section 01300 – Shop Drawings.
- B. Shop Drawings
  - 1. Manufacturer's catalog cuts and drawings showing all technical information and construction details, including dimensions, type of wiring, weight, and size.
  - 2. Lamp type and technical information.
  - 3. Pole and base construction details.
  - 4. Bill of materials.
  - 5. Submit certification of compliance with NYS DOT standards.
- C. Provide Operation and Maintenance manuals in accordance with Section 01831 - Operation and Maintenance Manuals.

**1.04 QUALITY ASSURANCE**

- A. Reference Standards: The following organizations have generated standards that are to be used as guides in assuring quality and reliability of components and systems; govern nomenclature; and define parameters of configuration and construction, in addition to specific details in this specification:
  - 1. AASHTO, American Association of State Highway and Transportation Officials
  - 2. ITE, Institute of Transportation Engineers

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. Deliver, store, and handle all products and materials as specified in Section 01651 – Transportation and Handling of Materials and Equipment, and Section 01661 – Protection of Materials and Equipment.
- B. Inspect all materials and equipment against approved shop drawings at time of delivery. Immediately return for replacement or repair any equipment or materials damaged or not meeting the requirements of the approved shop drawings.
- C. Label all equipment and materials after they have been inspected. Store all equipment and materials in dry, covered, ventilated location. Protect from harm in accordance with the manufacturer's recommendations.

**1.06 PROJECT CONDITIONS**

- A. Project Environmental Requirements: Design and construct the system for continuous operation under the following temperature and humidity conditions:
  - 1. Indoor locations
    - a. Tipping Floor: Similar to outdoor locations
  - 2. Outdoor locations
    - a. Ambient Temperature: -10 to 120 degrees F
    - b. Relative Humidity: 100 percent maximum
  - 3. Where required, provide thermal enclosures equipped with thermostatically controlled space heaters.

**1.07 SPARE PARTS**

- A. Provide spare parts in accordance with Section 01750 – Spare Parts and Maintenance Materials.

- B. Furnish and deliver spare parts as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification Section.
- C. The following shall constitute the minimum spare parts:
  - 1. All standard recommended spare parts, as indicated in the equipment manufacturer's instructions manual for each component of the system.
  - 2. Furnish the following complete spare units:
    - a. One optical system of each type and color supplied
    - b. One dozen of each type and size of fuse used.

## PART 2 PRODUCTS

### 2.01 TRAFFIC LIGHTS

#### A. Housing

- 1. Material of Construction: Polycarbonate
  - a. Heat-resistant to the signal lamp
  - b. UV and heat stabilized
  - c. Flame retardant
- 2. Signal Size: As shown
- 3. Signal Type: Circular or square as shown
- 4. Housing, Door and Visor Color: Black
- 5. Door Hardware: Stainless steel
- 6. Visor Style: Cap-type

#### B. Optical System

- 1. Reflector: Specular aluminum
- 2. Lens
  - a. Material of Construction: Polycarbonate, conforming to ITE standards
  - b. UV resistant

## 3. Lens Types

- a. Circular: Red, green
- b. Square: Lane control type: Red "X", green arrow

## 4. Lamps

- a. Power: 120 Vac
- b. Type: LED
- c. Chromacity: In accordance with NYS DOT standards
- d. Minimum Luminous Intensity: In accordance with NYS DOT standards

C. Mounting: In accordance with current NYS DOT standards, and as shown.

## D. Manufacturers

- 1. Eagle Traffic Control Systems
- 2. Peek
- 3. US Traffic Corporation
- 4. Or approved equal

## 2.02 TRAFFIC POLES AND APPURTENANCES

- A. Pole Construction: Seamless, round, non-tapered
- B. Pole Materials of Construction: Aluminum
- C. Pole Wall Thickness: No less than 0.125-inch
- D. Pole Finish: Powder coat, dark bronze
- E. Pole Height: As shown
- F. Pole Diameter: 4 inches
- G. Pole Mounting: As shown
- H. Pole Wind Design: Meet the outdoor lighting standards wind design requirements of Section 16511 – Lighting of the Electrical Contract.
- I. Pole bases shall be cast aluminum, secured by stainless steel screws.
- J. Provide aluminum pole cap.
- K. Provide embedment of four anchor bolts, with eight nuts and eight washers; all assembled as a template for placement.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Contractor shall mount and install all traffic signals as shown and specified.
- B. Interface with Other Work: The traffic signals adjacent to the inbound and outbound scales shall interface with the scale data management system provided by others (PIN 82704RR00033). Driver Interface Panels provided as part of the scale data management system will include dry contacts, which shall be used to control the traffic signals.
- C. Field Quality Control: Adjust the mounting of the traffic signal assemblies to "aim" to signals towards the vehicle driver.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02891**  
**ALUMINUM SIGN PANELS AND ALUMINUM SIGN POSTS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section specifies requirements for the following:
1. Aluminum sign panels for use in the construction of guide, warning and regulatory roadway signs.

**1.02 REFERENCES**

- A. The following is a listing of the publications referenced in this Section:
1. American Association of State Highway and Transportation Officials (AASHTO)
    - a. A Policy on Geometric Design of Highway and Streets, 5<sup>th</sup> Edition
  2. Standard Specifications for Structural Supports for Highway Signs, Luminaries, and Traffic Signals (LTS-2)
  3. Manual for Signing and Pavement Markings of the National System for Interstate and Defense Highways
  4. American Society for Testing and Materials (ASTM)
    - a. ASTM A 153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware
    - b. ASTM A 193 Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service
    - c. ASTM A 194 Carbon and Alloy Steel Nuts for Bolts for High-Pressure and High-Temperature Service
    - d. ASTM A 325 High-Strength Bolts for Structural Steel Joints
    - e. ASTM A 325 High-Strength Bolts for Structural Steel Joints
    - f. ASTM B 209 Aluminum and Aluminum-Alloy Sheet and Plate
    - g. ASTM B 211 Aluminum-Alloy Bar, Rod and Wire
    - h. ASTM B 221 Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes and Tubes

5. American Welding Society (AWS)
  - a. AWS D 1.2 Structural Welding Code - Aluminum
6. Federal Highway Administration (FHWA)
  - a. Manual on Uniform Traffic Control Devices for Streets and Highway (MUTCD)
7. Federal Highway Administration (FHWA)
  - a. Standard Highway Signs

#### 1.03 DESIGN AND PERFORMANCE REQUIREMENTS

- A. Design of signs, supports and framing shall provide sufficient strength to withstand a wind loading of 80 miles per hour as per AASHTO LTS-2.

#### 1.04 DELIVERY, STORAGE, AND HANDLING

- A. All sign components and materials shall be transported and handled in a manner that shall cause no permanent deformation, injury or damage. Sign components and materials to be stored shall be stored above ground.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the requirements of this Section:
  1. Detailed sign face layout for all sign panels showing letter height, width, brush stroke, spacing between letters, words, symbols and lines, border width, symbols details, and overall dimensions of the sign panels.
  2. Shop drawings of sign panels showing the sizes of the members and their connection details including joining and anchorage, stiffening, and bracing.
  3. Catalog cuts of all the materials to be used for sign faces.
- B. Prior to fabrication, submit computations for the design of the sign panels and supports, as required in 1.03 of this Section, signed by a Professional Engineer licensed in New York State.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. Aluminum Sign Panels
  1. Aluminum sheets and plates shall conform to ASTM B 209, alloy 6061-T6.

2. Fabricate panels from standard sheet widths. The thickness for panel sizes of 30 inches by 30 inches or smaller shall be 0.080 inch and the thickness of larger panels shall be 0.125 inch unless otherwise shown on the Contract Drawings.
3. The panel blanks shall be free from laminations, blisters, open seams, pits, holes, or defects that may affect their strength, appearance or use. The thickness shall be uniform and the blanks shall be commercially flat.

**B. Panel Sheeting and Screen Printing**

1. Reflectorized Sheeting: Scotchlite Brand High Intensity Grade Series 2800 (heat activated adhesive) or Series 3800 (pressure sensitive adhesive) as manufactured by the Traffic Control Materials Division of the 3M Co., 223-3N 3M Center, St. Paul, Minnesota 55144, or approved equal, and shall meet or exceed the reflecting requirements associated with High Intensity Grade sheeting.
2. Non-Reflectorized Sheeting: Scotchcal Brand film Series 650 (heat activated adhesive) or Series 3600 (pressure sensitive adhesive) as manufactured by the Traffic Control Materials Division of the 3M Co., or approved equal.
3. Screen Printing Inks, Thinners and Toners
  - a. Scotchlite Brand Process Colors Series 700 for use on Reflectorized Sheeting, or approved equal
  - b. Scotchcal Brand Process Colors Series 3900 and 4100 for use on Non-Reflectorized Sheeting, or approved equal
4. Panel sheeting (reflective or non-reflective) and screen printing usage shall be as shown on the Contract Drawings.

**C. Stiffeners, Brackets and Miscellaneous Hardware**

1. Horizontal and vertical sign panel stiffeners (Z bars) and panel brackets shall be fabricated of aluminum alloy 6061-T6 conforming to ASTM B 221.
2. Other miscellaneous aluminum hardware including bolts, nuts, washers, screws, rivets, pull-type lockbolts and serrated or knob stem blind rivets shall be fabricated to meet the requirements of ASTM B 209 and B 211 for Alloy 2024-T4. Component designated as Alloy 2024-T4 shall be given an chromated sealed anodic coating.
3. High strength steel bolts, nuts and washers shall conform to ASTM A 325. High-strength bolts, nuts and washers shall be galvanized in accordance with ASTM A 153.

4. Stainless steel nuts shall conform to ASTM A 194, Grade 8F, except that the nuts shall be lock nuts with semifinished hex nuts equivalent to American Standard Heavy Series. Stainless steel bolts, washers, and screws shall conform to ASTM A 193, austenitic steel.

## 2.02 CONSTRUCTION FEATURES

- A. Sign face text, symbol, and border layouts shall be in accordance with the Contract Drawings and conform to the following requirements of:
  1. MUTCD
  2. Standard Highway Signs
- B. Sign characters shall be as shown on the Contract Drawings.
- C. Sign corner and border radii shall be approximately one-eighth (1/8) of the height of the sign but shall not exceed 12 inches; or as shown in the FHWA Standard Highway Signs. Sign borders shall be of the same type character as the legend and shall be approximately the same width as the stroke width of the major lettering or the sign; or as shown in the FHWA Standard Highway Signs.

## 2.03 FABRICATION

- A. All shearing, cutting and punching shall be performed prior to preparing the blanks for application of reflective material. All edges and corners shall be filed or ground smooth, leaving the entire sign blank free from sharp edges and burrs.
- B. The blanks shall be cleaned, degreased, and chromated or otherwise properly prepared in accordance with the sheeting manufacturers recommendations. After treatment, clean cotton gloves shall be used in handling the sign blank until the reflective sheeting is applied. All fabrication except for cutting the lower ends of embedded posts shall be done in the shop. The aluminum panels shall be clean, dry, and free from oils, dust, grit, or any other contaminants that would adversely affect the adhesion of the Reflectorized and Non-Reflectorized sheeting.
- C. Welding of aluminum shall consist of inert gas shielded metal arc welding with consumable electrodes. All welding of aluminum shall be performed in the shop. No field welding or aluminum shall be permitted. All welders shall be qualified in accordance with the qualification procedures of AWS D 1.2.
- D. Necessary drilling of holes required for shop and field assembly after sheeting is applied shall be done such that the drill bit does not snag, rip, or damage the sheeting outside of the drill hole. Holes shall be deburred prior to assembly.
- E. Exposed bolt heads on the face of the assembly sign shall be touched up with enamel paint of the same color as the sheeting surrounding the bolts.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Erect, cover, and remove signs as shown on the Contract Drawings.
- B. Side-of-road ground mounted signs shall be erected so that the sign face is truly vertical to the profile line and the intersection angle measured between the sign face and the centerline of the travel lane, which the sign serves shall be 93 degrees. Where lanes divide or curve, sign faces shall be oriented so as to be most effective both day and night, and to avoid the possibility of specular reflection.
- C. Except where otherwise specified, parking signs shall be placed facing approaching traffic at an angle of between 30 and 45 degrees with the line of traffic flow.
- D. All sign panels shall be securely fastened to their supports with bolts, nuts and washers of aluminum (2024-T4 alloy), hot-dip galvanized steel, or stainless steel conforming to 2.01 C, and 1.03 of this Section.
- E. Horizontal and vertical sign clearances shall be as shown on the Contract Drawings.

#### 3.02 FIELD INSPECTION

- A. Immediately prior to erection, all material will be inspected by the Commissioner for damage which is attributable to improper transportation, handling or storage procedures.
- B. An inspection of each completely erected sign shall be made in the daylight for proper location, line and grade of signs, vertical post alignment, condition, appearance and visibility. The completely erected signs may also be inspected at night by the Commissioner.
- C. As the Work progresses, the location, position and condition of all signs shall be monitored by the Commissioner.
- D. Any deviation from the above indicated procedure shall be approved by the Commissioner.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 02910  
GENERAL PLANTING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work includes but is not limited to the following:
1. Furnishing and installing new seeded lawns.
  2. Furnishing and installing mulch.
  3. Protection and maintenance of all seeded areas until Substantial Completion.
  4. Maintenance of seeded areas during the 24-month guarantee period.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 – Shop Drawings
- B. Section 02316 – Excavation
- C. Section 02317 - Backfilling
- D. Section 02371 - Dust, Soil Erosion & Sedimentation Control
- E. Section 02920 - Soil Mixes

**1.03 SUBMITTALS**

- A. All submittals, including the following, shall be as specified in Section 01330 - Shop Drawings.
- B. Samples: Submit samples of the following items:
1. Mulch: One (1) pound bag
- C. Product Data
1. Submit analysis of each seed mix to be used, showing percentage of purity, weed content and germination of seed.
  2. Submit certified analysis for each treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged material.
- D. Maintenance Program: Submit written schedule of maintenance operations proposed for the guarantee period. Schedule shall be in the form of a list of each maintenance operation, with dates showing when each maintenance task will be performed, and the frequency of occurrence.

**1.04 REGULATORY REQUIREMENTS**

- A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to City of New York.
- B. Procure and pay for permits and licenses required for work of this Section. Obtain all required permits in a timely manner to avoid delays to the work.

**1.05 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. Deliver packaged materials in unopened bags or containers, each clearly bearing the name of the producer, the material composition, manufacturers' certified analysis, and the weight of the material
- B. All packaged products shall be stored, handled and applied in strict accordance with manufacturers' instructions.

**1.06 COORDINATION**

- A. The Contractor shall coordinate his work with that of other Contractors. Such coordination shall include, but not be limited to:
  - 1. Location of all underground utility lines and structures
  - 2. Scheduling of seeding operations
  - 3. Scheduling of maintenance operations

**1.07 SUBSTANTIAL COMPLETION**

- A. Contractor shall submit a written request to the Commissioner, for a formal inspection of the planting work for Substantial Completion.
- B. At the time of inspection all plant material must be alive, healthy, and installed as specified to be accepted.
  - 1. If plants are dead, dying, unhealthy, or not serving their visual function in the landscape scheme in the opinion of the Commissioner, or if workmanship is unacceptable, written notice will be given to the Contractor in the form of a punch list which itemizes all remedial work required for Substantial Completion.
  - 2. This work may include plant replacement or maintenance and must be carried out prior to issuance of the Certificate of Substantial Completion.

## 1.08 GUARANTEES

- A. All new plant material shall be guaranteed for a period of 24 months after the date of Substantial Completion.
- B. Maintenance
  - 1. Contractor shall submit a written maintenance program and schedule to the Commissioner for approval.
  - 2. Maintenance program shall be revised and resubmitted as required until approved by Commissioner.
  - 3. During the guarantee period, the Contractor shall maintain all plant materials as specified herein, and as noted in the approved maintenance schedule, and shall replace, at no additional cost to the City of New York, any and all plant material that has died or, in the opinion of the Commissioner, is in unhealthy or unsightly condition.
- C. Vandalism: Contractor will not be held responsible for acts of vandalism occurring after the beginning of guarantee period.
- D. Site Inspection
  - 1. Approximately one month prior to the expiration of the guarantee period, the Contractor shall arrange a site inspection by the Commissioner.
  - 2. At this time the Commissioner will prepare a list of all remedial work required, including plant replacement or maintenance.
  - 3. This work shall be carried out before the end of the guarantee period, unless weather conditions cause delays, in which case such work shall be carried out as soon as is practical.
- E. Final Acceptance
  - 1. Following the completion of all remedial work and replacement plantings, the Contractor shall request the Commissioner in writing for a formal inspection of the landscape work for Final Acceptance.
  - 2. If replacement plantings are required, Final Acceptance will be provisional upon a final inspection at the end of the guarantee period for the plant replacements.
- F. All of the materials and labor required for maintenance and replacements during the guarantee period shall be included in the Contractor's bid price. No additional payments will be made therefor.

**PART 2 PRODUCTS****2.01 DRAINAGE GRAVEL**

- A. Drainage fill shall conform to the requirements of Specification 02317 - Backfilling, and shall be clean, free from silt and organic materials.

**2.02 MULCH**

- A. Mulch shall be double-shredded bark, as approved. Mulch shall be partially decomposed, dark brown in color, free from sawdust, and any material over three (3) inches in length.

**2.03 GRASS SEED**

- A. Grass seed shall be fresh recleaned seed of the latest crop. Seed mixture shall have the following proportions by weight:
  - 1. 60% Nassau Kentucky Bluegrass
  - 2. 20% Jamestown Chewings Fescue
  - 3. 20% Palmer Perennial Ryegrass
- B. Seed shall be Tri-Plex General seed mix by Lofts Seed Inc. (800) 526 3890, or approved equal.
- C. All seed shall be delivered in standard size bags of the vendor, showing weight, purity, and percentage of seed varieties.

**2.04 WATER**

- A. The Contractor shall be responsible for supplying all required water to the site at no additional cost to the City of New York.
  - 1. All work injured or damaged due to the lack of water, or the use of too much water or contaminated water shall be the Contractor's responsibility to correct.
  - 2. Water shall be free from impurities injurious to vegetation.

**PART 3 EXECUTION****3.01 INSPECTION**

- A. Contractor shall inspect the site before bidding to determine the characteristics of the site.

- B. The Contractor shall be liable for all damage to surrounding areas caused by planting operations and shall be required to restore or replace the damaged areas to their original condition.

### 3.02 UTILITIES

- A. Contractor is responsible for determining the location of all utilities, by contacting the appropriate utility company prior to any planting activities.
- B. Verify that underground utilities and irrigation systems in landscape areas are in place, at proper location, tested (except final irrigation testing) and ready for use.
  - 1. Take proper precautions so as not to disturb or damage sub-surface elements.
  - 2. Coordinate with other trades.
- C. Contractor is liable for any damage to such utilities during the course of construction, and is responsible for making necessary repairs to damaged utilities at his own expense.

### 3.03 WATERING

- A. Immediately after installation of each plant, the soil around it shall be thoroughly saturated with water.
  - 1. Apply water slowly so as to penetrate the entire root system.
  - 2. Watering shall continue throughout the maintenance and guarantee period, as frequently as seasonal conditions require, until final acceptance of the work.
  - 3. Contractor shall be responsible for adequate water both before and after installation of irrigation system.

### 3.04 MULCHING

- A. After planting operations are complete all plant bed areas shall be covered with approved mulch.
  - 1. Mulch shall be installed at an even depth of 3 inches.
  - 2. Mulch shall be contained within the plant bed areas and shall not be permitted to spread onto paved areas.

### 3.05 PREPARATION FOR SEEDING

- A. All areas to be seeded shall be thoroughly loosened to a depth of 6 inches and graded to true lines free from all unsightly variations, bumps, ridges or depressions. All sticks, stones, roots or other objectionable material shall be removed.

- B. Provide 12 inches of lawn soil mix, spread evenly over all areas to be seeded. Prepare topsoil to provide a crumbly seedbed, firm and level after tilling.
- C. Apply ground limestone and uniformly work in to top one inch of seedbed. The rate of limestone application shall be dependent on the pH of the soil, as determined by chemical analysis, and shall be as follows:

<b>pH of Soil</b>	<b>Rate: lbs/1000 Square Feet</b>
5.0 to 5.5	100
5.5 to 6.0	50
6.0 to 6.8	25
over 6.8	0

1. Apply commercial fertilizer and uniformly work in to top one inch of seedbed. The rate of application shall be: 20 pounds per 1000 sq. ft.
2. Apply superphosphate and uniformly work in to top one inch of seedbed. The rate of application shall be: 40 pounds per 1000 sq. ft.
3. After all materials have been worked in, firm up soil by rolling to eliminate all soft spots. Rake entire area into a crumbly state, with one inch of loose soil at the surface, using a wide-toothed rake or tine-harrow.

### 3.06 SEEDING OPERATIONS

- A. Apply seed with drop or cyclone spreader to uniformly cover seedbed at the rate of 5 lbs per 1000 sq feet.
- B. Lightly rake seed into soil, and cover entire area with salt hay, to a thickness of one inch.
- C. Water all seeded areas regularly during first 4 weeks following seeding to maintain adequate moisture for deep root growth.
- D. Seeded areas shall be protected during establishment.

### 3.07 WATERING OF SEEDED AREAS

- A. The Contractor shall provide all labor and arrange for all watering necessary to establish acceptable grass stands.
1. Begin watering immediately following installation.
  2. Watering shall continue throughout the contract period until Substantial Completion.

3. During the first two weeks after planting, in the absence of adequate rainfall, watering shall be performed up to 3 times daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least two inches.
  4. After the first two weeks, the Contractor shall water the grass areas to maintain adequate moisture in the upper two inches (2") of soil, necessary for the promotion of deep root growth.
- B. Watering shall be done in a manner which will provide uniform coverage, prevent erosion due to application of excessive quantities over small areas, and prevent damage to the finished surface by the watering equipment. The Contractor shall furnish sufficient watering equipment to apply one (1) complete coverage to the lawn areas in an eight (8) hour period.

### 3.08 RESEEDING

- A. Any areas which fail to show growth within 3 weeks of seeding shall be immediately reseeded at no additional cost to the City of New York.
- B. Reseeding shall be carried out as many times as necessary until a uniform grass cover is established.
- C. Scattered bare spots, none of which are larger than one square foot, will be allowed up to a maximum of 3 percent of any seeded area.

### 3.09 MOWING

- A. Mowing of all seeded lawn areas shall begin when lawn is firmly rooted and secure, and has reached a height of 3 inches, and shall continue until Substantial Completion.
- B. Mow all grass lawn areas to maintain a grass height of between 1-1/2 and 2-1/2 inches.

### 3.10 CLEAN UP

- A. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials. Store materials and equipment where directed.
- B. Immediately following the completion of planting operations, the Contractor shall remove all excess materials, stock piles, waste material, tools and equipment, and leave the site in a clear and clean condition.
- C. Immediately remove all rejected materials from the site. All rejected materials and other waste or debris shall become the property of the Contractor, who shall legally dispose of same off-site.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 02920  
SOIL MIXES****PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Work Included: This work includes, but is not limited to, the following:
  - 1. Supply of component materials and soil amendments for Soil Mixes from approved off-site sources.
  - 2. Preparation and blending of Soil Mixes.
  - 3. Installation, placement, spreading, and fine grading of Soil Mixes.
  - 4. Testing of all soil component materials, soil amendment materials, and Soil Mixes.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02317 - Backfilling
- C. Section 02371 - Dust, Soil Erosion & Sedimentation Control

**1.03 REFERENCES**

- A. Association of Official Agricultural Chemists
- B. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft<sup>3</sup> (600 kN-m/m<sup>3</sup>))
- C. NYS DEC 6NYRR Subpart 360-5

**1.04 SUBMITTALS**

- A. All submittals, including the following, shall be as specified in Section 01330 – Shop Drawings.
- B. Product Data: Submit manufacturer's technical information, including application instructions where relevant, for the following items:
  - 1. Fertilizers
  - 2. Herbicides
- C. Samples - Soil Mix Components: Each 1 lb. packaged.

1. Topsoil
2. Compost

D. Samples - Blended Soil Mixes: Each 1 lb. packaged.

1. Lawn Mix
2. Structural Soil Mix

E. Test Results - Soil Mix Components: Submit written reports, as specified herein, for each bulk component:

1. Topsoil
2. Sand
3. Compost
4. Crushed Stone

F. Test Results - Blended Soil Mixes: Submit written reports, as specified herein, for each blended soil mix:

1. Lawn Mix
2. Structural Soil Mix

1.05 TESTING

A. Contractor shall submit written test reports.

1. Testing shall be carried out by an independent testing laboratory.
2. Testing laboratory shall be approved by Engineer.
3. All testing required by this Section, or additionally required by Engineer, shall be furnished and paid for by Contractor.
4. Contractor shall be responsible for timely submittal of samples to the testing laboratory.

B. Each test shall be carried out using the categories and sieve sizes as specified herein. Failure to include any of the required criteria will be sufficient cause for rejection of the test.

C. Each test report shall include the following information:

1. Project Title
2. Name of Contractor
3. Name of material supplier
4. Testing Laboratory name, address and telephone number

5. Type of test
  6. Date of test
  7. Test results, including identification of deviations from acceptable ranges
- D. Each sample shall be tested, as applicable, for the following:
1. Mechanical analysis: Sieve method, using sieve sizes specified.
  2. pH
  3. Organic matter content: Percentage of oven-dry weight of soil, determined by loss on ignition of moisture-free sample, dried in accordance with the methods of the Association of Official Agricultural Chemists.
  4. Analysis of soluble salts: Sodium, calcium, magnesium, sulfates, chlorides and bicarbonates, in millimhos per centimeter.
  5. Analysis of minerals: Nitrogen, phosphorus, and potassium, in parts per million.
  6. Analysis of heavy metals: In parts per million.
  7. Corrective recommendations for nutrients and pH
- E. The Engineer may take and analyze at any time, such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested at no additional cost to the City.
- F. No component bulk material for Soil Mix shall be used or blended into a mix, until test reports have been received and approved by the Engineer. As necessary, make any and all soil mix amendments and resubmit test reports indicating amendments, until approved.

#### 1.06 REGULATORY REQUIREMENTS

- A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to City.
- B. Procure and pay for all permits and licenses required for the Work of this Section.

#### 1.07 DELIVERY AND STORAGE

- A. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.

- B. Packaged Materials: Deliver packaged materials to the location where planting Soil Mixes are to be blended, in unopened bags or containers, each bearing the name and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the material.
1. All bags shall be protected from water and contamination with other materials.
  2. Retain packages for inspection by Engineer.
  3. All packaged materials shall be stored, handled and applied in strict accordance with manufacturer's instructions.
- C. Stockpiles
1. Stockpiles of on-site or off-site bulk materials and Soil Mixes shall not exceed 50 cubic yards, and shall be no more than 6 feet in height to prevent anaerobic conditions within the piles.
  2. All stock piled materials shall be adequately covered with tarpaulins or otherwise protected to prevent excessive water absorption and blowing by winds, until time of actual use.

## PART 2 PRODUCTS

### 2.01 GENERAL

- A. All Soil Mix components shall be tested and approved prior to incorporation into blended Soil Mixes.
- B. Provide adequate quantities of all Soil Mix materials to attain, after compaction and natural settlement, all design finished grades.

### 2.02 TOPSOIL

- A. All topsoil shall consist of natural loam, free from subsoil, obtained from an area which has never been stripped.
1. Topsoil shall be removed to a depth of 12", or less if subsoil is encountered.
  2. Topsoil shall be of uniform quality, free from hard clods, stiff clay, hardpan, sods, roots, chips, sticks, partially disintegrated stone, cement, ashes, slag, concrete, tar residues, tarred paper, boards, or any other undesirable material. No topsoil shall be delivered in a frozen or muddy condition.
  3. Topsoil shall be free from refuse, material toxic or otherwise deleterious to plant growth, subsoil, seeds, or other viable propagules of invasive plants.

Construction and demolitions debris as classified under 6 NYCRR Part 360, other than uncontaminated land clearing debris, shall not be used to amend topsoil.

B. Topsoil shall conform to the following requirements:

1. pH: 5.5 to 7.0
2. Organic content: 4 - 6%

C. Topsoil shall conform to the following mechanical analysis:

Sieve Size	Percent Passing
1"	100
1/4"	90 - 99
# 10	60 - 80
# 40	40 - 60
# 60	40 - 60
# 100	10 - 30
# 200	10 - 20

D. When the topsoil otherwise complies with the requirements of the specification but shows a deficiency of not more than one percent (1%) organic matter content; then humus, compost, or other approved organic matter may be incorporated when or as permitted by the Engineer.

## 2.03 COMPOST

A. Shall conform to the following requirements:

1. Material shall be capable of sustaining the growth of vegetation, with no admixture of refuse or material toxic to plant growth.
2. Material shall be derived from organic wastes such as food and agriculture residues, composted cow or other animal manures, sewage sludge or other materials that meet the specified requirements.
3. Compost shall be screened, and shall be free of any stones, branches, roots, brush, weeds, or wood chips, and all debris such as plastic fragments, glass, and metal fragments.

B. Compost shall show conformance with the following requirements:

1. Organic content: 50% minimum

2. pH: 5.5 - 8.0
3. Carbon/nitrogen ratio: 25:1 to 35:1
4. Passing 1/2" screen: 100%

C. Heavy metal content shall not exceed the following indicated amounts:

<b>NYSDEC 6NYCRR, Subpart 360-5: Composting Facilities, Section 360-5.10, Table 7 Pollutant Limits- Products</b>		
Parameter	Monthly Average Concentration mg/kg, dry weight	Maximum Concentration mg/kg, dry weight
Arsenic (As)	41	75
Cadmium (Cd)	10	85
Chromium (Cr-total)	1000	1000
Copper (Cu)	1500	4300
Lead (Pb)	300	840
Mercury (Hg)	10	57
Molybdenum (Mo)	40	75
Nickel (Ni)	200	420
Selenium (Se)	100	100
Zinc (Zn)	2500	7500

- D. Compost shall meet requirements for "Monthly Average Concentration" pollutant limits of Table 7, except where the Engineer specifically allows the use of the Maximum Concentration pollutant limits.
- E. No compost shall be delivered until the approval of samples by the Engineer, but such approval does not constitute final acceptance. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications. When compost is stored on the job, it shall be done as directed by the Engineer.
- F. Certification: Only facilities permitted to compost biosolids under 6 NYCRR Part 360, will be allowed to furnish finished compost for use in topsoil. The certification shall be supplied by the Contractor prior to the delivery of any composted biosolids, topsoil containing sewage sludge, or other such regulated material to the site.

## 2.04 SOIL AMENDMENT MATERIALS

- A. Bonemeal: Shall be finely ground and have the following N-P-K (Nitrogen-Phosphorus-Potassium) analysis: 4-12-0.
- B. Commercial Fertilizer: Shall have the following N-P-K analysis: 10-6-4.
  1. A minimum of 50% of the nitrogen shall be derived from organic sources.
  2. If soil tests indicate need for a different composition, Contractor shall submit proposed alternate fertilizer for approval.

- C. **Controlled-release Fertilizer:** Shall be in granular form and shall have the following N-P-K analysis: 10-6-4.
1. Fertilizer shall be as manufactured by Osmocote, Meister, or other approved manufacturer.
  2. If soil tests indicate need for a different composition, Contractor shall submit proposed alternate fertilizer for approval.
- D. **Limestone:** Shall be granular limestone, produced from Dolomitic limestone specifically for use in planting, with a minimum of 88% of calcium and magnesium carbonates, conforming to the following requirements:

Sieve Size	Percent Passing
# 10	100
# 20	90 minimum
# 100	60 minimum

- E. **Sulfur:** Lower pH if required, by use of elemental sulfur product.
1. Peat moss or copper sulfate may not be used to lower pH.
- F. **Herbicides:** Acceptable products:
1. Post-emergent herbicide, for lawn areas and plant beds: Shall be Roundup, as manufactured by Monsanto Agricultural Products Company, C3NJ, St. Louis, MO 63166, or approved equal.
  2. Pre-emergent herbicide, not to be used at lawn areas or grasses: Shall be Treflan 5G, or approved equal.
- G. **Perlite:** Super-coarse size horticultural perlite.

## 2.05 CRUSHED STONE

- A. Crushed stone for Structural Soil Mix shall consist of clean, sound, tough, durable stone, free from soft, thin or laminated pieces, or vegetable matter or other deleterious substances. Crushed stone shall conform to the requirements of NYS DOT Type 4 Subbase Course materials, and shall meet the following gradations:

Sieve Size	Percent Passing
2"	100
1/4"	30 - 65

Sieve Size	Percent Passing
#40	5 - 40
#80	0 - 5

**2.06 LAWN MIX****A. Lawn Mix for all seeded areas, shall conform to the following requirements:**

1. Organic Matter: 4.5 % minimum
2. pH: 0 - 7.0
3. Soluble salts: Less than 2 millimhos per centimeter
4. Minerals:
  - a. Nitrogen: More than 12 ppm
  - b. Phosphorus: More than 7 ppm
  - c. Potassium: More than 150 ppm

**B. Mix shall consist of the following proportions by volume:**

1. Six parts topsoil
2. Two parts compost
3. Two parts sand
4. One part perlite

**C. The following items shall be added to the above mix:**

1. Five pounds bonemeal per cubic yard of soil mixture.
2. One pound commercial fertilizer per cubic yard of soil mixture.
3. One pound controlled release fertilizer per cubic yard of soil mixture.
4. Two pounds water absorbent polymer per cubic yard of soil mixture, or as recommended by manufacturer.
5. Ground limestone as required for specified pH

**2.07 STRUCTURAL SOIL MIX****A. The components of the structural soil mix shall be blended in the following proportions:**

Component	By Units of Weight
Crushed Stone	100
Planting Soil Mix	16 - 20
Super-absorbent polymer	0.03
Water	10 +/-

1. The quantity of water in the mix shall be adjusted to bring the mix to optimum moisture for compaction, as determined by AASHTO T 99 and ASTM D698.
- B. The ratio of the components in the mix shall be adjusted in accordance with the rodded unit weight of the crushed stone.
- C. If the stone sample porosity is near 40%, the weight of Planting Soil Mix may increase toward 20%. If the stone sample porosity is near 33%, the weight of Planting Soil Mix may decrease toward 14%.
- D. Blending Procedure: The components of the structural soil mix shall be blended as follows:
  1. Mix together the super-absorbent polymer and the water to produce a slurry. Wait at least four hours for hydration.
  2. Place the crushed stone in a truck-mounted rotary concrete mixer, or equivalent sized mixing hopper and set into motion.
  3. Add the water/super-absorbent polymer slurry, and mix until crushed stone is uniformly wetted by slurry.
  4. Add the Planting Soil Mix, and let the drum turn three revolutions, or the minimum needed to auger the soil from the loading access point to the furthest point in the drum.
  5. Deposit the material. The bulk of the mixing will occur during the revolutions of the mixer while the material is augured out.
  6. Do not over-mix. If the Planting Soil Mix begins to pelletize and separate from the crushed stone, the batch shall be discarded.

### PART 3 EXECUTION

#### 3.01 INSPECTION AND COORDINATION

- A. Contractor shall inspect the site before bidding to determine the characteristics of the site and the existing soil in areas to be planted.

1. Prior to construction and soil mix placement operations, the Contractor shall ascertain the location of all existing and proposed electric cables, conduits, irrigation, under-drainage systems and all other underground or at grade utilities, by contacting the appropriate utility company.
  2. Contractor shall take proper precautions so as not to disturb or damage any sub-surface elements.
  3. Contractor shall be liable for any and all damage to such utilities during the course of construction, and shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.
- B. Contractor shall be liable for any and all damage to surrounding areas caused by planting operations and shall be required to restore or replace damage areas to original conditions, to the satisfaction of the Engineer.
- C. Coordination: The Landscape Contractor shall coordinate, adjust, and relate together, work of this Section with other work of the Project and with work of other Contractors. Such coordination shall include but not be limited to:
1. Location of all underground utility lines and structures
  2. Scheduling of maintenance operations
- D. Verify that all work requiring access through or adjacent to areas where soil mixes are to be placed has been completed and no further access (other than Landscape installation) will be required. In the event that access will be required, this must be coordinated with the Engineer.

### 3.02 WEATHER LIMITATIONS

- A. Perform both blending and site soil work only during suitable weather conditions. Do not handle, haul, place, work, disc or rototill soil when frozen, excessively wet, or in otherwise unsatisfactory condition.

### 3.03 PREPARATION OF SOIL MIXES

- A. Uniformly blend all ingredients as required for each Soil Mix type, by wind rowing and/or tilling on a hard surfaced area.
1. The components of all soil mixes shall be blended so that ingredients are thoroughly incorporated into the mixture to assure uniform distribution.
  2. Do not over-mix; mix shall remain friable and well aerated.
  3. Organic matter shall be maintained moist, not wet, during blending.
  4. Delay mixing of fertilizers if planting will not follow within a few days.

### 3.04 PREPARATION OF SUB-GRADE

- A. Verify as-constructed or existing sub-grade elevation and perform additional grading operations as necessary to bring the sub-grade to a true, smooth, slope parallel to the finished grade, at all areas to receive soil mixes.
- B. Any sub-grades or soils polluted by gasoline, oil, plaster, construction debris, unacceptable soils, or other substances which would render material unsuitable for plant growth, shall be removed from the premises whether or not such pollution occurred or existed prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes shall be reviewed and approved by the Engineer.
- C. Clean sub-grade and dispose of all debris prior to placement of soil mixes.
  - 1. Remove all large clods, lumps, brush, roots, stumps, litter, trash, and other foreign material and stones one-half inch in diameter or larger.
  - 2. Dispose of removed material legally off-site.
- D. Spray all vegetation on sub-grade with a pre-emergent weed killer at the rate of application recommended by the manufacturer.
- E. Protect adjacent pavements, walls, utilities and other construction from damage or staining by any soil mix placement operations.

### 3.05 STRUCTURAL SOIL MIX

- A. Do not place Structural Soil Mix until all walls, footings, curbs, utility work, or other construction is completed.
  - 1. Protect adjacent pavements, walls, utilities and other construction from damage or staining by soil mix.
- B. Excessive moisture is detrimental to the Structural Soil Mix.
  - 1. Verify moisture content prior to compaction, and provide drainage or dewatering as required.
  - 2. Allow 24 hours to drain if moisture content is excessive.
  - 3. Do not allow excess water to enter the mix before compaction.

**C. Compaction**

1. Prior to placing Structural Soil Mix, compact the sub-grade to not less than 95% Modified Proctor.
2. Place and spread Structural Soil Mix over the approved sub-grade, in 6-inch lifts. Compact each lift to not less than 95% Modified Proctor.
3. Provide compaction testing to conform compliance to specified compaction densities.
4. After completion of compaction operations, protect the installation from contamination by toxic materials or trash, and from water containing cement, clay, silt or any other materials which may alter the particle size distribution of the mix.

- D. Immediately following installation of Structural Soil Mix, install pavement base material or other materials as shown on the drawings to cover the Mix. Structural Soil Mix shall not be left uncovered by pavement for more than 4 days.

**3.06 GRADING OF SOIL MIXES**

- A. After settlement has occurred, add soil to maintain finished grades. If for any reason soil is left exposed for a long duration prior to planting, add soil and regrade as required.
- B. Protect placed Soil Mixes against construction activity with snow fencing or by other acceptable methods.
1. Protect from the eroding effects of wind and rain with filter fabric, as necessary.

**3.07 CLEAN UP**

- A. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials.
- B. Immediately following the completion of soil mix installation operations, the Contractor shall remove all excess materials, stock piles, waste material, tools and equipment, and leave the site in a clear and clean condition.
- C. All waste materials shall become the property of the Contractor, who shall legally dispose of same off-site.

-END OF SECTION-

**Section 03100**  
**CONCRETE FORMS AND ACCESSORIES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to design, furnish materials for, fabricate, erect, and remove formwork, falsework and shoring for cast-in-place concrete complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- C. In addition to the basic elements of formwork, the work specified in this Section includes the furnishing and installation of joints, sleeves, openings and embedded items into formwork as specified herein.
- D. This Section includes, but is not limited to, the following items:
  - 1. Lumber Forms
  - 2. Plywood Forms
  - 3. Steel Forms
  - 4. Precast Concrete Forms
  - 5. Form Ties
  - 6. Chamfer Strips
  - 7. Inserts
  - 8. Dovetail Anchor Slots
  - 9. Form-Facing Material
  - 10. Form Caulking
  - 11. Form Release Agent
  - 12. Shop Fabricated Forms
  - 13. Void Forms (Expanded Polystyrene Blocks)
  - 14. Form Liners
  - 15. Rustications
  - 16. Patching Material for Form-Tie Holes

**1.02 RELATED SPECIFICATIONS**

- A. Section 03200 - Concrete Reinforcement
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 03350 - Concrete Finishes
- D. Section 04201 - Unit Masonry

## 1.03 REFERENCES

A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

1. American Concrete Institute (ACI)
  - a. ACI 301, Specifications for Structural Concrete
  - b. ACI 303.1, Standard Specification for Cast-in-Place Architectural Concrete
  - c. ACI 347R, Guide to Formwork for Concrete
  - d. ACI SP-4, Formwork for Concrete
2. American Plywood Association (APA)
  - a. APA Grade – Trademarks
3. American Society for Testing and Materials (ASTM)
  - a. ASTM A36/A36M, Carbon Structural Steel
  - b. ASTM A572, High-Strength, Low Alloy Columbium-Vanadium Structural Steel
  - c. ASTM A992, Steel for Structural Shapes for Use in Building Framing
  - d. ASTM C39, Compressive Strength of Cylindrical Concrete Cylinders
  - e. ASTM D6817, Rigid, Cellular Polystyrene Geofoam
4. City of New York

## a. WWPA Catalog "A" Product Use Manual

## 1.04 PERFORMANCE REQUIREMENTS

- A. Assume sole responsibility for the engineering, design, fabrication and installation of concrete formwork. Design formwork to produce concrete members identical in shape, lines and dimensions to members shown on the Contract Drawings.
- B. Design of formwork including layout, spans, fastenings, joints, framed openings, and shoring and reshoring systems shall be performed under the direct supervision of a licensed Professional Engineer currently registered in the State of New York, retained by the Contractor and experienced in structural design of formwork, falsework and shoring for cast-in-place concrete.
- C. Design and construct formwork in accordance with the provisions of ACI SP-4, ACI 303.1 and ACI 347R.
- D. Design formwork to resist the loads and lateral pressures prescribed in ACI 347R and wind loads as specified by the New York City Building Code, Local Law 76/2008.
- E. Design formwork bulkheads at construction joints to accommodate protrusion of reinforcing steel dowels as detailed on approved Shop or Working Drawings prepared in conjunction with Section 03200 - Concrete Reinforcement.
- F. Formwork surface materials: Use form surface material that will produce surfaces conforming to the following and as required to obtain the indicated finishes:
  - 1. Concrete exposed to view: Use material that will produce smooth, uniform, blemish-free concrete surfaces.
  - 2. Concrete concealed from view: Use material that will produce concrete surfaces free of fins and honeycombs.
- G. Void Forms: Adequacy of structural design of expanded polystyrene (EPS) blocks for use as void forms, including required density, compressive strength and dimensional stability, shall be certified by a licensed Professional Engineer currently registered in the State of New York.
- H. Special Sections: Provide construction joints, openings, offsets, keyways, recesses, moldings, chamfers, blocking, screeds, bulkheads, waterstops, anchorages, inserts, and other features as required.
- I. Design formwork to be readily removable without impact, shock, or damage to uncured, green concrete surfaces and adjacent materials.

## 1.05 SUBMITTALS

- A. Prepare and submit the following in accordance with the provisions of the General Conditions and Section 01330 - Shop Drawings:
1. Certification by a licensed Professional Engineer currently registered in the State of New York that structural designs for all field-constructed and prefabricated formwork to be used on this project, including shoring and reshoring procedures for horizontal members, falsework and structural adequacy of void forms, were prepared in accordance with applicable codes, standards and publications of the American Concrete Institute and the New York City Building Code, Local Law 76/2008 as referenced herein. Submission of the Contractor's detailed Shop and Working Drawings of proposed formwork systems is not required and will not be reviewed for approval.
  2. Manufacturer's product data, compliance certification (as applicable) and installation instructions for the following:
    - a. Form ties
    - b. Inserts
    - c. Dovetail anchor slots
    - d. Form-facing material
    - e. Form caulking or gasketing
    - f. Form release agent
    - g. Void forms (expanded polystyrene blocks)
    - h. Form liners
    - i. Rustications
    - j. Patching material for form-tie holes.
  3. Form Removal Schedule: Submit proposed schedule for form removal indicating minimum length of time for form removal proposed for each type of element.
  4. Contractor's Surveyor: Submit qualifications of the Contractor's Surveyor to adequately survey all formwork and falsework locations, sleeves for conduits and pipework, openings and other embedments for future work.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Installer Qualifications: Demonstrate that proposed installer of void forms (expanded polystyrene blocks) has prior proven experience in the design, use and installation of void forms as a lightweight fill application and concrete formwork system.

- C. Assume responsibility for errors of detailing and fabrication and the correct fit of the formwork.
- D. Obtain submittal reviews before delivery of materials to the project site.
- E. Engage the services of a qualified and approved independent surveyor (Contractor's Surveyor) licensed in the State of New York in accordance with the provisions of the General Conditions for the performance of survey work specified herein.
- F. Form Liners: A representative of the manufacturer shall be present at the site to supervise the initial installation of each type of form liner and on an as-requested basis throughout the entire project.
- G. Work of this Section shall be coordinated with the work of other trades so that construction is not delayed.
- H. Allowable Tolerances
  - 1. Set and maintain concrete forms within tolerance limits stated in ACI 347R. Provide more restrictive tolerances where required to meet project conditions.
  - 2. Formwork at exposed surface conditions, including slabs, beams, and walls shall not deviate more than 1/2" from theoretical design locations. Pile caps and grade beams shall not deviate more than 1" from theoretical design locations.
  - 3. Tolerances shall not be cumulative.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Store form panels at least two inches above ground and maintain form panels in a well ventilated and dry location, protected against damage, exposure to weather and contamination that can affect concrete. Support forms to protect against warpage.
- B. Lift form panels by means that will protect them against damage and destruction. Support panels using strongbacks while lifting panels in a horizontal position.
- C. Deliver manufactured products in manufacturer's original packaging with identification marks intact.

#### 1.08 PROJECT CONDITIONS

- A. After stake layout of on-site conditions, verify locations of on-site elements with the Commissioner and revise layout of formwork drawings as necessary to reflect adjustments and actual conditions.

- B. Protect formwork materials before, during and after erection to ensure acceptable finished concrete work. Protect in-place materials and other operations of work in connection with concrete placements.
- C. In the event of damage to erected forms, make necessary repairs or replacements prior to concrete placements at no expense to the City of New York.
- D. Allow sufficient times, as determined by the Commissioner from the approved schedule, between erection of forms and placing of concrete for the various trades to properly install their work.
- E. Do not apply external or superimposed loads, lateral or vertical, until concrete has developed the specified 28-day compressive strength and a minimum age of 14 days.
- F. Stay-in-place forms, except void forms where indicated, are not permitted without the Commissioner's prior approval.

## PART 2 PRODUCTS

### 2.01 FORM MATERIALS

#### A. Lumber Forms

- 1. Use only stress-grade lumber. Form framing, sheathing and shoring shall conform to WWP A Catalog A Product Use Manual.
- 2. For lumber in contact with concrete, use lumber dressed on at least the side contacting the concrete with dressed, tongue-and-groove or squared edges. Lumber shall be free of raised grain, knotholes, or other surface defects.
- 3. Other lumber may be dressed or rough.
- 4. Do not use lumber formwork where a smooth form finish is required; use plywood or steel forms.

#### B. Plywood Forms

- 1. Use only grade-marked plywood.
- 2. Use as a minimum B-B Plyform, Exterior Class 1 or 2, or HDO High Density concrete form plywood, Class 1 or 2 conforming to U.S. Product Standard PS 1.
- 3. Use thickness as required to maintain alignment and surface smoothness, but not less than 3/4-inch thick.

**C. Steel for Steel Forms**

1. Sheet: Use commercial grade not less than 16 gauge.
2. Structural shapes: Use structural shapes that conform to ASTM A36/A36M, ASTM A992 or ASTM A572 Grade 50.
3. Maintain steel forms in rust-free condition by use of steel wool and light grinding, followed by coats of approved form release agent.

**D. Steel Forms**

1. Use stock material for steel form surfaces that is free from warps, dents, bends, kinks, cracks, sags, and other irregularities. Thoroughly remove rust, oils and other foreign matter that could stain the concrete.
2. Fabricate panels in conformance with the Contractor's Shop or Working Drawings.
3. Reinforce outward facing surfaces as required to prevent warpage and deformation during concrete placement.

**E. Precast Concrete Forms**

1. Use precast concrete forms for cast-in-place concrete in-fill where indicated on the Contract Drawings and as specified herein.
2. Use forms of appropriate dimensions and adequate strength to withstand lateral pressures imposed by wet concrete.
3. Manufacture precast concrete forms in conformance with the Contractor's concrete mix design and Shop or Working Drawings.

**2.02 FORM ACCESSORIES****A. Form Ties**

1. Provide a cone-shaped, snap-in type form tie suitable for the intended use with a working load as required and an integral hot forged head.
2. Provide a form tie system that does not leave mild reinforcing steel after break-off or removal closer than 2 inches from the exposed surface. Do not use wire alone. Form ties and accessories shall not reduce the effective cover of the reinforcement.

3. Products: Subject to compliance with requirements, provide one of the following:
  - a. A-2 Cone Snap-in Form Tie; Dayton Superior, Miamisburg, OH
  - b. Equivalent form tie manufactured by Williams Form Engineering Corp., Grand Rapids, MI
  - c. Equivalent form tie manufactured by Symons Corp., Des Plaines, IL.
  - d. Or approved equal.
- B. Chamfer Strips: Provide one-inch by one-inch triangular fillets for chamfered corners. Provide fillets either milled from clear, straight-grain pine, surfaced each side, or of the extruded vinyl type with or without nailing flange unless otherwise indicated on the Contract Drawings.
- C. Inserts: Provide galvanized cast steel or galvanized welded steel inserts, complete with anchors to concrete and fittings such as bolts, wedges and straps.
- D. Dovetail Anchor Slots
  1. Provide dovetail anchor slots manufactured from minimum 22 gauge, electro-galvanized steel; with removable felt or polyurethane filler; bent tab anchors; securable to concrete formwork; use where indicated on the Contract Drawings or as specified in Section 04201 – Unit Masonry.
  2. Products: Subject to compliance with requirements, provide one of the following:
    - a. Dur-O-Wal, Inc., Folcroft, PA
    - b. Heckmann Building Products, Melrose Park, IL
    - c. BoMetals, Inc., Powder Springs, GA
    - d. Or approved equal
- E. Form-Facing Material
  1. Use structural plywood or other material that can absorb air trapped in pockets between the form and the concrete and surface paste produced by certain high water-cementitious materials ratio admixtures. Maximum form-facing material use is three times. Provide forms with a suitable form treatment to prevent bond of the concrete to the form.
  2. As an alternate to using an absorptive wood form contact face as a form liner, use "Zendrain" or an approved equal in strict accordance with the manufacturer's recommendations.

**F. Form Caulking**

1. Provide a one-component, gun-grade silicone sealant that is capable of producing flush, watertight and non-absorbent surfaces and joints. Use sealant that is compatible with the type of forming material and concrete ingredients used.
2. Products: Subject to compliance with requirements, provide one of the following:
  - a. Series 1200 Construction Caulking; GE Silicones, Waterford, NY
  - b. Dow Corning 999-A; Dow Corning Co., Midland, MI
  - c. Preco Silicone Caulk; Preco Industries, Ltd., Plainview, NY
  - d. Or approved equal

**G. Form Release Agent**

1. Provide a VOC-compliant, commercial formulation, form-coating compound that will not bind with, stain, nor adversely affect concrete surfaces, and will not impair subsequent treatment of concrete surfaces requiring bond or adhesion, nor impede wetting of surfaces to be cured with water or curing compounds. Product shall not cause surface dusting.
2. Products: Subject to compliance with requirements, provide one of the following:
  - (1) Aquaform; Tamms Industries, Mentor, OH
  - (2) Specco F-100; Specco Industries, Inc., Chicago, IL
  - (3) Debond Form Coating; L&M Construction Chemicals, Inc., Omaha, NE
  - (4) Eucoslip VOX; Euclid Chemical Co., Cleveland, OH
  - (5) Magic Kote; Symons Corporation, Des Plaines, IL
  - (6) Or approved equal

- H. Nails, Spikes, Lag Bolts, Through Bolts, Anchorages: Sized as required; of strength and character to maintain formwork in place while placing concrete.

**2.03 SHOP FABRICATED FORMS**

- A. Fabricate forms in accordance with the Contractor's Shop or Working Drawings.

- B. Maintain forms such that they remain clean, smooth, and free from imperfections, irregularities and warpage.
- C. Formwork Joints: Locate as indicated on the Contractor's Shop or Working Drawings. Note that horizontal construction joints in cast-in-place concrete shall be installed at locations shown on the Contract Drawings unless prior approval to deviate from those locations is obtained from the Commissioner.
- D. Arrange form panels in symmetrical patterns conforming to the general lines of the structure.
- E. Except when otherwise indicated, orient panels on vertical surfaces with the long dimension horizontal and with horizontal joints level and continuous.
- F. Precisely align form panels on each side of the panel joint by means of fasteners common to both panels, to result in a continuous, unbroken concrete plane surface.
- G. Use largest stock size practicable.
- H. Between form joints, line an area less than the stock size of the form liner material with a single piece of liner material.

#### 2.04 VOID FORMS

- A. Void Forms: Void forms are used in ground fill applications where a lightweight fill material is required to reduce stresses on underlying soils and serve as formwork for concrete placements. Provide void forms constructed of rigid, cellular, termite-resistant, moisture-resistant, lightweight expanded polystyrene (EPS) blocks where indicated on the Contract Drawings and as specified herein.
  - 1. Material Requirements: EPS blocks shall conform to the material requirements of ASTM D6817. All EPS blocks shall be treated by the manufacturer with a tested and proven termite treatment for below grade applications.
  - 2. Performance Requirements
    - a. Manufacture specified material to withstand applied construction loads and weight or lateral pressure of wet concrete prior to final set.
    - b. Material shall be unaffected by normally occurring weather at the time of installation and shall retain its physical properties under engineered conditions of use.
    - c. Adequacy of structural design, including density, compressive strength and dimensional stability, shall be certified by a licensed Professional Engineer registered in New York State.

3. Products: Subject to compliance with requirements, provide one of the following:

- a. Perform Guard EPS Geofoam; R-Control Building Systems, Burnsville, MN
- b. Block-fill: Insulfoam Co., The Dalles, OR
- c. EPS Geofoam; Branch River Plastics, Smithfield, RI
- d. Or approved equal

B. Void Form Accessories: Provide corrosion-resistant, galvanized steel, multi-barbed connector to restrain EPS blocks from lateral movement in layer over layer applications. Determine the number of attachments needed to adequately resist the applied loads.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. AFM GeoGripper Plates: AFM R-Control Building Systems, Burnsville, MN
- b. Equivalent galvanized plates engineered to secure EPS blocks in place
- c. Or approved equal

## 2.05 FORM LINERS

A. Provide special concrete forms or form liners constructed of plastic, wood or sheet metal in accordance with the provisions of Section 03350 - Concrete Finishes and as indicated on the Contract Drawings. Form liners shall produce desired concrete finish with exposed patterns, surface textures, score joints or rustications in the configuration shown.

B. Products: Subject to compliance with requirements, provide one of the following:

1. Dura-Tex; Symons Corporation, Des Plaines, IL
2. Architectural Form Liners; Greenstreak, Inc., St. Louis, MO
3. Or approved equal

## 2.06 RUSTICATIONS

A. Provide rustications where specified herein or as indicated on the Contract Drawings.

B. Products: Subject to compliance with requirements, provide one of the following:

1. Rustications; Symons Corporation, Des Plaines, IL
2. PVC Rustications; Victory Bear, Huber Heights, OH
3. Or approved equal

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Examine the areas and conditions under which work of this Section is to be performed. Correct conditions detrimental to the proper and timely completion of the work. Do not proceed until unsatisfactory conditions have been corrected. Prior to placement of concrete, inspect forms for cleanliness, accuracy of alignment, strength and required inserts and openings.
- B. Earth cuts are not permitted for use as forms for vertical surfaces against which concrete will be cast, including electrical ductbanks, unless shown on the Contract Drawings or specified herein.
- C. Verify that substrate, grade and other conditions which have been prepared under other Sections are acceptable for installation of void forms (EPS blocks) in accordance with manufacturer's instructions. Report in writing adverse conditions that are detrimental to the installation of void forms. Do not proceed until adverse conditions are corrected.
- D. Where different levels are indicated for wall footings, the footings shall be stepped. Unless otherwise indicated on the Contract Drawings, steps in wall footings shall not be of greater height than the thickness of the footings, and steps shall not lap less than 6 inches. No form shall be set at the back of such steps and where earth has slumped off in such locations, it shall be cut back to a vertical plane just before the concrete is placed.

### 3.02 ERECTION AND INSTALLATION

- A. Construct forms in accordance with the provisions of ACI 301 and ACI 347R to required dimensions, plumb and straight, true to line and grade, and make all joints and seams mortar-tight. Forms submerged in water shall be made watertight. Formwork shall be gasketed or otherwise rendered sufficiently tight to prevent leakage of paste or grout under heavy, high-frequency vibration. Securely brace and shore forms to prevent displacement and to safely support imposed concrete weight.
- B. Erect beam and girder soffits in accordance with the provisions of ACI 347R and to the standard tolerances delineated therein. Soffits shall be sufficiently braced, shored, and wedged to prevent deflection. Column sides shall be clamped in

accordance with this specification with metal column clamps, spaced according to the manufacturer's directions.

- C. Chamfer above grade exposed joints, edges and external corners of concrete forms with a one inch by one inch triangular fillet unless otherwise indicated.
- D. Furnish forms for repeated use in sufficient number to ensure the required rate of progress. Clean forms and inspect immediately prior to depositing concrete. Remove deformed, broken or defective forms from the work site.
- E. Provide temporary openings where interior area of formwork is inaccessible for cleanout and removal of debris, for inspection before concrete placement, and for placement of concrete. Securely brace temporary openings and set tightly to forms to prevent loss of concrete mortar. Locate temporary openings in forms in as inconspicuous a location as possible consistent with the requirements of the work.
- F. Provide openings in concrete formwork of the correct size and in the proper location to accommodate other operations of construction work in the project. Accurately place and securely support items to be built into forms. Install waterstops where shown on the Contract Drawings and as specified in Section 03300 - Cast-in-Place Concrete.
- G. Edge Forms and Screed Strips for Slabs: Set edge forms or bulkheads and intermediate screed strips for slabs to obtain required elevations and contours in the finished slab surface.
- H. Provide required finish on formed concrete surfaces for normal cast-in-place concrete in accordance with the provisions of Section 03350 - Concrete Finishes and as indicated on the Contract Drawings.
- I. Provide required finish on formed concrete surfaces for cast-in-place architectural concrete in accordance with the provisions of ACI 303.1 and as specified.
- J. Wet forms sufficiently to prevent joints in wood forms from opening prior to concrete placement.
- K. Cutting form ties back from the face of the concrete is prohibited.
- L. Roughen and clean interior contact surfaces of precast concrete forms prior to placing cast-in-place concrete in-fill. Apply approved epoxy bonding agent to dry, clean interior contact surfaces as specified in Section 03300 - Cast-in-Place Concrete and in strict accordance with manufacturer's printed instructions.
- M. Void Forms: Install void forms (EPS blocks) and related products in strict accordance with the manufacturer's instructions. Conform to the dimensions indicated on the Contract Drawings to completely fill the void underlying and adjacent to the formed surfaces of the concrete placement.

## N. Form Liners and Rustications

1. Install form liners and reveal rustication strips in strict accordance with the respective manufacturer's written instructions and recommendations. The ends of the form liner pattern shall be plugged and all form joints and edges shall be taped using 1/8-inch thick by 3/4-inch wide foam tape centered on the joints, then caulked in accordance with the manufacturer's recommendations each time forms are set. A representative of the manufacturer shall be present at the site to supervise the installation of the form liner for the initial installation of each type of form liner and on an as-requested basis throughout the entire project.
2. Forms for smooth concrete shall be installed in such a manner that there will be no horizontal form joints, and the forms shall be aligned so that vertical joints occur only at "V-Groove" rustications. Form ties shall be spaced in a uniform pattern vertically and horizontally. Form ties shall be positioned in smooth concrete bands and in panels between "reveal" rustications, if any.

## O. Apply form release agents in accordance with manufacturer's instructions and as specified herein.

1. Coat form contact surfaces with approved form release agent compound before reinforcement is placed. Do not allow excess form release agent material to accumulate in the forms or to come into contact with surfaces which are required to be bonded to fresh concrete such as concrete reinforcement and embedded items.
2. Before concrete placement, coat the contact surfaces of forms with a non-staining mineral oil, non-staining form coating compound, or two coats of nitrocellulose lacquer. Do not use mineral oil on forms for surfaces to which adhesive, paint, or other finish material is to be applied.
3. Coat steel forms with non-staining, rust-preventive form oil or otherwise protect against rusting. Do not use rust-stained steel surfaces for contact with concrete.
4. Do not allow form coatings to come in contact with construction joints or reinforcing steel.

## P. Observe formwork continuously while concrete is being placed to ensure that there are no deviations from desired elevation, alignment, plumbness and camber. If, during concrete placement, weakness develops and the formwork shows settlement, deflection or distortion, immediately stop the work, remove improperly cast concrete, and reconstruct the formwork to perform properly.

### 3.03 INSTALLATION TOLERANCES

- A. Allowable Tolerances: Set and maintain formwork within the tolerance limits delineated in ACI 347R.

### 3.04 PROTECTION

- A. During installation, do not use forms as a storage platform nor as a working platform until the forms have been permanently fastened in position.
- B. Do not overload the surface of installed forms.

### 3.05 RESHORING

- A. When reshoring is permitted or required, plan the operations in advance and in accordance with acceptable procedures. Prepare and submit for review and approval reshoring procedures under the direct supervision of the Contractor's licensed Professional Engineer registered in New York State.
- B. During reshoring, do not load the concrete in beams, slabs, columns, or any other structural members with combined dead and construction loads in excess of the loads permitted by the Commissioner for the developed concrete compressive strength at the time of reshoring.
- C. Do not permit elements to deflect or accept loads during form stripping or reshoring. Forms on columns, walls, or other load-bearing members may be stripped a minimum of two days after concrete placement if loads are not applied to the members.
- D. Install reshores after stripping operations are complete but in no case later than the end of the working day on which stripping occurs.
- E. After forms are removed, reshore slabs and beams over 10 feet in span and cantilevers over 4 feet in length for the remainder of the specified time period in accordance with the Article specified herein entitled "Removal of Forms and Ties." Perform reshoring operations to prevent subjecting concrete members to overloads, eccentric loading, or reverse bending.
- F. Reshoring elements, as a minimum, shall have the same load-carrying capabilities as original shoring and shall be spaced similar to original shoring. Firmly secure and brace reshoring elements to provide solid bearing and support.
- G. Perform reshoring for the purpose of early form removal so that at no time will large areas of new construction be required to support their own weight. While reshoring is under way, no live loads shall be permitted on the new construction. Tighten reshores to carry their required loads, but do not over-tighten such that the

new construction is overstressed. Maintain reshores in place until the concrete has reached its specified 28-day compressive strength, unless otherwise specified.

- H. For floors supporting shores under newly placed concrete, the original supporting shores or reshores shall be left in place. The shoring or reshoring system shall have a capacity sufficient to resist the anticipated dead and live loads and, in all cases, shall have a capacity equal to at least one-half of the capacity of the shoring system above. Reshores shall be located directly under the floors supporting shores unless other locations are permitted by the Commissioner or shown on the Contract Drawings.
- I. For multi-story buildings, extend reshoring over a sufficient number of stories to distribute the weight of newly placed concrete, forms, and construction live loads so that the design superimposed loads of the floors supporting shores are not exceeded.

### 3.06 REMOVAL OF FORMS AND TIES

- A. Remove forms and supports in accordance with ACI 347R recommendations without damage to concrete and in a manner to insure complete safety to the structure and the public. Forms, form ties and bracing shall not be removed without specific permission of the Contractor's licensed Professional Engineer registered in New York State.
- B. In general, do not remove forms until the concrete has hardened sufficiently to safely support its own load, plus any superimposed load that might be placed thereon. Forms shall remain in place for the minimum time periods specified in ACI 347R, except that forms may be removed earlier than specified if ASTM C39 test results of field-cured samples from a representative portion of the structure or other approved and calibrated non-destructive testing techniques show that the concrete has reached a minimum of 85 percent of the specified design strength.
- C. For concrete placed underwater, forms shall remain in place a minimum of 48 hours.
- D. Remove top forms on sloping surfaces of concrete as soon as removal operations will not allow the concrete to sag. Perform needed repairs or treatment required on sloping surfaces at once followed immediately with the specified curing.
- E. Whenever formwork is removed during the specified curing period, continue curing the exposed concrete surfaces in accordance with one of the methods specified in Section 03300 - Cast-in-Place Concrete.
- F. Upon removal of forms, notify the Commissioner in order that a review of the newly stripped surfaces may be made before patching.
- G. Loosen wood forms for wall openings without causing damage to the concrete. Avoid prying against the face of finished concrete. Use only wooden wedges.

- H. Take care in removing forms, wales, supports and form ties to avoid spalling or marring the concrete. Initiate rubbed finish, if required, and such patching as may be necessary immediately after removal.
- I. Patch form tie holes with an approved non-shrink patching material in accordance with the manufacturer's recommendations and subject to approval.
- J. Hammer-pack holes left by tie rods with stiff mortar of the same material as, but somewhat leaner than that in the concrete. Render the patch inconspicuous to view. Complete patching within 24 hours of form removal.

### 3.07 RE-USE OF FORMS

- A. Forms for re-use shall meet new form requirements with respect to effect on cast-in-place concrete appearance and structural stability.
- B. Limit reuse of plywood to no more than three times. Re-use may be further limited by the Commissioner if it is found that the pores of the plywood are clogged with paste to the degree that the wood does not absorb the air or surface paste produced by certain high water-cementitious materials ratio admixtures.
- C. Re-use of forms shall in no way delay or change the concrete placement schedule as compared to the schedule obtainable if all forms were new (in the case of wood forms) or if the total required forms were available (in the case of steel forms).
- D. Clean and re-oil formwork prior to re-use. Plywood forms may not be re-used if unused holes from form ties exist from a previous use.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 03200**  
**CONCRETE REINFORCEMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install epoxy-coated and uncoated reinforcement for cast-in-place concrete and precast structural concrete, including reinforcing bars, welded wire reinforcement and accessories, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- C. Provide concrete reinforcement for all cast-in-place and precast concrete structures and elements specified in Sections 03300 and 03410 as follows unless indicated otherwise on the Contract Drawings or in the Specifications:
  - 1. Epoxy Coated Reinforcement
    - a. Reinforced cast-in-place concrete elements of the transfer station, including supporting substructure, beyond the footprint of the enclosed superstructure (south of column line H and east of column line 17)
    - b. Reinforced concrete elements of the exterior ramp structures including the supporting substructure and abutments
    - c. Weigh scale supporting structure
    - d. Concrete approach slabs
    - e. Concrete apron slabs
    - f. Transformer Enclosure
  - 2. Uncoated Reinforcement:
    - a. Reinforced cast-in-place concrete elements of the transfer station including supporting substructure within the footprint of the enclosed superstructure (from column line A through H and 1 through 17)

- b. Structural precast concrete ventilation duct shafts within the transfer station
  - c. Reinforced concrete elements of land-based site structures
- D. This Section includes, but is not limited to, the following items:
  - 1. Reinforcing Steel Bars
  - 2. Welded Wire Reinforcement
  - 3. Steel Tie Wire
  - 4. Epoxy Coating
  - 5. Epoxy Repair Coating
  - 6. Supports for Reinforcement
  - 7. Exothermic Welded Splices
  - 8. Dowel Adhesive System
- E. Concrete reinforcement and coating requirements for precast architectural concrete are specified under Section 03450 - Plant-Precast Architectural Concrete.

#### 1.02 RELATED SPECIFICATIONS

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 03410 - Precast Structural Concrete
- C. Section 03450 - Plant-Precast Architectural Concrete

#### 1.03 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Concrete Institute (ACI)
    - a. ACI 301, Standard Specifications for Structural Concrete.
    - b. ACI 315, Manual for Standard Practice for Detailing Reinforced Concrete Structures
    - c. ACI 318, Building Code Requirements for Reinforced Concrete
    - d. ACI SP66, Detailing Manual
  - 2. American National Standards Institute/American Welding Society (ANSI/AWS)
    - a. ANSI/AWS, D1.4, Structural Welding Code - Reinforcing Steel

3. American Society for Testing and Materials (ASTM)
  - a. ASTM A82, Steel Wire, Plain, for Concrete Reinforcement
  - b. ASTM A185, Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
  - c. ASTM A496, Steel Wire, Deformed, for Concrete Reinforcement
  - d. ASTM A497, Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement
  - e. ASTM A615/A615M, Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
  - f. ASTM A775/A775M, Epoxy-Coated Reinforcing Steel Bars
  - g. ASTM D3963/D3963M, Fabrication and Jobsite handling of Epoxy-Coated Reinforcing Steel Bars
4. Concrete Reinforcing Steel Institute (CRSI), DA4, Manual of Standard Practice
5. City of New York
  - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto
6. Society for Protective Coatings (SSPC), formerly Steel Structures Painting Council, Steel Structures Painting Manual
  - a. SSPC-SP-10/NACE No. 2, Near-White Blast Cleaning

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  1. Shop Drawings
    - a. Detailed placing and shop fabrication drawings, for fabrications, bending and placement of concrete reinforcement prepared in conformance with ACI 315.

- b. Shop Drawings shall show bar schedules, stirrup spacing, diagrams of bent bar arrangements and assemblies, arrangement of concrete reinforcement, location and length of lap splices, special reinforcement required at openings through concrete structures or at embedments, supports, accessories, and concrete cover to the extent necessary for proper fabrication and placement of concrete reinforcement.
    - c. Shop Drawings shall be made to such a scale as to clearly show joint locations, openings, and the arrangement, spacing and splicing of reinforcement.
  - 2. Manufacturer's specifications and installation instructions for all proprietary materials and reinforcement accessories.
  - 3. Material specifications and mill test certification reports for reinforcing steel and welded wire reinforcement, showing physical and chemical analyses.
  - 4. Description of proposed supports for each type and location of reinforcement.
  - 5. Evidence that the epoxy-coating applicator is certified by CRSI.
  - 6. Description of reinforcing weld locations and weld procedures.
  - 7. Certification from an independent testing laboratory that mechanical connectors for reinforcing steel comply with specified requirements.
  - 8. Welders Certificates: Certify welders employed in the work, verifying ANSI/AWS qualification within the previous 12 months.
- B. Shop Drawings shall also indicate the following requests, as applicable:
- 1. Request to relocate any bars that cause interferences or that cause placement tolerances to be violated.
  - 2. Request to use splices not shown on the Contract Drawings.
  - 3. Request to use mechanical couplers accompanied by manufacturer's literature, installation instructions and certified load capacity test reports.
  - 4. Request for placement of column dowels without the use of templates.
  - 5. Request and procedure to field bend or straighten partially embedded reinforcing bars.
- C. Base Shop Drawings upon field-verified dimensions and elevations of existing or partially constructed structure, where applicable, to allow proper review of Shop Drawings.

- D. Prepare reinforcement placing drawings to provide a complete dimensioned representation of the arrangement of reinforcement to allow placement without reference to the Contract Drawings, including location of reinforcing steel, support bars, chairs and bolsters, locations of construction, expansion and control joints, and sequence of concrete placements.
- E. Prepare complete elevations of all walls and complete plans of all slabs, except where two or more walls or slabs are identical, and identify diameter and spacing of wall and slab reinforcing steel on such views. Prepare sections to clarify the arrangement of the steel reinforcement, and identify by diameter but not spacing of wall and slab reinforcement in such sections. For all reinforcing bars, unless the location of the bar is clear, provide a dimension from the bar or bars to a readily distinguishable structural feature on the drawing to facilitate placement.
- F. Check Shop Drawings for completeness and accuracy and make necessary corrections prior to submittal for review and approval. Obtain Commissioner's approval prior to fabrication.
- G. Review of Shop Drawings will be for general considerations and design intent only. Compliance with specified requirements for materials, fabrication and placement of concrete reinforcement shall be the Contractor's responsibility.

#### 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the New York City Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Testing and Inspection
  - 1. Fabrication, placement and welding of reinforcing steel shall be subject to special inspection in the mill, shop and field in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
  - 2. Special Inspections
    - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special

Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.

- b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
- c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

C. Allowable Tolerances

- 1. Fabrication: Deviations from indicated dimensions (plus or minus) in excess of the following will not be permitted.
  - a. Sheared length: 1 inch
  - b. Height of truss bars: 2 inch
  - c. Stirrups, ties, and spirals: 1/2 inch
  - d. Bent length: 1 inch
- 2. Placement: Conform to the requirements specified in ACI 318 and comply with CRSI recommended practice as specified herein.

D. The epoxy-coating applicator shall be certified by CRSI under the CRSI Fusion-Bonded Epoxy Coating Applicator Plant Certification Program.

E. Weld and Welder Qualifications: Perform welding of reinforcing steel using only welders qualified in accordance with ANSI/AWS D1.4. Perform welding procedure qualification, except for pre-qualified procedures, as required by ANSI/AWS D1.4, prior to executing welding of reinforcing steel.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Ship concrete reinforcement from source in bundles of one size and length, securely tied and identified with plastic tag showing specification number, grade, heat number, bundle number, and name and location of mill.

- B. Upon delivery to job site, store reinforcement in neat bundles, tagged for placement and properly identified for coordination with mill test reports.
- C. Identify each group of bent and straight bars with a metal tag providing the identifying member corresponding to the shop drawing and bar schedule.
- D. Store concrete reinforcement above ground surface and support as required to prevent formation of kinks, distortions, excessive rusting, contamination by oil, mud, and other materials that could destroy its usefulness. Protect reinforcement from exposure to weather at all times prior to placement by suitable covering. Protect reinforcement from conditions conducive to corrosion at all times until concrete is placed around it.
- E. Bulk delivery of reinforcement steel will not be permitted.
- F. Perform job site handling of epoxy-coated reinforcing steel bars in accordance with ASTM D3963/A3963M. Equipment for handling epoxy-coated reinforcing bars shall have protected contact areas. Lift bundles of epoxy-coated bars at multiple pickup points to prevent bar-to-bar abrasion from sags in the bundles. Dropping or dragging of epoxy-coated bars or bundles of epoxy-coated bars is prohibited. Store epoxy-coated bars on protective cribbing.
- G. Thoroughly clean the surfaces of reinforcing steel and accessories to be in contact with concrete of all dirt, grease, loose scale and rust, grout, mortar and other foreign substances just prior to concrete placement. Where there is a delay in concrete placement, re-inspect and re-clean reinforcement if necessary.

#### 1.07 PROJECT CONDITIONS

##### A. Field Measurements

- 1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
- 2. Take sufficient field measurements prior to preparation of Shop Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.
- 3. Actual field-verified conditions may require modifications to the construction details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 REINFORCEMENT MATERIALS

- A. Carbon Steel Reinforcing Steel Bars, Uncoated: Provide deformed billet steel reinforcing bars, conforming to ASTM A615/A615M, Grade 60 where noted in the Specifications or shown on the Contract Drawings..
- B. Carbon Steel Reinforcing Steel Bars, Epoxy-coated: Provide epoxy-coated deformed billet steel reinforcing bars, conforming to ASTM A615/A615M, Grade 60, and to ASTM A775/A775M where noted in the Specifications or shown on the Contract Drawings..
  - 1. Coating Color: Light color shades that will reveal rusted or undercoated areas of steel.
- C. Welded Wire Reinforcement, Uncoated: Provide plain welded wire reinforcement in flat sheets conforming to ASTM A185 for plain wire or ASTM A497 for deformed wire.
- D. Steel Wire, Uncoated or Epoxy Coated: ASTM A82, plain, cold drawn steel or ASTM A496, deformed, size D4 and larger. Use epoxy coating steel wire in conjunction with epoxy-coated reinforcing steel. Use for securing reinforcing bars and embedded items.

### 2.02 SUPPORTS FOR REINFORCEMENT

- A. Wire Bar Supports: Provide supports for reinforcement including bolsters, chairs, spacers and other devices for spacing, supporting and fastening reinforcing bars and welded wire reinforcement in place. Use Class 1 (plastic protected) wire bar type supports complying with maximum protection recommendations of CRSI Manual of Standard Practice DA4 for formed surfaces exposed to weather or to view. Use Class 2, moderate protection, wire bar supports for all other conditions.
  - 1. For slabs placed on grade, use supports with sand plates or horizontal runners where base material will not support chair legs.
  - 2. The use of concrete bricks, or other similar supports, is prohibited.
- B. Supports for Epoxy-Coated Reinforcement: Use CRSI Class 1A epoxy-coated or other dielectric-polymer-coated wire bar supports.

### 2.03 WELDING

- A. When required or permitted, all welding of reinforcing bars shall conform to ANSI/AWS D1.4. Unless otherwise specifically permitted by the Commissioner, welding of crossing bars (tack welding) for assembly of reinforcement is prohibited.

- B. Welding of wire to wire, and of wire or welded wire reinforcement to reinforcing bars or structural steels, shall conform to applicable provisions of ANSI/AWS D1.4 and any supplementary requirements specified by the Commissioner for the particular application.
- C. After completion of welding on epoxy-coated reinforcing bars, coating damage shall be repaired in accordance with the requirements described herein. All welds and all steel splice members when used to splice bars shall be coated with the same material used for repair of coating damage.

#### 2.04 EXOTHERMIC WELDED SPLICES

- A. Where applicable, use a welded butt splice system in conformance with ACI 301 that develops a minimum of 125 percent of the specified yield strength of the reinforcing bar in tension and compression via an exothermic load transfer between the bar deformations and an internally grooved sleeve. Coat connectors in accordance with same requirements as reinforcing bars.
- B. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Cadweld: Erico, Inc., Cleveland, OH
  - 2. Thermweld Process: Continental Industries, Tulsa, OK
  - 3. Or approved equal

#### 2.05 DOWEL ADHESIVE SYSTEM

- A. Where shown on the Contract Drawings or otherwise approved by the Commissioner on a case-by-case basis, use a two-component dowel adhesive system to anchor reinforcing bars into hardened concrete.
- B. Inject adhesive mix with a static mixing nozzle in accordance with manufacturer's printed instructions.
- C. Provide embedment depth in accordance with manufacturer's recommendations to provide minimum allowable bond strength equal to 125 percent of the yield strength of the bar, unless noted otherwise on the Contract Drawings.
- D. Obtain Commissioner's approval for use of a dowel adhesive system at locations other than those indicated on the Contract Drawings.
- E. Products: Subject to compliance with requirements, provide one of the following:
  - 1. HIT HY-150 Injection Adhesive Anchor System: Hilti, Inc., Tulsa, OK
  - 2. Epcon System: ITW Ramset/Redhead, Glendale Heights, IL
  - 3. Sikadur Injection Gel: Sika Corporation, Lyndhurst, NJ
  - 4. Or approved equal

## 2.06 EPOXY REPAIR COATING

- A. Provide a field-applied, VOC-compliant, epoxy-based corrosive-resistant coating either identical to or compatible with shop-applied epoxy coatings.
- B. Coatings which are not identical to those shop applied shall meet or exceed the minimum performance of the shop-applied materials.

## PART 3 EXECUTION

### 3.01 FABRICATION

- A. General: Conform to the accepted Shop Drawings.
- B. Cutting and Bending: Conform to requirements of ACI 318 and ACI 315. Perform cutting and bending of reinforcing bars in shop before shipment to the site and before epoxy coating unless written approval for field bending is obtained from the Commissioner or is required by local labor jurisdiction. Bend all bars cold unless permitted by the Commissioner in writing. Do not bend or straighten bars in a manner that could damage the materials.
- C. Fabricate reinforcing bars in accordance with the standard fabricating tolerances in Figures 4 and 5 of ACI 315. Tolerances shall not permit a reduction in concrete cover.
- D. Epoxy Coating: Prepare concrete reinforcement to be epoxy coated by abrasive blast cleaning to near-white metal in accordance with SSPC-SP-10. Apply coating by electrostatic spray method as soon thereafter as possible in accordance with the recommendations of the coating material manufacturer.

### 3.02 EXAMINATION

- A. Verify that surface over which concrete is to be placed is clean and in proper condition for installing reinforcement.
- B. Verify that items to be embedded and blockouts are secured in place as required.
- C. Verify that formwork supports are complete, secure and in place.

### 3.03 INSTALLATION

- A. General: Comply with provisions of ACI 301 and as herein specified.
- B. Clean reinforcement, as required, to remove loose rust, mill scale, earth, ice, grease, oil, clay or foreign substances that could reduce bond of reinforcement with concrete.

- C. Arrange and place reinforcement as indicated on the accepted bending diagrams and placement plans.
- D. Positively secure reinforcement and welded wire fabric against displacement during placement of concrete. Wire or clip bars together in accordance with ACI recommendations. Tack welding of reinforcement is not permitted.
- E. With formwork for as-cast finish, use spacers which will not be visible at exposed finish and which will be sheathed in nylon to the depth of minimum cover as required.
- F. Concrete Cover
  - 1. Accurately position reinforcement, including stirrups, to achieve a clear coverage for concrete protection, measured from outside of bar or welded wire reinforcement to surface of concrete, as detailed on the approved Shop Drawings or as directed by the Commissioner.
  - 2. Minimum concrete cover for reinforcement is shown below unless otherwise indicated on the Contract Drawings. Placement tolerance is plus 1/4 inch. Cover to principal reinforcement shall be not less than two times the nominal maximum aggregate size nor less than 1.5 times the effective diameter of the reinforcing bars.

<u>Minimum Concrete Cover for Reinforcement</u>	
<u>Description</u>	<u>Minimum Cover (inches)</u>
1. Concrete cast against and permanently exposed to earth	3
2. Concrete exposed to earth, liquids or weather: <ul style="list-style-type: none"> <li>a. Principal reinforcement</li> <li>b. Stirrups, ties and spirals</li> </ul>	2 1-1/2
3. Concrete not exposed to liquids or weather or in contact with earth: <ul style="list-style-type: none"> <li>a. Principal reinforcement</li> <li>b. Stirrups, ties and spirals</li> </ul>	1-1/2 1
4. Structural concrete floor and ramp slabs: <ul style="list-style-type: none"> <li>a. Top reinforcement</li> <li>b. Bottom reinforcement</li> </ul>	2 1-1/2
5. Concrete topping slab and composite steel deck (welded wire reinforcement)	1

<u>Minimum Concrete Cover for Reinforcement</u>	
<u>Description</u>	<u>Minimum Cover (inches)</u>
6. Footings and base slabs:	
a. At formed sides and ends and at bottoms bearing on concrete work mat	2
b. At unformed surfaces and bottoms in contact with earth	3
c. Top of footings	2
d. Over top of piles	2

- G. Do not place reinforcement continuous through expansion joints. Reinforcement shall be continuous through construction and control joints.
- H. Reinforcement or other embedded metal items bonded to the concrete shall not be continuous through any joint intended as an expansion joint. Dowels bonded on only one side of a joint and waterstops may extend through the joint.
- I. Place and secure reinforcement bars and welded wire reinforcement in position by means of accepted non-corrosive spacers, supports, chairs, runners, standees, bolsters or hangers as required.
- J. Do not field bend reinforcing bars partially embedded in concrete without the Commissioner's written approval.
- K. Welding: Welding of reinforcing steel is not permitted, unless approved by the Commissioner in advance for each specific application. Perform welds in accordance with ANSI/AWS D1.4.
- L. Moving bars to avoid interference with other reinforcement, conduits or embedded items exceeding the specified tolerances is subject to prior written approval of the Commissioner.
- M. Repair of Epoxy Coating
1. Repair damage to epoxy coating either as described in ASTM D3963/D3963M or by mechanical wire brush cleaning and painting with an approved epoxy repair coating in accordance with the coating manufacturer's written instructions.
  2. Repair any reinforcement with visible signs of rust.
  3. Repair of damaged epoxy coating of more than five percent of the total reinforcement surface area will not be allowed; replace such reinforcement at no additional cost to the City of New York.

4. Fading of the epoxy coating color will not be cause for rejection of epoxy-coated reinforcement.
  - N. Exposed Reinforcement: Reinforcement left exposed for the bonding of future construction shall be effectively protected from corrosion by encasement in cement mortar or lean concrete or by other temporary covering approved by the Commissioner.
  - O. Field Cutting of Reinforcement: Reinforcement shall not be cut in the field except when specifically permitted in writing by the Commissioner.
- 3.04 SUPPORTS AND SPACERS FOR REINFORCEMENT AND WELDED WIRE REINFORCEMENT
- A. Support reinforcing bars and welded wire reinforcement in position by means of accepted spacers, chairs or hangers.
  - B. Install sufficient number of supports and of strength to withstand deflection of reinforcement from indicated cross-sectional position. Do not place reinforcing bars more than two inches beyond the last leg of any continuous bar support. Do not use supports as bases for runways for concrete conveying equipment and similar construction loads.
  - C. Do not use stones, brick, wood blocks or pieces of broken concrete to support reinforcing steel.
  - D. Epoxy-coated reinforcing bars supported from formwork shall rest on coated wire bar supports or on bar supports made of dielectric material or other acceptable materials. Wire bar supports shall be coated with dielectric material for a minimum distance of 2 inches from the point of contact with the epoxy-coated reinforcing bars. Reinforcing bars used as support bars shall be epoxy coated. In walls having epoxy-coated reinforcing bars, spreader bars, where specified, shall be epoxy coated. Proprietary combination bar clips and spreaders used in wall with epoxy-coated reinforcing bars shall be made of corrosion-resistant material or coated with dielectric material.

3.05 SPLICING

- A. Locate splices as indicated on the approved Shop Drawings or as directed by the Commissioner. When it is necessary to splice reinforcing at points other than where shown, the character of the splice shall require approval by the Commissioner.
- B. Provide splices in accordance with the required lengths given on the Contract Drawings and in conformance with ACI 318 and ACI 315. Do not splice at points of maximum stress.

- C. Mechanical couplers and exothermic welded splices shall be used only where shown on the Contract Drawings unless permitted otherwise in writing by the Commissioner. Prepare ends of bars to be exothermically welded, insert ends into high strength welding sleeve and follow welding procedures in strict accordance with printed instructions of the exothermic welding system manufacturer.
- D. Couplers which are located at a joint face shall be a type which can be set either flush or recessed from the face as shown on the Contract Drawings. Seal couplers during concrete placement to completely eliminate concrete or cement paste from entering. After the concrete is placed, couplers intended for future connections shall be plugged and sealed to prevent any contact with water or other corrosive materials. Threaded couplers shall be plugged with plastic plugs which have an O-ring seal.

### 3.06 WELDED WIRE REINFORCEMENT PLACEMENT

- A. Install in as long lengths as practicable. Lap adjoining pieces at least one full mesh size and attach splices with No. 14 gauge tie wire, one tie for each running foot. Wires shall be staggered and tied in such a manner that they cannot slip. Offset end laps in adjacent widths to prevent continuous laps in either direction.
- B. Welded wire reinforcement for slabs on grade shall extend to within 2 inches of the concrete edge. Welded wire reinforcement shall extend through construction and contraction joints unless otherwise shown on the Contract Drawings.
- C. Adequately support welded wire reinforcement to assure proper positioning in the slab. Secure and support all welded wire reinforcement in the final location prior to the placement of concrete. The use of rakes to pull welded wire reinforcement into place or pushing welded wire reinforcement into place is prohibited.

### 3.07 DOWEL ADHESIVE SYSTEM INSTALLATION

- A. Install dowels in hardened concrete using an approved dowel adhesive system in strict conformance with the manufacturer's recommendations. Support dowels in the correct position until the adhesive sets and gains enough strength to prevent any dislocation.
- B. Proof test at least 25 percent of the dowels to be installed to 1.33 times the allowable load specified by the manufacturer of the adhesive-injection system.
- C. If the dowels are required to have a hook at the end to be embedded in the new work, an approved mechanical coupler shall be provided at a convenient distance from the face of existing concrete to facilitate the testing.

## 3.08 FIELD QUALITY CONTROL

- A. Use adequate number of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and methods needed for proper performance of the work of this Section.
- B. Do not install reinforcement or welded wire reinforcement without approved placement drawings on site. Prior to concrete placement, inspect the installed reinforcement and welded wire reinforcement for acceptable condition, compliance with approved Shop Drawings, adequate support against displacement, and proper concrete cover and location. Correct deficiencies prior to placing concrete. Concrete placed in violation of this provision may be rejected with subsequent removal by the Contractor at no cost to the City of New York.
- C. Unacceptable Materials: Do not use reinforcement with any of the following defects:
  - 1. Bar lengths, depths and bends exceeding specified fabrication tolerances.
  - 2. Bends not indicated on the approved Shop Drawings.
  - 3. Kinks, gouges, excessive rust, deleterious materials, or other visible damage.
  - 4. Visible gaps or other defects in the surface of epoxy-coated bars.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 03300**  
**CAST-IN-PLACE CONCRETE**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of providing all labor, materials, equipment, services and incidentals necessary to furnish and install normal weight and structural lightweight cast-in-place concrete complete in place as indicated on the Contract Drawings, as specified herein and as required for a complete installation in all respects.
- B. The work includes producing concrete consisting of specified constituents; development and control of concrete mix designs; storage and quality control of concrete ingredients; and batching, mixing, production quality control and delivering of concrete of specified compressive strength class, maximum size aggregate, and slump. The work also consists of placing, curing and protecting cast-in-place concrete, reinforced and non-reinforced as required. The work also includes providing openings in concrete; embedded items such as reinforcement, sleeves, frames, anchor bolts and inserts; and concrete equipment bases and support structures, all as required to facilitate work under this and other Sections.
- C. The work covered in this Section includes but is not necessarily limited to the following uses of cast-in-place concrete:
  - 1. Cast-in-place structural concrete for use in the transfer station building and pier deck, exterior access ramp structures and miscellaneous site structures, such as weigh scale supporting structures, retaining walls, transformer enclosures, equipment pads, utility supports, electrical duct banks, pipe encasements, manholes and vaults.
  - 2. Cast-in-place concrete toppings to be placed atop certain structural floor slabs in the transfer station building and bonded overlays on the traffic deck slab of exterior ramp structures.
  - 3. Structural lightweight concrete for use in the composite steel floor deck at the mezzanine level only.
  - 4. Concrete fill for use in steel pipe piles as specified in Section 02364 – Steel Pipe Piles.
- D. Cast-in-place concrete for uses specified elsewhere:
  - 1. Cast-in-place concrete for use in concrete paving, curbing, headers, sidewalks and appurtenant items is specified herein but uses are described in Section 02771 – Concrete Curbs, Headers and Sidewalks.

- E. Finishing of cast-in-place concrete surfaces shall conform to the requirements described in Section 03350 - Concrete Finishes.
- F. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- G. This Section includes, but is not limited to, the following items:
  - 1. Portland Cement
  - 2. Fly Ash or Pozzolan
  - 3. Ground Granulated Blast Furnace Slag
  - 4. Fine Aggregate
  - 5. Coarse Aggregate
  - 6. Water
  - 7. Concrete Admixtures
  - 8. Epoxy Bonding Agent
  - 9. Curing and Protection Materials
  - 10. Preformed Compressible Joint Filler
  - 11. Joint Sealant
  - 12. Joint Sealant Backer Rod
  - 13. Construction Joint Filler
  - 14. Epoxy Resin for Grouting Dowels
  - 15. Non-shrink Grout
  - 16. PVC Waterstops
  - 17. Hydrophilic Waterstop and Sealant
  - 18. Special Provisions for:
    - a. Exterior Cast-in-place Concrete Ramp Structures
    - b. Bonded Concrete Overlay for Exterior Ramp Structures

## 1.02 RELATED SPECIFICATIONS

- A. Section 02364 - Steel Pipe Piles
- B. Section 02771 - Concrete Curbs, Headers and Sidewalks
- C. Section 03100 - Concrete Forms and Accessories
- D. Section 03200 - Concrete Reinforcement
- E. Section 03350 - Concrete Finishes
- F. Section 05120 - Structural Steel

## 1.03 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

#### 1.04 DEFINITIONS

- A. Blending Size: An aggregate that complies with the quality requirements in ASTM C 33 and the paragraph entitled "Aggregates", as modified herein, and can be blended with coarse and fine aggregates to produce a well-graded combined grading.
- B. Cementitious Material: As used herein, shall include Portland cement, fly ash, or ground granulated blast-furnace slag.
- C. Design Strength ( $f'_c$ ): The specified compressive strength of concrete to meet structural design criteria.
- D. Mixture Proportioning: A description of the proportions of a concrete mixture that are selected to enable it to meet the performance durability requirements, workability, specified compressive strength, and constructability requirements.
- E. Mixture Proportions: The concrete supplier's by-mass proportions to replicate the mixture design.
- F. Field Test Strength ( $f_{cr}$ ): The required compressive strength of concrete to meet structural and durability criteria. Determine ( $f_{cr}$ ) during mixture proportioning process.
- G. Normal Weight Concrete: Concrete for which density is not a controlling attribute, produced with aggregates stipulated under ASTM C33, and having a unit weight in the range of 135 to 160 lbs. per cubic foot.
- H. Lightweight Concrete: Concrete intentionally produced to have low density by use of lightweight coarse aggregates stipulated under ASTM C330 and an air-dry unit weight less than 115 lbs. per cubic foot.

- I. Exposed Finish: A general use finish applicable to all formed concrete exposed to view including surfaces which may receive a paint coating.
- J. Unexposed Finish: A general use finish, with no appearance criteria, applicable to all formed concrete concealed from view after completion of construction.
- K. Inspection Requirements: The inspection requirements of the New York City Building Code, Local Law 76/2008 as defined in Sections 1704.4 for Concrete Construction shall apply to all applicable concrete materials and construction specified in this Section.

#### 1.05 DESIGN AND PERFORMANCE REQUIREMENTS

- A. Materials and workmanship for cast-in-place structural concrete for exterior ramp structures, excluding the bonded concrete overlay, shall conform to Class HP concrete as defined in the NYSDOT Standard Specification. Cast-in-place structural concrete for exterior ramp structures shall meet applicable provisions of Sub-sections 501-1, 501-2 and 501-3 of Section 501 - Portland Cement Concrete; Sub-sections 555-1, 555-2 and 555-3 of Section 555 - Structural Concrete; and Sub-sections 557-1, 557-2 and 557-3 of Section 557 - Superstructure Slabs and Structural Approach Slabs in the NYSDOT Standard Specification.
- B. Materials and workmanship for cast-in-place bonded concrete overlays for exterior ramp structures shall conform to Class 50 DP concrete in accordance with applicable provisions specified in Sub-sections 584-1, 584-2 and 584-3 of Section 584 - Specialized Overlays for Structural Slabs in the NYSDOT Standard Specification.
- C. Concrete Mixture Designs: Applicable to cast-in-place structural normal weight and structural lightweight concrete for use in buildings and site structures unless specified otherwise.
  - 1. Proportion trial mixtures, including the molding and curing of test specimens, or assemble field test data as appropriate, for each class of concrete. Proportion normal weight concrete in accordance with the recommendations of ACI 211.1. Proportion structural lightweight concrete in accordance with the recommendations of ACI 211.2.
  - 2. Establish the required average strength, ( $f_{cr}$ ), of the mixture design on the basis of trial mixtures or documented field test data for each mixture design and proportion concrete mixtures accordingly as specified in ACI 301.
    - a. Employ an independent and experienced testing laboratory acceptable to the Commissioner to prepare the proposed mixture design and required computations from the results of the test specimens in accordance with the provisions of ACI 301. This laboratory shall be responsible for all concrete mixture design and trial batch testing.

- b. Testing laboratory shall have been inspected within the last 2-1/2 years by the Cement and Concrete Reference Laboratory (CCRL) of the National Institute of Standards and Technology for testing concrete aggregates and for the preparation and testing of concrete trial batches with or without admixtures. The laboratory shall provide documentation indicating how any deficiencies in the latest CCRL inspection report have been corrected.
  - c. Prior to approval, all testing of proposed materials and mixture designs including trial batch and shrinkage testing shall be at the Contractor's expense.
3. Base the concrete design on the materials to be used in the work. If the specified requirements cannot be met, furnish other acceptable materials and/or make necessary changes in the mixing procedure to meet the specified requirements.
4. Design and proportion concrete mixtures to provide an average 28-day compressive strength in excess of the specified 28-day design compressive strength so that the minimum ultimate compressive strength required for each strength class will be obtained.
5. The determination of the concrete mixture proportion to attain the required strength shall be in accordance with the provisions of the New York City Building Code, Local Law 76/2008 unless otherwise specified.
  - a. Proportioning on the basis of field experience and/or trial mixtures shall be in accordance with section 1905.3 of the 2008 New York City Building Code, Local Law 76/2008. Where proportioning on the basis of field experience is used a mixture design employing the same ingredients proposed for use, and used successfully on a previous project, or projects, may be used provided the following are submitted by a licensed concrete testing laboratory and approved by the City of New York.
    - (1) The name and location of the plant from which the concrete will be batched.
    - (2) The concrete mixture design including detailed data and analysis of the ingredients proposed for use as specified herein.
    - (3) Reports for at least 50 consecutive tests of 7-day and 28-day concrete strength tests of the proposed mixture made during the previous twelve months of concrete batched and delivered from the same plant that is to furnish this job. These data shall include an evaluation in accordance with ACI 214 to determine the average strengths, moving averages and the coefficients of variation. In

addition, the results of a minimum of 3 shrinkage tests for this mixture made during the previous twelve months and using the same materials to be used on this project.

- (4) Reports of compliance tests of fine and coarse aggregates made during the above tests.
  - b. For those portions of the work where the Rules, Regulatory or Standard Specifications of agencies other than the Building Department govern, the concrete shall be proportioned in accordance with the applicable Code, Rules Regulations or Standards. Concrete shall be proportioned at a slump not to exceed 4 inches.
  - c. Concrete design mixtures for concrete used in the construction of Transformer Vault, shall not contain fly ash or pozzolan mineral admixture in accordance with Consolidated Edison's prescribed requirements.
6. Design mixture shall meet or exceed each specified property or requirement. Where more than one criterion is specified, conform to the most stringent. For example, a minimum cementitious content or maximum water-cementitious ratio may result in compressive strengths greater than the minimum specified. Likewise, a greater cement content or lower water-cement ratio may be required to achieve the required compressive strength.
7. At the start of construction, mix a full-sized batch, using the accepted materials, the type of mixer and the mixing procedure planned for the project to verify the adequacy of the selected proportions to produce concrete with the required total air content and consistency, and with workability compatible with the intended placing method. This batch will provide the basis for final adjustment of the accepted design.
8. Adjustment to Concrete Mixtures: Mixture design adjustments may be requested by the Contractor when characteristics of materials, job conditions, weather, test results, or other circumstances warrant. Submit laboratory test data for revised mixture design for the Commissioner's approval prior to using the revised mixture design in the work. Mixture design adjustments shall be at the sole expense of the Contractor.
9. Mixture design for cast-in-place structural concrete for exterior ramp structures shall conform to Table 501-3 in Section 501 - Portland Cement Concrete of the NYSDOT Standard Specification.
10. Mixture design for the cast-in-place bonded concrete overlay at the exterior ramp structures shall conform to Table 584-1 in Section 584 - Specialized Overlays for Structural Slabs of the NYSDOT Standard Specification.

11. The requirement for a trial batch may be waived if the required test information has been provided in a previous laboratory trial batch run on the identical mixture design within the previous two years. The same brand, type, and source of all materials shall have been used.
  12. Mixture design for the transformer vault shall conform to Consolidated Edison specification E0-1008 – Plain and Reinforced Concrete.
- D. Measurements and Allowable Tolerances: Conform to requirements of cited References in Article 1.03 but provide more restrictive tolerances where required to meet job conditions.
1. Concrete work at exposed surface conditions, including slabs, beams, and walls shall not deviate more than 1/2" from theoretical design locations. Pile caps shall not deviate more than 1" from theoretical design locations.
  2. Concrete Topping or Overlay: Areas to receive concrete topping or overlay shall conform to contour of finished grades indicated and shall not have variations in excess of plus 1/8" in 10'-0" and minus 1/4" in 10'-0".
  3. Variation from a 10-foot straightedge placed in all directions:
    - a. Horizontal and inclined surfaces: 1/8-inch.
    - b. Vertical surfaces: 1/4-inch.
    - c. Eliminate depressions on horizontal surfaces which could hold water.
  4. Out-of-plumb piers, walls, and joints: 1/4-inch in 10 feet, not to exceed one inch total.
  5. Level and grade of slab soffits, beam soffits, and arises: 1/4-inch in any 10 feet length; 3/8-inch in any 20 feet length; not to exceed 3/4-inch for entire surface.
  6. Cross sectional dimensions of beams, and slabs: Plus 1/4-inch, minus 0.
  7. Size and location of sleeves, floor openings, inserts and anchor bolts: 1/4-inch.
  8. Difference between the diagonal dimensions of a rectangular opening: Not more than two percent of the sum of the diagonal dimensions.
  9. Tolerances shall not be cumulative.

#### 1.06 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 1330 - Shop Drawings.

**B. Qualifications Submittals**

1. Contractor's Surveyor: Submit qualifications of the Contractor's licensed Surveyor to adequately survey all sleeves for conduits, deck openings and anchor bolts for future work.
2. Quality Assurance: Develop and submit for approval a quality control plan in accordance with the guidelines of ACI 121R and as specified herein. The plan shall include plans for the concrete supplier, the reinforcing steel supplier, and installer. Maintain a copy of ACI SP-15 and CRSI Manual of Practice at the project site.

**C. Quality Control Submittals****1. Concrete Mixture Designs**

- a. Proposed mixture design method and test data for each class of concrete and for each proposed change of ingredients and ingredient sources, including admixtures, in accordance with the documentation provisions of ACI 301. Identify for each mixture design submitted the method by which proportions have been selected.
- b. Mix proportions conforming to the requirements of the New York City Building Code, Local Law 76/2008 and this Section for water/cement ratio, cement content, slump, maximum size of coarse aggregate, air content, admixtures, and chloride concentration, as well as compressive strength. Mix proportions for structural lightweight concrete shall comply with the recommendations of ACI 211.2.
- c. For mixture designs based on trial mixtures, include laboratory trial mixture proportions, test results and graphical analysis, and indicate required average compressive strength,  $f'_c$ , developed at 7 and 28 days from not less than 3 test cylinders cast for each test and for each design mixture. Indicate quantity of each ingredient per cubic yard of concrete. Indicate type and quantity of admixtures proposed or required. Indicate aggregate gradation for fine and coarse aggregates.
- d. Submit for approval new historical field strength test data, data from new trial mixtures or evidence which indicates that the change will not adversely affect the relevant properties of the concrete prior to changing the brand, type, size or source of cementitious materials, aggregates, water, ice or admixtures.

## 2. Test Reports

- a. Submit following information for review:
  - (1) Types, classes, procedures, names and plant locations for cementitious materials.
  - (2) Types, pit or quarry locations, producers' names, gradations and properties required by ASTM C33 and ASTM C330 for aggregates for the building structure and site structures and by the NYSDOT Standard Specification for the exterior ramp structures.
  - (3) Types, brand names, producers' names for admixtures; and source of supply for water and ice.
- b. Except for admixtures and water, test results not more than 90 days old confirming the conformance of all concrete materials with applicable specifications.
- c. Cement: Submit test results in accordance with ASTM C150 Portland Cement and/or ASTM C595 and ASTM C1157 for blended cement. Submit current mill data.
- d. Fly Ash: Submit test results in accordance with ASTM C618. Submit test results performed within 6 months of submittal date.
- e. Ground Granulated Blast-Furnace Slag: Submit test results in accordance with ASTM C989 for ground iron blast-furnace slag. Submit test results performed within 6 months of submittal date.
- f. Aggregates: Submit test results for aggregate quality for normal weight concrete in accordance with ASTM C33, for aggregate quality for lightweight concrete in accordance with ASTM C330, the combined gradation curve for grading proposed for use in the work and used in the mixture qualification and ASTM C295 for results of petrographic examination. Where there is potential for alkali-silica reaction, provide results of tests conducted in accordance with ASTM C227 or ASTM C1260. Submit results of all tests during progress of the work in tabular and graphical form as noted above, describing the cumulative combined aggregate grading and the percent of the combined aggregate retained on each sieve.
- g. Admixtures: Submit test results in accordance with ASTM C494 and ASTM C1017 for concrete admixtures, ASTM C260 for air-entraining agent, and manufacturer's literature and test reports for corrosion inhibitor admixture. Submitted data shall be based upon tests performed within 6 months of submittal.

- h. Submit samples of materials as requested by the Commissioner including name, source and description of each type of aggregate.
- i. Submit copies of laboratory test reports for concrete materials and mixture design tests. Commissioner's review will be for information only. Production of concrete to comply with the specified requirements shall be the responsibility of the Contractor.
- j. A complete record of the date and details of each concrete placement including the exact location thereof and the date of removal of forms. This record shall be coordinated with and in addition to that maintained by the Commissioner.

### 3. Certifications

- a. Materials, equipment and aggregates approved by the Materials Bureau of the New York State Department of Transportation (NYSDOT), in the NYSDOT publications listed below, are acceptable for use without a detailed submission for review and approval. However, submittal is required to establish the particular material, equipment or aggregate source to be used with approval identification number, and/or page number.
  - (1) M.A.P. Code 7.42-3.1 - Approved Materials and Equipment for use on NYSDOT Projects
  - (2) M.A.P. Code 7.42-3.2 - Approved Sources of Fine and Coarse Aggregates
- b. All materials used in the manufacture of concrete shall be accompanied by a certificate from the manufacturer or supplier indicating test results of current production stockpiles or shipments.
- c. Certifications by the concrete supplier that all concrete ingredients conform to the specified requirements in accordance with ASTM C94. Be advised that the proposed concrete supplier is subject to the City of New York's approval based on experience and past performance on similar projects.
- d. Certifications by the concrete supplier of conformance of mixture designs.
- e. Manufacturer's certification that chloride content of each concrete admixture complies with specified requirements.

- f. Affidavits from an independent testing laboratory certifying that all materials furnished under this Section conform to specified requirements.

4. Material and Product Data

- a. Submit samples of materials as specified and as otherwise may be requested by the Commissioner, including names, sources, and descriptions.
- b. Submit manufacturer's technical data and installation instructions for manufactured materials and products.
- c. Furnish manufacturer's certifications and laboratory test reports as requested by the Commissioner.
- d. Submit notarized certification of conformance to referenced standards when requested by the Commissioner.
- e. Submit technical data from the microsilica admixture supplier to be used in the Class 50 DP concrete that shows that the admixture meets the NYC/NYSDOT requirements regarding fineness, silica content, total chloride ion content, solid contents (slurries) and moisture content (densified powders).

5. Form removal schedule: Submit schedule for form removal indicating element and minimum length of time for form removal. Submit technical literature of forming material or liner, form release agent, form ties, and gasketing to prevent leakage at form and construction joints. Provide a full description of materials and methods to be used to patch form-tie holes.

6. Shop Drawings and Construction Procedures

- a. Proposed concrete placement schedule and shop drawings prior to start of concrete placement operations, including location of all construction, expansion and control joints.
- b. Proposed equipment and method(s) of concrete pumping and conveying.
- c. Proposed equipment and method(s) of concrete placement, vibration and compaction.
- d. Proposed method(s) of concrete curing.
- e. Methods for cold and hot weather mixing, placement, curing and planned protective measures.

- f. Complete information pertinent to a concrete plant to be erected at the site as required by the CPMB Publication "Concrete Plant Standards of the Plant Manufacturers Bureau."
- g. Proposed special procedures for protection of concrete under wet weather placement conditions.
- h. Proposed method of measuring concrete surface temperature changes.
- i. Detailed procedures for removing stains, rust, efflorescence, and surface deposits.
- j. The following information, if ready-mixed concrete is used.
  - (1) Identification of Ready-Mixed Concrete Supplier including the plant location and all pertinent information required by the CPMB Publication "Concrete Plant Standards of the Plant Manufacturers Bureau."
  - (2) Locations of sources of materials for cement, fine and coarse aggregates, and water, and the brands and types of admixtures to be used.
  - (3) Physical capacity of mixing plant.
  - (4) Trucking facilities available.
  - (5) Estimated average amount which can be produced and delivered to the site during a normal 8-hour day, excluding the output to other customers.
  - (6) Estimated travel time to the site.

#### 7. Delivery Tickets

- a. Furnish the Commissioner with a copy of the delivery ticket for each load of concrete delivered to the site. Delivery tickets shall contain all information specified in Section 16.1 of ASTM C94.
- b. Provide batch tickets for each batch of job-site mixed concrete as specified.

### 1.07 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest

edition of each and amendments or supplements thereto. Work of this Section shall conform to all applicable Federal, State and local laws and regulations.

**B. Inspection and Testing**

1. All structural concrete work, including concrete materials and construction operations, shall be subject to special inspection and testing in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
2. Special Inspections
  - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
  - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
  - c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections.
    - (1) Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

- (2) Failure to detect defective work or material shall not in any way prevent rejection should a defect be discovered at a later date nor shall it obligate the Commissioner for final acceptance.
  3. Concrete materials, mixing and placement procedures are subject to special inspection and tests in the plant and field by the Special Inspector. Concrete materials and operations will be inspected and tested by the Special Inspector as the work progresses.
  4. Plant inspections may be made by the Special Inspector at its discretion. Provide at least 72 hours written notice to the Special Inspector prior to the beginning of any concrete materials or mixing work so that inspection may be provided. Furnish all facilities for the inspection of materials and workmanship in the plant, and allow the inspectors free access to the necessary parts of the work.
    - a. Special Inspectors shall have the authority to reject any material or work that does not meet the requirements of this Section.
    - b. Inspection at the plant is intended as a means of facilitating the work and avoiding errors, but it is expressly understood that it will in no way relieve the Contractor from the responsibility for furnishing proper materials or workmanship specified herein.
  5. Concrete materials and installed work may require testing and retesting, as directed by the Commissioner, at any time during the progress of the work. Allow free access to material stockpiles and facilities at all times. Bear the cost of tests not specifically indicated to be performed as special inspection by the Commissioner, including the retesting of rejected materials and installed work.
  6. Other quality control inspection and testing services required by the Contractor to ensure compliance with the Contract Documents for cast-in-place concrete shall be provided by an approved independent inspection and testing agency engaged by and supervised by the Contractor at no additional cost to the City of New York.
- C. Use adequate number of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- D. Comply with ACI 301, except as modified herein.
- E. Do not commence furnishing or placement of concrete until concrete mixture designs have been reviewed and approved by the Commissioner.

- F. Closely coordinate the work of this Section with other trades whose work affects, or is affected by, the work of this Section.
- G. Work in Connection with Other Sections and Contracts:
  - 1. Provide all sleeves, inserts, anchors and embedded items required for adjoining work or for its support prior to concreting. No concrete shall be deposited until the Commissioner has inspected the placement of the embedded items and the reinforcing bars and has given permission to place the concrete.
  - 2. Provide ample notice and opportunity to the other trades, whose work is related to the concrete or must be supported by it, to introduce and furnish embedded items before the concrete is placed.
  - 3. Install electrical conduits, junction boxes and pipes prior to concreting in accordance with all requirements of the New York City Building Code, Local Law 76/2008. Protect such installations to the extent that they are not displaced or damaged during the concrete placement.
  - 4. Provide openings in slabs for pipes, conduits and the like required for the work where indicated on the Contract Drawings or Shop Drawings. When work is completed, close up the excess part of the respective openings completely to the pipe sleeve and inserts to match the adjoining work.
  - 5. Provide and set true and to proper alignment in the concrete all sleeves for miscellaneous metal work, castings, pipes and anchors required under this Contract as indicated on the Contract Drawings or required by the manufacturer's templates.
  - 6. Temporarily fill voids in embedments with readily removable material to prevent entry of concrete into the void.

#### 1.08 DELIVERY, STORAGE AND HANDLING

- A. Cement shall be stored in weather-tight buildings, bins or silos which will provide protection from dampness and contamination and will minimize warehouse set.
- B. Aggregate stockpiles shall be arranged and used in a manner to avoid excessive segregation or contamination with other materials or with any other sizes of like aggregates. To insure that this condition is met, any test for determining conformance to requirements for cleanliness and grading shall be performed on samples secured from the aggregates at the point of batching. Frozen or partially frozen particles shall not be used.
- C. Stockpiles of natural or manufactured sand shall be allowed to drain freely to minimize variations in moisture content throughout the stockpile.

- D. Admixtures shall be stored in such a manner as to avoid contamination, evaporation or damage. For those used in the form of suspensions or non-stable solutions, suitable agitating equipment shall be provided to assure uniform distribution of the ingredients. Liquid admixtures shall be protected from freezing and other temperature changes that would adversely affect their characteristics. All admixture containers shall be clearly marked with paint as to their content and dosage.
- E. Do not deliver concrete until forms, reinforcement, embedded items, and chamfer strips are in place and ready for concrete placement.

## 1.09 PROJECT CONDITIONS

### A. Field Measurements

1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
2. Take sufficient field measurements prior to preparation of Shop Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.
3. Actual field-verified conditions may require modifications to the construction details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 CONCRETE QUALITY AND PROPORTIONING

- A. Select concrete proportions to produce the required design strength and provide durability against deterioration and abrasion, watertightness, workability and mixture consistency to facilitate concrete placement, compaction into the forms or metal deck and around reinforcement without segregation or excessive bleeding, and achieve the desired finished appearance.

- B. Durability and Strength: Conform to the applicable requirements of ACI 201.2R and ACI 211.1. Adjust the concrete 28-day design compressive strength to produce cast-in-place concrete of minimum design compressive strength ( $f'_c$ ) as follows:

<u>Item</u>	<u>Concrete Class</u>	<u>28-day Minimum Design Strength (<math>f'_c</math>)</u>
Concrete Workmats	Class 25	2,500 psi
Concrete Curbs, Headers and Sidewalks	Class 30	3,000 psi
Concrete for Buildings, Site Structures	Class 45	4,500 psi
Concrete for Exterior Ramps (NYSDOT)	Class 40 HP	4,000 psi
Structural Lightweight Concrete	Class 40 LT	4,000 psi
Exterior Ramp Overlay (Bonded)	Class 50 DP	5,000 psi
Concrete for Floor Toppings (Unbonded)	Class 45	4,500 psi
Concrete Fill for Steel Pipe Piles	Class 45	4,500 psi
Concrete for Transformer Enclosure	Class 50	5,000 psi

- C. Strength and Water-Cementitious Materials Ratio:

1. Strength requirements shall be based on 28-day compressive strength determined by testing 6-inch by 12-inch cylindrical specimens in accordance with ASTM C39. The specified compressive strength of the concrete ( $f'_c$ ) for each portion of the structure shall meet the requirements in the Contract Documents.
2. Produce cast-in-place concrete with a maximum water-cementitious materials ratio of 0.40 for normal weight concrete and 0.50 for structural lightweight concrete by weight of the total cementitious constituent. In computing the water-cement ratio, water content shall include free surface moisture contained in the aggregate and water content of all liquid admixtures.
3. The minimum amount of portland cement is 70 percent of the total mass of cementitious material. When used, fly ash conforming to ASTM C618 Type F shall be 15 percent by weight of the cementitious material. When used, ground granulated blast-furnace slag conforming to ASTM C989 shall not exceed 15 percent by weight of cement.

- D. Consistency: Proportion the concrete mixture to achieve, at the point of deposit, a maximum slump of 4 inches (without addition of water-reducing admixtures) as determined by ASTM C143, unless indicated otherwise. Where an ASTM C494, Type F or G admixture is used, the slump after the addition of the admixture shall be no less than 6 inches nor greater than 8 inches. Slump tolerances shall comply with the requirements of ACI 117. Maintain slump at lowest value consistent with the ability to satisfactorily place, consolidate and finish concrete.

- E. Air Content: Air entrain all normal weight and structural lightweight concrete. Total air content shall be 5.0 percent by volume in the plastic state within a

tolerance of  $\pm 1.5$  percent, as determined by ASTM C173 or C231, except as noted below.

1. For concrete surfaces that will receive a hard steel troweled or magnesium troweled finish, including the addition of a surface hardener, as specified in Section 03350 - Concrete Finishes, the maximum total air content shall be 3.0 percent.
- F. Slump: The concrete mixture shall be proportioned to have, at the point of deposit, a maximum slump of 4 inches as determined by ASTM C143. Where an ASTM C494, Type F or G admixture is used, the slump after the addition of the admixture shall be no less than 6 inches nor greater than 8 inches. Slump tolerances shall comply with the requirements of ACI 117.
- G. Required Average Strength of Concrete: The minimum compressive strength ( $f_{cr}$ ) of the selected mixture shall equal or exceed the strength required under ACI 301 for laboratory mixture designs. The average compressive strength produced under field tests shall be the minimum compressive strength ( $f_{cr}$ ) required during construction.
- H. Materials shall be proportioned to produce structural lightweight concrete with a calculated equilibrium density of not more than 115 lb/ft<sup>3</sup> as determined by ASTM C567.

## 2.02 MATERIALS

- A. General: Provide materials that meet the minimum requirements specified herein. Materials are applicable to cast-in-place structural concrete for use in buildings and site structures unless specified otherwise.
- B. Portland Cement: ASTM C150, Type I or Type II, or blended hydraulic cement, ASTM C595, Type 1P (MS), except as modified herein. Blended cements shall consist of a mixture of ASTM C150 cement and one of the following materials: ASTM C618 pozzolan or fly ash, or ASTM C989 ground granulated blast-furnace slag. Use one manufacturer for each type of cement, ground slag, fly ash, and pozzolan.
1. Type III (high early strength) may be used for cast-in-place concrete placed during cold weather with permission of the Commissioner. Air entraining cement is not permitted.
  2. For cast-in-place concrete for exterior ramp structures, use Type II or Type I/II as specified in Article 501-2.02.A in the NYSDOT Standard Specification.
  3. Use portland cement made by a well-known acceptable manufacturer and produced by not more than one plant. Alternate cement sources may be used provided that a mixture design has been accepted and a trial batch verifying performance has been made.

4. Do not use cement which has deteriorated because of improper storage or handling.
- C. Fly Ash or Pozzolan: Fly ash or pozzolan mineral admixture, when used, shall meet the requirements of ASTM C618 Class F, except as follows:
1. The loss on ignition shall be a maximum of 4 percent.
  2. The maximum percent of sulfur trioxide ( $\text{SO}_3$ ) shall be 4.0.
  3. Fly ash or pozzolan mineral admixture shall not be used for concrete used in the construction of Transformer Vault in accordance with Consolidated Edison's prescribed requirements.
- D. Ground Granulated Blast Furnace Slag:
1. Ground granulated blast furnace slag (GGBF) mineral admixture, when used, shall meet the requirements of ASTM C989, Grade 100 or better.
  2. GGBF slag will be permitted as a substitute for fly ash, at no additional cost to the City of New York, in the event that Class F Fly Ash is not available. The slag substitution shall be in the same proportions and percentages of the total cementitious material as indicated for Fly Ash. A higher percentage of GGBF slag of the total cementitious material in concrete shall be permitted as approved by the Commissioner to suit the project needs.
  3. Laboratory trial batches will be tested to determine compliance with strength requirements, times of setting, slump, slump loss, and shrinkage characteristics.
- E. Aggregates
1. Coarse and fine aggregates shall meet the requirements of ASTM C33 with the requirements of Table 3, Class 4S, except for aggregates used for structural lightweight concrete and the construction of exterior ramp structures and substructures. Soundness shall be tested using magnesium sulfate. Abrasion resistance shall be tested using the Los Angeles Abrasion Test. For testing requirements, concrete shall be assumed to be subject to abrasion.
  2. Fine and coarse lightweight aggregates used for structural lightweight concrete shall conform to ASTM C330 and consist of expanded shale, clay or slate material produced by the rotary kiln process.
  3. Fine and coarse aggregates used for construction of exterior ramp structures and substructures shall be in accordance with Article 501-2.02B as specified in the NYSDOT Standard Specification.

4. Where historical data is used, provide aggregates from the same sources having the same size ranges as those used in the concrete represented by historical data.
5. Do not use aggregates containing soluble salts or other substances such as iron sulfides, pyrite, marcasite, ochre, or other materials that can cause stains on exposed concrete surfaces. Marine dredged aggregates shall not be used. Provide aggregates containing no deleterious material properties as identified by ASTM C295.
6. The loading, storing, unloading, and batching of aggregates shall be conducted in such a manner as to prevent segregation, intermingling, or the inclusion of foreign materials. All aggregates shall remain in free drainage storage until a stable moisture content is attained prior to placement in the batching plant bins. Each size of coarse aggregate and the fine aggregate shall be kept in separate hoppers or bins. All aggregates shall be delivered to the batching plant bins by a belt conveyor or other approved means; and the operation thereof shall be controlled so as to prevent the mixing of the sizes and kinds of aggregates with each other. Any mixture of fine and coarse aggregates or of the two sizes of coarse aggregate in the batching plant bins or prior thereto shall be cause for rejection of such materials, and the affected bin or bins shall be emptied and inspected prior to refilling with the correctly graded aggregate.
7. Provide aggregates for exposed concrete from one source in accordance with ASTM C227. Do not provide aggregates that react deleteriously with alkalies in cement.
8. If ASTM C1260 considers aggregate to be potentially reactive with alkalies in the cement, mix design shall be tested as described in Paragraph 2.02G.
9. Fine aggregates for normal weight concrete
  - a. ASTM C33 including restrictions on reactive materials except that loss when tested for soundness using magnesium sulfate shall not exceed 12 percent.
  - b. Fine aggregate shall be composed of clean, sharp, hard, strong, durable, insoluble, uncoated, natural sand free from loam, clay lumps or other deleterious substances.
  - c. Dune sand, bank run sand and manufactured sand are not acceptable.
  - d. Sand having FM less than 2.40 or greater than 3.00 will not be allowed.

## 10. Coarse aggregate for normal weight concrete

- a. ASTM C33, Size No. 57, Class 4S, including restrictions on reactive materials except that loss when tested for soundness using magnesium sulfate shall not exceed 12 percent. For composite steel floor deck, concrete stairs and stair treads, use a mixture with a maximum coarse aggregate of 1/2 inch.
- b. Coarse aggregate shall be crushed stone processed from natural rock or stone and shall consist of clean, hard, strong, durable, insoluble, unweathered, and uncoated pieces of uniform quality throughout; and shall be free from such alkali, decomposed minerals, organic material, clay, mica, schist, or other foreign matter that will render it unsuitable.
- c. Use of slag and pit or bank run gravel is not permitted, nor clay lumps in excess of 1.0 percent by weight of coarse aggregate.

## 11. Combined Aggregate

- a. Aggregate gradations shall be judged based upon the combined gradation and particle distribution in the mixture of coarse and fine aggregates.
  - b. The combined aggregates shall be well graded from coarsest to the finest with not more than 18 percent nor less than 8 percent retained on each individual sieve between the coarsest size and the No. 50 sieve and the nominal maximum aggregate size sieve. The No. 100 and finer sieves shall have less than 8 percent retained. Use blending sizes where necessary, to provide a well graded combined aggregate. Maximum aggregate size shall be 1".
  - c. Fine aggregate and coarse aggregate sizes specified shall be combined in proportions as needed to meet the requirements specified herein for combined aggregate. The total quantity of fine aggregate shall not exceed 41 percent by weight of total aggregate for normal weight concrete.
  - d. Gradations of combined aggregate shall be plotted and submitted on:
    - (1) A combined grading chart (percent passing versus sieve size) on which the limits noted above shall be plotted.
    - (2) An aggregate Particle Distribution Chart (percent retained versus sieve size).
- F. Water: Clean, potable and free of substances that may be objectionable to concrete or steel. Water shall meet the requirements of ASTM C94 and the chloride and sulfate limits in accordance with ASTM D512 and ASTM D516. Mixing water

shall not contain more than 500 parts per million of chlorides as Cl and not more than 100 parts per million of sulfates as SO<sub>4</sub>. Water shall be free from injurious amounts of oils, acids, alkalies, salts, and organic materials.

#### G. Alkali-Silica Reaction

1. Concrete mix containing aggregates considered potentially reactive by ASTM C1260 shall be considered acceptable if the expansion as measured by ASTM C1260 (modified) is not greater than 0.08 percent at 16 days. Mix designs not meeting this requirement will be rejected.

#### H. Concrete Admixtures

1. Calcium Chloride: Not permitted. Do not use calcium chloride or admixtures containing chlorides, thiocyanate, or more than 0.05 percent chloride ions other than impurities from admixture ingredients.
2. Provide approved chemical admixtures produced and serviced by established, reputable manufacturers that comply with the requirements shown below and in accordance with manufacturer's recommendations, and appropriate for the climatic conditions and the construction needs.
3. Concentrations of corrosion-inducing chemicals shall not exceed limits shown below.

##### Limits on Corrosion-Inducing Chemicals

<u>Chemical*</u>	<u>Limits, Percent**</u>	<u>Test Method</u>
Chlorides	0.10	ASTM D512
Fluorides	0.10	ASTM D1179
Sulphites	0.13	ASTM D1339
Nitrates	0.17	ASTM D3867

\* Limits refer to water-soluble chemicals

\*\* Limits are expressed as a percentage of the mass of the total cementitious materials.

4. The total alkali content shall not increase the total sodium-oxide equivalent alkali content of the concrete by more than 0.5 lb/CY.
5. Air-Entraining Admixture: Provide a product conforming to requirements of ASTM C260, certified by manufacturer to be compatible with other selected admixtures.
6. Water-Reducing Admixture: Provide a product conforming to requirements of ASTM C494 Type A.

7. Accelerating Admixture: Provide a product conforming to requirements of ASTM C494 Type C.
8. Retarding Admixture: Provide a product conforming to requirements of ASTM C494 Type B or G.
9. Water-Reducing and Retarding Admixture: Provide a product conforming to requirements of ASTM C494 Type D.
10. Water-Reducing and Accelerating Admixture: Provide a product conforming to requirements of ASTM C494 Type E.
11. High Range Water-Reducing Admixture: Provide a product conforming to requirements of ASTM C494 Type F.
12. Corrosion Inhibiter
  - a. Provide corrosion inhibiting admixture containing a minimum of 30 percent calcium nitrite by mass, conforming to the requirements of Section 711-13 of the NYSDOT Standard Specifications.
  - b. Dosage shall be 3.0 gallons per cubic yard for normal weight concrete for transfer station building, pier deck and ramp structures. The quantity of mix water shall be adjusted to account for the water portion of the calcium nitrite solution. Water content of corrosion inhibitor shall be considered as 7.3 pounds per gallon in computing the water/cement ratio of the overall mix.
  - c. Retarding admixtures shall be provided as needed, since the calcium nitrite solution accelerates setting time, unless the admixture has been specifically formulated to not accelerate setting.
  - d. Products: Subject to compliance with requirements, provide one of the following:
    - (1) DCI or DCI-S; Grace Construction Products, Cambridge, MA
    - (2) Rheocrete CNI; Master Builders, Inc., Cleveland, OH
    - (3) Anti-Hydro NC; Anti-Hydro International, Inc., Flemington, NJ
    - (4) Eucon CIA; Euclid Chemical Company, Cleveland, OH
    - (5) Or approved equal
13. Microsilica Admixture for Class 50 DP bonded concrete overlay on exterior ramp structures: Provide a product conforming to slurry or densified powder included on the list of approved products for New York City/New York State Department of Transportation. When slurries are used, they shall be agitated to prevent separation and shall be maintained at a temperature above 32° F. at all times.

## 2.03 EPOXY BONDING AGENT

- A. Provide a two-component epoxy-resin bonding agent conforming to ASTM C881. Provide Type I for bonding hardened concrete to hardened concrete; Type II for bonding freshly mixed concrete to hardened concrete; and Type III as a binder in epoxy mortar or concrete, or for use in bonding skid-resistant materials to hardened concrete. Provide Grade 1 or 2 for horizontal surfaces and Grade 3 for vertical surfaces. Provide Class A if placement temperature is below 40° F.; Class B if placement temperature is between 40 and 60° F.; or Class C if placement temperature is above 60° F.
- B. Products: Subject to compliance with requirements, provide one of the following:
1. Sikadur 32, Hi-Mod LPL; Sika Corporation, Lyndhurst, NJ
  2. Eucopoxy LPL; Euclid Chemical Company, Cleveland, OH
  3. Or approved equal

## 2.04 CURING AND PROTECTION MATERIALS

- A. Provide curing materials that will not stain or affect concrete finish or lessen the concrete strength and comply with the following requirements:
1. Pervious Sheeting: Use materials conforming to AASHTO M182, Class 3; burlap cloth made from jute or kenaf, weighing approximately 10 ounces per square yard.
  2. Curing mats shall be heavy carpets or cotton mats, quilted at 4 inches on center. Curing mats shall weigh a minimum of 12 ounces per square yard when dry.
  3. Impervious Sheeting: Use materials conforming to ASTM C171; waterproof paper, clear or white polyethylene sheeting, or polyethylene-coated burlap.
  4. Liquid Membrane-Forming Compounds
    - a. Use material meeting the requirements of ASTM C309, Type 1 or Type 1-D, Class A or B and is VOC compliant. Be advised that removal of the curing compound may be required prior to the installation of certain floor finishes and concrete finish treatments or coatings in accordance with the manufacturer's recommendations and as described in Section 03350 – Concrete Finishes.
    - b. Products: Subject to compliance with requirements, provide one of the following:
      - (1) Kure-N-Seal; Sonneborn/BASF Admixture Systems, Cleveland, OH

- (2) L&M Cure R; L&M Construction Chemicals, Inc., Omaha, NE
- (3) KurezDR-100; Euclid Chemical Co., Cleveland, OH
- (4) Or approved equal

5. Insulation Blankets

- a. Closed cell flexible foam sheet material such as polystyrene or urethane. Provide foam sheet material which is capable of being bent 90° F. without breaking or tearing at corners. The foam insulation blankets shall be 1/2-inch thick.
- b. Quilted, flexible insulation blankets that retain their insulating value when wet and which retard the evaporation of water.

2.05 PREFORMED COMPRESSIBLE JOINT FILLER

- A. Use a preformed compressible joint filler composed of closed-cell polyethylene foam or closed-cell synthetic foam of isomeric polymers at expansion joints in cast-in-place concrete work as indicated on the Contract Drawings. Provide compressible joint filler that meets the requirements of ASTM D1751 or ASTM 1752, Sections 5.1 through 5.4, except that the compression requirement shall not be less than 100 psi and not greater than 250 psi to compress the test specimen to 50 percent of its thickness.
- B. Products: Subject to compliance with requirements, provide one of the following:
  1. Sealtight Ceramar; W.R. Meadows, Inc., Hampshire, IL
  2. Expansion-Joint Filler; BASF Building Systems, Shakopee, MN
  3. Or approved equal

2.06 JOINT SEALANT AND BACKER ROD

- A. Use a moisture-cured, single-component, polyurethane base, non-sag, gun-grade elastomeric sealant compound at new expansion joints and control joints in cast-in-place concrete work as indicated on the Contract Drawings. Provide joint sealant that meets the requirements of ASTM C920, Type S, Grade NS, Class 25 and Use T or NT as applicable. Provide a backer rod that is closed-cell polyethylene foam rod, non-gassing with a diameter as recommended by the manufacturer for the joint width indicated. Use a backer rod that is compatible with the joint sealant and acceptable to the joint sealant manufacturer.
- B. Products: Subject to compliance with requirements, provide one of the following:
  1. Sikaflex 1-a; Sika Corporation, Lyndhurst, NJ
  2. Eucolastic I; Euclid Chemical Company; Cleveland, OH
  3. Sonolastic SL-1; BASF Building Systems, Shakopee, MN
  4. Or approved equal

## 2.07 CONSTRUCTION JOINT FILLER

- A. Provide a two-component, self-leveling, elastic type, modified epoxy or polyurea joint filler for filling and sealing narrow grooves in horizontal construction and control joints. Joint sealer shall be suitable to protect concrete joint edges in heavy duty, industrial concrete floors and wearing surfaces subject to abrasion, heavy traffic and concentrated loads. Suitable for applications where anticipated joint movement will not exceed 10 percent of opening width. Provide joint filler capable of 100 percent elongation with a minimum tensile strength of 325 psi, a Shore A hardness between 75 and 95 and minimum adhesion strength to concrete of 200 psi.
- B. Products: Subject to compliance with requirements, provide one of the following:
1. Groove and Crack Filler #250; Anti-Hydro International, Inc., Flemington, NJ
  2. TF-100 Control Joint Filler, BASF Building Systems, Shakopee, MN
  3. Or approved equal

## 2.08 EPOXY RESIN FOR GROUTING DOWELS

## A. Vertical Dowels

1. Provide a two-component, 100-percent solids, moisture-tolerant, high-modulus epoxy resin specifically intended for grouting vertical dowels.
2. Products: Subject to compliance with requirements, provide one of the following:
  - a. Sikadur 32, Hi-Mod; Sika Corporation, Lyndhurst, NJ
  - b. E<sup>3</sup>-F High Flow Epoxy Grout System; Euclid Chemical Company, Cleveland, OH
  - c. Masterflow MP, BASF Building Systems, Shakopee, MN
  - d. Or approved equal

## B. Horizontal Dowels

1. Provide a two-component, 100-percent solids, moisture-tolerant, high-modulus epoxy resin specifically intended for grouting horizontal dowels.
2. Products: Subject to compliance with requirements, provide one of the following:
  - a. Sikadur 31, Hi-Mod Gel; Sika Corporation, Lyndhurst, NJ

- b. Duralcrete Gel Epoxy System; Euclid Chemical Company, Cleveland, OH
- c. Or approved equal

## 2.09 NON-SHRINK GROUT

- A. Provide a non-shrink, non-metallic, ready-mix grout conforming to the requirements of ASTM C1107, Grade A, where indicated on the Contract Drawings.
- B. Products: Subject to compliance with requirements, provide one of the following:
  - 1. SikaGrout 212; Sika Corporation, Lyndhurst, NJ
  - 2. Masterflow 713 Plus; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
  - 3. NS Grout; Euclid Chemical Company, Cleveland, OH
  - 4. Or approved equal

## 2.10 PVC WATERSTOPS

- A. Provide an extruded, ribbed-type virgin polyvinyl chloride (PVC) waterstop where indicated on the Contract Drawings that conforms to the requirements of CRD C572. Waterstops shall be extruded from high-quality PVC resins that are plasticized and stabilized to offer long-life performance, resistance to abrasion and attack by ozone, oxygen, alkalies and waterborne chemicals. Provide waterstop that has a Shore A durometer between 65 and 75, tensile strength not less than 1,850 psi and specific gravity not more than 1.38. No reclaimed PVC materials shall be used in the manufacture of the waterstops.
- B. PVC waterstops for construction joints shall be the flat ribbed type, 6 inches wide, with a minimum thickness of 3/8 inch adjacent to the hollow center bulb.
- C. PVC waterstops for expansion joints shall be ribbed with a center bulb, 9 inches wide with a minimum thickness at any point of 3/8 inches. The center bulb shall have an outside diameter of not less than 1-3/8 inches.
- D. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Model 679 for construction joints and Model 738 for expansion joints; Greenstreak, St. Louis, MO
  - 2. Sealtight Model 6380 for construction joints and Sealtight Model 9380 for expansion joints; W.R. Meadows, Hampshire, IL

3. Or approved equal

## 2.11 MISCELLANEOUS MATERIALS

- A. Pipe Sleeves: Sleeves for conduits and pipes shall be PVC Schedule 40 conforming to provisions of ASTM D1785.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until unsatisfactory conditions are corrected.
- B. For footings, pile caps, grade beams and slabs-on-grade, verify that subbase materials are properly compacted and in acceptable condition upon which to construct cast-in-place concrete.
- C. Verify that vapor barrier or membrane waterproofing has been installed where indicated on the Contract Drawings.
- D. Verify that formwork is properly constructed in conformance with Section 03100 – Concrete Forms and Accessories.
- E. Verify that reinforcement, supports, anchors, inserts, sleeves and other embedded items are accurately placed in conformance with Section 03200 – Concrete Reinforcement, are secured in position and will not interfere with proper placement of concrete.
- F. Verify that requirements for concrete cover to reinforcement are satisfied.
- G. Verify that anchor bolts are located as shown on approved anchor bolt layout drawings and are set accurately to templates and protected from damage.
- H. Provide ample notice and opportunity to other trades, whose work is related to the concrete or must be supported by it, to introduce and furnish embedded items before the concrete is placed.
- I. Coordinate through the Commissioner and provide sufficient clearance between reinforcement for drilled-in adhesive anchor for railings, miscellaneous structures, equipment, devices and those likely to be installed by other trades.

### 3.02 JOINT CONSTRUCTION

#### A. Construction Joints

1. Do not install horizontal construction joints except as shown on the Contract Drawings.
2. If additional construction joints are desired, secure the Commissioner's approval of joint design and location prior to start of concrete placement.
3. Install construction joints with 2-inch deep keyways in accordance with the details indicated on the Contract Drawings. Support joint forms adequately so as to rigidly maintain their positions during placement, vibration and hardening of concrete.
4. Continue reinforcement across and perpendicular to construction joints unless details specifically indicate otherwise. Do not locate lapped splice of reinforcement across construction joint.
5. Do not place new concrete adjacent to previously placed concrete at construction joint until at least 48 hours has elapsed since the initial placement.

#### B. Waterstops

1. Install specified waterstops where indicated on the Contract Drawings.
2. Use continuous lengths without splices, except as otherwise indicated on the Contract Drawings.
3. Connect all adjoining waterstops, including vertical and horizontal runs, in such a manner as to provide a continuous water barrier in accordance with manufacturer's recommendations and as indicated on the Contract Drawings.
4. Splices
  - a. Strength: Not less than that of the parent section
  - b. Watertightness: Make equal to that of continuous material
  - c. Polyvinyl Chloride: Heat seal adjacent surfaces in accordance with manufacturer's recommendations using a thermostatically controlled electric source of heat that provides sufficient heat to melt but not to char the material

**C. Expansion Joints and Control (Contraction) Joints**

1. Install at locations shown or noted on the Contract Drawings.
2. Construct control (contraction) joints, either formed or saw cut or cut with a jointing tool, to the indicated depth after the surface has been finished. Form control (contraction) joint by means of a wood strip, plastic strip, metal plate, or other approved material to be subsequently removed. Sawed joints shall be completed within 4 to 12 hours after concrete placement.
3. Provide 1/2-inch by 1/2-inch preformed recess at top of control (contraction) joint where indicated on the Contract Drawings and fill with joint sealant in accordance with sealant manufacturer's instructions.
4. Do not extend reinforcing steel or other embedded metal items through expansion joints except where indicated otherwise on the Contract Drawings.
5. Expansion joints shall extend the full depth of the concrete element. Fill expansion joints full depth with preformed compressible joint material, backer rod and joint sealant as described herein and as shown on the Contract Drawings.
6. When concrete placement is to be discontinued for more than 45 minutes and if the construction plane is to be horizontal, install keyways and embed dowel bars in the concrete before initial hardening. Use keyways and dowels in vertical concrete construction except when indicated or directed otherwise by the Commissioner.

**3.03 DRILLING AND GROUTING DOWELS WITH EPOXY RESIN**

- A. Drill holes for each dowel to the size and depth indicated on the Contract Drawings. Do not drill into or cut or otherwise damage existing reinforcement bars unless permitted by the Commissioner.
- B. Blow clean each finished hole with an air jet and then flush with a jet of clean water.
- C. Immediately prior to the grouting operation, remove all water from the hole and from the walls of the hole.
- D. Mix and place the epoxy resin completely around the dowel bar in strict accordance with the manufacturer's recommendations, with particular attention given to manufacturer's specified time limit within which the material must be placed after mixing. Do not retemper resin that has begun to stiffen; discard such resin.

## 3.04 BATCHING, MEASURING, MIXING, AND TRANSPORTING CONCRETE

- A. General: Comply with requirements of ASTM C94 and ACI 301, for batching, mixing and transporting concrete, and as modified herein.
- B. Mixing: Conform to the provisions of ASTM C94 and ACI 301. Machine mix concrete. Begin mixing within 30 minutes after the cement has been added to the aggregates. Dissolve admixtures in the mixing water and mix in the drum to uniformly distribute the admixtures throughout the batch. Place concrete within 90 minutes of either addition of mixing water to cement and aggregates or addition of cement to aggregates if the air temperature is less than 85° F.
  - 1. Reduce mixing time and place concrete within 60 minutes if the air temperature is greater than 85° F. except as follows: if set retarding admixture is used and slump requirements can be met, limit for placing concrete may remain at 90 minutes.
  - 2. Delete references for allowing additional water to be added to batch for material with insufficient slump. Addition of water to the batch will not be permitted.
  - 3. If the entrained air content falls below the specified limit, add a sufficient quantity of admixture to bring the entrained air content within the specified limits.
- C. Transporting
  - 1. Transport concrete from the mixer to the forms as rapidly as practicable. Prevent segregation or loss of ingredients. Clean transporting equipment thoroughly before each batch. Do not use aluminum pipe or chutes. Remove concrete that has segregated in transporting and dispose of as directed.
  - 2. Do not use concrete that has stood for over 30 minutes after leaving the mixer, or concrete that is not placed within 90 minutes (or 60 minutes as specified herein) after water is first introduced into the mix.

## 3.05 PLACING CONCRETE

- A. Preparation
  - 1. Remove foreign matter accumulated in the forms.
  - 2. Rigidly close openings left in the formwork.

3. Wet wood forms sufficiently to tighten up cracks. Wet other material sufficiently to maintain workability of the concrete.
  4. Use only clean tools.
- B. Application of Epoxy Bonding Agent: Apply a thin coat of compound to dry, clean surfaces. Scrub compound into the surface with a stiff-bristle brush. Place concrete while compound is tacky. Do not permit compound to harden prior to concrete placement. Follow manufacturer's instructions regarding safety and health precautions when working with epoxy resins.
- C. Conveying
1. Perform concrete placing at such a rate that concrete, which is being integrated, with fresh concrete is still plastic.
  2. Deposit concrete as nearly as practicable in its final location so as to avoid separation due to rehandling and flowing.
  3. Do not use concrete, which becomes non-plastic and unworkable, or does not meet required quality control limits, or has been contaminated by foreign materials.
  4. Remove rejected concrete from the job site.
  5. Do not drop concrete more than 60 inches without the aid of an "elephant trunk" or similar device that prevents aggregate separation.
  6. Placing concrete in forms:
    - a. Deposit concrete in horizontal layers not deeper than 24 inches, and avoid inclined construction joints.
    - b. Remove temporary spreaders in forms when concrete has reached the elevation of the spreaders.
- D. Placing Concrete Slabs
1. Deposit and consolidate concrete slabs in a continuous operation, within limits of construction joints, until the placing of a panel or section is completed.
  2. Dry-screed slab surfaces to the correct level using continuous intermediate screed strips, continuous edge forms, or continuous bulkheads as appropriate, set to the proper elevation and slope and spaced at a maximum width of 12 feet.

3. Intermediate screed strips are required at all locations where sloped slabs intersect. Slope slabs toward drains as indicated on the Contract Drawings. The use of wet-screed guides is prohibited.
  4. Use bullfloats to smooth the surface, leaving the surface free from bumps and hollows.
  5. Do not sprinkle water on the plastic surface. Do not disturb the slab surface prior to start of finishing operations.
- E. Pumping: Conform to ACI 304R and ACI 304.2R. Pumping shall not result in separation or loss of materials nor cause interruptions sufficient to permit loss of plasticity between successive increments. Loss of slump in pumping equipment shall not exceed 2 inches. Do not use pipe made of aluminum or aluminum alloy. Avoid rapid changes in pipe sizes. Limit maximum size of coarse aggregate to 33 percent of the diameter of the pipe. Maximum size of well-rounded aggregate shall be limited to 40 percent of the pipe diameter. Take samples for testing at both the point of delivery to the pump and at the discharge end.
- F. Hot and Cold Weather Requirements
1. Follow the recommendations of ACI 305R and ACI 306.1 for placement of concrete during hot and cold weather conditions, respectively, and as specified herein.
  2. Do not place concrete if its temperature at the time of placement exceeds 90° F and every effort has been made to maintain lower temperatures. If the temperature of the concrete being placed is consistently above 75° F and a noticeable decrease in slump occurs, use a retarding admixture.
  3. During hot weather, protect unformed surfaces of concrete from drying by continuous moist curing for at least 24 hours, except for concrete surfaces that have received a surface hardener. Commence curing as soon as the concrete has hardened sufficiently to withstand surface damage. If moist curing is not carried beyond 24 hours, cover the surface while damp with a suitable heat-reflecting plastic membrane or spray with a white pigmented curing compound.
  4. In the fall, from the time of the first frost and until the mean daily temperature at the site falls below 40° F, protect concrete from freezing for at least 24 hours after it is placed. When the daily mean temperature falls below 40° F, refer to subparagraphs 5 and 6 below. Protect concrete placed in the spring after the mean daily temperature at the site rises above 40° F until the danger of freezing is passed.
  5. Do not allow concrete temperature to decrease below 50° F. Obtain approval prior to placing concrete when ambient temperature is below 40° F. or when

concrete is likely to be subjected to freezing temperatures within 24 hours. When daily mean temperatures are generally below 40° F, maintain the temperature of the concrete at the time of placement not less than that specified in Chapter 3 of ACI 306.1 and continue to maintain the concrete at the recommended placement temperature for the duration specified in Chapter 5 of ACI 306.1. Initiate heating of aggregates, mixing water or both as needed to obtain the recommended placement temperatures. Do not permit the concrete temperature as mixed to exceed 45° F above the values specified in Lines 2, 3 and 4, as applicable, of Table 3.1 in ACI 306.1.

6. Maintain the temperature of concrete in place at 50° F or above by keeping forms in place, covering concrete with insulating materials, heated enclosures or employing combinations of these measures. Vent combustion heaters and do not heat or dry the concrete locally. Cure concrete during the period of temperature protection for such additional time as may be required to prevent exposed concrete surfaces from freezing or drying out.

- G. Depositing Concrete under Water: ACI 301 methods and equipment used shall prevent the washing of the cement from the mixture, minimize the formation of laitance, prevent the flow of water through the concrete before it has hardened, and minimize disturbance to the previously placed concrete. Do not deposit concrete in running water or in water temperatures below 35° F. Tremies, if used, shall be watertight and sufficiently large to permit a free flow of concrete. Keep the discharge end continuously submerged in fresh concrete. Keep the shaft full of concrete to a level well above the water surface. Discharge and spread the concrete by raising the tremie to maintain a uniform flow. Place concrete without interruption until the top of the fresh concrete is at the required height.

### 3.06 CONSOLIDATION

- A. Consolidate each layer of concrete immediately after placing, by use of internal motorized concrete vibrators supplemented by hand spading, rodding or tamping. Comply with the requirements of ACI 309R using vibrations with a minimum frequency of 9,000 vibrations per minute.
- B. Do not vibrate forms or reinforcement.
- C. Do not use vibrators to transport concrete inside the forms.

### 3.07 CONCRETE FINISHING

- A. Concrete finishing of formed and unformed surfaces shall comply with the requirements of Section 03350 - Concrete Finishes.
- B. Placement and finishing of concrete toppings on freshly placed or on hardened concrete shall conform to the provisions of ACI 301 and Section 03350 - Concrete Finishes.

## 3.08 CURING AND PROTECTION

- A. General: Comply with the recommendations of ACI 301 and ACI 308 unless otherwise specified. Immediately after placement, protect concrete from premature drying, excessive hot or cold temperatures and mechanical injury. Prevent concrete from drying by misting surface of concrete until curing commences. Begin curing immediately following final set. Avoid damage to concrete from vibration created by blasting, pile driving, movement of equipment in the vicinity, disturbance of formwork or protruding reinforcement, by rain or running water, adverse weather conditions, and any other activity resulting in ground vibrations. Protect concrete from injurious action by sun, rain, flowing water, frost, mechanical injury, tire marks, and oil stains. Do not allow concrete to dry out from time of placement until the expiration of the specified curing period.
- B. Do not use membrane-forming compound on surfaces where appearance would be objectionable, on any surface to be painted, where coverings are to be bonded to the concrete, or on concrete to which other concrete is to be bonded. If forms are removed prior to the expiration of the curing period, provide another curing procedure specified herein for the remaining portion of the curing period.
- C. Employ water or liquid membrane-forming compound curing methods in accordance with ACI 308. For bonded concrete overlay on exterior ramp structures, follow requirements of Article 584-3.06 of NYSDOT Standard Specifications.
- D. Moist Curing
  - 1. Ponding or Immersion: Continually immerse the concrete throughout the curing period. Water shall not be 20° F less than the temperature of the concrete. For temperatures between 40° F and 50° F, increase the curing period by 50 percent. Remove water without erosion or damage to the structure.
  - 2. Fog Spraying or Sprinkling: Apply water uniformly and continuously throughout the curing period. For temperatures between 40 and 50° F, increase the curing period by 50 percent.
  - 3. Pervious Sheeting: Completely cover surface and edges of the concrete with two thicknesses of wet sheeting. Overlap sheeting 6 inches over adjacent sheeting. Sheeting shall be at least as long as the width of the surface to be cured. During application, do not drag the sheeting over the finished concrete nor over sheeting already placed. Wet sheeting thoroughly and keep continuously wet throughout the curing period.
  - 4. Impervious Sheeting: Wet the entire exposed surface of the concrete thoroughly with a fine spray of water and cover with impervious sheeting throughout the curing period. Lay sheeting directly on the concrete surface

and overlap edges 12 inches minimum. Provide sheeting not less than 18 inches wider than the concrete surface to be cured. Secure edges and transverse laps to form closed joints. Repair torn or damaged sheeting or provide new sheeting. Cover or wrap columns, walls, and other vertical structural elements from the top down with impervious sheeting; overlap and continuously tape sheeting joints; and introduce sufficient water to soak the entire surface prior to completely enclosing.

- E. Application Rate of Liquid Membrane-Forming Compounds: Compound shall restrict the loss of water to not more than 0.113 lb/SF of surface area in 72 hours when tested in accordance with ASTM C156 at the coverage rate recommended by the manufacturer.
1. Submit a letter from the manufacturer stating that the coverage rate of liquid membrane-forming compound meets this restriction in loss of water.
  2. Curing Periods: Moist cure concrete using potable water continuously for a minimum of seven (7) days at an ambient temperature above 40° F. Continue additional curing for a minimum total period of 14 days. Begin curing immediately after placement. Protect concrete from premature drying, excessively hot or cold temperatures, and mechanical injury; and maintain minimal moisture loss at a relatively constant temperature for the period necessary for hydration of the cement and hardening of the concrete. The materials and methods of curing shall be subject to approval by the Commissioner.
  3. Protection of Treated Surfaces: Prohibit pedestrian and vehicular traffic and other sources of abrasion at least 72 hours after compound application. Maintain continuity of the coating for the entire curing period and immediately repair any damage.
- F. Maintenance of Traffic: Restrict vehicular and pedestrian traffic from traveling on newly placed concrete floor slabs until the concrete has attained 75 percent of its minimum ultimate compressive strength as verified by three (3) compressive strength tests.

### 3.09 PREFORMED COMPRESSIBLE JOINT FILLER INSTALLATION

- A. Install compressible joint filler where indicated on the Contract Drawings and in accordance with the manufacturer's instructions and recommendations.

### 3.10 JOINT SEALANT AND BACKER ROD INSTALLATION

- A. Install joint sealant to finish expansion joints where indicated on the Contract Drawings. Provide joint widths and sealant depths as shown, except that sealant depth shall not exceed 1/2 inch.

- B. Prepare joint surfaces to a sound, smooth, clean and dry condition free of visible contaminants. Where recommended by sealant manufacturer, apply compatible primer to dry joint surfaces.
- C. Control the depth of the sealant with the use of compatible joint fillers and backup materials. Install joint backing with approximately 30 percent compression to provide uniform depth of sealant in accordance with manufacturer's recommendations.
- D. Install joint sealant in strict accordance with manufacturer's recommendations.

### 3.11 CONSTRUCTION JOINT FILLER

- A. Provide narrow recess at the top of construction joints in the concrete wearing surface at the tipping and loader floor levels as shown on the Contract Drawings.
- B. Prepare joint surfaces to a sound, smooth, clean and dry condition free of visible contaminants.
- C. After taping both sides of the joint, fill joint cavity flush or slightly higher than adjacent concrete surface with epoxy resin. Apply by brush or pour cans in accordance with the manufacturer's instructions.

### 3.12 NON-SHRINK GROUT

- A. Install non-shrink grout where indicated on the Contract Drawings and in accordance with the manufacturer's instructions and recommendations. In particular, follow manufacturer's instructions closely regarding surface preparation, mixing, placement and curing procedures.

### 3.13 FIELD QUALITY CONTROL

- A. General: Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 for structural concrete work, including concrete materials and construction operations, will be provided by the Special Inspector. The Special Inspector will arrange for plant inspection of concrete materials at the mixer, concrete placement, and for the sampling and testing of concrete cylinders.
  - 1. Cooperate with the Special Inspector in the performance of its duties for special inspection. Assist the Special Inspector in performing all sampling and testing specified under Field Quality Control during construction by providing incidental labor to collect and store samples.
    - a. In cold weather conditions, provide a uniformly heated enclosure (minimum 65°F) for on-site storage of test cylinders until the testing laboratory picks them up.

2. The Special Inspector will have a qualified representative(s) at the job site to perform concrete testing and to make all necessary test cylinders. Do not place concrete without the Special Inspector's on-site inspector present.
3. The Special Inspector will also be responsible for curing, capping and breaking test cylinders used for compressive strength tests performed in the laboratory.
4. Concrete inspection and testing will include but not be limited to the following:
  - a. Forms will be inspected to see that they are in the correct location and that they will result in concrete of the required dimensions as shown on the Contract Drawings.
  - b. Reinforcement installations will be checked for size, bending, spacing, location, firmness of installation, and surface condition. Reviewed shop drawings will be used in conjunction with the Contract Documents.
  - c. Operations of mixing, conveying, placing, compacting, finishing, and curing of concrete will be inspected and will include control of field proportioning and field testing.
5. The Special Inspector will also be responsible for the following additional field inspection services:
  - a. Inspect concrete batching, mixing, and delivery operations in accordance with special inspection requirements of the New York City Building Code, Local Law 76/2008.
  - b. Check batching and mixing operations.
  - c. Review the manufacturer's report of each shipment of cement, aggregates and reinforcing steel and/or conduct laboratory spot checks of these materials as received.
  - d. Inspect the location and dimension of the forms, the placing of the reinforcing steel and the placing, conveying and depositing of the concrete.
  - e. Sample concrete at point of placement and other locations directed by the Commissioner and perform required tests.
  - f. Additional inspection and testing required because of changes in materials or mixture proportions requested by the Contractor. When required, such testing shall be performed at the Contractor's expense.

6. Identification: The Special Inspector will identify each test by number, mix, amount of admixture, origin of sample in the project, the date test specimen was made, the date test specimen was tested, the amount of slump determined, and the compressive strength test results.
7. Should test(s) yield results which do not meet the requirements of these specifications, the Contractor may be required to perform coring for additional testing and/or replacement of defective concrete.

**B. Evaluation of Mixture Designs (Using Test Slab and Wall)**

1. The adequacy of the concrete design mixture to produce the minimum specified strength and durability will be confirmed by testing field batches; casting concrete in a test slab and a test wall at the job using approved materials, equipment, and personnel; and testing the hardened concrete as described herein. The Contractor shall cast the test slab and wall in accordance with requirements specified herein. The slab shall be at least 8 feet square and have thickness of at least 8 inches. The wall shall be 8 feet long, 4 feet high and at least 8 inches thick. Slump shall not exceed the slump proposed for the work. The castings shall be water cured for a minimum of 7 days.
2. The fresh concrete will be tested as follows:
  - a. Slump in accordance with ASTM C143.
  - b. Air content in accordance with ASTM C231 or ASTM C173.
  - c. Unit weight in accordance with ASTM C138.
  - d. For strength, nineteen (19) 6-inch by 12-inch cylinders will be cast in accordance with ASTM C31/C31M.
3. The 6-inch by 12-inch cylinders cast under subparagraph 2d above will be tested as follows:
  - a. Each specimen will be measured and weighed to determine unit weight as they are stripped from the molds.
  - b. Test specimens will be tested at each age for pulse velocity through concrete in accordance with ASTM C597.
  - c. Two specimens will be tested at each age of 24 hours and 3 and 7 days in accordance with ASTM C39.
  - d. Three specimens will be tested at each age of 28, 56, and 90 days in accordance with ASTM C39.

- e. Two specimens will be tested at each age of 28 and 90 days in accordance with ASTM C496.
- 4. Twenty-five (25) additional 4-inch diameter hardened cores will each be extracted from the test slab and test wall in accordance with ASTM C42. Those to be tested at 7 days or earlier age will be drilled on the test date and tested as cored. Those to be tested at later ages will be drilled in adequate time for wet curing before testing. Cores will be tested as follows:
  - a. All cores will be tested at each age for pulse velocity through concrete in accordance with ASTM C597.
  - b. Two cores will be tested for static modulus of elasticity in accordance with ASTM C469 at age 28 days.
  - c. Two cores will be tested for specific gravity, absorption, and voids in concrete in accordance with ASTM C642.
  - d. Three cores will be tested for resistance to chloride ion penetration in accordance with ASTM C1202 at ages 28 and 90 days.
  - e. Compressive strength in accordance with ASTM C39 as follows:
    - (1) Two cores at 24 hours
    - (2) One core at 3 days
    - (3) Two cores at 7 days
    - (4) Three cores at 28 days
    - (5) Two cores at 90 days
    - (6) Three spare cores
- 5. Sampling and determination of water-soluble chloride ion content shall be determined in accordance with ASTM C1218/C1218M. Maximum water soluble chloride ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials, and admixtures shall not exceed 0.08 percent by weight of cement for non-prestressed concrete and 0.06 percent by weight of cement for prestressed concrete.
- 6. Test results will be submitted to the Commissioner for evaluation and acceptance.

#### C. Sampling

- 1. Sampling shall conform to ASTM C172. Samples of fresh concrete will be collected to perform tests specified. ASTM C31/C31M shall be followed for making test specimens.

2. Concrete will be sampled on a random basis except where a batch appears to be deficient and the test can be used to verify the observed deviation. Identify samples so taken in a manner that they can be isolated from other tests. At least one sample will be obtained for each 50 cubic yards, or fraction thereof, of each design mixture of concrete placed in any one day. When the total quantity of concrete with a given design mixture is less than 50 cubic yards, the strength tests may be waived by the Commissioner, if in his judgment, adequate evidence of satisfactory strength is provided.

#### D. Testing

1. The Special Inspector will immediately notify the Contractor and the Commissioner of any test results, which do not conform to specified requirements.
2. Slump Tests: Conform to ASTM C143. Concrete samples will be taken during concrete placement. The maximum slump may be increased as specified with the addition of an approved high range water reducing (HRWR) admixture provided that the water-cement ratio is not exceeded. Tests will be performed at commencement of concrete placement, when test cylinders are made, and for each batch (minimum) or every 10 cubic yards (maximum) of concrete.
3. Temperature Tests
  - a. The concrete delivered and the concrete in the forms will be tested. Tests will be conducted in hot or cold weather conditions below 50° F. and above 80° F. for each batch (minimum) or every 10 cubic yards (maximum) of concrete, until the specified temperature is obtained, and whenever test cylinders and slump tests are made.
  - b. The temperature of each composite sample will be determined in accordance with ASTM C1064. When the average of the highest and lowest temperatures during the period from midnight to midnight is expected to drop below 40° F for more than 3 successive days, concrete shall be delivered to meet the following minimum temperature at the time of placement:
    - (1) 55° F for sections less than 12 inches in the least dimension.
    - (2) 50° F for sections 12 to 36 inches in the least dimension.
    - (3) 45° F for sections 36 to 72 inches in the least dimension.
    - (4) 40° F for sections greater than 72 inches in the least dimension.
  - c. The minimum requirements may be terminated when temperatures above 50° F occur during more than half of any 24-hour duration. The temperature of concrete at time of placement shall not exceed 90° F.

4. Compressive Strength Tests: Conform to ACI 214 tests for compressive strength. Strength tests of concrete will be performed during construction in accordance with the following procedures:
  - a. Six 6-inch by 12-inch cylinders will be molded and cured from each sample taken in accordance with ASTM C31/C31M. Evaporation and loss of water from the specimen shall be prevented.
  - b. Cylinders will be tested in accordance with ASTM C39. One cylinder will be tested at 3 days, two cylinders at 7 days, two cylinders at 28 days, and one cylinder held in reserve. The compressive strength test results for acceptance shall be the average of the compressive strengths from the two specimens tested at 28 days. If one specimen in a test shows evidence of improper sampling, molding or testing, the specimen will be discarded and the strength of the remaining cylinder considered as the test result. If both specimens in a test show defects, the Commissioner may allow the entire test to be discarded.
  - c. If the average of any three consecutive strength test results is less than the specified strength ( $f_c$ ) or the minimum test strength ( $f_{cr}$ ) for durability, whichever is higher, by more than 500 psi, a minimum of three core samples will be obtained in accordance with ASTM C42 from the in-place work represented by the low test results. Locations represented by erratic core strengths will be retested and the Contractor will be charged for the cost of the retesting.
  - d. Upon review by the Commissioner and as directed by the Commissioner, the Contractor shall remove concrete not meeting specified strength criteria and provide new acceptable concrete. Repair core holes with non-shrink grout. Match color and finish of adjacent concrete.
  - e. Strength test reports shall include location in the work where the batch represented by a test was deposited, batch ticket number, time batched and sampled, slump, air content (where specified), mixture and ambient temperature, unit weight, and water added on the job. Reports of strength tests shall include detailed information of storage and curing of specimens prior to testing.
5. Air Content: Conform to ASTM C173 or ASTM C231 for normal weight concrete. Air content tests will be conducted on samples from the first three batches in the placement and until three consecutive batches have air contents within the range of the specified air content, at which time the procedure will be changed to test every fifth batch. This test frequency will be maintained until a batch is not within the specified range at which time testing of each batch will be resumed until three consecutive batches have air contents within the specified range. Additional tests will be performed as necessary for

control. Air content tests will be taken from planned composite samples or from samples taken in accordance with ASTM C172 at the point of concrete placement.

- E. Non-Destructive Tests: Use of the rebound hammer in accordance with ASTM C805, ASTM C597, or other non-destructive processes may be permitted by the Commissioner in evaluating the uniformity and relative concrete strength in place, or for selecting areas to be cored. Test results conducted on properly calibrated equipment will be evaluated and validated by the Commissioner in accordance with standard ASTM procedures indicated.
- F. Core Tests: Cores will be obtained and tested in accordance with ASTM C42. If concrete in the structure is dry under service conditions, cores (temperature 60° to 80° F, relative humidity less than 60 percent) will be air dried for 7 days before testing and tested dry. If concrete in the structure will be more than superficially wet under service conditions, the cores will be tested, after moisture conditioning, in accordance with ASTM C42. At least three representative cores will be tested from each member or area of concrete in place that is considered potentially deficient. The strength of the structure shall be impaired as little as possible. If, before testing, cores show evidence of having been damaged subsequent to or during removal from the structure, replacement cores will be ordered. Fill core holes with low slump concrete or mortar of a strength equal to or greater than the original concrete. The Commissioner will evaluate and validate core tests in accordance with the specified procedures. Before testing in compression, each core will be tested to determine pulse velocity through concrete in accordance with ASTM C597. Correlate pulse velocity of concrete cores with pulse velocity of in-place concrete.
- G. Acceptance of Concrete Strength
1. Standard Molded and Cured Strength Specimens: Concrete strength will be considered acceptable when the averages of all sets of three consecutive compressive strength test results equal or exceed the design compressive strength ( $f'_c$ ) or the required field test strength ( $f_{cr}$ ), whichever is higher, and no individual strength test falls below the specified compressive strength ( $f'_c$ ) or the required field durability strength ( $f_{cr}$ ) by more than 500 psi, whichever is higher. These criteria also apply when accelerated strength testing is specified unless another basis for acceptance is specified.
  2. Non-Destructive Tests: Non-destructive tests may be used when permitted to evaluate concrete where standard molded and cured cylinders have yielded results not meeting the criteria.
  3. Core Tests: When the average compressive strengths of the representative cores are equal to at least 85 percent of the design strength ( $f'_c$ ) or the required average test strength ( $f_{cr}$ ), whichever is higher, and if no single core is less than 75 percent of the specified strength ( $f'_c$ ) or the required average field test

strength ( $f_{cr}$ ), whichever is higher, the concrete strength will be considered acceptable.

- H. Verification of Miscellaneous Items to be Surveyed: The Contractor's Surveyor shall take optical survey measurements to certify the location of all conduit sleeves, concrete openings and anchor bolts for future work.

### 3.14 REMEDIAL WORK

- A. Repair or replace deficient concrete work as directed by the Commissioner and at no additional cost to the City of New York.
- B. Formed concrete repairs shall conform to those described in Section 03350 – Concrete Finishes and as specified herein. Repair defective formed surfaces by removing minor honeycombs, pits greater than one square inch in surface area or 0.25 inch maximum depth, or otherwise defective areas. Provide edges perpendicular to the surface and patch with non-shrink grout. Patch tie holes and defects when the forms are removed. Concrete with extensive honeycombing including exposed steel reinforcement, cold joints, entrapped debris, separated aggregate or other defects that affect the serviceability or structural strength will be rejected, unless correction of defects is approved. Obtain approval of corrective action prior to repair. The surface of the concrete shall not vary more than the allowable tolerances of ACI 347R. Exposed surfaces shall be uniform in appearance and finished to a smooth form finish unless otherwise indicated.
- C. Defects shall be defined by the more stringent of ACI 301 requirements for "Architectural Concrete" or the following:
1. Pockets of honeycomb (uncemented coarse aggregate) more than one-inch deep and 100 square inches in area are found.
  2. Sand streaks (pockets or streaks of uncemented fine aggregate more than one inch deep and 100 square inches in area) are found.
  3. Corners of forms are not filled.
  4. Bottom of concrete is not down to indicated levels or shows uncemented material at the bottom.
  5. Members are undersized.
  6. Concrete fails to "set-up" (indents under a hammer blow, after 7 days).
- D. Patch defective concrete surfaces with a suitable, approved patching material, mix or product as directed by the Commissioner.

-END OF SECTION-

**Section 03350**  
**CONCRETE FINISHES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all materials, labor, and equipment required to provide finishes of all concrete surfaces, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. This section includes, but is not limited to, the following items:
  - 1. Concrete Floor Sealer
  - 2. Heavy Duty Shake-on Aggregate Hardener
  - 3. Finishes on Formed Concrete Surfaces
  - 4. Slab and Floor Finishes

**1.02 RELATED SPECIFICATIONS**

- A. Section 03100 - Concrete Forms and Accessories
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 07140 - Fluid-Applied Waterproofing
- D. Section 07141 - Surface Applied Interior Waterproofing
- E. Section 09010 - Room Finish Schedule

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced unless otherwise noted. The publications are referred to in the text by the basic designation only.
  - 1. American Concrete Institute (ACI)
    - a. ACI 117, Standard Specifications for Tolerances for Concrete Construction and Materials
    - b. ACI 301, Specifications for Structural Concrete for Buildings
    - c. ACI 302.1, Guide for Concrete Floor and Slab Construction
  - 2. American Society for Testing and Materials (ASTM)
    - a. ASTM E1155, Standard Test Method for Determining  $F_F$  Floor Flatness and  $F_L$  Floor Levelness Numbers

## b. City of New York

- (1) New York City Building Code, Local Law 76/1968, latest edition and amendments or supplements thereto
- (2) York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto

## 1.04 PERFORMANCE REQUIREMENTS

## A. Field Sample Panel for Cast-in-Place Formed Concrete Finish

1. Produce, on the project site where directed by the Commissioner, an L-shaped sample panel of a cast-in-place concrete wall or panel that is a minimum of 4 feet high, 4 feet from the corner on two sides, 6 inches thick to demonstrate the expected range of finish, color and texture of architectural concrete finishes. Concrete shall conform to the applicable material and workmanship requirements of Section 03300 – Cast-in-Place Concrete for Class 45 concrete.
2. Reinforce the wall or panel with #4 bars at 12” on center each way on each face with 1-1/2” concrete cover unless otherwise shown in the Contract Drawings. Use form ties that are the same as those approved and with the form tie pattern similar to that approved in accordance with Section 03100 – Concrete Forms and Accessories. Use one face of the wall or panel for smooth architectural concrete including “reveal” rustication with form joints, and the opposite face for form liner concrete. Demonstrate methods of curing, aggregate exposure, sealers and coatings as directed by the Commissioner.
3. Plug the tie holes as specified to determine the correct mortar mixture to match the panel color. Remove and replace tie hole plugging mortar as necessary until an acceptable color match is obtained.
4. After the sample panels have been approved, intentionally damage an exposed surface for each finish in the presence of the Commissioner. Demonstrate materials and techniques proposed for repair of tie holes and surface blemishes to match adjacent undamaged surfaces. Patch portions of the finish surface of the panels for the purpose of determining the correct mixture for patching mortar and patching technique to match the original panel color and surface.
5. Leave the approved mock-up on the job during construction to serve as the standard of workmanship for the project. Remove the mock-up from the premises after completion of the work or as directed by the Commissioner.

**B. Field Sample Panels for Concrete Floor Finish**

1. Construct a floor finish sample panel at the project site for each type of concrete floor finish specified herein and as directed by the Commissioner. Construct each sample panel to be a minimum size of one foot square by 2-inches thick except as otherwise specified herein. Concrete shall conform to the applicable material and workmanship requirements of Section 03300 – Cast-in-Place Concrete for Class 45 concrete.
2. Construct a minimum 10-foot square by 6-inches thick field sample of a concrete floor slab with the non-metallic surface hardener in order to become familiar with the approved product characteristics and application procedures.
3. The sample panels shall be subject to review and approval by the Commissioner. The approved floor finish sample mock-ups shall remain at the City of New York's field trailer throughout the duration for which concrete floor finish work is performed. The sample panels will be used as a basis for the approval of the in-place concrete floor finishes. Remove the sample panels from the premises after completion of the work or as directed by the Commissioner.

**1.05 SUBMITTALS****A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:**

1. Product Data: Manufacturer's descriptive product data, current specifications, test results and installation instructions for materials proposed for the work of this Section.
2. Material certifications and technical data sheets.
3. Manufacturer's literature containing instructions and recommendations on the mixing, handling, placement, and appropriate uses for each product proposed for use.
4. Schedule of floor finishes by room/area designation.
5. Certifications that the applicator of the concrete sealer and the shake-on aggregate surface hardener each has a minimum of three (3) years of documented experience in installation of their respective product and is acceptable to the product manufacturer.
6. Technical service report for each site visit made by manufacturer's technical representative during placement of floor surface hardener. Report content shall conform to Paragraph 1.06.C.3.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Use adequate number of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- C. Floor Surface Hardener: Engage the services of the manufacturer's field service representative to supervise the application of the floor surface hardener and to perform the following technical services:
  - 1. Conduct a pre-construction conference a minimum of seven calendar days prior to initial concrete placement with the Commissioner, the Contractor's superintendent and concrete finisher foreman, who is actually performing the concrete placement and finishing work, to define critical times and procedures to be used in placement of floor surface hardener. Construct the field sample floor panel described above as part of the pre-job conference.
  - 2. Witness the initial placement of concrete and floor surface hardener and make a minimum of three subsequent site visits to ensure correct placement of the floor surface hardener. Apply the hardener using a controlled method approved by the Commissioner. Make additional site visits (in excess of the three specified) to address field problems as requested by the Commissioner at no additional cost to the City of New York.
  - 3. Submit a technical service report for each site visit made during placement of floor surface hardener. Each report shall include, as a minimum, the following information:
    - a. Time of concrete placement
    - b. Time of hardener placement
    - c. Quantity of hardener applied per square foot
    - d. Location of observed placement from placement schedule
    - e. Condition of bleed water on concrete at time of hardener placement
    - f. Types of floating and troweling used
    - g. Curing method used
    - h. Names of project, concrete supplier, Contractor and job supervisor
  - 4. Submit the technical service report in triplicate within seven calendar days after concrete placement with copies distributed to the Commissioner (two) and the Contractor.

- D. Concrete Floor Finishes: Conform to the designated finish type specified in the Concrete Finish Schedule unless otherwise indicated in Section 09010 – Room Finish Schedule for a particular room or area. Conform to the applicable provisions of ACI 302.1 - Guide for Concrete Floor and Slab Construction unless more stringent requirements are specified herein.
- E. Floor and Slab Finish Tolerances
  - 1. Floor and slab finishes shall meet the minimum F-number flatness tolerance specified herein for each finish type in accordance with the provisions of ACI 117.
  - 2. The Commissioner will conduct floor flatness tests of finished floor surfaces in accordance with the provisions of ASTM E1155. Floor flatness tolerance measurements will be taken by the Commissioner within 24 hours after completion of final troweling operation and before forms and shores are removed. Results of floor tolerance tests, including notification of acceptance or rejection, will be reported to the Contractor within 24 hours following data collection.
  - 3. Floor sections, defined as 100 square feet minimum of floor area, measuring at or above the minimum F-number will be accepted for tolerance compliance as constructed. Slabs-on-grade measuring below the specified minimum F-number shall be removed and replaced or ground as required and as directed by the Commissioner. Sections of elevated slabs measuring below the specified minimum F-number shall be ground as required and/or re-topped using an approved structural report mortar at the direction of the Commissioner. No remedies for sub-minimum F-number other than replacement of slabs-on-grade, or grinding and/or re-topping of elevated slabs will be permitted.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Failure to comply with the following shall be sufficient cause for rejection of materials by the City of New York and requiring their removal from the site. Supply new material at no additional expense to the City of New York.
- B. Delivery of Materials
  - 1. Deliver materials in manufacturer's original unopened and undamaged containers, with information accurately representing container contents as approved by the Commissioner at time of Shop Drawing submission.
  - 2. Include the following information on the label:
    - a. Name of material and supplier.
    - b. Installation, handling and protection requirements.

3. Deliver materials in sufficient quantities to allow uninterrupted continuity of the work.

C. Storage of Materials

1. Store only approved materials at the project site.
2. Store materials in original, undamaged containers with manufacturer's labels and seals intact.
3. Store all materials in a dry, enclosed area, off the ground and away from all possible contact with water, out of direct sunlight, and in a location where temperature can be constantly maintained between 60 degrees F and 75 degrees F.
4. Prevent damage to materials during storage primarily by minimizing the amount of time they are stored at the job site before being incorporated into the work.

1.08 PROJECT CONDITIONS

- A. General: Examine the areas and conditions under which the applied floor finish is to be installed and notify the Commissioner promptly in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until disputed conditions, discrepancies and/or damages have been corrected, unless otherwise directed by the Commissioner.
- B. Confirm applicability of designated floor finish indicated on Concrete Finish Schedule with manufacturers of approved concrete floor sealer and shake-on aggregate floor hardener prior to placing concrete. Modify concrete finish as necessary to conform to manufacturer's recommendations and obtain Commissioner's approval prior to placing concrete.

PART 2 PRODUCTS

2.01 CONCRETE FLOOR SEALER

- A. Concrete floor sealer: Provide a high performance, high-gloss, low-viscosity, VOC-compliant, one or two component, moisture-cured, polyurethane concrete floor sealer and dustproofing agent suitable for industrial and commercial applications. Product shall be designed to penetrate into cured concrete floor surfaces to provide a moisture-resistant barrier resistant to abrasion, impact, chemical attack and dusting. Add clean silica sand to the material to achieve a slip-resistant finish where required in accordance with the manufacturer's recommendation. Provide approved concrete floor sealer at concrete floor surfaces where indicated in Section 09010 and as specified herein.

B. Products: Subject to compliance with requirements, provide one of the following:

1. Euco Diamond Hard Sealer, Euclid Chemical Company, Cleveland, OH
2. Sealhard, L&M Construction Chemicals, Inc., Omaha, NE, BASF Construction Chemicals - Building Systems, Shakopee, MN
3. Day-Chem Sure Hard, Dayton Superior, Dayton, OH
4. Or approved equal

## 2.02 HEAVY DUTY SHAKE-ON AGGREGATE HARDENER

A. Heavy Duty Abrasive Shake-on Hardener: Provide an abrasive, non-slip, non-metallic, dry shake, ready-to-use surface treatment for heavy duty wear and exposure consisting of a specially graded, natural mineral aggregate manufactured from aluminum oxide (Corundum). Apply to the exposed surfaces of the concrete topping slabs at the tipping and loader floors at a rate of 1.5 lbs. per sq. ft. in strict accordance with the manufacturer's instructions.

B. Products: Subject to compliance with requirements, provide one of the following:

1. A-H Emery, Anti-Hydro International, Inc., Flemington, NJ
2. Emeryplate FF, L&M Construction Chemicals, Inc., Omaha, NE
3. Surflex Non-metallic Floor Hardener, Euclid Chemical Company, Cleveland, OH
4. Or approved equal

## PART 3 EXECUTION

### 3.01 FINISHES ON FORMED CONCRETE SURFACES

A. Construct formed structural concrete in conformance with Section 03300 – Cast-in-Place Concrete. After removal of forms, apply the finishes described below in accordance with the Concrete Finish Schedule presented herein. All formed surfaces shall receive at least a Type I finish unless specified or indicated otherwise. The Commissioner shall be the sole judge of applicability and acceptability of all formed concrete finish work.

1. Type I - Rough or Board Form Finish: Remove all fins, burrs and other projections left by formwork removal in accordance with the provisions of Section 03100 - Concrete Forms and Accessories. Fill solid all holes left by removal of ties, and all other holes, depressions, or voids with cement grout after first being thoroughly wetted. Chip back honeycombs to solid concrete,

as directed by the Commissioner, prior to patching with cement grout. Fill holes with a small tool that will permit packing the hole solidly with cement grout. Cement grout shall consist of one part cement to three parts sand, and the amount of mixing water shall be as little as consistent with the requirements of handling and placing. Color of cement grout shall closely match the adjacent wall surface. Thoroughly clean the surface of all stains or discolorations that will interfere or be incongruous with the final finish.

2. Type II - Smooth Form Finish: Concrete shall be cast against forms constructed of plywood not less than 5/8-inch thick, or of boards lined with tempered hardboard not less than 3/16-inch thick, or other approved materials in accordance with the provisions of Section 03100 - Concrete Forms and Accessories and as specified herein. Do not use form material that has raised grain, torn surfaces, worn edges, dents, patches of holes from previous use, other defects that would impair the texture, appearance or durability of the concrete surface, or that is not acceptable to the Commissioner. Utilize form material sheets as large as practicable in an orderly and symmetrical configuration and keep seams to a practical minimum. Other aspects of the finish shall conform to the requirements of Type I finish.
3. Type III - Grout Cleaned Finish: Where this finish is required, it shall be applied after completion of Type II finish. After the formwork is removed and the concrete has been pre-dampened, mix and spread a slurry consisting of one part cement to 1-1/2 parts sand passing the No. 30 sieve, by damp loose volume, over the surface with clean burlap pads or sponge rubber floats and scrubbed into the surface using a rotary motion. Include an appropriate quantity of white cement in the slurry mixture to produce a color closely matching the surrounding concrete. Remove any surplus material by scraping and then rubbing with clean burlap. Keep the finish damp for at least 36 hours after application.
4. Type IV - Smooth Rubbed Finish: Where this finish is required, it shall be applied after the completion of the Type II finish, and no later than one day following form removal. Do not commence rubbing before the concrete is thoroughly hardened and the mortar used for patching is firmly set. Obtain a smooth, uniform surface by wetting the concrete surface and rubbing it with a carborundum stone to eliminate irregularities. Unless the nature of the irregularities requires it, avoid cutting into the general surface of the concrete. Corners and edges shall be slightly rounded by the use of the carborundum stone. Brush finishing or painting with grout or neat cement will not be permitted.
5. Type V - Textured Finish: Use textured forms or textured form liners of plastic, wood, or sheet metal in accordance with Section 03100 - Concrete Forms and Accessories, as specified herein and which are acceptable to the Commissioner. Secure liner panels in forms by cementing or stapling, but not by methods which will permit impressions of nail heads, screw heads,

washers, or the like to be imparted to the surface of the concrete. Seal edges of textured panels to each other or to divider strips to prevent bleeding of cement paste. Use a sealant that will not stain the concrete surface.

6. Type VI - Exposed Aggregate Finish: Provide an exposed concrete surface that will duplicate a mock-up or sample panel prepared in advance and accepted by the Commissioner. Expose aggregate in the concrete surface using one of the following methods:
  - a. For a scrubbed finish, cast concrete against form faces that have been coated with a chemical retarder used in accordance with the manufacturer's recommendations. Wet the partially hardened concrete surface thoroughly and scrub with fiber or wire brushes, using water freely until the surface mortar is removed and the aggregate is uniformly exposed. Then rinse the surface with clear water. If portions of the surface have become too hard to permit uniform aggregate exposure, use dilute hydrochloric acid (one part commercial muriatic acid diluted with 4 to 10 parts water) to remove the excess surface mortar after the concrete is at least 2 weeks old. Remove the acid from the finished surface with clean water within 15 minutes after application.
  - b. For a blast finish, sandblast or waterblast the concrete surface to a degree sufficient to expose fine aggregates with occasional exposure of coarse aggregate, and to produce a uniform color with a maximum reveal of 1/16-inch unless specified otherwise in the Contract Documents. All surfaces with the same specified blast finish shall be prepared at approximately the same time after concrete placement. Use stainless steel or plastic reinforcement supports and spacers near concrete surfaces to be blasted. Protect adjacent materials and inserts during blasting operations.
  - c. For a tooled finish, dress the thoroughly cured concrete surface with electric, air, or hand tools to a uniform texture removing surface mortar where specified in the Contract Documents. Then provide the surface with a hand tooled, rough or fine pointed, crandalled, or bush-hammered surface texture, as specified by the Contract Documents.
7. Type VII - Applied Finish: When finishes of stucco, cementitious coatings, or similar troweled materials are required or permitted, prepare the surface of the concrete to ensure permanent adhesion of the finish. If the concrete is less than 24 hours old, roughen it with a heavy wire brush or scoring tool. If the concrete is more than 24 hours old, roughen the surface mechanically or by acid etching. After roughening, wash the surface free of all dust, acid, chemical retarder, and other foreign material before any final finish is applied.

## 3.02 SLAB AND FLOOR FINISHES

- A. General: The concrete finishes described below shall be applied to floors, slabs, overlays, toppings, and tops of formed walls in accordance with ACI 301, the Concrete Finish Schedule presented herein and the applicable portions of the Room Finish Schedule presented in Section 09010 – Room Finish Schedule. The Commissioner will test for finish flatness of finished floor surfaces within 24 hours of final troweling in accordance with the F-Number System of ACI 117. The Commissioner will review and approve the applicability of the required concrete finish for a given area. The Commissioner shall be the sole judge of acceptability of all such concrete finish work.
1. Type "A" – Screeded Finish: Place, consolidate by placing screeds at frequent intervals, and immediately strike off concrete to obtain proper contour, grade, and elevation before bleed water appears. Permit concrete to attain a set sufficient for floating and supporting the weight of the finisher and equipment. If bleed water is present prior to floating the surface, drag excess water off or remove by absorption with porous materials. Do not use dry cement to absorb bleed water. Produce a finish that will meet a minimum overall flatness tolerance of  $F_F15$  conventional bullfloated finish in accordance with ACI 117.
  2. Type "B" – Scratched Finish: Following completion of Type "A" finish, do not work concrete further until water sheen has disappeared and surface has stiffened slightly. Then roughen the surface with stiff brushes or rakes before final set.
  3. Type "C" – Floated Finish: Following completion of Type "A" finish, do not work the concrete further until the surface is ready for floating. Begin floating with a hand float, a bladed power float equipped with float shoes, a powered disc float highway straightedge as soon as the water sheen had disappeared and the surface has stiffened sufficiently to permit the operation. During or after the first floating, check flatness of surface with a 10-foot straightedge applied in two or more directions. Eliminate high spots and low spots during this procedure to produce a conventional, straightedge finish, then refloat the slab immediately to a uniform sandy texture. Repeat as necessary to produce a minimum overall flatness tolerance of  $F_F20$  conventional straightedged finish in accordance with ACI 117.
  4. Type "D" - Hard Steel Troweled Finish: Following completion of a Type "C" finish and sufficient hardening of the concrete to prevent excess fine material from working to the surface, compact and smooth the surface with a power trowel. Following the power trowel, hand trowel to provide a smooth, dense surface, free from defects, trowel marks, and blemishes. For surfaces exposed to wear, continue hand troweling until a ringing sound is produced as the floor is troweled to provide a hard steel trowel finish. For surfaces to receive a surface applied waterproofing system in accordance with Section 07140 -

Fluid-Applied Waterproofing or Section 07141 - Surface Applied Interior Waterproofing, provide water cure and light steel trowel finish followed by a fine hair broom texture.

5. Type "E" - Magnesium Troweled Finish: Following completion of a Type "C" finish and sufficient hardening of the concrete to prevent excess fine material from working to the surface, compact and smooth the surface with a power trowel. Following the power trowel, hand trowel to provide a smooth, dense surface, free from defects and blemishes. For surfaces requiring a non-slip finish, continue hand troweling with a magnesium surface trowel to produce a slightly swirled pattern.
6. Type "F" - Broom Finish: This finish shall provide the surface with a transverse scored texture by drawing a broom across the surface immediately after completion of a Type "C" finish. Apply transverse broom finish perpendicular to direction of travel. Amplitude of broom finish shall be approximately 1/8", with the exception of the concrete overlay surface for the exterior ramp deck slab which shall have minimum amplitude of broom finish of 1/4 inch but not more than 1/2 inch.
7. Type "G" - Concrete Floor Sealer: Following completion of a Type "E" finish and after the floor slab has been allowed to cure for a sufficient length of time, in accordance with the written instructions of the sealer manufacturer, remove all dirt, droppage, oil, grease, asphalt or other foreign matter with caustics and detergents as required prior to application. Apply approved concrete floor sealer in strict accordance with the manufacturer's instructions.
8. Type "H" - Heavy Duty Abrasive Shake-on Hardened Finish: Provide broadcast-applied hardener finish by applying a specially graded, non-metallic, natural mineral aggregate concurrently with the application of a hard burnished, power troweled, Type "D" hard steel trowel. Apply hardener in strict accordance with the manufacturer's instructions.

### 3.03 PLACEMENT OF CONCRETE TOPPINGS AND OVERLAYS

- A. Conform to the provisions of ACI 301 for placement of concrete toppings and overlays. Apply the following requirements to the placement of concrete toppings on concrete surfaces that are either freshly placed or still plastic, or on hardened concrete slabs.
  1. Placing on Fresh Concrete: Screed and bull float the base slab. As soon as water sheen has disappeared, lightly rake surface of the base slab with a stiff bristle broom to produce a bonding surface for the topping. Immediately spread topping mixture evenly over the roughened base before final set takes place. Place the topping and finish as specified.

2. **Bonding to Hardened Concrete:** When the topping is to be bonded to a roughened hardened base, remove dirt, laitance, and loose aggregate by means of a stiff wire broom. Keep the cleaned base wet for a period of 12 hours preceding the application of the topping. Remove excess water and apply a 1:1:1/2 cement-sand-water grout, and brush into the surface of the base slab. Do not allow the cement grout to dry, and spread it only short distances ahead of the topping placement. Do not allow the temperature differential between the completed base and the topping mixture to exceed 10 degrees F. at the time of placing. Place the topping and finish as specified.

### 3.04 FINISHES ON EQUIPMENT PADS

- A. Formed surfaces of equipment pads shall receive a Type II finish.
- B. Top surfaces of equipment pads, except those surfaces subsequently required to receive non-shrink grout and support equipment bases, shall receive a Type "D" finish, unless otherwise noted. Surfaces which will later receive non-shrink grout shall, before the concrete takes its final set, be made rough by removing the sand and cement that accumulates on the top to the extent that the aggregate will be exposed with irregular indentations in the surface up to 1/2-inch deep.

### 3.05 CONCRETE FINISH SCHEDULE

Item	Finish Type
Concrete surfaces not exposed to public view including utility spaces	I
Interior overhead surfaces exposed to view and interior push/shear walls	II
Surfaces to be painted	III
Exterior surfaces and interior vertical surfaces exposed to view	IV
Other architectural finishes	V, VI or VII as indicated in the Contract Documents
Surfaces to receive bonded cementitious mixtures, overlays or integral toppings	B
Surfaces to receive waterproofing membranes or rigid roofing insulation (see Sections 07140 and 07141)	D (see special requirements described above)
Floors to receive ceramic tile floor finish or receive resinous floor system, as indicated in Section 09010 - Room Finish Schedule	D
Exterior pier deck, sidewalks and exterior stairs	E
Wearing surface of integral concrete overlay of exterior vehicle ramps, and at driveways and apron slabs	F

Item	Finish Type
Floors for interior equipment and storage rooms, interior stairs, catwalks, vestibules, circulation galleries, maintenance area, and container loading area as indicated in Section 09010 - Room Finish Schedule	G
Wearing surface of non-integral concrete topping at vehicular traffic areas of tipping and loader floors	H

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 03410**  
**PRECAST STRUCTURAL CONCRETE**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install precast concrete ventilation shafts, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
  - 1. The work includes the providing precast, non-prestressed concrete members herein referred to as precast members.
  - 2. Precast members shall be the product of a manufacturer specializing in the production of precast concrete members.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 03200 - Concrete Reinforcement
- C. Section 03300 - Cast-in-Place Concrete

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Concrete Institute International (ACI)
    - a. ACI 304R, Measuring, Mixing, Transporting and Placing Concrete
    - b. ACI 305R, Hot Weather Concreting
    - c. ACI 306.1, Cold Weather Concreting
    - d. ACI 309R, Consolidation of Concrete
    - e. ACI 318/318M, Building Code Requirements for Structural Concrete.
  - 2. American Society for Testing and Materials (ASTM)
    - a. ASTM A82, Steel Wire, Plain, for Concrete Reinforcement
    - b. ASTM A185, Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
    - c. ASTM A497, Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement

- d. ASTM A615/A615M, Deformed and Plain Billet-Steel for Bars for Concrete Reinforcement
- e. ASTM C94, Ready-Mixed Concrete
- f. ASTM C1107, Packaged Dry, Hydraulic-Cement Grout (Non-shrink)
- 3. Precast/prestressed Concrete Institute (PCI)
  - a. PCI MNL-116, Quality Control for Plants and Production of Precast Prestressed Concrete Products
  - b. PCI MNL-120, Design Handbook - Precast and Prestressed Concrete.
- 4. City of New York:
  - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto.
  - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto.

#### 1.04 SUBMITTALS

- A. Submit the following information in accordance with the General Conditions and Section 01330 - Shop Drawings.
  - 1. Shop Drawings: Drawings for precast members including details of member geometry and details of reinforcing and embedments. Submit drawings indicating complete information for the fabrication, handling, and erection of the precast member. Drawings shall not be reproductions of Contract Drawings. Design calculations and drawings of precast members (including connections) shall be prepared and signed by the Contractor's licensed Professional Engineer registered in the State of New York, and submitted for approval prior to fabrication. The Shop Drawings shall indicate, as a minimum, the following information:
    - a. Marking of members for erection
    - b. Connections for work of other trades
    - c. Connections between members, and connections between members and other construction
    - d. Location and size of openings which require the relocation of reinforcing steel to be cast in the member

- e. Joints between members, and joints between members and other construction
  - f. Reinforcing steel details
  - g. Material properties of steel and concrete used
  - h. Lifting and erection inserts
  - i. Dimensions and surface finishes of each member
  - j. Erection sequence and handling requirements
  - k. Handling loads used in design
  - l. Bracing/shoring required
  - m. Areas to receive toppings, topping thickness
2. Quality Control Submittals
- a. Design Data
    - (1) Precast member design calculations: Design calculations and drawings of precast members (including connections) shall be prepared and signed by a licensed Professional Engineer registered in the State of New York, and submitted for approval prior to fabrication.
    - (2) Concrete mix design data: Submit a mix design for each strength and type of concrete. Include a complete list of materials including type; brand; source and amount of cement, ground granulated blast furnace slag, and admixtures; and applicable reference specifications.
      - (a) Submit copies of test reports showing that the mix has been successfully tested to produce concrete with the properties specified and will be suitable for the job conditions. Obtain approval before concrete placement.
  - b. Test Reports: Submit test reports in accordance with Section 03300 - Cast-in-Place Concrete, Subsection 1.04.E.2.
  - c. Certificates
    - (1) Quality control procedures and other data as required in Section 03300 - Cast-in-Place Concrete.

- (2) Procedures: Submit quality control procedures established in accordance with PCI MNL-116.

3. Product Data / Source Quality Control Data

- a. Submit mandatory batch ticket information for each load of ready-mixed concrete in accordance with ASTM C94.

## 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the New York City Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.

- B. Testing and Inspection

1. Fabrication, placement and welding of reinforcing steel shall be subject to special inspection in the mill, shop and field in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.

2. Special Inspections

- a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
  - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.

- c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- C. PCI Quality Certifications: ACI 318/318M and the PCI MNL-120. Design precast members for handling without cracking in accordance with the PCI MNL-120.
  - 1. Product Quality Control: PCI MNL-116 for PCI enrolled plants. Where panels are manufactured by specialists in plants not currently enrolled in the PCI "Quality Control Program," provide a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an approved, independent commercial testing laboratory. Submit test results to the Commissioner.
- D. Fabrication, Sampling, and Testing: PCI MNL-116 and Section 03300 - Cast-in-Place Concrete, whichever has the more stringent requirement for each respective test.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Lift and support precast members at the lifting and supporting points indicated on the approved Shop Drawings. Store precast members off the ground. Separate stacked members by battens across the full width of each bearing point. Protect from weather, marring, damage, and overload.

#### 1.07 PROJECT CONDITIONS

- A. Field Measurements
  - 1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
  - 2. Take sufficient field measurements prior to preparation of Shop and Working Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.

3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 CONCRETE

- A. The concrete mix design shall meet the requirements of Section 03300 - Cast-in-Place Concrete.

### 2.02 MATERIALS

- A. Cement shall conform to the requirements of Section 03300 - Cast-in-Place Concrete.
  1. Fly Ash shall conform to the requirements of Section 03300 - Cast-in-Place Concrete.
  2. Ground Granulated Blast-Furnace Slag shall conform to the requirements of Section 03300 - Cast-in-Place Concrete.
- B. Water shall conform to the requirements of Section 03300 - Cast-in-Place Concrete.
- C. Aggregates shall conform to the requirements of Section 03300 - Cast-in-Place Concrete.
- D. Nonshrink Grout: ASTM C1107.
- E. Admixtures shall conform to the requirements of Section 03300 - Cast-in-Place Concrete, including calcium nitrate corrosion inhibitor.
- F. Reinforcement
  1. Reinforcing Bars shall conform to the requirements of Section 03200 - Concrete Reinforcement. Bars shall be uncoated unless otherwise noted on the Contract Drawings.
  2. Welded Wire Fabric: ASTM A185 or ASTM A497.

### 2.03 FABRICATION

- A. Conform to PCI MNL-116, unless specified otherwise.
- B. Forms: Brace forms to prevent deformation. Forms shall produce a smooth, dense surface. Chamfer exposed edges of columns and beams 3/4 inch, unless otherwise indicated. Provide keys for deck panels as detailed on the Contract Drawings.

- C. Reinforcement Placement: Conform to ACI 318/318M for placement and splicing. Reinforcement may be preassembled before placement in forms. Provide exposed connecting bars, or other approved connection methods, between precast and cast-in-place construction. Remove any excess mortar that adheres to the exposed connections.
- D. Concrete
  - 1. Concrete Mixing: ASTM C94. Mixing operations shall produce batch-to-batch uniformity of strength, consistency, and appearance.
  - 2. Concrete Placing: ACI 304R, ACI 305R for hot weather concreting, ACI 306.1 for cold weather concreting, and ACI 309R, unless otherwise specified.
  - 3. Concrete Curing: Commence curing immediately following the initial set and completion of surface finishing. Provide curing procedures to keep the temperature of the concrete between 50 and 185 degrees F. When accelerated curing is used, apply heat at controlled rate and uniformly along the casting beds. Monitor temperatures at various points in a product line in different casts.
- E. Surface Finish: Repairs to honeycombed sections located in a bearing area shall be approved by the Commissioner prior to repairs. Precast members that contain honeycombed sections deep enough to expose reinforcement will be rejected. Members that exhibit hairline cracks that are less than 0.01 inches in width may be accepted. Members that exhibit cracks greater than 0.01 inches in width, but not greater than 0.02 inches in width shall be accepted only if approved by the Commissioner, and shall be repaired in an approved manner. Any member that exhibits a crack in excess of 0.02 inches in width, or is otherwise structurally impaired, shall be rejected by the Commissioner.
  - 1. Unformed Surfaces: Provide a rake finish with 1/4" amplitude for surfaces to receive cast-in-place concrete. Provide a steel troweled finish for surfaces to remain exposed in the finished work.
  - 2. Formed Surfaces: PCI MNL-116 (Appendix A - Commentary), Chapter 3, for grades of surface finishes.
    - a. Unexposed Surfaces: Provide a standard grade surface finish.
    - b. Exposed Surfaces: Provide a finish Grade B surface finish.

### PART 3 EXECUTION

#### 3.01 SURFACE REPAIR

- A. Prior to erection, and again after installation, check members for damage, such as cracking, spalling, and honeycombing. As directed by the Commissioner, members

that do not meet the surface finish requirements specified herein shall be repaired, or removed and replaced with new members.

### 3.02 ERECTION

- A. Erect precast members after the concrete has attained the specified compressive strength, unless otherwise approved by the Engineer and the member manufacturer.
  - 1. Erect members in accordance with the approved Shop Drawings. PCI MNL-116 and PCI MNL-120 (Chapter 8) shall apply for tolerances. Provide a 1:500 tolerance, if no tolerance is specified.
  - 2. Brace members unless design calculations submitted with the Shop Drawings indicate bracing is not required. Follow the manufacturer's recommendations for maximum construction loads.
  - 3. Place members level, plumb, and square within tolerances. Align member ends.

### 3.03 BEARING SURFACES

- A. Bearing surfaces shall be flat, free of irregularities, and properly sized.
  - 1. Correct bearing surface irregularities with non-shrink grout.
  - 2. Provide bearing pads where indicated or required.
  - 3. Place precast members at right angles to the bearing surface, unless indicated otherwise, and draw-up tight without forcing or distortion, with sides plumb.

### 3.04 WELDING

- A. Do not weld reinforcing steel. Protect the concrete and reinforcing from heat during welding of any adjacent structural steel components.

### 3.05 OPENINGS

- A. Where openings in members are required, the openings shall be formed into the members before casting and reinforcing steel shall be detailed to avoid interference with the opening. Holes or cuts requiring reinforcing steel to be cut, which are not indicated on the approved Shop Drawings, shall only be made with the approval of the Commissioner and the member manufacturer. Where approved, drill holes less than 12 inches in diameter with a diamond-tipped core drill.

3.06 GROUTING

- A. Clean and fill indicated keyways between precast members, and other indicated areas, solidly with non-shrink grout. Provide reinforcing where indicated. Remove excess grout before grout hardens.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 03450**  
**PLANT-PRECAST ARCHITECTURAL CONCRETE**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes the following:
1. Precast architectural concrete panel units, as indicated
  2. Precast concrete seat units
  3. Precast concrete paving strips

**1.02 RELATED SPECIFICATIONS**

- A. Section 01631 – Equivalent Materials and Equipment

**1.03 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide precast architectural concrete units and connections capable of withstanding design loads within limits and under conditions indicated:
1. Dead Loads: As per design thickness requirements provided by precast concrete manufacturer.
  2. Wind Loads: Per Current New York City Building Code.
  3. Earthquake Loads: Per Current New York City Building Code.
  4. Design system and connections to maintain clearances at openings and to allow for construction tolerances, as follows:
    - a. Vertical and horizontal adjustment of 2 inch, unless otherwise indicated.

**1.04 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Design Mixes: For each concrete face and back-up mix.
- C. Shop Drawings: Detail fabrication and installation of precast architectural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, limits of each finish, and types of reinforcement, including special reinforcement.
1. Indicate separate face and backup mix locations and thicknesses.

2. Indicate locations and extent and treatment of dry joints if two-stage casting is proposed.
  3. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.
  4. Indicate locations and details of anchorage devices to be embedded in other construction.
  5. Indicate locations and details of thin units and joint treatment.
  6. Indicate locations and details of facings, anchors, and treatment of joints.
  7. Indicate sizes and locations of conduit penetrations, service boxes, and other cast-in-place devices for the mounting of the exterior lighting fixtures and similar penetrations.
  8. Provide comprehensive engineering analysis signed and sealed by a New York State licensed professional engineer responsible for its preparation. Engineering shall include calculations demonstrating compliance with indicated requirements for panels, anchors and connections.
- D. Samples: For each type of finish indicated on exposed surfaces of precast architectural concrete units, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately 12 by 12 inches.
- E. Welding Certificates: Copies of certificates for welding procedures and personnel.
- F. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- G. Material Test Reports: From a qualified testing agency indicating and interpreting test results of the following for compliance with requirements indicated:
- H. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:
1. Concrete materials
  2. Reinforcing materials and prestressing tendons
  3. Admixtures
  4. Bearing pads
  5. Water-absorption test reports

## 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer, with a minimum of 3 years of experience, who has completed precast architectural concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- B. Fabricator Qualifications: A firm that complies with the following requirements and is experienced in manufacturing precast architectural concrete units similar to those indicated for this Project and with a record of successful in-service performance.
  - 1. Assumes responsibility for engineering precast architectural concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified Professional Engineer.
  - 2. Professional Engineer Qualifications: A professional Engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of precast architectural concrete that are similar to those indicated for this Project in material, design, and extent.
  - 3. Participates in PCI's Plant Certification program and is designated a PCI-certified plant for Group A, Category A1--Architectural Cladding and Load Bearing Units or in APA's Plant Certification Program for Production of Architectural Precast Concrete Products and is designated an APA-certified plant.
  - 4. Has sufficient production capacity to produce required units without delaying the Work.
  - 5. Is registered with and approved by authorities having jurisdiction.
- C. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.
- D. Design Standards: Comply with ACI 318 and the design recommendations of PCI MNL 120, "PCI Design Handbook--Precast and Prestressed Concrete."
- E. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."

- F. Product Options: Drawings indicate size, profiles, and dimensional requirements of precast concrete units and are based on the specific types of units indicated. Other fabricators' precast concrete units complying with requirements may be considered. Refer to Section 01631 – Equivalent Materials and Equipment.
- G. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"; and AWS D1.4, "Structural Welding Code--Reinforcing Steel."
- H. Mockups: Before installing precast architectural concrete units, build mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work:
  - 1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Commissioner.
  - 2. Notify Commissioner seven days in advance of dates and times when mockups will be constructed.
  - 3. Obtain Commissioner's approval of mockups before starting fabrication.
  - 4. In presence of Commissioner, damage part of an exposed face for each finish, color, and texture, and demonstrate materials and techniques proposed for repairs to match adjacent undamaged surfaces.
  - 5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
  - 6. Demolish and remove mockups when directed.
  - 7. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- I. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Section 01310 - Project Coordination.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. General: Adequately wrap, pack and protect precast architectural concrete fabrications with water-resistant, breathable coverings, hard non-absorbent fiber/wood containers/pallets and other protectives to ensure assemblies will be free of damages upon delivery to the job site.
  - 1. Support units during shipment on nonstaining shock-absorbing material.

- B. Deliver precast architectural concrete units to Project site in such quantities and at such times to ensure continuity of installation. Store units at Project site to prevent cracking, distorting, warping, staining, or other physical damage, and so markings are visible.
- C. Lift and support units only at designated lifting and supporting points as shown on Shop Drawings.

#### 1.07 SEQUENCING

- A. Furnish anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

### PART 2 PRODUCTS

#### 2.01 MOLD MATERIALS

- A. Molds: Provide molds and, where required, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete and dimensionally stable to produce continuous and true precast concrete surfaces within fabrication tolerances and suitable for required finishes
- B. Form Liners: Units of face design, texture, arrangement, and configuration indicated.

#### 2.02 REINFORCING MATERIALS

- A. Epoxy-Coated Reinforcing Bars: ASTM A 775, as follows:
  - 1. Steel Reinforcement: ASTM A 615, Grade 60, deformed
- B. Epoxy-Coated-Steel Wire: ASTM A 884, Class A coated, plain
- C. Epoxy-Coated-Steel Welded Wire Fabric: ASTM A 884, Class A coated, plain
- D. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117, and as follows:
  - 1. For epoxy-coated reinforcement, use CRSI Class 1A epoxy-coated or other dielectric-polymer-coated wire bar supports.
- E. Epoxy Repair Coating: Provide a field applied, VOC compliant, epoxy corrosive resistant coating either identical to, or compatible with shop applied epoxy coatings. Coatings which are not identical to those shop applied must meet, or exceed the minimum performance of the shop applied materials.

## 2.03 CONCRETE MATERIALS

- A. Portland Cement: ASTM C 150, Type I or Type III, white, of same type, brand, and source.
  - 1. Standard gray portland cement may be used for nonexposed backup concrete.
- B. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S.
  - 1. Face-Mix Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining.
    - a. Gradation: Uniformly graded
  - 2. Face-Mix Fine Aggregates: Selected, natural or manufactured sand of the same material as coarse aggregate, unless otherwise approved by Commissioner.
- C. Lightweight Aggregates: ASTM C 330
- D. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, temperature stable, nonfading, and alkali resistant
- E. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117
- F. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
- G. Water-Reducing Admixture: ASTM C 494, Type A
- H. Retarding Admixture: ASTM C 494, Type B
- I. Water-Reducing and Retarding Admixture: ASTM C 494, Type D
- J. High-Range, Water-Reducing Admixture: ASTM C 494, Type F
- K. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494, Type G
- L. Plasticizing Admixture: ASTM C 1017
- M. Fly Ash Admixture: ASTM C 618, Class C or F
- N. Metakaolin Admixture: ASTM C 618, Class N
- O. Silica Fume Admixture: ASTM C 1240

**2.04 STEEL CONNECTION MATERIALS**

- A. Welding Electrodes: Comply with AWS standards.
- B. Accessories: Provide clips, hangers, plastic shims, and other accessories required to install precast architectural concrete units.

**2.05 STAINLESS-STEEL CONNECTION MATERIALS**

- A. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
- B. Stainless-Steel Bolts and Studs: ASTM F 593, alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless steel washers.
- C. Stainless-Steel Headed Studs: ASTM A 276.

**2.06 BEARING PADS**

- A. Provide bearing pads for precast architectural concrete units as follows:
  - 1. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore A durometer, minimum tensile strength 2250 psi per ASTM D 412.
  - 2. Frictionless Pads: Tetrafluoroethylene, glass-fiber reinforced, bonded to mild-steel plate, of type required for in-service stress.
  - 3. High-Density Plastic: Multimonomer, nonleaching, plastic strip.

**2.07 WEEP TUBES**

- A. Cellular Plastic Weep/Vent: One-piece, flexible extrusion made from UV-resistant polypropylene copolymer, full height and width of head joint and depth 1/8 inch less than depth of outer wythe, in color selected from manufacturer's standard.
- B. Available Products: Provide one of the following:
  - 1. Heckmann Building Products Inc.; No. 85 Cell Vent
  - 2. Hohmann & Barnard, Inc.; Quadro-Vent
  - 3. Wire-Bond; Cell Vent
  - 4. or approved equal

**2.08 GROUT MATERIALS**

- A. Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.

- B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, of consistency suitable for application.

## 2.09 CONCRETE MIXES

- A. Prepare design mixes for each type of concrete required.
  - 1. Limit use of fly ash and silica fume to not exceed, in aggregate, 25 percent of portland cement by weight.
- B. Design mixes may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast architectural concrete fabricator's option.
- C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318.
- D. Normal-Weight Concrete Face and Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
  - 1. Compressive Strength (28 Days): 5000 psi. (minimum)
  - 2. Maximum Water-Cementitious Materials Ratio: 0.45.
- E. Water Absorption: 12 to 14 percent by volume, tested according to PCI MNL 117.
- F. Lightweight Concrete Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide lightweight concrete with the following properties:
  - 1. Compressive Strength (28 Days): 5000 psi. (minimum)
  - 2. Unit Weight: Calculated equilibrium unit weight of 115 lb/cu. ft., plus or minus 3 lb/cu. ft., according to ASTM C 567
- G. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.
- H. When included in design mixes, add other admixtures to concrete mixes according to manufacturer's written instructions.

## 2.10 MOLD FABRICATION

- A. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing operations.

1. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concreting. Coat form liner with non-staining form-release agent.
- B. Maintain molds to provide completed precast architectural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
  1. Edge, Reveal and Corner Treatment: Uniformly chamfered.

## 2.11 FABRICATION

- A. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
- B. Furnish loose stainless steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast architectural concrete units to supporting and adjacent construction.
- C. Cast-in reglets, slots, holes, and other accessories in precast architectural concrete units to receive cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.
- D. Cast-in openings larger than 10 inches in any dimension.
- E. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" and PCI MNL 117 for fabricating, placing, and supporting reinforcement.
  1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
  2. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
  3. Place reinforcement to maintain at least 3/4-inch minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
  4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
  5. Touch-up cut ends of reinforcement, and otherwise abraded/damaged epoxy coatings of re-bars and other such reinforcements with the epoxy repair coating specified herein.

- F. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.
- G. Prestress tendons for precast architectural concrete units by either pretensioning or posttensioning methods. Comply with PCI MNL 117. Delay detensioning or posttensioning of precast, prestressed architectural concrete units until concrete has reached its indicated minimum design release compressive strength as established by test cylinders cured under the same conditions as concrete.
- H. Mix concrete according to PCI MNL 117 and requirements in this Section. After concrete batching, no additional water may be added.
- I. Place face mix to a minimum thickness after consolidation of the greater of 1 inch or 1.5 times the maximum aggregate size, but not less than the minimum reinforcing cover.
- J. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 117 for measuring, mixing, transporting, and placing concrete.
  - 1. Place backup concrete to ensure bond with face mix concrete.
- K. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.
- L. Comply with ACI 306.1 procedures for cold-weather concrete placement.
- M. Comply with ACI 305R recommendations for hot-weather concrete placement.
- N. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.
- O. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.
- P. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by Commissioner.

## 2.12 FABRICATION TOLERANCES

- A. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with PCI MNL 117 product tolerances as well as position tolerances for cast-in items.

- B. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with the following product tolerances:
1. Overall Height and Width of Units, Measured at the Face Exposed to View:  
As follows:
    - a. 10 feet or under, plus or minus 1/8 inch
    - b. 10 to 20 feet, plus 1/8 inch, minus 3/16 inch
    - c. 20 to 40 feet, plus or minus 1/4 inch
    - d. Each additional 10 feet, plus or minus 1/16 inch
  2. Overall Height and Width of Units, Measured at the Face Not Exposed to View: As follows:
    - a. 10 feet or under, plus or minus 1/4 inch
    - b. 10 to 20 feet, plus 1/4 inch, minus 3/8 inch
    - c. 20 to 40 feet, plus or minus 3/8 inch
    - d. Each additional 10 feet, plus or minus 1/8 inch
  3. Total Thickness or Flange Thickness: Plus 1/4 inch, minus 1/8 inch
  4. Rib Thickness: Plus or minus 1/8 inch
  5. Rib to Edge of Flange: Plus or minus 1/8 inch
  6. Distance between Ribs: Plus or minus 1/8 inch
  7. Variation from Square or Designated Skew (Difference in Length of the Two Diagonal Measurements): Plus or minus 1/8 inch per 72 inches or 1/2 inch total, whichever is greater
  8. Length and Width of Block-outs and Openings within One Unit: Plus or minus 1/4 inch
  9. Location and Dimension of Block-outs Hidden from View and Used for HVAC and Utility Penetrations: Plus or minus 3/4 inch
  10. Dimensions of Haunches: Plus or minus 1/4 inch
  11. Haunch Bearing Surface Deviation from Specified Plane: Plus or minus 1/8 inch
  12. Difference in Relative Position of Adjacent Haunch Bearing Surfaces from Specified Relative Position: Plus or minus 1/4 inch
  13. Bowing: Plus or minus L/360, maximum 1 inch
  14. Local Smoothness: 1/4 inch per 10 feet

15. Variation between Adjacent Thin-Brick-Facing Products: 1/16 inch
  16. Warping: 1/16 inch per 12 inches of distance from the nearest adjacent corner
  17. Tipping and Flushness of Plates: Plus or minus 1/4 inch
  18. Dimensions of Architectural Features and Rustications: Plus or minus 1/8 inch
- C. Position Tolerances: For cast-in items measured from datum line location, as indicated on Shop Drawings.
1. Weld Plates: Plus or minus 1 inch
  2. Inserts: Plus or minus 1/2 inch
  3. Handling Devices: Plus or minus 3 inches
  4. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch
  5. Reinforcing Steel Extending out of Member: Plus or minus 1/2 inch of plan dimensions
  6. Tendons: Plus or minus 1/4 inch, vertical; plus or minus 1 inch, horizontal
  7. Location of Rustication Joints: Plus or minus 1/8 inch
  8. Location of Opening within Panel: Plus or minus 1/4 inch
  9. Flashing Reglets: Plus or minus 1/4 inch
  10. Flashing Reglets at Edge of Panel: Plus or minus 1/8 inch
  11. Reglets for Glazing Gaskets: Plus or minus 1/8 inch
  12. Electrical Outlets, Hose Bibs: Plus or minus 1/2 inch
  13. Haunches: Plus or minus 1/4 inch
  14. Allowable Rotation of Plate, Channel Inserts, Electrical Boxes: 2-degree rotation or 1/4 inch maximum over the full dimension of the unit

## 2.13 FINISHES

- A. Finish exposed-face surfaces of precast architectural concrete units to match approved sample panels and mockups and as follows:

1. Color and Texture: Provide No. 291-SB-L per PCI "Architectural Precast Concrete Color and Texture Selection Guide, 2<sup>nd</sup> Edition.
  2. Light Sand Blasted Finish: Use fine grained aggregates, air-blast equipment, protected application techniques and cleaning procedures to expose aggregate and surrounding surfaces.
- B. Finish exposed surfaces of precast architectural concrete units to match face-surface finish.

#### 2.14 SOURCE QUALITY CONTROL

- A. City will employ an independent testing agency to evaluate precast architectural concrete fabricator's quality-control and testing methods.
1. Allow The City of New York's testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with The City of New York's testing agency and provide samples of materials and concrete mixes as may be requested for additional testing and evaluation.
- B. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 117 requirements.
- C. Strength of precast concrete units will be considered deficient if units fail to comply with ACI 318 requirements.
- D. Testing: If there is evidence that the strength of precast concrete units may be deficient or may not comply with ACI 318 requirements, City will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42.
1. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by Commissioner.
  2. Cores will be tested in an air-dry condition.
  3. Strength of concrete for each series of 3 cores will be considered satisfactory if the average compressive strength is equal to at least 85 percent of the 28-day design compressive strength and no single core is less than 75 percent of the 28-day design compressive strength.
  4. Test results will be made in writing on the same day that tests are performed, with copies to Commissioner, Contractor, and precast concrete fabricator. Test reports will include the following:
    - a. Project identification name and number
    - b. Date when tests were performed

- c. Name of precast concrete fabricator
  - d. Name of concrete testing agency
  - e. Identification letter, name, and type of precast concrete unit or units represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed
- E. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mix that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
- F. Defective Work: Precast architectural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Do not install precast concrete units until supporting concrete has attained minimum design compressive strength.

#### 3.02 INSTALLATION

- A. Install clips, hangers, and other accessories required for connecting precast architectural concrete units to supporting members and backup materials.
- B. Install precast architectural concrete. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.
  - 1. Install bearing pads and plastic weep tubes as precast concrete units are being erected. Weep assemblies shall be installed at vertical joints of panel-to-panel conditions.
  - 2. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
  - 3. Remove projecting hoisting devices and use sand-cement grout to fill voids within recessed hoisting devices flush with surface of concrete.

- C. Anchor precast architectural concrete units in position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.
- D. Welding: Perform welding in compliance with AWS D1.1 and AWS D1.4, with qualified welders.
  - 1. Protect precast architectural concrete units and bearing pads from damage by field welding or cutting operations and provide noncombustible shields as required.
  - 2. Repair damaged steel surfaces by cleaning and applying a coat of galvanizing repair paint to galvanized surfaces.
- E. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.
- F. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.

### 3.03 ERECTION TOLERANCES

- A. Install precast architectural concrete units level, plumb, square, true, and in alignment without exceeding the noncumulative erection tolerances of PCI MNL 117, Appendix I.
- B. Install precast architectural concrete units level, plumb, square, and true, without exceeding the following noncumulative erection tolerances.
  - 1. Plan Location from Building Grid Datum: Plus or minus 1/2 inch
  - 2. Plan Location from Centerline of Steel: Plus or minus 1/2 inch
  - 3. Top Elevation from Nominal Top Elevation: As follows:
    - a. Exposed Individual Panel: Plus or minus 1/4 inch
    - b. Nonexposed Individual Panel: Plus or minus 1/2 inch
    - c. Exposed Panel Relative to Adjacent Panel: 1/4 inch
    - d. Nonexposed Panel Relative to Adjacent Panel: 1/2 inch
  - 4. Support Elevation from Nominal Support Elevation: As follows:
    - a. Maximum Low: 1/2 inch
    - b. Maximum High: 1/4 inch

5. Maximum Plumb Variation over the Lesser of Height of Structure or 100 Feet: 1 inch
6. Plumb in Any 10 Feet of Element Height: 1/4 inch
7. Maximum Jog in Alignment of Matching Edges: 1/4 inch
8. Joint Width (Governs over Joint Taper): Plus or minus 1/4 inch
9. Maximum Joint Taper: 3/8 inch
10. Joint Taper in 10 Feet: 1/4 inch
11. Maximum Jog in Alignment of Matching Faces: 1/4 inch
12. Differential Bowing or Camber, as Erected, between Adjacent Members of Same Design: 1/4 inch

#### 3.04 FIELD QUALITY CONTROL

- A. Testing: City will engage a qualified independent testing and inspecting agency to perform field tests and inspections.
- B. Field welds and connections using high-strength bolts will be subject to tests and inspections.
- C. Testing agency will report test results promptly and in writing to Contractor and Commissioner.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

#### 3.05 REPAIRS

- A. Repair exposed exterior surfaces of precast architectural concrete units to match color, texture, and uniformity of surrounding precast architectural concrete if permitted by Commissioner.
- B. Remove and replace damaged precast architectural concrete units if repairs do not comply with requirements.

#### 3.06 CLEANING

- A. Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.

1. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.
2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 03930**  
**CONCRETE RESTORATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work in this Section consists of furnishing all labor, materials, equipment, tools and other incidentals necessary to remove, repair and restore existing concrete surfaces as directed by the Commissioner, as specified herein and as required for a complete and proper restoration. Types of concrete repairs to be made include but are not limited to:
  - 1. Repair of surface spalls and delaminations in existing concrete
  - 2. Repair of existing cracks in existing concrete
- B. The concrete restoration work specified herein is applicable to existing structural concrete elements that are to remain and become incorporated in the final structures. The actual extent of the work shall be determined on the basis of field inspections conducted jointly by the Contractor and the Commissioner.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02222 - Demolition and Removals
- B. Section 03100 - Concrete Forms and Accessories
- C. Section 03200 - Concrete Reinforcement
- D. Section 03300 - Cast-in-Place Concrete
- E. Section 03350 - Concrete Finishes
- F. Section 05120 - Structural Steel

**1.03 MEASUREMENT AND PAYMENT**

- A. Measurement
  - 1. The Contractor shall perform all measurements for payment in the presence of the Commissioner.
  - 2. The Contractor shall prepare a listing of the types and locations of concrete repairs performed as described herein (e.g. shallow concrete spalls, deep concrete spalls, concrete cracks) including the units and actual quantities repaired under each repair category and present this list to the Commissioner for review and approval.
  - 3. The approved quantities of repair material actually incorporated in the work, delineated by the specified unit of measurement, will be the basis for payment.

4. Units of measurement for concrete repair work shall be as follows:

- a. Shallow Concrete Spall Repair (2" maximum depth) - square feet
- b. Deep Concrete Spall Repair (greater than 2" deep) - cubic feet
- c. Type A Concrete Crack Repair - linear feet
- d. Type B Concrete Crack Repair - linear feet
- e. Type C Concrete Crack Repair - linear feet

B. Payment

1. Payment for all work performed under this Section shall be determined by the agreed-upon quantities of concrete repairs actually incorporated in the work.
2. The basis for payment shall be the actual measured quantity of each repair type incorporated in the work, delineated by the specified unit of measure, multiplied by the corresponding contractual unit price shown on the Bid Form.
3. No separate payment will be made for surface sealing cracks and securing injection ports with epoxy resin compound prior to pressure injection of cracks. The costs thereof shall be included in the respective unit price bids for Types A and B concrete crack repairs.

1.04 REFERENCES

A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

1. American Concrete Institute (ACI)
  - a. ACI 308.1, Curing Concrete
  - b. ACI 546, Concrete Repair Guide
2. American Society for Testing and Materials (ASTM)
  - a. ASTM A82, Steel Wire, Plain, for Concrete Reinforcement
  - b. ASTM A185/A185M, Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
  - c. ASTM A276, Stainless Steel Bars and Shapes
  - d. ASTM C494/C494M, Chemical Admixtures for Concrete
  - e. ASTM C881, Epoxy-Resin Based Bonding Systems for Concrete

- f. ASTM C884, Thermal Compatibility of Concrete and an Epoxy-Resin Overlay
- 3. International Concrete Repair Institute (ICRI)
  - a. ICRI Technical Guideline No. 03730, Guide for Surface Preparation for the Repair of Deteriorated Concrete Resulting from Reinforcing Corrosion
- 4. Society for Protective Coatings (SSPC); Steel Structures Painting Manual
  - a. SSPC - SP2, Hand Tool Cleaning
  - b. SSPC - SP3, Power Tool Cleaning
- 5. City of New York:
  - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings. Review of required submittals shall be by the Commissioner for acceptance unless specifically noted otherwise.
  - 1. Product Data: Manufacturer's descriptive product data, current specifications, test results and installation instructions for materials proposed for the work of this Section. Data shall substantiate that each product meets the requirements set forth in this Section.
  - 2. Sketches of repair sites indicating type of repair, location, dimensions and areas to be repaired.
  - 3. Certification from each product manufacturer's representative stating in writing that the manufacturer:
    - a. Is familiar with the project and aware on the job conditions.
    - b. Agrees with the intended application of the specified products.
    - c. Agrees to provide necessary supervision or direction to ensure the product's satisfactory application.

4. Certification that each product applicator has a minimum of three (3) years of documented experience in installation of concrete restoration materials. Submit references and project information to demonstrate the proposed installation contractor's experience on projects of comparable scope and complexity.

#### 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Manufacturer's Representative Services: Arrange for and provide the services of each product manufacturer's technical representative to supervise the initial application of each concrete repair material and perform the following technical services:
  1. Conduct a pre-installation conference with the manufacturer's representative, the Contractor, the Commissioner and the installation contractor performing the concrete repair work to provide detailed instructions and procedures to be used in the installation of the concrete repair materials, including surface preparation, mixing, application and curing.
  2. Witness the initial application of each repair material and make subsequent site visits, as needed or as requested by the Commissioner, to ensure that the repair materials are being installed properly and as intended.
  3. Submit a technical service report within seven days after the site visit to document the discussions, observations and recommendations made on site.
- C. Applicator Qualifications
  1. Utilize an installation contractor having a minimum of three (3) years of demonstrated experience in the installation of concrete restoration materials on projects of comparable scope and complexity.
  2. Provide at least one person who shall be present at all times during execution of the concrete restoration work and who is thoroughly familiar with the type of materials being used and the means and methods to install it.
- D. Follow the recommended practices outlined in ACI 546 and ICRI Technical Guideline No. 03730 with regard to surface preparation, placement and curing of concrete repair materials or the concrete repair procedures specified herein, whichever is more stringent.

## 1.07 DELIVERY, STORAGE AND HANDLING

- A. Assume sole responsibility for properly receiving, handling and storing all materials furnished under this Section from the time that such materials are delivered to the site until final acceptance of the work by the City of New York.
- B. Maintain packaged materials in original containers with labels intact and with seals unbroken until time of use. All contained material shall have readable labels for the duration of the work.
- C. Store materials above ground in a dry place to avoid damage to material by water, freezing and the effects of weather.

## 1.08 PROJECT CONDITIONS

- A. Do not perform any repair work without prior approval of the Commissioner for location, limits and type of repair.
- B. Be advised that reinforcement may be encountered at repair locations.
- C. When using abrasive blasting, concrete sawing or chipping equipment, shield all work for the protection of the public and workers on the site.
- D. Some products specified may cause irritation to people through contact, inhalation of vapors, or ingestion, or may present other hazards.
- E. Safety precautions are solely the Contractor's responsibility. Take the necessary precautions to protect people from irritation and injury due to this work.
- F. Heed all label warnings by product manufacturers.
- G. Do not proceed with the installation of repair products under adverse weather conditions when defect to be repaired or sealed is frozen, or when temperatures are below or above the product manufacturer's recommended limitations for installation. Consult the product manufacturer for specific instructions before proceeding.
- H. Comply with all conditions of permits from the US Army Corp of Engineers and NY State Department of Environmental Conservation in executing the work.
  - 1. Prior to the start of each day's work provide means and measures to collect concrete chippings, repair mortar or concrete and prevent them from entering the waterway.
    - a. When working over land, provide drop cloths, tarps, plywood or similar devices laid atop the ground to collect removal debris or repair mortar and concrete droppings.

- b. When working over water, collect removal debris or repair mortar and concrete droppings on float stages secured to the structure. Provide fabric or other suitable device between float stages to prevent removal debris or repair mortar and concrete droppings from falling between the stages and entering the waterway. When working adjacent to sheet pile bulkheads equip float stages with "extensions" which fit into the valleys of the existing sheet piling.
  - c. Where use of float stages is not practical, collect removal debris or repair mortar and concrete droppings on a filter cloth or geotextile laid atop and secured to a chain or other type of wire-mesh laid on the waterway bottom or suspended from the structure which can be hauled out like a net. Suspend the outside edges of the filter cloth or geotextile from a floating boom around the work area to prevent chippings or repair mortar and concrete droppings from entering the waterway.
2. At the end of each day's work, haul out and remove all drop cloths, tarps, filter cloth/geotextile on chain/wire mesh and collect all debris. When working on a rising tide, adjust positioning of collection devices. Legally dispose of debris at a licensed offsite disposal facility.

## PART 2 PRODUCTS

### 2.01 MATERIALS

#### A. Shallow Concrete Spall Repairs (2" Maximum Depth)

1. Structural Repair Mortar: Use applicable structural repair mortar based on orientation of spalled surface for repair of spalled concrete surfaces up to two inches in depth.
  - a. Spalled concrete surfaces less than 1/4" in depth including minor surface imperfections and defects shall be considered superficial and shall not be repaired unless otherwise directed by the Commissioner.
2. Repair of Horizontal Top Surfaces:
  - a. Use a two-component, polymer-modified, portland cement, fast-setting, trowel-grade mortar specifically intended for repair of horizontal surfaces.
  - b. Products: Subject to compliance with requirements, provide one of the following:
    - (1) SikaTop 122 Plus; Sika Corporation, Lyndhurst, NJ
    - (2) Duraltop Fast Set; Euclid Chemical Co., Cleveland, OH

- (3) SD2 Repair Mortar; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
    - (4) Or approved equal
  - 3. Repair of Vertical and Overhead Surfaces
    - a. Use a two-component, polymer-modified, portland cement, fast-setting, non-sag mortar specifically intended for repairs of vertical and overhead surfaces.
    - b. Products: Subject to compliance with requirements, provide one of the following:
      - (1) SikaTop 123 Plus; Sika Corporation, Lyndhurst, NJ
      - (2) Duraltop Gel; Euclid Chemical Co., Cleveland, OH
      - (3) HB2 Repair Mortar; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
      - (4) Or approved equal
  - 4. Mechanical Expansion or Chemical Adhesive Anchors: Provide mechanical expansion or chemical adhesive anchors in accordance with the concrete repair details shown on the Contract Drawings and as specified in Section 05120 - Structural Steel.
  - 5. Cement Grout: Cement grout for patching concrete surfaces shall consist of one part cement to three parts sand, and the amount of mixing water shall be as little as consistent with the requirements of handling and placing.
- B. Deep Concrete Spall Repairs (Deeper than 2 inches)
  - 1. Concrete: Conform to the provisions of Section 03300 - Cast-in-Place Concrete except as follows:
    - a. Compressive strength: Class 45.
    - b. Coarse aggregate: Maximum 3/8" nominal washed stone (i.e., pea gravel).
    - c. Liquid membrane-forming curing compounds are not permitted.
  - 2. Welded Wire Fabric: ASTM A185/A185M. Provide uncoated welded wire fabric of the wire size and spacing shown on the concrete repairs details on the

Contract Drawings and as specified in Section 03200 – Concrete Reinforcement.

3. Steel Wire: ASTM A82, W4 or D4 minimum size.
4. Mechanical Expansion or Chemical Adhesive Anchors: Provide mechanical expansion or chemical adhesive anchors in accordance with the concrete repair details shown on the Contract Drawings and as specified in Section 05120 - Structural Steel.
5. Formwork: Provide formwork that conforms to the requirements of Section 03100 - Concrete Forms and Accessories.
6. Concrete Reinforcement: Provide new reinforcing bars of same size and spacing as existing reinforcement in accordance with the repair details shown on the Contract Drawings and as specified in Section 03200 - Concrete Reinforcement.
7. Anti-Corrosion Protective Coating: Provide a 3-component, water-based, epoxy-modified, cementitious, corrosion-resistant, VOC-compliant bonding agent suitable for bonding fresh mortar or concrete to exposed reinforcing steel surfaces.
  - a. Products: Subject to compliance with requirements, provide one of the following:
    - (1) Armatec 110 EpoCem; Sika Corporation, Lyndhurst, NJ
    - (2) Corr-Bond; Euclid Chemical Company, Cleveland, OH
    - (3) Or approved equal.
8. Cement Grout: Cement grout for patching concrete surfaces shall be as specified in Paragraph 2.01A.5 above.

C. Structural Crack Repairs

1. Type A Concrete Crack Repair
  - a. General: Applicable to existing concrete surface cracks in walls and slabs that are non-moving and exhibit no evidence of active or inactive leakage.
  - b. Crack width limited to a range of 0.01" to 0.25" max.
  - c. Make repairs using a using a two-component epoxy resin injected under pressure.

d. Epoxy Resin for Pressure Injection

- (1) Use a two-component, 100-percent solids, moisture-tolerant, low viscosity, epoxy resin system specifically intended for pressure injecting cracks in concrete.
- (2) Products: Subject to compliance with requirements, provide one of the following:
  - (a) Sikadur 52; Sika Corporation, Lyndhurst, NJ
  - (b) Duralcrete LV; Euclid Chemical Company, Cleveland, OH
  - (c) SCB Concrecive 1350; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
  - (d) Or approved equal

2. Type B Concrete Crack Repair

- a. General: Applicable to repair of structural cracks in concrete walls and slabs that presently leak or exhibit signs of previous leakage.
- b. Crack width limited to a range of 0.01" to unlimited width.
- c. Make repairs using a hydrophobic polyethylene resin sealant injected under pressure.
- d. Polyurethane grout and accelerator system
  - (1) Use a non-toxic, low viscosity, hydrophobic polymer of the isocyanate type to be mixed with an accelerator based on tertiary amines with a controlled reaction time of one to 10 minutes depending on the mix preparation. When the grout is mixed with 0.5% to 5% accelerator, the mixture will react upon contact with water and expand to five to seven times its original volume and cure to a polyurethane foam.
  - (2) Products: Subject to compliance with requirements, provide one of the following:
    - (a) Hydro-Active Flex LV with accelerator Hydro-Active Flex Cat; DeNeef Construction Chemicals, Inc., Houston, TX
    - (b) Hydro-Active Flex SLV with accelerator Hydro-Active Flex Cat; DeNeef Construction Chemicals, Inc., Houston, TX

- (c) Scotch-Seal Chemical Grout 5600 (Foam); Avanti Grout, Webster, TX
    - (d) SikaFix HH LV; Sika Corporation, Lyndhurst, NJ
    - (e) Or approved equal
  - e. Reaction Time Accelerator: Type recommended by the manufacturer of the sealant for the specific joint surface and conditions.
3. Type C Concrete Crack Repair
- a. General: Applicable only to concrete elements that are not actively leaking or exhibit signs of previous leakage but are over 0.25" in width.
  - b. Vertical or Overhead Surfaces
    - (1) Use a two-component, 100-percent solids, moisture tolerant, high-strength, structural grade epoxy of paste consistency.
    - (2) Products: Subject to compliance with requirements, provide one of the following:
      - (a) Sikadur 33; Sika Corporation, Lyndhurst, NJ
      - (b) Euco #452 Gel Epoxy System; Euclid Chemical Company, Cleveland, OH
      - (c) NC Adhesive; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
      - (d) Or approved equal
  - c. Horizontal Surfaces
    - (1) Use a two-component, 100-percent solids, moisture-tolerant epoxy resin system.
    - (2) Products: Subject to compliance with requirements, provide one of the following:
      - (a) Sikadur 35; Sika Corporation, Lyndhurst, NJ
      - (b) Euco #452 Gel Epoxy System; Euclid Chemical Company, Cleveland, OH

- (c) NC LV Adhesive; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
  - (d) Or approved equal.
- 4. Epoxy Compounds for Surface Sealing Cracks and Securing Injection Ports:
  - a. Use a two-component, 100-percent solids, moisture-tolerant, high-modulus epoxy resin system specifically intended for surface sealing cracks and securing injection ports prior to pressure injection.
  - b. Products: Subject to compliance with requirements, provide one of the following:
    - (1) Sikadur 33; Sika Corporation, Lyndhurst, NJ
    - (2) Euco #452 Gel Epoxy System; Euclid Chemical Company, Cleveland, OH
    - (3) NC Adhesive; MBT Protection and Repair Division of BASF Building Systems, Shakopee, MN
    - (4) Or approved equal
- 5. Hairline cracks narrower than 0.01 inch (10 mils) shall not be repaired for any type of crack described herein.

### PART 3 EXECUTION

#### 3.01 PREPARATION AND EXECUTION

##### A. Shallow Concrete Spall Repairs (2" Deep Max.)

- 1. General
  - a. This work consists of the removal of unsound concrete and the repair of spalled and delaminated concrete surfaces not exceeding 2" in depth, using a polymer-modified structural repair mortar as determined on the basis of a field inspection conducted by the Contractor in the presence of the Commissioner.
  - b. Do not repair spalled or otherwise defective concrete surfaces less than 1/4" in depth unless otherwise directed by the Commissioner.

## 2. Repair Procedure

- a. Inspection: In the presence of the Commissioner, inspect concrete surfaces to determine the type of repair, limits and locations of all areas to be repaired as shallow concrete spall repair work under this Section.
- b. Make a 1" deep saw cut around the perimeter of the repair area. Saw cut area shall be approximately square or rectangular in shape. Remove spalled, scaled, loose and deteriorated concrete to sound matrix.
- c. Use a hand-held (maximum 28 lb. size) pneumatic hammer or other approved method to remove deteriorated concrete. Hydro-demolition techniques may also be employed subject to approval of the Commissioner.
- d. Determine sound matrix by observation of the concrete chipping operation, by sounding the concrete with a rod or hammer, or other device acceptable to the Commissioner. Afford and accommodate the Commissioner access to the work in progress and provide use of the chipping gun as a means of evaluating the quality of the residual matrix. The determination of "sound" matrix will be predicated on the general criterion that concrete which is difficult to remove is "sound".
- e. Where concrete removal exposes reinforcing bars, the concrete around the bar shall be removed to provide a 3/4-inch minimum annular space around the bar so that new repair mortar will completely encapsulate the reinforcing bar. Use caution where reinforcing steel is uncovered so as not to damage the steel or its bond in the surrounding concrete. Do not use pneumatic tools in direct contact with reinforcing steel. Use a hand-held (maximum 28 lb. size) pneumatic hammer for chipping behind reinforcing steel. Clean exposed reinforcing steel in accordance with SSPC-SP-2, Hand Tool Cleaning, or SSPC-SP-3, Power Tool Cleaning, to remove all contaminants, rust and rust scale. After cleaning, coat exposed surfaces of reinforcing bars with approved anti-corrosion protective coating in accordance with manufacturer's instructions.
  - (1) Where exposed existing reinforcing steel is severely corroded or damaged, cut out reinforcing steel and replace with new reinforcing steel of the same size and spacing. Where existing reinforcing steel is determined by the Commissioner to have insufficient cover, either replace reinforcing steel or adjust as directed. Attach new reinforcing steel behind existing reinforcement with a minimum lap splice applicable to the bar diameter as indicated on the Contract Drawings.
- f. After obtaining approval of the surface preparation, wet sandblast or water blast surface to remove contaminants and to provide a roughened

surface. Water blasting equipment shall be capable of delivering water pressures of 7,500 psi. Adjust water pressure based on surface conditions, as approved. Dampen the surface for a minimum of 2 hours immediately before applying repair mortar. Immediately before applying repair mortar, inspect and re-clean, as required or directed, surfaces to be repaired. Use compressed air to remove water and sand residue. Surfaces to be repaired shall not have standing or running water.

- g. Remove all debris from the site in accordance with the provisions of Section 02222 - Demolition and Removals.
- h. For repairs between 1/2" and 2" deep, install mechanical expansion or chemical adhesive anchors in the concrete substrate at the grid spacing indicated on the Contract Drawings. Maintain 3/4" minimum concrete cover. Do not install mechanical expansion anchors at spalled concrete surfaces less than 1/2" deep.
- i. Mixing and application of repair mortar: Thoroughly mix in accordance with manufacturer's written directions. Apply repair material in lifts to be flush with adjacent surfaces and protect against damage in accordance with the manufacturer's recommended installation and curing instructions.

**B. Deep Concrete Spall Repairs (Deeper than 2")**

- 1. General: This work consists of the removal of unsound concrete and the repair of spalled and delaminated concrete surfaces in areas greater than 2" deep, using formed, cast-in-place concrete as determined on the basis of a field inspection conducted by the Contractor in the presence of the Commissioner.
- 2. Mixing Concrete
  - a. For hand or batch mixing of concrete, provide scale(s) approved by the Commissioner in which cement and aggregate can be accurately weighed for the required mix proportions.
  - b. Provide measuring instruments with graduated markings in inches for the proportioning of the Air Entraining Admixture (AEA) and Water Reducing-High Range (WR-HR) admixture. Do not mix the AEA and the WR-HR together before adding to the mix; the resultant solution will not work. Do not add the AEA and WR-HR at the mixture simultaneously; these admixtures shall be added separately in the mixing cycle. Store, mix and use manufactured materials in strict accordance with the written recommendations of the respective manufacturer.

### 3. Repair Procedure

- a. Inspection: In the presence of the Commissioner, inspect concrete surfaces to be repaired under work of this Section to determine the type of repair, limits and locations of all areas to be repaired as deep concrete spall repair work under work of this Section.
- b. Make a 1" deep saw cut around the perimeter of the repair area. Saw cut area shall be approximately square or rectangular in shape. Remove spalled, scaled, loose and deteriorated concrete to sound concrete. Use a hand-held (maximum 28 lb. size) pneumatic hammer or other approved method for deteriorated concrete removal up to 3" in depth. Heavier jackhammers may be used for removals greater than 3" in depth. However, the use of hoerams or similar equipment is strictly prohibited. Hydro-demolition techniques may also be employed subject to approval of the Commissioner.
- c. Determine sound matrix by observation of the concrete chipping operation, by sounding the concrete with a rod or hammer, or other device acceptable to the Commissioner. Afford and accommodate the Commissioner access to the work in progress and provide use of the chipping gun as a means of evaluating the quality of the residual matrix. The determination of "sound" matrix will be predicated on the general criterion that concrete which is difficult to remove is "sound".
- d. Where concrete removal exposes reinforcing bars the concrete around the bar shall be removed to provide a 3/4-inch minimum annular space around the bar so that new concrete will completely encapsulate the reinforcing bar. Use caution where reinforcing steel is uncovered so as not to damage the steel or its bond in the surrounding concrete. Do not use pneumatic tools in direct contact with reinforcing steel. Use a hand-held (maximum 28 lb. size) pneumatic hammer for chipping behind reinforcing steel. Clean exposed reinforcing steel in accordance with SSPC-SP-2, Hand Tool Cleaning, or SSPC-SP-3, Power Tool Cleaning, to remove all contaminants, rust and rust scale. After cleaning, coat exposed surfaces of reinforcing bars with approved anti-corrosion protective coating in accordance with manufacturer's instructions.
  - (1) Where exposed existing reinforcing steel is severely corroded or damaged, cut out reinforcing steel and replace with new reinforcing steel of the same size and spacing. Where existing reinforcing steel is determined by the Commissioner to have insufficient cover, either replace reinforcing steel or adjust as directed. Attach new reinforcing steel behind existing reinforcement with a minimum lap splice applicable to the bar diameter as indicated on the Contract Drawings.

- e. After obtaining approval of the surface preparation, wet sandblast or water blast surface to remove contaminants and to provide a roughened surface. Water blasting equipment shall be capable of delivering water pressures of 7,500 psi. Adjust water pressure based on surface conditions, as approved. Dampen the surface for a minimum of 2 hours immediately before applying concrete. Immediately before applying concrete mortar, inspect and re-clean, as required or directed, surfaces to be repaired. Use compressed air to remove water and sand residue. Surfaces to be repaired shall not have standing or running water.
- f. Remove unsound concrete material and concrete encasements in a manner to facilitate the uniform placement of and to preclude the entrapment of air or forming of voids in the freshly placed structural repair concrete. Thoroughly air blast and vacuum the newly exposed area prior to forming.
- g. Remove all resulting debris from the site in accordance with the provisions of Section 02222 - Demolition and Removals.
- h. Render all surfaces of exposed concrete and reinforcing steel free of oil, solvent, grease, dirt, dust, bitumen, rust, loose particles and other foreign matter.
- i. Install mechanical expansion or chemical adhesive anchors in the concrete substrate at the grid spacing indicated on the Contract Drawings. Install welded wire fabric of the wire size and spacing shown on the Contract Drawings. Maintain 3/4" minimum concrete cover.
- j. Install formwork at demolished areas on vertical surfaces of concrete members in accordance with Section 03100 - Concrete Forms and Accessories. Coat forms with a plastic coating or similar type film to facilitate form removal. Design forms so that placement access will be at the top of each formwork assembly.
  - (1) Prior to forming vertical surfaces, install reinforcement as indicated on the Contract Drawings or as required and directed by the Commissioner.
- k. Do not use bonding compounds for placement of concrete. Dampen exposed concrete surfaces immediately prior to placement of fresh concrete.
  - (1) Place concrete in the maximum lift height possible and consolidate during placement with adequately sized vibrators.
  - (2) Small holes may be drilled into forms to permit air to escape during placement and consolidation.

1. After curing and stripping of forms, blend the patched areas to match the physical appearance of the adjacent area as close as possible.
  - (1) The Commissioner will sound the patched areas to detect the presence of voids, delaminations or hollow spots. Remove and repair such defects to the satisfaction of the Commissioner at no additional cost to the City of New York.

C. Concrete Crack Repairs

1. General
  - a. This work consists of repairing structural cracks greater than 0.01" in width as determined on the basis of a field inspection conducted by the Contractor in the presence of the Commissioner.
  - b. Hairline cracks less than 0.01" (10 mils) in width shall not be repaired.
  - c. Before crack repair work is commenced, clean slab and wall surfaces within 2 inches of the crack to remove mineral deposits, laitance, loose material on the surface, grease, oil and all visible contaminants.
2. Type A Concrete Crack Repairs Using Epoxy Pressure Injection (0.01" to 0.25" max. in width):
  - a. Apply this crack repair method to concrete elements that are not actively leaking or exhibit signs of previous leakage. Repairs shall be made using an approved two-component, epoxy compound suitable for repairing concrete cracks by pressure injection.
  - b. Use automated pressure injection equipment to supply, meter, mix and dispense the two components of the epoxy resin into the prepared cracks. The unit shall be portable and be equipped with positive displacement-type pumps with interlock to provide positive ratio control of exact proportions of the two components of the epoxy resin at the nozzle. The pumps shall be air powered or electric and shall be equipped with an in-line mixing and metering system and contain drain-back plugs.
  - c. Thoroughly clean structural cracks and completely remove foreign matter such as dirt, laitance, grease, salt or any other contaminants within 2 inches of the crack.
  - d. Apply approved epoxy surface seal compound to the face of the crack along its entire length prior to the application of injection material.

- e. Establish openings in the surface seal (entry ports) along the crack length as recommended by the technical representative of the manufacturer. The distance between the entry ports shall not be greater than the thickness of the concrete member being repaired. For structures accessible on both sides, provide porting devices on opposite sides at staggered elevations.
  - f. Begin the injection of the epoxy compound by pressure at the entry port at the lowest elevation. Continue injection at the first port until the injection material begins to flow out of the port at the next higher elevation or the adjacent port. Plug the first entry port and start injection at the second port and continue until the epoxy resin flows from the next port. Inject the entire crack length following the same sequence. Perform the entire technique in strict accordance with the manufacturer's on-site instructions.
  - g. After the injection compound has cured, remove the surface seal completely. Finish the face of the crack flush with the adjacent concrete surface. Indentations or protrusions caused by placement of entry ports will not be acceptable.
3. Type B Concrete Crack Repairs for Leaking Cracks Using Polyurethane Grout (0.01" to unlimited crack width):
- a. Apply this crack repair method only to repair of vertical and overhead cracks in concrete slabs and walls that presently leak or exhibit signs of previous leakage. Implement repairs using a hydrophobic polyethylene resin sealant injected under pressure.
  - b. Protect walls, floor slabs, ductwork, piping and lighting below repair area to prevent staining due to spillage and migration of sealant compound of the cracks.
  - c. Clean crack surfaces and remove all mineral deposits and foreign matter within 2 inches of the crack.
  - d. Determine location of existing slab, wall and/or beam reinforcing steel bars along the length of the crack using a pachometer or other suitable means.
  - e. Drill test injection holes, install test injectors and test pump water to determine spacing for injectors along the crack. Drill hole size and injector size shall be in accordance with the manufacturer's instructions. Do not drill through or damage existing reinforcing steel bars.
  - f. Drill remainder of holes for grout injection and install grout injectors. Do not drill through or damage existing reinforcing steel bars.

- g. Flush the crack with clean water to remove dirt, dust and other contaminants.
  - h. Install all materials in accordance with the manufacturer's instructions unless otherwise directed.
  - i. Do not install sealant at a temperature below 40° F. unless the manufacturer specifically permits application of those materials at a lower temperature. Consult with the manufacturer's representative.
  - j. Use pressure injection equipment of a type, capacity and mechanical condition suitable for performing the work. Ensure that the sealant plant is of the continuous mixing type and is capable of supplying, proportioning, mixing and pumping the sealant in accordance with the recommendations of the grout manufacturer. Ensure that the hoses, check valves and other equipment have low moisture permeability and are compatible with the sealant.
  - k. Pump water into cracks that appear to be dry prior to injecting sealant.
  - l. Begin sealant injection into a crack at the lowest elevation and proceed upward on vertical cracks or begin at one end and proceed toward the other end on horizontal cracks.
  - m. Pump sealant into the first injector until sealant is observed at the second. Close the valve on the first injector and disconnect the supply line. Pump sealant into the second injector and repeat operation until the crack has been completely sealed.
  - n. Plug sealant leaks immediately with rags or oakum dipped in hydrophilic sealant or by other methods approved by the manufacturer.
  - o. Remove injectors and other fittings after grout has reached gel point. Fill any remaining holes with cement grout of the formulation specified herein..
4. Type C Concrete Crack Repairs for V-Groove Repairs in Excess of 0.25" in Width:
- a. Apply this crack repair method only to concrete elements that are not actively leaking or exhibit signs of previous leakage but are over 0.25" in width.
  - b. Cut or chisel crack to a minimum depth of 3/4" with an inverted "V" shape of 3/4" width at the bottom.

- c. Remove loose particles, laitance, dust, grease and any other contaminants that would prevent bonding of the repair compound to the structure.
- d. Mix and apply appropriate repair compound in strict accordance with the manufacturer's directions depending on whether the crack is at a horizontal, vertical or overhead surface.

### 3.02 CURING

- A. Follow the recommendations of ACI 308.1 for curing concrete.
- B. Cure polymer-modified structural concrete mortar materials in accordance with manufacturer's instructions.
- C. Forms for formed patches shall be kept in place for a minimum of 48 hours.
- D. Curing methods shall be as approved. Perform curing as soon as possible after concrete placement and finishing.
- E. Where burlap is used to protect freshly placed concrete, maintain concrete temperature above 50° F. Keep burlap continuously wet for a period of 24 hours for structural repair mortar and at least 7 days for portland cement concrete.

### 3.03 FIELD QUALITY CONTROL

- A. Use adequate number of skilled personnel who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- B. Manufacturer's Representative Services: Do not proceed with the first application of each concrete repair system without the Contractor's field personnel having received on-site detailed instructions from the product manufacturer's technical representative on the mixing, application and curing of the concrete repair materials for the intended use.
- C. Inspection and testing services required for concrete restoration work, including concrete materials and construction operations, will be provided by the Commissioner. The Commissioner will arrange for inspection of concrete materials at the mixer, concrete placement, and for the sampling and testing of concrete cylinders for Deep Spall Concrete Repairs similar to those services for cast-in-place concrete described in Section 03300 - Cast-in-Place Concrete.
  - 1. Cooperate with the Commissioner in the performance of its duties for concrete inspection and testing. Assist the Commissioner in performing applicable sampling and testing specified under Section 03300 - Cast-in-Place Concrete

during concrete restoration work by providing incidental labor to collect and store samples.

2. The Commissioner will have a qualified representative(s) at the job site to perform concrete testing and to make all necessary test cylinders. Do not place concrete without the Commissioner's on-site inspector present.
3. Testing acceptance criteria for concrete restoration work shall as defined for cast-in-place concrete in Section 03300 – Cast-in-Place Concrete.

### 3.04 REMEDIAL WORK

- A. Repair or replace deficient work as directed by the Commissioner and at no additional cost to the City of New York.
- B. Patch defective concrete surfaces with a suitable, approved patching material, mix or product as directed by the Commissioner.
- C. Formed concrete repairs shall conform to those described in Section 03350 – Concrete Finishes and as specified herein. Repair defective formed surfaces by removing minor honeycombs, pits greater than one square inch in surface area or 0.25 inch maximum depth, or otherwise defective areas. Remove all fins, burrs and other projections left by formwork removal in accordance with the provisions of Section 03100 - Concrete Forms and Accessories. Fill solid all holes, depressions and voids with cement grout after first being thoroughly wetted. Chip back honeycombs to solid concrete, as directed by the Commissioner, prior to patching with cement grout. Fill holes with a small tool that will permit packing the hole solidly with cement grout.
- D. Non-conforming Work: Repaired concrete surfaces which develop shrinkage cracks greater than approximately 0.01" (10 mils) wide, honeycombing or a large frequency of cracking within 28 days after installation shall be considered defective and shall be classified as non-conforming work.
- E. Repair or remove and replace non-conforming work as directed by the Commissioner and at no additional cost to the City of New York. Patch non-conforming repaired surfaces with a suitable, approved patching material, mix or product as approved by the Commissioner.

### 3.05 CLEANING

- A. As work progresses, immediately remove excess materials from adjacent surfaces with cleaning material recommended by the respective product manufacturer.
- B. Finish crack repair surfaces and unformed concrete spall repair surfaces to obtain a hard steel troweled finish meeting the finish requirements of a Type "D" finish described in Section 03350 – Concrete Finishes. Finish repaired surface flush with

adjacent concrete surface that will be left exposed or painted, including grinding as required.

- C. Do not discharge debris or waste into sewers or waste piping.
- D. Leave finished work in neat and clean condition.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 04201**  
**UNIT MASONRY**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section includes unit masonry assemblies consisting of the following:
1. Concrete masonry units (CMU)
  2. Pre faced concrete masonry units (GCMU)
  3. Mortar and grout
  4. Reinforcing steel
  5. Masonry joint reinforcement
  6. Ties and anchors
  7. Embedded flashing
  8. Miscellaneous masonry accessories
  9. Cavity-wall insulation
  10. Partition restraint system
- B. Products furnished, but not installed, under this Section include the following:
1. Dovetail slots for masonry anchors, installed under Section 03300 - Cast-in-Place Concrete.
  2. Anchor sections of adjustable masonry anchors for connecting to structural frame, installed under Section 05120 - Structural Steel.
  3. Manufactured reglets in masonry joints for metal flashing, furnished under Section 07620 - Sheet Metal Flashing and Trim.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02780 - Unit Pavers, for exterior unit masonry paving
- B. Section 03300 - Cast-in-Place Concrete, for masonry anchors installed in concrete
- C. Section 03450 - Plant-Precast Architectural Concrete for precast anchors installed in masonry
- D. Section 05500 - Metal Fabrications, for steel lintels, seismic restraint angles, and shelf angles for unit masonry
- E. Section 07115 - Bituminous Dampproofing, for dampproofing applied to cavity face of backup wythes of cavity walls
- F. Section 07210 - Building Insulation, for formed in-place cmu insulation

- G. Section 076620 - Sheet Metal Flashing and Trim, for sheet metal flashing
- H. Section 07811 - Sprayed Fire-Resistive Materials
- I. Section 07842 - Fire-Resistive Joint Systems, for fire-resistive joint systems at heads of masonry walls and firestopping at openings in masonry walls
- J. Section 07920 - Exterior Joint Sealants and Section 07921 - Interior Sealants, for sealing control and expansion joints in unit masonry
- K. Section 08520 - Aluminum Windows, for window work installed in masonry
- L. Section 08110 - Stainless Steel Doors and Frames and Section 08311 - Access Doors and Frames, for door frames installed in masonry
- M. Section 10200 - Louvers and Screens
- N. Sections related to Plumbing Work installed in masonry
- O. Sections related to HVAC Work installed in masonry
- P. Sections related to Electrical Work install in masonry

### 1.03 DEFINITIONS

- A. Reinforced Masonry: Masonry containing reinforcing steel in grouted cells

### 1.04 PERFORMANCE REQUIREMENTS

- A. Provide load-bearing unit masonry that develops indicated net-area compressive strengths ( $f_m$ ) at 28 days. Comply with NYC Building Code requirements.
- B. Provide fire-rated unit masonry compliant with NYC Building Code requirements.

### 1.05 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings:
  - 1. Masonry Units: Show sizes, profiles, coursing, and locations of special shapes and glazed finishes.
  - 2. Reinforcing Steel: Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement." Show elevations of reinforced walls.
  - 3. Fabricated Flashing: Detail corner units, end-dam units, and other special applications

- C. Samples for Initial Selection
1. Decorative glazed concrete masonry units, in the form of small-scale units.
  2. Colored mortar.
  3. Weep holes/vents.
- D. Samples for Verification: For each type and color of the following:
1. Exposed concrete masonry units
  2. Glazed concrete masonry units
  3. Special shapes
  4. Pigmented and colored-aggregate mortar. Make Samples using same sand and mortar ingredients to be used on Project. Label Samples to indicate types and amounts of pigments used.
  5. Weep holes/vents
  6. Accessories embedded in masonry
- E. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers, source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates.
1. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Engineer and approved in writing.
- F. Qualification Data: For testing agency.
- G. Material Certificates: Include statements of material properties indicating compliance with requirements including compliance with standards and type designations within standards. Provide for each type and size of the following:
1. Masonry units
    - a. Include material test reports substantiating compliance with requirements.
    - b. For masonry units used in structural masonry, include data and calculations establishing average net-area compressive strength of units.
  2. Cementitious materials. Include brand, type, and name of manufacturer.

3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.
  4. Grout mixes. Include description of type and proportions of ingredients.
  5. Reinforcing bars
  6. Joint reinforcement
  7. Anchors, ties, and metal accessories
- H. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.
1. Include test reports, per ASTM C780, for mortar mixes required to comply with property specification.
  2. Include test reports, per ASTM C1019, for grout mixes required to comply with compressive strength requirement.
- I. Statement of Compressive Strength of Masonry: For each combination of masonry unit type and mortar type, provide statement of average net-area compressive strength of masonry units, mortar type, and resulting net-area compressive strength of masonry determined according to Tables 1 and 2 in ACI 530.1/ASCE 6/TMS 602.
- J. Cold-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with cold-weather requirements.

#### 1.06 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent agency qualified according to ASTM C1093 for testing indicated, as documented according to ASTM E548.
- B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.
- C. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from a single manufacturer for each cementitious component and from one source or producer for each aggregate.
- D. Controlled Inspection Service: The City will engage a qualified independent testing agency to perform controlled inspection of masonry and reinforced masonry as required by NYC Building Code and as indicated below. Payment for these services will be made by the City. Retesting of materials that fail to meet specified requirements shall be done at Contractor's expense.

1. Concrete Masonry Unit Test: For each type of unit required, per ASTM C140
  2. Mortar Test (Property Specification): For each mix required, per ASTM C780
  3. Grout Test (Compressive Strength): For each mix required, per ASTM C1019
  4. Prism Test: For each type of construction required, per ASTM C1314
- E. Fire-Resistance Ratings: Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined per ASTM E119 by a testing and inspecting agency, by equivalent concrete masonry thickness, or by other means, as acceptable to authorities having jurisdiction.
- F. Sample Panels: Build sample panels to verify selections made under sample submittals and to demonstrate aesthetic effects. Comply with requirements in Division 1.
1. Build sample panels for each type of exposed unit masonry construction and typical exterior wall in sizes approximately 48 inches (1200 mm) long by 48 inches high by full thickness.
  2. Clean one-half of exposed faces of panels with masonry cleaner indicated.
  3. Protect approved sample panels from the elements with weather-resistant membrane.
  4. Approval of sample panels is for color, texture, and blending of masonry units; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; aesthetic qualities of workmanship; and other material and construction qualities specifically approved by Engineer in writing.
    - a. Approval of sample panels does not constitute approval of deviations from the Contract Documents contained in sample panels unless such deviations are specifically approved by Engineer in writing.
- G. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
1. Build mockups for each type of exposed unit masonry construction and typical exterior wall in sizes approximately 48 inches long by 48 inches high by full thickness, including face and backup wythes and accessories.
    - a. Include a sealant-filled joint at least 16 inches (400 mm) long in each exterior wall mockup.
    - b. Include lower corner of window opening at upper corner of exterior wall mockup. Make opening approximately 12 inches wide by 16 inches high.
    - c. Include through-wall flashing installed for a 24-inch length in corner of exterior wall mockup approximately 16 inches (400 mm) down from top

of mockup, with a 12-inch length of flashing left exposed to view (omit masonry above half of flashing).

2. Clean one-half of exposed faces of mockups with masonry cleaner as indicated.
3. Protect accepted mockups from the elements with weather-resistant membrane.
4. Approval of mockups is for color, texture, and blending of masonry units; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship.
  - a. Approval of mockups is also for other material and construction qualities specifically approved by Engineer in writing.
  - b. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless such deviations are specifically approved by The Engineer in writing.
5. Retain mock-ups until completion of masonry work. Remove mock-ups after masonry work has been accepted by Engineer.

H. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Section 01310 – Project Coordination.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.
- B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
- C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
- D. Deliver preblended, dry mortar mix in moisture-resistant containers designed for lifting and emptying into dispensing silo. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in a metal dispensing silo with weatherproof cover.
- E. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

## 1.08 PROJECT CONDITIONS

- A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.
  - 1. Extend cover a minimum of 24 inches down both sides and hold cover securely in place.
  - 2. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches down face next to unconstructed wythe and hold cover in place.
- B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.
- C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.
  - 1. Protect base of walls from rain-splashed mud and from mortar splatter by spreading coverings on ground and over wall surface.
  - 2. Protect sills, ledges, and projections from mortar droppings.
  - 3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.
  - 4. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.
- D. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
  - 1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F (4 deg C) and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.
- E. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Subject to compliance with Project requirements, products that may be incorporated into the Work include, but are not limited to, products specified.

## 2.02 MASONRY UNITS

- A. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to exceed tolerances and to contain chips, cracks, or other defects exceeding limits stated in the standard. Do not use units where such defects, including dimensions that vary from specified dimensions by more than stated tolerances, will be exposed in the completed Work or will impair the quality of completed masonry.

## 2.03 CONCRETE MASONRY UNITS

- A. Shapes: Provide shapes indicated and as follows:
1. Provide special shapes for lintels, corners, jambs, sashes, movement joints, headers, bonding, and other special conditions.
  2. Provide square-edged units for outside corners, unless otherwise indicated.
- B. Integral Water Repellent: Provide units made with integral water repellent for exposed units at exterior or interior locations.
1. Integral Water Repellent: Liquid polymeric, integral water-repellent admixture that does not reduce flexural bond strength. Units made with integral water repellent, when tested as a wall assembly made with mortar containing integral water-repellent manufacturer's mortar additive according to ASTM E514, with test period extended to 24 hours, show no visible water or leaks on the back of test specimen.
    - a. Products
      - (1) Addiment Incorporated; Block Plus W-10
      - (2) Grace Construction Products, a unit of W. R. Grace & Co. - Conn.; Dry-Block
      - (3) Master Builders, Inc.; Rheopel
      - (4) Or approved equal

- C. Concrete Masonry Units (CMU): Concrete units complying with ASTM C90.
1. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 1900 psi.
  2. Weight Classification: Normal weight, unless where indicated
  3. Size (Width): Manufactured to dimensions 3/8 inch less than nominal dimensions. Nominal units 4 by 8 by 16 inch; 6 by 8 by 16 inch and 8 by 8 by 16 inch.
- D. Pre-faced Concrete Masonry Units (GCMU): Concrete units complying with ASTM C90, with manufacturer's standard smooth resinous facing complying with ASTM C744.
1. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 1900 psi.
  2. Weight Classification: Lightweight
  3. Size (Width): Manufactured to dimensions specified in "Concrete Masonry Units" paragraph above, but with pre-faced surfaces having 1/16-inch wide returns of facing to create 1/4-inch wide mortar joints with modular coursing.
  4. Colors and Patterns: As selected by the Engineer from manufacturer's full range.
    - a. Special shapes: Provide manufacturer's standard units with glazed finish applied on exposed face. Provide corner units with glazed finish on 2 exposed faces. Provide bond-beam units with glazed finish on 3 exposed faces. Provide glazed bullnose units.

## 2.04 LINTELS

- A. Masonry Lintels (Bond Beams): Prefabricated or built-in-place masonry lintels made from bond beam concrete masonry units with reinforcing bars placed as indicated and filled with coarse grout. Cure precast lintels before handling and installing. Temporarily support built-in-place lintels until cured.

## 2.05 MORTAR AND GROUT MATERIALS

- A. Portland Cement: ASTM C150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.
- B. Hydrated Lime: ASTM C207, Type S.

- C. Portland Cement-Lime Mix: Packaged blend of Portland cement complying with ASTM C150, Type I or Type III, and hydrated lime complying with ASTM C207, Type S.
- D. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with a record of satisfactory performance in masonry mortar.

- 1. Products

- a. Bayer Corporation, Industrial Chemicals Div.; Bayferrox Iron Oxide Pigments
  - b. Davis Colors; True Tone Mortar Colors
  - c. Solomon Grind-Chem Services, Inc.; SGS Mortar Colors
  - d. Or approved equal

- E. Colored Cement Product: Packaged blend made from Portland cement, lime, and mortar pigments, all complying with specified requirements, and containing no other ingredients.

- 1. Formulate blend as required to produce color indicated or, if not indicated, as selected from manufacturer's standard colors.
  - 2. Pigments shall not exceed 10 percent of Portland cement by weight.

- 3. Products

- a. Colored Portland Cement-Lime Mix
    - (1) Capital Materials Corporation; Riverton Portland Cement Lime Custom Color
    - (2) Holcim (US) Inc.; Rainbow Mortamix Custom Color Cement/Lime
    - (3) Lafarge North America Inc.; Eaglebond
    - (4) Lehigh Cement Company; Lehigh Custom Color Portland/Lime Cement
    - (5) Or approved equal

- F. Aggregate for Mortar: ASTM C144

- 1. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.

2. For joints less than 1/4-inch thick, use aggregate graded with 100 percent passing the No. 16 sieve.
  3. White-Mortar Aggregates: Natural white sand or crushed white stone
  4. Colored-Mortar Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color
- G. Aggregate for Grout: ASTM C 404
- H. Cold-Weather Admixture: Nonchloride, noncorrosive, accelerating admixture complying with ASTM C494, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.
1. Products
    - a. Addiment Incorporated; Mortar Kick
    - b. Euclid Chemical Company (The); Accelguard 80
    - c. Grace Construction Products, a unit of W. R. Grace & Co. - Conn.; Morset
    - d. Sonneborn, Div. of ChemRex; Trimix-NCA
    - e. Or approved equal
- I. Water: Potable
- 2.06 REINFORCEMENT
- A. Galvanized Steel Reinforcing Bars: ASTM A767, Grade 60
- B. Masonry Joint Reinforcement: ASTM A951
1. Interior Walls: Hot-dip galvanized, carbon steel
  2. Exterior Walls: Stainless steel
  3. Wire Size for Side Rods: W1.7 or 0.148-inch and W2.8 or 0.188-inch diameter to suit application
  4. Wire Size for Cross Rods: W1.7 or 0.148-inch and W2.8 or 0.188-inch diameter to suit application
  5. Wire Size for Veneer Ties: W1.7 or 0.148-inch and W2.8 or 0.188-inch diameter to suit application
  6. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches on center

7. Provide in lengths of not less than 10 feet , with prefabricated corner and tee units.

- C. Masonry Joint Reinforcement for Single-Wythe Masonry: Either ladder or truss type with single pair of side rods.
- D. Masonry Joint Reinforcement for Veneers Anchored with Seismic Masonry-Veneer Anchors: Single 0.188-inch- diameter, hot-dip galvanized steel continuous wire.

## 2.07 TIES AND ANCHORS

- A. Materials: Provide ties and anchors specified in subsequent paragraphs that are made from materials that comply with subparagraphs below, unless otherwise indicated.

1. Stainless Steel bars: ASTM A666, Type 316

- B. Corrugated Metal Ties: Metal strips not less than 7/8 inch wide with corrugations having a wavelength of 0.3 to 0.5 inch and an amplitude of 0.06 to 0.10 inch made from stainless steel not less than 0.097 inch thick. Ties made from hot-dipped galvanized steel sheet may be used in interior walls, unless otherwise indicated.

- C. Wire Ties: Unless otherwise indicated, size wire ties to extend at least halfway through veneer but with at least 5/8-inch cover on outside face. Outer ends of wires are bent 90 degrees and extend 2 inches parallel to face of veneer.

- D. Individual Wire Ties: Rectangular units with closed ends and not less than 4 inches wide.

1. Z-shaped ties with ends bent 90 degrees to provide hooks not less than 2 inches long may be used for masonry constructed from solid units or hollow units laid with cells horizontal.

2. Where wythes do not align or are of different materials, use adjustable ties with pintle-and-eye connections having a maximum adjustment of 1-1/4 inches.

3. Wire: Fabricate from 1/4-inch diameter, stainless-steel wire; hot-dipped galvanized wire ties may be used in interior walls, unless otherwise indicated.

- E. Adjustable Anchors for Connecting to Structure: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

1. Anchor Section for Welding to Steel Frame: Crimped 1/4-inch diameter, stainless-steel wire; hot-dipped-galvanized wire may be used at interior walls, unless otherwise indicated.

2. Tie Section for Steel Frame: Triangular-shaped wire tie, sized to extend within 1 inch of masonry face, made from 0.25-inch diameter, stainless-steel

wire; hot-dipped-galvanized wire may be used at interior walls, unless otherwise indicated.

3. Connector Section for Concrete: Dovetail tabs for inserting into dovetail slots in concrete and attached to tie section; formed from 0.109-inch thick, stainless-steel sheet; 0.108-inch thick, hot-dipped-galvanized sheet may be used at interior walls, unless otherwise indicated.
  4. Tie Section for Concrete: Corrugated metal ties with dovetail tabs for inserting into dovetail slots in concrete and sized to extend to within 1 inch of masonry face.
- F. Partition Top anchors: 0.097-inch- thick metal plate with 3/8-inch diameter metal rod 6 inches long welded to plate and with closed-end plastic tube fitted over rod that allows rod to move in and out of tube. Fabricate from steel, hot-dip galvanized after fabrication.
- G. Rigid Anchors: Fabricate from steel bars 1-1/2 inches wide by 1/4 inch thick by 24 inches long, with ends turned up 2 inches or with cross pins, unless otherwise indicated.
- H. Precast Concrete Anchors: Fabricate dowels, cramps, and other stone anchors from stainless steel.
- 2.08 MISCELLANEOUS ANCHORS
- A. Unit Type Inserts in Concrete: Cast-iron or malleable-iron wedge-type inserts.
  - B. Dovetail Slots in Concrete: Furnish dovetail slots with filler strips, of slot size to suit application, fabricated from 0.034-inch, stainless steel sheet.
  - C. Anchor Bolts: Headed or L-shaped steel bolts complying with ASTM A307, Grade A; with ASTM A563 hex nuts and, flat washers; hot-dip galvanized to comply with ASTM A153, Class C.
  - D. Postinstalled Anchors: Provide chemical or torque-controlled expansion anchors, with capability to sustain, without failure, a load equal to six times the load imposed when installed in solid or grouted unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488 conducted by a qualified independent testing agency.
1. Corrosion Protection: Stainless-steel components complying with ASTM F593 and ASTM F594, Alloy Group 2 for bolts and nuts; ASTM A666 Type 316 for anchors.

**2.09 EMBEDDED FLASHING MATERIALS**

- A. Metal Flashing: Provide metal flashing, where flashing is exposed or partly exposed and where indicated, complying with Section 07620 - Sheet Metal Flashing and Trim and as follows:
1. Stainless Steel: ASTM A240, Type 304, 0.016 inch thick
  2. Fabricate continuous flashings in sections 96 inches long minimum, but not exceeding 12 feet. Provide splice plates at joints of formed, smooth metal flashing.
  3. Fabricate through-wall metal flashing embedded in masonry from stainless steel, with ribs at 3-inch intervals along length of flashing to provide an integral mortar bond.
    - a. Products
      - (1) Cheney Flashing Company; Cheney Flashing (Dovetail) or Cheney 3-Way Flashing (Sawtooth)
      - (2) Keystone Flashing Company, Inc.; Keystone 3-Way Interlocking Thruwall Flashing.
      - (3) Or approved equal
  4. Fabricate through-wall flashing with sealant stop, unless otherwise indicated. Fabricate by bending metal back on itself 3/4 inch at exterior face of wall and down into joint 3/8 inch to form a stop for retaining sealant backer rod.
- B. Solder and Sealants for Sheet Metal Flashings, unless otherwise indicated in Section 07620 - Sheet Metal Flashing and Trim, provide the following:
1. Solder for Stainless Steel: ASTM B32, Grade Sn60, with acid flux of type recommended by stainless-steel sheet manufacturer.
  2. Elastomeric Sealant: ASTM C 920, chemically curing sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.
- C. Adhesives, Primers, and Seam Tapes for Flashings: Flashing manufacturer's standard products or products recommended by flashing manufacturer for bonding flashing sheets to each other and to substrates.

**2.10 MISCELLANEOUS MASONRY ACCESSORIES**

- A. Compressible Filler: Premolded filler strips complying with ASTM D1056, Grade 2A1; compressible up to 35 percent; of width and thickness to suit application; formulated from neoprene or approved equal.

- B. Preformed Control-Joint Gaskets: Made from styrene-butadiene-rubber compound, complying with ASTM D2000, Designation M2AA-805 and designed to fit standard block and to maintain lateral stability in masonry wall; size, and configuration to suit application.
- C. Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D 226, Type I (No.15 asphalt felt).
- D. Weep/Vent Products: Use one of the following, unless otherwise indicated:
1. Round Plastic Weep/Vent Tubing: Medium-density polyethylene, 3/8-inch outside diameter by 4 inches long.
  2. Cellular Plastic Weep/Vent: One-piece, flexible extrusion made from UV-resistant polypropylene copolymer, full height and width of head joint and depth 1/8 inch less than depth of outer wythe, in color selected from manufacturer's standard.
    - a. Products
      - 1) Advanced Building Products Inc.; Mortar Maze weep vent
      - 2) Dayton Superior Corporation, Dur-O-Wal Division; Cell Vents
      - 3) Heckmann Building Products Inc.; No.85 Cell Vent
      - 4) Hohmann & Barnard, Inc.; Quadro-Vent
      - 5) Wire-Bond; Cell Vent
      - 6) Or approved equal
- E. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells with loops for holding reinforcing bars in center of cells. Units are formed from 0.142-inch steel wire, hot-dip galvanized after fabrication. Provide units with either two loops or four loops as needed for number of bars indicated.
1. Products
    - a. Dayton Superior Corporation, Dur-O-Wal Division; D/A 810, D/A 812 or D/A 817
    - b. Heckmann Building Products Inc.; Number. 376 Rebar Positioner
    - c. Hohmann & Barnard, Inc.; RB or RB-Twin Rebar Positioner
    - d. Wire-Bond; O-Ring or Double O-Ring Rebar Positioner
    - e. Or approved equal

## 2.11 MASONRY-CELL INSULATION

- A. Coordinate requirements for installation of foamed in-place masonry cell insulation with Division 7 Section "Building Insulation".

## 2.12 CAVITY-WALL RIGID INSULATION

- A. Extruded-Polystyrene Board Insulation with Increased R-Value: ASTM C578, Type IV, but with an aged thermal resistance (R-value) for 1-inch thickness of 5.6 deg F x h x sq. ft./Btu at 75 deg F at 5 years; closed-cell product with a carbon-black filler and extruded with an integral skin.
- B. Adhesive: Type recommended by insulation board manufacturer for application indicated.

## 2.13 MASONRY CLEANERS

- A. Proprietary Acidic Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

- 1. Manufacturers

- a. Diedrich Technologies, Inc.
  - b. EaCo Chem, Inc.
  - c. ProSoCo, Inc.
  - d. Or approved equal

## 2.14 MORTAR AND GROUT MIXES

- A. Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

- 1. Do not use calcium chloride in mortar or grout.
  - 2. Limit cementitious materials in mortar to portland cement and lime.
  - 3. Add cold-weather admixture (if used) at same rate for mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.
  - 4. Masonry Cement is not permitted.

- B. Preblended, Dry Mortar Mix: Furnish dry mortar ingredients in form of a preblended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

- C. Mortar for Unit Masonry: Comply with ASTM C 270 or BIA Technical Notes 8A, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry.
  - 1. For masonry below grade or in contact with earth, use TypeM
  - 2. For reinforced masonry, use TypeN
  - 3. For mortar parge coats, use TypeS
- D. Pigmented Mortar: Use colored cement product or select and proportion pigments with other ingredients to produce color required. Do not add pigments to colored cement products.
  - 1. Pigments shall not exceed 10 percent of portland cement by weight.
  - 2. Mix to match the Engineer's sample.
- E. Colored-Aggregate Mortar: Produce required mortar color by using colored aggregates and natural color or white cement as necessary to produce required mortar color.
  - 1. Mix to match the Engineer's sample.
- F. Grout for Unit Masonry: Comply with ASTM C476.
  - 1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 1.15.1 in ACI 530.1/ASCE 6/TMS 602 for dimensions of grout spaces and pour height.
  - 2. Provide grout with a slump of 8 to 11 inches as measured according to ASTM C143.

## 2.15 SOURCE QUALITY CONTROL

- A. The City will engage a qualified independent testing agency to perform source quality-control testing indicated below:
  - 1. Payment for these services will be made by the City.
  - 2. Retesting of materials failing to comply with specified requirements shall be done at Contractor's expense.
- B. Concrete Masonry Unit Test: For each type of unit furnished, per ASTM C140.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
  2. Verify that foundations are within tolerances specified.
  3. Verify that reinforcing dowels are properly placed.
- B. Before installation, examine rough-in and built-in construction for plumbing, HVAC and electrical systems to verify actual locations of system components to be built into masonry work.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. Thickness: Build cavity and composite walls and other masonry construction to full thickness shown. Build single-wythe walls to actual widths of masonry units, using units of widths indicated.
- B. Build chases and recesses to accommodate items specified in this and other Sections.
- C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match the construction immediately adjacent to opening.
- D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.
- E. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures.
- F. Comply with construction tolerances in ACI 530.1/ ASCE 6/ TMS 602 and with the following:
1. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 feet or 1/2 inch maximum.
  2. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 feet, or 1/2 inch maximum.
  3. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet, or 1/2 inch maximum.

4. For exposed bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch (3 mm), with a maximum thickness limited to 1/2 inch. Do not vary from bed-joint thickness of adjacent courses by more than 1/8 inch.
5. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch. Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 inch.
6. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch except due to warpage of masonry units within tolerances specified for warpage of units.
7. For exposed bed joints and head joints of stacked bond, do not vary from a straight line by more than 1/16 inch from one masonry unit to the next.

### 3.03 LAYING MASONRY WALLS

- A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.
- B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in running bond; do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.
  1. Lay GCMU in running bond pattern with glazed finish on all exposed faces.
- C. Lay concealed masonry with units in a wythe in running bond or bonded by lapping not less than 4-inches. Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.
- D. Stopping and Resuming Work: Stop work by racking back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.
- E. Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.
- F. Fill space between steel frames and masonry solidly with mortar, unless otherwise indicated.
- G. Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below and rod mortar or grout into core.

- H. Fill cores in hollow concrete masonry units with grout 24 inches under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated.
- I. Build non-load-bearing interior partitions full height of story to underside of solid floor or roof structure above, unless otherwise indicated.
  - 1. Install compressible filler in joint between top of partition and underside of structure above.
  - 2. Fasten partition top anchors to structure above and build into top of partition. Grout cells of CMU solidly around plastic tubes of anchors and push tubes down into grout to provide 1/2-inch clearance between end of anchor rod and end of tube. Space anchors 48 inches on center, unless otherwise indicated.
  - 3. At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Section 07842 - Fire-Resistive Joint Systems.

### 3.04 MORTAR BEDDING AND JOINTING

- A. Lay hollow concrete masonry units as follows:
  - 1. With face shells fully bedded in mortar and with head joints of depth equal to bed joints.
  - 2. With webs fully bedded in mortar in all courses of piers, columns, and pilasters.
- B. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.
- C. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness, unless otherwise indicated.
  - 1. For glazed masonry units, use a nonmetallic jointer 3/4 inch or more in width.
- D. Cut joints flush for masonry walls to receive bituminous dampproofing, tile or other direct-applied finishes (other than paint), unless otherwise indicated.

### 3.05 CAVITY WALLS

- A. Coat cavity face of backup wythe to comply with Section 07115 - Bituminous Dampproofing.
- B. Installing Cavity-Wall Insulation: Place small dabs of adhesive or mechanical fasteners, spaced approximately 12 inches on center<sup>4</sup> both ways, on inside face of insulation boards, or attach with plastic fasteners designed for this purpose. Fit courses of insulation between wall ties and other confining obstructions in cavity, with edges butted tightly both ways. Press units firmly against inside wythe of masonry or other construction as shown.

1. Fill cracks and open gaps in insulation with crack sealer compatible with insulation and masonry.

### 3.06 MASONRY-CELL INSULATION

- A. Install molded-polystyrene insulation units into masonry unit cells before laying units.

### 3.07 MASONRY JOINT REINFORCEMENT

- A. Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcement a minimum of 6 inches.
- B. Interrupt joint reinforcement at control and expansion joints, unless otherwise indicated.
- C. Provide continuity at wall intersections by using prefabricated T-shaped units.
- D. Provide continuity at corners by using prefabricated L-shaped units.
- E. Cut and bend reinforcing units as directed by manufacturer for continuity at corners, returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

### 3.08 ANCHORING MASONRY TO STRUCTURAL MEMBERS

- A. Anchor masonry to structural members where masonry abuts or faces structural members to comply with the following:
  1. Provide an open space not less than 1/2 inch in width between masonry and structural member, unless otherwise indicated. Keep open space free of mortar and other rigid materials.
  2. Anchor masonry to structural members with anchors embedded in masonry joints and attached to structure.
  3. Space anchors as indicated, but not more than 24 inches on center vertically and 36 inches on center horizontally.

### 3.09 CONTROL AND EXPANSION JOINTS

- A. Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.

- B. Form control joints in concrete masonry using one of the following methods:
  - 1. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar or rake out joint for application of sealant.
  - 2. Install temporary foam-plastic filler in head joints and remove filler when unit masonry is complete for application of sealant.
- C. Provide horizontal, pressure-relieving joints by either leaving an air space or inserting a compressible filler of width required for installing sealant and backer rod specified in Section 07921 - Interior Sealants, but not less than 3/8 inch.
  - 1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

### 3.10 LINTELS

- A. Install CMU or GCMU bond beam lintels where indicated and where openings of more than 24 inches for block-size units are indicated without structural steel or other supporting lintels.
- B. Provide minimum bearing of 8 inches at each jamb, unless otherwise indicated.

### 3.11 FLASHING, WEEP HOLES, CAVITY DRAINAGE, AND VENTS

- A. Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated. Install vents at shelf angles, ledges, and other obstructions to permit upward flow of air in cavities, and where indicated.
- B. Install flashing as follows, unless otherwise indicated:
  - 1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as recommended by flashing manufacturer.
  - 2. At multiwythe masonry walls, including cavity walls, extend flashing through outer wythe, turned up a minimum of 8 inches, and through inner wythe to within 1/2 inch of the interior face of wall in exposed masonry. Where interior face of wall is to receive furring or framing, carry flashing completely through inner wythe and turn flashing up approximately 2 inches on interior face.
  - 3. At lintels and shelf angles, extend flashing a minimum of 8 inches into masonry at each end. At heads and sills, extend flashing 8 inches at ends and turn up not less than 2 inches to form end dams.

- C. Install weep holes in head joints in exterior wythes at precast panels.
- D. Install vents in head joints in exterior wythes at spacing indicated.

### 3.12 FIELD QUALITY CONTROL

- A. Inspectors: The City will engage qualified independent inspectors to perform inspections and prepare reports. Allow inspectors access to scaffolding and work areas, as needed to perform inspections.
  - 1. Place grout only after inspectors have verified compliance of grout spaces and grades, sizes, and locations of reinforcement.
- B. Testing Agency: The City will engage a qualified independent testing and inspecting agency to perform field tests and inspections indicated below and prepare test reports:
  - 1. Payment for these services will be made by the City.
  - 2. Retesting of materials failing to comply with specified requirements shall be done at Contractor's expense.
- C. Testing Frequency: One set of tests for each 5000 sq. ft. of wall area or portion thereof.
- D. Concrete Masonry Unit Test: For each type of unit provided, per ASTM C140.
- E. Mortar Test (Property Specification): For each mix provided, per ASTM C780.
- F. Grout Test (Compressive Strength): For each mix provided, per ASTM C1019.
- G. Prism Test: For each type of construction provided, per ASTM C1314 at 7 days and at 28 days.

### 3.13 REPAIRING, POINTING, AND CLEANING

- A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.
- B. Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application.
- C. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry.

1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
2. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain the Engineer's approval of sample cleaning before proceeding with cleaning of masonry.
3. Protect adjacent surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
4. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
5. Clean concrete masonry by cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.

#### 3.14 MASONRY WASTE DISPOSAL

- A. Salvageable Materials: Unless otherwise indicated, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.

-END OF SECTION-

**Section 05081  
GALVANIZING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. All galvanizing of metals when such coating is specified or shown on the Contract Drawings, except as otherwise required.
- B. All galvanizing shall be done by the hot-dip process.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings

**1.03 REFERENCES**

- A. ASTM A53 - Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless
- B. ASTM A90 - Test Method for Weight (Mass) of Coating on Iron and Steel Articles with Zinc or Zinc-Alloy Coatings
- C. ASTM A111 - Zinc-Coated (Galvanized) "Iron" Telephone and Telegraph Wire
- D. ASTM A116 - Zinc-Coated (Galvanized) Steel Woven Wire Fence Fabric
- E. ASTM A121 - Zinc-Coated (Galvanized) Steel Barbed Wire
- F. ASTM A123 - Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
- G. ASTM A143 - Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedure for Detecting Embrittlement
- H. ASTM A153 - Zinc Coating (Hot-Dip) on Iron and Steel Hardware
- I. ASTM A239 - Test Method for Locating the Thinnest Spot in a Zinc (Galvanized) Coating on Iron or Steel Articles by the Preece Test (Copper Sulfate Dip)
- J. ASTM A384 - Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies

- K. ASTM A385 - Practice for Providing High-Quality Zinc Coatings (Hot-Dip)
- L. ASTM A392 - Zinc-Coated Steel Chain-Link Fence Fabric
- M. ASTM A475 - Zinc-Coated Steel Wire Strand
- N. ASTM A653 - Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
- O. ASTM A780 - Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
- P. ASTM A924 - General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process
- Q. ASTM B6 - Specification for Zinc
- R. ASTM E536 - Test Methods for Chemical Analysis of Zinc and Zinc Alloys
- S. ANSI C80.1 - Rigid Steel Conduit, Zinc Coated
- T. CSA G164-M - Hot Dip Galvanizing of Irregularly Shaped Articles
- U. American Galvanizers Association (AGA)
- V. Canadian Standards Association (CSA)

#### 1.04 TESTS

- A. General: Samples of galvanized articles shall be taken as specified in the appropriate ASTM standards listed in Table 1. Galvanized articles shall be tested to determine the following qualities of the coating:
  - 1. Thickness of coating
  - 2. Adherence
  - 3. Uniformity
- B. Thickness of the zinc coating may be tested either by the weighing or stripping methods in conformity with the requirements set forth in Table 1.
- C. Adherence of zinc coating shall be tested by the method indicated in the appropriate ASTM methods listed in Table 1.

D. Uniformity

1. Galvanized articles will be subjected to visual examination to determine uniformity of work.
2. In the event the Commissioner determines that such examination is not conclusive, the article shall be given the Preece test in conformity with ASTM A239.

1.05 SUBMITTALS

- A. The Contractor shall submit to the Commissioner, in accordance with the requirements of Section 01330 – Shop Drawings, the producer's or supplier's certification that the galvanized articles were manufactured, sampled, tested and inspected in accordance with the applicable standards specified herein and that the articles meet these requirements.

1.06 QUALIFICATIONS

- A. Galvanizing shall be done in a plant having sufficient facilities to produce the quality of coatings herein specified and ample capacity for the volume of work required.
- B. The plant shall follow the procedures in the Quality Assurance Manual of the AGA.

1.07 SHIPPING AND HANDLING

- A. Galvanized articles shall be shipped and handled in a manner that will avoid damage to the zinc coating.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Zinc used for galvanizing shall conform to ASTM B6, and shall be at least equal to the grade designated as Prime Western.
- B. Maximum amount of aluminum added to a galvanizing bath shall not exceed 0.01 percent.

PART 3 EXECUTION

3.01 PREPARATION OF MATERIALS

- A. Structural steel products shall be safeguarded against embrittlement in accordance with ASTM A143.

- B. Casting surfaces to be galvanized shall be sand blasted or ground smooth. When a smooth cast is required, castings shall be tumbled and all high spots ground flush. Castings shall be normalized to prevent cracking. Malleable iron shall be safeguarded against embrittlement by pre-annealing.
- C. Steel work shall be pre-cleaned utilizing a caustic bath, acid pickle and flux or shall be blast cleaned and fluxed to obtain an acceptable surface for quality hot dip galvanizing.

### 3.02 METHOD OF GALVANIZING

- A. All galvanizing shall be done by the hot-dip process in conformity with the appropriate ASTM Specifications listed in Table 1.
- B. Methods tending to agitate the dross shall not be used, and materials shall not contact the dross at any time.
- C. Chemical analysis for impurities in the bath shall be made in conformity with ASTM E536.

### 3.03 SCHEDULE OF REQUIREMENTS

- A. Table 1 - Schedule of Hot-Dip Galvanizing Requirements
  - 1. The work shall conform to the requirements of the tabulated standards in Table 1, below.
- B. Notes Applicable to Table 1
  - 1. Prefixes A, B and E identify ASTM Specifications; prefix G identifies CSA Standard.
  - 2. Galvanized articles shall not be subject to wiping or scraping processes that may reduce the thickness of zinc coating.
  - 3. Small hardware items shall be centrifuged to remove excess bath metal.
- C. Quality of Coating
  - 1. The zinc coating shall meet the standards set forth in Table 1, ASTM A385 and CSA G164-M. The coating shall adhere firmly to the surface of the base metal, be continuous, uniform in thickness, and of the quality of finish specified.
  - 2. When special galvanizing, such as heavier coating, flexibility to permit forming operations and similar work is required, it shall be so specified in the relevant specification section for that item.

3. All rejected materials shall be stripped and regalvanized before resubmitting for inspection and test.

3.04 REPAIR OF GALVANIZED COATINGS

- A. Galvanized coatings that are abraded or damaged shall be repaired in accordance with ASTM A780.
- B. The extent of the area to be repaired and the method of repair to be used shall be approved by the Commissioner.

NO FURTHER TEXT ON THIS PAGE

TABLE 1 - SCHEDULE OF HOT-DIP GALVANIZING REQUIREMENTS

CLASS OF WORK	ZINC		TEST OF ZINC COATING				COATING THICKNESS	
	Slab & Chemical Analysis	Coating	Thickness		By Stripping	Adherence	Uniformity	Oz. Per Sq. Ft.
			By Weight	By Stripping				
IRON & STEEL STRUCTURAL								
• Rolled, pressed and forged, shapes, castings, plates, bars and strips								
• Gratings, iron and steel	B6, E536	A123	A123	A90, G164-M		A123	A123, A239	Table 1, A123
SHEETS								
• Iron and steel	B6, E536	A653	A653, A924	A90, A924		A653	A239	Table 1, A653
HARDWARE								
• Castings of malleable iron and steel								
• Rolled, pressed, forged articles								
• Threaded fasteners								
• Very small work: rivets, nails, tacks, pins, small bolts and screws, stove bolts	B6, E536	A153	A153	A90, G164-M		A153	A153, A239	Table 1, A153
• Turnbuckles and similar work								
• Chain								
WIRE								
• Line wire	B6, E536	A111	--	A90		A111	A111	Table 1, A111
• Fencing wire	B6, E536	A116	--	A90		--	--	Table 3, A116
• Fencing fabric, chain link	B6, E536	A392	--	A90		--	--	Tables 1 and 2, A392
• Barbed wire	B6, E536	A121	--	A90		--	--	Table 3, A121
• Strand wire	B6, E563	A475	--	A90		A475	A475	Table 4, A475
PIPE	B6, E536	A53	--	A90		A53	--	1.8 oz. per sq. ft.
ELECTRICAL CONDUIT (Rigid Steel)	Shall comply with ANSI C80.1 - Rigid Steel Conduit, Zinc Coated.							

-END OF SECTION-

**Section 05120**  
**STRUCTURAL STEEL**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate, shop paint and erect structural steel and appurtenances in accordance with the extent of work and the details indicated on the Contract Drawings, as specified herein and as required for a complete installation.
- B. Structural steel, as referenced herein, is that work defined in the AISC Code of Standard Practice and as otherwise shown on the Contract Drawings, including stiffeners, plates, sag rods and other miscellaneous metal required for a complete installation.
- C. This Section includes structural steel shapes, plates, bars and fasteners required for the fabrication and erection of miscellaneous structure supports, structure reinforcements, equipment supports and non-framing steel fabrications affecting structural steel.
- D. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- E. This Section includes, but is not limited to, the following items:
  - 1. Carbon and Stainless Steel
  - 2. Structural Steel: Plates, Shapes and Bars
  - 3. Structural Steel Tubing and Pipe
  - 4. Steel Armor Plate for Pushwalls
  - 5. Steel Armor Plate for Curbs and Loading Slots
  - 6. Anchor Bolts, Nuts and Washers
  - 7. Sag and Hanger Rods
  - 8. High Strength Fasteners: Bolts, Nuts and Washers
  - 9. Stainless Steel Fasteners: Bolts, Nuts, Coupling Nuts and Washers
  - 10. Welding Electrodes
  - 11. Headed Anchors (Welded Studs)
  - 12. Mechanical Expansion Anchors
  - 13. Chemical Adhesive Anchors
  - 14. Crane Rails and Accessories (Maintenance Bay)
  - 15. Removable Pipe Bollards
  - 16. Protective Coatings, Shop Applied
  - 17. Galvanizing Repair Paint

- F. This Section also includes support framing for small openings in steel floor and roof decking described in Sections 05311 - Steel Floor Deck and 05312 - Steel Roof Deck, respectively, and non-framing steel fabrications affecting structural steel work.
- G. Cold-formed metal framing, connectors and accessories are not included in this Section but are specified in Section 05400 - Cold-Formed Metal Framing.
- H. Metal stairs are not included in this Section but are specified in Section 05511 - Exterior Metal Stairs and Section 05512 - Interior Metal Stairs.
- I. Handrails and railings are not included in this Section but are specified in Section 05521 - Exterior Pipe and Tube Railings and Section 05522 - Interior Pipe and Tube Railings (Stainless Steel).

#### 1.02 RELATED SPECIFICATIONS

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 05311 - Steel Floor Deck
- C. Section 05312 - Steel Roof Deck
- D. Section 05400 - Cold-Formed Metal Framing
- E. Section 05511 - Exterior Metal Stairs
- F. Section 05512 - Interior Metal Stairs
- G. Section 05521 - Exterior Pipe and Tube Railings
- H. Section 05522 - Interior Pipe and Tube Railings (Stainless Steel)
- I. Section 05660 - Carriage Rail System
- J. Section 05675 - Crane Rail System
- K. Section 07811 - Sprayed Fire-Resistive Materials
- L. Section 09911 - Exterior Painting
- M. Section 09912 - Interior Painting
- N. Section 09967 - Coatings for Steel Waterfront Structures

#### 1.03 REFERENCES

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Institute of Steel Construction (AISC)
    - a. AISC Manual of Steel Construction, Specification for Structural Steel Buildings, Allowable Stress Design with Commentary and Supplements
    - b. AISC Code of Standard Practice for Steel Building and Bridges, with Commentary

- c. AISC Specification for Structural Joints Using ASTM A325 or A490 Bolts with Commentary
- d. AISC Detailing for Steel Structures

  - a. SSPC-SP 1, Solvent Cleaning
  - b. SSPC-SP 3, Power Tool Cleaning
  - c. SSPC-SP 6, Commercial Blast Cleaning

#### 1.04 PERFORMANCE REQUIREMENTS

- A. Design of details not otherwise indicated, and fabrication, assembly, and inspection of steel structures shall conform to the following applicable specifications, codes and publications, latest issue, except as modified herein:
  - 1. AISC Manual of Steel Construction, Allowable Stress Design, including the following:
    - a. Specification for Structural Steel Buildings, Allowable Stress Design, with Commentary, AISC
    - b. Code of Standard Practice for Steel Buildings and Bridges, with Commentary, AISC

- c. Specification for Structural Joints Using ASTM A325 or A490 Bolts, with Commentary, Research Council on Structural Connections, endorsed by AISC
2. Structural Welding Code - Steel, ANSI/AWS D1.1
3. Bridge Welding Code, ANSI/AASHTO/AWS D1.5
4. Detailing for Structural Steel, AISC

#### 1.05 SUBMITTALS

A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:

1. Shop Drawings that depict all shop and erection layouts, details and schedules for fabrication and shop assembly of structural steel members including grade of steel; structural shapes, sizes and dimensions; crane rail and bumper stop details; welding technique and sequence, cuts, copes, gussets and all other members, connections, holes, fasteners, anchor bolts and setting plans; camber, fabrication and erection tolerances; surface preparation, type of primer paint system and other coatings, weights of members, and critical clearances. Indicate all surface finishes and welds both shop and field, by symbols conforming to ANSI/AWS Standards. Show relationship between structural steel, concrete, masonry and other materials and embedded items.
2. Design Calculations: Submit for review structural design calculations of all steel connections for which connection details or beam reaction values are not shown on the Contract Drawings. Calculations shall be prepared under the direct supervision of, and signed and sealed by, a licensed Professional Engineer registered in the State of New York and experienced in the structural design of structural steel connections.
3. Working Drawings that depict design and details of all required temporary supports, staying and bracing and shall include descriptive data, including design calculations, to illustrate the erection, transportation, and handling procedures including sequence of erecting and transfer of loads, if applicable.
4. Setting diagrams, templates, and directions for the installation of structural framing, anchor bolts, bearing plates, and other embedded items.
5. Do not commence shop fabrication until Shop Drawings and Working Drawings applicable to that portion of work have been reviewed and approved in writing by the Commissioner.
6. AISC Quality Certification Certificates, currently applicable, for steel fabricator and erector.

## 7. Welding Records and Data

- a. Procedure for pre-qualifying welders and welding procedures. For procedures other than those set forth in Paragraph 5.1 of ANSI/AWS D1.1, submit a copy of procedure qualification test records.
  - b. Certified copy of qualification test record for each welder, welding operator, and tacker who will be employed in the work, whether in the fabrication shop or in the field. All welders performing work within the city limits shall be certified by the City of New York in accordance with the latest rules of the New York City Board of Standards and Appeals and the current provisions of the New York City Building Code, Local Law 76/2008. All other welders shall be certified in accordance with ANSI/AWS D1.1, Structural Welding Code, Steel.
  - c. Descriptive data for field welding equipment, including type and electrical power requirements.
  - d. Test results of all non-destructive testing performed on field and shop welds.
8. Manufacturer's Data: Submit manufacturer's specifications, test reports and installation instructions for all proposed materials, products and accessories.
9. Notarized certificates of compliance for materials and products or certified copy of reports for analyses and tests required by referenced ASTM Specifications, including but limited to the following:
- a. Certified mill test reports
  - b. Affidavit of compliance with steel grade specified
  - c. Test reports for filler metals for welding
  - d. Mechanical test for high strength threaded fasteners
  - e. Paint certification.
10. Submit project-specific safety precautions proposed to prevent falls and provide fall protection during erection of structural steel.

## 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the New York City Board of Standards and Appeals, latest edition of each and amendments or supplements thereto. Work of this Section shall conform to all applicable Federal, State and local laws and regulations.

- B. Fabricator Qualifications: The steel fabricator shall be certified through the AISC Certification Program and designated as an AISC Certified Plant, Category STD, at time of bid.
- C. Erector Qualifications: The steel erector shall be a qualified installer who has participated in the AISC Certification Program and is designated as an AISC Certified Erector, Category CSE, at time of bid.
- D. Design of structural steel connections for which connection details or beam reaction values are not shown on the Contract Drawings shall be performed under the direct supervision of a licensed Professional Engineer registered in the State of New York and experienced in the structural design of structural steel connections.
- E. Testing and Inspection
  - 1. All welding operations and tensioning of high strength bolts, including material and fabrication procedures, shall be subject to special inspection in the mill, shop and field in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
  - 2. Special Inspections
    - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes, shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the New York City Construction Codes.
    - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.

- c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections.
  - d. The Contractor shall coordinate with the Commissioner to provide access and schedule the work for inspection by the Special Inspector.
3. Shop inspections may be made by the Special Inspector at their discretion. Provide at least 72 hours written notice to the Special Inspector prior to the beginning of any fabrication work so that inspection may be provided. Furnish all facilities for the inspection of materials and workmanship in the shop, and allow the inspectors free access to the necessary parts of the work.
- a. Special Inspectors shall have the authority to reject any material or work that does not meet the requirements of this Section.
  - b. Inspection at the shop is intended as a means of facilitating the work and avoiding errors, but it is expressly understood that it will in no way relieve the Contractor from the responsibility for furnishing proper materials or workmanship specified herein.
4. The Commissioner may elect to accept certificates of compliance for materials and products in lieu of specified testing procedures, except for materials and procedures for which special inspection is required.
5. Bolting
- a. The Special Inspector will inspect all field-assembled bolted construction in accordance with Section 9 of the "Specification for Structural Joints Using ASTM A325 or A490 Bolts." The Special Inspector may verify the tightening of bolts by visual verification of the load indicator washer, by use of a direct tension indicator, or by using an inspection wrench in accordance with Section 9 of the "Specification for Structural Joints Using ASTM A325 or A490 Bolts." The inspection wrench shall be used on the element turned to initially tighten the bolt.
  - b. Rejected bolts shall be either replaced or retightened as required. In cases of disputed bolt installation, the bolts in question shall be checked by a calibrated wrench certified by an independent testing laboratory. The cost of certification shall be at the Contractor's expense.
6. Welding Requirements
- a. All welding shall be performed by ANSI/AWS certified welders under the immediate supervision of a representative of the Special Inspector.

Cooperate with and assist the Special Inspector in the performance of its duties.

- b. All shop and field welds for structural steel will be visually inspected by an ANSI/AWS qualified welding inspector under the direction of the Special Inspector. The inspector will be an ANSI/AWS Certified Welding Inspector in accordance with the requirements specified in Section 6 of ANSI/AWS D1.1. The Special Inspector will furnish a letter of certification for each welded connection stating that these requirements have been met.
  - c. A minimum of ten (10) percent of all fillet welds greater in size than 5/16-inch and one-hundred (100) percent of partial and complete penetration welds which extend continuously for 24 inches or less will be completely tested by the Special Inspector. All butt and bevel welds which extend continuously for more than 24 inches will be spot tested at intervals not exceeding 36 inches. Acceptable non-destructive testing (NDT) methods shall be Radiographic Testing (RT), Ultrasonic Testing (UT) and Magnetic Particle Testing (MT) each being performed in accordance with ANSI/AWS D1.1, Chapter 6, Part D.
  - d. Welds that are required by the Special Inspector to be corrected shall be corrected or redone and retested as directed, at the Contractor's expense and to the satisfaction of the Special Inspector.
- F. Certifications: Certified mill test reports or certified tests made by the fabricator or a testing laboratory for structural steel in accordance with ASTM A6 and the governing specification shall constitute evidence of conformity with the ASTM Specification.
- G. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- H. Site Safety
- 1. Accept total responsibility for structural steel erection procedures and health and safety of the work force.
  - 2. Comply fully with OSHA workplace safety requirements and regulations and those of other authorities having jurisdiction.
  - 3. Provide and maintain OSHA-approved fall protection during erection of structural steel.
- I. Responsibility for Errors: Accept responsibility for errors of detailing and fabrication and for the correct fit of the work.

- J. Remedial Action: Promptly remove and replace materials, fabrications and workmanship found defective and provide new acceptable work in accordance with Contract requirements.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Delivery: Deliver materials to the site in an undamaged condition and at such intervals as will avoid delay in the work.
- B. Exercise care to avoid bending, scraping, and overstressing the steelwork. Block with wood or otherwise protect projecting parts likely to be bent or injured.
- C. Mark weight on all members. Match-mark all shop pre-fitted members.
- D. Ship small parts, such as rivets, bolts, nuts, washers, pins, fillers, and small connecting plates and anchors, in boxes, crates, or barrels. Pack separately each length and diameter of bolt and each size of nut and washer. Plainly mark an itemized list and description of contents on the outside of each container.
- E. Load, transport, unload, and store structural steel material in such a manner that the metal is kept clean and free from injury. Store material above ground on platforms, skids, or other supports, and cover and protect it from corrosion.
- F. Identify materials by heat and lot, if applicable.
- G. Replace pieces bent or damaged unless repairs are authorized by the Commissioner.

#### 1.08 PROJECT CONDITIONS

- A. General: Examine the areas and conditions under which structural steel is to be installed and notify the Commissioner promptly in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until disputed conditions, discrepancies and/or damages have been corrected, unless otherwise directed by the Commissioner.
- B. Field Measurements
  - 1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
  - 2. Take sufficient field measurements prior to preparation of Shop and Working Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.

3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 STRUCTURAL STEEL

- A. Provide structural steel in accordance with the following specifications as applicable and as indicated on the Contract Drawings.
  1. General Requirements: ASTM A6
  2. Structural Steel Wide Flange Shapes
    - a. Carbon Steel: ASTM A572, Grade 50 or ASTM A992 except ASTM A709, Grade 50 at exterior access ramps
    - b. Stainless Steel: ASTM A276, Type 304L
  3. Structural Steel Channels, Angles, Plates and Bars
    - a. Carbon Steel: ASTM A36 or ASTM A572, Grade 50
    - b. Stainless Steel: ASTM A167, Type 304L
  4. Rectangular or Square Tubing
    - a. Carbon Steel: ASTM A500, Grade B, Structural Grade ( $F_y = 46$  ksi)
    - b. Stainless Steel: ASTM A554, Seamless, Structural Grade
    - c. All members shall be furnished full length without splices unless otherwise noted or accepted by the Commissioner.
  5. Steel Pipe: ASTM A53, Grade B, Type S, black finish, extra strong (XS) or double extra strong (XXS) weight as indicated on the Contract Drawings.
  6. Steel Armor Plate for Pushwalls: Provide special abrasion resistant AR400 alloy steel plate for push wall protective facing; achieve desired properties through quenching and tempering of hardened wear resistant grade of abrasion resistant steel plate; provide hardened surface with smooth dark scale finish; brinell hardness between 360 and 440; minimum tensile strength of 180 ksi; nominal 140 ksi yield strength; sized in panels of the dimensions indicated on the Contract Drawings; leave exposed and unexposed surfaces unpainted.

7. Steel Armor Plate for Curbs and Loading Slots: ASTM A36 or ASTM A572, Grade 50 plate, as shown on the Contract Drawings. Galvanize after fabrication in accordance with ASTM A123.
  8. Anchor Bolts: ASTM A307, Grade C; ASTM A449 or ASTM F1554, Grade 36 or 55, non-headed type unless indicated otherwise, either bent or straight as indicated on the Contract Drawings. Galvanize anchor bolts, rods, nuts and washers under the supervision of the bolt manufacturer in accordance with ASTM A153, Class C.
  9. Sag and Hanger Rods: ASTM A307, Grade C, threaded each end, as shown on the Contract Drawings. Galvanize sag and hanger rods, nuts and washers in accordance with ASTM A153, Class C.
- B. Be advised that where specified structural steel shapes conforming to ASTM A36 are not readily available, ASTM A992 or ASTM A572 Grade 50 (with special requirements) may be substituted at no additional cost to the City of New York.

## 2.02 FASTENERS

- A. General: Furnish bolts, nuts and washers for a given grade and diameter of bolt from a single domestic manufacturer. For each diameter, only one grade may be used. Ship bolting materials to the job site in the bolt manufacturer's unopened containers with nuts and washers assembled and lot numbers marked on the container.
- B. Provide bolts and nuts that conform to applicable dimensional requirements of ANSI B18.2.1 for bolts and B18.2.2 for nuts.
- C. High Strength Bolts: Provide high-strength bolts conforming to the requirements of ASTM A325, Type 1, plain, for all bolted structural joints except where standard bolts conforming to ASTM A307 are specifically permitted on the Contract Drawings.
- D. Nuts: Nuts for ASTM A325 bolts shall conform to ASTM A563, Grade C, D, or DH or ASTM A194, Grade 2 or 2H.
- E. Washers: Hardened washers shall conform to ASTM F436 and the requirements of the Specification for Structural Joints Using ASTM A325 Bolts.
- F. Direct Tension Indicators: Compression-washer-type direct-tension indicators conforming to ASTM F959.
- G. Standard Carbon Steel Bolts and Nuts: Provide carbon steel bolts, where indicated on the Contract Drawings, meeting the requirements of ASTM A307, hex, Grade A or B. Nuts for A307 bolts shall conform to ASTM A563, Grade A.

- H. Anchor Bolts: ASTM A307, Grade C; ASTM A449 or ASTM F1554, Grade 36 or Grade 55, non-headed type unless indicated otherwise, either bent or straight as indicated on the Contract Drawings. Galvanize anchor bolts, rods, nuts and washers under the supervision of the bolt manufacturer in accordance with ASTM A153, Class C.
- I. Round Washers (other than those in contact with high-strength bolt heads and nuts): Provide round washers in accordance with ANSI B18.22.1.
- J. Beveled Washers (other than those in contact with high-strength bolt heads and nuts): Provide square, smooth and sloped washers to make contact surface of bolt head and nut parallel.
- K. Steel Plate Washers: Fabricate from ASTM A36 or ASTM A572 Grade 50 structural grade plate or bar for use in oversized, short-slotted and long-slotted holes. Conform to ASTM standards and the requirements of the Specification for Structural Joints Using ASTM A325 or A490 Bolts. Plate washers need not be fabricated from hardened steel.
- L. Stainless Steel Bolts: Provide stainless steel bolts conforming to ASTM F593 with nuts conforming to ASTM F594.
- M. Stainless Steel Coupling Nuts: Provide stainless steel coupling nuts conforming to the dimensions indicated on the Contract Drawings.
- N. Stainless Steel Screws: Provide stainless steel buttonhead screws conforming to the dimensions indicated on the Contract Drawings.
- O. Lubricant for Bolts: Provide molybdenum disulfide base lubricant for bolts.

## 2.03 WELDING ELECTRODES

- A. Use E70XX electrodes in conformance with ANSI/AWS Code. For field welding, use low hydrogen E70XX electrodes. No field welding will be permitted except where indicated on approved Shop Drawings and approved by the Commissioner.
- B. Use E316 electrodes for welding Type 316 stainless steel.
- C. Use E309 electrodes for welding stainless steel to carbon steel.

## 2.04 MISCELLANEOUS STEEL PRODUCTS

- A. Headed Anchors (Welded Studs): Provide weldable headed anchors meeting the requirements of ASTM A108 in accordance with ANSI/AWS D1; of the diameter and length shown on the Contract Drawings.

- B. Mechanical Expansion Anchors: Provide wedge-type mechanical expansion anchors manufactured from AISI 304 stainless steel meeting the requirements of Fed. Spec. A-A-1923 (formerly FF-S-325, Group II). Anchor may be headed, threaded or countersunk depending on intended use.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. HAD-P Undercut Anchor, Hilti, Inc., Tulsa, OK
    - b. TruBolt Wedge Anchors, ITW Red Head, Glendale Heights, IL
    - c. Strong Bolt, Simpson-Strong Tie Anchor Systems, Columbus, OH
    - d. Or approved equal
- C. Chemical Adhesive Anchors: Provide chemical adhesive anchors that consist of a stud-type, all-thread anchor rod, nut and washer, manufactured from AISI 304 stainless steel, and a two-part vinyl ester or structural epoxy resin adhesive and an amine-based hardener.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Epcon G5 Adhesive Anchoring System, ITW Red Head, Addison, IL
    - b. HVA Capsule Adhesive Anchoring System, Hilti, Inc., Tulsa, OK
    - c. Set-XP Epoxy-Tie, Simpson-Strong Tie Anchor Systems, Columbus, OH
    - d. Or approved equal
- D. Crane Rails and Accessories (Maintenance Bay): Furnish ASCE crane rail for maintenance bay crane designated for bridge crane runway service and conforming to crane rail manufacturer's material specifications and tolerances. Nominal weight of crane rail shall be as given on the Contract Drawings unless recommended otherwise by the approved bridge crane manufacturer. Furnish bolted splice bars fabricated as required to provide tight joints with finished rail ends. Provide adjustable bolted clip and filler type connection assembly in pairs with welded studs or machine bolts and self-locking nuts or nuts and lock washers. Floating type rail attachments will not be permitted.
1. Crane rails required for carriage track system and gantry crane rail system are not included in this Section but are specified in Sections 05660 and 05675, respectively.
  2. Furnish crane bumper stops and neoprene rubber bumper facing block as shown and located on the Contract Drawings.

- E. Removable Pipe Bollards: Provide prefabricated, removable pipe bollards that consist of round galvanized steel pipe that projects 36" above the floor surface and a flush-mounted, galvanized steel sleeve with flange and integral hinged locking lid. Provide either 3-1/2" O.D. by 0.216" wall thickness or 4" O.D. by 0.237" wall thickness pipe for portion of bollard that projects above the floor surface. Exposed portions of bollard shall be painted safety yellow. Bollard may be either twist-in or drop-in type. Provide removable padlock to lock bollard to sleeve when installed.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. TrafficGuard Round Post "Top-Lock" (Item No. TL1004RL), TrafficGuard Direct LLC, Geneva, IL
- b. External Padlocking/Removable Bollard (Item No. IBP4040), Cal Pipe Manufacturing, Hammond, IN
- c. Removable Posts w/Inserts and Flip Top (Model 102), ATEC Diversified Welding and Fabrication, Evansville, WY
- d. Or approved equal

## 2.05 NON-SHRINK GROUT

- A. Provide non-shrink grout in accordance with the provisions of Section 03300 - Cast-in-Place Concrete.

## 2.06 GALVANIZING REPAIR PAINT

- A. Provide high zinc-dust/zinc oxide content paint for repair of damaged galvanized surfaces and field touch-up of welds that meets the following requirements:
1. One application shall provide a minimum dry coating thickness of 2.0 mils.
  2. Dried film shall have a minimum zinc dust content equal to 94% by weight.
  3. The applied coating shall provide barrier protection and be anodic to steel.
  4. The coating may be applied under both shop and field conditions.
  5. The product used shall be approved by the galvanizer and shall be compatible with the galvanized surfaces and inert in concrete.

B. Products: Subject to compliance with requirements, provide one of the following:

1. ZRC, Z.R.C. Worldwide, Quincy, MA
2. Zinc Clad; Sherwin Williams, Cleveland, OH
3. Or approved equal

### PART 3 EXECUTION

#### 3.01 FABRICATION

A. General

1. The fabricator shall provide an affidavit stating that the structural steel furnished meets the requirements of the grade specified. All unidentified steel will be rejected and shall be removed from the site and replaced by the Contractor, at no additional cost to the City of New York.
2. Fabricate and shop-assemble work in accordance with AISC Specification for Structural Steel Buildings; Code of Standard Practice for Steel Buildings and Bridges; and Specification for Structural Joints Using ASTM A325 or A490 Bolts.
3. Members shall be straight and shall fit closely together. The finished work shall be free from burrs, twists, bends, open joints and other imperfections.

B. Connections

1. Unless noted otherwise herein or on the Contract Drawings, all beam connections shall be designed for reaction values indicated on the Contract Drawings.
2. Wherever beam reaction values or connection details are not shown, design the minimum connection to support one-half (50%) of the total uniform load capacity tabulated in the AISC tables for allowable loads for laterally supported beams for the given shape, span, and steel specified for the beam in question. Where the number of bolts is not indicated, connections shall be full depth. Design of structural steel connections for which connection details or beam reaction values are not shown on the Contract Drawings shall be prepared under the supervision of a licensed Professional Engineer registered in the State of New York.
3. Use high-strength bolted connections of the size and type indicated on the Contract Drawings. Use beveled washers against sloping flanges. Contact joint surfaces of friction-type bolted connections shall be free of oil, lacquer or other contaminants.

4. Bolted connections for secondary members (such as girts and stair framing) may be made with 3/4-inch diameter machine bolts conforming to ASTM A307.
  5. Gusset plates and connection angles shall be 3/8" minimum in thickness.
  6. Beam-splice connections are not permitted unless shown on the Contract Drawings.
  7. Where a beam connection is required to carry moment, design the connection for the allowable moment capacity of the smallest connected member.
- C. Bracing and bracing connections shall have a minimum of two bolts or the equivalent in weld strength unless otherwise shown on the Contract Drawings or approved Shop Drawings.
- D. Bearing stiffeners and stiffeners intended to support concentrated loads shall have full bearing on flanges to which they transmit load and on those from which they receive load. Mill or grind stiffener bearing surfaces. On weldable steel in compression areas of flanges, stiffeners may be welded as indicated. Stiffeners not located at points of concentrated loads shall be tight to that degree which will exclude water after being painted, unless otherwise indicated.
- E. Indicated steel dimensions are those which shall exist when ambient worksite temperature is 60E F. Dimensions at fabrication time shall be based on the formula:

$$L = D[1+ET]$$

where     L = Dimension at fabrication time, in inches.  
           D = Indicated steel dimensions, in inches.  
           E = 0.0000065  
           T = T(fab) - 60  
           T(fab) = Temperature at fabrication time in °F

- F. Plane sheared edges of plates thicker than 5/8" and carrying calculated stress to a depth of 1/4". If so indicated, face abutting joints and bring those joints to an even bearing. Build floor beams, stringers, and girders having end connection angles to exact length, back-to-back, of connection angles. If end connections are faced, finished thickness of angle shall be not thinner than that indicated. Machine-flatten metal bearing surfaces which will contact cement mortar grout to within 1/8" tolerance in 1" and to within 3/16" overall.
- G. Welding: Perform welding in accordance with ANSI/AWS D1.1 except as modified herein.
1. Perform procedure and sequence of welding so as to avoid unnecessary distortion and minimize stresses.

2. Make allowance in shop for expected weld shrinkage in laying out and assembling members. Trim members to size only when most or all of welding has been completed.
3. Repair defective welds by chipping or melting out such defects from one or more sides of joint as required removing only weld metal necessary to correct defect. Reweld and have weld tested, as directed by the Commissioner and at no additional cost to the City of New York.

H. Crane Rails and Attachments (Maintenance Bay)

1. Furnish crane rails for maintenance bay crane in standard and odd lengths as required to provide staggered joints on opposite sides of the crane runway and with due consideration to the wheelbase dimension of the approved bridge crane. Odd lengths required to complete a run or obtain the necessary stagger shall not be less than 10 feet long.
  2. Finish rail ends by milling or grinding to obtain tight splice joints. Perform special crane rail drilling and joint bar punching as required to match the pieces and provide tight splice joints.
  3. Fabricate adjustable bolted clip and filler type connection assemblies to permit longitudinal and controlled transverse movement through clamp clearances and filler adjustment. Conform to crane rail manufacturer's recommendations for bolt size, gage and detailed fabrication. Floating type rail attachments will not be permitted.
  4. Fabricate crane bumper stop and neoprene rubber bumper facing as detailed on the Contract Drawings.
- I. Mill or saw cut columns at bearing ends. Protect surfaces of bearing ends from corrosion. Holes in column base plates shall be 5/16" larger diameter than bolt size to allow for field adjustment unless otherwise indicated on the Contract Drawings.
- J. Provide holes in structural steel members required for anchors, anchor bolts, bolt holes, connection angles, supports and braces for stair stringers, equipment apparatus, sag rods, or other members noted on the Contract Drawings shall be provided by the fabricator and detailed on the Shop Drawings.
- K. Provide holes required for securing other work to structural steel framing, and for passage of other work through steel framing members, where indicated on the Contract Drawings. Cut, drill or punch holes perpendicular to metal surfaces. Do not flame cut holes or enlarge holes by burning. Drill holes in bearing plates.
- L. Provide slotted or oversized holes in framing members where indicated on the Contract Drawings or where necessary to facilitate steel erection. Hole sizes and slot lengths shall conform to AISC standards.

- M. Where shop assembly of field connections is shown, specified or required, the unmatched holes shall be reamed and the pieces match-marked before disassembly. The interchange of matching parts will not be permitted.
- N. The Special Inspector will visually inspect all field welds, except puddle welds, and test ten (10) percent of all field welds by appropriate non-destructive testing method as described in ANSI/AWS D1.1. Acceptance criteria shall be as defined in ANSI/AWS D1.1.

### 3.02 PROTECTIVE COATINGS

- A. Examination: At the request of the City of New York, provide access and pay all costs for the Special Inspector and the Commissioner to visit the fabricator's facility to inspect structural steel immediately prior to painting operations.
- B. Surface Preparation: After fabrication and before painting or galvanizing, clean new and existing steelwork to be painted or galvanized by removing loose rust, loose mill scale, and spatter, slag or flux deposits. Clean new structural steel prior to galvanizing and existing steel prior to painting in accordance with SSPC-SP 10 and SSPC-SP 6, respectively.
- C. Galvanizing: Hot-dip galvanized structural steel products and appurtenances indicated on the Contract Drawings to be galvanized after fabrication in accordance with ASTM A123 and A153, as applicable. Fabricate products either complete or in largest practical sections before galvanizing. Weight of zinc coating shall be Coating Grade 85 (2.0 oz. per square foot) as specified in ASTM A123, Section 6.
  - 1. Advise the galvanizer, in writing, that the galvanized steel surfaces will be painted after galvanizing.
  - 2. Coordinate with the galvanizer to locate and provide adequately sized drainage holes for welded assemblies as required.
  - 3. Portions of new steel surfaces to be machined or field welded shall be masked off to exclude galvanizing.
  - 4. Stainless steel shall not be galvanized.
- D. Shop Painting
  - 1. Perform shop painting in accordance with the requirements of Sections 09911, 09912 or 09967, as applicable.
  - 2. Shop paint new structural and miscellaneous steel not otherwise galvanized or coated as specified herein, except as given below.
    - a. Apply structural steel primer paint to all new steel surfaces including those to be encased in concrete or those that will receive cementitious or

intumescent mastic fire-resistive materials but not those to be machined or welded.

- b. Ensure that the approved primer is compatible with the approved cementitious or intumescent mastic fire-resistive materials as described in Section 07811 - Sprayed Fire-Resistive Materials.
- c. Primer paint shall be applied to faying surfaces (i.e. contact surfaces) at high-strength bolted with slip-critical (friction-type) connections provided that the coating is certified to provide a Class A or Class B faying surface in accordance with the test method adopted by Research Council on Structural Connections (RCSC) as presented in the "Specification for Structural Joints Using ASTM A325 or A490 Bolts."
  - (1) Section 5.4 of the RCSC specification defines a Class A faying surface as an uncoated clean mill steel surface or blast-cleaned steel surface protected by a Class A coating with a coefficient of friction not less than 0.33.
  - (2) A Class B faying surface is similarly defined as an uncoated blast-cleaned steel surface or a surface protected by a Class B coating on blast-cleaned steel with a coefficient of friction not less than 0.50.
- d. If coating requirements of sub-paragraph 3.02.D.2.c, above, cannot be met, faying surfaces at slip-critical connections shall be masked off to exclude paint including inadvertent overspray. Uncoated faying surfaces shall be free of scale, except tight mill scale, and free of coatings in areas closer than one bolt diameter but not less than one inch from the edge of any hole and in all areas within the bolt pattern.

### 3. Shop Coat

- a. Prime Coat: Immediately after surface preparation, apply shop prime paint as specified in Sections 09911, 09912 or 09967, as applicable, and in accordance with manufacturer's instructions. Use painting methods that result in full coverage of joints, corners, edges and exposed surfaces.
- b. Intermediate Coat: Apply structural steel intermediate coat to all new steel surfaces except those to be machined, welded, or high-strength bolted with slip-critical (friction-type) connections, encased in concrete or those that will receive sprayed fire-resistant materials. Mask the entire faying surface between parts at high-strength bolted connections to prevent overspray of intermediate coat onto primed faying surfaces.
- c. Finish painting of structural steel shall be performed in the field as specified in Sections 09911 - Exterior Painting, 09912 - Interior

Painting or 09967 – Coatings for Steel Waterfront Structures, as applicable.

- d. Stainless steel shall not be primed or painted.

E. Field Painting

1. Plies of slip-critical joints with coated faying surfaces shall not be assembled before the coating has cured for the minimum time that was used in the coating qualifying tests.
2. Field painting shall not proceed until all erection is complete including field bolting and field welding unless otherwise permitted by the City of New York.
3. Touch-up paint shop coated surfaces damaged during erection, exposed surfaces of fasteners and field welds with prime coat paint specified for the shop.
4. Apply intermediate and final coats in accordance with Sections 09911 – Exterior Painting, 09912 – Interior Painting or 09967 – Coatings for Steel Waterfront Structures, as applicable.

3.03 ERECTION

- A. Erection shall be in accordance with the Contract Documents, AISC Manual of Steel Construction, AISC Code of Standard Practice for Steel Buildings and Bridges, OSHA 29 CFR Part 1910 and Part 1926, and any other applicable state, municipal, or local regulations or codes.
- B. Report any damage caused during erection to the Commissioner. Complete corrective measures as directed by the Commissioner at no cost to the City of New York.
- C. Do not place temporary erection loads or permanent loads on any incomplete portions of the structure being erected unless it can be demonstrated by analysis in writing that the contemplated action is safe.
- D. Keep loose timbers, metal sheeting, bolt buckles, tools, debris, and temporary scaffolding restrained or removed from work areas. Assume responsibility for securing all equipment and materials within the steel erector's care, custody, and control during the erection operation.
- E. Maintain the job site in clean and safe condition at all times and properly dispose of, off premises, all crating, waste materials, and other refuse which has accumulated as a result of erection activities.

- F. Perform lifting of painted structural members with a non-abrasive choker.
- G. Keep a daily record, by piece number, of all material erected.
- H. Before commencing work, check foundations and other connection points to confirm their location, orientation, elevation, and condition.
- I. Anchor Bolts
  - 1. All anchor bolts for structural steel erection and other incidental items of the structural steel required to be built into concrete shall be properly set and securely held in position in the forms before the concrete is placed.
  - 2. Install anchor bolts accurately in position shown on the approved erection drawings within the permissible dimensional variations given in the AISC Code of Standard Practice.
  - 3. If anchor bolts are cast in substructure when it is being constructed, ensure that they are firmly held in their correct position and elevation by suitable templates. Set anchor bolts accurately to the template to provide suitable projection above concrete and/or grout as specified in AISC Code of Standard Practice. Set anchor bolts perpendicular to the theoretical bearing surface.
  - 4. If approval is given for installing anchor bolts in preformed holes or in drilled holes in concrete or masonry, use approved epoxy resin product as specified in Section 03300 - Cast-in-Place Concrete, for securing them in place.
  - 5. Where misalignment between anchor bolts and bolt holes in steel members is encountered, notify the Commissioner immediately. Submit a method to remedy the misalignment for review and approval by the Commissioner.
- J. Align column bases with leveling nut and steel shims as required. Shim bearing plates for beams and similar structural members with steel wedges or shims. Allowable deviation from a true horizontal plane shall not exceed 1/8" in 12 inches. After the supported members have been aligned and properly positioned and the anchor nuts have been tightened, fill the entire area under bearing plates with non-shrink grout material. Follow written procedures of the grout manufacturer.
- K. Erect steel structures true and plumb following the match marks.
- L. Use temporary supports and bracing to stabilize the structure against construction loads and all external imposed loads to which the structure may be subjected, including those from erection equipment or the operation of the same as specified in Division 1 - General Requirements. Field connections for structural steel falsework shall be made with ASTM A325 or A490 bolts with slip-critical (friction-type) connections. Leave temporary supports and bracing in place as long as may be

required for safety and, in any case, until all structural framing members are permanently installed.

M. Misfits at Bolted Connections

1. Where misfits in erection bolting are encountered, the Commissioner shall be immediately notified. Submit a method to remedy the misfit for review by the Commissioner. The Commissioner will determine whether the remedy is acceptable or if the member is required to be refabricated.
2. Incorrectly sized or misaligned holes in members shall not be enlarged by burning or by the use of drift pins. Notify the Commissioner immediately and submit a proposed method of remedy for review by the Commissioner.

N. Field Assembly

1. All materials shall be properly worked and match-marked for field assembly. Where finishing is required, complete assembly including bolting and welding of units before start of finishing operations.
2. Splice only where indicated on the approved Shop Drawings.
3. Align and adjust members forming parts of a complete assembly after assembly and before fastening.
4. Thoroughly clean surfaces to be joined together.
5. Fasten splices of compression members after the abutting surfaces have been brought completely into contact.
6. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
7. All field connections shall be accurately fitted up before being bolted. Limit drifting only to the extent that will bring the parts into position and not cause enlargement of the holes or distortion of the metal. Drill or ream all unfair holes.

O. Report immediately to the Commissioner errors in shop fabrication or deformation resulting from handling or transportation which prevents the proper erection and fitting of parts.

P. Grouting of Base Plates and Bearing Plates: All loose column base plates and billets shall be accurately set to the designated levels on steel wedges or angle screeds in preparation for grouting.

1. Prior to the placement of non-shrink grout beneath base and bearing plates, clean the bottom surface of the plates of all foreign materials, and clean concrete and masonry bearing surfaces of all foreign materials and roughen surface to improve bonding.
  2. Tighten anchor bolts after the supported members have been positioned and plumbed and the non-shrink grout has attained its specified strength.
  3. Grout base plates with non-shrink grout to assure full uniform bearing. Perform grouting prior to placing loads on the structure.
- Q. As erection progresses, perform sufficient bolting of the work to support dead load, wind load and erection loads. Perform permanent bolting when final alignment is completed.
- R. Ensure that holes are not enlarged and that the drifting done during assembly does not disturb or damage the metal in the vicinity of the holes.
- S. Enlarge holes to admit bolts for connections only if approved by the Commissioner. Make enlargements by reaming or drilling and not by burning. Avoid hand reaming. Do not burn holes through in the field to accommodate bolts.
- T. Do not weld main stress members in the field unless otherwise indicated on the Contract Drawings or on reviewed Shop Drawings.
- U. Bolted Connections
1. Install high-strength bolts in accordance with the "Specification for Structural Joints Using ASTM A325 or A490 Bolts."
  2. Furnish and install high-strength bolts, washers and nuts in conformity with all resolutions of the Board of Standards and Appeals, relevant sections of the New York City Building Code, Local Law 76/2008, and the latest rules relating to high-strength bolts by the New York City Buildings Department.
  3. Use indicator washers as the approved direct tension indicator at the Contractor's option. Direct tension indicator washers shall be installed according to the manufacturer's published specifications.
  4. Do not inter-mix mechanically galvanized bolts and nuts with hot-dip galvanized nuts and bolts.
  5. Color code, die punch, or otherwise mark the ends of torqued bolts indicating that the bolts have been properly tensioned and are ready for inspection.
  6. Alternate Fastener Systems for Field Bolted Connections (Tension Control Bolts) - Tension Control (T/C) Bolts may be used for field connections only,

at the Contractor's option at no additional cost to the City of New York, provided that the following criteria are met:

- a. Supply all bolts from a single manufacturer and with a single specified head marking representing that manufacturer. Submit this marking to the Commissioner for its record. Other T/C bolts with different markings will be rejected.
- b. Submit bolt certifications for all bolts, nuts and washers to the Commissioner certifying their compliance with ASTM A325 or ASTM A490.
- c. Bolt testing for both chemical and physical properties shall be performed upon a random selection of T/C bolts as selected by the Commissioner. A minimum of five (5) bolts will be randomly selected and tested in accordance with ASTM A325 or A490.
- d. Submit installation procedures for tightening, retightening and removal of T/C bolts to the Commissioner for their review. These procedures and any comments generated shall be agreed to and implemented in the field.
- e. Keep a "Skidmore" wrench at the site at all times for the purpose of calibration of the wrenches in the morning and afternoon in the presence of the Commissioner.
- f. Guidelines and procedures for testing and inspection of the T/C bolts shall be reviewed in a pre-construction conference.

#### V. Welded Connections

1. Weld in accordance with ANSI/AWS D1.1, except as modified herein. Bolts for temporarily fastening welded splices and welded connections shall be either tightened securely and left in place or removed and the holes filled with high strength bolts and fully torqued. If left in place, burn off portion of bolt which projects beyond nut. If bolt does not project beyond nut, tack weld end of bolt to nut. Burn off and tack weld before painting. Location and number of welded splices shall be as indicated on the Contract Drawings or on approved Shop Drawings.
2. Make all welds continuous unless alternate welding procedures are shown on the approved Shop Drawings or approved in writing by the Commissioner.
3. Field Welds: Surfaces within 2 inches of any field weld location shall be free of materials that would prevent proper welding or produce objectionable fumes while welding is being done.

- W. Stud Shear Connectors: Prior to welding stud shear connectors, prepare steel surfaces as recommended by the manufacturer of the connectors. As a minimum, remove any paint, oil, grease, loose mill scale and any other substance that may impair the proper welding of the stud. Weld only on dry surfaces. Weld connectors at the spacing shown on the Contract Drawings. Use automatic end welding of stud shear connectors in accordance with the manufacturer's printed instructions.
- X. Crane Rails and Attachments (Maintenance Bay)
1. Install crane rails on crane girder in conformance with approved layout and attachments. Stagger rail splices on each side of crane runway; do not locate rail splices at columns or over crane girder discontinuity. Attachments shall conform to CMAA Specification 70.
  2. Install crane bumper stops and rubber bumper facing as shown on the Contract Drawings. Weld to crane rails at the required locations in accordance with the details shown on the Contract Drawings.
- Y. Cutting and Burning: The use of a gas cutting torch in the field for correcting fabrication errors will not be permitted on a stress-carrying structural steel member. Its use may be permitted on other members if the member is not under stress, and only after the written approval of the Commissioner has been obtained.
1. No cutting of structural steel members in the field will be allowed except by written approval of the Commissioner.
  2. All cutting shall be done with an oxyacetylene torch in conformity with the New York City Building Code, Local Law 76/2008 and the latest rules of the Board of Standards and Appeals.
- Z. Install mechanical expansion anchors and chemical adhesive anchors in strict accordance with the manufacturer's written instructions and recommendations.

### 3.04 FIELD QUALITY CONTROL

- A. Perform pertinent field inspection and testing specified in Article 1.06.E and 1.06.F.
- B. Correction of Defects
1. Report immediately to the Commissioner errors in shop fabrication or deformation resulting from handling or transportation which prevents the proper erection and fitting of parts.
  2. No packing, shimming, filling, or wedging will be permitted to correct defects unless approved by the Commissioner.

3. Provide a sufficient quantity of shim plates to fill the spaces at field bolted connections. Maximum total thickness shall not exceed tolerances permitted by the AISC Code of Standard Practice.
4. Repair damaged areas of hot-dip galvanized surfaces with approved zinc cold galvanizing compound.
  - a. Surface Preparation: Remove foreign matter from damaged area and from adjacent undamaged area. Solvent clean per SSPC-SP1 followed by power tool cleaning per SSPC-SP3.
  - b. Immediately thereafter, apply cold galvanizing compound to the prepared area at the rate of 2.0 mils dry film thickness (400 square feet/gallon).
5. Repair all fielding storage, handling and erection damage to shop-applied paint coatings in accordance with the appropriate painting specification Sections 09911 – Exterior Painting, 09912 – Interior Painting and 09967 – Coating for Steel Waterfront Structures. Paint all galvanized bolt assemblies tightened against shop-applied paint.

C. Non-conforming Work

1. Repair or replace non-conforming structural steel work as directed by the Commissioner and at no additional cost to the City of New York.
2. Promptly remove and replace materials, fabrications and workmanship found defective and provide new acceptable work in accordance with applicable Contract requirements.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05311**  
**STEEL FLOOR DECK**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install non-cellular composite steel floor decking, non-composite steel form decking and appurtenant items, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. This Section includes, but is not limited to, the following items:
  - 1. Composite Steel Floor Deck Units
  - 2. Non-Composite Steel Form Deck Units
  - 3. Galvanized Finish
  - 4. Formed Metal Closure Strips or Plates
  - 5. Formed Metal Cover Plates
  - 6. Welding Washers
  - 7. Sheet Metal Accessories
  - 8. Galvanizing Repair Paint
- C. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- D. Steel roof deck is not included in this Section, but is specified in Section 05312 – Steel Roof Deck.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03200 - Concrete Reinforcement
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 05120 - Structural Steel

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Iron and Steel Institute (AISI)
    - a. AISI Specification for the Design of Cold-Formed Steel Structural Members

## 1.04 DESIGN AND PERFORMANCE REQUIREMENTS

### A. General

1. General: The Steel Deck Institute Design Manual for Composite Decks, Form Decks and Roof Decks shall govern the work under this Section unless noted otherwise.
2. Design Basis: The minimum depth, gauge and sectional properties of each type of steel floor deck required shall be as indicated on the Contract Drawings. The concrete slab thickness and reinforcement for composite steel floor deck shall be as indicated on the Contract Drawings.
3. Design Calculations: Provide manufacturer-certified structural calculations to verify that proposed steel floor deck meets minimum design requirements based on sectional properties calculated in accordance with AISI Specification for the Design of Cold-Formed Steel Structural Members. Coefficients for moments and deflections shall conform to the Steel Deck Institute Design Manual for Composite Decks, Form Decks and Roof Decks.
4. Deck units shall have a ribbed, non-cellular section providing a satisfactory surface for the reception of design loads. Wherever practicable, units shall be of sufficient length to span three or more supports.

### B. Allowable Deflection

1. Composite Floor Deck: Composite steel floor deck shall not exceed the maximum construction span recommended by the steel floor deck manufacturer under uniform design construction loads, including dead weight of wet concrete. Composite floor deck deflection under uniform design live load indicated on the Contract Drawings shall not exceed  $1/360$  of the span.
2. Non-Composite Form Deck: Non-composite steel form deck shall not exceed the maximum construction span recommended by steel floor deck manufacturer under uniform design construction loads, including dead weight of wet concrete. Non-composite form deck deflection under uniform design live load shall not exceed  $1/240$  of the span.

### C. Attachments: Install and anchor floor deck units to provide lateral stability to top flange of supporting members.

### D. Sectional Properties: Determine in accordance with AISI Specification for the Design of Cold-Formed Steel Structural Members. Compute properties of steel deck section on the basis of the effective design width as limited by the provisions of the AISI Specification. Calculated section properties shall be certified by the Steel Deck Institute. Provide not less than the metal deck section properties of the

acceptable products specified, including section modulus and moment of inertia per foot of width.

#### 1.05 SUBMITTALS

##### A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:

1. Shop and Working Drawings: Submit detailed Shop Drawings and Working Drawings which indicate, for each type of floor decking required, material description, steel sheet thickness, product designation, surface finish, dimensional cross-sectional profile, and computed structural properties to verify compliance with the specified requirements. Drawings shall show details of fabrication and erection, including various connections, layouts of deck units, placement directions, bearing on structural supports, anchorage details, attachment of accessories, each condition requiring closure panels, supplementary framing, cut openings, special jointing and other accessories as required to complete the work. Details shall conform to SDI Standard Practice Details to the extent applicable. Details and layout shall show location of supporting members, quantity and marking of deck units, size and location of holes and openings to be cut, and the location, type and sequence of welded connections.
2. Review of Shop Drawings and Working Drawings will be for general considerations only. Compliance with specified requirements for materials, fabrication and erection of metal decking shall be the Contractor's responsibility.

##### B. Certifications

1. General: Test requirements for materials as stated herein or incorporated in reference documents may be waived, provided that certified copies of test reports from approved laboratories performed on previously manufactured material are submitted for approval.
2. Manufacturer's Certifications: Submit manufacturer's certifications as may be required to show compliance with these specifications. Submit copies of mill test reports, including names and locations of mills and shops, covering the chemical and physical properties of the steel sheet to show compliance with these specifications. Test reports shall be accompanied by notarized certificates of compliance from the manufacturer certifying that the previously tested material is of the same type, quality and manufacture as that proposed for this project.
3. Certification of Welders: Provide certification that each welder has been qualified in accordance with ANSI/AWS D1.1 within the previous 12-month period.

- C. **Manufacturer's Data:** Submit manufacturer's specifications and installation instructions for each type of decking and accessory required, including sheet steel, floor deck units, galvanized mill finish, finish repair paint, welding electrodes, welding washers if proposed, fasteners, closure strips, cover plates, and similar items.
- D. **Qualifications Compliance:** Submit references and project information to demonstrate the proposed steel floor deck manufacturer and installation contractor's specialized experience on similar projects of comparable scope and complexity for a minimum of three years.
- E. Submit project-specific safety precautions proposed to prevent falls and provide fall protection during erection of steel floor deck.

#### 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. **Testing and Inspection**
  - 1. Welding of steel floor deck to structural steel framing shall be subject to special inspection in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
  - 2. **Special Inspections**
    - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
    - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related

costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.

- c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- C. Qualification of Manufacturer: Steel floor and form deck units and accessories shall be provided where indicated on the Contract Drawings and shall be the products of a single manufacturer who is regularly engaged in the manufacture of steel floor and form decking.
- D. Qualification of Installer: Steel floor and form deck units and accessories shall be installed by a reputable company specialized in such work with a minimum of three years of documented experience.
- E. Qualification of Welders: Each welder shall be currently qualified in accordance with ANSI/AWS D1.1. All welders performing work within city limits shall be certified by the City of New York in accordance with the latest rules of the New York City Board of Standards and Appeals and the current provisions of the New York City Building Code, Local Law 76/2008. A welder shall be retested and recertified when the welder certification is more than 12 months old and/or when the work of the welder creates a reasonable doubt as to proficiency. Such tests, when required, shall be conducted at no additional expense to the City of New York. Recertification of the welder shall be submitted only after the welder has taken and passed the required retest.
- F. Design floor deck layout, spans, fastening, joints and framed openings under the direct supervision of a licensed Professional Engineer registered in the State of New York and experienced in the structural design of steel decking.
- G. Testing and Inspection: Material and fabrication procedures are subject to inspection and tests in the mill, shop and field by the Commissioner. Such inspection and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- H. Factory Inspection: Except as specified otherwise in this paragraph, factory tests and inspections of materials for which inspections and tests are specified herein, or in referenced documents, will not be required provided that certified copies of factory test reports, which shall include manufacturer's certificates of compliance with all requirements of these specifications, are submitted to and approved by the

Commissioner. When the test reports are on materials previously manufactured, test reports shall be accompanied by notarized statements from the manufacturer certifying that the materials being furnished are identical with previously manufactured materials on which the factory test reports are based.

- I. Shop and Working Drawing Reviews: Obtain such reviews before custom fabrication is started and before delivery of materials to the project site.
  - J. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
  - K. Site Safety
    - 1. Accept total responsibility for floor deck erection procedures and health and safety of the work force.
    - 2. Comply fully with OSHA workplace safety requirements and regulations and those of other authorities having jurisdiction.
    - 3. Provide and maintain OSHA-approved fall protection during erection of composite and non-composite floor decking.
  - L. Responsibility for Errors: Accept responsibility for errors of detailing and fabrication and for the correct fit of the floor deck units.
  - M. Remedial Action: Promptly remove and replace materials, fabrications and workmanship found defective and provide new acceptable work in accordance with contract requirements at no additional expense to the City of New York.
- 1.07 PRODUCT DELIVERY, STORAGE AND HANDLING
- A. Delivery: Deliver materials to the site in an undamaged condition and at such intervals as will avoid delay in the work.
  - B. Storage: Store and protect material in a clean, properly drained location. Store material off the ground under a weather-tight covering permitting good air circulation. Store decking on dry wood sleepers, pallets, platforms or other appropriate supports; slope for positive drainage. Prevent distortion, excessive stresses, corrosion and other damage.
    - 1. Caution: Do not store materials on the structure in a manner that might cause distortion or damage to the supporting structure. The maximum uniform distributed storage load shall not exceed 20 pounds per square foot.
    - 2. Decking that is on-site but not yet installed shall be securely fastened to prevent sheets from becoming air-borne during periods of high wind and potentially causing damage or injury.

- C. Handling: Handle material safely and in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting.

## 1.08 PROJECT CONDITIONS

### A. Field Measurements

1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
2. Take sufficient field measurements prior to preparation of Shop and Working Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.
3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Galvanized Sheet Steel (for steel deck units): Provide sheet steel for galvanized metal deck units that conforms to ASTM A653 and ASTM A924, SQ Quality, Grade 33. Provide zinc-coated finish on both sides of deck that conforms to G90 Coating (0.90 ounces per square foot minimum total coating on both surfaces).
- B. Closure Strips or Plates, Metal: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 20 gauge, except as otherwise indicated.
- C. Cover Plates, Metal: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 20 gauge (but not less than the metal deck thickness), except as otherwise indicated.
- D. Welding Washers: Standard type compatible with decking furnished.
- E. Sheet Metal Accessories: ASTM A653, zinc-coated, G90 coating, Grade 33, commercial quality, of thickness indicated or as suitable for use intended.

- F. Galvanizing Repair Paint: High zinc-dust/zinc oxide content paint for repair of damaged galvanized surfaces and field touch-up of welds that meets the following requirements:
1. One application shall provide a minimum dry coating thickness of 2.0 mils.
  2. Dried film shall have a minimum zinc dust content equal to 94% by weight.
  3. The applied coating shall provide barrier protection and be anodic to steel.
  4. The coating may be applied under both shop and field conditions.
  5. The product used shall be approved by the galvanizer and shall be compatible with the galvanized surfaces and inert in concrete.

## 2.02 FABRICATION

- A. General: Deck units shall be manufactured in lengths to span three or more supports, where possible, with flush, telescoped or nested 2-inch end laps and nested side laps, unless otherwise indicated. End laps shall occur over supports. Deck configurations shall comply with SDI requirements and as specified herein.
- B. Composite Steel Floor Deck
1. Floor Deck Units
    - a. Provide galvanized composite steel floor deck units, where indicated on the Contract Drawings, which conform to the requirements specified herein.
    - b. Composite floor deck units shall be formed to provide a fluted profile and conform to the depth, metal thickness or gauge, and minimum section properties for each type of floor deck indicated on the Contract Drawings. Ribs shall be spaced at approximately 6 inches on centers, with integral embossing or raised patterns to provide mechanical bond with the concrete slab. Side laps shall be fabricated with lock seam joints.
    - c. Provide not less than the composite floor deck section properties of the acceptable products specified below, including section modulus and moment of inertia per foot of width.

2. Products: Subject to compliance with requirements, provide one of the following:
  - a. Type B-LOK; United Steel Deck, Inc.; South Plainfield, NJ
  - b. Type 1.5VL; Vulcraft Corporation; Florence, SC
  - c. Or approved equal
- C. Non-Composite Steel Form Deck
  1. Form Deck Units
    - a. Provide galvanized non-composite steel form deck units, where indicated on the Contract Drawings, which conform to the requirements specified herein.
    - b. Non-composite steel form deck units shall be formed to provide a fluted profile and conform to the depth and of metal thickness or gauge indicated on the Contract Drawings. Ribs shall be spaced at approximately 4 inches on centers. Side laps shall be fabricated with lock seam joints.
  2. Products (for 7/8-inch or one-inch deep form deck profile): Subject to compliance with requirements, provide one of the following:
    - a. Type 1.OC, Vulcraft Corporation; Florence, SC
    - b. CSV Conform, Vulcraft Corporation; Florence, SC
    - c. HD Deck, Dacs, Inc., Portsmouth, VA
    - d. Or approved equal
- D. Cast-in-Place Concrete Fill for Composite Floor Deck: Where indicated on the Contract Drawings, provide normal weight concrete or structural lightweight concrete, as applicable, with maximum 3/4-inch diameter coarse aggregate as specified under Section 03300 - Cast-in-Place Concrete.
- E. Concrete Reinforcement: Uncoated welded wire fabric of the size and spacing indicated on the Contract Drawings and as specified under Section 03200 - Concrete Reinforcement.
- F. Formed Metal Closure Strips: Fabricate metal closure strips of not less than 20 gauge galvanized sheet steel of the same quality as the deck units. Form to the configuration required to provide tight-fitting closures at open ends and sides of decking.
- G. Cleaning of Deck: Finished galvanized deck shall be thoroughly cleaned in a chemical bath, followed by a rinse, phosphatised, rinsed, dried and properly prepared for painting where required. Oiling of deck will not be allowed.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. General: Examine the areas and conditions under which steel deck is to be installed and notify the Commissioner promptly in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until disputed conditions, discrepancies and/or damages have been corrected, unless otherwise directed by the Commissioner.

### 3.02 INSTALLATION

- A. General
  - 1. Install composite steel floor deck units and non-composite steel form deck units in accordance with SDI Design Manual, as detailed on the approved shop drawings and as specified herein.
  - 2. Perform welding in conformance with ANSI/AWS D1.1.
  - 3. Coordinate deck bundles with structural steel erector in locating decking bundles to prevent overloading of structural members.
- B. Placing of Deck Units: Place deck units on supporting framework with edges up and flutes at right angles to supports. Adjust decking to final position with ends bearing not less than 3 inches on supporting members. Ensure that decking ends are accurately aligned and level on supports before being permanently fastened. Lap ends not less than two inches for welded construction of floor decking. Side laps shall be one-half corrugation. Do not stretch or contract the side lap interlocks. Place deck units flat and square and secured to adjacent framing without warp or excessive deflection and with close alignment between cells at ends of abutting deck units. Tape joints at all end laps to prevent concrete leakage.
- C. Cutting and Framing: Cut and fit floor deck units and accessories around other work projecting through or adjacent to the floor decking, as shown on the Contract Drawings. Provide neat, square and trim cuts.
- D. Welding: Permanently fasten metal deck units at ends and intermediate supports of steel supporting members by not less than 5/8-inch diameter fusion (puddle) welds or elongated welds of equal strength at maximum 12 inches on centers. Use welding washers where recommended by the deck manufacturer. Comply with ANSI/AWS requirements and procedures for manual shielded metal-arc welding, appearance, quality of welds and methods used in correcting welding work. The ambient temperature when the welding is performed shall be 35 degrees F. or higher. Weld metal accessories in place. Welds shall be free of cracks, craters and other defects. Units with burned holes or any other damage shall be replaced promptly with satisfactory units at no additional cost to the City of New York.

- E. Attachments: Fasten steel deck units to supporting members to resist lateral loads as indicated on the Contract Drawings in accordance with the SDI "Diaphragm Design Manual". In no case shall the fastening requirements be less than the following:
1. End Laps and Ends Terminating at Supports: Fasten using a weld washer at each side lap plus one intermediate weld (4 welds per 3-foot wide sheet) unless otherwise recommended by manufacturer.
  2. Intermediate Supports: Weld each sheet at each intermediate support not less than 12 inches on centers and at closer spacing where required for lateral force resistance as indicated on the Contract Drawings, unless otherwise recommended by manufacturer.
  3. Side Laps: Lock side laps between adjacent deck units at intervals not exceeding 24 inches on centers or half the span between supports, whichever is less, by tack welding, button punching or mechanical fasteners, unless otherwise indicated on the Contract Drawings. Weld side laps only on decking 18 gauge and heavier. Verify male/female joint is nested prior to fastening.
- F. Closure Strips, Metal: Provide metal closure strips at all open uncovered ends and edges of decking and in the voids between decking and other construction. Weld into upturned position to thickness of slab to contain wet concrete unless otherwise detailed. The closures shall be sufficient to remain stationary without distortion.
- G. Cover Plates: Provide metal joint covers at abutting ends of deck units, except where taped joints are required or permitted.
- H. Reinforcement at Openings
1. Provide additional steel reinforcement and closure pieces required for strength, continuity of decking, and support of other work, unless otherwise specified or shown on the Contract Drawings.
  2. Reinforce decking around openings less than 6 inches in any dimension by means of a steel sheet of the same profile as the deck placed over the opening and fusion welded to the top surface of the deck. Provide steel sheet of the same quality as the deck units, not less than 18 gauge and at least 14 inches wider and longer than the opening. Provide welds at each corner and spaced not more than 6 inches on centers along each side.
  3. Reinforce deck openings from 6 to 14 inches in each dimension with ASTM A36 steel angles on each side of the opening where framing is not shown on the Contract Drawings. The design of the framing angles shall be based on the design load of the applicable floor area and in no case shall the angles be less than 3x3x3/8 steel angles. Connect the angles parallel to the deck span to

structural steel floor framing and to the other two angles along the sides of the opening by welding. Anchor the angles to the deck by welding as required. Bolted and welded connections for supplemental framing angles shall meet the requirements of Section 05120 – Structural Steel.

4. Reinforce openings larger than 14 inches in any dimension in accordance with details indicated on the Contract Drawings.
  - I. Install 10 gauge minimum sheet steel end closure screeds at floor edge, upturned to thickness of slab, to contain wet concrete unless otherwise detailed. Provide closures of sufficient strength to remain stationary without distortion.
  - J. Install sheet steel end closure screeds to close openings between deck, walls, columns, and floor penetrations unless otherwise detailed on the Contract Drawings.
  - K. Clean surfaces of steel deck and accessories to receive concrete of all debris and foreign matter prior to installing welded wire fabric and placing concrete fill.
  - L. Touch-Up Galvanizing Repair Paint: Immediately after completion of installation, wire brush exposed surfaces of deck in accordance with SSPC-SP-2, Hand Tool Cleaning. Clean and touch-up decking and accessories, where field cut, welded, burned or otherwise damaged with approved galvanizing repair paint as provided by the manufacturer, applied in accordance with manufacturer's instructions. Spot repairs to galvanized finish shall be made where required at no cost to the City of New York.

### 3.03 PROTECTION

- A. During installation, do not use the floor decking as a storage platform nor as a working platform until the deck units have been permanently fastened in position.
- B. Do not overload the surface of installed floor decking during entire construction period.
- C. Do not suspend mechanical equipment or other loads, either temporarily or permanently, from steel decking unless otherwise shown or permitted and, in no case, until the deck units have been permanently fastened in position.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05312**  
**STEEL ROOF DECK**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install steel roof decking and appurtenant items, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. Roof deck units are required for exterior building roof and roof and vertical walls of the roof monitors.
- C. This section includes, but is not limited to, the following items:
  - 1. Steel Roof Deck Units
  - 2. Galvanized Finish
  - 3. Formed Metal Closure Strips or Plates
  - 4. Formed Metal Cover Plates
  - 5. Welding Washers
  - 6. Sheet Metal Accessories
  - 7. Ridge and Valley Plates
  - 8. Recessed Metal Roof Deck Pans
  - 9. Joint Sealant
  - 10. Galvanizing Repair Paint
- D. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- E. Composite and non-composite steel floor deck is not included in this Section, but is specified in Section 05311 – Steel Floor Deck.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05120 - Structural Steel
- B. Section 05311 - Steel Floor Deck

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.

1. American Iron and Steel Institute (AISI)
  - a. AISI Specification for the Design of Cold-Formed Steel Structural Members
  - b. AISI Cold-Formed Steel Design Manual
2. American Society for Testing and Materials (ASTM)
  - a. ASTM A36, Carbon Structural Steel
  - b. ASTM A526, Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Commercial Quality
  - c. ASTM A653, Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Structural (Physical) Quality
  - d. ASTM A780, Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
  - e. ASTM A924, General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process
  - f. ASTM C920, Elastomeric Joint Sealants
3. American National Standards Institute/American Welding Society (ANSI/AWS)

6. Society for Protective Coatings (SSPC), formerly Steel Structures Painting Council: SSPC-2, Hand Tool Cleaning

#### 1.04 DESIGN AND PERFORMANCE REQUIREMENTS

- A. General: The Steel Deck Institute Design Manual for Composite Decks, Form Decks and Roof Decks shall govern the work under this Section unless noted otherwise.
- B. Design Basis: The minimum depth, gauge and sectional properties of each type of steel roof deck required shall be as indicated on the Contract Drawings.
- C. Design Calculations: Provide manufacturer-certified structural calculations to verify that proposed steel roof deck meets minimum design requirements based on sectional properties calculated in accordance with AISI Specification for the Design of Cold-Formed Steel Structural Members. Coefficients for moments and deflections shall conform to the Steel Deck Institute Design Manual for Composite Decks, Form Decks and Roof Decks.
- D. Deck units shall have a ribbed, non-cellular section providing a satisfactory surface for the reception of design loads. Wherever practicable, units shall be of sufficient length to span three or more supports.
- E. Allowable Deflection: Roof deck shall comply with Factory Mutual, Loss Prevention Data, I-28 recommendation, but maximum deflection shall not exceed  $1/240$  of the span under uniform design live load indicated on the Contract Drawings nor 200 pound concentrated load at mid-span on a one-foot wide section of deck during construction.
- F. Attachments: Install and anchor roof deck units to supporting members to provide lateral stability to top flange of supporting members and resist design horizontal and uplift loadings indicated on the Contract Drawings. Fastening requirements to resist horizontal loads shall be in accordance with SDI Diaphragm Design Manual.
- G. Sectional Properties: Determine in accordance with American Iron and Steel Institute Specification for the Design of Cold-Formed Steel Structural Members. Compute properties of steel roof deck section on the basis of the effective design width as limited by the provisions of the AISI Specifications. Calculated section properties shall be certified by the Steel Deck Institute. Provide not less than the metal deck section properties of the acceptable products/manufacturers specified, including section modulus and moment of inertia per foot of width.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:

1. Shop Drawings: Submit detailed shop drawings which indicate, for each type of steel roof decking required, material description, steel sheet thickness, product designation, surface finish, dimensional cross-sectional profile, and computed structural properties to verify compliance with project requirements. Drawings shall show details of fabrication and erection, including various connections, layouts of deck units, placement directions, bearing on structural supports, anchorage details, attachment of accessories, each condition requiring closure panels, supplementary framing, cut openings, special jointing and other accessories as required to complete the work. Details shall conform to SDI Standard Practice Details to the extent applicable. Details and layout shall show location of supporting members, quantity and marking of decking units, size and location of holes and openings to be cut and the location, type and sequence of welded connections.
2. Review of Shop Drawings and Working Drawings will be for general considerations only. Compliance with specified requirements for materials, fabrication and erection of metal decking shall be the Contractor's responsibility.

**B. Certifications**

1. General: Test requirements for materials as stated herein or incorporated in reference documents may be waived, provided that certified copies of test reports from approved laboratories performed on previously manufactured material are submitted.
2. Manufacturer's Certifications: Submit manufacturer's certifications as may be required to show compliance with these specifications. Submit copies of mill test reports, including names and locations of mills and shops, covering the chemical and physical properties of the steel sheet to show compliance with these specifications. Test reports shall be accompanied by notarized certificates of compliance from the manufacturer certifying that the previously tested material is of the same type, quality and manufacture as that proposed for this project.
3. Certification of Welders: Provide certification that each welder has been qualified in accordance with ANSI/AWS D1.1 within the previous 12-month period.

- C. Manufacturer's Data:** Submit manufacturer's specifications, test reports and installation instructions for each type of material, decking and accessory required, including sheet steel, steel roof deck units, galvanized mill finish, finish repair paint, welding electrodes, welding washers if proposed, mechanical fasteners, depressed metal roof deck pans, closure strips, cover plates, joint sealant and similar items.

- D. Qualifications Compliance: Submit references and project information to demonstrate the proposed steel roof deck manufacturer and installation contractor's specialized experience on similar projects of comparable scope and complexity for a minimum of three years.
- E. Submit project-specific safety precautions proposed to prevent falls and provide fall protection during erection of steel roof deck.

#### 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Testing and Inspection
  - 1. Welding of steel roof deck to structural steel framing shall be subject to controlled inspection in accordance with the requirements of the New York City Building Code, Local Law 76/2008 and the applicable Contract provisions. Special inspection and testing services required by the New York City Building Code, Local Law 76/2008 will be provided by the Special Inspector. Construction inspection and testing of work not regulated under special inspection but covered under this Section will be performed under the direction of the Commissioner.
  - 2. Special Inspections
    - a. Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections made during the progress of the Work to ensure compliance with the Contract Documents and provisions of the New York City Construction Codes shall be made by a Special Inspector. The City of New York will retain the services of the Special Inspector and bear the costs for the performance of Special Inspections in compliance with 2008 New York City Construction Codes requirements or as additionally may be called for in the Specifications. The Special Inspector shall be an entity compliant with the requirements of the 2008 New York City Construction Codes.
    - b. The Contractor shall notify the relevant Special Inspector in writing at least 72 hours before the commencement of any work requiring Special Inspection. The Contractor shall be responsible for, and bear related costs, to assure that all construction or work shall remain accessible and exposed for inspection purposes until the required inspection is completed.
    - c. Inspections and tests performed under Special Inspections shall not relieve the Contractor of the responsibility to comply with the Contract

Documents, and that there is no warranty given to the Contractor by the City of New York in connection with such inspection and tests or certifications made under Special Inspections. Failure of a special inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

- C. Qualification of Manufacturer: Steel roof deck units and accessories shall be provided where indicated on the Contract Drawings and shall be the products of a single manufacturer who is regularly engaged in the manufacture of steel roof decking.
- D. Qualification of Installer: Steel roof deck units and accessories shall be installed by a reputable company specialized in such work with a minimum of three years of documented experience.
- E. Qualification of Welders: Each welder shall be currently qualified in accordance with ANSI/AWS D1.1. All welders performing work within the city limits shall be certified by the City of New York in accordance with the latest rules of the New York City Board of Standards and Appeals and the current provisions of the New York City Building Code, Local Law 76/2008. A welder shall be retested and recertified when the welder certification is more than 12 months old and/or when the work of the welder creates a reasonable doubt as to proficiency. Such tests, when required, shall be conducted at no additional expense to the City of New York. Recertification of the welder shall be submitted only after the welder has taken and passed the required retest.
- F. Design roof deck layout, spans, fastening, joints and framed openings under the direct supervision of a licensed Professional Engineer registered in the State of New York and experienced in the structural design of steel decking.
- G. Testing and Inspection: Material and fabrication procedures are subject to inspection and tests in the mill, shop and field by the Commissioner. Such inspection and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- H. Factory Inspection: Except as specified otherwise in this paragraph, factory tests and inspections of materials for which inspections and tests are specified herein, or in referenced documents, will not be required provided that certified copies of factory test reports, which shall include manufacturer's certificates of compliance with all requirements of these specifications, are submitted to and approved by the Commissioner. When the test reports are on materials previously manufactured, test reports shall be accompanied by notarized statements from the manufacturer certifying that the materials being furnished are identical with previously manufactured materials on which the factory test reports are based.

- I. Shop and Working Drawings Reviews: Obtain such reviews before custom fabrication is started and before delivery of materials to the project site.
- J. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- K. Site Safety
  - 1. Accept total responsibility for roof deck erection procedures and health and safety of the work force.
  - 2. Comply fully with OSHA workplace safety requirements and regulations and those of other authorities having jurisdiction.
  - 3. Provide and maintain OSHA-approved fall protection during erection of composite and non-composite floor decking.
- L. Responsibility for Errors: Accept responsibility for errors of detailing and fabrication and for the correct fit of the steel roof deck units.
- M. Remedial Action: Promptly remove and replace materials, fabrications and workmanship found defective and provide new acceptable work in accordance with contract requirements at no additional expense to the City of New York.

#### 1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Delivery: Deliver materials to the site in an undamaged condition and at such intervals as will avoid delay in the work.
- B. Storage: Store and protect material in a clean, properly drained location. Store material off the ground under a weather-tight covering permitting good air circulation. Store decking on dry wood sleepers, pallets, platforms or other appropriate supports; slope for positive drainage. Prevent distortion, excessive stresses, corrosion and other damage.
  - 1. Caution: Do not store materials on the structure in a manner that might cause distortion or damage to the supporting structure. The maximum uniform distributed storage load shall not exceed 20 pounds per square foot.
  - 2. Decking that is on-site but not yet installed shall be securely fastened to prevent sheets from becoming air-borne during periods of high wind and potentially causing damage or injury.
- C. Handling: Handle material safely and in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting.

## 1.08 PROJECT CONDITIONS

### A. Field Measurements

1. Prior to commencement of the work, field verify existing dimensions, elevations, locations and conditions applicable to the work. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner. Report variances and discrepancies from the Contract Drawings and potential interferences promptly to the Commissioner.
2. Take sufficient field measurements prior to preparation of Shop and Working Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, do not delay job progress. Allow for adjustments and fitting wherever the taking of field measurements before fabrication may not be possible or might delay the work.
3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. Perform the work to meet actual field conditions encountered.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Galvanized Sheet Steel (for steel deck units): Provide sheet steel for galvanized metal deck units that conforms to ASTM A653 and ASTM A924, zinc-coated, G90 coating, SQ Quality, Grade 33. Provide zinc-coated finish on both sides of deck that conforms to G90 coating (0.90 ounces per square foot minimum total coating on both surfaces).
- B. Closure Strips or Plates, Metal: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 20 gauge, except as otherwise indicated.
- C. Cover Plates, Metal: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 20 gauge (but not less than the metal deck thickness), except as otherwise indicated.
- D. Welding Washers: Standard type compatible with decking furnished.
- E. Sheet Metal Accessories: ASTM A526, commercial quality, galvanized, of thickness indicated or as suitable for use intended.
- F. Ridge and Valley Plates: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 20 gauge (but not less than the metal deck thickness), except as otherwise indicated.

- G. Recessed Metal Roof Deck Pans: ASTM A653, zinc-coated, G90 coating, SQ Quality, Grade 33, minimum 14 gauge (0.071 inch).
- H. Galvanizing Repair Paint: High zinc-dust/zinc oxide content paint for repair of damaged galvanized surfaces and field touch-up of welds that meets the following requirements:
1. One application shall provide a minimum dry coating thickness of 2.0 mils.
  2. Dried film shall have a minimum zinc dust content equal to 94% by weight.
  3. The applied coating shall provide barrier protection and be anodic to steel.
  4. The coating may be applied under both shop and field conditions.
  5. The product used shall be approved by the galvanizer and shall be compatible with the galvanized surfaces and inert in concrete.
- I. Joint Sealant: One-part, moisture-cured, polyurethane base, non-sag, gun-grade, elastomeric sealant meeting the requirements of Federal Specification TT-S-00230C, Type II, Class A and ASTM C920, Type S, Grade NS, Class 25. Acceptable products and manufacturers: Subject to compliance with requirements, provide one of the following:
1. Sikaflex-1a; Sika Corporation, Lyndhurst, NJ
  2. Eucolastic; Euclid Chemical Company, Cleveland, OH
  3. Sonolastic NP-1; BASF Construction Chemicals - Building Systems, Shakopee, MN
  4. Or approved equal

## 2.02 FABRICATION

- A. General: Deck units shall be manufactured in lengths to span three or more supports, where possible, with flush, telescoped or nested 2-inch end laps and nested side laps, unless otherwise indicated. End laps shall occur over supports. Deck configurations shall comply with SDI requirements and as specified herein.
- B. Metal Roof Deck
1. Roof Deck Units: Shall be manufactured from mill coated, extra heavy duty galvanized sheet steel conforming to ASTM A653 and A924. Configuration of roof deck units shall be formed to provide a fluted profile and conform to the depth, metal thickness or gauge, and sectional properties indicated on the Contract Drawings.

- a. Main Roof: Shall conform to standard SDI deep-rib fluted profile, approximately 3 inches in depth, minimum metal thickness of 20 gauge and ribs spaced at approximately 8 inches on center unless otherwise indicated on the Contract Drawings. Width of rib opening at top shall be not more than 2-3/4 inches; width of bottom rib surface shall be not less than 1-1/2 inches.
  - b. Roof Eave and Monitor Walls: Shall conform to standard SDI fluted profile, approximately 1-1/2 inches in depth, minimum metal thickness of 20 gauge, unless otherwise indicated on the Contract Drawings. Ribs shall be spaced at approximately 6 inches on center. Width of rib opening at top shall be not more than 2-1/2 inches; width of bottom rib surface shall be not less than 1-1/2 inches.
2. Provide not less than the roof deck section properties of the acceptable products/manufacturers specified below, including section modulus and moment of inertia per foot of width.
  3. Acceptable Products/Manufacturers: Subject to compliance with requirements, provide one of the following:
    - a. Main Roof
      - (1) Type NS; United Steel Deck, Inc.; South Plainfield, NJ
      - (2) Type 3N; Vulcraft Corporation; Florence, SC
      - (3) Or approved equal
    - b. Roof Eave and Monitor Walls
      - (1) Type B; United Steel Deck, Inc.; South Plainfield, NJ
      - (2) Type B; Vulcraft Corporation; Florence, SC
      - (3) Or approved equal
- C. Formed Steel Closure Strips: Fabricate metal closure strips of not less than 20 gauge galvanized sheet steel of the same quality as the deck units. Form to the configuration required to provide tight-fitting closures at open ends and sides of decking.
  - D. Ridge and Valley Plates: Fabricate ridge and valley plates of galvanized sheet steel of the same quality as the deck units with each leg not less than 2-1/4 inches wide, bent to provide tight-fitting closure with deck units. Provide plates in 10-foot lengths where possible.
  - E. Recessed Roof Deck Pans: Shall be recessed type fabricated from a single piece of not less than 14 gauge galvanized sheet steel of the same quality as the deck units, with level bottoms and sloping sides to direct water flow to the drain, unless otherwise shown. Provide deck pans of adequate size to receive roof drains, at least

2'-0" by 2'-0", and with bearing flanges not less than 3 inches wide. Recess pans not less than 1-1/2 inches below the roof deck surface, unless otherwise shown or required by deck configuration. Holes for drains shall be cut in the field.

- F. Cleaning of Deck: Finished galvanized deck shall be thoroughly cleaned in a chemical bath, followed by a rinse, phosphatised, rinsed, dried and properly prepared for painting where required. Oiling of deck will not be allowed.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. General: Examine the areas and conditions under which steel roof deck is to be installed and notify the Commissioner promptly in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until disputed conditions, discrepancies and/or damages have been corrected, unless otherwise directed by the Commissioner.

### 3.02 INSTALLATION

#### A. Steel Roof Deck

1. General: Finished roof decking shall be flat and suitable for application of insulation thereupon.
  - a. Criteria: Install deck units and accessories in accordance with manufacturer's recommendations, approved Shop Drawings and as specified herein.
  - b. Deck Bundles: Coordinate and cooperate with structural steel erector in locating decking bundles to prevent overloading of structural members.
  - c. Deck Storage: Do not use deck units for storage or working platform until permanently secured.
2. Placing of Deck Units: Place deck units on supporting steel framework with edges up and flutes at right angles to supports. Adjust to final position with ends bearing on supporting members not less than 3 inches and accurately aligned end to end before being permanently fastened. Lap ends not less than 2 inches for welded construction of all roof decks. Side laps shall be one-half corrugation. Do not stretch or contract the side lap interlocks. Place deck units flat and square, secured to adjacent framing without warp or excessive deflection and with close alignment between cells at ends of abutting deck units.

3. Cutting and Framing: Cut and fit roof deck units and accessories around other work projecting through or adjacent to the roof decking, as shown on the Contract Drawings. Provide neat, square and trim cuts.
4. Welding: Permanently fasten metal deck units to steel supporting members by not less than 5/8-inch-diameter fusion (puddle) welds or elongated welds of equal strength. Use welding washers where recommended by the deck manufacturer. Comply with ANSI/AWS requirements and procedures for manual shielded metal-arc welding, appearance, quality and methods used in correcting welding work. The ambient temperature when the welding is performed shall be 35 degrees F. or higher. Welds shall be free of cracks, craters and other defects. Units with burned holes or any other damage shall be replaced promptly with satisfactory units at no additional cost to the City of New York. Metal accessories shall be securely welded in place.
5. Attachments: Install and anchor roof deck units to supporting members to provide lateral stability to top flange of supporting members and resist design horizontal and uplift loadings indicated on the Contract Drawings if applicable. In no case shall the fastening requirements be less stringent than the following:
  - a. End Laps and Ends Terminating at Supports: End laps and all edge supports shall be fastened at 6 inches on center unless otherwise recommended by manufacturer.
  - b. Intermediate Supports: Each sheet shall be welded at each intermediate support not less than 12 inches on centers and at closer spacing where required for lateral force resistance, unless otherwise recommended by manufacturer.
  - c. Side Laps: Lock side laps between adjacent deck units at intervals not exceeding 36 inches on centers by tack welding, button punching or mechanical fasteners, unless otherwise recommended by the manufacturer. Weld side laps only on decking 18 gauge and heavier.
6. Formed Steel Closure Strips: Provide metal closure strips at all open uncovered ends and edges of roof decking and in the voids between decking and other construction. Weld into position to provide a complete decking installation.
7. Cover Plates: Provide metal joint covers at abutting ends of deck units, except where taped joints are required or permitted.

8. Reinforcement at Openings
    - a. Provide additional metal reinforcement and closure pieces as required for strength, continuity of decking and support of other work, unless otherwise shown or specified.
    - b. Reinforce roof decking around openings less than 6 inches in any dimension by means of a flat steel sheet placed over the opening and fusion welded to the top surface of the deck. Provide steel sheet of the same quality as the deck units, not less than 18 gauge and at least 12 inches wider and longer than the opening. Provide welds at each corner and spaced not more than 6 inches on centers along each side.
    - c. Reinforce deck openings larger than 6 inches in any dimension with ASTM A36 steel angles on each side of the opening where framing is not shown on the Contract Drawings. The design of the framing angles shall be based on the design load of the applicable floor area and in no case shall the angles be less than 3x3x3/8 steel angles. Connect the angles parallel to the deck span to structural steel floor framing and to the other two angles along the sides of the opening by welding. Anchor the angles to the deck by welding as required. Bolted and welded connections for supplemental framing angles shall meet the requirements of Section 05120 – Structural Steel.
  9. Roof Insulation Support: Provide metal closure strips for the support of roof insulation where the rib openings in the top surface of roof decking occur adjacent to edges and openings. Weld closure strips into position.
  10. Ridge and Valley Plates: Weld ridge and valley plates to the top surface of the roof decking. Lap end joints not less than 3 inches with laps made in the direction of water flow.
  11. Recessed Roof Deck Pans: Place roof deck pans over openings provided in the roof decking. Position pans with flanges bearing on top surface of deck and weld to the top deck surface. Fusion weld at each deck flute with at least one weld at each corner. Cut openings in the bottom of the roof deck pan to accommodate the drain size required.
- B. Touch-Up Galvanizing Repair Paint: Immediately after completion of installation, wire brush deck in accordance with SSPC-SP-2, Hand Tool Cleaning. Clean and touch-up decking and accessories, where field cut, welded, burned or otherwise damaged with approved galvanizing repair paint as provided by the manufacturer, applied in accordance with manufacturer's instructions. Spot repairs to galvanized finish shall be made where required in accordance with ASTM A780 at no cost to the City of New York.

3.03 PROTECTION

- A. During installation, do not use the steel roof decking as a storage platform nor as a working platform until the deck units have been permanently fastened in position.
- B. Do not overload the surface of installed steel roof decking during entire construction period.
- C. Do not suspend mechanical equipment or other loads, either temporarily or permanently, from steel roof decking unless otherwise detailed or permitted and, in no case, until the deck units have been permanently fastened in position.

-END OF SECTION-

**Section 05400**  
**COLD FORMED METAL FRAMING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install cold-formed metal framing and appurtenant items, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. This Section includes, but is not limited to, the following items:
  - 1. Metal Framing
  - 2. Galvanized Finish
  - 3. Steel Runners (Track)
  - 4. Blocking
  - 5. Lintels
  - 6. Fasteners and Accessories
- C. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- D. Metal framing for certain applications is specified in Section 05500 – Metal Fabrications.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05500 – Metal Fabrications
- B. Section 09265 – Gypsum Board Assemblies

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Iron and Steel Institute (AISI)
    - a. AISI Specification for the Design of Cold-Formed Steel Structural Members

2. American Society for Testing and Materials (ASTM)
  - a. ASTM A123 - Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
  - b. ASTM A568 - Steel, Sheet, Carbon and High-Strength, Low-Alloy Hot-Rolled and Cold-Rolled
  - c. ASTM A570 - Steel Sheet and Strip, Carbon, Hot-Rolled, Structural Quality
  - d. ASTM A611 - Steel, Sheet, Carbon, Cold-Rolled, Structural Quality
  - e. ASTM A653 - Steel Sheet, Zinc-Coated (Galvanized) Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
  - f. ASTM C645 - Nonstructural Steel Framing Members
  - g. ASTM C955 - Load-Bearing (Transverse and Axial) Steel Studs, Runners (Track), and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases
3. City of New York
  - a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - b. New York City Board of Standards and Appeals, latest edition and amendments or supplements thereto

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  1. Manufacturer's data sheets and erection instruction for each item specified.
  2. Working Drawings and Shop Drawings including layout and installation drawings for load-bearing framing members showing size and gauge designations, number, type, location, and spacing.
  3. Drawings indicating supplemental strapping, bracing, splices, bridging, accessories, and details required for proper installation.
  4. Samples of all framing components and fasteners.

- B. Review of Shop Drawings and Working Drawings will be for general considerations only. Compliance with specified requirements for materials, fabrication and installation of cold-formed metal framing shall be the Contractor's responsibility.

#### 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. All metal framing assemblies shall be inspected and approved by the Commissioner prior to application of finish materials. Assemblies not approved shall be replaced with new material at no additional expense to the City of New York.
- C. All defective, damaged or substandard quality work will be rejected and replaced with new work in accordance with the provisions of the Contract Documents at no additional expense to the City of New York.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Protect metal framing units from rusting and damage. Deliver to project site in manufacturer's unopened containers or bundles, fully identified with name, brand, type, and grade.
- B. Store materials off ground in a dry ventilated space or protect with waterproof tarpaulins that permit the movement of water vapor, so as not to create a humidity chamber.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. For 16-gauge and heavier units, fabricate metal framing components of structural quality steel sheet with a minimum yield point of 40,000 psi, conforming to ASTM A570, A611 or A653.
- B. For 18-gauge and lighter units, fabricate metal framing of commercial quality steel sheet with a minimum yield point of 33,000 psi, conforming to ASTM A570, A611 or A653.
- C. Provide steel runners (track), blocking, lintels, clip angles, shoes, reinforcements, fasteners, and accessories in accordance with manufacturer's recommendations for applications indicated on the Contract Drawings, and as needed to provide a complete metal framing system.
- D. Provide studs, tracks, etc. that conform to ASTM C955.

- E. Provide galvanized finish of metal framing components in accordance with ASTM A123 and ASTM A653.
- F. Where framing units are components of assemblies indicated for a fire-resistance rating, provide units that have been approved by authorities having jurisdiction. Coordinate metal framing with Section 09265 – Gypsum Board Assemblies.

## PART 3 EXECUTION

### 3.01 GENERAL

- A. Examine all Contract Drawings covering the work of this Section, and refer to all other Contract Drawings which may affect this work or require coordination by this trade.
- B. Execution of work of this trade constitutes acceptance of adjoining work and other conditions as being satisfactory in every respect. Later claims of defects in such cases will not constitute relief in any way from the requirements of these Specifications.

### 3.02 FABRICATION

- A. Framing components may be prefabricated into panels prior to erection. Fabricate panels plumb, square, true to line and braced against racking with joints welded. Perform lifting of prefabricated panels in a manner to prevent damage or distortion. Fabricate panel to a maximum allowable tolerance variation plumb, level, and true to line of 1/8 inch in 10 feet.
- B. Attach similar components by welding. Attach dissimilar components by welding, bolting or screw fasteners, as standard with manufacturer. Wire tying of framing is not permitted. Repair galvanized surfaces damaged by welding with zinc rich paint.

### 3.03 INSTALLATION

- A. Install metal framing system in accordance with manufacturer's printed instructions and recommendations.
- B. Install continuous tracks sized to match studs. Align tracks accurately to layout base and tops of studs. Secure tracks as recommended by stud manufacturer for type of construction involved, except do not exceed 24 inches. Provide fasteners at corners and end of track.
- C. Set studs plumb where stud system abuts columns or walls, anchor ends of stiffeners to supporting structure.
- D. Install supplementary framing, blocking, and bracing in metal framing system wherever walls or partitions are indicated to support fixtures, equipment, services,

case work, heavy trim and furnishings, and similar work requiring attachment to wall or partition. Where type of supplementary support is not otherwise indicated, comply with stud manufacturer's recommendations and industry standards, considering weight or loading resulting from each item supported.

- E. Secure studs to top and bottom runner tracks by either welding or screw fastening at both inside and outside flanges.
- F. Frame openings larger than 2 feet wide with double studs at each jamb, unless additional framing is indicated on the Contract Drawings, or indicated by manufacturer's instructions.
- G. Provide load-bearing headers at each opening.
- H. Install horizontal stiffeners in stud system, spaced vertically at not more than 4'-6" on center. Weld at each intersection.
- I. Install joists level and plumb, complete with bracing and reinforcing recommended by manufacturer.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05500**  
**METAL FABRICATIONS**

**PART 1 GENERAL**

**1.01 SUMMARY**

**A. Section includes:**

1. Steel framing and supports for ceiling-hung toilet compartments
2. Steel framing and supports for overhead doors
3. Steel framing and supports for countertops
4. Steel framing and supports for mechanical and electrical equipment
5. Steel framing and supports for applications where framing and supports are not specified in other Sections
6. Loose bearing and leveling plates
7. Steel weld plates and angles for casting into concrete not specified in other Sections
8. Miscellaneous steel trim including steel angle corner guards and steel edgings
9. Fixed metal ladders
10. Ladder safety cages
11. Metal bollards
12. Stair nosings

**B. Products furnished, but not installed, under this Section include the following:**

1. Loose steel lintels
2. Anchor bolts, steel pipe sleeves, and wedge-type inserts indicated to be cast into concrete or built into unit masonry
3. Stair nosings at reinforced concrete stairs

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete, for installing anchor bolts, steel pipe sleeves, wedge-type inserts and other items indicated to be cast into concrete.**

- B. Section 04201 - Unit Masonry, for installing loose lintels, anchor bolts, and other items indicated to be built into unit masonry
- C. Section 05120 - Structural Steel
- D. Section 05511 - Exterior Metal Stairs
- E. Section 05512 - Interior Metal Stairs
- F. Section 05521 - Exterior Pipe and Tube Railings (Stainless Steel)
- G. Section 05522 - Interior Pipe and Tube Railings (Stainless Steel)
- H. Section 06100 - Rough Carpentry
- I. Section 06400 - Architectural Woodwork/Casework
- J. Section 08331 - Overhead Coiling Doors
- K. Section 08342 - Overhead High Speed Fabric Doors
- L. Section 09911 - Exterior Painting
- M. Section 09912 - Interior Painting
- N. Section 09967 - Coatings for Steel Waterfront Structures

### 1.03 PERFORMANCE REQUIREMENTS

- A. Structural Performance of Ladders: Provide ladders capable of withstanding the effects of loads and stresses within limits and under conditions specified in ANSI A14.3.
- B. Thermal Movements: Provide exterior metal fabrications that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base Engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces

### 1.04 SUBMITTALS

- A. Product Data: For the following:
  - 1. Grout

- B. Shop Drawings: Show fabrication and installation details for metal fabrications.
  - 1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items and adjacent conditions.
  - 2. Provide templates for anchors and bolts specified for installation under other Sections.
  - 3. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified New York State licensed Professional Engineer responsible for their preparation.
- C. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements.
- D. Welding certificates
- E. Qualification Data: For professional Engineer

#### 1.05 QUALITY ASSURANCE

- A. Welding: Qualify procedures and personnel according to the following:
  - 1. AWS D1.1, "Structural Welding Code--Steel"
  - 2. AWS D1.3, "Structural Welding Code--Sheet Steel"
  - 3. AWS D1.6, "Structural Welding Code--Stainless Steel"

#### 1.06 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication and indicate measurements on Shop Drawings.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate wall and other contiguous construction to ensure that actual dimensions correspond to established dimensions.
  - 2. Provide allowance for trimming and fitting at site.

#### 1.07 COORDINATION

- A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

- B. Coordinate installation of steel weld plates and angles for casting into concrete that are specified in this Section but required for work of another Section. Deliver such items to Project site in time for installation.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
  - 1. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers or products specified.

### 2.02 METALS

- A. Metal Surfaces: Provide materials with smooth, flat surfaces, unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

### 2.03 FERROUS METALS

- A. Steel Plates, Shapes, and Bars: ASTM A 36
- B. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 316L
- C. Stainless-Steel Bars and Shapes: ASTM A 276, Type 316L
- D. Rolled-Stainless-Steel Floor Plate: ASTM A 793
- E. Abrasive-Surface Floor Plate: Steel plate with abrasive material metallurgically bonded to steel by a proprietary process
  - 1. IKG Industries, a Harsco company; Mebac
  - 2. W. S. Molnar Company; SlipNOT
- F. Steel Tubing: ASTM A500, cold-formed steel tubing
- G. Steel Pipe: ASTM A53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads
- H. Slotted Channel Framing: Cold-formed metal channels with continuous slot complying with MFMA-3
  - 1. Size of Channels: 1-5/8 by 1-5/8 inches unless otherwise indicated
  - 2. Material: Galvanized steel complying with ASTM A653, structural steel, Grade 33, with G90 coating; 0.064-inch nominal thickness unless another weight is indicated or required by structural loads

- I. Cast Iron: ASTM A 48/A 48M, Class 30, unless another class is indicated or required by structural loads

## 2.04 STAIR NOSINGS

- A. Cast-Metal Units: Cast aluminum with an integral abrasive finish consisting of aluminum oxide, silicon carbide, or a combination of both. Fabricate units in sizes and configurations indicated and in lengths necessary to accurately fit openings or conditions.

1. Manufacturers:

- a. American Safety Tread Co., Inc.
    - b. Balco Inc.
    - c. Barry Pattern & Foundry Co., Inc.
    - d. Granite State Casting Co.
    - e. Safe-T-Metal Co.
    - f. Wooster Products Inc.
    - g. Or approved equal

2. Configuration: Cross-hatched angle-shaped units, same depth as bar-grating treads and 1 to 1½ inches wide.

- B. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.
- C. Apply bituminous paint to concealed bottoms, sides, and edges of cast-metal units set into concrete.
- D. Apply clear lacquer to concealed bottoms, sides, and edges of extruded units set into concrete.

## 2.05 FASTENERS

- A. Unless otherwise indicated, provide Type 316 stainless-steel fasteners. Comply with ASTM B633. Select fasteners for type, grade, and class required.
- B. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, nuts and, where indicated, flat washers; ASTM F 59 for bolts and ASTM F 594 for nuts, Alloy Group 2 (A4)
- C. Anchor Bolts: ASTM F 1554, Grade 36
  1. Provide hot-dip galvanized anchor bolts where item being fastened is indicated to be galvanized.
- D. Lag Bolts: ASME B18.2.1
- E. Plain Washers: Round, ASME B18.22.1

- F. Lock Washers: Helical, spring type, ASME B18.21.1
- G. Cast-in-Place Anchors in Concrete: Anchors capable of sustaining, without failure, a load equal to four times the load imposed, as determined by testing according to ASTM E488, conducted by a qualified independent testing agency.
  - 1. Threaded or wedge type; galvanized ferrous castings, either ASTM A47 malleable iron or ASTM A27 cast steel. Provide bolts, washers, and shims as needed, hot-dip galvanized per ASTM A153.
- H. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E488, conducted by a qualified independent testing agency.
  - 1. Material for Anchors: Alloy Group 2 (A4) stainless steel bolts complying with ASTM F593 and nuts complying with ASTM F594

## 2.06 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Shop Primers: Provide primers that comply with Section 09967 - Coatings for Steel Waterfront Structures.
- C. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying with SSPC-Paint 20.
- D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- E. Non-shrink, Non-metallic Grout: Factory-packaged, non-staining, non-corrosive, non-gaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- F. Concrete Materials and Properties for bollards and wheel guards: Comply with requirements in Section 03300 - Cast-in-Place Concrete for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.

## 2.07 FABRICATION

- A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

- B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm), unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
- E. Weld corners and seams continuously to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts, unless otherwise indicated. Locate joints where least conspicuous.
- G. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
  - 1. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches, with a minimum 6-inch embedment and 2-inch hook, not less than 8 inches (200 mm) from ends and corners of units and 24 inches on center., unless otherwise indicated.

## 2.08 MISCELLANEOUS FRAMING AND SUPPORTS

- A. Provide steel framing and supports not specified in other Sections as needed to complete the Work.

- B. Fabricate units from steel shapes, plates, and bars of welded construction, unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction retained by framing and supports. Cut, drill, and tap units to receive hardware, hangers, and similar items.

- C. Galvanize miscellaneous framing and supports.

## 2.09 LOOSE STEEL LINTELS

- A. Fabricate loose steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated. Weld adjoining members together to form a single unit where indicated.
- B. Size loose lintels to provide bearing length at each side of openings equal to 1/12 of clear span but not less than 8 inches, unless otherwise indicated.
- C. Galvanize loose steel lintels.

## 2.010 LOOSE BEARING AND LEVELING PLATES

- A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction. Drill plates to receive anchor bolts and for grouting.
- B. Galvanize plates after fabrication.

## 2.11 STEEL TRIM

- A. Unless otherwise indicated, fabricate units from Type 316L stainless steel shapes, plates, and bars with continuously welded joints and smooth exposed edges. Miter corners and use concealed field splices where possible.
- B. Provide cutouts, fittings, and anchorages as needed to coordinate assembly and installation with other work.
  - 1. Provide with integrally welded stainless steel strap anchors for embedding in concrete or masonry construction.

## 2.12 METAL LADDERS

- A. Comply with ANSI A14.3, unless otherwise indicated.
- B. Space siderails minimum 16 inches apart, unless otherwise indicated.
- C. Support each ladder at top and bottom and not more than 60 inches on center with welded or bolted brackets, made from same metal as ladder.

**D. Steel Ladders**

1. Siderails: Continuous, 1/2-by-2-1/2-inch steel flat bars, with eased edges
2. Rungs: 1-inch- diameter or 1-inch- square steel bars
3. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
4. Provide nonslip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
5. Provide nonslip surfaces on top of each rung by coating with abrasive material metallically bonded to rung by a proprietary process.
6. Products
  - a. IKG Industries, a Harsco company; Mebac
  - b. W. S. Molnar Company; SlipNOT
  - c. Or approved equal
7. Galvanize ladders, including brackets and fasteners

**2.13 LADDER SAFETY CAGES**

- A. Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or with stainless-steel fasteners.
- B. Provide primary hoops at tops and bottoms of cages and spaced not more than 20 feet on center. Provide secondary intermediate hoops spaced not more than 48 inches on center between primary hoops.
- C. Fasten assembled safety cage to ladder rails and adjacent construction by welding or with stainless-steel fasteners, unless otherwise indicated.
- D. Steel Ladder Safety Cages
  1. Primary Hoops: 1/4-by-4-inch flat bar hoops
  2. Secondary Intermediate Hoops: 1/4-by-2-inch flat bar hoops
  3. Vertical Bars: 3/16-by-1-1/2-inch flat bars secured to each hoop
- E. Galvanize ladder cages including fasteners

**2.14 METAL BOLLARDS**

- A. Fabricate metal bollards from Schedule 80 steel pipe.

## 2.15 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish metal fabrications after assembly.

## 2.16 STEEL AND IRON FINISHES

- A. Galvanizing: Hot-dip galvanize items to comply with applicable standard listed below:
  - 1. ASTM A123, for galvanizing steel and iron products
  - 2. ASTM A153/A, for galvanizing steel and iron hardware

## 2.17 STAINLESS-STEEL FINISHES

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- C. Dull Satin Finish: No. 6.
- D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

# PART 3 EXECUTION

## 3.01 INSTALLATION

- A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- B. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- C. Field Welding: Comply with the following requirements:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.

4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
  - D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag bolts, wood screws, and other connectors.
  - E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- 3.02 MISCELLANEOUS FRAMING AND SUPPORTS
- A. Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.
- 3.03 BEARING AND LEVELING PLATES
- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of plates.
  - B. Set bearing and leveling plates on wedges, shims, or leveling nuts. After bearing members have been positioned and plumbed, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
    1. Use non-shrink grout, either metallic or non-metallic, in concealed locations where not exposed to moisture; use non-shrink, non-metallic grout in exposed locations, unless otherwise indicated.
    2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.
- 3.04 PIPE BOLLARDS
- A. Anchor bollards in place with studs attached to embedded weld-plate anchored to concrete footings.
  - B. Fill bollards solidly with concrete and install cap.
- 3.05 ADJUSTING AND CLEANING
- A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.

- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

-END OF SECTION-

**Section 05511**  
**EXTERIOR METAL STAIRS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes industrial-type exterior stainless steel stairs with stainless steel grating type treads, landings and platforms.

**1.02 RELATED SPECIFICATIONS**

1. Section 03300 – Cast-in-Place Concrete
2. Section 05120 – Structural Steel
3. Section 05500 - Metal Fabrications
4. Section 05521 - Exterior Pipe and Tube Railings
5. Section 06100 - Rough Carpentry

**1.03 SUBMITTALS**

- A. Product Data: For metal stairs and the following:
1. Ferrous and non-ferrous metals
  2. Grout
  3. Engineering calculations
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Provide templates for anchors and bolts specified for installation under other Sections.
- C. Welding certificates.
- D. Qualification Data: For testing agency.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for stairs.
1. Test railings according ASTM E 894 and ASTM E 935.

**1.04 QUALITY ASSURANCE**

- A. Installer Qualifications: Fabricator of products.
- B. NYC Building Code: Comply with applicable requirements for stair design, structural loading and railings.

- C. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.

- 1. Industrial-Type Stairs: Industrial class.

- D. Welding: Qualify procedures and personnel according to the following:

- 1. AWS D1.6, "Structural Welding Code - Stainless Steel."

- E. Engineering Calculations: Provide engineering calculations certified by a qualified NYS Professional Engineer demonstrating compliance with structural loading and performance or as indicated.

#### 1.05 COORDINATION

- A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

### PART 2 PRODUCTS

#### 2.01 METALS, GENERAL

- A. Metal Surfaces: Provide materials with smooth, flat surfaces, unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

#### 2.02 FERROUS METALS

- A. Stainless Steel Plates, Shapes and Bars: ASTM A 666, Type 316.
- B. Stainless Steel Tubing: ASTM A 554, Grade MT 316.

#### 2.03 STAINLESS STEEL FASTENERS

- A. General: Provide stainless steel fasteners fabricated from Type 316 alloy. Select fasteners for type, grade, and class required.
- B. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, nuts and, where indicated, flat washers; ASTM F 593 for bolts and ASTM F 594 for nuts, Alloy Group 2.
- C. Anchor Bolts: ASTM F 1554, Grade 36.
  - 1. Provide Type 316 stainless steel anchor bolts.

- D. Machine Screws: ASME B18.6.3.
  - 1. Provide Type 316 stainless steel machine screws.
- E. Plain Washers: Round, ASME B18.22.1.
  - 1. Provide Type 316 stainless steel washers.
- F. Lock Washers: Helical, spring type, ASME B18.21.1.
  - 1. Provide Type 316 stainless steel washers.

#### 2.04 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- C. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

#### 2.05 FABRICATION, GENERAL

- A. Provide complete stair assemblies, including metal framing, hangers, struts, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.
  - 1. Join components by welding to the greatest extent possible, unless otherwise indicated.
  - 2. Use connections that maintain structural value of joined pieces.
- B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
- E. Weld connections to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.
  4. Weld exposed corners and seams continuously, unless otherwise indicated.
  5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated. Locate joints where least conspicuous.

## 2.06 STEEL-FRAMED STAIRS

### A. Stair Framing, General

1. Fabricate stringers of plates or channels, as indicated.
  - a. Provide closures for exposed ends of channel stringers.
2. Construct platforms of stainless steel plate or channel headers and miscellaneous framing members as needed to comply with performance requirements indicated.
3. Weld stringers to headers; weld framing members to stringers and headers.
4. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

### B. Metal Bar-Grating Stairs: Form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual."

1. Fabricate treads and platforms from pressure-locked stainless steel grating with 1-by-3/16-inch bearing bars at 11/16 inch o.c. and crossbars at 4 inches o.c.
2. Surface: Plain
3. Finish: Brushed stainless steel
4. Fabricate stainless steel grating treads stainless steel angle or stainless steel plate carrier at each end for stringer connections. Secure treads to stringers with bolts.

5. Fabricate grating platforms with nosing matching that on grating treads. Provide toeplates at open-sided edges of grating platforms. Bolt grating to platform framing.

## 2.07 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish metal stairs after assembly.

## PART 3 EXECUTION

### 3.01 INSTALLATION, GENERAL

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.
- C. Install metal stairs by welding/bolting stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.
- D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units which are for bolted or screwed field connections.
- F. Field Welding: Comply with the following requirements:
  1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove welding flux immediately.
  4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

### 3.02 INSTALLING METAL STAIRS WITH GROUTED BASEPLATES

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of baseplates.
- B. Set stainless steel stair baseplates on wedges, shims, or leveling nuts. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
  - 1. Use nonmetallic, nonshrink grout, unless otherwise indicated.
  - 2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

### 3.03 ADJUSTING AND CLEANING

- A. Clean field welds, bolted connections, and abraded areas and repair damaged finishes to match adjacent finished stair components; repairs are subject to the acceptance of the Commissioner.

-END OF SECTION-

**Section 05512**  
**INTERIOR METAL STAIRS**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes the following:
1. Pre-assembled stainless steel stairs with concrete-filled treads.
  2. Industrial-type stainless steel stairs with grating treads.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete for concrete fill for stair treads and platforms
- B. Section 05522 - Interior Pipe and Tube Railings (Stainless Steel), for pipe and tube railings attached to metal stairs and to walls adjacent to metal stairs

**1.03 PERFORMANCE REQUIREMENTS**

- A. Structural Performance of Stairs: Provide stairs complying with NYC Building code requirements and capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
1. Uniform Load: 100 lbf/sq. ft.
  2. Concentrated Load: 300 lbf applied on an area of 4 sq. in.
  3. Uniform and concentrated loads need not be assumed to act concurrently.
  4. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
  5. Limit deflection of treads, platforms, and framing members to  $L/240$  or  $1/4$  inch, whichever is less.
- B. Seismic Performance: Provide stairs capable of withstanding the effects of earthquake motions in accordance with NYC Building code requirements.
- C. Calculations: Provide stair design calculations prepared by a NYS Licensed Engineer demonstrating compliance with requirements indicated.

**1.04 SUBMITTALS**

- A. Product Data: For metal stairs and the following:
1. Metal-pan stair treads
  2. Nonslip aggregates and nonslip-aggregate finishes

3. Stainless steel grating treads
  4. Abrasive nosings
  5. Grout
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Provide templates for anchors and bolts specified for installation under other Sections.
  2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: For products involving selection of color, texture, or design.
- D. Samples for Verification: For the following products, in manufacturer's standard sizes:
1. Stair treads with nonslip-aggregate surface finish.
- E. Welding certificates.
- F. Qualification Data
1. For NYS Licensed Professional Engineer
  2. Testing Agency
- G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for stairs.
1. Test railings according ASTM E894 and ASTM E935
- H. Certified Engineering Calculations.
- 1.05 QUALITY ASSURANCE
- A. Installer Qualifications: Fabricator of products similar to work of this project for a period of not less than three (3) years.
- B. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.
1. Industrial-Type Stairs: Industrial class

C. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code--Steel"
2. AWS D1.6, "Structural Welding Code--Stainless Steel"

1.06 COORDINATION

- A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Coordinate locations of hanger rods and struts with other work so that they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
  1. Subject to compliance with requirements, products and manufacturers that may be incorporated into the Work include, but are not limited to, products and manufacturers specified.

2.02 METALS

- A. Metal Surfaces, Provide materials with smooth, flat surfaces, unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

2.03 STAINLESS STEEL

- A. Tubing: ASTM A554, Grade MT 316L
- B. Pipe: ASTM A312, Grade TP316L
- C. Plate and Sheet: ASTM A666, Type 316L
- D. Gratings: ASTM A666, Type 316L
- E. Expanded Metal: ASTM F1267, Type II (expanded and flattened), Class 3 (corrosion-resistant steel), made from stainless-steel sheet complying with ASTM A666, Type 316
  1. Style Designation: 3/4 number 13

## 2.04 STAIR NOSINGS

- A. Cast-Metal Units: Cast aluminum with an integral abrasive finish consisting of aluminum oxide, silicon carbide, or a combination of both. Fabricate units in sizes and configurations indicated and in lengths necessary to accurately fit openings or conditions.
  - 1. Manufacturers
    - a. American Safety Tread Co., Inc.
    - b. Balco Inc.
    - c. Barry Pattern & Foundry Co., Inc.
    - d. Granite State Casting Co.
    - e. Safe-T-Metal Co.
    - f. Wooster Products Inc.
    - g. Or approved equal
  - 2. Configuration: Cross-hatched angle-shaped units, same depth as bar-grating treads and 1 to 1-1/2 inches wide.
- B. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.
- C. Apply bituminous paint to concealed bottoms, sides, and edges of cast-metal units set into concrete.
- D. Apply clear lacquer to concealed bottoms, sides, and edges of extruded units set into concrete.

## 2.05 FASTENERS

- A. Stainless Steel: Type 316 fasteners
- B. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E488, conducted by a qualified independent testing agency.
  - 1. Material for Anchors: Alloy Group 2 (A4) stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

## 2.06 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

- B. Non-shrink, Non-metallic Grout: Factory-packaged, non-staining, non-corrosive, non-gaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- C. Concrete Materials and Properties: Comply with requirements in Section 03300 - Cast-in-Place Concrete for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.
- D. Nonslip-Aggregate Concrete Finish: Factory-packaged abrasive aggregate made from fused, aluminum-oxide grits or crushed emery; rustproof and nonglazing; unaffected by freezing, moisture, or cleaning materials.
- E. Welded Wire Fabric: ASTM A185, 6 by 6 inches--W1.4 by W1.4, unless otherwise indicated.

## 2.07 FABRICATION

- A. Provide complete stair assemblies, including metal framing, hangers, struts, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms to supporting structure.
  - 1. Fabricate treads and platforms of stairs so finished walking surfaces slope to drain.
- B. Preassembled Stairs: Assemble stairs in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- E. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
- F. Weld connections to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. Weld exposed corners and seams continuously, unless otherwise indicated.

5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated. Locate joints where least conspicuous.
- H. Fabricate joints that will be exposed to water or other fluids in a manner to exclude fluids. Provide weep holes where fluids may accumulate.

## 2.08 STAINLESS STEEL FRAMED STAIRS

### A. Stainless Steel Stair Framing:

1. Fabricate stringers of tubes, plates, or channels.
  - a. Provide closures for exposed ends of channel stringers.
2. Construct platforms of plate or channel headers and miscellaneous framing members.
3. Weld stringers to headers; weld framing members to stringers and headers. If using bolts to fabricate, join so bolts are not exposed on finished surfaces.
4. Where stairs are enclosed by gypsum board or masonry assemblies, provide hanger rods or struts to support landings from floor construction above or below. Locate hanger rods and struts where they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.
5. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

### B. Metal-Pan Stairs: Form risers, subtread pans, and subplatforms to configurations shown from stainless steel sheet of thickness needed to comply with performance requirements.

1. Directly weld metal pans to stringers; locate welds on top of subtreads where they will be concealed by concrete fill. Do not weld risers to stringers.
2. Construct subplatforms with smooth soffits.

- C. Metal Bar-Grating Stairs: Form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual."
1. Fabricate treads and platforms from welded steel grating with 1-1/4-by-3/16-inch bearing bars at 15/16 inch on center and crossbars at 4 inches on center, NAAMM designation: W-15-4 (1-1/4 x 3/16) STAINLESS STEEL.
  2. Surface: Serrated
  3. Finish: Stainless steel

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.
- C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete or masonry, unless otherwise indicated.
- D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- F. Field Welding Requirements
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove welding flux immediately.
  4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

- G. Place and finish concrete fill for treads and platforms to comply with Section 03300 - Cast-in-Place Concrete.

- 1. Install abrasive nosings with anchors fully embedded in concrete. Center nosings on tread width.

### 3.02 METAL STAIRS WITH GROUTED BASEPLATES

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of baseplates.
- B. Set steel stair baseplates on wedges, shims, or leveling nuts. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
  - 1. Use nonmetallic, nonshrink grout, unless otherwise indicated.
  - 2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

### 3.03 STAINLESS STEEL TUBE RAILINGS

- A. Comply with requirements of other Section 05522 – Interior Pipe and Tube Railings (Stainless Steel) for handrails and the following.
- B. Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and rail ends to building construction as follows:
  - 1. Anchor posts to steel by welding directly to steel supporting members.
  - 2. Anchor handrail ends to concrete and masonry with steel round flanges welded to rail ends and anchored with postinstalled anchors and bolts.
- C. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:
  - 1. Use type of bracket with predrilled hole for exposed bolt anchorage.
  - 2. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
  - 3. For hollow masonry anchorage, use toggle bolts.

4. For steel-framed gypsum board assemblies, fasten brackets directly to steel framing or concealed steel reinforcements using self-tapping screws of size and type required to support structural loads.

#### 3.04 ADJUSTING AND CLEANING

- A. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.
- B. Clean metal stairs and railings of dirt, debris, spatters and deleterious materials.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05521**  
**EXTERIOR PIPE AND TUBE RAILINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes exterior stainless-steel pipe and tube railings, as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-In-Place Concrete
- B. Section 03450 - Plant- Precast Architectural Concrete
- C. Section 05511 - Exterior Metal Stairs

**1.03 SUBMITTALS**

- A. Product Data: For the following:
  - 1. Grout, anchoring cement, and paint products.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
- C. Samples for Verification: For each type of exposed finish required.
  - 1. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
  - 2. Fittings and brackets.
  - 3. Assembled Sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Sample need not be full height.
    - a. Show method of finishing and connecting members at intersections.
- D. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.
- E. Welding certificates.
- F. Qualification Data: For professional engineer.

**1.04 QUALITY ASSURANCE**

- A. Source Limitations: Obtain each type of railing through one source from a single manufacturer.

- B. Welding: Qualify procedures and personnel according to the following:
  - 1. AWS D1.6, "Structural Welding Code--Stainless Steel"
- C. Comply with structural performance requirements indicated per New York City Building Code.

#### 1.05 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating railings without field measurements. Coordinate wall and other contiguous construction to ensure that actual dimensions correspond to established dimensions.

#### 1.06 COORDINATION AND SCHEDULING

- A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following manufacturers or approved equal:
  - 1. Exterior Stainless-Steel Pipe and Tube Railings:
    - a. Julius Blum & Co., Inc.
    - b. Stainless Fabricators, Inc.
    - c. Wagner, R & B, Inc.; a division of the Wagner Companies
    - d. Or approved equal

## 2.02 METALS, GENERAL

- A. Metal Surfaces: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
  - 1. Tubing: ASTM A 554, Grade MT 316L
  - 2. Pipe: ASTM A 312, Grade TP 316L
  - 3. Castings: ASTM A 743, Grade CF 8M or CF 3M
  - 4. Plate and Sheet: ASTM A 666, Type 316L
- B. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails, unless otherwise indicated.

## 2.03 FASTENERS

- A. General: Provide the following:
  - 1. Stainless-Steel Railings: Type 316 stainless-steel fasteners
- B. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated. When the size, length, or load carrying capacity of an anchor bolt, concrete anchor, or concrete insert is not shown on the Drawings, provide the size, length, type and capacity required to carry four times (safety factor) the design load.
- C. Fasteners for Interconnecting Railing Components
  - 1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method for railings indicated.
  - 2. Provide tamper-resistant flat-head machine screws for exposed fasteners, unless otherwise indicated.
- D. Anchors: Provide chemical or torque-controlled expansion anchors, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.

## 2.04 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

- C. Non-shrink, Non-metallic Grout: Factory-packaged, non-staining, non-corrosive, non-gaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- D. Anchoring Cement: Factory-packaged, non-shrink, non-staining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.
  - 1. At exterior locations provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

## 2.05 FABRICATION

- A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage.
  - 1. Unless otherwise indicated on the Drawings, fabricate railings from 1-1/2 inch inside diameter stainless steel pipe, type 316 Schedule 40 pipe;.
  - 2. Unless otherwise indicated, stainless steel pipe railing assemblies shall consist of two rails welded to posts spaced not more than 60 inches on center.
- B. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- D. Form work true to line and level with accurate angles and surfaces.
- E. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
- G. Connections: Fabricate railings with welded connections, unless otherwise indicated.
- H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

2. Obtain fusion without undercut or overlap.
  3. Remove flux immediately.
  4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
  5. Form changes in directions as indicated on the Drawings.
- I. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
  - J. Close exposed ends of railing members with prefabricated end fittings.
  - K. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.
  - L. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work, unless otherwise indicated.
  - M. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
  - N. Woven-Wire Mesh Infill Panels: Provide where indicated, and fabricate infill panels from woven-wire mesh crimped into 1-by-1/2-by-1/8-inch metal channel frames. Make wire mesh and frames from same metal as railings in which they are installed.
    1. Orient wire mesh with wires horizontal and vertical, unless otherwise indicated on the approved Shop Drawing.
  - O. Safety Chains: Provide where indicated, stainless steel link chain fabricated from 3/8" diameter bar stock. Form links approximately 1-1/2" x 2-1/2" and fully welded ends to form links.
    1. Secure chains to posts with 1/2" diameter stainless steel snap-shackle connected to 2-1/2" diameter x 4" stainless steel "D" rings welded to posts.
- 2.06 FINISHES, GENERAL
- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

## 2.07 STAINLESS-STEEL FINISHES

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- C. Directional Satin Finish: No. 4.
- D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrate and assemblies to receive railings to verify that surfaces have been prepared to receive railing assemblies.

### 3.02 INSTALLATION, GENERAL

- A. Fit exposed connections together to form tight, hairline joints.
- B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
  - 1. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
  - 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
  - 3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.
- C. Adjust railings before anchoring to ensure matching alignment at abutting joints.
- D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

### 3.03 RAILING CONNECTIONS

- A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in Part 2 "Fabrication" Article whether welding is performed in the shop or in the field.
- B. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

### 3.04 ANCHORING POSTS

- A. Anchor posts to concrete surfaces with rectangular flanges, angle type, or floor type as required by conditions, connected to posts and to concrete supporting members as follows:
  - 1. For stainless-steel pipe railings, weld flanges to post and bolt to supporting surfaces.

### 3.05 ATTACHING HANDRAILS TO WALLS

- A. Attach handrails to wall with wall brackets. Provide brackets with 1-1/2-inch clearance from inside face of handrail and finished wall surface.
  - 1. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt, unless otherwise indicated.
- B. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.

### 3.06 ADJUSTING AND CLEANING

- A. Clean stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

### 3.07 PROTECTION

- A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.
- B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05522**  
**INTERIOR PIPE AND TUBE RAILINGS (STAINLESS STEEL)**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section includes interior stainless-steel pipe and tube railings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05512 - Interior Metal Stairs, for steel tube railings associated with metal stairs.

**1.03 PERFORMANCE REQUIREMENTS**

- A. In engineering railings to withstand structural loads indicated, determine allowable design working stresses of railing materials based on the following:

1. Stainless Steel: 60 percent of minimum yield strength.

- B. Structural Performance: Provide railings complying with NYC Building Code requirements and capable of withstanding the effects of gravity loads and the following minimum loads and stresses within limits and under conditions indicated:

- C. Thermal Movements: Provide exterior railings that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

- D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

- E. Engineering Calculations: Provide certified calculations prepared by NYS Licensed Professional Engineer demonstrating compliance with requirements indicated.

**1.04 SUBMITTALS**

- A. Product Data: For the following:

1. Manufacturer's product lines of mechanically connected railings.  
2. Grout and anchoring cement.

- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: For products involving selection of color, texture, or design including mechanical finishes on stainless steel.
- D. Samples for Verification: For each type of exposed finish required.
  - 1. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
  - 2. Fittings and brackets.
  - 3. Assembled Sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Sample need not be full height.
    - a. Show method of connecting members at intersections.
- E. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.
- F. Welding certificates.
- G. Qualification Data: For Professional Engineer and testing agency.
- H. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.
- I. Certified Engineering Calculations.

#### 1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of railing through one source from a single manufacturer.
  - 1. Provide products by manufacturers with a minimum of three (3) years experience manufacturing similar products to the work of this section.
- B. Welding: Qualify procedures and personnel according to the following:
  - 1. AWS D1.6, "Structural Welding Code--Stainless Steel."

## 1.06 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating railings without field measurements. Coordinate wall and other contiguous construction to ensure that actual dimensions correspond to established dimensions.
  - 2. Provide allowance for trimming and fitting at site.

## 1.07 COORDINATION AND SCHEDULING

- A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Blum, Julius & Co., Inc.
  - 2. Paragon Aquatics; Division of Pentair Pool Products, Inc.
  - 3. Pisor Industries, Inc.
  - 4. Stainless Fabricators, Inc.
  - 5. Sterling Dula Architectural Products, Inc.
  - 6. Tubular Specialties Manufacturing, Inc.
  - 7. Tuttle Aluminum & Bronze
  - 8. Wagner, R & B, Inc.; a division of the Wagner Companies
  - 9. Or approved equal

### 2.02 METALS

- A. Metal Surfaces: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
- B. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails, unless otherwise indicated.

## 2.03 STAINLESS STEEL

- A. Tubing: ASTM A 554, Grade MT 316L
- B. Pipe: ASTM A312, Grade TP316L
- C. Castings: ASTM A743, Grade CF 8M or CF 3M
- D. Plate and Sheet: ASTM A666, Type 316L
- E. Expanded Metal: ASTM F1267, Type II (expanded and flattened), Class 3 (corrosion-resistant steel), made from stainless-steel sheet complying with ASTM A 666, Type 316
  - 1. Style Designation: 3/4 number 13

## 2.04 FASTENERS

- A. Provide Type 316 stainless-steel fasteners.
- B. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.
- C. Fasteners for Interconnecting Railing Components:
  - 1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless otherwise indicated.
  - 2. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method for railings indicated.
  - 3. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.
- D. Anchors: Provide cast-in-place, chemical, or torque-controlled expansion anchors, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488 conducted by a qualified independent testing agency.

## 2.05 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined

by testing according to ASTM E488, conducted by a qualified independent testing agency.

1. Material for Anchors: Alloy Group 2 (A4) stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.
- C. Non-shrink, Non-metallic Grout: Factory-packaged, non-staining, non-corrosive, nongaseous grout complying with ASTM C 107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

## 2.06 FABRICATION

- A. Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
- B. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- D. Form work true to line and level with accurate angles and surfaces.
- E. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
- G. Connections: Fabricate railings with either welded or nonwelded connections, unless otherwise indicated.
- H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
  1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove flux immediately.

4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
- I. Welded Connections: Fabricate railings to interconnect members with concealed internal welds that eliminate surface grinding, using manufacturer's standard system of sleeve and socket fittings.
- J. Nonwelded Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
  1. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.
- K. Form changes in direction as follows:
  1. As detailed.
  2. By radius bends of radius indicated or by inserting prefabricated elbow fittings of radius indicated.
- L. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
- M. Close exposed ends of railing members with prefabricated end fittings.
- N. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.
- O. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work, unless otherwise indicated.
  1. At brackets and fittings fastened to plaster or gypsum board partitions, provide fillers made from crush-resistant material, or other means to transfer wall loads through wall finishes to structural supports and prevent bracket or fitting rotation and crushing of substrate.
- P. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
- Q. For railing posts set in concrete, provide steel sleeves not less than 6 inches long with inside dimensions not less than 1/2 inch greater than outside dimensions of post, with steel plate forming bottom closure.

- R. For removable railing posts, fabricate slip-fit sockets from stainless-steel tube or pipe whose ID is sized for a close fit with posts; limit movement of post without lateral load, measured at top, to not more than one-fortieth of post height. Provide socket covers designed and fabricated to resist being dislodged.
  - 1. Provide chain with eye, snap hook, and staple across gaps formed by removable railing sections at locations indicated. Fabricate from same metal as railings.
- S. Expanded-Metal Infill Panels: Fabricate infill panels from expanded metal made from same metal as railings in which they are installed.
  - 1. Edge panels with U-shaped channels made from metal sheet, of same metal as expanded metal and not less than 0.0428 inch thick.
  - 2. Orient expanded metal with long dimension of diamonds parallel to top rail.
- T. Toe Boards: Where indicated, provide toe boards at railings around openings and at edge of open-sided floors and platforms. Fabricate to dimensions and details indicated.

## 2.07 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
- D. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

## 2.08 STAINLESS-STEEL FINISHES

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Dull Satin Finish: No. 6.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Fit exposed connections together to form tight, hairline joints.
- B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
  - 1. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
  - 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
  - 3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.
- C. Adjust railings before anchoring to ensure matching alignment at abutting joints.
- D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

### 3.02 RAILING CONNECTIONS

- A. Non-welded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Use wood blocks and padding to prevent damage to railing members and fittings. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of railings.
- B. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in Article 2.06 Fabrication whether welding is performed in the shop or in the field.
- C. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to 1 side, and locate joint within 6 inches of post.

### 3.03 ANCHORING POSTS

- A. Secure posts to concrete surfaces with stainless steel expansion anchors through flanges, type as required by conditions.

- B. Secure posts to metal surfaces with oval flanges, angle type, or floor type as required by conditions, connected to posts and to metal supporting members. For stainless-steel pipe railings, weld flanges to post and bolt to supporting surfaces.
- C. Install removable railing sections, where indicated, in slip-fit metal sockets cast in concrete.

#### 3.04 ANCHORING RAILING ENDS

- A. Anchor railing ends to concrete and masonry with round flanges connected to railing ends and anchored to wall construction with anchors and bolts.
- B. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces and welded to railing ends or connected to railing ends using nonwelded connections.

#### 3.05 ATTACHING HANDRAILS TO WALLS

- A. Attach handrails to wall with wall brackets. Provide brackets with 1-1/2-inch clearance from inside face of handrail and finished wall surface.
  - 1. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt.
  - 2. Use type of bracket with predrilled hole for exposed bolt anchorage.
- B. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.
- C. Secure wall brackets to building construction as follows:
  - 1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
  - 2. For hollow masonry anchorage, use toggle bolts.

#### 3.06 ADJUSTING AND CLEANING

- A. Clean stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

#### 3.07 PROTECTION

- A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

- B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

-END OF SECTION-

**Section 05532**  
**STAINLESS STEEL FLOOR GRATINGS AND**  
**CHECKERED PLATES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install stainless steel floor gratings and checkered plates and accessories, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. Gratings and checkered plates shall be complete with frames, anchors, fastening devices and miscellaneous appurtenances.
- C. The work includes all incidental and miscellaneous items not specified under another Section but required for the work of this Section, whether or not specifically referred to herein.
- D. This Section includes, but is not limited to, the following items:
  - 1. Stainless Steel Grating
  - 2. Stainless Steel Checkered Plate
  - 3. Stainless Steel Stair Treads and Landings
  - 4. Fastening Devices

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 05120 - Structural Steel

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Society for Testing and Materials (ASTM)
    - a. ASTM A167, Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
    - b. ASTM A276, Stainless and Heat-Resisting Steel Bars and Shapes
    - c. ASTM A480, General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plates, Sheet and Strips

- d. ASTM A666, Austenitic Stainless Steel, Sheet, Strip, Plate, and Flat Bar
  - e. ASTM A793, Rolled Floor Plate, Stainless Steel
  - f. ASTM F593, Stainless Steel Bolts, Hex Cap Screws and Studs
  - g. ASTM F594, Stainless Steel Nuts
2. National Association of Architectural Metal Manufacturers (NAAMM)
- a. ANSI/NAAMM MBG 531, Metal Bar Grating Manual
  - b. ANSI/NAAMM MBG 532, Heavy Duty Metal Bar Grating Manual
  - c. NAAMM MBG 533, Welding Specifications for Fabrication of Steel, Aluminum and Stainless Steel Bar Grating
3. City of New York
- a. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - b. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto

#### 1.04 DESIGN AND PERFORMANCE REQUIREMENTS

- A. The design live load for grating or plate covering floor openings shall be that designated for the adjacent floor area but not less than a uniform load of 150 pounds per square foot or a concentrated load of 300 pounds distributed over a 12-inch square area at the center of span, whichever produces the greater stress.
- B. The design live load for grating or checkered plate on platforms shall be as designated on the Contract Drawings but not less than a uniform load of 100 pounds per square foot.
- C. Grating or checkered plate in areas subject to vehicular traffic shall be designed for the maximum weight vehicle that can access the area. The maximum design wheel loads for forklifts or other similar wheeled vehicles shall be as indicated on the structural Contract Drawings or as defined by the approved manufacturer. When design wheel loads are not indicated on the Contract Drawings for a certain area or defined by the manufacturer, the design wheel loads shall be defined as 40 percent of the gross loaded weight of the maximum size vehicle to be accommodated.
- D. The maximum allowable deflection due to dead load plus live load shall not exceed the span divided by 240, but not more than 1/4 inch.

- E. Design gratings and checkered plate in accordance with the design criteria specified herein, and the NAAMM specifications, unless otherwise noted on the Contract Drawings or as required by the New York City Building Code, Local Law 76/2008.
- F. Stainless steel plate thickness shall be 1/4 inch minimum. In the event the 1/4-inch plate does not meet the specified deflection or allowable stress criteria, the plate shall be thickened or stiffened with stainless steel angles or bars welded to the bottom of the plate as needed to meet the criteria. Stiffeners shall extend to within 2 inches of supports as a minimum. The ends of all stiffeners shall be welded to a continuous stiffener extending the length of the plate.

#### 1.05 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  - 1. Shop Drawings and Working Drawings, including shop fabrication drawings, and material specifications of all gratings and checkered plates.
  - 2. Manufacturer's specifications and installation instructions for all proprietary materials and reinforcement accessories.
  - 3. Design Calculations: Provide structural calculations for review and approval to verify that proposed grating and checkered plate meet minimum wheel load design requirements.
  - 4. Description of proposed supports for each type and location of grating and checkered plate.
  - 5. Submit samples of grating, checkered plates and fastening devices for review and approval by the Commissioner.
  - 6. Base Shop Drawings upon field-verified dimensions and elevations of existing or partially constructed structure, where applicable, to allow proper review of drawings.
  - 7. Check Shop Drawings for completeness and accuracy and make necessary corrections prior to submittal for review and approval. Obtain Commissioner's approval prior to fabrication.
  - 8. Do not manufacture or fabricate gratings and checkered plates until the Contractor's Shop Drawings and Working Drawings have been approved by the Commissioner.
  - 9. Qualifications Compliance: Submit references and project information to demonstrate the proposed steel floor grating and checkered plate

manufacturer's specialized experience on similar projects of comparable scope and complexity for a minimum of three years.

#### 1.06 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Qualification of Manufacturer: Steel floor grating and checkered plates and accessories shall be provided where indicated on the Contract Drawings and shall be the products of a reputable manufacturer specialized in such work who is regularly engaged in the manufacture of steel floor grating and checkered plates with a minimum of three years of documented experience.
- C. Testing and Inspection: Material and fabrication procedures are subject to inspection and tests in the mill, shop and field by the Commissioner. Such inspection and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- D. Factory Inspection: Except as specified otherwise in this paragraph, factory tests and inspections of materials for which inspections and tests are specified herein, or in referenced documents, will not be required provided that certified copies of factory test reports, which shall include manufacturer's certificates of compliance with all requirements of these specifications, are submitted to and approved by the Commissioner. When the test reports are on materials previously manufactured, test reports shall be accompanied by notarized statements from the manufacturer certifying that the materials being furnished are identical with previously manufactured materials on which the factory test reports are based.
- E. Shop and Working Drawing Reviews: Obtain such reviews before custom fabrication is started and before delivery of materials to the project site.
- F. Coordination: Coordinate work of this Section with the work of other trades so that construction is not delayed.
- G. Responsibility for Errors: Accept responsibility for errors of detailing and fabrication and for the correct fit of the floor deck units.
- H. Remedial Action: Promptly remove and replace materials, fabrications and workmanship found defective and provide new acceptable work in accordance with contract requirements at no additional expense to the City of New York.

#### 1.07 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Delivery: Deliver products to the site in an undamaged condition and at such intervals as will avoid delay in the work.

- B. Handling: Handle products safely and in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting.

## 1.08 PROJECT CONDITIONS

- A. Check all dimensions in the field after all piping and equipment are set in place and determine the exact dimensions and locations of openings and cut-outs.
- B. Provide templates where required for location and size of openings and cut-outs.
- C. Field verify all pertinent dimensions prior to grating and checkered plate fabrication.

## PART 2 PRODUCTS

### 2.01 TYPES OF GRATINGS AND CHECKERED PLATES

- A. Type of Gratings: Unless otherwise shown or specified, gratings shall be one of the following types and shall be the product of one manufacturer. The type of grating specified herein or in other Sections shall be used exclusively throughout the work.
  - 1. Type "A" - Parallel bearing bars, with cross members at right angles
  - 2. Type "B" - Parallel bearing bars, with diagonal cross members
- B. Types of Checkered Plates: Checkered plates, where indicated on the Contract Drawings, shall be:
  - 1. Type "F" - Fixed Cover
  - 2. Type "H" - Hinged Cover

### 2.02 MATERIALS

- A. Floor gratings, checkered plates and appurtenances shall be fabricated of Type 316L Stainless Steel and shall conform to the requirements specified herein and to the following standards:
  - 1. Gratings: ASTM A167; ASTM A480; ASTM A666
  - 2. Checkered Plate: ASTM A793
  - 3. Frames, Curb Angles, Braces, Skirt Angles, Bolts and Fastening Devices: ASTM A276; ASTM A480; ASTM F593, ASTM F594

## 2.03 GRATING FABRICATION

- A. Type "A" Grating (Pressure Locked or Welded) shall consist of parallel bearing bars spaced not more than 1-3/16 inches on centers joined by cross members spaced not more than 4 inches on center (unless shown otherwise on the Contract Drawings), to form rectangular openings. Approved welded, electric-forged, slotted, friction fitted or interlocking joints shall be used in joining cross members to the bearing bars to give the grating the required strength, rigidity and durability. The distance between the support and the nearest cross bar shall not exceed 2 inches.
- B. Type "B" Grating (Welded or Riveted) shall consist of parallel bearing bars spaced not more than 1-5/16 inches on center, joined by welded or riveted bent diagonal cross bars. Rivets shall be 1/4 inch in diameter and shall be spaced not more than 4 inches on center unless shown otherwise on the Contract Drawings. The distance between the support and the center of the nearest rivet shall not exceed 1 inch.
- C. Provide 1-1/4-inch minimum grating depth with bearing bars not less than 3/16 inches thick.
- D. Welded cross members shall not be less than 3/16 inch in thickness. Mechanically interlocked cross members shall not be less than 1/8 inch in thickness. The depth of cross members shall not be less than one-half the depth of the bearing bars, but such depth need not exceed one inch. Riveted cross members shall be as specified for mechanically interlocked cross members.
- E. Serrated grating shall be provided where shown on the Contract Drawings. Depth of serrated grating shall be not less than 1/4 inch greater than required standard bar grating.
- F. Each section of grating shall be sized to weigh a maximum of 100 pounds unless noted otherwise in the Specifications.

## 2.04 GRATING CUT-OUTS

- A. Provide cut-outs in the grating for the passage of pipe, valve stems, columns and similar work. Where more than two bearing bars are included in the cut-out, banding bars of the same dimensions as the bearing bars shall be provided around the opening and welded or electric-forged to the component parts of the grating.

## 2.05 GRATING STAIR TREADS AND LANDINGS

- A. Grating stair treads shall be one inch wider than tread widths shown on the Contract Drawings and shall be securely fastened to angles or carrier bars which in turn shall be fastened to stringers. The outer edge or nosing of stair treads shall be so constructed as to make it distinctly visible and contrasting with the other part of the tread. Non-slip nosings shall be furnished on all the stair treads and landings.

## 2.06 CHECKERED PLATES

### A. General

1. Provide an approved, raised pattern, non-skid surface for checkered plates. Stiffener angles shall be provided as required to meet the loading and deflection limits specified herein.
  2. Fabricate all checkered plate sections so that no one section will weigh more than 150 pounds. Provide flush type lifting handles for all sections of checkered plates.
- B. Furnish Type "F" Fixed Cover checkered plates complete with frames, anchors, lifting handles and stainless steel flush head screw fastenings.
- C. Furnish Type "H" Hinged Cover checkered plates complete with frames, anchors, lifting handles and heavy duty concealed hinges. Hinges shall be Type 316L stainless steel, with stainless steel pins and fastenings. A minimum of two hinges shall be provided for each checkered plate section.

## 2.07 FABRICATION

- A. Gratings and checkered plates shall be accurately fabricated, free from warps, twists or other defects which affect the appearance and serviceability of the grating and checkered plates.
- B. The tops of the grating bearing bars and cross bars shall be in the same plane.
- C. Gratings and checkered plates shall have a mill finish unless otherwise noted on the Contract Drawings.
- D. All welds shall be ground smooth and conform to the requirements of NAAMM MBG 533.
- E. Openings in and edges of all grating sections shall be banded with bearing bars. Bands shall be welded to all intersecting members.
- F. For watertight and gas-tight checkered plate installations, provide neoprene gasket all around the perimeter and between plate sections as shown on the Contract Drawings.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Gratings and checkered plates shall be installed with each section readily removable and replaceable. Adjacent units shall be neatly fitted together.

- B. The clearance at the ends or between sections of gratings and checkered plates shall be a maximum of 1/4 inch.
- C. Tops of gratings and checkered plates shall be set flush with surrounding construction.
- D. Gratings and checkered plates shall be set with a full and uniform end bearing on the stainless steel frames to preclude rocking movement; wedges or similar shimming devices shall not be used.

3.02 FASTENING DEVICES

- A. Install approved fastening devices to hold the gratings rigidly to the supports with means for easy removal.
- B. Fastening devices shall not protrude above the walking surface of the grating.
- C. Install fasteners in accordance with the manufacturer's recommendations.

-END OF SECTION-

## Section 05561

## MISCELLANEOUS METAL CASTINGS

## PART 1 GENERAL

## 1.01 SECTION INCLUDES

- A. Miscellaneous metal castings shall include all miscellaneous ferrous and non-ferrous castings to be furnished and installed by the Contractor.
- B. Included in this classification are manhole frames, covers and grades, stop plank grooves, cast iron brackets or other cast iron supports for piping, floor drains, traps, cleanouts, special malleable iron castings and inserts and other special castings of any nature or material, and all necessary bolts, nuts, washers, gaskets and other appurtenances required to join sections of castings.

## 1.02 RELATED SPECIFICATION

- A. Section 09911 - Exterior Painting
- B. Section 09912 - Interior Painting

## 1.03 REFERENCES

- A. ASTM A27 - Steel Castings, Carbon, for General Application
- B. ASTM A47 - Ferritic Malleable Iron Castings
- C. ASTM A48 - Gray Iron Castings
- D. ASTM A148 - Steel Castings, High Strength for Structural Purposes
- E. ASTM A536 - Ductile Iron Castings
- F. ASTM B26 - Aluminum-Alloy Sand Castings
- G. ASTM B96 - Copper-Silicon Alloy Plate, Sheet, Strip and Rolled Bar for General Purposes and Pressure Vessels
- H. ASTM B98 - Copper-Silicon Alloy Rod, Bar, and Shapes
- I. ASTM B148 - Aluminum-Bronze Sand Castings
- J. ASTM B584 - Copper Alloy Sand Castings for General Applications

K. NY Spec 20-I-1 - Iron Castings, Gray and Malleable

L. American Association of State Highway and Transportation Officials (AASHTO)

#### 1.04 DESIGN REQUIREMENTS

A. Castings exterior to structures shall be designed for an AASHTO H-20 truck loading, unless otherwise noted on the Contract Drawings.

B. Interior castings shall be designed for the loading designated on the Contract Drawings for the adjacent floor area. If no loading is designated, castings shall be designed for a minimum load of 300 pounds per square foot, or as required for their intended use.

#### 1.05 SUBMITTALS

A. The Contractor shall submit working drawings and material specifications for approval in accordance with the requirements of the General Conditions and of Section 01330 – Shop Drawings.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

A. Metal castings shall conform to the requirements specified herein and to the following standards:

- |    |  |   |                               |
|----|--|---|-------------------------------|
| 1. | Gray Iron                              | - | ASTM A48, NY Spec 20-I-1      |
| 2. | Malleable Iron                         | - | ASTM A47                      |
| 3. | Carbon Steel                           | - | ASTM A27                      |
| 4. | Alloy Steel                            | - | ASTM A148                     |
| 5. | Manganese Bronze                       | - | ASTM B584                     |
| 6. | Aluminum Alloy                         | - | ASTM B26                      |
| 7. | Aluminum Bronze                        | - | ASTM B148                     |
| 8. | Copper Silicon Alloys (Silicon Bronze) | - | ASTM B96, ASTM B98, ASTM B584 |

B. Where these metals are designated by class, grade, type, alloy, temper or coating, they shall conform to the requirements of the Specifications or as shown on the Contract Drawings.

C. Gray Iron castings shall conform to the requirements of ASTM A48 and manhole frames and covers shall be Class 25B, 30B or 35B with Class 25B, having a tensile strength of 25 ksi, being the lowest class utilized. Pier cleats, bollards and machinery castings shall be Class 20B or 25B with Class 20B having a tensile strength of 20 ksi, being the lowest class utilized.

- D. High Strength Yellow Brass: Commercial designation for this alloy is leaded manganese bronze and castings shall conform to the requirements of ASTM B584, copper alloy UNS No. C86700 (former designation B32-B).
- E. Silicon Bronze castings shall conform to the requirements of ASTM B584, copper alloy UNS No. C87610 (former designation B198-12A).

## 2.02 FABRICATION

- A. Castings shall be true to pattern in form and dimensions without sharp unfiltered angles or corners, free from pouring faults, sponginess, cracks, blow holes and other defects in positions affecting their strength.
- B. All castings shall be made accurately to the dimensions shown on the Contract Drawings and shall be planed or ground where marked or where otherwise necessary to secure perfectly flat and true surfaces. Allowance shall be made in patterns so that specified thicknesses will not be reduced.
- C. Manhole covers and floor plates shall conform to the details shown on the Contract Drawings or in their absence to the standards of the Department of Sanitation and shall be true and seat evenly at all points.
- D. Catalog numbers indicated on the Contract Drawings are given to show required types and configurations. All covers shall be cast with raised letters as designated on the Contract Drawings.

## 2.03 IRON CASTINGS

- A. General - Iron Castings shall include, but not be limited to frames, covers, and grates for trench drains, catch basins, and inlets; and stop log grooves.
  - 1. Castings shall be of gray iron of uniform quality, free from defects, smooth and well cleaned by shotblasting.
  - 2. Catalog numbers on the Drawings are provided only to show required types and configuration. All covers shall be cast with raised letters as designated on the Drawings.
  - 3. Castings shall be as manufactured by Dewey Brothers, or Neenah Foundry Company, or approved equal.
- B. Covers and Grates
  - 1. Covers and grates shall be provided with matching frames. Cover shall fit flush with the surrounding finished surface. The cover shall not rock or rattle when loading is applied.

2. Round covers and frames shall have machined bearing surfaces.
3. Design loadings
  - a. Where located within a structure, a minimum design loading of 300 psf shall be used, unless noted otherwise.
  - b. At all locations not within a structure, the design loading shall be a standard AASHTO H-20 truck loading, unless otherwise noted.
4. Watertight gasketing, bolting, locking devices, patterns, lettering, pickholes, vents, or self-sealing features shall be as detailed on the Contract Drawings.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. All castings shall be erected to accurate grades and alignment and when placed in concrete or other surrounding materials, shall be carefully supported to prevent movement during placement of concrete or other materials.

#### 3.02 PAINTING

- A. Where metal castings are required to be painted, such work shall be done in conformity with Section 09911 – Exterior Painting and Section 09912 – Interior Painting.
- B. Non-ferrous castings shall be painted only when so stated in the Specifications.
- C. Outdoor manhole frames and covers are not required to be painted.

-END OF SECTION-

**Section 05660**  
**CARRIAGE RAIL SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install all track work to the limits indicated or as directed by the Commissioner to provide a fully operational carriage track system, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. Work includes but shall not be limited to carriage rails, sole plates, elastomeric pad, fastening system, rubber rail trough filler, grouting and other carriage rail material. Carriage rail shall be installed on structural reinforced concrete as indicated on the Contract Drawings and in accordance with AREMA guidelines.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03200 - Concrete Reinforcement
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 05675 - Crane Rail System

**1.03 REFERENCES**

- A. See Section 05675, Article 1.03.

**1.04 SUBMITTALS**

- A. Conform to Section 05675, Article 1.04.

**1.05 QUALITY ASSURANCE**

- A. Conform to Section 05675, Article 1.05.

**PART 2 PRODUCTS**

**2.01 RAIL**

- A. General
  - 1. All rail shall be new. Used rail will not be accepted.
  - 2. All rail shall be from continuous cast blooms and shall be identified by a designation for heat number, strand number and bloom number.

3. Classifications, markings and brandings shall conform to AREMA specifications.
  4. Ensure that rail is ultrasonically tested over its full length. Test all rails 100% in-line with a fully computerized DAPCO 300 testing unit or approved equal. Testing shall conform to the requirements of Chapter 4, Part 2, Section 8 of the AREMA Manual.
- B. Rail Section shall be 115 RE, as specified in AREMA Manual for Railway Engineering - Volume 1, Chapter 4 (Rail), Part 1 (Design), Figure 1-1 "115RE Rail Section."
- C. Hardness
1. All rail shall be high-strength rail, in accordance with AREMA Manual for Railway Engineering - Volume 1, Chapter 4 (Rail), Part 2, Sections 2.1.4.1 and 2.1.4.2.
  2. High alloy, high strength rail, such as UIC 860/O Grade 1100A, will not be accepted.
- D. Length
1. Rail shall be furnished in lengths of at least 20 feet.

## 2.02 SOLE PLATE

- A. Conform to Section 05675, Article 2.02.

## 2.03 CARRIAGE RAIL CLIPS AND PAD

- A. Conform to Section 05675, Article 2.03, except that clips shall be equal to Part Number WL 24/115P of the Weldlok series and pad shall be equal to Model Number 140RFS, both as manufactured by Gantrex North America, 275 Curry Hollow Road, Pittsburgh, PA 15236, PH: (800) 242-6873, [www.gantrex.com](http://www.gantrex.com).

## 2.04 SOLE PLATE ANCHORAGE

- A. Conform to Section 05675, Article 2.04.

## 2.05 SOLE PLATE GROUT

- A. Conform to Section 05675, Article 2.05.

**2.06 RAIL SPLICES**

- A. Rail splices shall be made with two standard 115 RE rail 36-inch long joint bars in a manner conforming to AREMA standards.

**2.07 RUBBER RAIL TROUGH FILLER**

- A. Conform to Section 05675, Article 2.06.

**2.08 END RETAINING CLIPS FOR RUBBER RAIL TROUGH FILLERS**

- A. Conform to Section 05675, Article 2.07.

**PART 3 EXECUTION****3.01 INSTALLATION OF TRACK ON STRUCTURAL SLAB**

- A. Conform to Section 05675, Article 3.03.

**3.02 INSTALLATION OF JOINT BARS**

- A. Joint bars shall be clean. Rail joints shall be installed so that bars are not cocked between the base and head of the rail. Bars shall be properly seated in the rail and the full number of correct-size bolts, nuts, and spring washers installed. Bolts shall be placed with nuts alternately on inside and outside of rail. A corrosion resistant lubricant shall be applied to the bolt threads prior to application of nuts. Bolts shall be tightened to torque of approximately 350 ft-lbs, beginning at the center of the joint and working both ways to the ends of the joint. After the track has been in service, but before acceptance of the work, all bolts shall be checked and retightened to a torque of approximately 350 ft-lbs. Defective joint bars designated on the contract drawings, discovered by the Contractor during track repair operations, or as identified by the Commissioner shall be replaced with acceptable joint bars.

**3.03 INSTALLATION OF SOLE PLATES**

- A. Conform to Section 05675, Article 3.04.

**3.04 INSTALLATION OF CARRIAGE RAILPAD AND CLIPS**

- A. Conform to Section 05675, Article 3.05.

**3.05 INSTALLED TOLERANCES**

- A. Conform to Section 05675, Article 3.06.

3.06 MANUFACTURER'S REPRESENTATIVE

- A. Conform to Section 05675, Article 3.07.

3.07 RUBBER RAIL TROUGH FILLER INSTALLATION

- A. Conform to Section 05675, Article 3.08.

3.08 FIELD QUALITY CONTROL

- A. Conform to Section 05675, Article 3.09.
- B. Inspect bolted joints for loose bolts.

-END OF SECTION-

**Section 05675**  
**CRANE RAIL SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install all track work to the limits indicated or as directed by the Commissioner to provide a fully operational crane track system, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. Work includes but shall not be limited to crane rails, sole plates, elastomeric pad, fastening system, rubber rail trough filler, grouting and other crane rail material. Crane rail shall be installed on structural reinforced concrete as indicated on the Contract Drawings and in accordance with AREMA guidelines.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03200 - Concrete Reinforcement
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 05660 - Carriage Rail System

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. American Railway Engineering and Maintenance of Way Association (AREMA): Manual for Railway Engineering
  - 2. American National Standards Institute/American Society for Nondestructive Testing (ANSI/ASNT)

#### 1.04 SUBMITTALS

A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:

1. Compliance: Submit supplier's certification that the material delivered to the site is in compliance with specified requirements.
  - a. Include all test results and submittals stipulated in the AREMA Manual and the specified ASTM standards, as they apply.
  - b. Include mill certificates for crane and carriage rail and anchor bolts and as required by paragraphs 1.05D and 2.01A.
2. Samples: Submit, as requested by the submittal reviewer, samples and certifications of materials specified under this Section.
3. Qualifications
  - a. Submit qualifications of rail installer including list of similar projects that the Contractor or his/her specialty subcontractor has completed, along with the respective owner's contact persons for those projects demonstrating experience required by Paragraph 1.05A.
  - b. Welder Qualifications: Submit copy of welder qualification certificates for any welders performing welds in the shop or field.
  - c. Testing Technicians and Testing Agency: Submit data on qualifications of Contractor's proposed testing agency and technicians for approval by the Commissioner prior to performing any work. Comply with related requirements in Paragraph 1.05C.

4. Shop Drawings: Submit shop drawing and product data for:
  - a. Crane rail: Document testing in accordance with AREMA standards. Include:
    - (1) Schedule of rail production, inspection, shipment and final delivery.
    - (2) A detailed description of the steel metallurgy.
    - (3) A detailed description of the methods and procedures to be used to remove hydrogen in the steel.
    - (4) A description of the method and verification testing to achieve the required rail hardness.
    - (5) A description of the ultrasonic testing method and equipment.
    - (6) Method of handling, shipping, unloading, and stacking rail.
    - (7) Certified rail test report showing the test results for chemical composition, yield strength, tensile strength, and date(s) of testing for each heat of rail.
    - (8) Macroetch and ultrasonic test records and all other required test records.
    - (9) Report of physical examinations of rails, for conformance to section and straightness tolerances.
    - (10) Mill certificate of inspections in accordance with Paragraph 1.05C and Brinell hardness readings.
    - (11) Laying schedule of rail shipment indicating rail lengths.
  - b. Crane rail bolt, clip, pad and joint details.
  - c. Carriage rail bolt, clip, pad and joint details.
  - d. Rubber rail trough filler for crane and carriage rail track, including gauge and field side pieces. Shop drawings shall include detailed dimensions of the rubber pieces themselves, as well as their installation in the rail pocket with interfacing crane and carriage rail track components supplied by others. Include Quality Control Program and Quality Control Test reports as specified in Paragraphs 1.05G.1 and 1.05G.2.

- e. Clips for fastening together contiguous pieces of rubber rail trough filler, and all other materials required to complete the installation.
  - f. Manufacturer's data for epoxy grout.
5. Submit the following welding procedure and equipment data:
- a. Samples, procedure qualification welds, test reports including requirements of Paragraphs 1.05E and 1.05F, ultrasonic tests, hardness tests, certificates, welder's qualification, welding procedure, rail correction method, rail preparation, welding equipment manufacturer's instructions.
6. Quality Control Program: Within 15 days of notice to proceed for all crane and carriage track components and rubber rail trough filler, the supplier/manufacturer(s) shall submit their Quality Control Program(s) for review and approval.
7. Manufacturer's Installation Manual: The supplier of rubber rail trough fillers shall submit an installation manual to the Commissioner for approval at least 60 days before installation. After approval, the supplier shall supply at least five copies of the manual to both the Commissioner and the installation contractor.
8. Warranty and Maintenance Manual: Submit in accordance with the requirements of Section 01831 – Operation and Maintenance Manuals as per Paragraph 1.05D herein.
9. Manufacturer's Representative: The supplier of the rubber rail trough fillers shall provide a manufacturer's technical representative at the job site, at no additional cost to the City of New York, to meet with the installation contractor before start of installation to ensure proper preparation and equipment for installation. During at least the first day of installation of the rubber rail trough fillers, the technical representative shall visit the job site to assist the Contractor in the proper installation of the materials in accordance with the Manufacturer's Installation Manual. If the installation must be discontinued for any reason during the period that the manufacturer's representative is on the job-site, said representative shall stay and/or return to the job site when the installation is continued.
10. Trough Filler Installation Procedures: The Contractor shall submit for approval proposed procedures for installing the rubber fillers in rail pocket, including any additional methods not included in the Manufacturer's Installation Manual, and/or any proposed differences. Include proposed method for holding the rubber fillers in place tight against the rails before and during placement of concrete around them. Submit these procedures for approval at least 45 days before installation.

## 1.05 QUALITY ASSURANCE

- A. Track shall be installed by a firm having a minimum of three (3) years experience in the installation of similar installations. Track construction shall be performed under the direction of qualified and competent supervisory personnel experienced in crane rail construction and previous satisfactory experience in the installation of similar installations.
- B. Welding shall be performed under the direct supervision of an experienced welding supervisor or foreman.
- C. Testing Agency/Laboratory: Engage the services of an independent testing laboratory approved by the Commissioner to perform testing specified to be performed by the Contractor. Testing shall be performed by an approved accredited laboratory. Include the services of AWS-certified welding inspectors for fabrication and erection inspection and testing and verification inspections. Welding inspectors shall visually inspect and mark welds. Inspectors shall meet the requirements specified in Paragraph 3.09A.2.
- D. The crane rail contractor and carriage rail contractor shall provide mill certificates for the rail and anchor bolts. The mill certificates shall indicate the chemical and physical properties including Brinell hardness of the material. The crane rail and carriage rail manufacturer(s) shall submit four (4) copies of the requisite number of operations and warranty and maintenance manuals as specified in Section 01831 – Operations and Maintenance Manuals. The system shall be warranted for a minimum of two years.
- E. Crane rails shall be inspected prior to final acceptance of the work. The testing shall include:
  - 1. Non-destructive (NDT) rail weld test for each field butt weld
  - 2. Random anchor bolt / rail clip bolt torque tests
- F. Testing and inspection shall conform to applicable sections of the AREMA manual and shall be performed by a qualified inspection agency. All testing and retesting shall be performed at no additional cost to the City of New York.
- G. Manufacturing Quality Control for Rubber Rail Trough Filler
  - 1. Quality Control Program: Comply with the submitted and approved Quality Control Program.
  - 2. Conduct quality control tests to ensure quality and uniformity of rubber material, including but not limited to the following:
    - a. Prepare test slabs, strips or blocks in accordance with ASTM D3182. These slabs or blocks shall be prepared from the same production lot of

compound and the same rate of cure as is used on the finished products supplied for this contract.

- b. Test each batch of mixed compound and produce a rheometer curve to indicate proper mix and cure rates, in accordance with ASTM D2084.
- 3. Permanently mold or emboss manufacturer name, part name, part number, and manufacturing lot number on each part.
- H. Defective Materials: Materials that do not conform to the requirements of the specifications or manufacturer's quality control program shall be considered as defective and shall be replaced with acceptable materials at the expense of the supplier.

## PART 2 PRODUCTS

### 2.01 RAIL

- A. Provide new quality, 171CR (171 lb/yd) crane rail conforming to the shape, hardness and chemical properties of ASTM A759 including Supplemental Requirement S2. The rails shall be supplied with blank ends suitable for butt welding. Rails shall be shipped in pre-fabricated lengths of 39 to 78 feet, with pre-welded lengths as required. Mill certificates shall be provided. All rails shall be manufactured from a single rolling.

### 2.02 SOLE PLATE

- A. Sole plate shall be ASTM A36 or ASTM A572, of sizes indicated on the Contract Drawings, provided for placement in segments of lengths indicated. Plate shall be furnished pre-drilled for anchor bolts. Rail clip lower components shall be shop welded to the sole plate in conformance with AWS D1.1. A removable jacking bolt leveling system shall be provided with the sole plates. Sole plate, with lower clip components welded, shall be hot-dip galvanized as a unit in conformance with ASTM A123.

### 2.03 CRANE RAIL CLIPS AND PAD

- A. The crane rail fastening system shall consist of fully forged weldable adjustable clips, Part Number WL 43/171P of the Weldlok series as manufactured by Gantrex North America, 275 Curry Hollow Road, Pittsburgh, PA 15236, PH: (800) 242-6873, [www.gantrex.com](http://www.gantrex.com) or approved equal. The clips shall consist of two wedge-shaped components. The upper component shall be fabricated of ASTM A29 Grade 1045 forged steel with synthetic rubber nose attached by vulcanization process, and shall be furnished with a hot-dip galvanized finish. The lower component shall be fabricated of ASTM A29 Grade 1030 forged steel and shall not be hot-dip galvanized until after attachment to the sole plate. The rail clips shall provide a minimum lateral adjustment of 3/4 inches. Bolts shall be hex cap screws of strength

consistent with ASTM A325. Nuts shall conform to ASTM A563, Grade DH. Washers shall conform to ASTM F436. Bolts, nuts and washers shall be hot-dip galvanized in conformance with ASTM A153.

- B. The steel reinforced rail pad shall be MK 6 as manufactured by Gantrex North America, 275 Curry Hollow Road, Pittsburgh, PA 15236, PH: (800) 242-6873, [www.gantrex.com](http://www.gantrex.com) or approved equal. It shall be made of synthetic rubber manufactured via extrusion process to minimum 60-foot lengths, with continuous curing. It shall have a steel core for a minimum 90% of pad width. The steel core shall be galvanized. The pad shall include edge seals, top and bottom. Pad elastomer shall meet the following requirements:

<u>Physical Properties</u>	<u>Test</u>	<u>Required</u>
1. Tensile Strength, Min.	ASTM D412	1525 psi
2. Elongation after aging, Min.	ASTM D412	200%
3. Hardness, Shore A	ASTM D2240	75 ± 5
4. Tear Resistance Die "C"	ASTM D624	200 lbs./in.
5. Polymer		Nitrile butadiene
6. Coefficient of Friction	ASTM D1894	1.7 Avg.
7. Water Resistance	ASTM D471	

#### 2.04 SOLE PLATE ANCHORAGE

- A. Anchor bolts shall conform to A449, Type 1 or ASTM F1554, Grade 105 with ASTM A563 heavy hex nuts, ASTM A36 or A572 plate washers at bottom, and SAE AS 7240 spring lock washers at sole plate. Carbon steel anchor bolts, nuts and washers shall be hot-dip galvanized in conformance with ASTM A153. Alternatively, bolts shall conform to ASTM A193 Grade B7 (AISI 4140), with nuts conforming to ASTM A194, Grade 7. Anchor bolts and nuts shall be hot-dip galvanized in conformance with ASTM A153.

#### 2.05 SOLE PLATE GROUT

- A. Sole plate grout shall be non-shrink epoxy grout, of flowable consistency at placement, with minimum 28-day compressive strength of 10,000 psi.

#### 2.06 RUBBER RAIL TROUGH FILLER

- A. General Requirements – Rubber Rail Trough Fillers for both Crane Rail Track and Carriage Rail Track
1. Design
    - a. Rubber fillers shall be designed for placement between the rail and the side of the rail trough in the concrete track slab, as indicated. Rubber fillers shall provide damping, protection from thermal expansion and

contraction, and allow simplified construction. The design shall allow for normal rail deflection on the rail support pad and under traffic loading without transferring this force to the surrounding concrete pavement.

- b. The design shall provide a tight fit with the rail to minimize moisture infiltration and facilitate easy installation in both tangent and curved track.
- c. The tread surfaces of both gauge and field side pieces shall have domed ribs or similar shaped grooves to help absorb initial impact energy of vehicular traffic, prohibiting destructive forces from affecting the rail fastening system or adjacent concrete slab and improving skid resistance of pedestrian and vehicular traffic.
- d. The forming of the tread surface shall match the design of the adjacent concrete trough surface and provide a smooth surface for pedestrian and vehicular traffic running across the track.
- e. Cross-sectional dimensions shall match those shown on the Contract Drawings as close as possible. Slight variations in overall width, flangeway dimensions, and shape from that indicated may be permitted with the approval of the Commissioner, as long as the rubber fillers are compatible with, and match the designs and dimensions of the indicated rails, plates, rail pads, clip assemblies.
- f. Minimum length of gauge and field pieces shall be 15 feet.

## 2. Materials and Manufacture

- a. The elastomeric materials shall be manufactured from a single high quality, homogeneous, ultraviolet and ozone-resistant compound that, when properly cured, will comply with the requirements of this specification.
- b. The cured compound shall be effectively resistant to breakdown and oxidation in sunlight, weathering under outdoor installation conditions, and urban air quality typical of the New York metropolitan area, and permanent deformation under load.
- c. The rubber fillers shall be preformed and free of porosity, surface defects and dimensional irregularities that may affect serviceability.
- d. The material compound shall be designed to provide surface wear resistance and surface chemical spillage protection.
- e. The ends of each piece of rubber filler shall be precision cut with square ends. For lengths longer than the minimum manufactured length, the

square ends and forming of holes for end retainer clips shall be precision matched to ensure a tight fit that will minimize fluid infiltration.

- f. All materials shall be new and warranted to be of the quality specified.

3. Physical Properties: Conform to the following requirements:

- a. Hardness: 65 +/- 5 Durometer Shore A, when tested in accordance with ASTM D2240
- b. Tensile at Break: 1450 psi minimum, when tested in accordance with ASTM D412 - Die C
- c. Elongation, Ultimate: 250% minimum, when tested in accordance with ASTM D412 - Die C
- d. Tear Strength: 200 lbs./in. minimum, when tested in accordance with ASTM D624 - Die C
- e. Heat Resistance: Oven aged for 70 hours at 212°F in accordance with ASTM D573
  - (1) Change in Hardness: 10 maximum Shore A points change, when tested in accordance with ASTM D2240.
  - (2) Change in Tensile Strength at Break: 75% minimum retention, when tested in accordance with ASTM D412.
  - (3) Change in Ultimate Elongation: 75% minimum retention, when tested in accordance with ASTM D412.
- f. Compression Set
  - (1) 25% maximum, when tested in accordance with ASTM D395, for 22 hours at 158°F, 0.375 bar.
  - (2) 60% maximum, when tested in accordance with ASTM D395, Method B, for 22 hours at 257°F, 0.375 bar.
- g. Low Temperature Resistance: Pass, when tested in accordance with ASTM D2137, Method A, 9.3.2 Non-brittle after 3 minutes at -40°F.
- h. Water Resistance: 5% maximum volume change, when tested in accordance with ASTM D471, for 70 hours at 212°F.
- i. Ozone Resistance: 100% minimum quality retention rating, when tested in accordance with ASTM D1171.

- j. Electrical Resistivity:  $1.5 \times 10^7$  ohm-cm minimum, when tested in accordance with ASTM D257.

4. Manufacturing Tolerances

- a. Critical Sealing Dimensions:  $\pm 1$  mm
- b. Square End Cuts:  $\pm 0.50$
- c. End Retainer Hole Drilling:  $\pm 1$  mm
- d. Overall Height Dimensions:  $\pm 3$  mm
- e. Overall Width Dimensions:  $\pm 3$  mm
- f. Non-critical Dimensions:  $\pm 4$  mm

B. Rubber Rail Trough Fillers for Crane Rail Track

- 1. Provide both gauge and field side fillers of the same shape, with wheel flangeways on both sides of the rail.
- 2. Rubber fillers shall be designed for placement against new 171CR crane rail with rail pad, and with clearance to clipped rail support plate assembly, as indicated.

C. Rubber Rail Trough Fillers for Carriage Rail Track

- 1. Provide both gauge and field side fillers. Gauge side fillers shall incorporate a wheel flangeway. Field side fillers shall not incorporate a wheel flangeway.
- 2. Rubber fillers shall be designed for placement against new 115RE tee rail with rail pad, and with clearance to clipped rail support plate assembly, as indicated.

2.07 END RETAINING CLIPS FOR RUBBER RAIL TROUGH FILLERS

- A. For track lengths equal to or shorter than the minimum required length of rubber filler, install only one continuous piece on each side of the rails. Splicing together shorter lengths of rubber filler together will not be permitted.
- B. For tracks longer than the minimum required length of rubber filler, provide steel clips for fastening together contiguous pieces of rubber rail trough filler. Clips shall be formed from hot-rolled square bar,  $3/8"$  x  $3/8"$  square, galvanized to ASTM A153, or Commissioner-approved equal.

PART 3 EXECUTION

3.01 CONTINUOUS RAIL WELDING

- A. Both field welding and shop pre-welding of the rail shall be done using the electric flash-butt method. The subcontractor performing electric flash butt welding shall

have automated equipment for producing quality welds and qualified experienced personnel. Acceptable welding equipment is the K 355 G Welderhead by Holland Company, 1000 Holland Drive Crete, IL 60417-2120, Phone: (708) 672-2300 www.hollandco.com, or approved equal. Welding shall be performed before rail is placed on sole plate and in accordance with AREMA specifications. Field welding of the rail shall be performed while the rail is positioned directly above its required position, so horizontal movement would not be required to set the rail on the sole plate. Protect sole plate finish from damage by welding process.

### 3.02 WELDING PROCESS

#### WELDING RANGE

Rail steel	ASTM A759 (171 lbs./yd. crane rail)
------------	--

#### PRODUCTION

Welding time proper (171 lbs./yd. crane rail)	3 to 4 minutes
Overall cycle time allowance	5 to 6 minutes

#### TRACK CURVATURE

Allowable Maximum	N/A
-------------------	-----

#### FORGING UNIT

Maximum forging force	72 tons
Maximum machine stroke	3-11/32"
Maximum upset stroke	1"
Maximum upset speed	3/4"/sec.

#### CLAMPING UNIT

Maximum clamping force	200 tons
------------------------	----------

#### RAIL ALIGNMENT

Horizontal adjustment	Automatic
Vertical adjustment	Automatic

#### GAP CLOSING

Maximum starting gap	9-1/2"
----------------------	--------

WELDING TRANSFORMERS

Transformers rating	150 KVA at 50% duty cycle
---------------------	---------------------------

ELECTRIC POWER REQUIREMENTS

Welding power and control system 60 Hz/1 Ph	480 VAC
--	---------

HYDRAULIC POWER REQUIREMENTS

Maximum operating pressure	2000 PSI
----------------------------	----------

COOLING WATER REQUIREMENTS

Minimum consumption - internal	8 GPM
--------------------------------	-------

## 3.03 INSTALLING TRACK ON STRUCTURAL SLAB

- A. Spacing of the rail anchorages on slab shall be as shown on the Contract Drawings. Anchor bolts shall be cast in the concrete beams. Templates shall be used for setting anchor inserts and be securely held to the correct line and grade. Use of the sole plates as templates to hang the bolts in position while casting will be permitted. Check templates before, during and after concrete placement. Coordinate with requirements of Section 03200 – Concrete Reinforcement and Section 03300 – Cast-in-Place Concrete.
- B. The exposed threads of the anchor bolt shall be protected from damage or blockage by debris, grout, etc.
- C. The vertical axis of the installed anchor shall be  $90^{\circ} \pm 2^{\circ}$  to the horizontal plane of the installed sole plate.

## 3.04 INSTALLATION OF SOLE PLATES

- A. Plates shall be positioned level, not following the incidental slope of the slab. Plates shall be centered on the rail gage line (centerline of rail). Use removable jacking bolts under the sole plate to provide accurate sole plate setting to a 1/32 inch vertical tolerance.
- B. Anchor bolt nuts shall be installed hand tight prior to sole plate grouting. The sole plates shall be removed and normalized if excessive anchor bolt torque is required to level the sole plates. Tighten the anchor bolts to a torque of 180 to 200 ft-lbs after the grout has attained the specified strength.

### 3.05 INSTALLATION OF CRANE RAILPAD AND CLIPS

- A. Fasteners shall be installed according to manufacturer's specifications. The vertical clamping force of the rail clip shall allow longitudinal thermal movement of the rail.
- B. Follow the manufacturer's recommendations for the installation of the pad and the clip, specifically:
  - 1. Ensure that the pad is centered under the rail with the grooves up, butt joints.
  - 2. The rail clip upper component should be in contact with the toe of rail.
  - 3. Tighten the clip bolts to a torque of 180 to 200 ft-lbs.

### 3.06 INSTALLED TOLERANCES

- A. The rail shall be installed to the following tolerances:
  - 1. Elevation
    - a. Maximum slope  $\pm 1/8"$  in 10 ft.
    - b. Elevation each side  $\pm 1/8"$
    - c. Differential elevation  $\pm 1/8"$
  - 2. Alignment
    - a. Maximum sweep  $\pm 1/4"$  in 10 ft
    - b. Alignment each side  $\pm 1/4"$
    - c. Gauge  $\pm 1/4"$

### 3.07 MANUFACTURER'S REPRESENTATIVE

- A. Provide on-site inspection by welding system supplier's and rail accessory manufacturer's representatives to insure that recommended installation and operating procedures are followed for welding and bolting. Representatives shall issue inspection reports to the Commissioner.

### 3.08 RUBBER RAIL TROUGH FILLER INSTALLATION

- A. General
  - 1. A factory representative from the supplier of the rubber rail trough filler is required to be on the job site before and during the installation to assist the installer in initial preparation and proper installation.
  - 2. Install the rubber rail trough filler in accordance with the approved Manufacturer's Installation Manual and approved supplier shop drawings, and as instructed by the on-site factory representative. Any differences in the

procedure in that manual and the Specifications herein shall be resolved with the Commissioner as early as possible prior to the start of installation.

#### B. Preparation

1. Before installing rubber rail trough filler in either the crane rail track or carriage rail track, complete the installation of the sole plates, rail support pads, rails and rail clip assemblies. Ensure that the sole plate anchorage is complete, the track is at final alignment, gauge and profile, and rail clip assemblies are installed.
2. Clean the rail, plates, clip assemblies and anchor bolt assemblies of any dirt, debris, and grout or concrete laitance, to ensure proper fit tight seal of the rubber filler pieces against the rail. Blow out any standing water or other liquid in the rail trough areas with compressed air until dry.
3. Using templates cut to the same height and width as the rubber fillers, measure the height from the top of the sole plate to top of rail, to ensure that the rubber fillers will properly match the height and fit with the rail installation assemblies. Make any necessary adjustments in rail assemblies, and/or trim the rubber fillers as required, in accordance with the Manufacturer's Installation Manual from the rubber filler supplier, to ensure a proper fit of the rubber fillers before installation and placement of trough filler concrete.

#### C. Installation

1. Position the pieces of rubber rail trough filler loosely in place along the rail to verify placement and required length. Sawcut the rubber filler to required length, square to the sides.
2. Place the gauge and field side pieces in position against the rail, making sure that it is flush against the web of the rail, and positioned properly in relationship to rail, sole plate and rail clips, as shown on the manufacturer's shop drawings.
3. If the track is longer than the supplied length of rubber filler, splice-join contiguous pieces of rubber filler together using the supplied end retaining clips. They are designed for a very tight fit, so it may be easier to drive them on by tapping one leg partly in first, then driving them all the way on, flush with the side of both rubber pieces.
4. Using the procedures in the approved Contractor's Installation Procedures, fasten the rubber fillers securely to the rail for the whole length of the rubber. The proposed fastening method shall secure the rubber filler flush with and against the rail but not damage the rubber fillers.

5. Place removable temporary tape on top of the rubber fillers and rail to protect them from concrete spillage and curing compound during concrete placing/finishing/ curing operations.
6. Place/finish concrete around the rubber fillers as specified in Section 03300 – Cast-in-Place Concrete. Run joint edge tool along top corner of concrete next to the rubber fillers.
7. Remove protective tape from the top of the rail and rubber fillers.
8. Cut the exposed plastic banding off flush with the concrete using a knife, taking care not to nick the rubber fillers or damage the concrete.
9. Do not run rail vehicles or rubber-tired vehicles on or across the track until the concrete has reached sufficient cure.

### 3.09 FIELD QUALITY CONTROL

- A. Quality control inspection and field testing shall be performed by the Contractor in accordance with the following requirements:
  1. Track: Inspection shall be performed to ensure that all the requirements of these specifications are met. Rail, sole plates, rail clips and pads and sole plate anchorage shall be checked to ensure that the rail is properly seated and has full bearing on the sole plate and concrete. Upon completion of construction, measurements of track gage, cross level, and alignment shall be taken and recorded at least once every 25 feet of track centerline length. A copy of these measurements shall be provided to the Commissioner.
  2. Welded Joints - Visual Inspection: Quality control inspection and field testing shall be performed by a technician certified to meet ANSI/ASNT CP-189 level II or III qualifications with a minimum of one year experience in testing rail for defects. Each welded joint shall be inspected by the Contractor in the presence of the Commissioner's Representative on completion of the weld. The Contractor shall pay particular attention to surface cracking, slag inclusion, gas pockets, and lack of fusion. The Contractor shall correct or replace, at no extra cost to the City of New York, any weld found defective. The method of correction shall be as approved by the Commissioner.
  3. Electric Flash-Butt Welding of Rails: Testing shall conform to AREMA Specifications for the Quality Assurance of Electric Flash-Butt Welding of Rails. The testing will determine whether or not each weld meets the quality criteria. Defective welds will be removed and the item re-welded at the Contractor's expense.

-END OF SECTION-

**Section 05820**  
**BRIDGE BEARINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, place and set bridge bearings at the locations indicated on the Contract Drawings, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. The bearing units shall accommodate rotation by the deformation of a confined elastomeric element reinforced with steel plates. Steel reinforced elastomeric bearings shall be fabricated in fixed and expansion versions. The expansion version accommodates movement by means of sliding elements. Expansion versions shall be guided, allowing movement in only one direction.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 05120 - Structural Steel
- C. Section 09911 - Exterior Painting

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. New York State Department of Transportation (NYSDOT)
    - a. Section 565- Bridge Bearings, NYSDOT Standard Specifications
    - b. Section 716-11, Material Specifications for Steel Laminated Elastomeric Bridge Bearings, NYSDOT Standard Specifications
    - c. Section 728-02 and 728-03, Material Specifications for Rubber Impregnated Random Fiber Pad & Plain Rubber Pad, respectively, NYSDOT Standard Specifications
  - 2. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - 3. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto

#### 1.04 SUBMITTALS

- A. Shop drawings are not required for approval by the Commissioner unless a change in the details shown on the Contract Drawings is proposed.
- B. When approved shop drawings are required, they shall be furnished in accordance with the General Conditions, Section 01330 - Shop Drawings and the Steel Construction Manual (SCM), Section 2. The manufacturer shall note the following on all shop drawings:
  - 1. The Contract Number, bridge identification, type, size and quantity of bearing produced.
  - 2. The design load (dead load plus live load) for each type and size of bearing.
  - 3. The effective rubber thickness, typical laminate thickness, compressive data, shear area and shape factor.
  - 4. The Manufacturer's name, the location of the fabrication plant and the name and phone number of the Manufacturer's representative who will coordinate production, inspection, and sampling and testing with the Commissioner.
  - 5. The specification reference and grade of steel used.
- C. Copy of fabrication shop's quality control program.

#### 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Fabricators Quality Control Program: As a minimum, the quality control plan shall address the trace-ability of materials to mill certificates, and the documentation to show that welders and technicians are properly certified to perform the subject work and the inspection, testing and dimensional checks performed during fabrication.
- C. Field welding shall be subject to controlled inspection in accordance with the requirements of the New York City Building Code Local Law 76/2008 and the provisions of the General Conditions. Controlled inspection and testing services required by the New York City Building Code Local Law 76/2008 will be provided by the Commissioner. The Contractor shall cooperate with the Commissioner in the performance of its duties for controlled inspection. Failure of a controlled inspection to detect a defect in materials or workmanship shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

## PART 2 PRODUCTS

## 2.01 MATERIALS

- A. Conform to the provisions of Section 05120 - Structural Steel unless otherwise indicated herein.
- B. All materials shall be new with no reclaimed material in the finished bearings.
- C. Steel laminates in steel reinforced elastomeric bearings shall be made from rolled mild steel conforming to ASTM A36, A572 or equivalent and shall have a nominal thickness as shown on the Contract Drawings.
- D. Unless otherwise specified, stainless steel shall conform to ASTM A167 or A240 type 304, and have a minimum thickness as shown on the Contract Drawings. Stainless steel in contact with PTFE sheet shall be polished to a #8 mirror finish.
- E. Bolts shall conform to ASTM A325 (AASHTO M164), ASTM A490 (AASHTO M253), unless otherwise specified.
- F. Requirements for Steel Reinforced Elastomeric Bearings
  - 1. The raw elastomer shall be either virgin neoprene or virgin natural rubber. The elastomer compound shall be classified as being of low temperature grade 0, 2, 3, 4, and 5. The bearings shall be made of elastomer of durometer hardness of 50.
  - 2. The vulcanized bond between elastomer and steel reinforcement shall develop minimum peel strength of 40 pounds per inch. Peel strength tests shall be performed by ASTM D429 Method B.
- G. PTFE resin shall be 100 percent pure new material and shall comply with ASTM D1457. No reclaimed material shall be used. Woven fabric PTFE shall be made from oriented multi-filament PTFE fibers or from a mixture of PTFE fibers made from twisted, slit PTFE tape and other fibers.
- H. Lubricants, if used, shall consist of a combination of solids, which does not react chemically, or electrolytically with the PTFE and its mating surface and shall remain stable in the environmental conditions expected at the site.
- I. The elastomeric compound used in the construction of these bearings shall contain only virgin crystallization resistant polychlorine (neoprene) or virgin natural polyisoprene (natural rubber) as the raw polymer. The resulting area shall be free of porous areas, weak sections, bubbles, foreign matter, or other defects affecting serviceability.

## 2.02 FABRICATIONS

- A. Bearings with steel laminates shall be cast as a unit in a mold and shall be bonded and vulcanized under heat and pressure. The mold finish shall conform to standard shop practice. The internal steel laminates shall be sand blasted and cleaned of all surface coatings, rust, mill scale and dirt before bonding and shall be free of sharp edges and burns. External load plates for guided expansion bearings and sole plates for the fixed bearings shall be protected from rusting by the manufacturer, and preferably should be hot bonded to the bearing during vulcanization.
- B. Steel components of bridge bearings shall be fabricated in accordance with the applicable requirements of the NYS Steel Construction Manual (SCM). In addition, component parts of individual bearings shall meet fabrication details as shown on the Contract Drawings.
- C. Each bearing shall be shipped as an assembled unit. Bearings shall be packaged in such a manner to protect all rotating and sliding surfaces from the intrusion of outside material.

## 2.03 PAINTING

- A. Machined finished surfaces in contact, including pins, pinholes, shall receive one coat of automotive grease as soon as machining is complete. None of these surfaces shall be painted.
  - B. Stainless steel and polytetrafluoroethylene surfaces shall not be painted or otherwise coated.
  - C. After fabrication, steel surfaces exposed to the atmosphere, except stainless steel surfaces, shall be shop painted to protect against corrosion.
  - D. The final painting of these surfaces shall be done in the field after completion of all welding.
  - E. Metal to metal surfaces to be field welded shall be given a coat of clear lacquer or other protective coating approved by the Commissioner, if exposure is to exceed three months prior to welding. The coating shall be removed at the time of welding. Painting, if required, shall be done only after the completion of all welding. Surfaces to be painted shall be primed and painted. Conform to the provisions of Section 05120 - Structural Steel for surface preparation and shop painting unless otherwise indicated herein.
- 1. All metal surfaces shall be cleaned to meet SSPC-SP6, Surface Preparation Specification No. 6 Commercial Blast Cleaning, and painted with three coats of paint. Prime Coat: Immediately after surface preparation, apply shop prime paint as specified in Sections 05120 - Structural Steel and 09911 - Exterior Painting and in accordance with manufacturer's instructions. Use painting

methods that result in full coverage of joints, corners, edges and exposed surfaces.

2. Intermediate Coat: Within four days after manufacturer's recommended cure time for prime coat, apply shop intermediate coat as specified in Sections 05120 – Structural Steel and 09911 – Exterior Painting and in accordance with manufacturer's instructions. Use painting methods that result in full coverage of joints, corners, edges and exposed surfaces. Do not exceed specified thickness.
  3. Finish painting of new structural steel will be performed in the field as specified in Section 09911 – Exterior Painting.
- F. Field Painting: Field painting shall not proceed until all erection is complete including field bolting and field welding unless otherwise permitted by the Commissioner.

### PART 3 EXECUTION

#### 3.01 CONSTRUCTION DETAILS

- A. The elevation of the concrete bearing surface may vary from that given on the Contract Drawings depending on the vertical dimension of the actual bearing supplied. The Contractor shall notify the Commissioner of all required elevation changes. Changes to the roadway profile will not be allowed. All elevation adjustments necessary to maintain the profile shall be made to the concrete bearing surfaces. Any adjustments, including changes to the reinforcement, will be made at no additional cost to the City of New York.
- B. Concrete Bearing Surface Preparation. No bearing shall be placed upon a concrete bearing surface, which is deformed, irregular, or poorly finished. The entire bearing surface area shall be floated and troweled.
- C. Setting Anchor Bolts. Anchor bolts shall be set as shown on the Contract Drawings unless changes are permitted by the Commissioner. If anchor bolts are cast in substructure concrete, templates, or other suitable means, shall be used to keep the bolts vertical at the required embedment and in the correct horizontal position during concrete placement.
- D. Bearing Pad Installation. Bearing pads placed between concrete, and/or other masonry, and steel masonry plates shall be located to correct alignment and elevation, and placed at the time of masonry plate installation. Each bearing pad shall be the same size in plan as the masonry plate it supports. Holes to accommodate anchor bolts shall be cleanly and accurately cut prior to bearing pad placement.

### E. Bearing Installation and Alignment

1. General. The centerline of sole plates or other fixed portions of bearing assemblies attached to the structural steel shall not be offset from the centerline of bearing stiffeners or diaphragm connection plates by more than one-half the thickness of the flange at that location, or the thickness of the bearing stiffener or connection plate, whichever is the lesser distance.
2. Fixed. No additional requirements apply.
3. Expansion. These may vary from perfect alignment. Therefore expansion bearings shall be set in accordance with the following:
  - a. The sliding plate shall be centered on the masonry plate under full dead load at an ambient temperature of 68°F.
  - b. The maximum variation from perfect alignment between the centerline of the fixed and movable portions of the bearing device, taking into account the effects of temperature and load at the time of measurement, shall not exceed plus or minus one inch longitudinally unless otherwise indicated on the Contract Drawings. This variation shall be measured as the horizontal distance between the centerline of the sliding plate and the centerline of the masonry plate.
  - c. No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted to the Commissioner for approval. All adjustments shall be made at no additional cost to the City of New York.

F. Welding: During field welding operations the temperature of the steel adjacent to the rotational element shall not exceed 194°F. Temperature shall be controlled by welding procedures and monitored using temperature indicating crayons, or other devices. Procedures, crayons, and other devices shall be acceptable to the Commissioner. If the temperature limit is exceeded, notify the Commissioner immediately. The Commissioner will provide the proper repair procedure, which may include complete replacement of the bearing. All repair work shall be done at no additional cost to the City of New York.

G. Grouting Anchor Bolt Holes. All slotted anchor bolt holes in masonry plates shall be filled with concrete grouting material to the top edge of the hole. All excess grout material shall be cleaned from the bearing surfaces in a manner satisfactory to the Commissioner.

- H. Slotted anchor bolt holes in fixed bearings may be filled any time subsequent to stringer placement. Slotted holes in expansion bearings shall be filled only after all necessary bearing adjustments have been made.

### 3.02 FIELD QUALITY CONTROL

- A. Final Verification: Prior to final acceptance of the structure, the Commissioner will verify that all necessary adjustments have been made; that all steel bearings, or sole plates, are permanently welded or attached with cap screws to the superstructure steel as shown on the Contract Drawings; that all slotted holes are completely filled with grout; that all anchor bolts are firmly tightened; and that all other work required to make the bearings fully functional has been completed.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 05830**  
**BRIDGE EXPANSION JOINT ASSEMBLIES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The work specified in this Section consists of all labor, materials, equipment and services necessary to furnish, fabricate and install an expansion joint system to accommodate movement at interface between ramp structures and building structures, complete in place as shown on the Contract Drawings, as specified herein and as required for a complete installation.
- B. The joints shall be proprietary designs consisting of armored joint segments, angles, anchor studs, threaded studs, bolts, nuts, lock washers, expansion bolt anchors and sealant, all combined as noted on the Contract Drawings so that a fully operational and waterproof system shall seal the joint in which it is installed.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete

**1.03 REFERENCES**

- A. The work covered in this Section shall conform to the latest edition and latest addenda thereto of the following publications to the extent referenced. The publications are referred to in the text by the basic designation only.
  - 1. New York State Department of Transportation (NYSDOT)
    - a. Steel Construction Manual
  - 2. New York City Building Code, Local Law 76/2008, latest edition and amendments or supplements thereto
  - 3. New York City Board of Standards and Appeals (BS&A), latest edition and amendments or supplements thereto

**1.04 SUBMITTALS**

- A. Submit the following in accordance with the General Conditions and Section 01330 - Shop Drawings:
  - 1. Template Drawings - Submit typical expansion joint cross-section(s) indicating pertinent dimensioning, general construction, component connections, and anchorage methods.

2. Submit manufacturer's literature completely describing all materials, standard instructions and any special instructions and/or precautions applicable to this project a minimum of two weeks prior to the supply of these items.
3. Submit references and project information to demonstrate the specialized experience of the proposed manufacturer and applicator in expansion control systems on similar projects of comparable scope and complexity.

#### 1.05 QUALITY ASSURANCE

- A. All work shall comply with the provisions of the New York City Building Code, Local Law 76/2008, and the rules of the Board of Standards and Appeals, latest edition of each and amendments or supplements thereto.
- B. Manufacturer: Shall have a minimum three (3) years of successful experience specializing in the manufacture of heavy duty expansion control systems capable of accommodating vehicular loads and multi-directional movement.
- C. Applicator: The specified expansion control systems shall be installed by the manufacturer's licensed applicator; factory trained and certified in the proper installation of the specified expansion control systems.

#### 1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver products in manufacturer's original, intact, labeled containers and store under cover in a dry location until installed. Store off the ground, protect from weather and construction activities.

#### 1.07 WARRANTY

- A. The system installer shall furnish a written single source performance warranty that the expansion joint systems will be free of defects related to workmanship or material deficiency for a one (1) year period from the date of substantial completion. The following problems shall be specifically covered under the warranty:
  1. Cohesive and adhesive failure of the expansion joint systems.
  2. Weathering deficiencies resulting in failure of the expansion joint system.
  3. Failure of the expansion joint system resulting from normal traffic use including rubber tipped snowplows without raising plow.
- B. The system installer shall submit a detailed warranty statement for approval consistent with the terms of the specification prior to construction. The approved warranty shall be made part of the contractual agreement and shall represent the sole warranty statement for the project.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. The naming of certain manufacturers in the following provisions is intended to establish a standard of quality and is not intended to limit competition among bidders.
- B. Subject to compliance with all provisions of this section, products of the following manufacturers or equivalent products of alternate manufacturers will be acceptable:

Watson Bowman Acme Corp.  
95 Pine View Drive  
Amherst, NY 14228  
800-253-9226

D.S. Brown Company  
300 East Cheery Street  
North Baltimore, Oh 45872  
419-257-3561

Kinedyne Corporation  
3566 S. Benzing Road  
Buffalo, NY 14127  
888-358-5438

- C. Alternate manufacturers and their products will be considered provided that they meet the design concept and are produced of materials that will satisfy trouble-free operation of the joint system for its intended service life operation and are equal to or superior to those specified in the base product specification.
- D. Proposed alternate systems shall be submitted in accordance with the provisions of Section 01631 – Equivalent Materials and Equipment and receive approval. Manufacturers wishing to submit alternate systems for prior approval shall provide the following:
  - 1. A working 12" sample of the proposed alternate system with a letter describing how the systems are considered equal or superior to the specified systems.
  - 2. A project proposal drawing that illustrates the proposed alternate system installed in the concrete deck and wall panels that are specific to the uses on this project. Typical catalog cut sections will not be considered.
  - 3. Verifiable list of prior installations and contact references showing successful experience with the proposed alternate system.

## 2.02 GENERAL

- A. Provide a heavy-duty floor expansion control system capable of accommodating vehicular loads and multi-directional movements without stress to its components. Throughout normal service, the system shall resist the passage of water through the joint opening, by utilizing the manufacturer's standard preformed seal, which shall be mechanically locked to the members of the assembly.

## 2.03 FLOOR EXPANSION CONTROL SYSTEM PERFORMANCE CRITERIA

- A. Expansion control system assembly shall be capable of accommodating imposed vehicular load of HS-25 Trucks and/or CAT-345B wheel loads as indicated on the Contract Drawings.
- B. Design of expansion control joints at the interface of the access ramp structure and the transfer station building shall allow movement in all directions with maximum allowable movement in:

Longitudinal direction	9 inches
Transverse direction	4 inches and
Vertical direction	2 inches
- C. Joints shall also be capable of allowing thermal movements of the adjacent structures. Functional temperature shall be considered as 120 degrees F. maximum and a minimum of -30 degrees F.
- D. Moisture Barrier: A seal arrangement shall be designed with a configuration allowing maximum movement and flexibility. Side lugs shall mechanically locked into a corresponding metal profile. Material shall be a quality flame-retardant vinyl or approved equal with a minimum material thickness of 0.063 inches. Install profile using Prima Lub or other equivalent adhesive product.
- E. Anchorage: Provide expansion anchorage of sufficient strength to secure base member firmly to concrete slab.
- F. Accessories: Provide necessary sealants and assembly hardware required for complete installation.

## 2.04 FABRICATION

- A. All metal plates and components shall be fabricated in accordance with the requirements of the NYSDOT Steel Construction Manual.
- B. Fire Barriers – Fabricate and ship manufacturer's standard assembly including fire caulks, sealants (if applicable) and hardware for the required hourly rating. Assemblies shall be miter cut in the field as required to accommodate changes in direction.

## PART 3 EXECUTION

### 3.01 INSTALLATION

#### A. Preparatory Work For Expansion Joint System

1. Provide a suitable blackout in the concrete slab to the dimensions indicated on the Contract Drawings and as required and acceptable to the manufacturer for the proper installation of the expansion joint system.
2. Repair all edge raveling at the joint opening or concrete spalls with an approved structural repair compound to provide a solid, square blackout upon which to seat the expansion joint system assembly.
3. Do not install the expansion joint system until the substrate concrete has cured sufficiently in accordance with Section 03300 – Cast-in-Place Concrete. The blackout substrate shall be sandblasted clean of all contaminants and impurities immediately prior to the system installation to assure proper expansion joint system installation.
4. Tape off and protect adjacent deck surfaces to ensure a clean, neat, professional installation.

#### B. Installation

1. Install expansion joint systems in strict accordance with the manufacturer's standard details and written instructions, with technical field support provided by the manufacturer's qualified technical representative. In the event of a conflict, the requirements specified herein shall govern.
2. A technical representative of the manufacturer shall be present at the beginning of the installation. The representative shall be fully knowledgeable and conversant with the correct installation methods in all respects. The representative shall be responsible to advise both the Commissioner and the Contractor that the proper the proper installation method is being followed.

C. Expansion joint systems shall be set to the proper width for the ambient temperature at the time of installation. This information is indicated in the Contract Drawings.

D. Prevent traffic from crossing the expansion joint system until entire assembly is firmly cured and accepted by the Commissioner.

### 3.02 CLEANING AND PROTECTION

A. Protect all expansion joint component parts from damage during installation, placing of concrete and thereafter until completion of construction.

- B. After construction work is complete, clean exposed surfaces with a suitable cleaner that will not harm or damage the elastomeric material.

**-END OF SECTION-**

**Section 06061**  
**UNTREATED TIMBER AND LUMBER**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The Contractor shall furnish and install all untreated timber and lumber as shown on the Contract Drawings, specified, or required for the Work.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05081 - Galvanizing

**1.03 REFERENCES**

- A. ASTM D245 - Standard Practice for Establishing Structural Grades and Related Allowable Properties for Visually Graded Lumber
- B. AWP A C20 - Structural Lumber, Fire Retardant Treatment by Pressure Processes
- C. American Wood Preservers Association (AWPA).

**1.04 SUBMITTALS**

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Prior to shipping any materials to the site, the Contractor shall submit to the Commissioner copies of manufacturer's certificates showing compliance with the specified material requirements.
- C. Certification shall be submitted for timber and lumber designated to be fire retardant treated.

**PART 2 PRODUCTS**

**2.01 TIMBER AND LUMBER**

- A. All timber and lumber used for sheeting, shoring, bracing, decking and for other purposes shall be sound and free from any defect that may impair its strength and shall be graded in accordance with ASTM D245. Timber and lumber shall have sufficient strength, be of suitable quality for the purposes intended and be of sizes shown on the Contract Drawings, specified or required for the work.

- B. Timber and lumber for shoring and bracing shall be new, merchantable pine, Douglas fir, or spruce, unless otherwise shown on the Contract Drawings, and shall be squared to the required dimensions throughout its entire length.
- C. Timber and lumber for decking and supports shall be suitable, hard, yellow pine.
- D. No second-hand timber or lumber shall be used where strength and appearance are important considerations and in all cases the Commissioner shall determine if such material is suitable for the proposed use.
- E. Timber and lumber designated on the Contract Drawings or specified shall be pressure impregnated with flame proofing in accordance with AWWA C20.

## 2.02 FASTENERS

- A. Timber and lumber shall be fastened with nails, spikes, bolts, rods, plates, washers and all other hardware shall be of the type, size and spacing to meet the conditions encountered.
- B. Fasteners exposed to the weather shall be hot dip galvanized in accordance with Section 05081 - Galvanizing, unless other materials are indicated on the Contract Drawings.

## PART 3 EXECUTION

### 3.01 STORAGE AND HANDLING

- A. Materials shall be stored on raised platforms, indoors at the site. If outdoor storage has to be incorporated, the material shall be set on raised platforms and covered with suitable weatherproof protective coverings, such as tarpaulins or heavy polyethylene film. Covers shall be battened down to prevent the covers from blowing off.
- B. All timber and lumber shall be carefully handled to avoid splitting or damage to the surface and edges.

### 3.02 WORKMANSHIP

- A. Timber and lumber shall be firmly fastened with approved nails, spikes, bolts, rods, plates and all other hardware of the proper sizes and lengths required to obtain the necessary strength and stability.
- B. All sheeting and bracing shall be installed by skilled mechanics, keyed tight by wedges where necessary and arranged to permit ready withdrawal without endangering the adjacent soil. Sheeting shall not be cracked or split in driving.
- C. Sheeting shall be tongued and grooved where necessary to obtain required results.

- D. The sustaining members in bracing systems shall be designed and constructed to fully support, without undue deflection, all loads imposed.
- E. Wedges, steel plates and other devices approved by the Commissioner shall be used in effecting the necessary reactions. Special care shall be taken to assure the stability of foundations supporting vertical posts.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 06100**  
**ROUGH CARPENTRY**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes the following:
1. Framing with dimension lumber for staging and temporary construction.
  2. Equipment bases and support curbs.
  3. Wood blocking, cants, and nailers.
  4. Wood grounds.
  5. Plywood backing panels.

**1.02 RELATED SPECIFICATIONS**

- A. Section 06200 - Finish Carpentry  
B. Section 06400 - Architectural Woodwork/Casework, for cabinets and countertops  
C. Division 7 Roofing Sections  
D. Divisions 15 and 16 Mechanical and Electrical Work

**1.03 DEFINITIONS**

- A. Rough Carpentry: Carpentry work not specified in other Sections and not exposed, unless otherwise indicated.
- B. Lumber grading agencies, and the abbreviations used to reference them, include the following:
1. NELMA - Northeastern Lumber Manufacturers Association
  2. NLGA - National Lumber Grades Authority
  3. RIS - Redwood Inspection Service
  4. SPIB - Southern Pine Inspection Bureau
  5. WCLIB - West Coast Lumber Inspection Bureau
  6. WWPA - Western Wood Products Association

**1.04 SUBMITTALS**

- A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.
1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material.

2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials, both before and after exposure to elevated temperatures when tested according to ASTM D 5516 and ASTM D 5664.
  3. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
  4. Include copies of warranties from chemical treatment manufacturers for each type of treatment.
- B. Material Certificates: For dimension lumber specified to comply with minimum allowable unit stresses. Indicate species and grade selected for each use and design values approved by the American Lumber Standards Committee Board of Review.
- C. Research/Evaluation Reports: For the following, showing compliance with building code in effect for Project:
1. Preservative-treated wood
  2. Fire-retardant-treated wood
  3. Power-driven fasteners
  4. Powder-actuated fasteners
  5. Expansion anchors
  6. Metal framing anchors

#### 1.05 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.
- B. Source Limitations for Engineered Wood Products: Obtain each type of engineered wood product through one source from a single manufacturer.
- C. Source Limitations for Fire-Retardant-Treated Wood: Obtain each type of fire-retardant-treated wood product through one source from a single producer.
- D. Provide products complying with NYC Building Code requirements.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Stack lumber, plywood, and other panels; place spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings. Store products in dry location and cover to prevent from getting wet.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following:

1. Metal Framing Anchors:

- a. Alpine Engineered Products, Inc.
- b. Cleveland Steel Specialty Co.
- c. Harlen Metal Products, Inc.
- d. KC Metals Products, Inc.
- e. Silver Metal Products, Inc.
- f. Simpson Strong-Tie Company, Inc.
- g. Southeastern Metals Manufacturing Co., Inc.
- h. United Steel Products Company, Inc.
- i. Or approved equal

## 2.02 WOOD PRODUCTS, GENERAL

A. Lumber: DOC PS 20 and applicable rules of lumber grading agencies certified by the American Lumber Standards Committee Board of Review.

1. Factory mark each piece of lumber with grade stamp of grading agency.
2. Provide dressed lumber, S4S, unless otherwise indicated.
3. Provide dry lumber with 19 percent maximum moisture content at time of dressing for 2-inch nominal (38-mm actual) thickness or less, unless otherwise indicated.

## 2.03 WOOD-PRESERVATIVE-TREATED MATERIALS

A. Preservative Treatment by Pressure Process: AWPAC2 (lumber) , except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWPAC31 with inorganic boron (SBX).

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and the following:
  - a. Chromated copper arsenate (CCA)
  - b. Ammoniacal copper zinc arsenate (ACZA)
  - c. Ammoniacal, or amine, copper quat (ACQ)
  - d. Copper bis (dimethyldithiocarbamate) (CDDC)
  - e. Ammoniacal copper citrate (CC)
  - f. Copper azole, Type A (CBA-A)
  - g. Oxine copper (copper-8-quinolinolate) in a light petroleum solvent

- B. Kiln-dry material after treatment to a maximum moisture content of 19 percent for lumber. Do not use material that is warped or does not comply with requirements for untreated material.
- C. Mark each treated item with the treatment quality mark of an inspection agency approved by the American Lumber Standards Committee Board of Review.
- D. Application: Treat all rough carpentry, unless otherwise indicated.

#### 2.04 FIRE-RETARDANT-TREATED MATERIALS

- A. Where fire-retardant-treated materials are indicated, provide materials that comply with performance requirements in AWPAC20 (lumber). Identify fire-retardant-treated wood with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Use treatment for which chemical manufacturer publishes physical properties of treated wood after exposure to elevated temperatures, when tested by a qualified independent testing agency according to ASTM D 5664, for lumber.
  - 2. Use treatment that does not promote corrosion of metal fasteners.
  - 3. Use Exterior type for exterior locations and where indicated.
  - 4. Use Interior Type A High Temperature (HT), unless otherwise indicated.

#### 2.05 DIMENSION LUMBER

- A. Provide dimension lumber of grades indicated according to the American Lumber Standards Committee National Grading Rule provisions of the grading agency indicated.

#### 2.06 MISCELLANEOUS LUMBER

- A. General: Provide lumber for support or attachment of other construction, including the following:
  - 1. Equipment bases and support curbs
  - 2. Blocking
  - 3. Cants
  - 4. Nailers
  - 5. Grounds
- B. For items of dimension lumber size, provide Construction, Stud grade lumber with 19 percent maximum moisture content and any of the following species:
  - 1. Mixed southern pine, No. 1 grade; SPIB

2. Hem-fir or Hem-fir (north), Prime or D Finish grade; NLGA, WCLIB, or WWP
3. Spruce-pine-fir (south) or Spruce-pine-fir, 2 Common grade; NELMA, NLGA, WCLIB, or WWP

## 2.07 PLYWOOD BACKING PANELS

- A. Telephone and Electrical Equipment Backing Panels: DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated or, if not indicated, not less than 3/4-inch thick.

## 2.08 FASTENERS

- A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
  1. Provide fasteners of Type 304 or 316 stainless steel, unless otherwise acceptable to the Commissioner.
- B. Nails, Brads, and Staples: ASTM F 1667
- C. Power-Driven Fasteners: CABO NER-272
- D. Wood Screws: ASME B18.6.1
- E. Screws for Fastening to Cold-Formed Metal Framing: ASTM C 954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.
- F. Lag Bolts: ASME B18.2.1. (ASME B18.2.3.8M)
- G. Bolts: Stainless steel bolts complying with ASTM F 593, Group 1 or 2; with ASTM F 594 hex nuts and, where indicated, flat washers.
- H. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.
  1. Material: Stainless steel with bolts and nuts complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Grade A1 or A4)

## 2.09 METAL FRAMING ANCHORS

- A. General: Provide framing anchors made from metal indicated, of structural capacity, type, and size indicated, and as follows:
  - 1. Research/Evaluation Reports: Provide products acceptable to authorities having jurisdiction and for which model code research/evaluation reports exist that show compliance of metal framing anchors, for application indicated, with building code in effect for Project.
  - 2. Allowable Design Loads: Provide products with allowable design loads, as published by manufacturer, that meet or exceed those indicated. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis and demonstrated by comprehensive testing performed by a qualified independent testing agency.
- B. Stainless-Steel Sheet: ASTM A 666, Type 304.
  - 1. Use for interior and exterior locations, unless otherwise acceptable to the Commissioner.

## PART 3 EXECUTION

### 3.01 INSTALLATION, GENERAL

- A. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit rough carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.
- B. Do not use materials with defects that impair quality of rough carpentry or pieces that are too small to use with minimum number of joints or optimum joint arrangement.
- C. Apply field treatment complying with AWP A M4 to cut surfaces of preservative-treated lumber and plywood.
- D. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
  - 1. CABO NER-272 for power-driven fasteners
  - 2. Published requirements of metal framing anchor manufacturer
  - 3. Table 23-II-B-1, "Nailing Schedule," and Table 23-II-B-2, "Wood Structural Panel Roof Sheathing Nailing Schedule," in the Uniform Building Code
  - 4. Table 2305.2, "Fastening Schedule," in the BOCA National Building Code

5. Table 2306.1, "Fastening Schedule," in the Standard Building Code
  6. Table 602.3(1), "Fastener Schedule for Structural Members," and Table 602.3(2), "Alternate Attachments," in the International One- and Two-Family Dwelling Code
- E. Use threaded fasteners, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; predrill as required.
- 3.02 WOOD GROUND, BLOCKING, AND NAILER INSTALLATION
- A. Install where indicated and where required for attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.
- B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated. Build anchor bolts into masonry during installation of masonry work. Where possible, secure anchor bolts to formwork before concrete placement.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 06200**  
**FINISH CARPENTRY**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section includes shelving.

**1.02 RELATED SPECIFICATIONS**

- A. Section 09912 - Interior Painting, for all painting storage areas.

**1.03 DEFINITIONS**

- A. Inspection agencies, and the abbreviations used to reference them, include the following:

1. AWWA – American Wood Preservers Association.

**1.04 SUBMITTALS**

- A. Product Data: For each type of process and factory-fabricated product. Include construction details, material descriptions, dimensions of individual components and profiles, textures, and colors.

1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material.
2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements.
3. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

- B. Samples for Initial Selection: Color charts consisting of actual materials in small sections for each type of material indicated.

- C. Samples for Verification

1. For each species and cut of lumber and panel products with nonfactory-applied finish, with 1/2 of exposed surface finished, 50 sq. in. for lumber and 8 by 10 inches for panels.

2. For each finish system and color of lumber and panel products with factory-applied finish, 50 sq. in. for lumber and 8 by 10 inches for panels.

- D. Research/Evaluation Reports: Showing that fire-retardant-treated wood complies with building code in effect for Project.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer experienced in finish carpentry work similar to the types indicated.
- B. Fire-Test-Response Characteristics: Where fire-retardant materials are indicated, provide materials with specified fire-test-response characteristics as determined by a testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency on surfaces of materials that will be concealed from view after installation.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Protect materials against weather and contact with damp or wet surfaces. Stack lumber, plywood, and other panels. Provide for air circulation within and around stacks and under temporary coverings.
- B. Deliver interior finish carpentry only when environmental conditions meet requirements specified for installation areas. If finish carpentry must be stored in other than installation areas, store only where environmental conditions meet requirements specified for installation areas.

#### 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install interior finish carpentry until building is enclosed and weatherproof, wet work in space is completed and nominally dry, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. Lumber: DOC PS20 and applicable grading rules of inspection agencies certified by the American Lumber Standards' Committee Board of Review.
  1. Factory mark each piece of lumber with grade stamp of inspection agency indicating grade, species, moisture content at time of surfacing, and mill.
  2. For exposed lumber, mark grade stamp on end or back of each piece

- B. Medium-Density Fiberboard: ANSI A208.2, Grade MD. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material.

## 2.02 WOOD-PRESERVATIVE-TREATED MATERIALS

- A. Preservative Treatment by Pressure Process: AWWA C2 (lumber), except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWWA C31 with inorganic boron (SBX).
  - 1. Preservative Chemicals: Acceptable to authorities having jurisdiction and the following:
    - a. Ammoniacal copper quat (ACQ)
    - b. Copper bis (dimethyldithiocarbamate) (CDDC)
    - c. Ammoniacal copper citrate (CC)
    - d. Copper azole, Type A (CBA-A)
    - e. Oxine copper (copper-8-quinolinolate) in a light petroleum solvent
  - 2. Do not use chemical formulations that require incising.
  - 3. For exposed items indicated to receive transparent finish, do not use chemical formulations that contain colorants or that bleed through or otherwise adversely affect finishes.
  - 4. Kiln-dry material after treatment to levels required for untreated material. Do not use material that is warped or does not comply with requirements for untreated material.
  - 5. Mark each treated item with the Quality Mark Requirements of an inspection agency approved by the American Lumber Standards' Committee Board of Review.

## 2.03 FIRE-RETARDANT-TREATED MATERIALS

- A. Use materials impregnated with fire-retardant chemicals by a pressure process or other means acceptable to authorities having jurisdiction to produce products with the following fire-test-response characteristics:
  - 1. Flame-spread index of not greater than 25 when tested according to ASTM E84 with test continued for a period of 30 minutes with no evidence of significant progressive combustion. Flame front shall not progress more than 10-1/2 feet beyond centerline of burner at any time during test.

- B. For exposed items indicated to receive transparent finish, do not use chemical formulations that contain colorants or that bleed through or otherwise adversely affect finishes.
- C. Interior, Low-Hygroscopic-Type, Fire-Retardant Treatment: Formulation that results in treated material with an apparent moisture content of not more than 28 percent when tested according to ASTM D3201 at 92 percent relative humidity.
- D. Mill lumber before treatment and implement special procedures during treatment and drying processes that prevent lumber and plywood from warping and developing discolorations from drying sticks or other causes, marring, and other defects affecting appearance of treated woodwork.
- E. Kiln-dry material after treatment to levels required for untreated material. Do not use material that does not comply with requirements for untreated material or is warped or discolored.

#### 2.04 SHELVING

- A. Shelving: 3/4-inch medium-density fiberboard shelving with radiused front.
  - 1. Shelf Cleats: 3/4-by-5-1/2-inch boards with holes to receive clothes rods, of same species and grade indicated above for interior lumber trim for opaque finish. Provide stiffeners as required below shelving.
  - 2. Shelf Brackets: Prime-painted formed steel with provision to support clothes rod where rod is indicated.

#### 2.05 MISCELLANEOUS MATERIALS

- A. Fasteners for Interior Finish Carpentry: Nails, screws, and other anchoring devices of type, size, material, and finish required for application indicated to provide secure attachment, concealed where possible.
  - 1. Where finish carpentry materials are exposed in areas of high humidity, provide fasteners and anchorages with hot-dip galvanized coating complying with ASTM A 153/A 153M.

#### 2.06 FABRICATION

- A. Wood Moisture Content: Comply with requirements of specified inspection agencies and with manufacturer's written recommendations for moisture content of finish carpentry at relative humidity conditions existing during time of fabrication and in installation areas.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Clean substrates of projections and substances detrimental to application.
- B. Before installing finish carpentry, condition materials to average prevailing humidity in installation areas for a minimum of 24 hours, unless longer conditioning is recommended by manufacturer.

### 3.03 INSTALLATION

- A. Do not use materials that are unsound, warped, improperly treated or finished, inadequately seasoned, or too small to fabricate with proper jointing arrangements.
  - 1. Do not use manufactured units with defective surfaces, sizes, or patterns.
- B. Install finish carpentry level, plumb, true, and aligned with adjacent materials. Use concealed shims where necessary for alignment.
  - 1. Scribe and cut finish carpentry to fit adjoining work. Refinish and seal cuts as recommended by manufacturer.
  - 2. Countersink fasteners, fill surface flush, and sand where face fastening is unavoidable.
  - 3. Install to tolerance of 1/8 inch in 96 inches (3 mm in 2438 mm) for level and plumb. Install adjoining finish carpentry with 1/32-inch (0.8-mm) maximum offset for flush installation and 1/16-inch (1.5-mm) maximum offset for reveal installation.
  - 4. Coordinate finish carpentry with materials and systems in or adjacent to it. Provide cutouts for mechanical and electrical items that penetrate finish carpentry.

### 3.04 ADJUSTING

- A. Replace finish carpentry that is damaged or does not comply with requirements. Finish carpentry may be repaired or refinished if work complies with requirements and shows no evidence of repair or refinishing. Adjust joinery for uniform appearance.

3.05 CLEANING

- A. Clean finish carpentry on exposed and semi-exposed surfaces. Touch up factory-applied finishes to restore damaged or soiled areas.

-END OF SECTION-

**Section 06400**  
**ARCHITECTURAL WOODWORK / CASEWORK**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section includes the following:
  - 1. Plastic-laminate cabinets
  - 2. Solid-surfacing-material countertops

**1.02 RELATED SPECIFICATIONS**

- A. Section 06100 - Rough Carpentry, for wood furring, blocking, shims, and hanging strips required for installing woodwork and concealed within other construction before woodwork installation.
- B. Section 07921 - Interior Sealants

**1.03 DEFINITIONS**

- A. Interior architectural woodwork includes wood furring, blocking, shims, and hanging strips for installing woodwork items, unless concealed within other construction before woodwork installation.

**1.04 SUBMITTALS**

- A. Product Data: For each type of product indicated including cabinet hardware and accessories and finishing materials and processes.
  - 1. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements.
- B. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.
  - 1. Apply AWI-certified compliance label to first page of Shop Drawings.
- C. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available for each type of material indicated.
  - 1. Shop-applied opaque finishes
  - 2. Plastic laminates
  - 3. Solid-surfacing materials

D. Samples for Verification: For the following:

1. Lumber and panel products with shop-applied opaque finish, 50 sq. in for lumber and 8 by 10 inches for panels, for each finish system and color, with 1/2 of exposed surface finished.
2. Plastic-laminate-clad panel products, 8 by 10 inches, for each type, color, pattern, and surface finish, with separate samples of unfaced panel product used for core.
3. Solid-surfacing materials, 6 inches square.
4. Corner pieces as follows:
  - a. Cabinet front frame joints between stiles and rail, as well as exposed end pieces, 18 inches high by 18 inches wide by 6 inches deep.
  - b. Miter joints for standing trim.
5. Exposed cabinet hardware and accessories, one unit for each type and finish.

E. Product Certificates: Signed by manufacturers of woodwork certifying that products furnished comply with requirements.

F. Qualification Data: For firms and persons specified in Article 1.05, Quality Assurance to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

## 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed architectural woodwork similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- B. Fabricator Qualifications: A firm experienced in producing architectural woodwork similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- C. Source Limitations: Engage a qualified woodworking firm to assume undivided responsibility for production and installation of interior architectural woodwork with sequence-matched wood veneers including wood doors where veneer matching includes door faces.

- D. Quality Standard: Unless otherwise indicated, comply with AWI's "Architectural Woodwork Quality Standards" for grades of interior architectural woodwork, construction, finishes, and other requirements.
  - 1. Provide AWI Quality Certification Program certificate indicating that woodwork complies with requirements of grades specified.
- E. Fire-Test-Response Characteristics: Where fire-retardant materials or products are indicated, provide materials and products with specified fire-test-response characteristics as determined by testing identical products per test method indicated by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify with appropriate markings of applicable testing and inspecting agency in the form of separable paper label or, where required by authorities having jurisdiction, imprint on surfaces of materials that will be concealed from view after installation.
- F. Mockups: Before fabricating and installing interior architectural woodwork, build mockups for each form of construction and finish required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work:
  - 1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Commissioner.
  - 2. Notify Commissioner seven days in advance of dates and times when mockups will be fabricated and installed.
  - 3. Demonstrate the proposed range of aesthetic effects and workmanship.
  - 4. Obtain Commissioner's approval of mockups before starting interior architectural woodwork fabrication.
  - 5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
  - 6. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Do not deliver woodwork until painting and similar operations that could damage woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas where environmental conditions comply with requirements specified in Article 1.07, Project Conditions.

## 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install woodwork until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.
- B. Field Measurements: Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed and indicate measurements on Shop Drawings.

## 1.08 COORDINATION

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that interior architectural woodwork can be supported and installed as indicated.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Provide materials that comply with requirements of the AWI quality standard for each type of woodwork and quality grade specified, unless otherwise indicated.
- B. Medium-Density Fiberboard: ANSI A208.2, Grade MD.
- C. High-Pressure Decorative Laminate: NEMA LD3, grades as indicated, or if not indicated, as required by woodwork quality standard. Subject to compliance with Project requirements, manufacturers offering high-pressure decorative laminates that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Formica Corporation
  - 2. International Paper; Decorative Products Div.
  - 3. Laminart
  - 4. Pioneer Plastics Corp.
  - 5. Westinghouse Electric Corp.; Specialty Products Div.
  - 6. Wilsonart International; Div. of Premark International, Inc.
  - 7. Or approved equal
- D. Adhesive for Bonding Plastic Laminate: Contact cement recommended by laminate manufacturer.

- E. Solid-Surfacing Material: Homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6, without a precoated finish. Subject to compliance with Project requirements, provide one of the following:

1. Avonite; Avonite, Inc.
2. Corian; DuPont Polymers
3. Surell; Formica Corporation
4. Fountainhead; International Paper, Decorative Products Div.
5. Swanstone; Swan Corporation (The)
6. Gibraltar; Wilsonart International, Div. of Premark International, Inc.
7. Or approved equal

## 2.02 FIRE-RETARDANT-TREATED MATERIALS

- A. Use materials impregnated with fire-retardant chemical formulations indicated by a pressure process or other means acceptable to authorities having jurisdiction to produce products with fire-test-response characteristics specified.
1. Do not use treated material that does not comply with requirements of referenced woodworking standard or that is warped, discolored, or otherwise defective.
  2. Use fire-retardant-treatment formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants in solution to distinguish treated material from untreated material.
- B. Fire-Retardant-Treated Lumber and Plywood by Pressure Process: Comply with AWPAC20 (lumber) and AWPAC27 (plywood), for woodwork items indicated as fire-retardant treated. Use the following treatment type:
1. Interior Type A: Low-hygroscopic formulation.
  2. Mill lumber before treatment and implement special procedures during treatment and drying processes that prevent lumber from warping and developing discolorations from drying sticks or other causes, marring, and other defects affecting appearance of treated woodwork.
  3. Kiln-dry material to levels required for untreated material.
  4. For panels 3/4 inch (19 mm) thick and less, comply with ANSI A208.1 for Grade M-2 except for the following minimum properties: density, 45-lb/cu. ft; modulus of rupture, 1600 psi; modulus of elasticity, 300,000 psi; internal bond, 80 psi; and screw-holding capacity on face and edge, 250 lbf and 225 lbf, respectively.
  5. For panels 13/16 to 1-1/4 inches thick, comply with ANSI A208.1 for Grade M-1 except for the following minimum properties: density, 44-lb/cu. ft; modulus of rupture, 1300 psi ; modulus of elasticity, 250,000 psi; linear

expansion, 0.50 percent; and screw-holding capacity on face and edge, 250 lbf and 175 lbf, respectively.

6. Product: Subject to compliance with requirements, provide "Duraflake FR" by Willamette Industries, Inc.

- C. Fasteners: use hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper fasteners with all fire-retardant treated wood products.

## 2.03 CABINET HARDWARE AND ACCESSORIES

- A. Provide cabinet hardware and accessory materials associated with architectural cabinets.

- B. Hardware Standard: Comply with BHMA A156.9 for items indicated by referencing BHMA numbers or items referenced to this standard.

- C. Butt Hinges: 2-3/4-inch, 5-knuckle steel hinges made from 0.095-inch- thick metal, and as follows:

1. Semi concealed Hinges for Flush Doors: BHMA A156.9, B01361

- D. Back-Mounted Pulls: BHMA A156.9, B02011

- E. Wire Pulls: Back mounted, 5 inches long, 2-1/2 inches deep, and 5/16 inches in diameter.

- F. Catches: Magnetic catches, BHMA A156.9, B03141

- G. Adjustable Shelf Standards and Supports: BHMA A156.9, B04071; with shelf rests, B04081.

- H. Shelf Rests: BHMA A156.9, B04013

- I. Drawer Slides: Side-mounted, full-extension, zinc-plated steel drawer slides with steel ball bearings, BHMA A156.9, B05091, and rated for the following loads:

1. Box Drawer Slides: 100 lbf
2. File Drawer Slides: 200 lbf
3. Pencil Drawer Slides: 45 lbf
4. Keyboard Slide: 75 lbf
5. Trash Bin Slides: 200 lbf

- J. Door Locks: BHMA A156.11, E07121

- K. Drawer Locks: BHMA A156.11, E07041

- L. Grommets for Cable Passage through Countertops: 2-inch OD, black, molded-plastic grommets and matching plastic caps with slot for wire passage. Subject to compliance with requirements, provide "SG series" by Doug Mockett and Co., Inc.

- M. Paper Slots: 17 inches long by 1-3/4 inches wide by 1 inch deep; black, molded-plastic, paper-slot liner with 1/4-inch lip. Subject to compliance with Project requirements, provide Model "CP-1" by Doug Mockett and Co., Inc.
  - N. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated.
    - 1. Satin Stainless Steel: BHM A630
  - O. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements in BHMA A156.9.
- 2.04 FABRICATION
- A. Interior Woodwork Grade: Provide Premium grade interior woodwork complying with the referenced quality standard.
  - B. Wood Moisture Content: Comply with requirements of referenced quality standard for wood moisture content in relation to ambient relative humidity during fabrication and in installation areas.
  - C. Sand fire-retardant-treated wood lightly to remove raised grain on exposed surfaces before fabrication.
  - D. Fabricate woodwork to dimensions, profiles, and details indicated. Ease edges to radius indicated for the following:
    - 1. Corners of Cabinets and Edges of Solid-Wood (Lumber) Members and Rails: 1/16 inch.
  - E. Complete fabrication, including assembly, finishing and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
    - 1. Notify Commissioner seven days in advance of the dates and times woodwork fabrication will be complete.
    - 2. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements indicated on Shop Drawings before disassembling for shipment.

- F. Shop cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

- 1. Seal edges of openings in countertops with a coat of varnish.

## 2.05 PLASTIC-LAMINATE CABINETS

- A. Quality Standard: Comply with AWI Section 400 requirements for laminate cabinets.

- B. Grade: Premium

- C. AWI Type of Cabinet Construction: Flush overlay

- D. Laminate Cladding for Exposed Surfaces: High-pressure decorative laminate complying with the following requirements:

- 1. Horizontal Surfaces Other Than Tops: HGS
  - 2. Postformed Surfaces: HGP
  - 3. Vertical Surfaces: HGS
  - 4. Edges: HGS

- E. Materials for Semi exposed Surfaces: Provide surface materials indicated below:

- 1. Surfaces Other Than Drawer Bodies: High-pressure decorative laminate, Grade VGS
  - 2. Drawer Sides and Backs: Thermoset decorative overlay
  - 3. Drawer Bottoms: Thermoset decorative overlay

- F. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:

- 1. Provide Commissioner's selections from laminate manufacturer's full range of colors and finishes in the following categories:
    - a. Solid colors with core same color as surface.

- G. Provide dust panels of 1/4-inch plywood or tempered hardboard above compartments and drawers, unless located directly under tops.

## 2.06 SOLID-SURFACING-MATERIAL COUNTERTOPS

- A. Quality Standard: Comply with AWI Section 400 requirements for countertops.

- B. Grade: Premium

- C. Solid-Surfacing-Material Thickness: 3/4 inch (19 mm)
- D. Colors, Patterns, and Finishes: Provide materials and products that result in colors of solid-surfacing material as selected by Commissioner.
- E. Fabricate tops in one piece with shop-applied backsplashes and edges, unless otherwise indicated. Comply with solid-surfacing-material manufacturers written recommendations for adhesives, sealers, fabrication, and finishing.
- F. Install integral sink bowls in countertops in shop.
- G. Drill holes in countertops for plumbing fittings and soap dispensers in shop.

### PART 3 EXECUTION

#### 3.01 PREPARATION

- A. Condition woodwork to average prevailing humidity conditions in installation areas before installation.
- B. Before installing architectural woodwork, examine shop-fabricated work for completion and complete work as required, including removal of packing and backpriming.

#### 3.02 INSTALLATION

- A. Quality Standard: Install woodwork to comply with AWI Section 1700 for the same grade and type of woodwork involved.
- B. Install woodwork level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb (including tops) to a tolerance of 1/8 inch in 96 inches.
- C. Scribe and cut woodwork to fit adjoining work, and refinish cut surfaces and repair damaged finish at cuts.
- D. Fire-Retardant-Treated Wood: Handle, store, and install fire-retardant-treated wood to comply with recommendations of chemical treatment manufacturer, including those for adhesives used to install woodwork.
- E. Anchor woodwork to anchors or blocking built in or directly attached to substrates. Secure with countersunk, concealed fasteners and blind nailing as required for complete installation. Use fine finishing nails or finishing screws for exposed fastening, countersunk and filled flush with woodwork and matching final finish if transparent finish is indicated.
- F. Cabinets: Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings

and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.

1. Install cabinets with no more than 1/8 inch in 96-inch (3 mm in 2400-mm) sag, bow, or other variation from a straight line.
2. Maintain veneer sequence matching of cabinets with transparent finish.
3. Fasten wall cabinets through back, near top and bottom, at ends and not more than 16 inches (400 mm) o.c. with screw bolts through metal backing or metal framing behind wall finish.

G. Countertops: Anchor securely by screwing through corner blocks of base cabinets or other supports into underside of countertop.

1. Align adjacent solid-surfacing-material countertops and form seams to comply with manufacturer's written recommendations using adhesive in color to match countertop. Carefully dress joints smooth, remove surface scratches, and clean entire surface.
2. Install countertops with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
3. Secure backsplashes to tops with concealed metal brackets at 16 inches on center and to walls with adhesive.
4. Caulk space between backsplash and wall with sealant specified in Section 07921 - Interior Sealants.

H. Complete the finishing work specified in this Section to extent not completed at shop or before installation of woodwork. Fill nail holes with matching filler where exposed. Apply specified finish coats, including stains and paste fillers if any, to exposed surfaces where only sealer/prime coats were applied in shop.

### 3.03 ADJUSTING AND CLEANING

- A. Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.
- B. Clean, lubricate, and adjust hardware.
- C. Clean woodwork on exposed and semi-exposed surfaces. Touch up shop-applied finishes to restore damaged or soiled areas.

-END OF SECTION-

**Section 07115**  
**BITUMINOUS DAMPPROOFING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes cold-applied, cut-back asphalt dampproofing applied to the following surfaces:
  - 1. Exterior face of masonry indicated to receive architectural precast concrete panels.
  - 2. Miscellaneous applications as indicated on the Drawings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 - Plant - Precast Architectural Concrete
- B. Section 04201 - Unit Masonry
- C. Section 05500 - Metal Fabrications
- D. Section 07210 - Building Insulation
- E. Transformer Building: Within this structure, Consolidated Edison Co. specifications precedence over the contract documents and drawings take

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include recommendations for method of application, primer, number of coats, coverage or thickness, and protection course.
- B. Material Certificates: For each product, signed by manufacturers.

**1.04 QUALITY ASSURANCE**

- A. Source Limitations: Obtain primary dampproofing materials and primers through one source from a single manufacturer. Provide secondary materials recommended by manufacturer of primary materials.

**1.05 PROJECT CONDITIONS**

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit asphalt dampproofing to be performed according to manufacturers' written instructions.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Cold-Applied, Cut-Back (Solvent-Based) Asphalt Dampproofing:

- a. Henry Company
- b. Karnak Corporation
- c. Koppers Industries, Inc.
- d. Meadows, W. R., Inc.
- e. Sonneborn, Div. of ChemRex, Inc.
- f. Or approved equal

### 2.02 BITUMINOUS DAMPPROOFING

- A. Cold-Applied, Cut-Back (Solvent-Based) Asphalt Dampproofing:

1. Brush and Spray Coats: ASTM D 4479, Type I

### 2.03 MISCELLANEOUS MATERIALS

- A. Cut-Back Asphalt Primer: ASTM D 41
- B. Emulsified-Asphalt Primer: ASTM D 1227, Type III, Class 1, except diluted with water as recommended by manufacturer

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, with Applicator present, for compliance with requirements for surface smoothness and other conditions affecting performance of work.
- B. Begin dampproofing application only after substrate construction and penetrating work have been completed and unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Protection of Other Work: Mask or otherwise protect adjoining exposed surfaces from being stained, spotted, or coated with dampproofing. Prevent dampproofing materials from entering and clogging weep holes and drains.
- B. Clean substrates of projections and substances detrimental to work; fill voids, seal joints, and apply bond breakers if any, as recommended by prime material manufacturer.

3.03 APPLICATION, GENERAL

- A. Comply with manufacturer's written recommendations unless more stringent requirements are indicated or required by Project conditions to ensure satisfactory performance of dampproofing.
  - 1. Apply additional coats if recommended by manufacturer or required to achieve coverages indicated.
  - 2. Allow each coat of dampproofing to cure 24 hours before applying subsequent coats.

3.04 COLD-APPLIED, CUT-BACK ASPHALT DAMPPROOFING

- A. On Masonry: Apply primer and one brush or spray coat at not less than 1 gal./100 sq.ft.

3.05 CLEANING

- A. Remove dampproofing materials from surfaces not intended to receive dampproofing.
- B. Remove temporary coverings from adjacent surfaces.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 07140**  
**FLUID-APPLIED WATERPROOFING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
  - 1. Single-component, non-bituminous, non-asphaltic, modified polyurethane waterproofing for sub-slab applications at Tipping Floor, Loading Floor, Maintenance Equipment Storage Areas , and elsewhere as indicated.
  - 2. Protection course.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 07920 - Exterior Joint Sealants
- C. Section 07921 - Interior Sealants
- D. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over the contract documents.

**1.03 PERFORMANCE REQUIREMENTS**

- A. Provide waterproofing membrane that prevents the passage of water, and is not adversely affected, damaged or degraded by petro-chemicals such as diesel fuel, motor oil, and gasoline.

**1.04 SUBMITTALS**

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, installation instructions and tested physical and performance properties of waterproofing.
- B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
- C. Samples: For the following products:
  - 1. 12-by-12-inch square of flashing sheet
  - 2. 4-by-4-inch square of protection board
  - 3. 12-by-12-inch square of cured membrane installed on a cement board substrate

- D. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- E. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
- F. Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

#### 1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain waterproofing materials, protection course, and other accessories through one source from a single manufacturer.
- B. Mockups: Apply waterproofing to 100 sq. ft. of deck to demonstrate surface preparation, crack and joint treatment, corner treatment, thickness, texture, and execution quality.
  - 1. If Commissioner determines mockups do not comply with requirements, reapply waterproofing until mockups are approved.
  - 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in "Section 01310 - Project Coordination." Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, protection and repairs.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver liquid materials to Project site in original containers with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, shelf life, and directions for storing and mixing with other components.
- B. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by waterproofing manufacturer.
- C. Remove and replace liquid materials that cannot be applied within their stated shelf life.
- D. Protect stored materials from direct sunlight.

## 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate, when relative humidity exceeds 85 percent, or when temperatures are less than 5 deg F above dew point.
  - 1. Do not apply waterproofing in snow, rain, fog or mist, or when such weather conditions are imminent during application and curing period.
- B. Maintain adequate ventilation during application and curing of waterproofing materials.

## 1.08 WARRANTY

- A. Special Manufacturer's Warranty: Written warranty, signed by waterproofing manufacturer and Installer agreeing to repair or replace waterproofing that does not comply with requirements or that does not remain watertight within specified warranty period.
  - 1. Warranty Period: Two years after date of Substantial Completion
- B. Warranty shall include all materials and labor required to correct failures, deficiencies and other defects of the entire waterproofing system; and resulting repairs shall be executed to the satisfaction of the Commissioner, and as required to maintain the remaining terms of the "special Manufacturer's Warranty." The City will not incur the costs, fees and other charges related to "warranty" repairs; such costs shall be the responsibility of the Contractor.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide one of the following products:
  - 1. Single-Component, Non-Bituminous, Non-Asphaltic, Modified Polyurethane Waterproofing:
    - a. Anti-Hydro International, Inc.; A-H Seamless Membrane
    - b. Carlisle Corporation, Carlisle Coatings & Waterproofing Div.; CCW-525
    - c. Mameco International, Inc.; Vulkem 201
    - d. Pecora; Duramem 500
    - e. Pacific Polymers; Elastodeck B.T.

f. Sherwin Williams; AR 425

g. Or approved equal

## 2.02 WATERPROOFING MATERIALS

A. General: Provide waterproofing materials recommended by manufacturer to be compatible with one another and able to develop bond to substrate under conditions of service and application, as demonstrated by waterproofing manufacturer based on testing and field experience.

1. Produce waterproofing materials suitable for application to vertical, horizontal, and sloped substrates, as applicable.
2. Provide waterproofing materials with not less than 82 percent solids.

B. Cold Fluid-Applied Waterproofing: Comply with ASTM C 836, with manufacturer's written physical requirements, and as follows:

1. Single-component, non-bituminous, non-asphaltic, modified polyurethane waterproofing
2. Tensile Strength: 150 psi (minimum) in accordance with ASTM D412
3. Elongation: 800% in accordance with ASTM D412
4. Hardness: 30-40 shore A in accordance with ASTM D2240
5. Resilience Recovery (Die C): 100% recovery at 100 and 200 percent elongation as per ASTM D 412
6. Adhesion (Peel) Resistance: 8 lbf/in (minimum)

## 2.03 AUXILIARY MATERIALS

- A. Primer: Manufacturer's standard, factory-formulated polyurethane or epoxy primer
- B. Sheet Flashing: 50-mil- minimum, nonstaining uncured sheet neoprene
1. Adhesive: Manufacturer's recommended contact adhesive
- C. Reinforcing Strip: Manufacturer's recommended fiberglass mesh or polyester fabric

- D. Joint Sealant: Multicomponent polyurethane sealant, compatible with waterproofing, complying with ASTM C 920 Type M, Class 25; Grade NS for sloping and vertical applications or Grade P for deck applications; Use NT exposure; and as recommended by manufacturer for substrate and joint conditions.
  - 1. Backer Rod: Closed-cell polyethylene foam
- E. Protection Course: Semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows; or as recommended by the waterproofing manufacturer, and as acceptable to the Commissioner.
  - 1. Thickness: 1/4 inch, nominal
  - 2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for type of protection course

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance.
  - 1. Verify that concrete has cured and aged for not less than 28 days or the minimum time period recommended by waterproofing manufacturer, whichever is greater.
  - 2. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
  - 3. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 SURFACE PREPARATION

- A. Clean and prepare substrate according to manufacturer's written recommendations. Provide clean, dust-free, and dry substrate for waterproofing application.
- B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage or overspray affecting other construction.
- C. Close off deck drains and other deck penetrations to prevent spillage and migration of waterproofing fluids.
- D. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

- E. Remove fins, ridges, and other projections and fill honeycomb, aggregate pockets, and other voids.

### 3.03 PREPARATION AT TERMINATIONS AND PENETRATIONS

- A. Prepare vertical and horizontal surfaces at terminations and penetrations through waterproofing and at expansion joints, drains, and sleeves according to ASTM C 898 and manufacturer's written instructions.
- B. Prime substrate, unless otherwise instructed by waterproofing manufacturer.
- C. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat when recommended by waterproofing manufacturer.
  - 1. Provide sealant cants around penetrations and at inside corners of deck-to-wall butt joints when recommended by waterproofing manufacturer.

### 3.04 JOINT AND CRACK TREATMENT

- A. Prepare, treat, rout, and fill joints and cracks in substrate according to ASTM C 898 and waterproofing manufacturer's written instructions. Remove dust and dirt from joints and cracks complying with ASTM D 4258 before coating surfaces.
  - 1. Comply with ASTM C 1193 for joint-sealant installation.
- B. Install sheet flashing and bond to deck and wall substrates where indicated or required according to waterproofing manufacturer's written instructions.
  - 1. Extend sheet flashings onto perpendicular surfaces and other work penetrating substrate according to ASTM C 898.

### 3.05 WATERPROOFING APPLICATION

- A. Apply waterproofing according to ASTM C 898 and manufacturer's written instructions.
- B. Start installing waterproofing in presence of manufacturer's technical representative.
- C. Apply primer over prepared substrate.
- D. Mix materials and apply waterproofing by spray, roller, notched squeegee, trowel, or other application method suitable to slope of substrate.
  - 1. Apply one or more coats of waterproofing to obtain a seamless membrane free of entrapped gases, with an average dry film thickness of 60 mils and a minimum dry film thickness of 50 mils at any point.
  - 2. Apply waterproofing to prepared wall terminations and vertical surfaces.
  - 3. Verify wet film thickness of waterproofing every 100 sq. ft..

- E. Install protection course with butted joints over nominally cured membrane before starting subsequent construction operations.

### 3.06 FIELD QUALITY CONTROL

- A. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
  - 1. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.
  - 2. Flood each area for 72 hours.
  - 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.
- B. The City will engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.

### 3.07 CURING, PROTECTING, AND CLEANING

- A. Cure waterproofing according to manufacturer's written recommendations, taking care to prevent contamination and damage during application stages and curing.
  - 1. Do not permit foot or vehicular traffic on unprotected membrane.
- B. Protect waterproofing from damage and wear during remainder of construction period.
- C. Protect installed materials from damage, physical abuse, and other causes. Provide temporary coverings where materials will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
- D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

-END OF SECTION-

NO TEXT ON THIS PAGE •

**Section 07141**  
**SURFACE APPLIED INTERIOR WATERPROOFING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes interior, surface applied, polyurethane waterproofing system, interstitial floor (Loading Level), roofs of Tipping Level office, electric room, and elsewhere as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 – Cast-in-Place Concrete
- B. Section 03350 – Concrete Finishes
- C. Section 07920 - Exterior Joint Sealants
- D. Section 07921 - Interior Sealants
- E. Section 09010 - Room Finish Schedule

**1.03 SUBMITTALS**

- A. Product Data: For each product indicated.
- B. Shop Drawings: Show extent of each surface applied waterproofing system component. Include details for treating substrate joints and cracks, flashings, deck penetrations, and other termination conditions.
- C. Samples for Verification: For each type of surface applied waterproofing system required, prepared on rigid backing and of same thickness and material indicated for the Work.
  - 1. Provide stepped samples on backing large enough to illustrate build-up of surface applied waterproofing system; including, but not limited to primers, base coats, flashings, reinforcements, intermediate coats, aggregates, top coats and other system accessories.
- D. Material Certificates: Signed by manufacturer certifying that systems comply with requirements, based on comprehensive testing of current product formulations within the last three years.
  - 1. Include the manufacturer's material certification, which clearly states the materials compliance with VOC limits of authorities having jurisdiction.
- E. Maintenance Data: To include in maintenance manuals specified in Division 1. Identify substrates and types of traffic coatings applied. Include recommendations for periodic inspections, cleaning, care, maintenance, and repair of traffic coatings.

## 1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced applicator who has specialized in installing work similar in material, design, and extent to that indicated for this Project and who is acceptable to manufacturer.
- B. Source Limitations
  - 1. Use primary and secondary materials of a single surface applied waterproofing system manufacturer.
  - 2. Secondary materials shall include, but not be limited to primers, aggregates, sheet flashings, joint sealants, and substrate repair materials of type and from source recommended by surface applied interior waterproofing manufacturer.
- C. Fire-Test-Response Characteristics: Provide surface applied interior waterproofing system and related materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
  - 1. Fire Rating: Class A in accordance with UL 790.
- D. Mockups: Commissioner will select one representative surface for each coating and each substrate to receive surface applied waterproofing coatings/systems. Apply each component of the complete system to at least 200 sq. ft. of each substrate to demonstrate surface preparation, joint and crack treatment, thickness, texture, color, and standard of workmanship.
  - 1. Remove and reapply mockups until they are approved by Commissioner.
  - 2. Keep approved mockups undisturbed during construction as a standard for judging completed traffic coatings. Undamaged mockups may be incorporated into the Work.
- E. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.
  - 1. Before installing surface applied interior waterproofing coatings, meet with representatives of authorities having jurisdiction, manufacturer's technical representative, The City of New York, Commissioner, consultants, independent testing agency, and other concerned entities. Review requirements for coating system. Notify participants at least seven days before conference.

### 1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in original packages and containers with seals unbroken and bearing manufacturer's labels showing the following information:
  - 1. Manufacturer's brand name
  - 2. Type of material
  - 3. Directions for storage
  - 4. Date of manufacture and shelf life
  - 5. Lot or batch number
  - 6. Mixing and application instructions
  - 7. Color
- B. Store materials in a clean, dry location protected from exposure to direct sunlight. In storage areas, maintain environmental conditions within range recommended in writing by manufacturer.

### 1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Apply coating systems within the range of ambient and substrate temperatures recommended in writing by manufacturer. Do not apply coatings to damp or wet substrates, when temperatures are below 40 deg F, when relative humidity exceeds 85 percent, or when temperatures are less than 5 deg F above dew point.
  - 1. Do not apply coatings when weather conditions do not comply with the waterproofing system manufacturer's requirements; during the application and curing period.

### 1.07 WARRANTY

- A. General Warranty: Special warranty specified in this Article shall not deprive the City of other rights the City may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Warranty: Written warranty, signed by surface applied interior waterproofing system manufacturer agreeing to repair or replace coatings that do not comply with requirements or that deteriorate during the specified warranty period.
  - 1. Deterioration of waterproof coatings includes, but is not limited to, the following:
    - a. Adhesive or cohesive failures
    - b. Abrasion or tearing failures

- c. Surface crazing or spalling
- d. Intrusion of water, oils, gasoline, grease, salt, deicer chemicals, or acids into deck substrate.

C. Warranty Period: Five years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Physical Requirements: Provide traffic coatings complying with ASTM C 957.
- B. Material Compatibility: Provide primers; base, intermediate, and top coats; and miscellaneous materials that are compatible with one another and with substrate under conditions of service and application, as demonstrated by the manufacturer based on testing and field experience.

### 2.02 SURFACE APPLIED INTERIOR WATERPROOFING SYSTEM

- A. Available Products: Subject to compliance with requirements, provide a surface applied interior waterproof coating systems as manufactured by Tremco, Incorporated, or approved equal by one of the following:
  - 1. American Colloid Company
  - 2. Watson Bowman Acme Corp.
  - 3. Sonneborn, Div. of ChemRex, Inc.
- B. Selected Products/Systems: Provide the following:
  - 1. Traffic Surfaces/Ramps: Provide interior, traffic bearing, waterproof coating system "Vulkem 350/345/346" as manufactured by Tremco Incorporated.
  - 2. Interior Roof Surfaces, Interstitial Floor Surfaces and Other Locations Indicated:: Provide interior, waterproof coating system "Vulkem 360/351 as manufactured by Tremco Incorporated.
- C. Primer: Manufacturer's standard factory-formulated primer recommended for substrate and conditions indicated.
  - 1. Material: Urethane
- D. Base Coats: Manufacturer's standard one-part (single component) liquid polyurethane elastomer.
- E. Intermediate Coat: Manufacturer's standard two-part (multi component) liquid polyurethane elastomer.

- F. Top Coat: Manufacturer's standard single- or multi-component aliphatic liquid polyurethane elastomer.
  - 1. Color: As selected by Commissioner from manufacturer's full range.
- G. Component Coat Thicknesses: As recommended by manufacturer for substrate and service conditions indicated, but not less than a total wet film thickness of 50 mils (approximately 44mils dry film thickness) (excluding substrate primer and aggregate).
  - 1. Base Coat: 25-mils wet/ 21-mils dry film thickness; or approximately 60 sq. ft. per gallon
  - 2. Intermediate Coat: 15-mils wet/ 12-mils dry film thickness; or approximately 105 sq. ft. per gallon
  - 3. Top Coat: 9 to 11-mils wet film thickness; or approximately 150 to 175 sq. ft. per gallon
- H. Aggregate: Uniformly graded washed silica sand of particle sizes, shape, and minimum hardness recommended in writing by coating manufacturer.
  - 1. Spreading Rate: As recommended by manufacturer for substrate and service conditions indicated, but not less than the following:
    - a. Intermediate Coat: 25 to 50 lb/100 sq. ft.

## 2.03 MISCELLANEOUS MATERIALS

- A. Joint Sealants: Multicomponent urethane sealant recommended in writing by manufacturer for substrate and joint conditions indicated and for compatibility with traffic coatings; complying with ASTM C 920, Type M, Class 25, Grade NS for sloping and vertical applications or Grade P for deck applications, and Use T where subject to traffic or Use NT elsewhere.
- B. Sheet Flashing: 50-mil minimum, nonstaining uncured neoprene sheet material recommended by manufacturer.
- C. Adhesive: Manufacturer's recommended contact adhesive.
- D. Reinforcing Strip: Manufacturer's recommended fiberglass mesh.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, with Applicator present, for compliance with requirements and for other conditions affecting performance of traffic coatings.
  - 1. For the record, prepare written report, endorsed by Applicator, listing conditions detrimental to performance.
  - 2. Verify compatibility with and suitability of substrates.
  - 3. Begin coating application only after minimum concrete curing and drying period recommended by coating manufacturer has passed, after unsatisfactory conditions have been corrected, and after surfaces are dry.
  - 4. Verify that substrates are visibly dry and free of moisture. Test for moisture by method recommended in writing by manufacturer.
  - 5. Application of coating indicates acceptance of surfaces and conditions.

### 3.02 PREPARATION

- A. Clean and prepare substrates according to manufacturer's written recommendations to produce clean, dust-free, dry substrate for coating application.
- B. Mask adjoining surfaces not receiving coatings, drains, and other substrate penetrations to prevent spillage, leaking, and migration of coatings.
- C. Concrete Substrates: Concrete finish type 'D'. See Section 03350 – Concrete Finishes.
  - 1. Remove grease, oil, paints, and other penetrating contaminants from concrete.
  - 2. Remove concrete fins, ridges, and other projections.
  - 3. Remove laitance, glaze, efflorescence, curing compounds, concrete hardeners, form-release agents, and other incompatible materials that might affect coating adhesion.
  - 4. Remove remaining loose material to provide a sound surface, and clean surfaces according to ASTM D 4258.

### 3.03 TERMINATIONS AND PENETRATIONS

- A. Prepare vertical and horizontal surfaces at terminations and penetrations through traffic coatings and at expansion joints, drains, and sleeves according to ASTM C 1127 and manufacturer's written recommendations.
- B. Provide sealant cants at penetrations and at reinforced and nonreinforced deck-to-wall butt joints.
- C. Terminate edges of deck-to-deck expansion joints with preparatory base-coat strip.
- D. Install sheet flashings at deck-to-wall expansion and dynamic joints, and bond to deck and wall substrates according to manufacturer's written recommendations.

### 3.04 JOINT AND CRACK TREATMENT

- A. Prepare, treat, rout, and fill joints and cracks in substrates according to ASTM C 1127 and coating manufacturer's written recommendations. Before coating surfaces, remove dust and dirt from joints and cracks according to ASTM D 4258.
  - 1. Comply with recommendations in ASTM C 1193 for joint-sealant installation.

### 3.05 SURFACE APPLIED INTERIOR WATERPROOFING SYSTEM

- A. Apply coating material according to ASTM C 1127 and manufacturer's written recommendations.
  - 1. Start coating application in presence of manufacturer's technical representative.
  - 2. Verify that wet film thickness of each component coat complies with requirements every 100 sq. ft.
  - 3. Apply coatings to prepared wall terminations and vertical surfaces to height indicated and omit aggregate on vertical surfaces and loading level interstitial floor areas.

### 3.06 FIELD QUALITY CONTROL

- A. Testing: The City will engage a qualified testing agency to perform the following field quality-control testing:
  - 1. Samples of material delivered to Project site shall be taken, identified, sealed, and certified in presence of the Commissioner and Contractor.

2. Testing agency shall perform tests for characteristics specified, using applicable referenced testing procedures or, if not referenced, using tests cited in manufacturer's product data.
  3. Testing agency shall verify thickness of coatings during coating application.
- B. If test results show coating materials do not comply with requirements, remove noncomplying materials, prepare surfaces, and reapply coatings.
  - C. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.07 CURING AND PROTECTING

- A. Cure coatings according to manufacturer's written recommendations. Prevent contamination and damage during application and curing stages.
- B. Protect coatings from damage and wear during remainder of construction period.

-END OF SECTION-

**Section 07210**  
**BUILDING INSULATION**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Spray-applied thermal insulation
  - 2. Foamed in-place masonry cell thermal insulation
  - 3. Miscellaneous concealed fiberglass insulation

**1.02 RELATED SPECIFICATIONS**

- A. Section 02504 - Sanitary and Storm Sewer Structures, for insulated drainage panels
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 04201 - Unit Masonry, for insulation installed in cavity walls and masonry cells
- D. Section 07211 - Foundation and Underslab Insulation, for insulation installed below slabs
- E. Section 07410 - Metal Wall Panels, for insulation installed as part of the exterior wall system and linear panel system
- F. Section 07610 - Sheet Metal Roofing, for insulation specified as part of roofing construction
- G. Section 07811 - Sprayed Fire-Resistive Materials
- H. Section 07842 - Fire-Resistive Joint Systems
- I. Section 09260 - Gypsum Board Assemblies and Section 09265 - Gypsum Board Shaft Wall Assemblies, for insulation specified as part of drywall construction.
- J. Division 15 Sections for "Piping Insulation" and "Duct Insulation"

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Samples for Verification: Full-size 12" x 12" units for each type of insulation indicated.

- C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for insulation products.
- D. Research/Evaluation Reports: For foam-plastic insulation.

#### 1.04 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of building insulation through one source.
- B. Fire-Test-Response Characteristics: Provide insulation and related materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
  - 1. Surface-Burning Characteristics: ASTM E 84
  - 2. Fire-Resistance Ratings: ASTM E 119
  - 3. Combustion Characteristics: ASTM E 136

#### 1.05 DELIVERY, STORAGE, AND HANDLING

- A. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Glass-Fiber Insulation (Miscellaneous Applications)
    - a. CertainTeed Corporation
    - b. Johns Manville Corporation
    - c. Knauf Fiber Glass
    - d. Owens-Corning
    - e. Or approved equal
  - 2. Spray-Applied Thermal Insulation
    - a. Applegate Insulation, Inc.
    - b. Cafco / Isolotek International, Inc
    - c. Or approved equal

### 3. Foamed In-Place Masonry Cell Insulation

- a. Applegate Insulation, Inc.
- b. Cafco / Isolotek International, Inc.
- c. Or approved equal

## 2.02 INSULATING MATERIALS

- A. General: Provide insulating materials that comply with requirements and with referenced standards.
- B. Foil-Faced, Flexible Glass-Fiber Board Insulation: ASTM C 612, Type IA or ASTM C 553, Types I, II, and III; faced on one side with foil-scrim-kraft vapor retarder; with maximum flame-spread and smoke-developed indices of 25 and 50, respectively; and of the following properties:
  1. Nominal density of not less than 1.5 lb/cu. ft. (24 kg/cu. m) nor more than 1.7 lb/cu. ft. (26 kg/cu. m), thermal resistivity of 4 deg F x h x sq. ft./Btu x in. at 75 deg F (27.7 K x m/W at 24 deg C).
- C. Faced Fiberglass Blanket Insulation: ASTM C 665, Type III (blankets with reflective membrane facing), Class A (membrane-faced surface with a flame spread of 25 or less); Category 1 (membrane is a vapor barrier), faced with foil-scrim-kraft, foil-scrim, vapor-retarder membrane on one face; consisting of fibers.
- D. Self-Supported, Spray-Applied, Thermal Insulation: ASTM C 1149 for type indicated below, chemically treated for flame-resistance, processing, and handling characteristics.
  1. Type I materials applied with liquid adhesive; suitable for either exposed or enclosed applications.
    - a. Fire Performance Characteristics per ASTM E 84:
      - (1) Flame Spread: 0-5
      - (2) Smoke Developed: 0-10
      - (3) Non-combustible per ASTM E136
    - b. Thermal Insulation Value:  $R = 3.7$  per 1" thickness.
  2. Subject to compliance with requirements provide one of the following:
    - a. "ThermoCon" sprayed thermal insulation by Applegate Insulation

- b. "Heat Shield" sprayed thermal insulation by Cafco / Isolotek International, Inc.
  - c. Or approved equal
- E. Foamed In-Place Masonry Cell Thermal Insulation: ASTM C 1149 for type indicated below, chemically treated for flame-resistance, processing, and handling characteristics.
  - 1. Fire Performance Characteristics per ASTM C 739-97 and C 1149-90:
    - a. Flame Spread: 15
    - b. Smoke Developed: 5
    - c. Non-combustible per ASTM C 739-97 and C 1149-90
  - 2. Thermal Insulation Value:  $R = 3.8$  per 1.3 to 1.6 lb. / cu. ft.

## 2.03 AUXILIARY INSULATING MATERIALS

- A. Adhesive for Bonding Insulation: Product with demonstrated capability to bond insulation securely to substrates indicated without damaging insulation and substrates.

## 2.04 INSULATION FASTENERS

- A. Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Adhesively Attached, Spindle-Type Anchors
    - a. AGM Industries, Inc.; Series T TACTOO Insul-Hangers
    - b. Eckel Industries of Canada Limited; Stic-Klip Type N Fasteners
    - c. Gemco; Spindle Type
    - d. Or approved equal
  - 2. Insulation-Retaining Washers
    - a. AGM Industries, Inc.; RC150
    - b. AGM Industries, Inc.; SC150
    - c. Gemco; Dome-Cap
    - d. Gemco; R-150
    - e. Gemco; S-150
    - f. Or approved equal

3. Insulation Standoff
  - a. Gemco; Clutch Clip
  - b. Or approved equal
4. Anchor Adhesives
  - a. AGM Industries, Inc.; TACTOO Adhesive
  - b. Eckel Industries of Canada Limited; Stic-Klip Type S Adhesive
  - c. Gemco; Tuff Bond Hanger Adhesive
  - d. Or approved equal
- B. Adhesively Attached, Spindle-Type Anchors: Plate welded to projecting spindle; capable of holding insulation of thickness indicated securely in position indicated with self-locking washer in place; and complying with the following requirements:
  1. Plate: Perforated galvanized carbon-steel sheet, 0.030 inch (0.762 mm) thick by 2 inches (50 mm) square
  2. Spindle: Copper-coated, low carbon steel, fully annealed, 0.105 inch (2.67 mm) in diameter, length to suit depth of insulation indicated
- C. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- (0.41-mm-) thick galvanized steel sheet, with beveled edge for increased stiffness, sized as required to hold insulation securely in place, but not less than 1-1/2 inches (38 mm) square or in diameter.
  1. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in the following locations:
    - a. Crawlspace
    - b. Ceiling plenums
    - c. Where indicated
- D. Insulation Standoff: Spacer fabricated from galvanized mild-steel sheet for fitting over spindle of insulation anchor to maintain air space of dimension indicated between face of insulation and substrate to which anchor is attached.
  1. Air Space: 1 inch (25 mm)
- E. Anchor Adhesive: Product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for Sections in which substrates and related work are specified and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Clean substrates of substances harmful to insulations, including removing projections capable of puncturing or interfering with insulation attachment.

### 3.03 INSTALLATION, GENERAL

- A. Comply with insulation manufacturers written instructions applicable to products and application indicated.
- B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed at any time to ice and snow.
- C. Extend insulation in thickness indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.
- D. Water-Piping Coordination: If water piping is located on inside of insulated exterior walls, coordinate location of piping to ensure that it is placed on warm side of insulation and insulation encapsulates piping.
- E. Apply single layer of insulation to produce thickness indicated, unless multiple layers are otherwise shown or required to make up total thickness.

### 3.04 INSTALLATION OF GENERAL BUILDING INSULATION

- A. Apply insulation units to substrates by method indicated, complying with manufacturer's written instructions. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.
- B. Set vapor-retarder-faced units with vapor retarder to warm side of construction, unless otherwise indicated. Do not obstruct ventilation spaces, except for firestopping.
  - 1. Tape joints and ruptures in vapor retarder, and seal each continuous area of insulation to surrounding construction to ensure airtight installation.

- C. Install mineral-fiber blankets in cavities formed by framing members according to the following requirements:
  - 1. Use blanket widths and lengths that fill the cavities formed by framing members. If more than one length is required to fill cavity, provide lengths that will produce a snug fit between ends.
  - 2. Place blankets in cavities formed by framing members to produce a friction fit between edges of insulation and adjoining framing members.
  - 3. For metal-framed wall cavities where cavity heights exceed 96 inches (2438 mm), support unfaced blankets mechanically and support faced blankets by taping stapling flanges to flanges of metal studs.
- D. Install board insulation on concrete substrates by adhesively attached, spindle-type insulation anchors as follows:
  - 1. Fasten insulation anchors to concrete substrates with insulation anchor adhesive according to anchor manufacturer's written instructions. Space anchors according to insulation manufacturer's written instructions for insulation type, thickness, and application indicated.
  - 2. Apply insulation standoffs to each spindle to create cavity width indicated between concrete substrate and insulation.
  - 3. After adhesive has dried, install board insulation by pressing insulation into position over spindles and securing it tightly in place with insulation-retaining washers, taking care not to compress insulation below indicated thickness.
  - 4. Where insulation will not be covered by other building materials, apply capped washers to tips of spindles.
- E. Stuff glass-fiber, loose-fill insulation into miscellaneous voids and cavity spaces where shown. Compact to approximately 40 percent of normal maximum volume equaling a density of approximately 2.5 lb/cu. ft. (40 kg/cu. m).

### 3.05 INSTALLATION OF FOAMED IN-PLACE MASONRY CELL INSULATION

- A. Preparation: Verify that surfaces and conditions are suitable to begin the Work. Masonry ties, and flashings shall be in place prior to proceeding. Report in writing to the Contractor and Commissioner any defects in surfaces or conditions that may adversely affect the performance of the products installed under this Section prior to commencement of the Work. Commencement of the Work shall be deemed as acceptance of surfaces and conditions in the current work area.
  - 1. Clear all cracks, spaces, voids, and openings to be sealed of debris, moisture, ice, and materials prior to the commencement of foaming operations. Clean

substrates of substances harmful to insulations, including moisture, dirt, or unbonded coatings that will effect the insulation or prevent an airtight seal.

2. Cover joints and close off openings to prevent foam leakage. Check to insure that the cavities to be sealed are properly finished, that they are free of debris.
3. Mask areas to be protected from over-spray.
4. Fenestration jambs shall be adequately braced, if necessary, to prevent the expanding foam sealant from bowing or springing the jamb or jamb extension. Foam sealant in these spaces shall be adequate to create a seal, but the spaces do not have to be filled unless required in the Contract Documents (reduces the need for bracing).

#### B. Processing

1. Process a two-component urethane foam system in accordance with the manufacturer's written instructions and recommendations.
2. Monitor and maintain the ratio and mix the components of the urethane chemicals in accordance with the manufacturer's product specifications and processing instructions to achieve the desired density and physical properties. Verify the product component ratio with flow meters and programmable ratio monitoring equipment that can prevent the installation of product that is off-ratio by more than the manufacturer's prescribed limits.
3. Monitor and maintain the component temperatures in accordance with the manufacturer's product specifications and processing instructions to achieve the desired mix, density, and physical properties.
4. Chemical components are to be maintained at a minimum of 60 degrees while stored on site.

#### C. Installation

1. Spray-applied/pumped application of urethane foam insulation shall be performed in accordance with the manufacturer's recommendations. Apply only when surfaces and environmental conditions are within limits prescribed by the manufacturer.
2. Continuity of the spray-applied urethane foam insulation system shall be maintained at all intersections of the building assemblies, across expansion and control joints, and around elements penetrating through the building envelope by sealing with a continuous application of approved sealant.
3. The temperature of the cavities, surfaces, cracks, etc. must be a minimum of 40 degrees during foaming and for a forty-eight (48) hour period after foam

has been placed in the masonry cells. If the ambient temperature is below 40 degrees, the interior temperature must be maintained at 40 degrees for a minimum of eight hours prior to sealing and forty-eight (48) hours after completion. The outside temperature should not be less than 20 degrees unless the outside is protected by temporary or permanent thermal insulation.

4. During foaming operations, the above temperature requirements must be met while providing two (2) air changes per hour for ventilation for installation personnel.
5. Apply the insulation into the masonry cells as recommended by the manufacturer. Minimum foam density shall be 2.0 lb/cu ft; and shall be installed to completely fill the masonry cells, unless otherwise indicated.
6. Trim foam flush with the exposed surfaces. Remove foam from finished surfaces such as window glass, casings, and gypsum board; and other surfaces which will be exposed in the completed construction.

D. Exercise care to avoid damaging insulation during construction.

### 3.06 INSTALLATION OF SPRAYED THERMAL INSULATION

- A. Apply self-supported, spray-applied, thermal insulation according to manufacturer's written instructions. Do not apply insulation until sprayed fireproofing and installation of pipes, ducts, conduits, wiring, and electrical outlets in walls is completed and windows, electrical boxes, and other items not indicated to receive insulation are masked. After insulation is applied, make it even by using method recommended by insulation manufacturer.

### 3.07 PROTECTION

- A. Protect installed insulation and vapor retarders from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

### 3.08 CLEANING

- A. Clean off excess sprayed insulation adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of the sprayed insulation.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 07211**  
**FOUNDATION AND UNDERSLAB INSULATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
  - 1. Insulation under slabs-on-grade
  - 2. Insulation between double-slab construction
  - 3. Foundation wall and perimeter wall insulation
  - 4. Vapor retarders, tapes and accessories

**1.02 RELATED SPECIFICATIONS**

- A. Section 02316 - Excavation
- B. Section 02317 - Backfilling
- C. Section 03200 - Concrete Reinforcement
- D. Section 03300 - Cast-in-Place Concrete
- E. Sections related to Plumbing Work
- F. Sections related to HVAC Work
- G. Sections related to Electrical Work

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for insulation products.
- C. Research/Evaluation Reports: For foam-plastic insulation.

**1.04 QUALITY ASSURANCE**

- A. Source Limitations: Obtain each type of building insulation through one source.
- B. Fire-Test-Response Characteristics: Provide insulation and related materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
  - 1. Surface-Burning Characteristics: ASTM E 84
  - 2. Fire-Resistance Ratings: ASTM E 119
  - 3. Combustion Characteristics: ASTM E 136

## 1.05 DELIVERY, STORAGE, AND HANDLING

- A. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.
- B. Protect plastic insulation as follows:
  - 1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.
  - 2. Protect against ignition at all times. Do not deliver plastic insulating materials to Project site before installation time.
  - 3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Extruded-Polystyrene Board Insulation:
    - a. Pactiv Corporation
    - b. Dow Chemical Company
    - c. Owens Corning
    - d. Or approved equal

### 2.02 INSULATING MATERIALS

- A. General: Provide insulating materials that comply with requirements and with referenced standards.
  - 1. Preformed Units: Sizes to fit applications indicated; selected from manufacturer's standard thicknesses, widths, and lengths.
- B. Extruded-Polystyrene Board Insulation: ASTM C 578, of type and density indicated below, with maximum flame-spread and smoke-developed indices of 75 and 450, respectively:
  - 1. Type VII, 2.20 lb/cu. ft. (60 psi compressive strength), unless otherwise indicated.
  - 2. Type V, 3.00 lb/cu. ft. (100 psi compressive strength), for all horizontal and double slab applications.

### 2.03 AUXILIARY INSULATING MATERIALS

- A. Adhesive for Bonding Insulation: Product with demonstrated capability to bond insulation securely to substrates indicated without damaging insulation and substrates.
- B. Vapor-Proof Tape: Pressure-sensitive tape of the type, permeance resistance, and other properties recommended by the polystyrene insulation manufacturer for sealing joints, laps and penetrations in, through and about the horizontal/underslab plastic insulation installations.

### 2.04 INSULATION FASTENERS

- A. Adhesively Attached, Spindle-Type Anchors: Plate welded to projecting spindle; capable of holding insulation of thickness indicated securely in position indicated with self-locking washer in place; and complying with the following requirements:
  - 1. Plate: Perforated galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
  - 2. Spindle: Copper-coated, low carbon steel, fully annealed, 0.105 inch in diameter, length to suit depth of insulation indicated.
- B. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick galvanized steel sheet, with beveled edge for increased stiffness, sized as required to hold insulation securely in place, but not less than 1-1/2 inches square or in diameter.
  - 1. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in the locations indicated.
  - 2. Air Space: 2 inches, unless otherwise indicated
- C. Anchor Adhesive: Product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

### 2.05 VAPOR RETARDERS

- A. Polyethylene Vapor Retarder: ASTM D 4397, 6 mils thick, with maximum permeance rating of 0.13 perms.
- B. Vapor-Retarder Tape: Pressure-sensitive tape of type recommended by vapor-retarder manufacturer for sealing joints and penetrations in vapor retarder.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for Sections in which substrates and related work are specified and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Clean substrates of substances harmful to insulations or vapor retarders, including removing projections capable of puncturing vapor retarders or of interfering with insulation attachment.

### 3.03 INSTALLATION, GENERAL

- A. Comply with insulation manufacturers written instructions applicable to products and application indicated.
- B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed at any time to ice and snow.
- C. Extend insulation in thickness indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.
- D. Water-Piping Coordination: If water piping is located on inside of insulated double-slabs or exterior walls, coordinate location of piping to ensure that it is placed on warm side of insulation.
- E. Apply single layer of insulation to produce thickness indicated, unless multiple layers are otherwise shown or required to make up total thickness.

### 3.04 INSTALLATION OF PERIMETER AND UNDER-SLAB INSULATION

- A. On vertical surfaces, set units utilizing insulation fasteners or adhesives specifically designed for this application/purpose. Apply fasteners and adhesives according to the manufacturers written instructions. Use only those adhesive recommended by, or acceptable to the insulation manufacturer.
  - 1. If not indicated, extend insulation a minimum of 24 inches below exterior grade line.
- B. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units. Secure perimeter of horizontal insulation areas to prevent insulation movement.

1. Install a continuous, uninterrupted application of the specified vapor-proof, pressure-sensitive tape at all joints, laps, butts, penetrations and terminations of the horizontal/underslab polystyrene insulation. Insulation surfaces requiring such taped joints shall be cleaned and free of materials and conditions which will prevent full adhesion. Install tapes free of wrinkles, twists and similar conditions.
  2. Repair breaks, cracks, tears, punctures and other such conditions in insulations immediately before concealment by other work. Replace insulations that can not be repaired. Cover with vapor-retarder tape or another layer of vapor retarder.
  3. Comply with insulation manufacturers' instructions and written recommendations.
- C. Protect below-grade insulation on vertical surfaces from damage during backfilling by applying protection course with joints butted. Set in adhesive according to insulation manufacturer's written instructions.

### 3.05 INSTALLATION OF VAPOR RETARDERS

- A. General: Extend vapor retarder to extremities of areas to be protected from vapor transmission. Secure in place with adhesives or other anchorage system as indicated. Extend vapor retarder to cover miscellaneous voids in insulated substrates, including those filled with loose-fiber insulation.
- B. Seal vertical joints in vapor retarders by lapping and sealing. Secure vapor retarders to at top, end, and bottom edges; at perimeter of openings; and at lap joints. Space fasteners 16 inches o.c.
1. Before installing vapor retarder, apply a continuous bead of urethane sealant to surfaces of substrates which define the vapor retarder terminations (including openings). Seal overlapping joints in vapor retarders with vapor-retarder tape according to vapor-retarder manufacturer's written instructions. Locate all joints over solid substrates.
- C. Firmly attach vapor retarders to solid substrates with vapor-retarder fasteners as recommended by vapor-retarder manufacturer.
- D. Seal joints caused by pipes, conduits, electrical boxes, and similar items penetrating vapor retarders with vapor-retarder tape to create an airtight seal between penetrating objects and vapor retarder.
- E. Repair tears or punctures in vapor retarders immediately before concealment by other work. Cover with vapor-retarder tape or another layer of vapor retarder.

3.06 PROTECTION

- A. Protect installed insulation and vapor retarders from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

-END OF SECTION-

**Section 07410**  
**METAL WALL PANELS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
1. Factory-formed and field-assembled, exposed-fastener, lap-seam metal wall panel system.
  2. Factory-formed and field-assembled, concealed-fastener, flush interior panel system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 - Plant-Precast Architectural Concrete
- B. Section 05120 - Structural Steel
- C. Section 05400 - Cold Formed Metal Framing
- D. Section 07210 - Building Insulation
- E. Section 07610 - Sheet Metal Roofing
- F. Section 07620 - Sheet Metal Flashing and Trim
- G. Section 07920 - Exterior Joint Sealants
- H. Section 08520 - Aluminum Windows
- I. Section 08630 - Translucent Insulating Panels
- J. Section 10200 - Louvers and Screens
- K. Sections related to Plumbing Work
- L. Sections related to HVAC Work
- M. Sections related to Electrical Work

**1.03 DEFINITIONS**

- A. Metal Wall Panel Assembly: Metal wall panels, attachment system components, miscellaneous metal framing, and accessories necessary for a complete weathertight system.
- B. Metal Sheet Thickness: Minimum thickness of base metal without metallic coatings or painted finishes.

**1.04 PERFORMANCE REQUIREMENTS**

- A. General: Provide metal wall panel assemblies that comply with performance requirements specified as determined by testing manufacturers' standard assemblies similar to those indicated for this Project, by a qualified testing and inspecting agency.

- B. Air Infiltration: Air leakage through assembly of not more than 0.06 cfm/sq. ft. of wall area when tested according to ASTM E 283 at a static-air-pressure difference of 6.24 lbf/sq. ft.
  - C. Water Penetration: No water penetration when tested according to ASTM E 331 at a minimum differential pressure of 20 percent of inward-acting, wind-load design pressure of not less than 8.0 lbf/sq. ft. and not more than 12 lbf/sq. ft..
  - D. Water Absorption: Maximum 1.0 percent absorption rate by volume when tested according to ASTM C 209.
  - E. Structural Performance: Provide metal wall panel assemblies capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated, based on testing according to ASTM E 1592:
    - 1. Wind Loads: Determine inward and outward loads based on the current New York City Building Code.
    - 2. Deflection Limits: Engineer metal wall panel assemblies to withstand test pressures with deflection no greater than 1/240 of the span and no evidence of material failure, structural distress, or permanent deformation exceeding 0.2 percent of the clear span.
      - a. Test Pressures: 150 percent of inward and outward wind-load design pressures
  - F. Seismic Performance: Provide metal wall panel assemblies capable of withstanding the effects of earthquake motions determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 9, "Earthquake Loads" unless otherwise required by applicable code requirements.
  - G. Thermal Movements: Provide metal wall panel assemblies that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
    - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces
- 1.05 SUBMITTALS
- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of metal wall panel and accessory.
  - B. Shop Drawings: Show fabrication and installation layouts of metal wall panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment

system, trim, flashings, closures, and accessories; and special details. Distinguish between factory- and field-assembled work.

1. Accessories: Include details of the following items, at a scale of not less than 1-1/2 inches per 12 inches:
    - a. Flashing and trim
    - b. Trim
    - c. Panel enclosures
    - d. Outside corner units
  2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer licensed by New York State, responsible for their preparation.
- C. Coordination Drawings: Exterior elevations drawn to scale and coordinating penetrations and wall-mounted items. Show the following:
1. Wall panels and attachments
  2. Girts and other supports, framing and braces
  3. Wall-mounted items including doors, windows, louvers, and lighting fixtures
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
1. Metal Wall Panels: 12 inches long by actual panel width. Include fasteners, closures, and other metal wall panel accessories
  2. Trim, Closures and Outside Corner Units: 12 inches long. Include fasteners and other exposed accessories
  3. Accessories: 12-inch- long Samples for each type of accessory
  4. Exposed Gaskets: 12 inches long
  5. Exposed Sealants: For each type and color of joint sealant required. Install joint sealants in 1/2-inch- wide joints formed between two 6-inch- long strips of material matching the appearance of metal wall panels adjacent to joint sealants.
- E. Provide comprehensive engineering analysis signed and sealed by a New York State licensed professional engineer responsible for its preparation. Engineering shall include calculations demonstrating compliance with indicated requirements for panels, anchors and connections.
- F. Qualification Data: Provide qualification data for the Installer, Professional Engineer and the Testing Agency.

1. Include installer's statement of qualifications; a list of completed projects of similar size and scope. Include photographs, address/location information, Owner's/Owner's Representatives names phone numbers for the successfully completed projects.
- G. Compatibility and Adhesion Test Reports: From sealant manufacturer indicating the following:
1. Materials forming joint substrates and joint sealant backings have been tested for compatibility and adhesion with joint sealants.
  2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- H. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for the following:
1. Metal Wall Panels: Include reports for air infiltration, water penetration, and structural performance.

#### 1.06 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer. Qualified Installer shall have a minimum of three (3) years successful experience in the installation of metal wall panel systems similar in type, size, scope and complexity as those specified herein.
1. Installer's responsibilities include fabricating and installing metal wall panel assemblies and providing professional engineering services needed to assume engineering responsibility.
  2. Engineering Responsibility: Preparation of data for metal wall panels, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.
- B. Fabricator Qualifications: Certified by wall panel manufacturer to fabricate and install manufacturer's wall panel system.
- C. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated, as documented according to ASTM E 548.
- D. Source Limitations: Obtain each type of metal wall panel through one source from a single manufacturer.
- E. Product Options: Drawings indicate size, profiles, and dimensional requirements of metal wall panels and are based on the specific system indicated. Refer to Section 01631 - Equivalent Materials and Equipment.

1. Do not modify intended aesthetic effects, as judged solely by Commissioner, except with Commissioner's approval. If modifications are proposed, submit comprehensive explanatory data to Commissioner for review.
- F. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.
1. Use manufacturer's standard test methods to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
    - a. Perform tests under environmental conditions replicating those that will exist during installation.
  2. Submit no fewer than nine pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
  4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures, including the use of specially formulated primers.
- G. Mockups: Build mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution.
1. Build mockup of typical corner wall panel, including soffits, trims, liner panels, closures and other trims, as shown on Drawings; approximately 48 inches square by full thickness, including supports, attachments, and accessories.
  2. Approval of mockups is for other material and construction qualities specifically approved by Commissioner in writing.
  3. Approval of mockups does not constitute approval of deviations contained in mock-ups from the Contract Documents, unless such deviations are specifically approved by Commissioner in writing.
  4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination. Review methods and procedures related to metal wall panel assemblies including, but not limited to, the following:

1. Meet with The City of New York, Commissioner, City's insurer (if applicable), testing and inspecting agency representative, metal wall panel Installer, metal wall panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects metal wall panels including installers of doors, windows, and louvers.
2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
3. Review methods and procedures related to metal wall panel installation, including manufacturer's written instructions.
4. Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
5. Review flashings, special details, wall penetrations, openings, and condition of other construction that will affect metal wall panels.
6. Review governing regulations and requirements for insurance, certificates, and testing and inspecting if applicable.
7. Review temporary protection requirements for metal wall panel assembly during and after installation.
8. Review wall panel observation and repair procedures after metal wall panel installation.
9. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver components, sheets, metal wall panels, and other manufactured items so as not to be damaged or deformed. Package metal wall panels for protection during transportation and handling.
- B. Unload, store, and erect metal wall panels in a manner to prevent bending, warping, twisting, and surface damage.
- C. Stack metal wall panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal wall panels to ensure dryness, with positive slope for drainage of water. Do not store metal wall panels in contact with other materials that might cause staining, denting, or other surface damage.
- D. Protect strippable protective covering on metal wall panels from exposure to sunlight and high humidity, except to extent necessary for period of metal wall panel installation.

**1.08 PROJECT CONDITIONS**

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal wall panels to be performed according to manufacturers' written instructions and warranty requirements.
- B. Field Measurements: Verify locations of structural members and wall opening dimensions by field measurements before metal wall panel fabrication and indicate measurements on Shop Drawings.

**1.09 COORDINATION**

- A. Coordinate metal wall panel assemblies with rain drainage work, flashing, trim, and construction of girts, studs, soffits, braces and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

**1.10 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal wall panel assemblies that fail in materials or workmanship within specified warranty period.
  - 1. Failures include, but are not limited to, the following:
    - a. Structural failures, including rupturing, cracking, or puncturing.
    - b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
  - 2. Warranty Period: Two years from date of Substantial Completion.
- B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal wall panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
  - 1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
    - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
    - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
    - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
  - 2. Finish Warranty Period: 20 years from date of Substantial Completion.

- C. Special Weathertightness Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace metal wall panel assemblies that fail to remain weathertight, including leaks, within specified warranty period.

1. Weathertight Warranty Period: 10 years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

1. CENTRIA Architectural Systems
2. Custom Panel Industries, LLC
3. Fabral, Inc.
4. Morin Corporation; a Metecno Group Company

### 2.02 PANEL MATERIALS

- A. Aluminum Sheet: Coil-coated sheet, ASTM B 209, alclad alloy 3003, 3004, or 3105 for painted finishes, with temper as required to suit forming operations and structural performance required.

1. Alternative alloys include the following:

- a. Alclad Alloy 3003: H14, H16, H24, or H26 temper
- b. Alclad Alloy 3004: H22, H24, H32, or H34 temper
- c. Alloy 3105: H14 or H16 temper
- d. Alloy 5005: H14, H16, H24, H26, H34, or H36 temper

2. Finishes: Apply the following coating to the interior and exterior surfaces of the metal panel system (including accessories), as specified or indicated on Drawings.

- a. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

- (1) Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer (0.8 mil), fluoropolymer color coat (0.8 mil), and clear fluoropolymer topcoat (0.8 mil), with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight, with a minimum total dry film thickness of 2.4 mil; and complying with AAMA 2605.

- (2) Color: Match Commissioner's sample; Panetone "Cool Gray No. 2U."

B. Aluminum Extrusions: ASTM B 221, alloy and temper recommended by manufacturer for type of use and finish indicated.

C. Panel Sealants

1. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.
2. Joint Sealant: ASTM C 920; elastomeric silicone sealant; of type, grade, class, and use classifications required to seal joints in metal wall panels and remain weathertight; and as recommended in writing by metal wall panel manufacturer; refer to Section 07920 - Exterior Joint Sealants for additional requirements.

2.03 MISCELLANEOUS METAL FRAMING AND SUPPORTS

- A. Steel Sheet Components, General: Complying with ASTM C 645 requirements for metal and with ASTM A 653, G90, hot-dip galvanized zinc coating.
- B. Subgirts: C- or Z-shaped sections fabricated from 0.0598-inch bare steel thickness, cold-formed, with a G90 hot-dip galvanized zinc-coating complying with ASTM A 653. Provide where girts are not provided under Section 05120 - Structural Steel.
- C. Zee Clips: 0.079-inch bare steel thickness, cold-formed, galvanized steel sheet.
- D. Base or Sill Angles/Channels: 0.079-inch bare steel thickness, cold-formed, stainless steel.
- E. Fasteners for Metal Framing: Provide non-corrosive stainless steel fastener of the alloy, type, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates; and as acceptable to the Commissioner.

2.04 MISCELLANEOUS MATERIALS

- A. Fasteners: Self-tapping stainless steel screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Provide exposed fasteners with heads matching color of metal wall panels by means of plastic caps or factory-applied coating.
1. Fasteners for Wall Panels: Self-drilling or self-tapping 410 stainless steel hex washer head, with EPDM or PVC washer under heads of fasteners bearing on weather side of metal wall panels

2. Fasteners for Flashing and Trim: Blind fasteners or self-drilling screws with hex washer head
  3. Blind Fasteners: High-strength aluminum or stainless-steel rivets
- B. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.
- C. Provide fiberglass batt insulation for installation within metal wall panel system where indicated. Comply with requirements of Section 07210 – Building Insulation.

#### 2.05 EXPOSED-FASTENER, LAP-SEAM METAL WALL PANELS

- A. General: Provide factory-formed metal wall panels designed to be field assembled by lapping side edges of adjacent panels and mechanically attaching panels to supports using exposed fasteners in side laps. Include accessories required for weathertight installation.
- B. Deep-Box-Rib-Profile, Exposed-Fastener Metal Wall Panels: Formed with raised, box-shaped ribs that are wider than recesses, evenly spaced across panel width, and with rib/recess sides angled more than 60 degrees.
1. Material: Aluminum sheet, 0.040 inch thick (minimum); but not less than that required to meet the performance criteria specified.
    - a. Exterior Finish: 3-coat fluoropolymer
    - b. Color: Match Commissioner's samples
  2. Rib Spacing: 12 inches o.c., unless otherwise indicated
  3. Panel Coverage: 24 inches, unless otherwise indicated
  4. Panel Height: 4.0 inches, unless otherwise indicated

#### 2.06 ACCESSORIES

- A. Wall Panel Accessories: Provide components required for a complete metal wall panel assembly including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, liner panels, and similar items. Match material and finish of metal wall panels, unless otherwise indicated.
1. Closures: Provide formed closures at eaves and rakes, fabricated of same metal as metal wall panels.
  2. Panel End Closures: Provide the manufacturer's custom panel end closure assemblies matching the material, profile and finish of the field panels; assemblies shall be of fully welded/seamless construction.

3. Backing Plates: Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.
  4. Panel End Closure Strips: Neoprene; closed-cell expanded cellular rubber; crosslinked, polyolefin-foam or closed-cell laminated polyethylene; flexible closure strips; extruded, cut or premolded to match metal wall panel profile. Provide closure strips as secondary seal to close exposed panel end caps, or where indicated or necessary to ensure weathertight construction.
  5. Interior (Liner) Panels: Provide 1-1/2 inch deep by 12 inches wide interlocking (concealed fastener type) panel assemblies formed from 0.032 inch aluminum, to conceal and protect insulation where inner panels are indicated. Provide filler panels and top and bottom trim to provide for continuous finished surface at installed locations.
  6. Corner Units: Provide the manufacturer's standard fully welded corner units/assemblies at all outside corners, unless otherwise indicated. Corner units shall match the field panels in material, profile and finish.
- B. Flashing and Trim: Formed from the same coil coated material as the wall panels. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent metal wall panels.

## 2.07 FABRICATION

- A. General: Fabricate and finish metal wall panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
1. Fabricate wall panels with panel stiffeners as required to maintain fabrication tolerances and to withstand design loads.
- B. Fabricate metal wall panels in a manner that eliminates condensation on interior side of panel and with joints between panels designed to form weathertight seals.
- C. Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel.
- D. Where indicated, fabricate metal wall panel joints with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will minimize noise from movements within panel assembly.

- E. Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of item indicated.
1. Form exposed sheet metal accessories that are without oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
  2. Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
  3. Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
  4. Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
  5. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
  6. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended by metal wall panel manufacturer.
    - a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application but not less than thickness of metal being secured.

## 2.08 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of work.
  - 1. Examine primary and secondary wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
  - 2. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
- B. Examine roughing-in for components and systems penetrating metal wall panels to verify actual locations of penetrations relative to seam locations of metal wall panels before metal wall panel installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Clean substrates of substances harmful to insulation, and metal panels including removing projections capable of interfering with attachment.
- B. Install flashings and other sheet metal to comply with requirements specified in Section 07620 - Sheet Metal Flashing and Trim.
- C. Miscellaneous Framing: Install subgirts, base angles, sills, furring, and other miscellaneous wall panel support members and anchorage according to ASTM C 754 and metal wall panel manufacturer's written recommendations.
  - 1. Soffit Framing: Mechanically fasten or clip furring channels to supports, as required to comply with requirements for assemblies indicated.

### 3.03 METAL WALL PANEL INSTALLATION, GENERAL

- A. General: Install metal wall panels in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to girts and subgirts, unless otherwise indicated. Anchor metal wall panels and other components of the Work securely in place, with provisions for thermal and structural movement.
  - 1. Field cutting of metal wall panels by torch is not permitted.
  - 2. Shim or otherwise plumb substrates receiving metal wall panels.

3. Rigidly fasten base end of metal wall panels and allow eave end free movement due to thermal expansion and contraction. Predrill panels.
  4. Flash and seal metal wall panels with weather closures at eaves, rakes, and at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until weather barrier and flashings that will be concealed by metal wall panels are installed.
  5. Install screw fasteners in predrilled holes.
  6. Locate and space fastenings in uniform vertical and horizontal alignment.
  7. Install flashing and trim as metal wall panel work proceeds.
  8. Locate panel splices over structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
  9. Apply elastomeric sealant continuously between metal base channel (sill angle) and concrete, and elsewhere as indicated or, if not indicated, as necessary for waterproofing.
  10. Align bottom of metal wall panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
  11. Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
  12. Fasteners: Use gasketed stainless-steel fasteners for surfaces exposed to the interior and exterior.
  13. Provide prefabricated, mitered, and fully welded units at all outside corners. Provide corner cap covers at outside corners of canted wall panels.
  14. Provide Prefabricated panel end panel caps at exposed panel ends.
- B. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by metal wall panel manufacturer.
1. Coat back side of aluminum wall panels with bituminous coating where wall panels will contact ferrous metal or cementitious construction.
- C. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weatherproof performance of metal wall panel assemblies. Provide types of gaskets, fillers, and sealants indicated or, if not indicated, types recommended by metal wall panel manufacturer.

1. Seal metal wall panel end laps with double beads of tape or sealant, full width of panel. Seal side joints where recommended by metal wall panel manufacturer.
2. Prepare joints and apply sealants to comply with requirements in Section 07920 - Exterior Joint Sealants.

### 3.04 FIELD-ASSEMBLED METAL WALL PANEL INSTALLATION

#### A. Lap-Seam Metal Wall Panels: Fasten metal wall panels to supports with fasteners at each lapped joint at location and spacing recommended by manufacturer.

1. Arrange and nest side-lap joints so prevailing winds blow over, not into, lapped joints. Lap ribbed or fluted sheets one full rib corrugation. Apply panels and associated items for neat and weathertight enclosure. Avoid "panel creep" or application not true to line.
2. Provide gaskets under washer heads of exposed fasteners bearing on weather side of metal wall panels.
3. Locate and space exposed fasteners in uniform vertical and horizontal alignment. Use proper tools to obtain controlled uniform compression for positive seal without rupture of washer.
4. Install screw fasteners with power tools having controlled torque adjusted to compress washer tightly without damage to washer, screw threads, or panels. Install screws in predrilled holes.
5. Provide sealant tape at lapped joints of metal wall panels and between panels and protruding equipment, vents, and accessories.
6. Apply a continuous ribbon of sealant tape to weather-side surface of fastenings on end laps, and on side laps of nesting-type panels; on side laps of corrugated nesting-type, ribbed, or fluted panels; and elsewhere as needed to make panels weatherproof to driving rains.
7. At panel splices, nest panels with minimum 6-inch end lap, sealed with butyl-rubber sealant and fastened together by interlocking clamping plates.
8. Provide concealed vent openings at top and bottom of insulated metal cavity wall sections. Comply with panel manufacturer's written recommendations to inhibit condensation, permit drainage and prevent water penetration.

#### B. Interior Panels: Install horizontal sub-girts as indicated. Install batt insulation with vapor barrier between sub-girts. Install interior panels in vertical orientation, secured to sub-girts with concealed fasteners.

- C. Soffit and Fascia Panels: Align bottom of panels and fasten with blind rivets, bolts, or self-tapping screws. Flash and seal panels with weather closures where fasciae meet soffits, along lower panel edges, and at perimeter of all openings.

### 3.05 ACCESSORY INSTALLATION

- A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.
  - 1. Install components required for a complete metal wall panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.

### 3.06 ERECTION TOLERANCES

- A. Installation Tolerances: Shim and align metal wall panel units within installed tolerance of 1/4 inch in 20 feet, non-accumulative, on level, plumb, and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

### 3.07 FIELD QUALITY CONTROL

- A. Testing Agency: City will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Water Penetration: Test areas of installed system indicated on Drawings for compliance with system performance requirements according to ASTM E 1105 at minimum differential pressure of 20 percent of inward-acting, wind-load design pressure as defined by ASCE 7, "Minimum Design Loads for Buildings and Other Structures," but not less than 6.24 lbf/sq. ft.
- C. Water-Spray Test: After completing the installation of 75-foot- by-2-story minimum area of metal wall panel assembly, test assembly for water penetration according to AAMA 501.2 in a 2-bay area directed by Commissioner.
- D. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect completed metal wall panel installation, including accessories. Report results in writing.
- E. Remove and replace applications of metal wall panels where inspections indicate that they do not comply with specified requirements.
- F. Additional tests and inspections, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.08 CLEANING AND PROTECTION

- A. Remove temporary protective coverings and strippable films, if any, as metal wall panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of metal wall panel installation, clean finished surfaces as recommended by metal wall panel manufacturer. Maintain in a clean condition during construction.
- B. After metal wall panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- C. Replace metal panels (wall, liner soffit and accessory) that have been damaged or have deteriorated. Repair by finish touchup or similar minor repair procedures where minor damage has occurred.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 07610**  
**SHEET METAL ROOFING**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes, but is not limited to the following:
1. On-site, roll formed standing-seam metal roofing
  2. On-site, roll formed standing seam metal siding
  3. Snow- and ice-guard assemblies
  4. Coordination of the pre-engineered fall restraint system specified in Section 11010
  5. Roof insulation, secondary membrane/vapor barrier, ventilation mats, flashings, concealed gutter, closures, trims, sheet metal ground strips, fasteners, retainers, protective coatings, separators, plastic shield tubes for insulation shield tubes and other accessories

**1.02 RELATED SPECIFICATIONS**

- A. Section 05120 - Structural Steel
- B. Section 05312 - Steel Roof Deck
- C. Section 05400 - Cold Formed Metal Framing
- D. Section 06100 - Rough Carpentry
- E. Section 07210 - Building Insulation
- F. Section 07620 - Sheet Metal Flashing and Trim
- G. Section 07721 - Roof Hatches
- H. Section 07920 - Exterior Joint Sealants
- I. Section 10200 - Louvers and Screens
- J. Section 11010 - Fall Restraint System
- K. Sections related to Plumbing Work
- L. Sections related to HVAC Work
- M. Sections related to Electrical Work

**1.03 PERFORMANCE REQUIREMENTS**

- A. General: Provide complete sheet metal roofing system, including, but not limited to, on-site roll-formed metal roof and siding panels, cleats, clips, anchors and fasteners, sheet metal flashing and drainage components related to sheet metal roofing and siding, fascia panels, trim, underlayment, insulation and accessories as indicated and as required for a weathertight installation.
- B. Wind-Uplift Resistance: Provide custom-fabricated sheet metal assemblies capable of resisting negative uplift pressure as required by the current New York City

Building Code. Provide clips, ground strips, fasteners and clip spacings of type indicated and with capability to sustain, without failure, a load equal to 3 times the design negative uplift pressure.

- C. Wind-Uplift Resistance: Provide portable roll-forming equipment capable of producing sheet metal roofing and siding assemblies that comply with UL 580 for Class 90 wind-uplift resistance.

1. Maintain UL certification of portable roll-forming equipment for duration of sheet metal roofing and siding work.

- D. Thermal Movements: Provide sheet metal assemblies that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of sheet metal roofing thermal movements. Base engineering calculations on surface temperature of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg. F, ambient; 180 deg. F, material surfaces

- E. Water Infiltration: Provide sheet metal roofing and siding that does not allow water infiltration to building interior, with metal flashing and connections of sheet metal roofing lapped to allow moisture to run over and off the material.

#### 1.04 SUBMITTALS

- A. Product Data: For each product indicated. Include details of construction relative to materials, dimensions of individual components and profiles, and finishes.

- B. Shop Drawings: Show fabrication and installation layouts of sheet metal roofing and siding, including plans, elevations, and keyed references to termination points. Distinguish between both shop-and field-assembled work, and back coated and non-back-coated sheet metal work. Include the following:

1. Details for forming sheet metal roofing/siding, including seams and dimensions.
2. Details for joining and securing sheet metal assemblies, including layout of fasteners, sheet metal ground strips, clips, and other attachments. Include locations and profiles of seams and expansion joints.
3. Details of termination points and assemblies, including fixed points.
4. Details of expansion joints, including showing direction of expansion and contraction.

5. Details of roof penetrations.
  6. Details of edge conditions, including eaves, ridges, valleys, rakes, crickets, concealed gutters and counter flashings.
  7. Details of special conditions.
  8. Details of connections to adjoining work.
  9. Details of the following accessory item, at a scale or not less than 1-1/2 inches per 12 inches:
    - a. Typical and atypical flashings and trims; each different type
    - b. Snow guards; include large-scale details of structural connections/attachments
    - c. Fall restraint assemblies; include large-scale details of structural connections/attachments for coordination of system installations; refer to Section 11010 – Fall Restraint Systems for additional requirements
    - d. Concealed gutter assemblies
    - e. Roof hatches
  10. Where assemblies are indicated to comply with structural and other performance criteria specified herein, provide comprehensive engineering analysis signed and sealed by a New York State licensed professional engineer responsible for its preparation. Engineering shall include calculations demonstrating compliance with indicated requirements for systems, anchors and connections.
- C. Coordination Drawings: Roof plans drawn to scale and coordinating penetrations and roof-mounted items. Show the following:
1. Sheet metal roofing, sheet metal ground strips and attachments
  2. Purlins and rafters
  3. Roof-mounted items including roof hatches, equipment supports, pipe supports and penetrations, lighting fixtures, lightning protection devices, fall arrest system supports, snow and ice guards, and other items mounted on roof curbs
- D. Samples for Verification: For each type of exposed finish required, prepared on samples of size indicated below:
1. Sheet Metal Roofing/Siding: 12 inches long by actual pan width, including finished seam. Include fasteners, clips, closures, membranes, and other

attachments. Provide not less than two samples of each different type sheet metal required (back coated and non-coated).

2. Trim and Closures: 12 inches long. Include fasteners and other exposed accessories.
  3. Accessories: 12-inch-long Samples for each type of accessory
  4. Snow Guard System: Full-size Sample
- E. Roll-Forming Equipment Certificate: Issued by UL for manufacturer's portable roll-forming equipment designed for producing sheet metal roofing. Show expiration date no earlier than two months after scheduled end of sheet metal roofing.
- F. Qualification Data: For Installer and fabricator.
1. Include statements of qualification from both the fabricator and the installer; include a list of completed projects of similar size and scope. Include photographs, address/location information, Owner's/Owner's Representatives names phone numbers for the successfully completed projects.
- G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for sheet metal roofing and portable roll-forming equipment. Include reports for structural performance.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Minimum of 5 years successful experience installing sheet metal roofing/siding systems similar in type, size, scope and complexity as those specified for Project and acceptable to the fabricator of sheet metal roofing.
- B. Roll-Formed Sheet Metal Fabricator Qualifications: An authorized representative of roll-formed sheet metal roofing/siding manufacturer for fabrication and installation of units required for the Project with a minimum of 5 years experience fabricating sheet metal roofing similar to this Project.
- C. Professional Engineer Qualifications: A professional Engineer who is legally qualified to practice in the State of New York and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for the design, fabrication and installation of the snow and ice guard systems similar to those indicated for this Project; in material, design, and extent.
- D. Sheet Metal Roofing Standard: Comply with SMACNA's "Architectural Sheet Metal Manual". Conform to dimensions and profiles shown unless more stringent requirements are indicated.

- E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and qualities of materials and execution.
1. Build mockup of typical roof eave/gutter assembly, including standing seam roofing, gutter, fascia, soffit and snow and ice guard assemblies as shown on Drawings; approximately 24 inches by 48 inches by full thickness, including attachments, underlayment, and accessories.
  2. Build mockup of typical standing seam wall siding assembly, including standing seam siding, closures, fascia, and fillers as shown on Drawings; approximately 24 inches by 48 inches by full thickness, including attachments, underlayment, membranes, and accessories.
  3. Approval of mockups is for material and construction compliance with the contract documents as specifically approved by Commissioner in writing.
  4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver metal coils or sheet metal roofing pans, components, and other sheet metal roofing and siding materials so as not to be damaged or deformed. Package sheet metal roofing materials for protection during transportation and handling.
- B. Unload, store, and erect sheet metal roofing materials in a manner to prevent bending, warping, twisting, and surface damage.
- C. Stack materials on pallets, covered with waterproof covering with ventilation provided from underneath pallets. Store metal coils and sheet metal roofing materials to ensure dryness. Do not store metal coils or sheet metal roofing materials in contact with other materials that might cause staining, denting, or other surface damage.
  1. Store materials away from uncured concrete and masonry.
- D. Protect strippable protective covering on sheet metal roofing and siding from exposure to sunlight and high humidity, except to extent necessary for period of sheet metal roofing installation.

#### 1.07 COORDINATION

- A. Coordinate installation of roof curbs, snow guards, fall restraint systems, equipment supports, and roof penetrations, which are specified in this Section and in other sections.
- B. Coordinate sheet metal roofing and siding with rain drainage work, flashing, trim, and construction of metal decks, wall sheathing, purlins and rafters, bulkhead and

parapet, walls, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

## 1.08 WARRANTY

- A. General: Provide special warranties from both the Panel Material Manufacturer and the Panel Fabricator. Both special warranties shall state that the Panel Material Manufacturer/Panel Fabricator agree to replace sheet metal roofing/siding which show evidence of deterioration, or are otherwise defective in manufacture/fabrication within the specified warranty period.

1. Warranty Period: 20 years from date of Substantial Completion

- B. Special Installer's Warranty: Sheet metal roofing/siding Installer's warranty, signed by Installer, in which Installer agrees to repair or replace components of custom-fabricated sheet metal roofing/siding that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

- a. Structural failures
- b. Loose parts
- c. Wrinkling or buckling in excess of oil canning or pillowing within limits generally accepted within the zinc roofing industry.
- d. Failure to remain weathertight, including uncontrolled water leakage
- e. Deterioration of metals, metal finishes, and other materials beyond normal weathering, including nonuniformity of color or finish
- f. Galvanic action between sheet metal roofing and dissimilar materials

2. Warranty Period: Two (2) years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Rheinzink America, Inc.
  2. VM ZINC North America - Sogem USA
  3. Approved equal

**2.02 ROOFING SHEET METALS**

- A. Zinc Sheet: Electrolytic, 99 percent pure zinc alloyed with 1 percent titanium and 1 percent copper, Special High Grade Zinc meeting ASTM B69-11.
  - 1. Thickness: 22 gage (minimum)
  - 2. Finish: Bright rolled
  - 3. Exposed Finish/Appearance: Matching the Commissioner's sample

**2.03 SUBSTRATE MATERIALS**

- A. General: The following materials are listed in order of installation over the properly prepared steel roof deck.
- B. Rigid Roofing Insulation: Provide perlite board type insulation complying with ASTM C 728; composed of expanded perlite, cellulosic fibers, binders, and waterproofing agents with a top surface seal coated. Perlite insulation shall be not less than 1-1/2" inches thick and possess a minimum compressive strength of 25lbs/sqft. Provide one of the following:
  - 1. Energy Guard Perlite by GAF Materials Corporation
  - 2. Perlite Roof Insulation by Koppers Industries.
  - 3. Fesco Board by Johns Manville International, Inc.
- C. Insulation Cover Board: Provide 1/2" Fiberglass-Mat Faced Gypsum Roof Board. Provide DensDeck Prime by Georgia Pacific or equal.
- D. Secondary Membrane/Vapor Barrier Underlayment: Self-adhering, 30-40 mils thick, butyl rubber smooth (polyethylene film) faced membrane capable of performing at high temperature up to 240 deg. F as per ASTM D 1970 without degradation or failure. Provide primer when recommended by the membrane manufacturer.
  - 1. Ultra by W.R. Grace, Inc.
  - 2. WIP 300HT by Carlisle Coatings and Waterproofing
  - 3. Perma-Seal PE by Henry Company
  - 4. Or approved equal.
- E. Ventilation Mat/Drainage Conduit: Provide metal roof manufacturer's approved prefabricated geocomposite with plastic (nylon) filament ventilation mat/drainage conduit. Ventilation mat shall be 0.30 inches thick and weigh 8.0 oz/yd<sup>2</sup>.
  - 1. Enkamat 7010 by Colbond Geosynthetics
  - 2. Approved equal

## 2.04 MISCELLANEOUS MATERIALS

- A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for a complete roofing system and as recommended by fabricator for sheet metal roofing.
- B. Solder for Zinc: ASTM B 32, 60 percent lead and 40 percent tin with low antimony, as recommended by manufacturer.
- C. Fasteners: Self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads.
  - 1. Fasteners shall be stainless steel.
  - 2. Exposed Fasteners: Minimize use of exposed fasteners limited to application where concealed fastener are not possible. Heads matching color of sheet metal roofing by means of plastic caps or factory-applied coating.
  - 3. Fasteners for Flashing and Trim: Blind fasteners or self-drilling stainless steel screws with hex washer head
  - 4. Blind Fasteners: High-strength stainless-steel rivets
- D. Sealing Type: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealing tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape.
- E. Elastomeric Joint Sealant: ASTM C 920, of base polymer, type, grade, class, and use classifications required to produce joints in sheet metal roofing that will remain weathertight an as recommended by sheet metal roofing manufacturer for installation indicated.
- F. Expansion-Joint Sealant: For hooked-type expansion joints, which must be free to move, provide nonsetting, nonhardening, nonmigrating, heavy-bodied polyisobutylene sealant.

## 2.05 ACCESSORIES

- A. Sheet Metal Roofing Accessories: Provide components required for a complete sheet metal roofing assembly including trim, copings, fasciae, corner units, ridge, closures, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of sheet metal roofing, unless otherwise indicated.
  - 1. Closures: Provide closures at eaves and ridges, fabricated of same metal as sheet metal roofing.
  - 2. Clips: Minimum 0.0625-inch-thick, stainless steel panel clips designed to withstand positive and negative-load requirements and to accommodate

- thermal movement without damage or failure. Provide fixed, sliding and "Z" clips as required.
3. Backing Plates: Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.
  4. Closures: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 1-inch thick, flexible closure strips; cut or premolded to match sheet metal roofing profile. Provide closure strips where indicated or necessary to ensure weathertight construction.
- B. Flashing and Trim. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, eaves, rakes, corners, bases, framed openings, ridges, fasciae, and fillers. Finish flashing and trim with same finish system as adjacent sheet metal roofing.
- C. Concealed Gutters: Formed with 22 gage stainless steel sheet (Type 314/316). Match profiles indicated on the approved Shop Drawings; complete with end pieces, outlet tubes, and other special pieces as required. Fabricate in minimum 96-inch long sections, sized according to SMACNA's "Architectural Sheet Metal Manual". Furnish gutter splices, expansion joints and other accessories fabricated from the same metal as gutters.
- D. Snow Guard System: Prefabricated, noncorrosive stainless steel units designed to be installed without penetrating sheet metal roofing, and complete with predrilled holes, clamps, or hooks for anchoring.
1. Snow guard system shall meet the specified performance criteria; and be installed in strict compliance with the manufacturer's recommendations and the approved Shop Drawings.
  2. Seam-Mounted, Bar-Type Snow Guards: Stainless steel rods or bars held in place by stainless steel clamps attached to vertical ribs of standing seam sheet metal roofing.
  3. Engineer snow guard system and supporting anchorage system to withstand a minimum load of 300 pounds per linear foot; unless otherwise indicated on the approved Shop Drawings; or greater loads are prescribed by authorities having jurisdiction.
- E. Pre-Engineered Fall Restraint System: Refer to Section 11010 – Fall Restraint Systems for materials and requirements.
- F. Ice Guard System: Prefabricated, noncorrosive stainless steel units designed to be installed without penetrating sheet metal roofing. Provide continuous bar mounted ice guards. Provide one ice guard per roof pan; centered between standing seams, clamped to horizontal support bars.

1. Provide snow/ice guard assemblies as manufactured by UMICORE Building Products, Inc., or approved equal.
  2. Provide ice guard assemblies at eaves, as indicated.
- G. Pipe Flashing: Unless otherwise indicated on Drawings, premolded EPDM pipe collar with flexible aluminum ring bonded to base.

## 2.06 FABRICATION

- A. General: Fabricate roll-formed steel metal roofing panels to comply with details shown and roll-formed sheet metal roofing manufacturer's written instructions.
1. Standing-Seam Roofing: Form standing-seam pans with finished seam height as indicated.
  2. Employ the manufacturer's standard back-coated sheet metal materials for both "low-slope" areas and assemblies located above heated/conditioned spaces as recommended by the roofing manufacturer; and as acceptable to the Commissioner.
- B. Fabricate sheet metal roofing to allow for expansion in running work sufficient to prevent leakage, damage, and deterioration of the Work. Form exposed sheet metal work to fit substrates without excessive oil canning, buckling, and tool marks, true to line and levels indicated, and with exposed edges folded back to form hems.
1. Lay out sheet metal roofing so cross seams, when required, are made in direction of flow with higher pans overlapping lower pans. Stagger cross seams.
  2. Fold and cleat eaves and transverse seams in the shop.
  3. Form and fabricate sheets, seams, strips, cleats, valleys, ridges, edge treatments, integral flashings, and other components of metal roofing to profiles, patterns, and drainage arrangements shown and as required for leakproof construction.
- C. Expansion Provisions: Where lapped or bayonet-type expansion provisions in the Work cannot be used, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with sealant (concealed within joints).
- D. Sealant Joints: Where movable, nonexpansion joints are indicated or required to produce weathertight seams, form metal to provide for proper installation of elastomeric sealant, in compliance with SMACNA standards.
- E. Metal Protection: Where dissimilar metals will contact each other, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by manufacturers of dissimilar metals or by fabricator.

## 2.07 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for surface preparation, installation tolerances, sheet metal roofing supports, and other conditions affecting performance of work.
  - 1. Examine primary and secondary roof framing to verify that rafters, purlins, angles, channels, and other structural panel support members and anchorages have been installed.
  - 2. Examine roof decking to verify that deck joints are supported by framing or blocking and that installation is within flatness tolerances.
  - 3. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and completely anchored, and that provision has been made for roof drains, flashings, and penetrations through sheet metal roofing.
  - 4. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
- B. Examine roughing-in for components and systems penetrating sheet metal roofing to verify actual locations of penetrations relative to seam locations of sheet metal roofing before sheet metal roofing installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Verify field dimensions before fabrication. Notify Commissioner of any discrepancies between field measurements and dimensions indicated in Construction Documents.

- B. Insulation: Install insulation in accordance with manufacturer's written instructions with staggered seams. Comply with additional requirement of Section 07210 - Building Insulation.
- C. Secondary Membrane/Vapor Barrier (Self-Adhering Sheet) Underlayment: Install self-adhering sheet vapor barrier, wrinkle free, over insulation. Apply primer if required by underlayment manufacturer and compatible with insulation. Comply with temperature restrictions of vapor barrier manufacturer for installation; use primer for installing vapor barrier at low temperatures. Apply over entire roof area, in shingle fashion to shed water, with end laps not less than 3-1/2 inches. Extend underlayment below concealed gutter trough assemblies. Roll laps with roller. Cover within maximum time period allowed by vapor barrier manufacturer.
- D. Vent Course Layer: Install ventilation mat in accordance with manufacturer's written instructions.
  - 1. Place ventilation mat course horizontally, starting at the bottom of the roof and working up. Abut ventilation mat materials at end and side laps; do not overlap materials; fit snug to penetrations.
  - 2. At roof terminations (lowest point) leave enough ventilation mat (and self-adhering membrane materials) to extend materials over the facing edge. Make certain these ventilation mats are installed over the waterproof underlayments.
  - 3. At highest point in the roof assembly, terminate ventilation mat in accordance with the manufacturer's recommendations; and as acceptable to the Commissioner.
  - 4. Secure ventilation mat with either stainless steel fasteners or temperature resistant adhesives specifically designed for this purpose.
- E. Install flashings to cover underlayment to comply with requirements specified in Section 07620 - Sheet Metal Flashing and Trim.
- F. Red rosin paper is not permitted.

### 3.03 PERLITE BOARD INSTALLATION

- A. General: Coordinate installing sheet metal roofing system components so insulation is not exposed to precipitation or left exposed at the end of the workday.
- B. Comply with sheet metal roofing manufacturer's written instructions for installing roof insulation.
- C. Install one or more layers of insulation under area of sheet metal roofing system to achieve required thickness. Where overall insulation thickness is 2 inches or greater, install 2 or more layers with joints of each succeeding layer staggered from joints of previous layer a minimum of 6 inches in each direction.

- D. Trim surface of insulation where necessary so completed surface is flush and does not restrict flow of water.
- E. Install insulation with long joints of insulation in a continuous straight line with end joints staggered between rows, abutting edges and ends between boards. Fill gaps exceeding 1/4 inch with insulation.
  - 1. Cut and fit insulation within 1/4 inch of nailers, projections, and penetrations.
- F. Mechanically Fastened Insulation: Install each layer of insulation and secure to deck using mechanical fasteners; employ the roofing system manufacturer's recommended high density polyethylene "shield tubes" specifically designed to resist compressive forces on the roof insulation; sized for fastening specified board-type roof insulation to deck type.
  - 1. Fasten insulation according to requirements in FMG's "Approval Guide" for specified Windstorm Resistance Classification; and in accordance with additional requirements of UL P740.
  - 2. Fasten insulation to resist uplift pressure at corners, perimeter, and field of roof.

### 3.04 INSTALLATION, GENERAL

- A. Manufacturer's Recommendations: Except as otherwise shown or specified, comply with recommendations and instructions of manufacturer of sheet metal being fabricated and installed.
  - 1. Do not install in inclement weather.
  - 2. Do not install over a damp substrate.
  - 3. Do not install when inclement weather is threatening.
  - 4. If covering of zinc panels is required, provide free air flow around the zinc material to manufacturer's requirement to prevent white rust.
- B. Install sheet metal roofing in areas as shown on drawings, perpendicular to purlins or supports. Anchor sheet metal roofing and other components of the Work securely in place, with provisions for thermal and structural movement. Install insulation, underlayments, fasteners, solder, protective coatings, separators, sealants, and other miscellaneous items as required for a complete roofing system and as recommended by fabricator for sheet metal roofing.
  - 1. Field cutting of sheet metal roofing by torch is not permitted.
  - 2. Rigidly fasten eave end of sheet metal roofing and allow ridge end adequate movement to accommodate thermal expansion and contraction. Predrill roofing.

3. Provide metal closures at peaks rake edges rake walls and each side of ridge and hip caps.
  4. Flash and seal sheet metal roofing with weather closures are eaves, rakes, and at perimeter of all openings. Fasten with self-tapping screws.
  5. Locate and space fastenings in uniform vertical and horizontal alignment.
  6. Install ridge and hip caps as sheet metal roofing work proceeds.
  7. Locate roofing splices over, but not attached to, structural supports. Stagger roofing splices and end laps to avoid a four-panel lap splice condition.
  8. Lap metal flashings over sheet metal roofing to shed water, allowing moisture to run over and off the material.
  9. Install back coated sheet metal roofing systems in accordance with the manufacturer's instructions, and the approved Shop Drawings.
- C. Install work to be truly straight and square or conform to curvilinear geometry indicated on drawings.
1. Fabricate and install work with lines and corners of exposed units true and accurate.
  2. Form exposed faces free of buckles, excessive waves, and avoidable tool marks considering temper and reflectivity of metal.
  3. Shim and align panel units within installed tolerance of  $\frac{1}{4}$  inch in 20'-0".
  4. All seams shall be of uniform appearance and dimensions, straight and level with minimum exposure of solder and sealant.
  5. Except as otherwise shown, fold back sheet metal to form a hem on concealed side of exposed edges.
  6. Form all seams to be weatherproof, leaving room for expansion and contraction with specified and required tolerances. Provide sealing tape to seams in areas prone to ice dams and continuously on roof slopes less than 10 degrees (2:12).
  7. Comply with manufacturer's recommendations and SMACNA "Architectural Sheet Metal Manual" for flashings and sheet metal work.
- D. Provide work as indicated on approved Shop Drawings.
1. Form and fabricate sheets, seams, strips, cleats, valleys, ridges, edge treatments, integral flashings and other components of metal roofing to

profiles, patterns, and drainage arrangements shown and as required for rainproof construction.

- E. Fasteners: Use fasteners of sizes that will not penetrate completely through fireproofing course at deck underside.
  - 1. Zinc Roofing: Use stainless steel fasteners.
- F. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by fabricator of sheet metal roofing.
  - 1. Coat back side of sheet metal roofing with bituminous coating where roofing will contact wood, ferrous metal, or cementitious construction.
- G. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.
- H. Fascia: Align bottom of sheet metal roofing and fasten with blind bolts, or self-tapping screws. Flash and seal sheet metal roofing with weather closures where fasciae meet soffits, along lower panel edges, and at perimeter of all openings.

### 3.05 ACCESSORY INSTALLATION

- A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.
  - 1. Install components required for a complete sheet metal roofing assembly including trim, copings, ridge closures, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.
- B. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions and SMACNA'S "Architectural Sheet Metal Manual". Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.
  - 1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.
  - 2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type

expansion provisions cannot be used or would not be sufficiently weather resistant and water-proof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with mastic sealant (concealed within joints).

- C. Concealed Gutters: Join sections with riveted and soldered or lapped and sealed joints. Secure gutter assemblies and flash in accordance with the approved Shop Drawings. Provide prefabricated expansion joint assemblies and seal watertight with sealant. Provide for thermal expansion.
- D. Snow and Ice Guard Assemblies: Attach bar supports to vertical rib of standing-seam sheet metal roofing with clamps or set screws. Do not use fasteners that will penetrate sheet metal roofing.
  - 1. Provide snow and ice guard assemblies in the locations and of the spacing as indicated on the approved Shop Drawings.
- E. Pipe Flashing: Form flashing around pipe penetration and sheet metal roofing. Fasten and seal to sheet metal roofing as recommended by manufacturer.

### 3.06 ERECTION TOLERANCES

- A. Installation Tolerances: Shim and align sheet metal roofing within installed tolerance of  $\frac{1}{4}$  inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

### 3.07 CLEANING AND PROTECTION

- A. Clean and exposed metal surfaces of substances that interfere with uniform oxidation and weathering.
- B. Clean and neutralize flux materials. Clean off excess solder and sealants.
- C. Remove temporary protective coverings and strippable films, if any, as sheet metal roofing is installed. On completion of sheet metal roofing installation, clean finished surfaces, including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain in a clean condition during construction.
- D. Repair minor damages and defects of the metal roof panels and accessories in accordance with the manufacturer's instructions and recommendations. Field repairs shall be acceptable to the Commissioner.
  - 1. In the event that such repairs are not acceptable to the Commissioner, or if the damages are such that a field repair is not recommended by the manufacturer, provide replacement materials/panels identical to those originally installed; and as follows.

2. Replace panels that have been damaged, or have become deteriorated beyond successful repair (as judged by the Commissioner) by field touch-up and other such remedial procedures.

**-END OF SECTION-**

NO TEXT ON THIS PAGE

**Section 07620**  
**SHEET METAL FLASHING AND TRIM**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following sheet metal flashing and trim:
  - 1. Formed wall flashing and trim
  - 2. Manufactured reglets
  - 3. Formed equipment support flashing

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 03450 - Plant- Precast Architectural Concrete
- C. Section 04201 - Unit Masonry
- D. Section 06100 - Rough Carpentry
- E. Section 07410 - Metal Wall Panels
- F. Section 07610 - Sheet Metal Roofing
- G. Section 07721 - Roof Hatches
- H. Section 07920 - Exterior Joint Sealants
- I. Section 08110 - Stainless Steel Doors and Frames
- J. Section 08342 - Overhead High Speed Fabric Doors
- K. Section 08520 - Aluminum Windows
- L. Section 08630 - Translucent Insulating Panels
- M. Section 10200 - Louvers and Screens
- N. Sections related Plumbing Work
- O. Sections related to HVAC Work
- P. Sections related to Electrical Work

**1.03 PERFORMANCE REQUIREMENTS**

- A. General: Install sheet metal flashing and trim to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failing, rattling, leaking, and fastener disengagement.
- B. Thermal Movements: Provide sheet metal flashing and trim that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of sheet metal and trim thermal movements. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

- C. Water Infiltration: Provide sheet metal flashing and trim that do not allow water infiltration to building interior.

#### 1.04 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Show layouts of sheet metal flashing and trim, including plans and elevations. Distinguish between shop- and field-assembled work. Include the following:
  1. Identify material, thickness, weight, and finish for each item and location in Project.
  2. Details for forming sheet metal flashing and trim, including profiles, shapes, seams, and dimensions.
  3. Details for fastening, joining, supporting, and anchoring sheet metal flashing and trim, including fasteners, clips, cleats, and attachments to adjoining work.
  4. Details of expansion-joint covers, including showing direction of expansion and contraction.
- C. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below:
  1. Sheet Metal Flashing: 12 inches long. Include fasteners, cleats, clips, closures, and other attachments.
  2. Trim: 12 inches long. Include fasteners and other exposed accessories.
  3. Accessories: Full-size Sample

#### 1.05 QUALITY ASSURANCE

- A. Sheet Metal Flashing and Trim Standard: Comply with SMACNA's "Architectural Sheet Metal Manual." Conform to dimensions and profiles shown unless more stringent requirements are indicated.

B. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

1. Meet with Commissioner, City of New York's insurer if applicable, Installer, and installers whose work interfaces with or affects sheet metal flashing and trim including installers of roofing materials, roof accessories, translucent panel clerestory materials, and roof-mounted equipment.
2. Review methods and procedures related to sheet metal flashing and trim.
3. Examine substrate conditions for compliance with requirements, including flatness and attachment to structural members.
4. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver sheet metal flashing materials and fabrications undamaged. Protect sheet metal flashing and trim materials and fabrications during transportation and handling.
- B. Unload, store, and install sheet metal flashing materials and fabrications in a manner to prevent bending, warping, twisting, and surface damage.
- C. Stack materials on platforms or pallets, covered with suitable weathertight and ventilated covering. Do not store sheet metal flashing and trim materials in contact with other materials that might cause staining, denting, or other surface damage.

#### 1.07 COORDINATION

- A. Coordinate installation of sheet metal flashing and trim with interfacing and adjoining construction to provide a leakproof, secure, and noncorrosive installation.

### PART 2 PRODUCTS

#### 2.01 SHEET METALS

- A. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304.
  1. Finish: No. 4 (fine reflective, polished directional satin), unless otherwise acceptable to the Commissioner.
  2. Thickness: As indicated; if not indicated, not less than 24-gage

#### 2.02 UNDERLAYMENT MATERIALS

- A. Polyethylene Sheet: 6-mil- thick polyethylene sheet complying with ASTM D 4397.

- B. Felts: ASTM D 226, Type II (No. 30), asphalt-saturated organic felt, non-perforated.
- C. Slip Sheet: Rosin-sized paper, minimum 3 lb/100 sq. ft.

## 2.03 MISCELLANEOUS MATERIALS

- A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation.
- B. Fasteners: Stainless steel (type 316) wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads.
  - 1. Exposed Fasteners: Heads matching color of sheet metal by means of plastic caps or factory-applied coating.
  - 2. Fasteners for Flashing and Trim: Blind fasteners or self-drilling screws, gasketed, with hex washer head.
  - 3. Blind Fasteners: High-strength Type 316 stainless-steel rivets.
- C. Solder for Stainless Steel: ASTM B 32, Grade Sn60, with acid flux of type recommended by stainless-steel sheet manufacturer.
- D. Sealing Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealing tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape.
- E. Elastomeric Sealant: ASTM C 920, elastomeric polysulfide polymer sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.
- F. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant, polyisobutylene plasticized, heavy bodied for hooked-type expansion joints with limited movement.
- G. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.
- H. Asphalt Roofing Cement: ASTM D 4586, asbestos free, of consistency required for application.

## 2.04 MANUFACTURED SHEET METAL FLASHING AND TRIM

- A. Reglets: Units of type, material, and profile indicated, formed to provide secure interlocking of separate reglet and counterflashing pieces, and compatible with flashing indicated with factory- mitered and -welded corners and junctions.
  - 1. Material: Stainless steel, 0.0187 inch thick.
  - 2. Surface-Mounted Type: Provide with slotted holes for fastening to substrate, with neoprene or other suitable weatherproofing washers, and with channel for sealant at top edge.
  - 3. Concrete Type: Provide temporary closure tape to keep reglet free of concrete materials, special fasteners for attaching reglet to concrete forms, and guides to ensure alignment of reglet section ends.
  - 4. Masonry Type: Provide with offset top flange for embedment in masonry mortar joint.
  - 5. Flexible Flashing Retainer: Provide resilient plastic or rubber accessory to secure flexible flashing in reglet where clearance does not permit use of standard metal counterflashing or where Drawings show reglet without metal counterflashing.
  - 6. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of counterflashing lower edge.

## 2.05 FABRICATION, GENERAL

- A. General: Custom fabricate sheet metal flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated. Shop fabricate items where practicable. Obtain field measurements for accurate fit before shop fabrication.
- B. Fabricate sheet metal flashing and trim in thickness or weight needed to comply with performance requirements, but not less than that specified for each application and metal.
- C. Fabricate sheet metal flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.
  - 1. Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
- D. Sealed Joints: Form non-expansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA recommendations.

- E. Expansion Provisions: Where lapped or bayonet-type expansion provisions in the Work cannot be used, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with elastomeric sealant concealed within joints.
- F. Conceal fasteners and expansion provisions where possible on exposed-to-view sheet metal flashing and trim, unless otherwise indicated.
- G. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal.
  - 1. Thickness: As recommended by SMACNA's "Architectural Sheet Metal Manual" and FMG Loss Prevention Data Sheet 1-49 for application but not less than thickness of metal being secured.

## 2.06 WALL SHEET METAL FABRICATIONS

- A. Through-Wall Flashing: Fabricate continuous flashings in minimum 96-inch- long, but not exceeding 12 foot long, sections, under copings, at shelf angles, and where indicated. Fabricate discontinuous lintel, sill, and similar flashings to extend 6 inches beyond each side of wall openings. Form with 2-inch- high end dams. Fabricate from the following material:
  - 1. Stainless Steel: 0.0156 inch thick

## 2.07 MISCELLANEOUS SHEET METAL FABRICATIONS

- A. Equipment Support Flashing: Fabricate from the following material:
  - 1. Stainless Steel: 0.0187 inch thick

## 2.08 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## PART 3 EXECUTION

## 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions and other conditions affecting performance of work.
  - 1. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.
  - 2. Proceed with installation only after unsatisfactory conditions have been corrected.

## 3.02 INSTALLATION, GENERAL

- A. General: Anchor sheet metal flashing and trim and other components of the Work securely in place, with provisions for thermal and structural movement. Use fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system.
  - 1. Torch cutting of sheet metal flashing and trim is not permitted.
- B. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating or by other permanent separation as recommended by fabricator or manufacturers of dissimilar metals.
  - 1. Coat side of stainless-steel sheet metal flashing and trim with bituminous coating where flashing and trim will contact wood, ferrous metal, or cementitious construction.
  - 2. Underlayment: Where installing metal flashing directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet or install a course of polyethylene underlayment.
  - 3. Bed flanges in thick coat of asphalt roofing cement where required for waterproof performance.
- C. Install exposed sheet metal flashing and trim without excessive oil canning, buckling, and tool marks.
- D. Install sheet metal flashing and trim true to line and levels indicated. Provide uniform, neat seams with minimum exposure of solder, welds, and elastomeric sealant.
- E. Install sheet metal flashing and trim to fit substrates and to result in watertight performance. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.

1. Space cleats not more than 12 inches apart. Anchor each cleat with two fasteners. Bend tabs over fasteners.
- F. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently watertight, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with butyl sealant concealed within joints.
- G. Fasteners: Use fasteners of sizes that will penetrate substrate not less than 1-1/4 inches for nails and not less than 3/4 inch for wood screws.
  1. Stainless Steel: Use stainless-steel fasteners.
- H. Seal joints with butyl sealant as required for watertight construction.
  1. Where sealant-filled joints are used, embed hooked flanges of joint members not less than 1 inch into sealant. Form joints to completely conceal sealant. When ambient temperature at time of installation is moderate, between 40 and 70 deg F, set joint members for 50 percent movement either way. Adjust setting proportionately for installation at higher ambient temperatures. Do not install sealant-type joints at temperatures below 40 deg F.
  2. Prepare joints and apply sealants to comply with requirements in Section 07920 - Exterior Joint Sealants.
- I. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pretin edges of sheets to be soldered to a width of 1-1/2 inches except where pretinned surface would show in finished Work.
  1. Stainless-Steel Soldering: Pretin edges of uncoated sheets to be soldered using solder recommended for stainless steel and phosphoric acid flux. Promptly wash off acid flux residue from metal after soldering.
  2. Heat surfaces to receive solder and flow solder into joints. Fill joints completely. Completely remove flux and spatter from exposed surfaces.

### 3.03 WALL FLASHING INSTALLATION

- A. General: Install sheet metal wall flashing to intercept and exclude penetrating moisture according to SMACNA recommendations and as indicated. Coordinate installation of wall flashing with installation of wall-opening components such as windows, doors, and louvers.
  1. Provide hemmed edges at exposed flashing terminations.
- B. Through-Wall Flashing: Installation of formed through-wall flashing is specified in Section 04201 - Unit Masonry.

- C. Reglets: Installation of reglets is specified in Section 03300 - Cast-in-Place Concrete.

#### 3.04 MISCELLANEOUS FLASHING INSTALLATION

- A. Roof Hatch and Equipment Support Flashing: Coordinate installation of roof hatch and equipment support flashing with installation of roofing and equipment. Weld or seal flashing with elastomeric sealant to hatch frame and equipment support member.

#### 3.05 CLEANING AND PROTECTION

- A. Clean and neutralize flux materials. Clean off excess solder and sealants.
- B. Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed. On completion of installation, clean finished surfaces, including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain in a clean condition during construction.
- C. Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond repair. Repair minor damages by finish touchup or similar minor repair procedures acceptable to the Commissioner.

- END OF SECTION -

NO TEXT ON THIS PAGE

**Section 07721**  
**ROOF HATCHES**

**PART 1 GENERAL****1.01 SECTION INCLUDES****A. This Section includes the following:**

1. Roof access hatches
2. Smoke actuated vent hatches

**1.02 RELATED SPECIFICATIONS**

- A. Section 05312 - Steel Roof Deck
- B. Section 05500 - Metal Fabrications
- C. Section 05521 - Exterior Pipe and Tube Railings
- D. Section 06100 - Rough Carpentry
- E. Section 07610 - Sheet Metal Roofing
- F. Section 07620 - Sheet Metal Flashing and Trim
- G. Section 09911 - Exterior Painting
- H. Sections related to HVAC Work
- I. Sections related to Electrical Work

**1.03 SUBMITTALS**

- A. **Product Data:** For each type of roof accessory indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. **Shop Drawings:** Show fabrication and installation details for roof accessories. Show layouts of roof accessories including plans and elevations. Indicate dimensions, weights, loadings, required clearances, method of field assembly, and components. Include plans, elevations, sections, details, and attachments to other work.
- C. **Coordination Drawings:** Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:
  1. Size and location of roof accessories specified in this Section.
  2. Method of attaching roof accessories to roof or building structure.
  3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
- D. **Samples:** For each type of exposed factory-applied finish required and for each type of roof accessory indicated, prepared on Samples of size to adequately show color and finish.

- E. Warranty: Special warranty specified in this Section.

#### 1.04 QUALITY ASSURANCE

- A. Sheet Metal Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" details for fabrication of units, including flanges and cap flashing to coordinate with type of roofing indicated.

#### 1.05 DELIVERY, STORAGE, AND HANDLING

- A. Pack, handle, and ship roof accessories properly labeled in heavy-duty packaging to prevent damage.

#### 1.06 PROJECT CONDITIONS

- A. Field Measurements: Verify required openings for each type of roof accessory by field measurements before fabrication and indicate measurements on Shop Drawings.

#### 1.07 COORDINATION

- A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.

#### 1.08 WARRANTY

- A. Special Warranty on Painted Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace roof accessories that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
  - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
  - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
  - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
2. Finish Warranty Period: 20 years from date of Substantial Completion.

## PART 2 PRODUCTS

## 2.01 METAL MATERIALS

- A. Aluminum Sheet: ASTM B 209, alloy and temper recommended by manufacturer for type of use and finish. Coil-coat finish as follows:
  - 1. High-Performance Organic Finish (2-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish: Cleaned with inhibited chemicals; Chemical Finish: Conversion coating; Organic Coating: Manufacturer's standard 2-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturer's written instructions.
    - a. Color and Gloss: Match Commissioner's sample.
- B. Galvanized Steel Tube: ASTM A 500, round tube, hot-dip galvanized to comply with ASTM A 123/A 123M
- C. Galvanized Steel Pipe: ASTM A 53/A 53M

## 2.02 MISCELLANEOUS MATERIALS

- A. Glass-Fiber Board Insulation: ASTM C 726, 1 inch thick
- B. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.
- C. Polyethylene Sheet: 6-mil- thick, polyethylene sheet complying with ASTM D 4397
- D. Felt: ASTM D 226, Type II (No. 30), asphalt-saturated organic felt, nonperforated.
  - 1. Slip Sheet: Rosin-sized paper, minimum 3 lb/100 sq. ft.
- E. Fasteners: Same metal as metals being fastened, or nonmagnetic stainless steel or other noncorrosive metal as recommended by roof accessory manufacturer. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners.
- F. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, or PVC; or flat design of foam rubber, sponge neoprene, or cork.
- G. Elastomeric Sealant: ASTM C 920, silicone sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.

- H. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant, polyisobutylene plasticized, and heavy bodied for hooked-type expansion joints with limited movement.
- I. Roofing Cement: ASTM D 4586, nonasbestos, fibrated asphalt cement designed for trowel application or other adhesive compatible with roofing system.

## 2.03 ROOF HATCHES

- A. Fabricate roof hatches with insulated double-wall lids and insulated single-wall curb frame with integral deck mounting flange and lid frame counterflashing. Fabricate with welded or mechanically fastened and sealed corner joints. Provide continuous weathertight perimeter gasketing and equip with corrosion-resistant or hot-dip galvanized hardware.
- B. Manufacturers
  - 1. Babcock-Davis; a Cierra Products Inc. Company
  - 2. Bilco Company (The)
  - 3. Dur-Red Products
  - 4. Milcor Inc.; a Gibraltar Company
  - 5. Or approved equal
- C. Loads: Fabricate roof hatches to withstand 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loads.
- D. Type and Size: Sizes as indicated.
- E. Curb and Lid Material: Aluminum sheet, 0.090 inch thick.
  - 1. Finish: High-performance organic coating.
- F. Insulation: Glass-fiber board
- G. On ribbed or fluted metal roofs, form flange at perimeter bottom to conform to roof profile.
- H. Fabricate units to minimum height of 12 inches, unless otherwise indicated.
- I. Sloping Roofs: Fabricate hatch curbs with uniform height to match slope.
- J. Hardware: Stainless-steel spring latch with turn handles, butt- or pintle-type hinge system, and padlock hasps inside.

## K. Ladder Safety Post

1. Performance Requirements: Fabricate safety post to comply with OSHA 1910.27 for fixed ladders. Must support 200 pound load.
2. Post to lock in place on full extension. Provide release mechanism to return post to closed position and a pull up loop at the upper end of the post to facilitate raising the post.
3. Spring assist: Stainless steel balancing spring mechanism shall be provided to provide smooth, easy, controlled operation when raising and lowering the safety post.
4. Height: 42 inches above finished roof deck
5. Material and Finish: Stainless steel 304, mill finished
6. Hardware: Stainless steel 304
7. Diameter: Pipe with 1-5/8-inch OD tube
8. Manufacturers
  - a. Bilco Company (The)
  - b. Nystrom, Inc.
  - c. Or approved equal

## 2.04 SMOKE ACTUATED VENT HATCHES

- A. Smoke vents shall be manufacturer's standard hatch-type smoke vents with integral double-wall insulated curbs and frame, with welded or sealed mechanical corner joints, integral condensation gutter, and cap flashing. Fabricate with insulated double-wall lid, continuous weathertight perimeter lid gaskets, and equip with automatic self-lifting mechanisms, UL-listed fusible links rated at 165 deg F, smoke-detection system, and stainless steel hardware including hinges, hold-open devices, and independent manual-release devices for inside and outside operation of lids.
- B. Manufacturers
  1. Babcock-Davis; a Cierra Products Inc. Company
  2. Bilco Company (The)
  3. Nystrom, Inc.
  4. Milcor Inc.; a Gibraltar Company
  5. Or approved equal

- C. Loads: Fabricate heat and smoke vent to withstand a minimum 40-lbf/sq. ft. external live load and 30-lbf/sq. ft. uplift.
  - 1. When release is actuated, lid shall open against 10-lbf/sq. ft. snow or wind load and lock in position.
- D. Types and Sizes: As indicated on the Drawings.
- E. Regulatory Requirements: UL 793 and NFPA 204, unless otherwise acceptable to the authorities having jurisdiction.
- F. Smoke Vent Compliance: Provide units that have been tested and UL Listed and FMG approved.
- G. Fire Resistance of Lids: UL Class A rating
- H. Integral Curb, Framing, and Lid Material: Manufacturer's standard 11 gage aluminum sheet material; with all seams fully welded, stiffened and formed with self-flashing curbs.
  - 1. Finish: Manufacturer's standard mill finish, unless otherwise directed by the Commissioner.
- I. Insulation: Manufacturer's standard rigid fiberboard at curb perimeter; and polystyrene in cover assemblies.
- J. Fabricate integral curbs to minimum height of 12 inches, unless otherwise indicated.
- K. Sloping Roofs: Fabricate hatch curbs with uniform height to match slope.
- L. Hardware: Provide the manufacturer's standard stainless steel hardware including, but not limited to, heavy-duty hinges with non-removable pins, positive hold-release type latch mechanisms, electric/thermal resettable links interfaced with building alarm system, heavy-duty compression springs, heavy-duty shock absorbers, and continuous EPDM gaskets/weatherseals.
- M. Selected Product: Subject to compliance with requirements, provide smoke actuated vent assemblies "Model B-SVA" as manufactured by Babcock-Davis, or equivalent acceptable to the Commissioner by one of the specified manufacturers.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of work.
  - 1. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored and is ready to receive roof accessories.

2. Verify dimensions of roof openings for roof accessories.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. Install roof accessories according to manufacturer's written instructions. Anchor roof accessories securely in place and capable of resisting forces specified. Use fasteners, separators, sealants, and other miscellaneous items as required for completing roof accessory installation. Install roof accessories to resist exposure to weather without failing, rattling, leaking, and fastener disengagement.
- B. Install roof accessories to fit substrates and to result in watertight performance.
- C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.
  1. Coat concealed side of uncoated aluminum and stainless-steel roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
  2. Underlayment: Where installing exposed-to-view components of roof accessories directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet, or install a course of polyethylene underlayment.
  3. Bed flanges in thick coat of asphalt roofing cement where required by roof accessory manufacturers for waterproof performance.
- D. Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.
- E. Roof Hatch Installation:
  1. Check roof hatch for proper operation. Adjust operating mechanism as required. Clean and lubricate joints and hardware.
  2. Attach safety railing system to roof hatch curb.
  3. Attach ladder safety post according to manufacturer's written instructions.
- F. Smoke Actuated Vent Hatch Installation:
  1. Check smoke hatch for proper operation. Adjust operating mechanism as required. Clean and lubricate joints and hardware.

2. Attach safety railing system to roof hatch curb.
3. Coordinate the installation of the smoke actuated vent hatch interlock system with the fire alarm system specified in other sections.

- G. Seal joints with elastomeric or butyl sealant as required by manufacturer of roof accessories.

### 3.03 TOUCH UP

- A. Touch up factory-primed surfaces with compatible primer ready for field painting in accordance with Section 09911 – Exterior Painting.
- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

### 3.04 CLEANING

- A. Clean exposed surfaces according to manufacturer's written instructions.

-END OF SECTION-

**Section 07811**  
**SPRAYED FIRE-RESISTIVE MATERIALS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
1. Sprayed cementitious fire-resistive materials
  2. Sprayed intumescent mastic fire-resistive materials
  3. Topcoats
  4. Sealers
  5. Expanded metal lath for support of sprayed cementitious fireproofing

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete and Section 03350 - Concrete Finishes, for concrete protecting structural steel
- B. Section 04201 - Unit Masonry, for masonry protecting structural steel
- C. Section 05120 - Structural Steel
- D. Section 05312 - Steel Roof Deck, for surface conditions receiving sprayed fire-resistive materials
- E. Section 07842 - Fire-Resistive Joint Systems, for fire-resistance-rated joint systems
- F. Section 09260 - Gypsum Board Assemblies

**1.03 DEFINITIONS**

- A. Concealed Sprayed Fire-Resistive Materials: Applied to surfaces that are concealed from view behind other construction when the Work is completed.
- B. Exposed Sprayed Fire-Resistive Materials: Applied to surfaces that are exposed to view when the Work is completed and surfaces that are accessible through acoustical metal panel ceilings.

**1.04 SUBMITTALS**

- A. Product Data: For each type of product indicated.
1. Provide listed UL assemblies for each application indicated.
- B. Shop Drawings: Structural framing plans indicating the following:
1. Locations and types of surface preparations required before applying sprayed fire-resistive material.

2. Extent of sprayed fire-resistive material for each construction and fire-resistance rating, including the following:
    - a. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
    - b. Minimum thicknesses needed to achieve required fire-resistance ratings of structural components and assemblies.
    - c. Designation of restrained and unrestrained conditions based on definitions in ASTM E 119, Appendix X3. All sprayed fire resistive material applications shall be considered as restrained unless noted otherwise as determined by a qualified professional engineer.
  3. Treatment of sprayed fire-resistive material after application.
- C. Samples for Initial Selection: For each type of colored, exposed sprayed fire-resistive material indicated.
  - D. Samples for Verification: For each type of colored, exposed sprayed fire-resistive material, two Samples, each 4 inches (102 mm) square, of each color, texture, and material formulation to be applied. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
  - E. Product Certificates: For each type of sprayed fire-resistive material, signed by product manufacturer.
  - F. Qualification Data: For Installer, manufacturer, professional engineer and testing agency.
  - G. Compatibility and Adhesion Test Reports: From sprayed fire-resistive material manufacturer indicating the following:
    1. Materials have been tested for bond with substrates.
    2. Materials have been verified by sprayed fire-resistive material manufacturer to be compatible with substrate primers and coatings.
    3. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
  - H. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for proposed sprayed fire-resistive materials.
  - I. Research/Evaluation Reports: For sprayed fire-resistive materials.
  - J. Warranties: Special warranties specified in this Section.

## 1.05 QUALITY ASSURANCE

- A. **Installer Qualifications:** A firm or individual certified, licensed, or otherwise qualified by sprayed fire-resistive material manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements. A manufacturer's willingness to sell its sprayed fire-resistive materials to Contractor or to an installer engaged by Contractor does not in itself confer qualification on the buyer.
  - 1. Installer's responsibilities include providing professional engineering services needed to assume engineering responsibility for designation of restrained and unrestrained conditions.
- B. **Testing Agency Qualifications:** An independent testing agency, acceptable to authorities having jurisdiction, with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.
- C. **Source Limitations:** Obtain sprayed fire-resistive materials through one source from a single manufacturer.
- D. **Sprayed Fire-Resistive Materials Testing:** By a qualified testing and inspecting agency engaged by Contractor or manufacturer to test for compliance with specified requirements for performance and test methods.
  - 1. Sprayed fire-resistive materials are randomly selected for testing from bags bearing the applicable classification marking of UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
  - 2. Testing is performed on specimens of sprayed fire-resistive materials that comply with laboratory testing requirements specified in Part 2 and are otherwise identical to installed fire-resistive materials, including application of accelerant, sealers, topcoats, tamping, troweling, rolling, and water overspray, if any of these are used in final application.
  - 3. Testing is performed on specimens whose application the independent testing and inspecting agency witnessed during preparation and conditioning. Include in test reports a full description of preparation and conditioning of laboratory test specimens.
- E. **Compatibility and Adhesion Testing:** Engage a qualified testing and inspecting agency to test for compliance with requirements for specified performance and test methods.
  - 1. Test for bond per ASTM E 736 and requirements in UL's "Fire Resistance Directory" for coating materials. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.

2. Verify that manufacturer, through its own laboratory testing or field experience, has not found primers or coatings to be incompatible with sprayed fire-resistive material.
- F. Fire-Test-Response Characteristics: Provide sprayed fire-resistive materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify bags containing sprayed fire-resistive materials with appropriate markings of applicable testing and inspecting agency.
1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another testing and inspecting agency acceptable to authorities having jurisdiction, for sprayed fire-resistive material serving as direct-applied protection tested per ASTM E 119.
  2. Surface-Burning Characteristics: ASTM E 84.
- G. Provide products containing no detectable asbestos as determined according to the method specified in 40 CFR 763, Subpart E, Appendix E, Section 1, "Polarized Light Microscopy."
- H. Mockups: Apply mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution and set quality standard for fabrication and installation.
1. Locations of Mockups: To be selected by the Commissioner.
  2. Extent of Mockups: Approximately 100 sq. ft. (9 sq. m) of surface for each product indicated.
  3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- I. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination. Review methods and procedures related to sprayed fire-resistive materials including, but not limited to, the following:
1. Review and finalize construction schedule and verify sequencing and coordination requirements.
- 1.06 DELIVERY, STORAGE, AND HANDLING
- A. Deliver products to Project site in original, unopened packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, shelf life if applicable, and fire-resistance ratings applicable to Project.

- B. Use materials with limited shelf life within period indicated. Remove from Project site and discard materials whose shelf life has expired.
- C. Store materials inside, under cover, aboveground, and kept dry until ready for use. Remove from Project site and discard wet or deteriorated materials.

#### 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not apply sprayed fire-resistive material when ambient or substrate temperature is 40 deg F (4 deg C) or lower unless temporary protection and heat is provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.
- B. Ventilation: Ventilate building spaces during and after application of sprayed fire-resistive material. Use natural means or, if they are inadequate, forced-air circulation until fire-resistive material dries thoroughly.

#### 1.08 COORDINATION

- A. Sequence and coordinate application of sprayed fire-resistive materials with other related work specified in other Sections to comply with the following requirements:
  - 1. Provide temporary enclosure as required to confine spraying operations and protect the environment.
  - 2. Provide temporary enclosures for applications to prevent deterioration of fire-resistive material due to exposure to weather and to unfavorable ambient conditions for humidity, temperature, and ventilation.
  - 3. Avoid unnecessary exposure of fire-resistive material to abrasion and other damage likely to occur during construction operations subsequent to its application.
  - 4. Do not apply fire-resistive material to metal deck substrates until concrete topping, if any, has been completed. For metal roof decks without concrete topping, do not apply fire-resistive material to metal roof deck substrates until roofing has been completed; prohibit roof traffic during application and drying of fire-resistive material.
  - 5. Do not begin applying fire-resistive material until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.
  - 6. Defer installing ducts, piping, and other items that would interfere with applying fire-resistive material until application of fire protection is completed.
  - 7. Do not install enclosing or concealing construction until after fire-resistive material has been applied, inspected, and tested and corrections have been made to defective applications.

## 1.09 WARRANTY

- A. Special Warranty: Each product manufacturer's standard form, signed by Contractor and by Installer, in which manufacturer agrees to repair or replace sprayed fire-resistive materials that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
1. Cracking, flaking, spalling, or eroding in excess of specified requirements; peeling; or delaminating of sprayed fire-resistive materials from substrates.
  2. Not covered under the warranty are failures due to damage by occupants and the City's maintenance personnel, exposure to environmental conditions other than those investigated and approved during fire-response testing, and other causes not reasonably foreseeable under conditions of normal use.
- B. Warranty Period: Two years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 SPRAYED CEMENTITIOUS FIRE-RESISTIVE MATERIALS

- A. General: For applications of sprayed cementitious fire-resistive materials, provide manufacturer's standard products complying with requirements indicated for material composition and physical properties representative of installed products.
- B. Products
1. Carbolite Company Pyrocrete 40 or Pyrocrete 239 (exterior listing)
  2. Grace, W. R. & Co.--Conn., Construction Products Div.; Monokote Type MK-6s or Type Z146 (exterior listing)
  3. Arabian Vermiculite Industries – Type MK-6/CBF, MK-6/ED, MK-6/AY
  4. Grace Korea Inc. – Types MK-6/CBF, MK-6/ED, MK-6/HY, MK-6S
  5. Or approved equal
- C. Material Composition: Cementitious sprayed fire-resistive material consisting of factory-mixed, dry formulation of gypsum or portland cement binders and lightweight mineral or synthetic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.
- D. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:

1. Dry Density: 28 lb/cu. ft. or 40 lb/cu. ft. for average and individual densities regardless of density indicated in referenced fire-resistance design, or greater if required to attain fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method."
2. Thickness: Provide minimum average thickness required for fire-resistance design indicated according to the following criteria as outlined in UL Design P739 or P740 and as per installation procedure outlined in AWCI Tech Manual 12-A but not less than 0.375 inch (9 mm), per ASTM E 605:
  - a. Where the referenced fire-resistance design lists a thickness of 1 inch (25 mm) or greater, the minimum allowable individual thickness of sprayed fire-resistive material is the design thickness minus 0.25 inch (6 mm).
  - b. Where the referenced fire-resistance design lists a thickness of less than 1 inch (25 mm) but more than 0.375 inch (9 mm), the minimum allowable individual thickness of sprayed fire-resistive material is the greater of 0.375 inch (9 mm) or 75 percent of the design thickness.
  - c. No reduction in average thickness is permitted for those fire-resistance designs whose fire-resistance ratings were established at densities of less than 15 lb/cu. ft. (240 kg/cu. m).
3. Bond Strength: 150 lbf/sq. ft. (7.2 kPa) minimum per ASTM E 736 under the following conditions:
  - a. Field test sprayed fire-resistive material that is applied to flanges of wide-flange, structural-steel members on surfaces matching those that will exist for remainder of steel receiving fire-resistive material.
  - b. If surfaces of structural steel receiving sprayed fire-resistive material are primed or otherwise painted for coating materials, perform series of bond tests specified in UL's "Fire Resistance Directory." Provide bond strength indicated in referenced UL fire-resistance criteria, but not less than 150 lbf/sq. ft. (7.2 kPa) minimum per ASTM E 736.
  - c. Minimum thickness of sprayed fire-resistive material tested in laboratory shall be 0.75 inch (19 mm).
4. Compressive Strength: 5.21 lbf/sq. in. (35.9 kPa) as determined in the laboratory per ASTM E 761. Minimum thickness of sprayed fire-resistive material tested shall be 0.75 inch (19 mm) and minimum dry density shall be as specified, but not less than 15 lb/cu. ft. (240 kg/cu. m).
5. Corrosion Resistance: No evidence of corrosion per ASTM E 937.
6. Deflection: No cracking, spalling, or delamination per ASTM E 759.

7. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
8. Air Erosion: Maximum weight loss of 0.000 g/sq. ft. in 24 hours per ASTM E 859. For laboratory tests, minimum thickness of sprayed fire-resistive material is 0.75 inch (19 mm), maximum dry density is 15 lb/cu. ft. (240 kg/cu. m), test specimens are not prepurged by mechanically induced air velocities, and tests are terminated after 24 hours.
9. Fire-Test-Response Characteristics: Provide sprayed fire-resistive materials with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
  - a. Flame-Spread Index: 10 or less
  - b. Smoke-Developed Index: 0
10. Fungal Resistance: No observed growth on specimens per ASTM G 21.

## 2.02 INTUMESCENT MASTIC FIRE-RESISTIVE COATINGS

### A. Available Products

1. Fire-Resistive, Water-Based Intumescent Mastic Coating Material
  - a. A/D Fire Protection Systems Inc.; Firefilm II and Colorcoat
  - b. Albi Manufacturing, Division of StanChem Inc.; Albi Clad TF or 800
  - c. Carbolite Co., Fireproofing Products Div.; Nullifire S606 and Topseal or Nullifire, UL test design X629
  - d. Isolatek International Corp., Cafco Products; Cafco SprayFilm-WB II Basecoat and Topseal
  - e. Or approved equal

### B. Thin-Film Fire-Resistive Intumescent Mastic Coating: Factory-mixed formulation, exterior grade only.

1. Water-Based Formulation: Approved by manufacturer and authorities having jurisdiction for interior use.
2. Multicomponent system consisting of intumescent base coat and topcoat.
3. Provide primer as recommended by product manufacturer.

### C. Color and Gloss: As selected by the Commissioner from manufacturer's full range.

## 2.03 AUXILIARY FIRE-RESISTIVE MATERIALS

- A. General: Provide auxiliary fire-resistive materials that are compatible with sprayed fire-resistive materials and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.
- B. Substrate Primers: For use on each substrate and with each sprayed fire-resistive product, provide primer that complies with one or more of the following requirements:
  - 1. Primer's bond strength complies with requirements specified in UL's "Fire Resistance Directory," for coating materials based on a series of bond tests per ASTM E 736.
  - 2. Primer is identical to those used in assemblies tested for fire-test-response characteristics of sprayed fire-resistive material per ASTM E 119 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Adhesive for Bonding Fire-Resistive Material: Product approved by manufacturer of sprayed fire-resistive material.
- D. Galvanized Metal Lath: Expanded metal lath fabricated from material of weight, configuration, and finish required to comply with fire-resistance designs indicated and fire-resistive material manufacturer's written recommendations. Include clips, lathing accessories, corner beads, and other anchorage devices required to attach lath to substrates and to receive sprayed fire-resistive material.
- E. Reinforcing Fabric: Glass-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated, approved by manufacturer of intumescent mastic coating fire-resistive material.
- F. Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance designs indicated, approved by manufacturer of intumescent mastic coating fire-resistive material. Include pins and attachment.
- G. Topcoat: Type recommended in writing by manufacturer of each sprayed fire-resistive material for application over exposed sprayed fire-resistive materials.
- H. Cement-Based Topcoat: Factory-mixed, cementitious hardcoat formulation recommended in writing by manufacturer of sprayed fire-resistive materials for trowel or spray application over exposed sprayed fire-resistive materials.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of work. A substrate is in satisfactory condition if it complies with the following:
  - 1. Substrates comply with requirements in the Section where the substrate and related materials and construction are specified.
  - 2. Substrates are free of oil, grease, rolling compounds, incompatible primers, loose mill scale, dirt, or other foreign substances capable of impairing bond of fire-resistive materials with substrates under conditions of normal use or fire exposure.
  - 3. Objects penetrating fire-resistive material, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
  - 4. Substrates are not obstructed by ducts, piping, equipment, and other suspended construction that will interfere with applying fire-resistive material.
- B. Conduct tests according to fire-resistive material manufacturer's written recommendations to verify that substrates are free of oil, rolling compounds, and other substances capable of interfering with bond.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Cover other work subject to damage from fallout or overspray of fire-resistive materials during application.
- B. Clean substrates of substances that could impair bond of fire-resistive material, including dirt, oil, grease, release agents, rolling compounds, loose mill scale, and incompatible primers, paints, and encapsulants.
- C. Prime substrates where recommended in writing by sprayed fire-resistive material manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive sprayed fire-resistive material.
- D. For exposed applications, repair substrates to remove any surface imperfections that could affect uniformity of texture and thickness in finished surface of sprayed fire-resistive material. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

## 3.03 INSTALLATION, GENERAL

- A. Comply with fire-resistive material manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and spray on fire-resistive material, as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.
- B. Apply sprayed fire-resistive material that is identical to products tested as specified in Part 1 "Quality Assurance" Article and substantiated by test reports, with respect to rate of application, accelerator use, sealers, topcoats, tamping, troweling, water overspray, or other materials and procedures affecting test results.
- C. Install metal lath as indicated, and as required, to comply with fire-resistance ratings and fire-resistive material manufacturer's written recommendations for conditions of exposure and intended use. Securely attach lath to substrate in position required for support and reinforcement of fire-resistive material. Use anchorage devices of type recommended in writing by sprayed fire-resistive material manufacturer. Attach lathing accessories where indicated or required for secure attachment to substrate.
- D. Coat substrates with adhesive before applying fire-resistive material where required to achieve fire-resistance rating or as recommended in writing by sprayed fire-resistive material manufacturer for material and application indicated.
- E. Extend fire-resistive material in full thickness over entire area of each substrate to be protected. Unless otherwise recommended in writing by sprayed fire-resistive material manufacturer, install body of fire-resistive covering in a single course.
- F. Spray apply fire-resistive materials to maximum extent possible. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by sprayed fire-resistive material manufacturer.
- G. Where sealers are used, apply products that are tinted to differentiate them from sprayed fire-resistive material over which they are applied.

## 3.04 INSTALLATION, CONCEALED SPRAYED FIRE-RESISTIVE MATERIALS

- A. Apply concealed sprayed fire-resistive material in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities where specified in Part 2 "Sprayed Fire-Resistive Materials" Article.
- B. Apply sealer to concealed sprayed fire-resistive material where recommended by manufacturer.
- C. Apply topcoat to concealed sprayed fire-resistive material where recommended by manufacturer.

## 3.05 INSTALLATION, EXPOSED SPRAYED FIRE-RESISTIVE MATERIALS

- A. Apply exposed sprayed fire-resistive material in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if indicated.
  - 1. For steel beams and bracing, provide a thickness of not less than 1 inch (25 mm).
  - 2. For metal floor or roof decks, provide a thickness of not less than 1/2 inch (13 mm).
- B. Provide a uniform finish complying with description indicated for each type of material and matching the Commissioner's sample or, if none, finish approved for field-erected mockup.
- C. Apply exposed cementitious sprayed fire-resistive material to produce the following finish:
  - 1. Even, spray-textured finish, produced by rolling flat surfaces of fire-protected members with a damp paint roller to remove drippings and excessive roughness.
- D. Apply intumescent mastic fire-resistive coating as follows:
  - 1. Install reinforcing fabric as required to obtain designated fire-resistance rating.
- E. Apply thin-film intumescent mastic fire-resistive coating as follows:
  - 1. Finish: Spray apply successive base coat(s) and finish topcoat. Allow to dry and cure between coats. Before applying finish topcoat, determine required dry film thickness according to manufacturers written recommendations.
  - 2. Finish: Spray application with surface lightly rolled before drying to smooth out surface irregularities and to seal in surface fibers.
- F. Cure exposed cementitious sprayed fire-resistive material according to product manufacturer's written recommendations to prevent premature drying.

## 3.06 FIELD QUALITY CONTROL

- A. Testing Agency: The City will engage a qualified independent testing and inspecting agency to perform field tests and inspections and to prepare test reports.
  - 1. Testing and inspecting agency will interpret tests and state in each report whether tested work complies with or deviates from requirements.

- B. Testing Services: Testing and inspecting of completed applications of sprayed fire-resistive material shall take place in successive stages, in areas of extent and using methods as follows. Do not proceed with application of sprayed fire-resistive material for the next area until test results for previously completed applications of sprayed fire-resistive material show compliance with requirements. Tested values must equal or exceed values indicated and required for approved fire-resistance design.
1. Thickness for Floor, Roof, and Wall Assemblies: For each 1000-sq. ft. (93-sq. m) area, or partial area, on each floor, from the average of 4 measurements from a 144-sq. in. (0.093-sq. m) sample area, with sample width of not less than 6 inches (152 mm) per ASTM E 605.
  2. Thickness for Structural Frame Members: From a sample of 25 percent of structural members per floor, taking 9 measurements at a single cross section for structural frame beams or girders, 7 measurements of a single cross section for joists and trusses, and 12 measurements of a single cross section for columns per ASTM E 605.
  3. Density for Floors, Roofs, Walls, and Structural Frame Members: At frequency and from sample size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method."
  4. Bond Strength for Floors, Roofs, Walls, and Structural Framing Members: For each 10,000-sq. ft. (929 sq. m) area, or partial area, on each floor, cohesion and adhesion from one sample of size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 736.
  5. If testing finds applications of sprayed fire-resistive material are not in compliance with requirements, testing and inspecting agency will perform additional random testing to determine extent of noncompliance.
- C. Remove and replace applications of sprayed fire-resistive material where test results indicate that it does not comply with specified requirements for cohesion and adhesion, for density, or for both.
- D. Apply additional sprayed fire-resistive material per manufacturer's written instructions where test results indicate that thickness does not comply with specified requirements.
- E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.07 CLEANING, PROTECTING, AND REPAIR

- A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.
- B. Protect sprayed fire-resistive material, according to advice of product manufacturer and Installer, from damage resulting from construction operations or other causes so fire protection will be without damage or deterioration at time of Substantial Completion.
- C. Coordinate application of sprayed fire-resistive material with other construction to minimize need to cut or remove fire protection. As installation of other construction proceeds, inspect sprayed fire-resistive material and patch any damaged or removed areas.
- D. Repair or replace work that has not been successfully protected.

-END OF SECTION-

**Section 07842**  
**FIRE-RESISTIVE JOINT SYSTEMS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes fire-resistive joint systems for the following:

1. Head-of-wall joints
2. Wall-to-wall joints
3. Floor, wall and ceiling penetration firestopping

**1.02 RELATED SPECIFICATIONS**

- A. Section 07610 – Sheet Metal Roofing, for fire-resistive roof expansion assemblies.
- B. Section 07921 - Interior Sealants, for non-fire-resistive joint sealants.
- C. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

**1.03 PERFORMANCE REQUIREMENTS**

- A. General: Provide fire-resistive joint systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly in which fire-resistive joint systems are installed.
1. Comply with applicable requirements of the NYC Building Code.
- B. Joint Systems in and between Fire-Resistance-Rated Constructions: Provide systems with assembly ratings equaling or exceeding the fire-resistance ratings of construction that they join, and with movement capabilities and L-ratings indicated as determined by UL 2079.
1. Load-bearing capabilities as determined by evaluation during the time of test.
- C. Perimeter Fire-Resistive Joint Systems: For joints between edges of fire-resistance-rated floor assemblies and exterior curtain walls, provide systems of type and with ratings indicated below and those indicated in the Fire-Resistive Joint System Schedule at the end of Part 3, as determined by UBC Standard 26-9 and NFPA 285 and UL 2079.
1. UL-Listed, Perimeter Fire-Containment Systems: Integrity ratings equaling or exceeding fire-resistance ratings of floor or floor/ceiling assembly forming one side of joint.

#### 1.04 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each fire-resistive joint system, show each kind of construction condition in which joints are installed; also show relationships to adjoining construction. Include fire-resistive joint system design designation of testing and inspecting agency acceptable to authorities having jurisdiction that demonstrates compliance with requirements for each condition indicated.
  - 1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each fire-resistive joint system configuration for construction and penetrating items.
- C. Product Certificates: For each type of fire-resistive joint system, signed by product manufacturer.
- D. Qualification Data: For Installer.
- E. Research/Evaluation Reports: Each type of fire-resistive joint system must comply with requirements of the NYC Building Code.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: A firm that has been approved by FMG according to FMG 4991, "Approval of Firestop Contractors."
- B. Installation Responsibility: Assign installation of through-penetration firestop systems and fire-resistive joint systems in Project to a single qualified installer.
- C. Source Limitations: Obtain fire-resistive joint systems, for each kind of joint and construction condition indicated, through one source from a single manufacturer.
- D. Fire-Test-Response Characteristics: Provide fire-resistive joint systems that comply with the following requirements and those specified in Article 1.03 Performance Requirements:
  - 1. Fire-resistance tests are performed by a qualified testing and inspecting agency. A qualified testing and inspecting agency is UL or another agency performing testing and follow-up inspection services for fire-resistive joint systems acceptable to authorities having jurisdiction.
  - 2. Fire-resistive joint systems are identical to those tested per methods indicated in Article 1.03 Performance Requirements and comply with the following:
    - a. Fire-resistive joint system products bear classification marking of qualified testing and inspecting agency.

- b. Fire-resistive joint systems correspond to those indicated by referencing system designations of the qualified testing and inspecting agency.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver fire-resistive joint system products to Project site in original, unopened containers or packages with qualified testing and inspecting agency's classification marking applicable to Project and with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, lot number, shelf life, curing time, and mixing instructions for multicomponent materials.
- B. Store and handle materials for fire-resistive joint systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

#### 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install fire-resistive joint systems when ambient or substrate temperatures are outside limits permitted by fire-resistive joint system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate fire-resistive joint systems per manufacturer's written instructions by natural means or, if this is inadequate, forced-air circulation.

#### 1.08 COORDINATION

- A. Coordinate construction of joints to ensure that fire-resistive joint systems are installed according to specified requirements.
- B. Coordinate sizing of joints to accommodate fire-resistive joint systems.
- C. Notify City of New York's inspecting agency at least seven days in advance of fire-resistive joint system installations; confirm dates and times on days preceding each series of installations.
- D. Do not cover up fire-resistive joint system installations that will become concealed behind other construction until City of New York's inspecting agency and building inspector of authorities having jurisdiction have examined each installation.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, fire-resistive joint systems that may be incorporated into the Work include, but are not limited to, those systems indicated in the Fire-Resistive Joint System Schedule at the end of Part 3.

## 2.02 FIRE-RESISTIVE JOINT SYSTEMS

- A. Compatibility: Provide fire-resistive joint systems that are compatible with joint substrates, under conditions of service and application, as demonstrated by fire-resistive joint system manufacturer based on testing and field experience.
- B. Accessories: Provide components of fire-resistive joint systems, including primers and forming materials, that are needed to install fill materials and to comply with Article 1.03 Performance Requirements. Use only components specified by fire-resistive joint system manufacturer and approved by the qualified testing and inspecting agency for systems indicated.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for joint configurations, substrates, and other conditions affecting performance of work.
  - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Surface Cleaning: Clean joints immediately before installing fire-resistive joint systems to comply with fire-resistive joint system manufacturer's written instructions and the following requirements:
  - 1. Remove from surfaces of joint substrates foreign materials that could interfere with adhesion of fill materials.
  - 2. Clean joint substrates to produce clean, sound surfaces capable of developing optimum bond with fill materials. Remove loose particles remaining from cleaning operation.
  - 3. Remove laitance and form-release agents from concrete.
- B. Priming: Prime substrates where recommended in writing by fire-resistive joint system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. Masking Tape: Use masking tape to prevent fill materials of fire-resistive joint system from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from fire-resistive joint system materials. Remove tape as soon as possible without disturbing fire-resistive joint system's seal with substrates or damaging adjoining surfaces.

### 3.03 INSTALLATION

- A. General: Install fire-resistive joint systems to comply with Article 1.03 Performance Requirements and fire-resistive joint system manufacturer's written installation instructions for products and applications indicated.
- B. Install forming/packing/backing materials and other accessories of types required to support fill materials during their application and in position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
- C. Install fill materials for fire-resistive joint systems by proven techniques to produce the following results:
  - 1. Fill voids and cavities formed by openings and forming/packing/backing materials as required to achieve fire-resistance ratings indicated.
  - 2. Apply fill materials so they contact and adhere to substrates formed by joints.
  - 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

### 3.04 FIELD QUALITY CONTROL

- A. Inspecting Agency: Engage a qualified independent inspecting agency to inspect fire-resistive joint systems and prepare inspection reports.
- B. Testing Services: Inspecting of completed installations of fire-resistive joint systems shall take place in successive stages as installation of fire-resistive joint systems proceeds. Do not proceed with installation of joint systems for the next area until inspecting agency determines completed work shows compliance with requirements.
  - 1. Inspecting agency shall state in each report whether inspected fire-resistive joint systems comply with or deviate from requirements.
- C. Remove and replace fire-resistive joint systems where inspections indicate that they do not comply with specified requirements.
- D. Additional inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- E. Proceed with enclosing fire-resistive joint systems with other construction only after inspection reports are issued and fire-resistive joint systems comply with requirements.

## 3.05 CLEANING AND PROTECTING

- A. Clean off excess fill materials adjacent to joints as Work progresses by methods and with cleaning materials that are approved in writing by fire-resistive joint system manufacturers and that do not damage materials in which openings occur.
- B. Provide final protection and maintain conditions during and after installation that ensure fire-resistive joint systems are without damage or deterioration at time of Substantial Completion. If damage or deterioration occurs despite such protection, cut out and remove damaged or deteriorated fire-resistive joint systems immediately and install new materials to produce fire-resistive joint systems complying with specified requirements.

## 3.06 FIRE-RESISTIVE JOINT SYSTEM SCHEDULE

- A. Designation System for Joints in or between Fire-Resistance-Rated Constructions: Alphanumeric systems listed in UL's "Fire Resistance Directory" under Product Category XHBN.
- B. Designation System for Joints at the Intersection of Fire-Resistance-Rated Floor or Floor/Ceiling Assembly and an Exterior Curtain-Wall Assembly: Alphanumeric systems listed in UL's "Fire Resistance Directory" under Product Category XHDG.
- C. Head-of-Wall Fire-Resistive Joint Systems FRJS-1
  - 1. Available UL-Classified Systems: HW-D-0041
  - 2. Assembly Rating: 2 hour
  - 3. Nominal Joint Width: 1 In.
  - 4. Movement Capabilities: Class II—12.5 percent compression or extension
- D. Head-of-Wall Fire-Resistive Joint Systems FRJS-2
  - 1. Available UL-Classified Systems: HW-D-0149
  - 2. Assembly Rating: 2 hours
  - 3. Nominal Joint Width: 1 In.
  - 4. Movement Capabilities: Class II - 25 percent compression or extension
- E. Wall-to-Wall Fire-Resistive Joint Systems FRJS-6
  - 1. Available UL-Classified Systems: WW- D-0027
  - 2. Assembly Rating: 1 hour
  - 3. Joint Width: 1 In Max
  - 4. Movement Capabilities: Class II – 12.5 percent compression or extension

F. Through-Penetration Fire Stop Systems TPFSRS-1

1. Available UL-Classified Through Penetration Fire Stop Systems: W-J- 7007
  - a. Integrity Rating: 2 hours
  - b. Insulation Rating: 1/2 hour
  - c. Maximum Area Opening: 73.7 sq ft

G. Through-Penetration Fire Stop Systems TPFSRS-2:

1. Available UL-Classified Through Penetration Fire Stop Systems: C-AJ-1393
  - a. Integrity Rating: 2 hours
  - b. Temperature Rating: 0 hours
  - c. L-Rating at Ambient Temperature: Less than 1 cfm/sq ft.
  - d. L-Rating at 400 deg F: 3 cfm/sq ft
  - e. W rating Class 1

H. Through-Penetration Fire Stop Systems TPFSRS-3:

1. Available UL-Classified Through Penetration Fire Stop Systems: C-AJ-1402
  - a. Integrity Rating: 2 hours
  - b. Temperature Rating: 0 hours

-END OF SECTION-

**Section 07845**  
**ANNULAR SPACE SEALS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section includes sealants for interior joints applications. Fire rated and non-fire rated sealant specifications are included in this section. For fire rated sealants the Contractor must furnish and install mechanical cable, conduit and pipe sealing system in order to prevent the passage of fire smoke, gasses, dust and water.
  - 1. Interior joints in the following vertical surfaces and horizontal non-traffic surfaces:
    - a. Control and expansion joints on exposed interior surfaces of exterior walls.
    - b. Vertical joint on exposed surfaces of interior unit masonry, concrete walls and partitions, metal wall panels and translucent insulating panels.
    - c. Perimeter joint between built-in casework, countertops and interior wall surfaces and frames of interior doors and windows.
    - d. Joints between plumbing fixtures and adjoining walls, floors, and counters.
    - e. Other joint as indicated.
  - 2. Interior joints in the following horizontal traffic surfaces:
    - a. Isolation joints in cast-in-place concrete slabs.
    - b. Other joints as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 – Cast in Place Concrete
- B. Section 04201 – Unit Masonry
- C. Section 13915 – Fire-Suppression Piping
- D. Section 15430 – Plumbing Specialties
- E. Section 16742 – Radio Communications System
- F. Section 16752 – Digital Video System

## 1.03 REFERENCES

- A. American Society for Testing and Materials (ASTM) standard test methods for:
  - 1. ASTM E84: Surface Burning Characteristics of Building Materials
  - 2. ASTM E119: Fire Tests of Building Construction and Materials
  - 3. ASTM E814: Fire Tests of Through-Penetration Fire stops
- B. Underwriters Laboratories Inc.
  - 1. UL 263: Fire Test of Building Construction Materials
  - 2. UL 723: Surface Burning Characteristics Test of Building Materials
  - 3. UL 1479: Fire Test of Through-Penetration Firestops
- C. National Fire Protection Association (NFPA)
  - 1. NFPA 70: National Electrical Code
  - 2. NFPA 101: Life Safety Code
- D. National Electrical Manufacturers Association (NEMRA)
  - 1. NEMA Standard 1-10-79 For Type 1-6p and 11-13 Enclosures
- E. Pipe Seals shall conform to the New York City Building Code in respect to plumbing and other applications covered by these codes.

## 1.04 SUBMITTALS

- A. Product Data: For each join-sealant product indicated
- B. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- C. Sample for Verification: For each type and color of joint sealants required, provide samples with joint sealants in ½ inch- wide joints formed between two 6 inch long strips of material matching the appearance of exposed adjacent to joint sealants.
- D. Submit working drawings, shop drawings and material specifications including, but not limited to:
  - 1. Locations where pipe seals will be placed
  - 2. Catalog data for stayplates, screws, and compression system
  - 3. Other seal appurtenances

## 1.05 QUALITY ASSURANCE

- A. The pipe seals covered by these Specifications shall be provided by the Contractor through qualified manufacturers experienced in the fabrication and manufacture of the pipe seals specified herein. The pipe seals shall be designed, fabricated and installed in accordance with the standards specified.
- B. Installer Qualifications: Manufacturer's authorized Installer who is approved or licensed for installation of sealants required for this project.
- C. Product Testing: Obtain test results from a qualified testing agency based on testing current sealant formulations within a 36-month period preceding the Notice to Proceed with the Work.
  - 1. Testing Agency Qualification: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated, as documented according to ASTM E 548.
  - 2. Test joint sealants for compliance with requirements specified by reference to ASTM C 920, and where applicable, to other standard test methods.
- D. Preconstruction Field-Adhesion Testing: Before installing sealants, field test their adhesion to Project joint surfaces as follows:
  - 1. Locate test joints where indicated on Contract Drawings or, if not indicated, as directed by the Commissioner.
  - 2. Conduct field tests for each type of sealant and joint surface indicated
  - 3. Notify the Commissioner seven days in advance of dates and times when test joints will be erected.
  - 4. Arrange for test to take place with joint-sealant manufacturer's technical representative present.
    - a. Test method: Test joint sealant according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C 1193.
      - (1) For joints with dissimilar surfaces, verify adhesion to each surface separately; extend cut along on side, verifying adhesion to opposite side. Repeat procedure for opposite side.
  - 5. Report whether sealant in joint connected to pulled-out portion failed to adhere to joint surface or tore cohesively. Include data on pull distance used to test each type of product and joint surface. For sealants that fail adhesively, retest until satisfactory adhesion is obtained.

6. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint surface during testing.

## 1.06 PROJECT CONDITIONS

- A. Do not proceed with installation of joint sealant under the following conditions:
  1. When ambient and surface temperature conditions are outside limited permitted by join-sealant manufacturer.
  2. When joint surfaces are wet.
  3. Where joint widths are less than those allowed by manufacturer for applications indicated.
  4. Contaminates capable of interfering with adhesion have not yet been removed from joint surfaces.

## 1.07 GUARANTEE

- A. Special Installer's Guarantee: Installer's standard form in which Installer agrees to repair or replace joint seals that do not comply with performance and other requirements specified in this Section within specified guarantee period.
  1. Guarantee Period: One (1) year from date of Substantial Completion

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. System consists of stainless steel frame, compression mechanism, and stayplates. The system must be adaptable to several sizes of pipe diameters.
- B. Pipes seals must prevent the passage of fire, water smoke, gasses, and rodents.
- C. Any lubricant needed for proper installation must be non-corrosive to pipe material and supplied by the pipe seal vendor.

### 2.02 SYSTEM REQUIREMENTS

- A. Fire Rated Seals
  1. Designs selected for installation shall provide a fire resistance rating that is at least 2 hrs and/or equal to the hourly resistance rating of the floor, wall or partition into which the firestop design will be installed.

2. Designs should also have a L Rating ( $CF/FT^2$ ) of  $<1$  at Ambient and  $<1$  at  $400^\circ$
3. Sealing system should be water-tight 4 bar/58 psi.
4. Sealing system must be Halogen free.
5. Design should provide pipe retention support of 170 lbs or more per pipe.
6. Acceptable pipe seal vendors include:
  - a. Roxtec, Inc; G 2x2 AISI 316, Wedge 120 mm AISI 316, TSL 15x6 Rubber Strip, Stayplates 120 mm AISI 316, RM 30.
  - b. Or approved equal.

B. Non-Fire Rated Seals

1. Designs selected for installation shall provide prevent the passage water, gasses, and rodents.
2. Sealing system should be water-tight to 4 bar/58 psi.
3. Sealing system must be Halogen free.
4. Design should provide pipe retention support of 170 lbs or more per pipe.
5. Acceptable pipe seal vendors include:
  - a. Roxtec, Inc; North Kingstown, RI
  - b. Link-Seal, Thunderline Corporation, Wayne, MI
  - c. Or approved equal

## PART 3 EXECUTION

### 3.01 GENERAL

- A. Examine joints indicated to receive pipe seals, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.
- B. Proceed with installation only after all non-satisfactory conditions have been satisfied.

### 3.02 PREPARATION

- A. **Surface Cleaning of Joints:** Clean out joints immediately before installing seals to comply with joint-seal manufacturer's written instruction and the following requirements:
1. Remove all foreign material from joint surfaces that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by seal manufacturer), old joint seals, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
  2. Clean porous surfaces by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound surface capable of developing optimum bond with seals. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint surfaces include the following:
    - a. Concrete
    - b. Masonry
  3. Remove laitance and form-release agents from concrete.
  4. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm surfaces, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint surfaces include the following:
    - a. Metal
    - b. Glass
    - c. Glazed surfaces or ceramic tile
- B. **Joint Priming:** Prime joint surfaces where recommended in writing by joint-seal manufacturer based on preconstruction joint-surface testing. Apply primer to comply with joint-seal manufacturer's written instructions. Continue primers to areas of joint-seal bond; do not allow spillage or migration onto adjoining surfaces.

### 3.03 INSTALLATION

- A. **General:** Comply with joint-seal manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.
1. Installation of Mechanical System does not require the qualification by the manufacturer. Installation shall be performed in accordance with manufacturer's detailed installation procedures.

- B. Seal Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.
- C. Install seals backings of type indicated to support seals during installation and at position required to produce cross-sectional shapes and depths of installed seals relative to joint widths that allow optimum seal movement capabilities.
  - 1. Do not leave gaps between ends of seal and seal backing
  - 2. Do not stretch, twist, puncture, or tear seal backing.
  - 3. Remove absorbent seal backings that have become wet before seal application and replace them with dry materials
- D. Install bond-beaker tape behind seals where seal backing are not used between sales and back of joints.

#### 3.04 FIELD QUALITY CONTROL

- A. Prepare and install system in accordance with manufacturer's printing instructions and recommendations
- B. Inspect the system to ensure that the system is installed per manufacturer's instruction.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 07920**  
**EXTERIOR JOINT SEALANTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes joint sealants for the exterior joints in the following vertical surfaces and horizontal non-traffic surfaces, including those specified by reference to this Section:
1. Construction joints in cast-in-place concrete
  2. Joints between plant-precast architectural concrete units
  3. Control and expansion joints in unit masonry
  4. Joints between metal panels
  5. Joints between different materials listed above
  6. Perimeter joints between materials listed above and frames of doors, windows and louvers
  7. Control and expansion joints
  8. Other joints as indicated

**1.02 RELATED SPECIFICATIONS**

- A. Section 04201 - Unit Masonry
- B. Section 07410 - Metal Wall Panels
- C. Section 07610 - Sheet Metal Roofing
- D. Section 07620 - Sheet Metal Flashing and Trim
- E. Section 07842 - Fire Resistive Joint Systems
- F. Section 07721 - Roof Hatches
- G. Section 08110 - Stainless Steel Doors and Frames
- H. Section 08520 - Aluminum Windows
- I. Section 08630 - Translucent Insulating Panels
- J. Section 08800 - Glazing
- K. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

**1.03 PERFORMANCE REQUIREMENTS**

- A. Provide elastomeric joint sealants that establish and maintain watertight and airtight continuous joint seals without staining or deteriorating joint substrates.

## 1.04 SUBMITTALS

- A. Product Data: For each joint-sealant product indicated.
- B. Samples for Initial Selection: Manufacturer's color charts consisting of strips of cured sealants showing the full range of colors available for each product exposed to view.
- C. Samples for Verification: For each type and color of joint sealant required, provide Samples with joint sealants in 1/2-inch- wide joints formed between two 6-inch-long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.
- D. Product Certificates: For each type of joint sealant and accessory, signed by product manufacturer.
- E. Sealant, Waterproofing & Restoration Institute (SWRI) Validation Certificate: For each elastomeric sealant specified to be validated by SWRI's Sealant Validation Program.
- F. Qualification Data: For Installer and testing agency.
- G. Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
  - 1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
  - 2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- H. Product Test Reports: Based on comprehensive testing of product formulations performed by a qualified testing agency, indicating that sealants comply with requirements.
- I. Warranties: Special warranties specified in this Section.

## 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized Installer who is approved or licensed for installation of elastomeric sealants required for this Project.
- B. Source Limitations: Obtain each type of joint sealant through one source from a single manufacturer.
- C. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.

1. Use ASTM C 1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
  2. Submit not fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
  4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
  5. Testing will not be required if joint-sealant manufacturers submit joint preparation data that are based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
- D. Product Testing: Obtain test results for "Product Test Reports" Paragraph in "Submittals" Article from a qualified testing agency based on testing current sealant formulations within a 36-month period preceding the commencement of the Work.
1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated, as documented according to ASTM E 548.
  2. Test elastomeric joint sealants for compliance with requirements specified by reference to ASTM C 920, and where applicable, to other standard test methods.
  3. Test elastomeric joint sealants according to SWRI's Sealant Validation Program for compliance with requirements specified by reference to ASTM C 920 for adhesion and cohesion under cyclic movement, adhesion-in-peel, and indentation hardness.
  4. Test other joint sealants for compliance with requirements indicated by referencing standard specifications and test methods.
- E. Mockups: Build mockups incorporating sealant joints, as follows, to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution:
1. Joints in mockups of assemblies specified in other Sections that are indicated to receive elastomeric joint sealants, which are specified by reference to this Section.

- F. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

## 1.06 PROJECT CONDITIONS

- A. Do not proceed with installation of joint sealants under the following conditions:
  - 1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 40 deg F.
  - 2. When joint substrates are wet.
  - 3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
  - 4. Contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

## 1.07 WARRANTY

- A. Special Installer's Warranty: Installer's standard form in which Installer agrees to repair or replace elastomeric joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.
  - 1. Warranty Period: Two years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products listed in other Part 2 articles and listed in other related sections of these specifications.

### 2.02 MATERIALS, GENERAL

- A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer, based on testing and field experience.
- B. Colors of Exposed Joint Sealants: Match Commissioner's samples.

### 2.03 ELASTOMERIC JOINT SEALANTS

- A. Elastomeric Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied chemically curing sealant specified, including those referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.

- B. Stain-Test-Response Characteristics: Where elastomeric sealants are specified to be non-staining to porous substrates, provide products that have undergone testing according to ASTM C 1248 and have not stained porous joint substrates indicated for Project.
- C. Single-Component Neutral-Curing Silicone Sealant:
  - 1. Available Products
    - a. Dow Corning Corporation; 790
    - b. GE Silicones; SilPruf LM SCS2700
    - c. Or approved equal
  - 2. Type and Grade: S (single component) and NS (nonsag)
  - 3. Class: 100/50
  - 4. Use Related to Exposure: NT (nontraffic)
  - 5. Uses Related to Joint Substrates: M, G, A, and, as applicable to joint substrates indicated, O
  - 6. Stain-Test-Response Characteristics: Non-staining to porous substrates per ASTM C 1248

#### 2.04 JOINT-SEALANT BACKING

- A. General: Provide sealant backings of material and type that are non-staining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.
- B. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin), and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance:
- C. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.

#### 2.05 MISCELLANEOUS MATERIALS

- A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

- B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.
- C. Masking Tape: Non-staining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 PREPARATION

- A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
  - 1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
  - 2. Clean porous joint substrate surfaces by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:
    - a. Concrete
    - b. Masonry
    - c. Unglazed surfaces of ceramic tile
  - 3. Remove laitance and form-release agents from concrete.

4. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:
  - a. Metal
  - b. Glass
- B. Joint Priming: Prime joint substrates, where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.
- C. Masking Tape: Use masking tape where required to prevent contact of sealant with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

### 3.03 INSTALLATION OF JOINT SEALANTS

- A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.
- B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.
- C. Install sealant backings of type indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
  1. Do not leave gaps between ends of sealant backings.
  2. Do not stretch, twist, puncture, or tear sealant backings.
  3. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.
- D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.
- E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
  1. Place sealants so they directly contact and fully wet joint substrates.
  2. Completely fill recesses in each joint configuration.

3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

3.04 CLEANING

- A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.05 PROTECTION

- A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

-END OF SECTION-

**Section 07921**  
**INTERIOR SEALANTS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes sealants for interior joints applications indicated in the Joint Sealant Schedule at the end of Part 3.

1. Interior joints in the following vertical surfaces and horizontal nontraffic surfaces:
  - a. Vertical control and expansion joints on exposed interior surfaces of exterior walls.
  - b. Interior perimeter joints of exterior openings.
  - c. Interior ceramic tile expansion, control, contraction, and isolation joints in horizontal traffic surfaces.
  - d. Interior joints between plumbing fixtures and adjoining walls, floors, and counters.
  - e. Vertical joints on exposed surfaces of interior unit masonry and concrete walls and partitions.
  - f. Perimeter joints between interior wall surfaces and frames of interior doors and windows.
  - g. Joints between built-in casework and countertops and walls
  - h. Other joints as indicated.
2. Interior joints in the following horizontal traffic surfaces:
  - a. Isolation joints in cast-in-place concrete slabs.
  - b. Other joints as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 04201 - Unit Masonry, for masonry control and expansion joint fillers and gaskets.
- B. Section 07842 - Fire-Resistive Joint Systems, for sealing joints in fire-resistance-rated construction.
- C. Section 07920 - Exterior Joint Sealants, for sealing joints in exterior applications indicated.

- D. Section 08800 - Glazing, for glazing sealants.
- E. Section 09310 - Ceramic Tile, for sealing tile joints.
- F. Section 09513 - Acoustical Snap-In Metal Pan Ceilings, for sealing edge moldings at perimeters of acoustical ceilings.
- G. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

### 1.03 PERFORMANCE REQUIREMENTS

- A. Provide joint sealants for interior applications that establish and maintain airtight and water-resistant continuous joint seals without staining or deteriorating joint substrates.

### 1.04 SUBMITTALS

- A. Product Data: For each joint-sealant product indicated.
- B. Samples for Initial Selection: Manufacturer's color charts consisting of strips of cured sealants showing the full range of colors available for each product exposed to view.
- C. Samples for Verification: For each type and color of joint sealant required, provide Samples with joint sealants in 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.
- D. Product Certificates: For each type of joint sealant and accessory, signed by product manufacturer.
- E. SWRI Validation Certificate: For each elastomeric sealant specified to be validated by SWRI's Sealant Validation Program.
- F. Qualification Data: For Installer and testing agency.
- G. Preconstruction Field Test Reports: Indicate which sealants and joint preparation methods resulted in optimum adhesion to joint substrates based on preconstruction testing specified in "Quality Assurance" Article.
- H. Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
  - 1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
  - 2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

- I. Field Test Report Log: For each elastomeric sealant application.
- J. Product Test Reports: Based on comprehensive testing of product formulations performed by a qualified testing agency, indicating that sealants comply with requirements.
- K. Warranties: Special warranties specified in this Section.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized Installer who is approved or licensed for installation of elastomeric sealants required for this Project.
- B. Source Limitations: Obtain each type of joint sealant through one source from a single manufacturer.
- C. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.
  - 1. Use ASTM C 1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
  - 2. Submit not fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  - 3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
  - 4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
  - 5. Testing will not be required if joint-sealant manufacturers submit joint preparation data that are based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
- D. Product Testing: Obtain test results for "Product Test Reports" Paragraph in "Submittals" Article from a qualified testing agency based on testing current sealant formulations within a 36-month period preceding the Notice to Proceed with the Work.
  - 1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated, as documented according to ASTM E 548.

2. Test elastomeric joint sealants for compliance with requirements specified by reference to ASTM C 920, and where applicable, to other standard test methods.
  3. Test elastomeric joint sealants according to SWRI's Sealant Validation Program for compliance with requirements specified by reference to ASTM C 920 for adhesion and cohesion under cyclic movement, adhesion-in-peel, and indentation hardness.
- E. Preconstruction Field-Adhesion Testing: Before installing elastomeric sealants, field test their adhesion to Project joint substrates as follows:
1. Locate test joints where indicated on Project or, if not indicated, as directed by the Commissioner.
  2. Conduct field tests for each type of elastomeric sealant and joint substrate indicated.
  3. Notify the Commissioner seven days in advance of dates and times when test joints will be erected.
  4. Arrange for tests to take place with joint-sealant manufacturer's technical representative present.
    - a. Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C 1193.
      - (1) For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
  5. Report whether sealant in joint connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. For sealants that fail adhesively, retest until satisfactory adhesion is obtained.
  6. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.
- F. Mockups: Build mockups incorporating sealant joints, as follows, to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution:
1. Joints in mockups of assemblies specified in other Sections that are indicated to receive elastomeric joint sealants, which are specified by reference to this Section.

- G. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

#### 1.06 PROJECT CONDITIONS

- A. Do not proceed with installation of joint sealants under the following conditions:
1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.
  2. When joint substrates are wet.
  3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
  4. Contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

#### 1.07 WARRANTY

- A. Special Installer's Warranty: Installer's standard form in which Installer agrees to repair or replace elastomeric joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.
1. Warranty Period: 2 years from date of Substantial Completion.
- B. Special Manufacturer's Warranty: Manufacturer's standard form in which elastomeric sealant manufacturer agrees to furnish elastomeric joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.
1. Warranty Period: 10 years from date of Substantial Completion.

### PART 2 PRODUCTS

#### 2.01 MATERIALS, GENERAL

- A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer, based on testing and field experience.
- B. Colors of Exposed Joint Sealants: As selected by the Commissioner from manufacturer's full range.

#### 2.02 ELASTOMERIC JOINT SEALANTS

- A. Elastomeric Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied chemically curing sealant specified, including those

referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.

- B. Stain-Test-Response Characteristics: Where elastomeric sealants are specified to be non-staining to porous substrates, provide products that have undergone testing according to ASTM C 1248 and have not stained porous joint substrates indicated for Project.
- C. Suitability for Immersion in Liquids. Where elastomeric sealants are indicated for Use I for joints that will be continuously immersed in liquids, provide products that have undergone testing according to ASTM C 1247 and qualify for the length of exposure indicated by reference to ASTM C 920 for Class 1 or 2. Liquid used for testing sealants is deionized water, unless otherwise indicated.
- D. Suitability for Contact with Food: Where elastomeric sealants are indicated for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.
- E. Comply with joint-sealant manufacturer's written installation instructions. See Part 3.03.
- F. Multicomponent Nonsag Polysulfide Sealant ES-1

- 1. Products

- a. Pacific Polymers, Inc.; Elasto-Seal 227 Type II (Gun Grade)
- b. Pecora Corporation; Synthacalk GC-2+
- c. Polymeric Systems Inc.; PSI-350
- d. PolySpec Corp.; T-2235-M
- e. PolySpec Corp.; T-2282
- f. PolySpec Corp.; Thiokol 2P
- g. Sonneborn, Division of ChemRex Inc.; Sonolastic Polysulfide Sealant
- h. Or approved equal

- 2. Type and Grade: M (multicomponent) and NS (nonsag)

- 3. Class: 25

- 4. Uses Related to Exposure: T (traffic) and NT (nontraffic)

- 5. Uses Related to Joint Substrates: M, G, A, and, as applicable to joint substrates indicated, O

- a. Use O Joint Substrates: concrete and cmu substrates

## G. Single-Component Mildew-Resistant Neutral-Curing Silicone Sealant ES-3:

1. Products
  - a. Pecora Corporation; 898
  - b. Tremco; Tremsil 600 White
  - c. Or approved equal
2. Type and Grade: S (single component) and NS (nonsag)
3. Class: 25
4. Use Related to Exposure: NT (nontraffic)
5. Uses Related to Joint Substrates: M, G, A, and, as applicable to joint substrates indicated, O
  - a. Use O Joint Substrates: concrete and cmu substrates

## H. Multicomponent Nonsag Urethane Sealant ES-2:

1. Products
  - a. Pecora Corporation; Dynatrol II
  - b. Tremco; Dymeric 511
  - c. Tremco; Vulkem 922
  - d. Or approved equal
2. Type and Grade: M (multicomponent) and NS (nonsag)
3. Class: 50
4. Uses Related to Exposure: NT (nontraffic) and T (traffic)
5. Uses Related to Joint Substrates: M, G, A, and, as applicable to joint substrates indicated, O.
  - a. Use O Joint Substrates: concrete and cmu substrates.

## 2.03 JOINT-SEALANT BACKING

- A. General: Provide sealant backings of material and type that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.
- B. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin), O (open-cell material), B (bicellular material with a surface skin) or any of the preceding types, as approved in writing by joint-sealant manufacturer for

joint application indicated, and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance:

- C. Elastomeric Tubing Sealant Backings: Neoprene, butyl, EPDM, or silicone tubing complying with ASTM D 1056, nonabsorbent to water and gas, and capable of remaining resilient at temperatures down to minus 26 deg F (minus 32 deg C). Provide products with low compression set and of size and shape to provide a secondary seal, to control sealant depth, and to otherwise contribute to optimum sealant performance.
- D. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.

## 2.04 MISCELLANEOUS MATERIALS

- A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.
- B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.
- C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
  - 1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility

by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

2. Clean porous joint substrate surfaces by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:
    - a. Concrete
    - b. Masonry
  3. Remove laitance and form-release agents from concrete.
  4. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:
    - a. Metal
    - b. Glass
    - c. Glazed surfaces of ceramic tile
- B. Joint Priming: Prime joint substrates where recommended in writing by joint-sealant manufacturer based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.
- C. Masking Tape: Use masking tape where required to prevent contact of sealant with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.
- 3.03 INSTALLATION OF JOINT SEALANTS
- A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.
  - B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.
  - C. Acoustical Sealant Application Standard: Comply with recommendations in ASTM C 919 for use of joint sealants in acoustical applications as applicable to materials, applications, and conditions indicated.

- D. Install sealant backings of type indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
  - 1. Do not leave gaps between ends of sealant backings.
  - 2. Do not stretch, twist, puncture, or tear sealant backings.
  - 3. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.
- E. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.
- F. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
  - 1. Place sealants so they directly contact and fully wet joint substrates.
  - 2. Completely fill recesses in each joint configuration.
  - 3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.
- G. Tooling of Non-sag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
  - 1. Remove excess sealant from surfaces adjacent to joints.
  - 2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
  - 3. Provide concave joint configuration per Figure 5A in ASTM C 1193, unless otherwise indicated.
  - 4. Provide flush joint configuration where indicated per Figure 5B in ASTM C 1193.
  - 5. Provide recessed joint configuration of recess depth and at locations indicated per Figure 5C in ASTM C 1193.
    - a. Use masking tape to protect surfaces adjacent to recessed tooled joints.
- H. Installation of Preformed Tapes: Install according to manufacturer's written instructions.

- I. Installation of Preformed Silicone-Sealant System: Comply with the following requirements:
  1. Apply masking tape to each side of joint, outside of area to be covered by sealant system.
  2. Apply silicone sealant to each side of joint to produce a bead of size complying with preformed silicone-sealant system manufacturer's written instructions and covering a bonding area of not less than 3/8 inch . Hold edge of sealant bead 1/4 inch inside masking tape.
  3. Within 10 minutes of sealant application, press silicone extrusion into sealant to wet extrusion and substrate. Use a roller to apply consistent pressure and ensure uniform contact between sealant and both extrusion and substrate.
  4. Complete installation of sealant system in horizontal joints before installing in vertical joints. Lap vertical joints over horizontal joints. At ends of joints, cut silicone extrusion with a razor knife.
- J. Installation of Preformed Foam Sealants: Install each length of sealant immediately after removing protective wrapping, taking care not to pull or stretch material, producing seal continuity at ends, turns, and intersections of joints. For applications at low ambient temperatures where expansion of sealant requires acceleration to produce seal, apply heat to sealant in compliance with sealant manufacturer's written instructions.

### 3.04 FIELD QUALITY CONTROL

- A. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:
  1. Extent of Testing: Test completed elastomeric sealant joints as follows:
    - a. Perform 10 tests for the first 1000 feet (300 m) of joint length for each type of elastomeric sealant and joint substrate.
    - b. Perform 1 test for each 1000 feet (300 m) of joint length thereafter or 1 test per each floor per elevation.
  2. Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab in Appendix X1 in ASTM C 1193, as appropriate for type of joint-sealant application indicated.
    - a. For joints with dissimilar substrates, verify adhesion to each substrate separately; do this by extending cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.

3. Inspect joints for complete fill, for absence of voids, and for joint configuration complying with specified requirements. Record results in a field-adhesion-test log.
4. Inspect tested joints and report on the following:
  - a. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field-adhesion hand-pull test criteria.
  - b. Whether sealants filled joint cavities and are free of voids.
  - c. Whether sealant dimensions and configurations comply with specified requirements.
5. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.
6. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

- B. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

### 3.05 CLEANING

- A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

### 3.06 PROTECTION

- A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

## 3.07 JOINT SEALANT SCHEDULE

- A. Joint Sealant Application JS-1: Vertical control and expansion joints on exposed interior surfaces of exterior walls.
  - 1. Joint Sealant: Multicomponent nonsag polysulfide sealant ES-1.
  - 2. Joint-Sealant Color: As selected by the Commissioner from manufacturer's full range.
- B. Joint Sealant Application JS-2: Interior perimeter joints of exterior openings.
  - 1. Joint Sealant: Multicomponent nonsag polysulfide sealant ES-1.
  - 2. Joint-Sealant Color: As selected by the Commissioner from manufacturer's full range.
- C. Joint Sealant Application JS-3: Interior ceramic tile expansion, control, contraction, and isolation joints in horizontal traffic surfaces.
  - 1. Joint Sealant: Multicomponent nonsag urethane sealant ES-2.
  - 2. Joint-Sealant Color: As selected by the Commissioner from manufacturer's full range.
- D. Joint Sealant Application JS-4: Interior joints between plumbing fixtures and adjoining walls, floors, and counters.
  - 1. Joint Sealant: Single-component mildew-resistant neutral -curing silicone sealant ES-3.
  - 2. Joint Sealant Color: As selected by the Commissioner from manufacturer's full range.
- E. Joint Sealant Application JS-5: Vertical joints on exposed surfaces of interior unit masonry and concrete walls and partitions.
  - 1. Joint Sealant: Multicomponent non-sag polysulfide sealant ES-1.
  - 2. Joint Sealant Color: As selected by the Commissioner from manufacturer's full range.
- F. Joint Sealant Application JS-6: Perimeter joints between interior wall surfaces and frames of interior doors and windows.
  - 1. Joint Sealant: Multicomponent non-sag polysulfide sealant ES-1.
  - 2. Joint Sealant Color: As selected by the Commissioner from manufacturer's full range.

- G. Joint Sealant Application JS-7: Joints between built-in casework and countertops and walls.
1. Joint Sealant: Single-component mildew-resistant neutral-curing silicone sealant ES-3.
  2. Joint Sealant Color: As selected by the Commissioner from manufacturer's full range.

-END OF SECTION-

**Section 08110**  
**STAINLESS STEEL DOORS AND FRAMES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

A. This Section includes the following for highly corrosive applications:

1. Stainless-steel, hollow-metal doors
2. Stainless-steel, hollow-metal frames

**1.02 RELATED SPECIFICATIONS**

- A. Section 04201 –Unit Masonry
- B. Section 08711 –Door Hardware
- C. Sections related to Electrical and Access Systems
- D. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

**1.03 DEFINITIONS**

- A. Stainless-Steel Sheet Thicknesses: Indicated as the specified thicknesses for which over- and under-thickness tolerances apply, according to ASTM A 480/A 480M.

**1.04 SUBMITTALS**

- A. Product Data: Include construction details, material descriptions, core descriptions, label compliance, fire-resistance and temperature-rise ratings, and finishes for each type of stainless-steel door and frame specified.
- B. Shop Drawings: In addition to requirements below, provide a schedule of stainless-steel doors and frames using same reference numbers for details and openings as those on Drawings:
  1. Elevations of each door design
  2. Details of doors, including vertical and horizontal edge details
  3. Frame details for each frame type, including dimensioned profiles
  4. Details and locations of reinforcement and preparations for hardware
  5. Details of each different wall opening condition
  6. Details of anchorages, accessories, joints, and connections
  7. Details of glazing frames and stops showing glazing
  8. Details of conduit and preparations for electrified door hardware and controls

- C. Coordination Drawings: Drawings of each opening, including door and frame, drawn to scale and coordinating door hardware. Show elevations of each door design type, showing dimensions, locations of door hardware, and preparations for power, signal, and electrified control systems.
- D. Samples for Verification: For each type of exposed finish required.
- E. Construction Samples: 12- by-12-inch corner section representing the specified construction of stainless-steel doors and frames to be furnished by manufacturer.
  - 1. Doors: Show vertical-edge, top, and internal construction; and hinge and other door hardware reinforcement.
    - a. Include glazing stops, with stops applied to show corner joint.
  - 2. Frames: Show welded corner joint at head to jamb; and hinge mortise and reinforcement.
    - a. Include glazing stops, with stops applied to show corner joint.
- F. Oversize Construction Certification: For stainless-steel door assemblies required to be fire rated and exceeding limitations of labeled assemblies; include statement that doors comply with requirements of design, materials, and construction but have not been subjected to fire test.
- G. Qualification Data: For testing agency
- H. Product Test Reports: Based on evaluation of comprehensive fire tests performed by a qualified testing agency, for each type of stainless-steel door and frame.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Testing Agency Qualifications: An independent agency qualified according to ASTM E 329 for testing indicated, as documented according to ASTM E 548.
- C. Source Limitations: Obtain stainless-steel doors and frames through one source from a single manufacturer.
- D. Fire-Rated Door Frame Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated.

1. Test Pressure: Test according to ASTM E 152 per NYC Building Code and NFPA 252 or UL 10C. After 5 minutes into the test, the neutral pressure level in furnace shall be established at 40 inches or less above the sill.
  2. Oversize Fire-Rated Door Assemblies: For units exceeding sizes of tested assemblies, provide certification by a testing agency acceptable to authorities having jurisdiction that doors comply with standard construction requirements for tested and labeled fire-protection-rated door assemblies except for size.
  3. Temperature-Rise Rating: At exit enclosures, provide doors that have a temperature-rise rating of 450 deg F maximum in 30 minutes of fire exposure.
- E. Fire-Rated, Borrowed-Light Frame Assemblies: Assemblies complying with ASTM E 152 per NYC Building Code and NFPA 80 that are listed and labeled, by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing according to NFPA 257 or UL 9. Label each individual glazed lite.
- F. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver doors and frames palletized, wrapped, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic.
- B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.
- C. Store doors and frames under cover at Project site. Place units in a vertical position with heads up, spaced by blocking, on minimum 4-inch high, wood blocking. Avoid using non-vented plastic or canvas shelters that could create a humidity chamber.
  1. If wrappers on doors become wet, remove cartons immediately. Provide minimum 1/4-inch space between each stacked door to permit air circulation.

#### 1.07 PROJECT CONDITIONS

- A. Field Measurements: Verify openings by field measurements before fabrication and indicate measurements on Shop Drawings.
  1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating stainless-steel frames without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to established dimensions.

## 1.08 COORDINATION

- A. Coordinate installation of anchorages for stainless-steel frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. American Steel Products, Inc.
  - 2. Ceco Door Products; an ASSA ABLOY Group Company
  - 3. National Custom Hollow Metal Doors & Frames
  - 4. Pioneer Industries, Inc.
  - 5. Steelcraft; an Ingersoll-Rand Company
  - 6. Or approved equal

## 2.02 MATERIALS

- A. Stainless-Steel Sheet: ASTM A 666, austenitic stainless steel, Type indicated.
- B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B; suitable for exposed applications.
- C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.
- D. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum A60 zinc-iron-alloy (galvannealed) coating designation.
- E. Supports and Anchors: After fabricating, galvanize units to be built into exterior walls according to ASTM A 153/A 153M, Class B.
- F. Inserts, Bolts, and Fasteners: Provide items to be built into exterior walls, hot-dip galvanized according to ASTM A 153/A 153M.
- G. Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching stainless-steel door frames of type indicated.
- H. Grout: Comply with Section 04201-Unit Masonry.

- I. Mineral-Fiber Insulation: ASTM C 665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool with 6- to 12-lb/cu. ft. density; with maximum flame-spread and smoke-developed indexes of 25 and 50 respectively; passing ASTM E 136 for combustion characteristics.
- J. Glazing: Comply with requirements in Section 08800 - Glazing.
- K. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

## 2.03 STAINLESS STEEL DOORS

- A. General: Provide flush-design doors, not less than 1-3/4 inches thick, of seamless hollow construction, unless otherwise indicated. Construct doors with smooth, flush surfaces without visible joints or seams on exposed faces.
  - 1. Visible joints or seams around glazed lite inserts are permitted.
  - 2. For single-acting swing doors, bevel both vertical edges 1/8 inch in 2 inches.
  - 3. For double-acting swing doors, round vertical edges with 2-1/8-inch radius.
- B. Face Sheets: Fabricated from minimum 0.042-inch- thick, stainless-steel sheet, Type as follows:
  - 1. Doors for Highly Corrosive Applications: Type 316
- C. Core Construction: Fabricate doors with core indicated. Provide thermal-resistance-rated cores for exterior doors and interior doors where indicated.
  - 1. Steel-Stiffened Core: 0.026-inch- thick, stainless steel vertical stiffeners extending full-door height, with vertical webs spaced not more than 6 inches apart, spot welded to face sheets a maximum of 5 inches o.c. Spaces filled between stiffeners with glass- or mineral-fiber insulation.
  - 2. Fire-Rated Door Core: As required to provide fire-protection and temperature-rise ratings indicated.
- D. Top and Bottom Channels: Minimum 0.053-inch- thick, stainless steel channel spot welded, not more than 6 inches o.c., to face sheets.
  - 1. Top and bottom edges closed with closing channels of same material and thickness as face sheets; welded so webs of channels are flush with door edges.

- E. Hardware Reinforcement: Fabricate reinforcement plates from stainless steel as indicated in Part 2 "Fabrication" Article, to comply with the following minimum sizes:
1. Hinges and Pivots: Minimum 0.167 inch thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
  2. Lock Face, Flush Bolts, Closers, and Concealed Holders: Minimum 0.093 inch thick.
  3. All Other Surface-Mounted Hardware: Minimum 0.067 inch thick.
- F. Hardware Enclosures: Provide enclosures and junction boxes within doors for electrically operated door hardware, interconnected with UL-approved, 1/2-inch-diameter conduit and connectors.
1. Where indicated for installation of wiring, provide access plates to junction boxes, fabricated from same material and thickness as face sheet and fastened with at least 4 security fasteners spaced not more than 6 inches o.c.

## 2.04 STAINLESS STEEL FRAMES

- A. General: Fabricate frames of construction indicated, with faces of corners mitered and contact edges closed tight.
1. Frames for Doors: Welded
  2. Door Frames for Openings 48 Inches Wide or Less: Fabricated from 0.053-inch-thick, stainless-steel sheet
  3. Door Frames for Openings More Than 48 Inches Wide: Fabricated from 0.067-inch-thick, stainless-steel sheet
- B. Material: Fabricate frames from stainless-steel sheet, Type as follows:
1. Frames for Highly Corrosive Applications: Type 316
- C. Hardware Reinforcement: Fabricate reinforcement plates from stainless steel, as indicated in Part 2 "Fabrication" Article, to comply with the following minimum sizes:
1. Hinges and Pivots: Minimum 0.167 inch thick by 1-1/4 inches wide by 10 inches long, secured by not less than 6 spot welds
  2. Strikes, Flush Bolts, Hold-Open Arms, and Closers: Minimum 0.093 inch thick

3. Surface-Mounted Hardware: Minimum 0.093 inch thick
- D. Head Reinforcement: Minimum 0.093-inch- thick, stainless steel channel or angle stiffener.
- E. Jamb Anchors: Formed from material indicated in Part 2 "Fabrication" Article.
  1. Masonry Type: T-shaped anchors to suit frame size, not less than 0.053 inch thick, with corrugated or perforated straps not less than 2 inches wide by 10 inches long.
  2. Compression Type for Slip-on Frames: Adjustable compression anchors
  3. Postinstalled Expansion Type for In-Place Concrete or Masonry: Minimum 3/8-inch- diameter bolts with expansion shields or inserts. Provide pipe spacer from frame to wall, with throat reinforcement plate, welded to frame at each anchor location.
- F. Floor Anchors: Formed from material indicated in Part 2 "Fabrication" Article, not less than 0.067 inch thick, and as follows:
  1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners
  2. Separate Topping Concrete Slabs: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at finish floor surface.

## 2.05 STOPS AND MOLDINGS

- A. Moldings for Glazed Lites in Doors: Minimum 0.032 inch thick, fabricated from same material as door face sheet in which they are installed.
- B. Fixed Frame Moldings: Formed integral with stainless-steel frames, minimum 5/8-inch high, unless otherwise indicated.
- C. Loose Stops for Glazed Lites and Solid Panels in Frames: Minimum 0.032 inch thick, fabricated from same material as frames in which they are installed.

## 2.06 FABRICATION

- A. General: Fabricate stainless-steel doors and frames to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.

B. Stainless-Steel Doors: Comply with ANSI A250.4, Level A.

1. Exterior Doors: Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
2. Glazed Lites: Factory cut openings in doors.
3. Edges: Door face sheets joined at vertical edges by continuous weld extending full height of door; with edges ground and polished, providing smooth, flush surfaces with no visible seams.
4. Doors for Highly Corrosive Applications: Fabricate doors with door faces and internal components, including stiffeners and hardware reinforcements, from Type 316 stainless-steel sheet.

C. Stainless-Steel Frames: Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible. Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated from same thickness metal as frames.

1. Frames for Highly Corrosive Applications: Fabricate frames with internal components, including anchors, plaster guards, and hardware reinforcements, from Type 316 stainless-steel sheet.
2. Mullions Rails and Transom Bars: Provide closed tubular members with no visible face seams or joints. Fasten members at crossings and to jambs by butt welding according to joint designs in HMMA 820.
3. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners, unless otherwise indicated.
4. Plaster Guards: Weld guards to frame at back of hardware mortises in frames installed in concrete or masonry.
5. Where installed in masonry, leave vertical mullions in frames open at top for grouting.
6. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.

7. Jamb Anchors: Provide number and spacing of anchors as follows:
  - a. Masonry Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:
    - (1) Two anchors per jamb up to 60 inches in height
    - (2) Three anchors per jamb from 60 to 90 inches in height
    - (3) Four anchors per jamb from 90 to 96 inches in height
    - (4) Four anchors per jamb plus 1 additional anchor per jamb for each 24 inches or fraction thereof more than 96 inches in height
  - b. Compression Type: Not less than two anchors in each jamb.
  - c. Postinstalled Expansion Type: Locate anchors not more than 6 inches from top and bottom of frame. Space anchors not more than 26 inches o.c.
8. Head Reinforcement: For frames more than 48 inches wide, provide continuous head reinforcement for full width of opening, welded to back of frame at head.
9. Door Silencers: Except on weather-stripped doors, drill stops to receive door silencers as follows. Provide plastic plugs to keep holes clear during construction.
  - a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
  - b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.
- D. Hardware Preparation: Factory prepare stainless-steel doors and frames to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping, according to the Door Hardware Schedule and templates furnished as specified in Section 08711 - Door Hardware.
  1. Reinforce doors and frames to receive non-templated mortised and surface-mounted door hardware.
  2. Locate door hardware as indicated, or if not indicated, according to HMMA 831, "Recommended Hardware Locations for Custom Hollow Metal Doors and Frames."

- E. Stops and Moldings: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints.
  - 1. Single Glazed Lites: Provide fixed stops and moldings welded on secure side of door or frame.
  - 2. Multiple Glazed Lites: Provide fixed and removable stops and moldings such that each lite is capable of being removed independently.
  - 3. Coordinate rabbet width between fixed and removable stops with type of glazing and type of installation indicated.

## 2.07 STAINLESS-STEEL FINISHES

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Remove tool and die marks and stretch lines or blend into finish.
  - 1. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches.
    - a. Grain for Doors: Vertical (long dimension of door)
    - b. Grain for Frame Jambs: Vertical (long dimension of jamb)
    - c. Grain for Frame Heads: Horizontal (long dimension of head)
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Finish stainless-steel doors and frames after assembly.
- D. Directional Satin Finish: No. 4 finish
- E. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of stainless-steel doors and frames.
  - 1. Examine roughing-in for embedded and built-in anchors to verify actual locations of stainless-steel door-frame connections before frame installation.

2. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Remove welded-in shipping spreaders installed at factory.
- B. Prior to installation and with installation spreaders in place, adjust and securely brace stainless-steel door frames for squareness, alignment, twist, and plumb to the following tolerances:
  1. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
  2. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
  3. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
  4. Plumbness: Plus or minus 1/16 inch, measured at jambs on a perpendicular line from head to floor.
- C. Drill and tap doors and frames to receive nontemplated mortised and surface-mounted door hardware.

### 3.03 INSTALLATION

- A. General: Install stainless-steel doors and frames plumb, rigid, properly aligned, and securely fastened in place; comply with Drawings and manufacturer's written instructions.
- B. Stainless-Steel Frames: Install stainless-steel frames for doors and other openings, of size and profile indicated.
  1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.
    - a. At fire-protection-rated openings, install frames according to NFPA 80.
    - b. Where frames are fabricated in sections due to shipping or handling limitations, field splice at approved locations by welding face joint

- continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.
- c. Install frames with removable glazing stops located on secure side of opening.
  - d. Install door silencers in frames before grouting.
  - e. Remove temporary braces necessary for installation only after frames have been properly set and secured.
  - f. Check plumb, squareness, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.
  - g. Apply bituminous coating to backs of frames that are filled with mortar, grout, and plaster containing antifreezing agents.
2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor and secure with post-installed expansion anchors.
    - a. Floor anchors may be set with powder-actuated fasteners instead of post-installed expansion anchors, if so indicated and approved on Shop Drawings.
  3. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with mortar as specified in Division 4 Section "Unit Masonry."
  4. Concrete Walls: Solidly fill space between frames and concrete with grout. Install grout in lifts and take precautions, including bracing frames, to ensure that frames are not deformed or damaged by grout forces.
  5. In-Place Concrete or Masonry Construction: Secure frames in place with post-installed expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
  6. Installation Tolerances: Adjust stainless-steel door frames for squareness, alignment, twist, and plumb to the following tolerances:
    - a. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head
    - b. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall
    - c. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall

- d. Plumbness: Plus or minus 1/16 inch, measured at jambs at floor
- C. Stainless-Steel Doors: Fit non-fire-rated doors accurately in frames with the following clearances:
  - 1. Non-Fire-Rated Doors
    - a. Jambs and Head: 1/8 inch plus or minus 1/16 inch
    - b. Between Edges of Pairs of Doors: 1/8 inch plus or minus 1/16 inch
    - c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch
    - d. Between Bottom of Door and Top of Finish Floor (No Threshold): Maximum 3/4 inch
  - 2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.
- D. Glazing: Comply with installation requirements in Division 8 Section "Glazing" and with stainless-steel door and frame manufacturer's written instructions.
  - 1. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c., and not more than 2 inches o.c. from each corner.

### 3.04 ADJUSTING AND CLEANING

- A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work including stainless-steel doors or frames that are warped, bowed, or otherwise unacceptable.
- B. Clean grout and other bonding material off stainless-steel doors and frames immediately after installation.
- C. Stainless-Steel Touchup: Immediately after erection, smooth any abraded areas of stainless steel and polish to match undamaged finish.

### 3.05 DOOR AND FRAME SCHEDULE

- A. Provide stainless steel doors and frames as specified herein and on Contract Documents.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 08311**  
**ACCESS DOORS AND FRAMES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
1. Wall access doors and frames
  2. Fire-rated wall and ceiling access doors and frames
  3. Floor doors and frames

**1.02 SUBMITTALS**

- A. Product Data: For each type of door and frame indicated. Include construction details relative to materials, individual components and profiles, finishes, and fire ratings (if required) for access doors and frames.
- B. Shop Drawings: Show fabrication and installation details of customized doors and frames. Include plans, elevations, sections, details, and attachments to other Work.
- C. Samples: For each door face material, at least 3 by 5 inches in size, in specified finish.
- D. Schedule: Provide complete door and frame schedule, including types, general locations, sizes, construction details, latching or locking provisions, and other data pertinent to installation.
- E. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items with concealed framing, suspension systems, piping, ductwork, and other construction. Show the following:
1. Method of attaching door frames to surrounding construction.
  2. Ceiling-mounted items including access doors and frames, lighting fixtures, diffusers, grilles, speakers, sprinklers, and special trim.

**1.03 QUALITY ASSURANCE**

- A. Source Limitations: Obtain doors and frames through one source from a single manufacturer.
- B. Fire-Rated Access Doors and Frames: Units complying with NYC Building Code and NFPA 80 that are identical to access door and frame assemblies tested for fire-test-response characteristics per the following test method and that are labeled and listed by UL, or another testing and inspecting agency acceptable to authorities having jurisdiction:

1. UL 10B for vertical access doors
2. UL 263 for horizontal access doors and frames

- C. Size Variations: Obtain Commissioner's acceptance of manufacturer's standard-size units, which may vary slightly from sizes indicated.

#### 1.04 COORDINATION

- A. Verification: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on schedule specified in "Submittals" Article.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

A. Access Doors

1. Cendrex, Inc.
2. Karp Associates, Inc.
3. Nystrom Building Products Co.
4. Or approved equal

B. Floor Doors

1. Bilco Company (The)
2. Cendrex, Inc.
3. Karp Associates, Inc.
4. Milcor Limited Partnership
5. Nystrom Building Products Co.
6. Or approved equal

#### 2.02 MATERIALS

- A. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 316; with minimum sheet thickness indicated representing specified thickness according to ASTM A 480/A 480M.
- B. Stainless-Steel Bars and Shapes: ASTM A 276, Type 304
- C. Rolled-Stainless-Steel Floor Plate: ASTM A 793

#### 2.03 ACCESS DOORS AND FRAMES

- A. General Requirement for Access Doors and Frames: Subject to compliance with requirements provide stainless steel access doors and frames at all locations indicated on the drawings and at all locations where indicated on Plumbing, HVAC and Electrical Contract Drawings which would otherwise be inaccessible behind wall or ceiling construction.

B. Flush, Insulated, Fire-Rated Access Doors and Frames with Exposed Trim:  
Material to be stainless steel.

1. Location: At room 112
2. Fire-Resistance Rating: None
3. Temperature Rise Rating: 250 deg F at the end of 30 minutes
4. Door: Flush panel with a core of mineral-fiber insulation enclosed in sheet metal with a minimum thickness of 0.036 inch.
5. Frame: Minimum 0.060-inch- thick sheet metal with 1-inch- wide, surface-mounted trim.
6. Hinges: Concealed pin type
7. Automatic Closer: Spring type
8. Latch: Self-latching bolt operated by key with interior release
9. Lock: Key-operated cylinder lock with interior release

C. Flush, Un-insulated, Fire-Rated Access Doors and Frames with Exposed Trim:  
Material to be stainless steel.

1. Locations: All other masonry walls as indicated in the drawings.
2. Fire-Resistance Rating: One and one-half hours
3. Door: Minimum 0.060-inch- thick sheet metal, flush construction.
4. Frame: Minimum 0.060-inch- thick sheet metal with 1-inch- wide, surface-mounted trim.
5. Hinges: Concealed pin type
6. Automatic Closer: Spring type
7. Latch: Self-latching bolt operated by flush key with interior release.
8. Lock: Key-operated cylinder lock with interior release.

2.04 FLOOR DOORS

- A. Floor Doors, General: Equip each door with adjustable counterbalancing springs, heavy-duty hold-open arm that automatically locks door open at 90 degrees, release

handle with red vinyl grip that allows for one-handed closure, and recessed lift handle.

- B. Stainless Steel Floor Door: Stainless-steel angle frame with 3/16- or 1/4-inch-thick, diamond-pattern, stainless-steel tread plate door; non-watertight; loading capacity to support 300-lbf/sq. ft. pedestrian live load.
- C. Options: Include the following options:
  - 1. Hinges: Heavy-duty, stainless steel butt hinges with stainless-steel pins.
  - 2. Latch: Stainless steel slam latch.
  - 3. Lock: Stainless-steel snap lock with removable outside handle.
  - 4. Hardware Material: Stainless steel, including latch and lifting mechanism assemblies, hold-open arms, and all brackets, hinges, pins, and fasteners.
  - 5. Safety Accessories: Safety chains.

## 2.05 FABRICATION

- A. General: Provide access door assemblies manufactured as integral units ready for installation.
- B. Stainless Steel Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access panels to types of supports indicated.
  - 1. Exposed Flanges: Nominal 1 to 1-1/2 inches wide around perimeter of frame.
  - 2. Provide mounting holes in frames to attach frames to metal, or concrete construction. Furnish adjustable metal masonry anchors.
- C. Latching Mechanisms: Furnish number required to hold doors in flush, smooth plane when closed.
  - 1. For cylinder lock, furnish two keys per lock and key all locks alike.

## 2.06 STAINLESS-STEEL FINISHES

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

C. Bright, Directional Polish: No. 4 finish.

1. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 EXECUTION

3.01 PREPARATION

- A. Advise installers of other work about specific requirements relating to access door and floor door installation, including sizes of openings to receive access door and frame, as well as locations of supports, inserts, and anchoring devices.

3.02 INSTALLATION

- A. Comply with manufacturer's written instructions for installing access doors and frames and floor doors and frames.
- B. Set frames accurately in position and attach securely to supports with plane of face panels aligned with adjacent finish surfaces.

3.03 ADJUSTING AND CLEANING

- A. Adjust doors and hardware after installation for proper operation.
- B. Remove and replace doors and frames that are warped, bowed, or otherwise damaged.

- END OF SECTION -

NO TEXT ON THIS PAGE

**Section 08331**  
**OVERHEAD COILING DOORS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following types of electric-motor-operated overhead coiling doors:
  - 1. Stainless Steel Insulated overhead coiling doors.
  - 2. Stainless Steel Fire-rated counter shutters.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01821 - Equipments Start Up and Training
- B. Section 08711 - Door Hardware
- C. Division 16 for electrical service and connections for powered operators and accessories.
- D. Division 17 for SCADA System requirements.

**1.03 DEFINITIONS**

- A. Operation Cycle: One cycle of a door is complete when it is moved from the closed position to the fully open position and returned to the closed position.

**1.04 PERFORMANCE REQUIREMENTS**

- A. Operation-Cycle Requirements: Provide overhead coiling door components and operators capable of operating for not less than 100 cycles a day.
  - 1. Include tamperproof cycle counter.

**1.05 SUBMITTALS**

- A. Product Data: For each type and size of overhead coiling door, fire-rated shutter and accessory. Include the following:
  - 1. Summary of forces and loads on walls and jambs.
- B. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's product data.

- C. Samples for Verification: Of each type of exposed finish required, prepared on Samples of size indicated below.

1. Curtain Slats: 12 inches long
2. Bottom Bar: 6 inches long
3. Guides: 6 inches long
4. Brackets: 6 inches square
5. Hood: 6 inches square

- D. Qualification Data: For Installer.

## 1.06 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project.
- B. Source Limitations: Obtain overhead coiling doors through one source from a single manufacturer. Obtain operators and controls from overhead coiling door manufacturer.
- C. Fire-Test-Response Characteristics: Provide assemblies complying with NFPA 80 that are identical to door and frame assemblies tested for fire-test-response characteristics per UL 10B and, and that are listed and labeled for fire ratings indicated by UL, or another testing and inspecting agency acceptable to authorities having jurisdiction.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Cookson Company.
  2. Cornell Iron Works Inc.
  3. McKeon Rolling Steel Door Company, Inc.
  4. Or approved equal

### 2.02 DOOR CURTAIN MATERIALS AND CONSTRUCTION

- A. Insulated Overhead Coiling Doors: Type 304 ASTM A 666, not less than 24 gauge interlocking double stainless steel flat slats, cold roll formed. Fill slat with manufacturer's standard rigid cellular polyurethane-foam-type thermal insulation with R-value of not less than 5.0 and complying with maximum flame-spread and

smoke-developed indexes of 75 and 450, respectively, according to ASTM E 84. Enclose insulation completely within metal slat faces.

- B. Endlocks for Overhead Coiling Doors: Malleable-iron casings galvanized after fabrication, secured to curtain slats with galvanized rivets or high-strength nylon. Provide locks on not less than alternate curtain slats for curtain alignment and resistance against lateral movement. Bottom Bar for Overhead coiling doors: Consisting of 2 angles, each not less than 1-1/2 by 1-1/2 by 1/8 inch thick; stainless-steel to suit type of curtain slats.
- C. Curtain Jamb Guides for Overhead Coiling Doors: Fabricate curtain jamb guides of Type 304 stainless steel with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Build up units with not less than 3/16-inch- thick steel sections complying with ASTM A666. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent over travel of curtain. Provide UL approved smoked seals on each guide assembly.

## 2.03 HOODS AND ACCESSORIES

- A. Hood: Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods and provide fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sagging.
  - 1. Fabricate hoods for stainless-steel doors of minimum 0.025-inch thick stainless-steel sheet, Type 316, complying with ASTM A 666.
  - 2. Shape: round.
- B. Smoke Seals: Provide fire shutters with UL-listed and tested smoke-seal perimeter gaskets.
- C. Fabricate locking device assembly with lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bar to engage through slots in tracks.
  - 1. Lock cylinder is specified in Section 08711 - Door Hardware.
  - 2. If door unit is power operated, provide safety interlock switch to disengage power supply when door is locked.
- D. Provide automatic-closing device that is inoperative during normal door operations, with governor unit complying with requirements of NFPA 80 and with an easily tested and reset release mechanism, and designed to be activated by the following:
  - 1. Manufacturer's standard UL-labeled heat detector and door-holder-release devices.

2. Door-holder-release devices connected with building fire alarm and detection system.

#### 2.04 COUNTERBALANCING MECHANISM

- A. General: Counterbalance doors by means of adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to door curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of slats and to limit barrel deflection to not more than 0.03 in./ft. of span under full load.
- C. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Provide cast-steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of cold-rolled steel, sized to hold fixed spring ends and carry torsional load.
- E. Brackets: Provide mounting brackets of manufacturer's standard design, either cast iron or cold-rolled steel plate.

#### 2.05 ELECTRIC DOOR OPERATORS

- A. Overhead Coiling Doors: Provide electric door operator assembly of size and capacity recommended and provided by door manufacturer for door and operation-cycle requirements specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation. Equip operator with an adjustable screw-type limit switch to break a circuit at termination of travel.
  1. Motor: Provide continuous duty, thermally protected, ball bearing with a class F insulation. Single-phase motors are to be capacitor start, polyphase are to be squirrel cage induction.
  2. Starter: Provide magnetic reversing starter, size "0", across the line type with mechanical and electrical interlocks, 10 amp rating and 24 volts control circuit.
  3. Brake: Intermediate duty, rectifier activated, integral, within the operator's housing.

4. Control Station: Furnish all operators with one three bottom control station marked open, close, and stop, housed in NEMA 4X enclosure. Mount on inside and outside of door.
  5. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging chain and sprocket operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
  6. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
  7. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24V, ac or dc.
- B. Obstruction Detection Device: Provide each motorized door with indicated external automatic safety device capable of protecting full width of door opening. Activation of sensor immediately stops and reverses downward door travel.
1. Manufacturer's standard system designed to detect an obstruction in door opening without contact between door and obstruction.

## 2.06 FIRE RATED COUNTER SHUTTERS

- A. Curtain: Shall be assembled of interlocking stainless steel slats, cold rolled. Slats shall have end locks locking each end of alternate slats to act as a wearing surface, and maintain slat alignment. Curtain shall be 22 gauge minimum (.029 thick) or gauge required by Underwriters Laboratories and Factory Mutual.
1. Slats: Shall be of a cross section not less than 1 1/4" wide by 1/2" deep.
- B. Bottom Bar: Shall consist of one (1) angle not less than 1 1/2" x 1 1/2" x 1/8" stainless steel formed to fit slats. Bottom bar shall be provided with slotted holes to allow for thermal expansion.
- C. Guides: Each stainless steel guide assembly shall be fabricated of a minimum of 1/8" angles and channels in a box type configuration. Guides shall be provided with slotted holes to allow for thermal expansion. Provide UL approved smoke seals on each guide assembly conforming to UL1784. Provide units with an "S" Label.
- D. Brackets: Mounting brackets of hot rolled 1/4" steel plate, shall be provided to house ends of the counterbalance assembly.
- E. Hood: Shall be provided to entirely enclose curtain and counterbalance assemblies. The stainless steel hood shall be of a design to match brackets. Tops and bottoms shall be bent and reinforced for stiffness. Provide intermediate support brackets at all seams to prevent sagging. Provide UL approved lintel smoke seals.

- F. Hand Crank Operator: Hand Crank operated door shall be provided with a compact power unit designed and built by the door manufacturer. Operators shall be equipped with high efficiency planetary gearing running in an oil bath, and shall be furnished together with a centrifugal governor, spring-set brake and a fail-safe magnetic release device, completely housed to protect against damage, dust, and moisture.
- G. Self-Closing Mechanism: The fire door is to be designed with a centrifugal governor as an integral part of the operator's construction. The automatic release mechanism shall be triggered by a fusible link, smoke detector or fire alarm. When triggered the door is released and begins to close due to gravitational force. The speed of the door is governed by a centrifugal governor, designed to match the normal operating speed of the door, at a rate of not greater than 9" per second or less than 6" per second.
- H. Magnetic Release with 10 Second Time Delay: A fail-safe magnetic release device shall be built into the operator as an integral part of the release mechanism. When power is interrupted to the release mechanism by the smoke detector or fire alarm, the door shall begin to self-close. In the event of power failure the time delay shall prevent the fire door from closing for a period of 10 seconds. Once the 10 seconds have lapsed, the fire door shall self close. Once power has been restored the automatic reset time delay as well as the fire door shall reset themselves, and the door shall automatically power it-self back to the fully open position.
- I. Finishing: All stainless steel shall be finished to a #4 grade.

## 2.07 FINISHES, GENERAL

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## 2.08 STAINLESS-STEEL FINISHES

- A. General: Remove or blend stretch lines and tool and die marks into finish.
  - 1. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. Bright, Directional Polish: No. 4 finish.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## PART 3 EXECUTION

## 3.01 INSTALLATION

- A. General: Install coiling doors and operating equipment complete with necessary hardware, jamb and head molding strips, anchors, inserts, hangers, and equipment supports.

- 1. Install fire-rated doors to comply with NFPA 80.

## 3.02 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust doors to operate easily, free of warp, twist, or distortion and fit around entire perimeter.

## 3.03 STARTUP SERVICES

- A. Engage a factory-authorized service representative to perform startup service.

- 1. Complete installation and startup checks according to manufacturer's written instructions.
  - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    - a. Test door closing when activated by detector or alarm-connected fire-release system. Reset door-closing mechanism after successful test.

## 3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train City's maintenance personnel to adjust, operate, and maintain overhead coiling doors. Refer to Section 01821 - Training.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 08342**  
**OVERHEAD HIGH SPEED FABRIC DOORS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following types of overhead high speed coiling doors:
  - 1. High speed, overhead fabric coiling service door assemblies, as indicated.
  - 2. Motors, operators, control devices, actuator systems, guides/tracks, hoods closures and other accessories.

**1.02 RELATED SPECIFICATIONS**

- A. Section 08110 – Stainless Steel Doors and Frames
- B. Section 14511 – Container Transport System
- C. Section 17600 – SCADA System – Control Strategies
- D. Sections related to Electrical Power Signal and Control Work

**1.03 DEFINITIONS**

- A. Operation Cycle: One complete cycle of a door begins with the door in the closed position. The door is then moved to the open position and back to the closed position.

**1.04 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide overhead high speed fabric door assemblies capable of withstanding the effects of gravity loads and the following loads and stresses without evidencing permanent deformation of door components:
  - 1. Wind Load: Uniform pressure (velocity pressure) of 40 lbf/sq. ft., acting inward and outward.
- B. Operation-Cycle Requirements: Design overhead high speed door components and operator to operate for 5 years minimum, but not less than 750,000 cycles and for 400 cycles per day.
  - 1. Include tamperproof cycle counter.

**1.05 SUBMITTALS**

- A. Product Data: For each type and size of overhead high speed fabric door and accessory. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes. Provide roughing-in diagrams, operating instructions, and maintenance information. Include the following:

1. Setting drawings, templates, and installation instructions for built-in or embedded anchor devices.
  2. Summary of forces and loads on walls and jambs.
  3. Motors: Show nameplate data and ratings; characteristics; mounting arrangements; size and location of winding termination lugs, conduit entry, and grounding lug; and coatings.
- B. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's data sheets.
1. Wiring Diagrams: Detail wiring for power, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring and between components provided by door manufacturer and those provided by others.
  2. Include design drawings fully detailing each door assembly; indicate size, clearances, and load diagrams; construction details for jamb, head, and sill; material types, sizes, shapes, thicknesses, joints and connections; hardware, safety devices, and mechanical device descriptions including motor sizes in HP, voltage, phase, and hertz; location of control panels and drive units; and all design and detail data for work of other trades affected by the installation of the overhead fabric doors.
- C. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
- 1.06 QUALITY ASSURANCE
- A. Installer Qualifications: Engage an experienced installer who is an authorized representative of the overhead high speed fabric door manufacturer for both installation and maintenance of units required for this Project.
- B. Source Limitations: Obtain overhead high speed fabric coiling doors through one source from a single manufacturer.
1. Obtain operators and controls from the overhead fabric door manufacturer.
- C. Listing and Labeling: Provide electrically operated fixtures specified in this Section that are listed and labeled.
1. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.
  2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

## 1.07 DELIVER, STORAGE AND HANDLING

- A. Delivery of materials shall be in original rolls, packages, boxes, or crates bearing the manufacturers name, brand, model number, and installation location. Store all materials in dry locations with adequate ventilation, free from dust and water, and available for inspection and handling. Handle doors carefully to prevent damage. Remove damaged items that cannot be restored to the acceptance of the Commissioner, and replace with new items.

## 1.08 WARRANTY

- A. Warranty: Manufacturer's standard form in which manufacturer and installer agree to repair or replace overhead high speed fabric door assemblies that fail in materials or workmanship within specified warranty periods.

- 1. Warranty Period: Provide the following:

- a. Door Type 1: Balance springs, mechanical, and electrical components for two years from date of Substantial Completion; and door fabric for the life of the installation.
  - b. Door Type 2: Balance/tension springs and door fabric for five years from date of Substantial Completion.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide overhead high speed fabric door assemblies as manufactured by the following:

- 1. Albany International Corporation
  - 2. Rytec Corporation
  - 3. Or approved equal

- B. Selected Products: Provide the following:

- 1. High Speed Coiling Fabric Door Assemblies (Type 1): Subject to compliance with requirements, provide counterbalanced, high speed coiling fabric door assemblies "M&I Re-Coil-Away" as manufactured by Albany International Corp.
  - 2. High Speed Coiling Fabric Door Assemblies (Type 2): Subject to compliance with requirements, provide counterbalanced high speed coiling fabric door assemblies "Rapid Roll Model 670" as manufactured by Albany International Corp., or "Fast Seal" as manufactured by Rytec Corp.

## 2.02 DOOR CURTAIN MATERIALS AND CONSTRUCTION

- A. Door Fabric/Curtain: Fabricate overhead high speed fabric door curtains of flame-resistant material with reinforcing, designed to withstand wind loading indicated, in a continuous length for width of each door opening (without splices). Unless otherwise indicated, provide curtain of material thickness recommended by door manufacturer for performance, size, and type of door indicated, and as follows:
1. Door Type 1: Provide the manufacturer's heavy-duty, woven polyester reinforced, styrene butadiene rubber fabric (70 durometer); not less than 1/4 inch thick. Reinforced rubber fabric shall be provided with the manufacturer's standard bonded continuous beveled "Windlok" assemblies. Fabric shall be UV stable, self-extinguishing, and suitable to withstand temperatures between +180 to -40 degrees F. without limiting door operation.
    - a. Color: As selected by the Commissioner from the manufacturer's standard colors to match Commissioner's sample – Pantone "Blue No. 301U."
  2. Door Type 2: Provide the manufacturer's heavy-duty, woven polyester reinforced, PVC impregnated and coated fabric; not less than 0.08" thick. Fabric shall be UV stable, self-extinguishing, and suitable to withstand temperatures between +212 to -31 degrees F. without limiting door operation.
    - a. Color: As selected by the Commissioner from the manufacturer's standard colors to match Commissioner's sample – Pantone "Blue No. 301U".
  3. Windows (Type 1/Type 2): Provide manufacturer's standard transparent vinyl fabric windows integrated with fabric panels. Provide windows as shown on drawings.
- B. Door Headers and Balance Mechanisms
1. Headers: Provide the following header assemblies:
    - a. Type 1: Provide 8-5/8" diameter high strength steel tubes, with a minimum 0.188 inch wall thickness; complying with ASTM A 513. Drum tube deflection shall be limited 0.03" per foot. Provide 2" diameter bolt-on steel, drive barrel shafts complying with ASTM C1045.
      - (1) Idler: Provide 4" diameter (outside) round tubing guiding barrel with a minimum wall thickness of 0.134 inches. Provide 1-1/2" diameter steel support shafts complying with ASTM C 1018.

- (2) Top Plates: Manufacturer's standard 1/4" thick hot rolled steel plates fitted with heavy duty, self-aligning bearings and cast iron housings. Two inch shaft bearings shall be rated at 10,800 lbs dynamic and 6,400 lbs static; 1-1/2 inch idler bearings shall be load-rated at 8,150 lbs dynamic and 4,400 lbs. static. Provide manufacturer's top roll alignment plates.
    - (3) Truss: Provide manufacturer's recommended, fully welded, steel truss/spreader bar assemblies fabricated from 2-1/2" x 2-1/2" x 1/4" (minimum) steel angles with diagonal braces. Size assemblies to support loads of up to 2,000 lbs.
  - b. Type 2: Provide 5-1/2" diameter high strength steel tubes, 11 gage minimum wall thickness; complying with ASTM A 513. Drum tube deflection shall be limited 0.01" per foot; and shall not exceed 0.14" over the entire length.
- 2. Counterbalance Assemblies: Provide the following:
  - a. Type 1: Provide the manufacturer's standard pre-mounted counterbalance system with evenly balanced 200,000 cycle oil tempered helical outboard torsion springs with protective hood.
  - b. Type 2: Provide the manufacturer's standard internally mounted counterbalance system utilizing an extension spring along with factory lubricated 6 x 3/16" steel cables, and Alloy 319 die cast cable drums, and high impact injection molded plastic pulley mechanism with a pair of permanently sealed lubricated ball bearings; with evenly balanced 200,000 cycle torsion springs with protective hood.
- C. Endlocks: Malleable-iron castings galvanized after fabrication, secured to fabric curtain with stainless steel rivets, galvanized rivets, or high-strength nylon. Provide locks on fabric curtain for curtain alignment and resistance against lateral movement in accordance with the approved Shop Drawings.
- D. Bottom Bar: Provide the following:
  - 1. Type 1: Consisting of a 2-1/2" x 2-1/2" x 1/4" steel angle and a 3" x 0.188" flat bar; mechanically fastened together. Bottom bar shall have a "break bols, each not less than 2-1/2 by 2-1/2 by 1/4 inch thick and 3 x 0.188 inch flat bar bolted together. Assembly shall be fabricated with the manufacturer's recommended "break-away" center section construction.
    - a. Provide a 6-inch replaceable, self-adjusting, continuous, compressible gasket of flexible EPDM weatherproofing loop.
    - b. Provide fail-safe type, automatic, electric, revering mechanism located in door assemblies bottom edge.

2. Type 2: Consisting of the manufacturer's standard, 4-1/2" high, extruded aluminum, alloy 6063 removable bottom beam /bar.
    - a. Provide the manufacturer's "contact-less" through-beam photocells and retractable steel end guides. Locate photocell position sensor at a height of 6 inches below bottom of door edge. Include replaceable, self-adjusting, continuous, compressible flexible EPDM gasket door bottom with additional pneumatically operated pressure switch.
    - b. Provide fail-safe type, automatic, electric, reversing mechanism located in door assemblies bottom edge.
- E. Fabric Jamb Guides: Fabricate fabric jamb guides as follows:
1. Type 1: Provide the manufacturer's standard heavy-duty, breakaway style "Windlok" and guide system. System shall be fabricated from 8-1/2" x 5" heavy-duty hot-dip galvanized steel side frames; fabricated and arranged to meet the specified performance criteria; and allow the fabric to operate smoothly.
    - a. Build up units with not less than the sizes recommended by the manufacturer, and fabricated of galvanized steel sections complying with ASTM A 36, and ASTM A 123. Provide for guide adjustment. Provide removable stops on guides to prevent overtravel of fabric curtain and a continuous bar for holding windlock assemblies.
    - b. Finish: Manufacturer's standard chemical/corrosion resistant finish system; color as selected by the Commissioner from manufacturer's standard colors.
  2. Type 2: Provide the manufacturer's standard heavy-duty, 14 gage galvanized sections including covers with 12 gage galvanized structural C-channel to guide door panel during operation.
    - a. Provide the manufacturer's standard "brush" seals.
    - b. Finish: Manufacturer's standard chemical/corrosion resistant finish system; color as selected by the Commissioner from manufacturer's standard colors.
  3. Provide covers at jamb mechanisms with either swinging or lift-off service panels as required by adjacent curbs, rails, or other obstructions.
- F. Wind Bars (Type 1 and Type 2): Provide manufacturer's standard retracting internal and external wind bar stiffener battens to resist wind loads indicated.

## 2.03 DOOR CONTROLS

- A. General: Provide the high-speed roll-up door controls as specified herein, as scheduled in Section 08110, and as indicated on the Drawings. Coordinate the installation, and interface, of these controls with Section 17600 – SCADA System – Control Strategies.
- B. Controls “Category A”
  - 1. Provide a vendor-supplied controller, mounted as shown, which will control the door. The controller shall include all opening and closing logic, including all safety-related logic. The controller shall include the following front-panel mounted items:
    - a. Manual-auto selector switch
    - b. Open and close push buttons
  - 2. Manual Mode Operation: The door shall be opened and closed by the operator in either of two following locations:
    - a. The open and close push buttons on the vendor-supplied controller
    - b. Open and close push buttons on the outboard lidding station
  - 3. Automatic Mode Operation: The door shall be opened and closed automatically from signals from the container transport system via the outboard lidding control panel. The system shall open the door immediately prior to moving a shuttle car into or out of the building, and shall close the door immediately after the shuttle car passes through the door. Signals from the vendor-supplied controller to the container transport system (via the outboard lidding station) shall be dry contact closures, rated at 5 amps at 120 VAC, and shall be as follows:
    - a. Door in auto mode
    - b. Door fully open
    - c. Door fully closed
    - d. Door failure
  - 4. The vendor-supplied controller shall accept dry contact closures, rated at 5 amps at 120 VAC, from the outboard lidding station as follows:
    - a. Open door
    - b. Close door
  - 5. The vendor-supplied controller shall also provide a dry contact closure, rated at 5 amps at 120 VAC, for connection to the access control security system. The signal shall be as follows:
    - a. Door fully closed

6. Applications: Provide "Category A" controls for doors OHD-05 through OHD-08.

C. Controls "Category B"

1. Provide a vendor-supplied controller, mounted as shown, which will control the door. The controller shall include all opening and closing logic, including all safety-related logic. The controller shall include Open and Close push buttons on the front of the panel.
2. Door information shall be sent to the SCADA system. Signals between the vendor-supplied controller and the SCADA system shall be dry contact closures, rated at 5 amps at 120 VAC, and shall be as follows:
  - a. Door fully open
  - b. Door fully closed
  - c. Door failure
3. The vendor-supplied controller shall also provide a dry contact closure, rated at 5 amps at 120 VAC, for connection to the access control security system. The signal shall be as follows:
  - a. Door fully closed
4. Applications: Provide "Category B" controls for door OHD-03.

D. Controls "Category C"

1. Provide a vendor-supplied controller, mounted as shown, which will control each door. The controller shall include all opening and closing logic, including all safety-related logic. The controller shall include "Open" and "Close" push buttons on the front of the panel. An additional push-button station, containing "Open" and "Close" push buttons, shall be provided and mounted as shown.
2. Applications: Provide "Category C" controls for door OHD-04 and OHD-20.

E. Controls "Category D"

1. Provide a vendor-supplied controller, mounted as shown, which will control the door. The controller shall include all opening and closing logic, including all safety-related logic. The controller shall include the following front-panel mounted items:
  - a. Manual-auto selector switch
  - b. Open and Close push buttons
2. Manual Mode Operation: The door shall be opened and closed by the Open and Close push buttons on the vendor-supplied controller.

3. Automatic Mode Operation: The door shall be opened and closed automatically, based on controls and sensors provided by the door supplier. A magnetometer-based vehicle detection system, installed to detect oncoming traffic, shall open the door. Photo-eyes, installed in the doorframes, shall close the door shortly after the vehicle passes through the door.
4. Door information shall be sent to the SCADA system. Signals between the vendor-supplied controller and the SCADA system shall be dry contact closures, rated at 5 amps at 120 VAC, and shall be as follows:
  - a. Door fully open
  - b. Door fully closed
  - c. Door failure
5. The vendor-supplied controller shall also provide a dry contact closure, rated at 5 amps at 120 VAC, for connection to the access control security system. The signal shall be as follows:
  - a. Door fully closed
6. Applications: Provide "Category D" controls for doors OHD-01 and OHD-02.

F. Controls "Category E"

1. Provide a vendor-supplied controller, mounted as shown, which will control the door. The controller shall include all opening and closing logic, including all safety-related logic. The controller shall include the following front-panel mounted items:
  - a. Manual-auto selector switch
  - b. Open and Close push buttons
2. Manual Mode Operation: The door shall be opened and closed by the Open and Close push buttons on the vendor-supplied controller.
3. Automatic Mode Operation: The door shall be opened and closed automatically, based on controls and sensors provided by the door supplier. Two magnetometer-based vehicle detection systems shall be installed to detect oncoming traffic on either side of the door. Either loop detector, sensing a vehicle, shall open the door. The opposing loop detector shall close the door after the vehicle passes through the door.
4. The vendor-supplied controller shall also provide a dry contact closure, rated at 5 amps at 120 VAC, for connection to the access control security system. The signal shall be as follows:
  - a. Door fully closed

5. Applications: Provide "Category E" controls for door OHD-10.

- G. Vehicle Detection: Vehicle detection shall be a magnetometer-based vehicle detection system as shown. System shall include sensor, wireless access point, and contact closure card as shown. Gate controller shall use the contact closure card input to determine absence of vehicle from shadow area. Detection system shall include all power supplies, interposing relays, enclosures and appurtenances to comprise a complete operating system.

## 2.04 HOODS AND ACCESSORIES

- A. Hood: Form to entirely enclose coiled fabric curtain and operating mechanism at opening head and act as weatherseal. Contour to suit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sag.
1. Fabricate hoods of stainless-steel sheet, Type 316, complying with ASTM A 240 or ASTM A 666, and not less than 0.025-inch thick
  2. Shape: As indicated.
- B. Weatherseals: Provide replaceable, adjustable, continuous, compressible weatherstripping gaskets fitted to exterior doors, unless otherwise indicated. Employ the manufacturer's replaceable, continuous type secured to inside of fabric coil hood.
1. Provide motor-operated doors with combination bottom weatherseal and sensor edge, unless otherwise indicated.
  2. Door jambs shall be replaceable, adjustable, continuous, flexible seals of flexible vinyl, rubber, or neoprene for a weathertight installation.
- C. Fabricate locking device assembly with lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bar to engage through slots in tracks.
1. Lock cylinder is specified in Section 08711 - Door Hardware.
- D. Where door unit is power operated, provide safety interlock switch to disengage power supply when door is locked.

## 2.05 FINISHES, GENERAL

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance

of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## 2.06 STAINLESS-STEEL FINISHES

- A. General: Remove or blend tool and die marks and stretch lines into finish.
- B. Bright, Cold-Rolled, Unpolished Finish: No. 2B finish.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## 2.07 FERROUS METAL FINISHES

- A. General: Manufacturer's standard primer, compatible with shop -applied finish according to manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness.
  - 1. Apply to ferrous surfaces except zinc-coated metal.
- B. Finish: Manufacturer's standard chemical and corrosion resistant, high performance finish consisting of chemical wash type primer and topcoats according to coating manufacturer's written instructions for cleaning, pretreatment, application, curing, and minimum dry film thickness.
  - 1. Color and Gloss: A selected by Commissioner from manufacturer's full range.

## 2.08 ELECTRIC DOOR OPERATORS

- A. General: Provide heavy-duty electric door operator assemblies of size and capacity recommended and provided by door manufacturer for door and operational life specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation.
  - 1. Type 1: Drive unit shall be an electrically operated, heavy-duty assembly featuring a self-inhibiting worm gear. The motor and gearbox shall be designed for high cycle operation. Door position shall be controlled by top and bottom limit switch. Basic operation features a manual disengagement lever to place door in manual operation mode. A safety disengagement switch shall be included with the disengagement mechanism. Drive assembly shall include a back-up safety top and bottom limits.
  - 2. Type 2: Drive unit shall be an electrically operated, heavy-duty assembly featuring the manufacturer's standard Hypoid gear. The motor and gearbox shall be designed for high cycle operation. Door position shall be controlled by a bi-directional pulse encoder or limit switches.. Basic operation features

shall include inverter for soft starting and stopping, automatic closing timer, emergency stop, one actuating push button, and inline photocell and a brake release lever with a safety switch for manual operation.

- B. Comply with NFPA 70.
- C. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging sprocket-chain operator and releasing brake for emergency manual operation while disconnecting motor, without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA 4, with NFPA 70 Class 2 control circuit, maximum 110 VAC.
- F. Door-Operator Type: Provide wall-, hood-, or bracket-mounted, jackshaft, gear-head hoist-type door operator unit consisting of electric motor, enclosed worm-gear running-in-oil primary drive, chain and sprocket secondary drive, and auxiliary chain-hoist and floor level disconnect.
- G. Electric Motors: Provide the following:
  - 1. Type 1: Provide high-starting torque, reversible, continuous-duty, Class A insulated, 5 HP, two-speed electric motors, complying with NEMA MG 1, with overload protection, sized to start, accelerate, and operate door in either direction, from any position, at not less than the following speeds; without exceeding nameplate ratings or considering service factor.
    - a. Speed: 3' per second, unless otherwise acceptable to the Commissioner.
    - b. Type: 3 Phase, 60Hz, 20 amps; voltage as recommended by the manufacturer.
    - c. Service Factor: According to NEMA MG 1, unless otherwise indicated.
    - d. Coordinate wiring requirements and electric characteristics of motors with building electrical system.
    - e. Provide totally enclosed, non-ventilated or fan-cooled motors, fitted with plugged drain, and controller with NEMA ICS 6, Type 4 enclosure where indicated.
  - 2. Type 2: Provide high-starting torque, reversible, continuous-duty, Class A insulated, 1.5 HP, two-speed electric motors, complying with NEMA MG 1, with overload protection, sized to start, accelerate, and operate door in either

direction, from any position, at not less than the following speeds; without exceeding nameplate ratings or considering service factor.

- a. Speed: 100" per second, unless otherwise acceptable to the Commissioner.
  - b. Type: 3 Phase, 60 Hz, 15 amps; voltage as recommended by the manufacturer.
  - c. Service Factor: According to NEMA MG 1, unless otherwise indicated.
  - d. Coordinate wiring requirements and electric characteristics of motors with building electrical system.
  - e. Provide open drip-proof-type motor, and controller with NEMA ICS 6, Type 1 enclosure.
  - f. Provide totally enclosed, non-ventilated or fan-cooled motors, fitted with plugged drain, and controller with NEMA ICS 6, Type 4 enclosure where indicated
- H. Remote-Control Station: Provide momentary-contact, 2-button control station with push-button controls labeled "Open," and "Close."
1. Provide exterior units, full-guarded, standard-duty, surface-mounted, weatherproof type, NEMA ICS 6, Type 4 enclosure, key operated.
- I. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.
- J. Provide electric operators with ADA-compliant audible alarm and visual indicator lights.
- K. Control Panels: Provide the manufacturer's standard drive controller assemblies. Assemblies shall be a fully programmable logic type controller or ACS 50 controller as acceptable to the Commissioner. Control panels shall be pre-wired to the greatest extent possible, and be ULC listed. Control panel shall accommodate soft/start soft/start ability. Control panel shall allow for top and bottom limit adjustment via the control panel, unless otherwise acceptable to the Commissioner. Control panel shall include an adjustable, automatic closing timer, emergency stop, one actuating push button and cycle counter.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Install doors and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, inserts, hangers, and equipment supports according to approved Shop Drawings, manufacturer's written instructions, and as specified.

3.02 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust doors to operate easily, free from warp, twist, or distortion and fitting weathertight for entire perimeter.

3.03 DEMONSTRATION/ TRAINING

- A. Startup Services: Engage a factory-authorized service representative to perform startup services and to train City of New York's maintenance personnel as specified below:
  - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - 2. Train City of New York's designated personnel on procedures and schedules related to startup and shutdown, trouble-shooting, servicing, preventive maintenance, and procedures for testing and resetting release devices.
  - 3. Review data in the maintenance manuals. Refer to Section 01781 - Project Closeout and Section 01831 – Operation and Maintenance Manuals.
  - 4. Schedule training with the City of New York with at least 7 days' advance notice.

-END OF SECTION-

**Section 08520**  
**ALUMINUM WINDOWS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following types of aluminum-framed windows:
  - 1. Interior and exterior fixed windows, as indicated.
  - 2. Exterior projected windows, as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 – Plant-Precast Architectural Concrete
- B. Section 04201 - Unit Masonry
- C. Section 07410 - Metal Wall Panels
- D. Section 07620 - Sheet Metal Flashing and Trim
- E. Section 07920 - Exterior Joint Sealants
- F. Section 08660 - Window Security Screens
- G. Section 08800 - Glazing

**1.03 DEFINITIONS**

- A. HC: Heavy Commercial
- B. Performance grade number, included as part of the AAMA/NWWDA product designation code, is actual design pressure in pounds force per square foot used to determine structural test pressure and water test pressure.
- C. Structural test pressure, for uniform load structural test, is equivalent to 150 percent of design pressure.
- D. Minimum test size is smallest size permitted for performance class (gateway test size). Products must be tested at minimum test size or at a size larger than minimum test size to comply with requirements for performance class.

**1.04 PERFORMANCE REQUIREMENTS**

- A. General: Provide aluminum windows capable of complying with performance requirements indicated, based on testing manufacturer's windows that are representative of those specified and that are of test size indicated below:
  - 1. Minimum size required by gateway performance requirements for determining compliance with AAMA/NWWDA 101/I.S.2 for both gateway performance requirements and optional performance grades.

- B. AAMA/NWWDA Performance Requirements: Provide aluminum windows of the performance class and grade indicated that comply with AAMA/NWWDA 101/I.S.2.
  - 1. Performance Class/Grade: AP-AW50
- C. Condensation-Resistance Factor: Provide aluminum windows tested for thermal performance according to AAMA 1503, showing a CRF of 45.
- D. Thermal Transmittance: Provide aluminum windows with a whole-window U-value maximum indicated at 15-mph exterior wind velocity and winter condition temperatures when tested according to AAMA 1503.
  - 1. U-Value: 0.57 Btu/sq. ft. x h x deg F. (maximum)
- E. Solar Heat-Gain Coefficient: Provide aluminum windows with a whole-window SHGC maximum of 0.77, determined according to NFRC 200 procedures.
- F. Sound Transmission Class: Provide glazed windows rated for not less than 30 STC when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 413.
- G. Thermal Movements: Provide aluminum windows, including anchorage, that accommodate thermal movements of units resulting from the following maximum change (range) in ambient and surface temperatures without buckling, distortion, opening of joints, failure of joint sealants, damaging loads and stresses on glazing and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F material surfaces

#### 1.05 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, fabrication methods, dimensions of individual components and profiles, hardware, finishes, and operating instructions for each type of aluminum window indicated.
- B. Shop Drawings: Include plans, elevations, sections, details, hardware, attachments to other Work, operational clearances, and the following:
  - 1. Joinery details
  - 2. Flashing and drainage details
  - 3. Weather-stripping details
  - 4. Thermal-break details

5. Glazing details
6. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation and used to determine the following:
  - C. Samples for Initial Selection: For units with factory-applied color finishes.
  - D. Samples for Verification: For aluminum window components required, prepared on Samples of size indicated below.
    1. Main Framing Member: 12-inch- long, full-size sections of extrusions with factory-applied color finish.
    2. Hardware: Full-size units with factory-applied finish.
    3. Weather Stripping: 12-inch- long sections.
    4. Commissioner reserves the right to require additional samples that show fabrication techniques, workmanship, and design of hardware and accessories.
  - E. Qualification Data: For Installer.
  - F. Product Test Reports: Based on evaluation of comprehensive tests performed within the last four years by a qualified testing agency, for each type, grade, and size of aluminum window. Test results based on use of down-sized test units will not be accepted.
  - G. Maintenance Data: For operating hardware, weatherstripping and finishes to include in maintenance manuals.

#### 1.06 QUALITY ASSURANCE

- A. Installer Qualifications: An installer acceptable to aluminum window manufacturer for installation of units required for this Project.
- B. Source Limitations: Obtain aluminum windows through one source from a single manufacturer.
- C. Product Options: Information on Drawings and in Specifications establishes requirements for aluminum windows' aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.

- D. Fenestration Standard: Comply with AAMA/NWWDA 101/I.S.2, "Voluntary Specifications for Aluminum, Vinyl (PVC) and Wood Windows and Glass Doors," for minimum standards of performance, materials, components, accessories, and fabrication unless more stringent requirements are indicated.

1. Provide AAMA-certified aluminum windows with an attached label.

- E. Glazing Publications: Comply with published recommendations of glass manufacturers and GANA's "Glazing Manual" unless more stringent requirements are indicated.

- F. Mockups: Build mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution.

1. Build mockup in building envelope wall in locations shown on Drawings.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

- G. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

#### 1.07 PROJECT CONDITIONS

- A. Field Measurements: Verify aluminum window openings by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating aluminum windows without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to established dimensions.

#### 1.08 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace aluminum windows that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:

1. Failure to meet performance requirements.

2. Structural failures including excessive deflection.

3. Water leakage, air infiltration, or condensation.

4. Faulty operation of movable sash and hardware.

5. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
  6. Insulating glass failure.
- B. Warranty Period: Three years from date of Substantial Completion.
- C. Warranty Period for Metal Finishes: 15 years from date of Substantial Completion.
- D. Warranty Period for Glass: 10 years from date of Substantial Completion.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. EFCO Corporation
  2. Kawneer Company, Inc.
  3. TRACO
  4. Or approved equal
- B. Selected Product: Subject to compliance with requirements, provide heavy commercial (Architectural Grade) aluminum projected window assemblies "Series 3902 Thermal" as manufactured EFCO, or approved equal acceptable to the Commissioner.

### 2.02 MATERIALS, GENERAL

- A. Aluminum Extrusions: Alloy and temper recommended by aluminum window manufacturer for strength, corrosion resistance, and application of required finish, but not less than 22,000-psi ultimate tensile strength, not less than 16,000-psi minimum yield strength, and not less than 0.062-inch thickness at any location for the main frame and sash members.
- B. Fasteners: Nonmagnetic stainless steel, epoxy adhesive, or other materials warranted by manufacturer to be noncorrosive and compatible with aluminum window members, trim, hardware, anchors, and other components.
1. Reinforcement: Where fasteners screw-anchor into aluminum less than 0.125 inch thick, reinforce interior with aluminum or nonmagnetic stainless steel to receive screw threads, or provide standard, noncorrosive, pressed-in, splined grommet nuts.
  2. Exposed Fasteners: Unless unavoidable for applying hardware, do not use exposed fasteners. For application of hardware, use fasteners of nonmagnetic stainless steel with exposed surfaces finished to match members or hardware being fastened, as appropriate.

- C. Anchors, Clips, and Accessories: Nonmagnetic stainless steel complying with ASTM B 633 for SC 3 severe service conditions; provide sufficient strength to withstand design pressure indicated.
- D. Reinforcing Members: Aluminum, nonmagnetic stainless steel, nickel/chrome-plated steel complying with ASTM B 456 for Type SC 3 severe service conditions, or zinc-coated steel or iron complying with ASTM B 633 for SC 3 severe service conditions; provide sufficient strength to withstand design pressure indicated.
- E. Compression-Type Weather Stripping: Provide compressible weather stripping designed for permanently resilient sealing under bumper or wiper action, and completely concealed when aluminum window is closed.
  - 1. Weather-Stripping Material: Manufacturer's standard system and materials complying with AAMA/NWWDA 101/I.S.2.
- F. Replaceable Weather Seals: Comply with AAMA 701/702.
- G. Sealant: For sealants required within fabricated windows, provide window manufacturer's standard, permanently elastic, nonshrinking, and nonmigrating type recommended by sealant manufacturer for joint size and movement.

## 2.03 GLAZING

- A. Glass and Glazing Materials: Refer to Section 08800 - Glazing for glass units and glazing requirements applicable to glazed aluminum window units.

## 2.04 HARDWARE

- A. General: Provide manufacturer's premium/custom hardware fabricated from nonmagnetic stainless steel, complying with AAMA 907, or other corrosion-resistant material compatible with aluminum; designed to smoothly operate, tightly close, and securely lock aluminum windows and sized to accommodate sash or ventilator weight and dimensions. Do not use aluminum in frictional contact with other metals. Where exposed, provide nonmagnetic stainless steel.
- B. Four-Bar Friction Hinges: Comply with AAMA 904.1.
  - 1. Locking mechanism and handles (standard cam- and pole ring cam-types) for manual operation.
  - 2. Friction Shoes: Provide friction shoes of nylon or other nonabrasive, non-staining, non-corrosive, durable material.
- C. Limit Devices: Provide limit devices designed to restrict sash or ventilator opening.
  - 1. Safety Devices: Limit clear opening to 6 inches for ventilation.

- D. Projected and Inswing Windows: Provide the following operating hardware:
1. Hinge: Concealed four- bar friction hinge with adjustable-slide friction shoe; two per ventilator.
  2. Lock: Manual or pole-operated cam-type lock and keeper assemblies.
  3. Limit Device: Concealed support arms with adjustable, limited, hold-open limit device; located on jamb of each ventilator.
  4. Pole Operators: Provide the window manufacturers standard tubular-shaped anodized aluminum pole operators; with rubber-capped lower end and standard push-pull hook at top to match hardware design; of sufficient length to operate bottom hinged inswing aluminum windows; 1 pole operator and pole hanger per room that has bottom hinged inswing windows.

## 2.05 FABRICATION

- A. General: Fabricate aluminum windows, in sizes indicated, that comply with AAMA/NWDA 101/I.S.2 for performance class and performance grade indicated. Include a complete system for assembling components and anchoring windows.
- B. Fabricate aluminum windows that are reglazable without dismantling sash or ventilator framing.
- C. Thermally Improved Construction: Fabricate aluminum windows with an integral, concealed, low-conductance thermal barrier; located between exterior materials and window members exposed on interior side; in a manner that eliminates direct metal-to-metal contact.
1. Provide thermal-break construction that has been in use for not less than three years and has been tested to demonstrate resistance to thermal conductance and condensation and to show adequate strength and security of glass retention.
  2. Provide thermal barriers tested according to AAMA 505; determine the allowable design shear flow per the appendix in AAMA 505.
  3. Provide hardware with low conductivity or nonmetallic material for hardware bridging thermal breaks at frame or vent sash.
- D. Weather Stripping: Provide full-perimeter weather stripping for each operable sash and ventilator.
- E. Weep Holes: Provide weep holes and internal passages to conduct infiltrating water to exterior.
- F. Provide watershed members above side-hinged ventilators and similar lines of natural water penetration.

- G. Mullions: Provide mullions and cover plates as shown, matching window units, complete with anchors for support to structure and installation of window units. Allow for erection tolerances and provide for movement of window units due to thermal expansion and building deflections, as indicated. Provide mullions and cover plates capable of withstanding design loads of window units.
- H. Subframes: Provide subframes with anchors for window units as shown, of profile and dimensions indicated but not less than 0.062-inch- thick extruded aluminum. Miter or cope corners, and weld and dress smooth with concealed mechanical joint fasteners. Finish to match window units. Provide subframes capable of withstanding design loads of window units.
- I. Factory-Glazed Fabrication: Glaze aluminum windows in the factory where practical and possible for applications indicated. Comply with requirements in Section 08800 - Glazing and with AAMA/NWWDA 101/I.S.2.
- J. Glazing Stops: Provide snap-on glazing stops coordinated with Section 08800 - Glazing and glazing system indicated. Provide glazing stops to match sash and ventilator frames.

## 2.06 FINISHES

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- C. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - 1. Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
    - a. Color: Custom color matching Pantone Matching System (PMS) Color – Color Gray No 2U.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine openings, substrates, structural support, anchorage, and conditions, with Installer present, for compliance with requirements for installation tolerances; rough

opening dimensions; levelness of sill plate; coordination with wall flashings, vapor retarders, and other built-in components; operational clearances; and other conditions affecting performance of work.

1. Masonry Surfaces: Visibly dry and free of excess mortar, sand, and other construction debris.
2. Metal Surfaces: Dry; clean; free of grease, oil, dirt, rust, corrosion, and welding slag; without sharp edges or offsets at joints.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General: Comply with manufacturer's written instructions for installing windows, hardware, accessories, and other components; Drawings; and Shop Drawings.
- B. Install windows level, plumb, square, true to line, without distortion or impeding thermal movement, anchored securely in place to structural support, and in proper relation to wall flashing and other adjacent construction.
- C. Set sill members in bed of sealant or with gaskets, as indicated, for weathertight construction.
- D. Install windows and components to drain condensation, water penetrating joints, and moisture migrating within windows to the exterior.
- E. Metal Protection: Separate aluminum and other corrodible surfaces from concrete, masonry, and other sources of corrosion or electrolytic action at points of contact with other materials by complying with requirements specified in "Dissimilar Materials" Paragraph in Appendix B in AAMA/NWWDA 101/I.S.2.

### 3.03 ADJUSTING

- A. Adjust operating sashes and ventilators, hardware, and accessories for a tight fit at contact points and weather stripping for smooth operation and weathertight closure. Lubricate hardware and moving parts.

### 3.04 PROTECTION AND CLEANING

- A. Protect window surfaces from contact with contaminating substances resulting from construction operations. In addition, monitor window surfaces adjacent to and below exterior concrete and masonry surfaces during construction for presence of dirt, scum, alkaline deposits, stains, or other contaminants. If contaminating substances do contact window surfaces, remove contaminants immediately according to manufacturer's written recommendations.

- B. Clean aluminum surfaces immediately after installing windows. Avoid damaging protective coatings and finishes. Remove excess sealants, glazing materials, dirt, and other substances.
- C. Clean factory-glazed glass immediately after installing windows. Comply with manufacturer's written recommendations for final cleaning and maintenance. Remove nonpermanent labels and clean surfaces.
- D. Remove and replace glass that has been broken, chipped, cracked, abraded, or damaged during construction period.

- END OF SECTION -

**Section 08630**  
**TRANSLUCENT INSULATING PANELS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes assemblies incorporating fiberglass sandwich panels and aluminum frame systems as follows:

1. Clerestory wall assemblies, as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 05120 - Structural Steel
- C. Section 07210 - Building Insulation
- D. Section 07410 - Metal Wall Panels
- E. Section 07620 - Sheet Metal Flashing and Trim
- F. Section 07920 - Exterior Joint Sealants
- G. Section 10436 - Exterior Signs

**1.03 PERFORMANCE REQUIREMENTS**

- A. Provide assemblies, including anchorage, capable of withstanding, without failure, the effects of the following:

1. Structural loads
2. Thermal movements
3. Movements of supporting structure
4. Dimensional tolerances of building frame and other adjacent construction

- B. Failure includes the following:

1. Deflection exceeding specified limits
2. Water leakage
3. Thermal stresses transferred to building structure
4. Noise or vibration created by wind and thermal and structural movements
5. Loosening or weakening of fasteners, attachments, and other components
6. Delamination of fiberglass-sandwich-panel faces from panel cores
7. Deterioration of fiberglass facing materials

- C. Structural Loads

1. Wind Loads: 40 lbs/sf acting inward or outward (minimum), unless otherwise required by the current New York City Building Code.
2. Seismic Loads: As indicated by earthquake design data on Drawings.

3. Load Combinations: Calculate according to requirements of applicable code indicated on Drawings.

D. Deflection of Assemblies

1. Vertical Assemblies: Limited to  $L/360$  of clear span for each assembly component.
2. Horizontal Assemblies: Limited to  $L/360$  of clear span for each assembly component.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

1.04 PERFORMANCE TESTING

A. Provide assemblies that comply with test-performance requirements indicated, as evidenced by reports of tests performed on manufacturer's standard assemblies by a qualified independent testing agency.

B. Structural-Performance Test: ASTM E 330.

1. Performance at Design Load: When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
2. Performance at Maximum Test Load: When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main supporting members exceeding 0.2 percent of span.
3. Test Durations: As required by design wind velocity but not less than 10 seconds.

C. Air-Infiltration Test: ASTM E 283.

1. Minimum Static-Air-Pressure Difference: 6.24 lbf/sq. ft.
2. Maximum Air Leakage: 0.06 cfm/sq. ft.

D. Test for Water Penetration under Static Pressure: ASTM E 331.

1. Minimum Static-Air-Pressure Difference: 20 percent of positive wind-load design pressure, but not less than 10 lbf/sq. ft.
2. Water Leakage: None.

E. Test for Water Penetration under Dynamic Pressure: AAMA 501.1.

1. Dynamic Pressure: 20 percent of positive wind-load design pressure, but not less than 15 lbf/sq. ft..
2. Water Leakage: No uncontrolled water penetrating systems or appearing on systems' normally exposed interior surfaces from sources other than condensation. Water controlled by flashing and gutters that is drained to exterior and cannot damage adjacent materials or finishes is not considered water leakage.

1.05 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for assemblies.
- B. Shop Drawings: For assemblies. Include plans, elevations, sections, details, and attachments to other work.
  1. Include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.
- E. Fabrication Sample: Of each frame system intersection of assemblies, made from 12-inch lengths of full-size components and showing details of the following:
  1. Joinery
  2. Anchorage
  3. Expansion provisions
  4. Fiberglass sandwich panels
  5. Flashing and drainage
  6. Curved components
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for assemblies.
- G. Maintenance Data: For assemblies to include in maintenance manuals.
- H. Warranties: Special warranties specified in this Section.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications: Entity capable of assuming engineering responsibility, including preparation of Shop Drawings, and performing work of this Section and who is acceptable to manufacturer.

- B. **Manufacturer Qualifications:** For fiberglass sandwich panels, a qualified manufacturer whose facilities, processes, and products are monitored by an independent, accredited quality-control agency for compliance with applicable requirements in ICBO ES AC04, "Sandwich Panels."
- C. **Product Options:** Information on Drawings and in Specifications establishes requirements for assemblies' aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including testing conducted by an independent testing agency and in-service performance.
  - 1. Do not modify intended aesthetic effects, as judged solely by Commissioner, except with Commissioner's approval. If modifications are proposed, submit comprehensive explanatory data to Commissioner for review.
  - 2. The translucent insulated panel system provided shall not be used to support other building components, finishes, or systems other than itself.
- D. **Fire-Test-Response Characteristics:** Where fire-test-response characteristics are indicated for assemblies and components, provide products identical to those tested per test method indicated by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- E. **Welding:** Qualify procedures and personnel according to AWS D1.2, "Structural Welding Code - Aluminum."
- F. **NFRC Certification:** Provide fiberglass sandwich panels that are certified for U-factors indicated according to NFRC 100 and listed in its "National Fenestration Council Incorporated - Certified Products Directory."
- G. **Mockups:** Build mockups to demonstrate aesthetic effects and set quality standards for fabrication and installation.
  - 1. Build mockup of typical corner assembly area as shown on Drawings.
  - 2. Field testing shall be performed on mockups according to requirements in Part 3 "Field Quality Control" Article.
  - 3. Protect approved mock-ups from weather and other elements which could cause damage.
  - 4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- H. **Preinstallation Conference:** Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

**1.07 DELIVERY, STORAGE, AND HANDLING**

- A. Package, wrap, crate and otherwise protect translucent insulated panel systems/components to ensure assemblies are delivered, stored and handled until time of installation without damages. Clearly mark cartons, crates and other wrappings identifying contents. Do not use permanent markings on exposed portions of the translucent insulated panel systems
  - 1. Protect system components from the elements.
  - 2. Immediately remove and re-wrap assemblies which have become wet.
  - 3. Remove protective wrappings/films after installation is complete (unless otherwise recommended by the manufacturer) to prevent fading and other such defects resulting from differential UV exposure.

**1.08 PROJECT CONDITIONS**

- A. Field Measurements: Indicate measurements on Shop Drawings.

**1.09 WARRANTY**

- A. Special Assembly Warranty: Manufacturer's standard form in which manufacturer and Installer agree to repair or replace components of assemblies that fail in materials or workmanship within specified warranty period.
  - 1. Failures include, but are not limited to, the following:
    - a. Structural failures including, but not limited to, excessive deflection
    - b. Deterioration of metals, metal finishes, and other materials beyond normal weathering
    - c. Water leakage
  - 2. Warranty Period: Five years from date of Substantial Completion.
- B. Special Fiberglass-Sandwich-Panel Warranty: Manufacturer's standard form in which manufacturer agrees to replace panels that exhibit defects in materials or workmanship.
  - 1. Defects include, but are not limited to, the following:
    - a. Fiberbloom
    - b. Delamination of coating, if any, from exterior face sheet

- c. Discoloration of exterior face sheet of more than 8.0 units Delta E when measured according ASTM D 2244
  - d. Delamination of panel face sheets from panel cores
- 2. Warranty Period: 10 years from date of Substantial Completion
- C. Special Aluminum-Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.
  - 1. Failures include, but are not limited to, checking, crazing, peeling, chalking, and fading of finishes.
  - 2. Warranty Period: 20 years from date of Substantial Completion

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Kalwall Corporation
  - 2. Major Industries, Inc.
  - 3. Skywall Translucent Systems; Vistawall Group (The)
  - 4. Structures Unlimited, Inc.
  - 5. Or approved equal

### 2.02 ALUMINUM FRAME SYSTEMS

- A. Aluminum: Alloy and temper recommended in writing by manufacturer for type of use and finish indicated.
  - 1. Sheet and Plate: ASTM B 209
  - 2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221
  - 3. Extruded Structural Pipe and Tubes: ASTM B 429
- B. Components: Manufacturer's standard extruded-aluminum members of thickness required and reinforced as required to support imposed loads.
- C. Exposed Flashing and Closures: Manufacturer's standard aluminum components not less than 0.060 inch thick.
- D. Frame-System Gaskets: Manufacturer's standard.
- E. Frame-System Sealants: As recommended in writing by manufacturer.

- F. Anchors, Fasteners, and Accessories: Manufacturer's standard, corrosion-resistant, nonstaining, and nonbleeding; compatible with adjacent materials.
  - 1. At closures, retaining caps, or battens, use ASTM A 193/A 193M, 300 series stainless-steel screws.
  - 2. Where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
  - 3. At movement joints, use slip-joint linings, spacers, and sleeves of material and type recommended in writing by manufacturer.
- G. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A 123/A 123M or ASTM A 153/A 153M requirements.
- H. Anchor Bolts: ASTM A 307, Grade A, hot-dip zinc coating, ASTM A 153/A 153M, Class C.
- I. Frame System Fabrication
  - 1. Fabricate components before finishing.
  - 2. Fabricate components that, when assembled, have the following characteristics:
    - a. Profiles that are sharp, straight, and free of defects or deformations.
    - b. Accurately fitted joints with ends coped or mitered.
    - c. Internal guttering systems or other means to drain water passing joints, condensation occurring within components, and moisture migrating within the assembly to exterior.
  - 3. Fabricate sill closures with weep holes and for installation as continuous component.
  - 4. Reinforce components as required to receive fastener threads.
  - 5. Weld components in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

## 2.03 FIBERGLASS SANDWICH PANELS

- A. Panel Construction: Assembly of uniformly colored, translucent, thermoset, fiberglass-reinforced-polymer face sheets bonded to both sides of a grid core and complying with requirements applicable to panel materials in ICBO ES AC04, "Sandwich Panels."
  - 1. Face-Sheet, Self-Ignition Temperature: 650 deg F or more per ASTM D 1929
  - 2. Face-Sheet Burning Extent: 1 inch or less per ASTM D 635
  - 3. Face-Sheet, Smoke-Developed Index: 450 or less per ASTM E 84
  - 4. Interior Face-Sheet, Flame-Spread Index: Not more than 25 per ASTM E 84
  - 5. Light Transmission: 50% minimum
- B. Panel Thickness: 2-3/4 inches
- C. Panel U-Factor: Not more than 0.53 measured in Btu/sq. ft. x h x deg F according to NFRC 100 or ASTM C 1363 using procedures described in ASTM C 1199 and ASTM E 1423.
- D. Panel Strength Characteristics
  - 1. Maximum Panel Deflection: 1.9 inches at 30 psf over a 10-foot span when tested according to ASTM E 72.
  - 2. Panel Support Strength: Capable of supporting, without failure, a 300-lbf concentrated load when applied to a 3-inch- diameter disk according to ASTM E 661.
- E. Grid Core: Mechanically interlocked extruded-aluminum I-beams, with a minimum flange width of 7/16 inch.
  - 1. Extruded Aluminum: ASTM B 221, in alloy and temper recommended in writing by manufacturer
  - 2. I-Beam Construction: Thermally broken; two separate extruded-aluminum components permanently bonded by a material of low thermal conductance
  - 3. Grid Pattern: As indicated on Drawings
- F. Exterior Face Sheet
  - 1. Thickness: 0.070 inches
  - 2. Color: White, unless otherwise selected by the Commissioner.

3. Color Stability: Not more than 4.0 units Delta E when measured according to ASTM D 2244 after outdoor weathering in southern Florida according to procedures in ASTM D 1435 with panels mounted facing south and as follows:
  - a. Panel Mounting Angle: Not more than 5 degrees from horizontal
  - b. Exposure Period: 60 months
4. Erosion Protection: Manufacturer's standard.
5. Impact Resistance: No fracture or tear at impact of 230 ft. x lbf by a 3-1/4-inch- diameter, 5-lb free-falling ball according to test procedure in UL 972.

G. Interior Face Sheet

1. Thickness: 0.060 inch
2. Color: White, unless otherwise selected by the Commissioner.

H. Fiberglass-Sandwich-Panel Adhesive: ASTM D 2559.

1. Compatible with facing and core materials.
2. Tensile and shear bond strength of aged adhesive ensures permanent adhesion of facings to cores, as evidenced by testing according to ASTM C 297 and ASTM D 1002 after accelerated aging procedures that comply with aging requirements for adhesives with high resistance to moisture in ICBO ES AC05, "Sandwich Panel Adhesives."

I. Panel Fabrication: Factory assemble and seal panels.

1. Laminate face sheets to grid core under a controlled process using heat and pressure to produce straight adhesive bonding lines that cover width of core members and that have sharp edges.
  - a. White spots indicating lack of bond at intersections of grid-core members are limited in number to 4 for every 40 sq. ft. of panel and limited in diameter to 3/64 inch.
2. Fabricate with grid pattern that is symmetrical about centerlines of each panel.
3. Fabricate panel to allow condensation within panel to escape.
4. Reinforce panel corners.

2.04 ACCESSORY MATERIALS

- A. Insulating Materials: Specified in Section 07210 - Building Insulation.

- B. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil thickness per coat.

## 2.05 ALUMINUM FINISHES

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- C. High-Performance Organic Finish (3-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: conversion coating; Organic Coating: manufacturer's standard 3-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions.
  - 1. Color and Gloss: Match Commissioner's sample.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
  - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General
  - 1. Comply with manufacturer's written instructions.
  - 2. Do not install damaged components.
  - 3. Fit joints between aluminum components to produce hairline joints free of burrs and distortion.
  - 4. Rigidly secure nonmovement joints.
  - 5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.

6. Weld aluminum components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
  7. Seal joints watertight, unless otherwise indicated.
  8. Do not permit other building materials, systems or finishes from being supported by, or on the translucent insulated panel system (including, but not limited to panel system extrusions).
- B. Metal Protection: Where aluminum components will contact dissimilar materials, protect against galvanic action by painting contact surfaces with bituminous paint or by installing nonconductive spacers as recommended in writing by manufacturer for this purpose.
- C. Install continuous aluminum sill closure with weatherproof expansion joints and locked and sealed or welded corners. Locate weep holes at rafters.
- D. Install components to drain water passing joints, condensation occurring within aluminum members and panels, and moisture migrating within assembly to exterior.
- E. Install components plumb and true in alignment with established lines and elevations.
- F. Install insulation materials as specified in Section 07210 - Building Insulation.
- G. Erection Tolerances: Install assemblies to comply with the following maximum tolerances:
1. Alignment: Limit offset from true alignment to 1/32 inch where surfaces abut in line, edge to edge, at corners, or where a reveal or protruding element separates aligned surfaces by less than 3 inches; otherwise, limit offset to 1/8 inch.
  2. Location and Plane: Limit variation from true location and plane to 1/8 inch in 12 feet; 1/2 inch over total length.

### 3.03 FIELD QUALITY CONTROL

- A. Testing Agency: City will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Testing Services: Testing and inspecting of representative areas to determine compliance of installed assemblies with specified requirements shall take place as follows and in successive stages as indicated on Drawings. Do not proceed with installation of the next area until test results for previously completed areas show compliance with requirements.

1. Water Penetration under Static Pressure: Before installation of interior finishes has begun, areas shall be tested according to ASTM E 1105.
    - a. Test Procedures: Test under uniform and cyclic static air pressure
    - b. Static-Air-Pressure Difference: Not less than 27 lbf/sq. ft.
    - c. Water Penetration: None
  2. Water-Spray Test: Before installation of interior finishes has begun, assemblies shall be tested according to AAMA 501.2 and shall not evidence water penetration.
- C. Repair or remove work where test results and inspections indicate that it does not comply with specified requirements.
- D. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- 3.04 CLEANING AND REPAIR
- A. General: After translucent panel system installation clean both interior and exterior exposed surfaces of the panels, framing members and closures of dust, surface contaminants, and other such dirt in accordance with the system manufacturer's recommendations.
  - B. Remove protective wrapping/coverings, applied labels and other such markings from exposed surfaces.
  - C. Repair minor damages resulting from delivery, storage, handling and installation. Replace damaged components of the translucent insulated panel system, which cannot be repaired in the field, to the satisfaction of the Commissioner.

- END OF SECTION -

**Section 08660**  
**WINDOW SECURITY SCREENS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes fixed and operable security screen assemblies, as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 – Plant-Precast Architectural Concrete
- B. Section 07920 - Exterior Joint Sealants
- C. Section 08520 - Aluminum Windows

**1.03 REFERENCES**

- A. References and industry standards listed in this Section are applicable to the Work. Unless more restrictive criteria or differing requirements are explicitly stated in the Specifications, or mandated by governing codes or regulations, the recommendations, suggestions, and requirements described in the referenced standards shall be deemed mandatory and applicable to the Work.

- 1. American Society for Testing and Materials (ASTM)
- 2. New York City Building Code

**1.04 SUBMITTALS**

- A. Product Data: Include construction details, material descriptions, descriptions, and finishes for each type of security screen and frame specified.
- B. Shop Drawings: In addition to requirements specified herein, provide a detailed location schedule of security screen assemblies using same reference numbers for details and openings as those on Drawings:
- 1. Elevations of each security screen
  - 2. Details of security screens
  - 3. Frame details for each frame type, including dimensioned profiles
  - 4. Details and locations of reinforcement and preparations for hardware
  - 5. Details of each different wall/substrate condition
  - 6. Details of anchorages, accessories, joints, and connections
  - 7. Section and connection details at 3/4" scale (minimum)

8. Indicate how release mechanisms are coordinated with operating sash on shop drawings

C. Samples for Verification: For each type of exposed finish required.

D. Construction Samples: 12-by-12-inch corner section representing the specified construction of security screens to be furnished by manufacturer.

1. Show welded corner joint, attachments and reinforcement.

E. Qualification Data: For Installer.

F. Warranties: Submit a sample of the actual manufacturer's warranty.

G. Keys: Provide two operating keys per window security screen assembly. Keys and locking mechanisms shall be keyed alike. Deliver keys to City and obtain receipt.

#### 1.05 QUALITY ASSURANCE

A. Manufacturer: Minimum of three (3) years experience in successful manufacture of product of type and quality of that specified.

B. Installer: Minimum of three (3) years experience in installation of product of type specified.

C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver security screens wrapped, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic.

B. Store assemblies under cover at Project site. Place units in a vertical position; spaced by blocking, on minimum 4-inch- high, wood blocking. Avoid using non-vented plastic or canvas shelters that could create a humidity chamber.

1. If wrappers become wet, remove cartons immediately. Provide minimum 1/4-inch space between each stacked door to permit air circulation.

#### 1.07 PROJECT CONDITIONS

A. Field Measurements: Verify sizes and locations of each security screen by field measurements before fabrication and indicate measurements on Shop Drawings.

## 1.08 COORDINATION

- A. Coordinate installation of anchorages for security screens. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in masonry. Deliver such items to Project site in time for installation.

## 1.09 WARRANTY

- A. Warranty: Manufacturer's standard form in which manufacturer and installer agrees to repair or replace security screen assemblies that fail in materials or workmanship within specified warranty period.
- B. Warranty Period: One year from date of Substantial Completion.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide security screen assemblies as manufactured by the following:
  - 1. Exeter Architectural Products
  - 2. Harmony Products, Inc.
  - 3. Or approved equal
- B. Selected Products: Provide the following:
  - 1. "Crime-Shield" as manufactured by Exeter Architectural Products or approved equal
  - 2. "HP 1050A" as manufactured by Harmony Products, Inc. or approved equal

## 2.02 SECURITY SCREENS

- A. General: Provide fixed and operable, aluminum framed, perforated galvanized steel sheet type security screen assemblies. Assemblies shall receive a high performance synthetic powder coat finish system.
  - 1. Colors: Matching the Commissioner's sample.
- B. Security screen assembly construction as follows:
  - 1. General: Assemblies shall consist of an extruded aluminum frame; permanently affixed to fenestrations indicated on the Drawings; positioned in, and retained by frame. Individual screen panels shall be unitized and each three-dimensional assembly fabricated from a single sheet of steel formed into rigid unit.

2. Exterior Frames: Aluminum extrusions, alloy 6063-T6, minimum wall thickness 0.10". Joints mitered, fitted with corner keys, and welded (in an area concealed when installed).
3. Screen Panels: 12-gage cold-rolled steel, mill-galvanealed both sides. Provide "InvisiPerf No. 1" perforated panels with a minimum open area of 51% and visibility quotient of 2.60.

C. Fabrication

1. Screen Panels: Continuously protected by solid frame flanges running full height and width of each side of window opening; operate through a single-point exterior, keyed release mechanism for maximum security and safety.
  - a. Upon turning key the sliding planar motion shall first free barrier from frame retention members. Outward pivoting motion shall open panel.
2. Hinge and latch components, and fastening hardware, shall be fully concealed and inaccessible from exterior. Latch protected by a stainless steel enclosure, angled 45 degrees to deflect drill or other penetration attempts. A single locking pin shall be used, and shall not be visible through gaps in frame or between frame and barrier panel. Provide exterior key actuated latch device for hinged screens.
3. Frame retention members, together with hinge assembly and pivot shall be non-interdependent in design and construction so that compromised (or removed) hinged pins shall not make security screen panel operable from exterior. Panels shall be fully secured only by combined action of frame retention panels and latch pin.
4. Bottom frame member on side-pivoting units shall be equipped with UHMW (ultra-high molecular weight) plastic or other lifetime-lubricated bearing surface.
5. Frame equipped by manufacturer with adjustable mounting brackets to accommodate variations in window size and out-of-square conditions. Range of adjustability shall be minimum 3", vertically and horizontally.
6. Fasteners: Stainless steel, type determined by installer to best suit mounting to substrate. Mounting brackets shall be designed in such a way that fasteners employed to affix brackets to buildings shall always be within plane of exterior wall and hence stressed on forcible entry attempts in shear.
7. Barriers shall be for installation from exterior of building with common hand tools.
8. Frames shall be of type required for method of mounting (recessed and flush with plane of exterior wall) as detailed or indicated on Drawings.

## 2.03 FINISH

- A. Powder Coating: Coat with a colored polymeric urethane powder coating, minimum thickness of 3 mils. Coatings containing epoxy or lead are not acceptable.
  - 1. Substrate: Provide mechanical cleaning, chemical cleaning and then application of a corrosive inhibiting zinc coating before the final powder coat.
  - 2. Uniformly apply powder coating by the electrostatic method and then oven-cure at 400 degrees F to chemically bond the finish.
    - a. All fabrication including cutting, coping, grinding and welding shall be completed prior to application of corrosion inhibiting agent.
  - 3. Colors: Matching the Commissioner's samples.
- B. Coating Performance: The powder coating shall comply with ASTM standards as follows:
  - 1. Adhesion Cross Hatching Test                      ASTM D 3359B
  - 2. Flexibility Conical Mandrel                        ASTM D 522
  - 3. Pencil Hardness Test                                ASTM D 3363 (H-2H)
  - 4. Impact Resistance Test                             ASTM D 2794
  - 5. Overbake Resistance Test                         ASTM D 2454
  - 6. Salt Spray Resistance Test                        ASTM B 117
  - 7. Abrasion Resistance Test                          ASTM D 4060 (Modified)
  - 8. Humidity Resistance Test                         ASTM D 2247

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of security screens.
  - 1. Examine roughing-in for embedded and built-in anchors to verify actual locations of security screen connections before frame installation.
  - 2. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
  - 3. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. General: Verify openings for security screens and conditions are satisfactory to accommodate installation of security screens.

- B. Prior to installation, adjust and securely brace security screens for squareness, alignment, and plumb to the following tolerances:

1. Squareness: Plus or minus 1/16 inch
2. Alignment: Plus or minus 1/16 inch
3. Plumbness: Plus or minus 1/16 inch

### 3.03 INSTALLATION

- A. General: Install security screens plumb, rigid, properly aligned, and securely fastened in place.
- B. Install as detailed on Drawings and as recommended by Manufacturer. Generally, provide "reveal" or "recessed" mounting" (between jambs) at window locations.
- C. After completion, adjust screens/barrier for proper working order and leave Work clean and free of labels.

### 3.04 ADJUSTMENT AND CLEANING

- A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work including security screens that are warped, bowed, or otherwise unacceptable.
1. Instruct and train City of New York's personnel in the proper operation and maintenance of the installed security window screen assemblies.
- B. Clean grout and other bonding material off security screens immediately after installation.
- C. Touchup: Immediately after erection, smooth abraded, chipped, scratched or otherwise damaged areas of shop finished (powder coated) metals and re-apply the manufacturer's field applied touch-up paint. Touch-up paint system is subject to the acceptance of the Commissioner.
1. Repairs to shop applied finishes which are unacceptable to the Architect shall be removed, and returned to the shop for re-coating; or replaced with new units identical to the systems/finishes specified.

-END OF SECTION-

**Section 08711**  
**DOOR HARDWARE**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Commercial door hardware for the following:
    - a. Swinging doors
    - b. Other doors to the extent indicated
  - 2. Cylinders for doors specified in other Sections
  - 3. Electrified door hardware
- B. Products furnished, but not installed, under this Section include the following. Coordinating, purchasing, delivering, and scheduling remain requirements of this Section.
  - 1. Permanent cores to be installed by City of New York.

**1.02 RELATED SPECIFICATIONS**

- A. Section 08110 Stainless-Steel Doors and Frames for doors and frames to receive door hardware and for astragals provided as part of fire-rated labeled assemblies and for door silencers provided as part of hollow-metal frames.
- B. Section 08311 Access Doors and Frames for access door hardware, including cylinders
- C. Section 08331- Overhead Coiling Doors for cylinder lock requirements
- D. Section 08342-High Speed Fabric Doors for cylinder lock requirements
- E. Section 16121 Wires and Cables – 600 Volts and Below for connections to electrical power system and for low-voltage wiring work
- F. Section 16491 Control Components and Devices for control devices
- G. Division 17 for SCADA System requirements
- H. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

## 1.03 REFERENCES

## A. Codes and standards to follow are:

1. BHMA A156.1 Butt and Hinges
2. BHMA A156.2 Bored and Preassembled Locks and latches
3. BHMA A156.4 Door Controls and Closers
4. UL 305 Panic hardware

## 1.04 SUBMITTALS

## A. Product Data: Include construction and installation details, material descriptions, dimensions of individual components and profiles, and finishes.

## B. Shop Drawings: Details of electrified door hardware, indicating the following:

1. Wiring Diagrams: Power, signal, and control wiring. Include the following:
  - a. System schematic
  - b. Point-to-point wiring diagram
  - c. Riser diagram
  - d. Elevation of each door
2. Detail interface between electrified door hardware and fire alarm access control security building control system.
3. Operation Narrative: Describe the operation of doors controlled by electrified door hardware.

## C. Samples for verification: Submit minimum 2-by-4-inch plate Samples of each type of finish required, except prime finish.

## D. Product Certificates: For electrified door hardware, signed by product manufacturer.

1. Certify that door hardware approved for use on types and sizes of labeled fire doors complies with listed fire door assemblies.

## E. Qualification Data: For Installer and Architectural Hardware Consultant.

## F. Maintenance Data: For each type of door hardware to include in maintenance manuals. Include final hardware and keying schedule.

## G. Warranty: Special warranty specified in this Section.

## H. Other Action Submittals

1. Door Hardware Sets: Prepared by or under the supervision of Installer detailing fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final door hardware sets with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.

- a. Content: Include the following information:

- (1) Identification number, location, hand, fire rating, and material of each door and frame
- (2) Type, style, function, size, quantity, and finish of each door hardware item. Include description and function of each lockset and exit device
- (3) Complete designations of every item required for each door or opening including name and manufacturer
- (4) Fastenings and other pertinent information
- (5) Location of each door hardware set, cross-referenced to Drawings, both on floor plans and in door and frame schedule
- (6) Explanation of abbreviations, symbols, and codes contained in schedule
- (7) Mounting locations for door hardware
- (8) Door and frame sizes and materials
- (9) Description of each electrified door hardware function, including location, sequence of operation, and interface with other building control systems
  - (a) Sequence of Operation: Include description of component functions that occur in the following situations: authorized person wants to enter; authorized person wants to exit; unauthorized person wants to enter; unauthorized person wants to exit.
- (10) List of related door devices specified in other Sections for each door and frame

- b. Submittal Sequence: Submit the final door hardware sets at earliest possible date, particularly where approval of the door hardware sets must precede fabrication of other work that is critical in Project

construction schedule. Include Product Data, Samples, Shop Drawings of other work affected by door hardware, and other information essential to the coordinated review of the door hardware sets.

2. Keying Schedule: Prepared by or under the supervision of Installer, detailing City's final keying instructions for locks. Include schematic keying diagram and index each key set to unique door designations.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by lock manufacturer.
  1. Installer's responsibilities include supplying and installing door hardware and providing a qualified Architectural Hardware Consultant available during the course of the Work to consult with Contractor, Commissioner, and City about door hardware and keying.
  2. Installer shall have warehousing facilities in Project's vicinity.
  3. Scheduling Responsibility: Preparation of door hardware and keying schedules.
- B. Architectural Hardware Consultant Qualifications: A person who is currently certified by DHI as an Architectural Hardware Consultant and who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project.
- C. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to NFPA 252.
  1. Test Pressure: Test at atmospheric pressure after 5 minutes into the test, neutral pressure level in furnace shall be established at 40 inches or less above the sill.
- D. Electrified Door Hardware: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. Keying Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination. In addition to City of New York, Resident Engineer, Contractor, and Commissioner, conference participants shall also include Installer's Architectural Hardware Consultant and City's security consultant. Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including, but not limited to, the following:
  1. Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion

2. Preliminary key system schematic diagram
  3. Requirements for key control system
  4. Address for delivery of keys
- F. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination. Review methods and procedures related to electrified door hardware including, but not limited to, the following:
1. Review required testing, inspecting, and certifying procedures.
- 1.06 DELIVERY, STORAGE, AND HANDLING
- A. Inventory door hardware on receipt and provide secure lock-up for door hardware delivered to Project site.
  - B. Tag each item or package separately with identification related to the final door hardware sets, and include basic installation instructions, templates, and necessary fasteners with each item or package.
  - C. Deliver keys and permanent cores to City by registered mail or overnight package service.
- 1.07 COORDINATION
- A. Coordinate layout and installation of recessed pivots and closers with floor construction. Cast anchoring inserts into concrete. Concrete, reinforcement, and formwork requirements are specified in Section 03100 - Concrete Forms and Accessories and Section 03200 - Concrete Reinforcement and Section 03300 - Cast-In-Place Concrete.
  - B. Electrical System Roughing-in: Coordinate layout and installation of electrified door hardware with connections to power supplies fire alarm system and detection devices, access control system, security system, building control system.
- 1.08 WARRANTY
- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of door hardware that fail in materials or workmanship within specified warranty period.
    1. Failures include, but are not limited to, the following:
      - a. Structural failures including excessive deflection, cracking, or breakage.
      - b. Faulty operation of operators and door hardware.

- c. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.
- 2. Warranty Period: Three years from date of Substantial Completion, except as follows:
  - a. Electromagnetic, Delayed-Egress Locks: Five years from date of Substantial Completion.
  - b. Exit Devices: Five years from date of Substantial Completion.
  - c. Manual Closers: 10 years from date of Substantial Completion.
  - d. Concealed Floor Closers: 10 years from date of Substantial Completion.

#### 1.09 MAINTENANCE SERVICE

- A. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for City's continued adjustment, maintenance, and removal and replacement of door hardware.

### PART 2 PRODUCTS

#### 2.01 SCHEDULED DOOR HARDWARE

- A. General: Provide door hardware for each door to comply with requirements in this Section and door hardware sets indicated in door and frame schedule and door hardware sets indicated in Part 3 "Door Hardware Sets" Article.
  - 1. Door Hardware Sets: Provide quantity, item, size, finish or color indicated.
  - 2. Sequence of Operation: Provide electrified door hardware function, sequence of operation, and interface with other building control systems indicated.
- B. Designations: Requirements for design, grade, function, finish, size, and other distinctive qualities of each type of door hardware are indicated in Part 3 "Door Hardware Sets" Article. Products are identified by using door hardware designations, as follows:
  - 1. Named Manufacturers' Products: Manufacturer and product designation are listed for each door hardware type required for the purpose of establishing minimum requirements. Manufacturers' names are abbreviated in Part 3 "Door Hardware Sets" Article.
  - 2. References to BHMA Standards: Provide products complying with these standards and requirements for description, quality, and function.

- C. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

## 2.02 HINGES, GENERAL

- A. Quantity: Provide the following, unless otherwise indicated:

1. Two Hinges: For doors with heights up to 60 inches.
2. Three Hinges: For doors with heights 61 to 90 inches.
3. Four Hinges: For doors with heights 91 to 120 inches.
4. For doors with heights more than 120 inches provide 4 hinges, plus 1 hinge for every 30 inches of door height greater than 120 inches.

- B. Template Requirements: Provide only template-produced units.

- C. Hinge Weight: Unless otherwise indicated, provide the following:

1. Entrance Doors: Heavyweight hinges
2. Doors with Closers: Antifriction-bearing hinges
3. Interior Doors: Standard-weight hinges

- D. Hinge Base Metal: Unless otherwise indicated, provide the following:

1. Exterior Hinges: Stainless steel, with stainless-steel pin
2. Interior Hinges: Stainless steel, with stainless-steel pin
3. Hinges for Fire-Rated Assemblies: Stainless steel, with stainless-steel pin

- E. Electrified Functions for Hinges: Comply with the following:

1. Power Transfer: Concealed PTFE-jacketed wires, secured at each leaf and continuous through hinge knuckle.
2. Monitoring: Concealed electrical monitoring switch.
3. Power Transfer and Monitoring: Concealed PTFE-jacketed wires, secured at each leaf and continuous through hinge knuckle, and with concealed electrical monitoring switch.

- F. Fasteners: Comply with the following:

1. Machine Screws: For metal doors and frames. Install into drilled and tapped holes.

2. Screws: Phillips flat-head; machine screws (drilled and tapped holes) for metal doors. Finish screw heads to match surface of hinges.

## 2.03 HINGES

- A. Butts and Hinges: BHMA A156.1. Listed under Category A in BHMA's "Certified Product Directory."
- B. Template Hinge Dimensions: BHMA A156.7.
- C. Acceptable Manufacturers
  1. Hager Companies (HAG)
  2. PBB, Inc. (PBB)
  3. Stanley Commercial Hardware; Div. of The Stanley Works (STH)
  4. Or approved equal

## 2.04 ELECTRIFIED MORTISE LOCKS:

- A. Mortise Locks: Stamped steel case with steel or brass parts; BHMA A156.13, Grade 1 Listed under Category F in BHMA's "Certified Product Directory."
  1. Provide heavy duty electrified mortise locks providing locking/unlocking functions without unlatching the door.
  2. Provide vandal resistant clutch lever that permits outside lever to operate without retracting the latch when locked.
  3. Mode: Field selectable, Fail-Safe or Fail-Secure, as required by installation and or indicated in Section 08110 - Stainless Steel Doors and Frames.
  4. Function: Field selectable, locked both sides or outside only, as required by installation.
  5. Voltage: Field selectable 12 or 24 VDC, as required by installation.
  6. Hand: Field selectable hand.
  7. Provide internal request-to-exit (R) SPDT Switch
  8. Provide SPDT door position switch to indicate door open or closed.
  9. Provide cable and connector.
  10. Finish: BHMA 630: Satin stainless steel.
  11. Lever trim to be selected by Commissioners from manufacturer's standard models.

## 12. Acceptable Manufacturers

- a. SARGENT Manufacturing Company; an ASSA ABLOY Group company (SGT)
- b. Schlage Commercial Lock Division; an Ingersoll-Rand Company (SCH)
- c. Security Door Controls (SDC)
- d. Yale Commercial Locks and Hardware; an ASSA ABLOY Group company (YAL)
- e. Or approved equal

## 2.05 POSITION SENSORS

## A. General: Electromagnetic concealed SPDT door position sensor.

1. Coordinate door and frame preparations with door and frame suppliers.
2. Switches shall be installed in frame head approximately 4" from latching door edge.
3. Acceptable Manufacturers
  - a. SARGENT Manufacturing Company; an ASSA ABLOY Group company (SGT)
  - b. GE Security Industrial
  - c. Yale Commercial Locks and Hardware; an ASSA ABLOY Group company (YAL)
  - d. Or approved equal

## 2.06 MECHANICAL LOCKS AND LATCHES

## A. Mortise Locks: Stamped steel case with steel or brass parts; BHMA A156.13, Grade 1 Listed under Category F in BHMA's "Certified Product Directory."

1. Acceptable Manufacturers
  - a. SARGENT Manufacturing Company; an ASSA ABLOY Group company (SGT)
  - b. Schlage Commercial Lock Division; an Ingersoll-Rand Company (SCH)
  - c. Security Door Controls (SDC)

- d. Yale Commercial Locks and Hardware; an ASSA ABLOY Group company (YAL)
- e. Or approved equal

## 2.07 ELECTROMAGNETIC LOCKS

- A. General: BHMA A156.23; electrically powered, of strength and configuration indicated; with electromagnet attached to frame and armature plate attached to door. Listed under Category E in BHMA's "Certified Product Directory."
  - 1. Type: Full exterior or full interior, as required by application indicated
  - 2. Strength Ranking: More than 1200 lbf less than 1700 lbf

## 2.08 ELECTRIFIED CYLINDRICAL LOCKS:

- A. General: Heavy duty BHMA A156.23 electrified lock providing locking/ unlocking functions without unlatching the door.
- B. Vandal resistant clutch lever release with power return spring mechanism. BHMA Grade.
- C. Provide internal request-to-exit (REX) switch.
- D. Finish: BHMA 630: Satin stainless steel

## 2.09 ELECTRIC STRIKES

- A. General: Heavy duty BHMA A156.23 Electric strikes for use with cylindrical locks or mortise locks. Stainless steel construction, tamper resistant, inboard solenoid, heavy-duty construction. Release with 20 lb side load. Horizontal keeper adjustment for door alignment. Non-handed, reversible and plug in connector.
- B. Finish BHMA 630: Satin stainless steel.

## 2.10 DOOR BOLTS

- A. Bolt Throw: Comply with testing requirements for length of bolts required for labeled fire doors, and as follows:
  - 1. Half-Round Surface Bolts: Minimum 7/8-inch throw.
  - 2. Interlocking Surface Bolts: Minimum 15/16-inch throw.
  - 3. Fire-Rated Surface Bolts: Minimum 1-inch throw; listed and labeled for fire-rated doors.
  - 4. Dutch-Door Bolts: Minimum 3/4-inch throw.
  - 5. Mortise Flush Bolts: Minimum 3/4-inch throw.

- B. Dustproof Strikes: BHMA A156.16, Grade 1.
- C. Surface Bolts: BHMA A156.16, Grade 1.
  - 1. Flush Bolt Heads: Minimum of 1/2-inch- diameter rods of brass, bronze, or stainless steel with minimum 12-inch- long rod for doors up to 84 inches in height. Provide longer rods as necessary for doors exceeding 84 inches.
  - 2. Acceptable Manufacturers
    - a. Burns Manufacturing Incorporation (BM)
    - b. IVES Hardware; an Ingersoll-Rand Company (IVS)
    - c. Stanley Commercial Hardware; Div. of The Stanley Works (STH)
    - d. Trimco (TBM)
    - e. Or approved equal
- D. Manual Flush Bolts: BHMA A156.16, Grade 1 designed for mortising into door edge.
  - 1. Acceptable Manufacturers
    - a. Burns Manufacturing Incorporation (BM)
    - b. IVES Hardware; an Ingersoll-Rand Company (IVS)
    - c. Stanley Commercial Hardware; Div. of The Stanley Works (STH)
    - d. Trimco (TBM)
    - e. Or approved equal

## 2.11 EXIT DEVICES

- A. Exit Devices: BHMA A156.3, Grade 1.
- B. Exit Devices for Means of Egress Doors: Comply with NFPA 101. Exit devices shall not require more than 15 lbf to release the latch. Locks shall not require use of a key, tool, or special knowledge for operation.
- C. Panic Exit Devices: Listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for panic protection, based on testing according to UL 305.
- D. Fire-Exit Removable Mullions: Provide removable mullions for use with fire exit devices complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire and panic protection, based on testing according to UL 305 and NFPA 252. Mullions shall be used only with exit devices for which they have been tested.
- E. Outside Trim: Lever with cylinder, Pull, Pull with cylinder; material and finish to match locksets, unless otherwise indicated.
  - 1. Match design for locksets and latchsets, unless otherwise indicated.

F. Through Bolts: For exit devices and trim on metal doors.

G. Acceptable Manufacturers

1. Corbin Russwin Architectural Hardware; an ASSA ABLOY Group company (CR)
2. SARGENT Manufacturing Company; an ASSA ABLOY Group company (SGT)
3. Von Duprin; an Ingersoll-Rand Company (VD)
4. Yale Commercial Locks and Hardware; an ASSA ABLOY Group company (YAL)
5. Or approved equal

## 2.12 LOCK CYLINDERS

A. Cylinders: Manufacturer's standard tumbler type, constructed from brass or bronze, stainless steel, or nickel silver, and complying with the following:

1. Number of Pins: Six.
2. Mortise Type: Threaded cylinders with rings and straight- or clover-type cam.
3. Rim Type: Cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
  - a. High-Security Grade: BHMA A156.5, Grade 1A, listed and labeled as complying with pick- and drill-resistant testing requirements in UL 437 (Suffix A).

B. Permanent Cores: Manufacturer's standard; finish face to match lockset; complying with the following:

1. Interchangeable Cores: Core insert, removable by use of a special key; usable with other manufacturers' cylinders to be installed by contractor.

C. Construction Keying: Comply with the following:

1. Construction Cores: Provide construction cores that are replaceable by permanent cores. Provide 10 construction master keys.
  - a. Replace construction cores with permanent cores and install as directed by City.

D. Acceptable Manufacturer: See Section 2.06.A.1 for a list of acceptable manufacturers.

## 2.13 KEYING

- A. Keying System: Factory registered, complying with guidelines in BHMA A156.28, Appendix A. Incorporate decisions made in keying conference, and as follows:

1. Great-Grand Master Key System: Cylinders are operated by a change key, a master key, a grand master key, and a great-grand master key.

Existing System: Master key or grand master key locks to City's existing system.

- B. Keys: Nickel silver.

1. Stamping: Permanently inscribe each key with a visual key control number and include the following notation:

- a. Notation: "DO NOT DUPLICATE." Information to be furnished by City.

2. Quantity: In addition to one extra key blank for each lock, provide the following:

- a. Cylinder Change Keys: Three
- b. Master Keys: Five
- c. Grand Master Keys: Five
- d. Great-Grand Master Keys: Five

## 2.14 KEY CONTROL SYSTEM

- A. Key Control Cabinet: BHMA A156.5, Grade 1; metal cabinet with baked-enamel finish; containing key-holding hooks, labels, 2 sets of key tags with self-locking key holders, key-gathering envelopes, and temporary and permanent markers; with key capacity of 700 percent of the number of locks.

1. Wall-Mounted Cabinet: Cabinet with hinged-panel door equipped with key-holding panels and pin-tumbler cylinder door lock.

- B. Cross-Index System: Multiple index system for recording key information. Include three receipt forms for each key-holding hook. Set up by key control manufacturer.

1. Acceptable Manufacturers

- a. Key Control Systems, Inc. (KCS)
- b. Lund Equipment Co., Inc. (LUN)
- c. Sunroc Corporation (SUN)
- d. Or approved equal

## 2.15 CLOSERS

- A. Door Closers for Means of Egress Doors: Comply with NFPA 101. Door closers shall not require more than 30 lbf to set door in motion and not more than 15 lbf to open door to minimum required width.
- B. Surface Closers: BHMA A156.4, Grade 1. Listed under Category C in BHMA's "Certified Product Directory." Provide type of arm required for closer to be located on non-public side of door, unless otherwise indicated.
  - 1. Acceptable Manufacturers
    - a. LCN Closers; an Ingersoll-Rand Company (LCN)
    - b. Norton Door Controls; an ASSA ABLOY Group company (NDC)
    - c. Rixson Specialty Door Controls; an ASSA ABLOY Group company (RIX)
    - d. Or approved equal
- C. Coordinators: BHMA A156.3.

## 2.16 PROTECTIVE TRIM UNITS

- A. Size: 1-1/2 inches less than door width on push side and 1/2 inch less than door width on pull side, by height specified in door hardware sets.
- B. Fasteners: Manufacturer's standard machine or self-tapping screws.
- C. Metal Protective Trim Units: BHMA A156.6; beveled top and 2 sides; fabricated from the following material:
  - 1. Material: 0.050-inch- thick stainless steel.
  - 2. Acceptable Manufacturers
    - a. Burns Manufacturing Incorporated (BM)
    - b. Rockwood Manufacturing Company (RM)
    - c. Trimco (TBM)
    - d. Or approved equal

## 2.17 STOPS AND HOLDERS

- A. Stops and Bumpers: BHMA A156.16, Grade 1.
  - 1. Provide floor stops for doors unless wall or other type stops are scheduled or indicated. Do not mount floor stops where they will impede traffic. Where floor or wall stops are not appropriate, provide overhead holders.

- B. Combination Floor and Wall Stops and Holders: BHMA A156.8, Grade 1.
- C. Combination Overhead Stops and Holders: BHMA A156.8, Grade 1.
- D. Silencers for Metal Door Frames: BHMA A156.16, Grade 1; neoprene or rubber, minimum diameter 1/2 inch, fabricated for drilled-in application to frame.
- E. Acceptable Manufacturers
  - 1. Burns Manufacturing Incorporated (BM)
  - 2. Dynalock (DYN)
  - 3. Stanley Commercial Hardware; Div. of The Stanley Works (STH)
  - 4. Trimco (TBM)
  - 5. Or approved equal

## 2.18 DOOR GASKETING

- A. Standard: BHMA A156.22. Listed under Category J in BHMA's "Certified Product Directory."
- B. General: Provide continuous weather-strip gasketing on exterior doors and provide smoke, light, and sound gasketing on interior doors. Provide non-corrosive stainless steel fasteners for exterior applications and elsewhere as indicated.
  - 1. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.
  - 2. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.
  - 3. Door Bottoms: Apply to bottom of door, forming seal with threshold when door is closed.
- C. Air Leakage: Not to exceed 0.50 cfm per foot of crack length for gasketing other than for smoke control, as tested according to ASTM E 283.
- D. Smoke-Labeled Gasketing: Assemblies complying with NFPA 105 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for smoke-control ratings indicated, based on testing according to UL 1784.
  - 1. Provide smoke-labeled gasketing on 20-minute-rated doors and on smoke-labeled doors.

- E. Fire-Labeled Gasketing: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to NFPA 252.
  - 1. Test Pressure: Test at atmospheric pressure after 5 minutes into the test, neutral pressure level in furnace shall be established at 40 inches or less above the sill.
- F. Sound-Rated Gasketing: Assemblies that are listed and labeled by a testing and inspecting agency, for sound ratings indicated, based on testing according to ASTM E 1408.
- G. Replaceable Seal Strips: Provide only those units where resilient or flexible seal strips are easily replaceable and readily available from stocks maintained by manufacturer.
- H. Gasketing Materials: ASTM D 2000 and AAMA 701/702.
- I. Acceptable Manufacturers
  - 1. Pemko Manufacturing Co. (PEM)
  - 2. Reese Enterprises (RE)
  - 3. Zero International (ZRO)
  - 4. Or approved equal

## 2.19 THRESHOLDS

- A. Standard: BHMA A156.21. Listed under Category J in BHMA's "Certified Product Directory."
- B. Thresholds for Means of Egress Doors: Comply with NFPA 101. Maximum 1/2 inch high.
- C. Acceptable Manufacturers
  - 1. Pemko Manufacturing Co. (PEM)
  - 2. Reese Enterprises (RE)
  - 3. Zero International (ZRO)
  - 4. Or approved equal

## 2.20 FABRICATION

- A. Base Metals: Produce door hardware units of base metal, fabricated by forming method indicated, using manufacturer's standard metal alloy, composition, temper, and hardness. Furnish metals of a quality equal to or greater than that of specified door hardware units and BHMA A156.18. Do not furnish manufacturer's standard materials or forming methods if different from specified standard.

- B. Fasteners: Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. Provide screws according to commercially recognized industry standards for application intended, except aluminum fasteners are not permitted. Provide Phillips flat-head screws with finished heads to match surface of door hardware, unless otherwise indicated.
1. Concealed Fasteners: For door hardware units that are exposed when door is closed, except for units already specified with concealed fasteners. Do not use through bolts for installation where bolt head or nut on opposite face is exposed unless it is the only means of securely attaching the door hardware. Where through bolts are used on hollow door and frame construction, provide sleeves for each through bolt.
  2. Steel Machine: For the following fire-rated applications:
    - a. Mortise hinges to doors
    - b. Strike plates to frames
    - c. Closers to doors and frames
  3. Steel Through Bolts: For the following fire-rated applications unless door blocking is provided:
    - a. Surface hinges to doors
    - b. Closers to doors and frames
    - c. Surface-mounted exit devices
  4. Spacers or Sex Bolts: For through bolting of hollow-metal doors.

## 2.21 FINISHES

- A. Standard: BHMA A156.18, as indicated in door hardware sets.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire door assembly construction, wall and floor construction, and other conditions affecting performance.

- B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Stainless Steel Doors and Frames: Comply with DHI A115 Series.
  - 1. Surface-Applied Door Hardware: Drill and tap doors and frames according to ANSI A250.6.

### 3.03 INSTALLATION

- A. Mounting Heights: Mount door hardware units at heights indicated as follows unless otherwise indicated or required to comply with governing regulations.
  - 1. Standard Stainless Steel Doors and Frames: DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."
- B. Install each door hardware item to comply with manufacturer's written instructions. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Division 9 Sections. Do not install surface-mounted items until finishes have been completed on substrates involved.
  - 1. Set units level, plumb, and true to line and location. Adjust and reinforce attachment substrates as necessary for proper installation and operation.
  - 2. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.
- C. Key Control System: Tag keys and place them on markers and hooks in key control system cabinet, as determined by final keying schedule.
- D. Thresholds: Set thresholds for exterior in full bed of sealant complying with requirements specified in Section 07920 - Exterior Sealants.

### 3.04 FIELD QUALITY CONTROL

- A. Independent Architectural Hardware Consultant: The City will engage a qualified independent Architectural Hardware Consultant to perform inspections and to prepare inspection reports. The Independent Architectural Hardware Consultant will inspect door hardware and state in each report whether installed work complies with or deviates from requirements, including whether door hardware is properly installed and adjusted.

### 3.05 ADJUSTING

- A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.
  - 1. Spring Hinges: Adjust to achieve positive latching when door is allowed to close freely from an open position of 30 degrees.
  - 2. Electric Strikes: Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.
  - 3. Door Closers: Unless otherwise required by authorities having jurisdiction, adjust sweep period so that, from an open position of 70 degrees, the door will take at least 3 seconds to move to a point 3 inches from the latch, measured to the leading edge of the door.
- B. Occupancy Adjustment: Approximately six months after date of Substantial Completion, Installer's Architectural Hardware Consultant shall examine and readjust, including adjusting operating forces, each item of door hardware as necessary to ensure function of doors, door hardware, and electrified door hardware.

### 3.06 CLEANING AND PROTECTION

- A. Clean adjacent surfaces soiled by door hardware installation.
- B. Clean operating items as necessary to restore proper function and finish.
- C. Provide final protection and maintain conditions that ensure that door hardware is without damage or deterioration at time of Substantial Completion.

### 3.07 DEMONSTRATION

- A. Engage a factory-authorized service representative to train City's maintenance personnel to adjust, operate, and maintain door hardware and door hardware finishes. Refer to Section 01821 - Equipment Start-up and Training.

### 3.08 DOOR HARDWARE SETS

- A. See next page for Door Hardware Sets.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 08800**  
**GLAZING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes glazing for the following products and applications, including those specified in other Sections where glazing requirements are specified by reference to this Section:
  - 1. Interior and exterior window glazing
  - 2. Doors
  - 3. Glazed openings

**1.02 RELATED SPECIFICATIONS**

- A. Section 05500 - Metal Fabrications
- B. Section 08110 - Stainless Steel Doors and Frames
- C. Section 08520 - Aluminum Windows

**1.03 DEFINITIONS**

- A. Manufacturers of Glass Products: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.
- B. Glass Thickness: Indicated by thickness designations in millimeters according to ASTM C 1036; provide equivalent thickness in inches.
- C. Interspace: Space between lites of an insulating-glass unit that contains dehydrated air or a specified gas.
- D. Deterioration of Coated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
- E. Deterioration of Insulating Glass: Failure of hermetic seal under normal use that is attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.
- F. Deterioration of Laminated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination

materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

#### 1.04 PERFORMANCE REQUIREMENTS

- A. General: Provide glazing systems capable of withstanding normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.
- B. Glass Design: Glass thickness designations indicated are minimums and are for detailing only. Confirm glass thicknesses by analyzing Project loads and in-service conditions. Provide glass lites in the thickness designations indicated for various size openings, but not less than thicknesses and in strengths (annealed or heat treated) required to meet or exceed the following criteria:
  - 1. Glass Thicknesses: Select minimum glass thicknesses to comply with ASTM E 1300, according to the following requirements:
    - a. Design Wind Loads: Determine design wind loads applicable to Project from basic wind speed indicated in miles per hour at 33 feet above grade, according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 6.5, "Method 2-Analytical Procedure," based on mean roof heights above grade indicated on Drawings.
      - (1) Basic Wind Speed: 125 mph (40 lbs./sq. ft.)
      - (2) Importance Factor: I
      - (3) Exposure Category: A
    - b. Gravity Loads: For horizontal glazing applications, determine gravity loads as per the New York City Building Code.
      - (1) Dead loads
      - (2) Live loads created by snow and personnel access
      - (3) Other loads per code
    - c. Probability of Breakage for Vertical Glazing: 8 lites per 1000 for lites set vertically or not more than 15 degrees off vertical and under wind action.
      - (1) Load Duration: 60 seconds or less
    - d. Maximum Lateral Deflection: For the following types of glass supported on all 4 edges, provide thickness required that limits center deflection at design wind pressure to 1/50 times the short side length or 1 inch, whichever is less.
      - (1) For monolithic-glass lites heat treated to resist wind loads

- (2) For insulating glass
  - e. Minimum Glass Thickness for Exterior Lites: Not less than 1/4 inch.
  - f. Thickness of Heat-Absorbing Glass: Provide the same thickness for each heat absorbing glass indicated throughout Project.
- C. Thermal Movements: Provide glazing that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures acting on glass framing members and glazing components. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- D. Thermal and Optical Performance Properties: Provide glass with performance properties specified based on manufacturer's published test data, as determined according to procedures indicated below:
  - 1. For monolithic-glass lites, properties are based on units with lites 1/4 inch thick.
  - 2. For insulating-glass units, properties are based on units with lites 1/4 inch and a nominal 1/2-inch- wide interspace.
  - 3. Center-of-Glass Values: Based on using LBL-44789 WINDOW 5.0 computer program for the following methodologies:
    - a. U-Factors: NFRC 100 expressed as Btu/ sq. ft. x h x deg F
    - b. Solar Heat Gain Coefficient: NFRC 200
    - c. Solar Optical Properties: NFRC 300

#### 1.05 SUBMITTALS

- A. Product Data: For each glass product and glazing material indicated.
- B. Samples: For the following products, in the form of 12-inch- square Samples for glass.
  - 1. Float glass
  - 2. Coated vision glass
  - 3. Each color of laminated glass interlayer
  - 4. Insulating glass for each designation indicated
  - 5. Wire glass
  - 6. For each color of exposed glazing sealant indicated

- C. Glazing Schedule: Use same designations indicated on Drawings for glazed openings in preparing a schedule listing glass types and thicknesses for each size opening and location.
- D. Product Certificates: Signed by manufacturers of glass and glazing products certifying that products furnished comply with requirements.
  - 1. For solar-control low-e-coated glass, provide documentation demonstrating that manufacturer of coated glass is certified by coating manufacturer.
- E. Qualification Data: For installers.
- F. Preconstruction Adhesion and Compatibility Test Report: From glazing sealant manufacturer indicating glazing sealants were tested for adhesion to glass and glazing channel substrates and for compatibility with glass and other glazing materials.
- G. Product Test Reports: For each of the following types of glazing products:
  - 1. Coated float glass
  - 2. Insulating glass
  - 3. Glazing sealants
  - 4. Laminated glass
- H. Warranties: Special warranties specified in this Section.

#### 1.06 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed glazing similar in material, design, and extent to that indicated for this Project; whose work has resulted in glass installations with a record of successful in-service performance; and who employs glass installers for this Project who are certified under the National Glass Association's Certified Glass Installer Program.
- B. Source Limitations for Glass with Low-E Coatings: Where solar-control low-e coatings of a primary glass manufacturer that has established a certified fabricator program is specified, obtain low-e-coated glass in fabricated units from a manufacturer that is certified by coated-glass manufacturer.
- C. Source Limitations for Glazing Accessories: Obtain glazing accessories through one source from a single manufacturer for each product and installation method indicated.
- D. Glass Product Testing: Obtain glass test results for product test reports in "Submittals" Article from a qualified testing agency based on testing glass products.
  - 1. Glass Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.

- E. Elastomeric Glazing Sealant Product Testing: Obtain sealant test results for product test reports in "Submittals" Article from a qualified testing agency based on testing current sealant formulations within a prior 36-month period.
1. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated, as documented according to ASTM E 548.
  2. Test elastomeric glazing sealants for compliance with requirements specified by reference to ASTM C 920, and where applicable, to other standard test methods.
- F. Preconstruction Adhesion and Compatibility Testing: Submit to elastomeric glazing sealant manufacturers, for testing indicated below, samples of each glazing material type, tape sealant, gasket, glazing accessory, and glass-framing member that will contact or affect elastomeric glazing sealants:
1. Use ASTM C 1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of glazing sealants to glass, tape sealants, gaskets, and glazing channel substrates.
  2. Submit not fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
  4. For materials failing tests, obtain sealant manufacturer's written instructions for corrective measures, including the use of specially formulated primers.
  5. Testing will not be required if elastomeric glazing sealant manufacturers submit data based on previous testing of current sealant products for adhesion to, and compatibility with, glazing materials matching those submitted.
- G. Safety Glazing Products: Comply with testing requirements in 16 CFR 1201.
1. Subject to compliance with requirements, obtain safety glazing products permanently marked with certification label of the Safety Glazing Certification Council or another certification agency acceptable to authorities having jurisdiction.
  2. Where glazing units, including Kind FT glass and laminated glass, are specified in Part 2 articles for glazing lites more than 9 sq. ft. in exposed surface area of one side, provide glazing products that comply with Category II materials, for lites 9 sq. ft. or less in exposed surface area of one side, provide glazing products that comply with Category I or II materials,

except for hazardous locations where Category II materials are required by 16 CFR 1201 and regulations of authorities having jurisdiction.

- H. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, unless more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.

1. GANA Publications: GANA's "Glazing Manual"
2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "Glazing Guidelines for Sealed Insulating Glass Units"

- I. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of the following testing and inspecting agency:

1. Insulating Glass Certification Council.
2. Associated Laboratories, Inc.

- J. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Commissioner.
2. Build glass mockups by installing the following kinds of glass in mockups specified in "Section 08520 - Aluminum Windows" to match glazing systems required for Project, including glazing methods:
  - a. Heat-strengthened coated glass
  - b. Fully tempered glass
3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

- K. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Section 01310 - Project Coordination.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. Protect glazing materials according to manufacturer's written instructions and as needed to prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.
- B. For insulating-glass units that will be exposed to substantial altitude changes, comply with insulating-glass manufacturer's written recommendations for venting and sealing to avoid hermetic seal ruptures.

## 1.08 PROJECT CONDITIONS

- A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.
  - 1. Do not install liquid glazing sealants when ambient and substrate temperature conditions are outside limits permitted by glazing sealant manufacturer or expected to fall below 40 deg F. during curing period

## 1.09 WARRANTY

- A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer's standard form, made out to Owner and signed by coated-glass manufacturer agreeing to replace coated-glass units that deteriorate as defined in "Definitions" Article, at the Project site, within specified warranty period indicated below.
  - 1. Warranty Period: 10 years from date of Substantial Completion
- B. Manufacturer's Special Warranty on Insulating Glass: Manufacturer's standard form, made out to Owner and signed by insulating-glass manufacturer agreeing to replace insulating-glass units that deteriorate as defined in "Definitions" Article, at the Project site, within specified warranty period indicated below.
  - 1. Warranty Period: 10 years from date of Substantial Completion
- C. Manufacturer's Special Warranty on Laminated Glass: Manufacturer's standard form, made out to Owner and signed by laminated-glass manufacturer agreeing to replace laminated-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
  - 1. Warranty Period: Five years from date of Substantial Completion

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
  - 1. Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products specified.

### 2.02 GLASS PRODUCTS

- A. Annealed Float Glass: ASTM C 1036, Type I (transparent flat glass), Quality-Q3; of class indicated.

- B. Heat-Treated Float Glass: ASTM C 1048; Type I (transparent flat glass); Quality-Q3; of class, kind, and condition indicated.
1. Fabrication Process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed, unless otherwise indicated.
  2. Provide Kind HS (heat-strengthened) float glass in place of annealed float glass where needed to resist thermal stresses induced by differential shading of individual glass lites and to comply with glass design requirements specified in Part 1 "Performance Requirements" Article.
  3. For uncoated glass, comply with requirements for Condition A.
  4. For coated vision glass, comply with requirements for Condition C (other uncoated glass).
  5. Provide Kind FT (fully tempered) float glass in place of annealed or Kind HS (heat-strengthened) float glass where safety glass is indicated, and for horizontal glazing applications.
- C. Sputter-Coated Float Glass: ASTM C 1376, float glass with metallic-oxide or -nitride coating deposited by vacuum deposition process after manufacture and heat treatment (if any), and complying with other requirements specified.
- D. Wired Glass: ASTM C 1036, Type II (patterned and wired flat glass), Class 1 (clear), Quality-Q-6; and of form and mesh pattern specified.
- E. Laminated Glass: ASTM C 1172, and complying with other requirements specified and with the following:
1. Interlayer: Polyvinyl butyral or cured resin of thickness indicated with a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after laminating glass lites and installation.
    - a. For polyvinyl butyral interlayers, laminate lites in autoclave with heat plus pressure.
    - b. For cured-resin interlayers, laminate lites with laminated-glass manufacturer's standard cast-in-place and cured-transparent-resin interlayer.
- F. Laminating Process: Fabricate laminated glass to produce glass free of foreign substances and air or glass pockets.
- G. Insulating-Glass Units, General: Factory-assembled units consisting of sealed lites of laminated glass separated by a dehydrated interspace, and complying with ASTM E 774 for Class CBA units and with requirements specified in this Article and in Part 2 "Insulating-Glass Units" Article.

1. Provide Kind HS (heat-strengthened) float glass in place of annealed glass where needed to resist thermal stresses induced by differential shading of individual glass lites and to comply with glass design requirements specified in Part 1 "Performance Requirements" Article.
2. Overall Unit Thickness and Thickness of Each Lite: Dimensions indicated for insulating-glass units are nominal and the overall thicknesses of units are measured perpendicularly from outer surfaces of glass lites at unit's edge.
3. Sealing System: Dual seal, with primary and secondary sealants as follows:
  - a. Polyisobutylene and polyurethane
4. Spacer Specifications: Manufacturer's standard spacer material and construction complying with the following requirements:
  - a. Spacer Material: Stainless steel
  - b. Desiccant: Molecular sieve or silica gel, or blend of both
  - c. Corner Construction: Manufacturer's standard corner construction

## 2.03 GLAZING SEALANTS

- A. General: Provide products of type indicated, complying with the following requirements:
  1. Compatibility: Select glazing sealants that are compatible with one another and with other materials they will contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.
  2. Suitability: Comply with sealant and glass manufacturers' written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.
  3. Colors of Exposed Glazing Sealants: As selected by Commissioner from manufacturer's full range.
- B. Elastomeric Glazing Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied chemically curing sealant specified, including those referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.
  1. Single-Component Neutral-Curing Silicone Glazing Sealants:
    - a. Available Products: Provide one of the following, or approved equal.
      - (1) GE Silicones; SilPruf SCS2000

- (2) Pecora Corporation; 890
- (3) Tremco; Spectrem 3
- b. Type and Grade: S (single component) and NS (nonsag)
- c. Class: 50
- d. Use Related to Exposure: NT (nontraffic)
- e. Uses Related to Glazing Substrates: M, G, A, and, as applicable to glazing substrates indicated, O
  - (1) Use O Glazing Substrates: Coated glass and aluminum coated with a high-performance coating

#### 2.04 GLAZING TAPES

- A. Back-Bedding Mastic Glazing Tapes: Preformed, butyl-based elastomeric tape with a solids content of 100 percent; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; packaged on rolls with a release paper backing; and complying with ASTM C 1281 and AAMA 800 for products indicated below:
  - 1. AAMA 804.3 tape, where indicated
  - 2. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure
  - 3. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure

#### 2.05 MISCELLANEOUS GLAZING MATERIALS

- A. General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.
- B. Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.
- C. Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.
- D. Spacers: Elastomeric blocks or continuous extrusions with a Shore, Type A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.

- E. Edge Blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walking).
- F. Cylindrical Glazing Sealant Backing: ASTM C 1330, Type O (open-cell material), of size and density to control glazing sealant depth and otherwise produce optimum glazing sealant performance.

## 2.06 FABRICATION OF GLAZING UNITS

- A. Fabricate glazing units in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.
- B. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites in a manner that produces square edges with slight kerfs at junctions with outdoor and indoor faces.
- C. Grind smooth and polish exposed glass edges and corners.

## 2.07 INSULATING-GLASS UNITS

- A. Solar-Control Low-E Insulating-Glass Units (Glass Type 1): Transparent Insulating Glass.
  - 1. Overall Unit Thickness and Thickness of Each Lite: As indicated
  - 2. Interspace Content: Air
  - 3. Outdoor Lite: Class 1 (clear) laminated float glass; matching Commissioner's sample
    - a. Kind HS (heat strengthened)
  - 4. Indoor Lite: Class 1 (clear) float glass
    - a. Kind HS (heat strengthened)
  - 5. Low-E Coating: Sputtered on third surface, unless otherwise indicated on the approved sample
  - 6. Visible Light Transmittance: 40 percent minimum
  - 7. Winter Nighttime U-Factor: 0.31 maximum
  - 8. Summer Daytime U-Factor: 0.32 maximum
  - 9. Solar Heat Gain Coefficient: 0.40 maximum
  - 10. Outdoor Visible Reflectance: 0.34percent maximum

11. Applications: Provide 1" thick, solar-control low-E coated insulating glass at all interior and exterior aluminum windows, and other locations indicated.
- B. Heat-Treated Obscure Laminated-Glass Units (Glass Type 2): Obscure Insulating Glass.
  1. Overall Unit Thickness and Thickness of Each Lite: As indicated
  2. Interspace Content: Air
    - a. Outdoor Lite: Provide two layers of 5.0 mm thick heat strengthened, Class 1 (clear) tempered glass factory laminated together with an opaque (white) 0.60" thick pvb interlayer; interlayer translucency matching the Commissioner's sample.
  3. Indoor Lite: Class 1 (clear) float glass
    - a. Kind HS (heat strengthened)
  4. Applications: Provide obscure insulating glazing at exterior toilets and locker room toilet rooms, and other locations indicated.

## 2.08 HORIZONTAL/STRUCTURAL LAMINATED GLAZING

- A. Multi-Ply Laminated Laminated-Glass Units (Glass Type 4): Structural Laminated Safety Glass.
  1. Provide multi-layer structural laminated glass assemblies matching the Commissioner's samples. Structural laminated glass assemblies shall be fabricated from tempered safety glass. Structural laminated glass shall be of the thickness, composition and strength required to meet the New York City Building code requirements, performance criteria specified and span/support spacings indicated on the Drawings.
  2. Prior to fully tempering the glass assemblies, provide bores, holes and other such modifications to the structural glass assemblies (including the grinding and polishing of exposed glass edges) as required to accommodate the stainless steel studs, caps and fittings which secure units to supporting members.
- B. Applications: Provide structural laminated safety glass at canopy glazing, and other locations indicated.

## 2.09 MONOLITHIC WIRED-GLASS UNITS

- A. Polished Wired-Glass Units (Glass Type 3): Wire Glass.
  1. Form 1 (wired glass, polished both sides), Quality-Q6, 6.0 mm thick, Mesh 1 Diamond pattern, unless otherwise selected by the Commissioner.

2. Applications: Provide monolithic wired glazing at fire rated doors and vision panel glazing, and other locations indicated.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine framing glazing, with Installer present, for compliance with the following:
  1. Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners
  2. Presence and functioning of weep system
  3. Minimum required face or edge clearances
  4. Effective sealing between joints of glass-framing members
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 PREPARATION

- A. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

#### 3.03 GLAZING, GENERAL

- A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.
- B. Glazing channel dimensions, as indicated on Drawings, provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
- C. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.
- D. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.
- E. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
- F. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.

- G. Provide spacers for glass lites where length plus width is larger than 50 inches as follows:
1. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
  2. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
- H. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.
- I. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.
- J. Where wedge-shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.
- K. Square cut wedge-shaped gaskets at corners and install gaskets in a manner recommended by gasket manufacturer to prevent corners from pulling away; seal corner joints and butt joints with sealant recommended by gasket manufacturer.

#### 3.04 TAPE GLAZING

- A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.
- B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.
- C. Cover vertical framing joints by applying tapes to heads and sills first and then to jambs. Cover horizontal framing joints by applying tapes to jambs and then to heads and sills.
- D. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.
- E. Do not remove release paper from tape until just before each glazing unit is installed.

- F. Apply heel bead of elastomeric sealant.
- G. Apply cap bead of elastomeric sealant over exposed edge of tape.

### 3.05 SEALANT GLAZING (WET)

- A. Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.
- B. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.
- C. Tool exposed surfaces of sealants to provide a substantial wash away from glass.

### 3.06 CLEANING AND PROTECTION

- A. Protect exterior glass from damage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels, and clean surfaces.
- B. Protect glass from contact with contaminating substances resulting from construction operations, including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove substances immediately as recommended by glass manufacturer.
- C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains; remove as recommended in writing by glass manufacturer.
- D. Remove and replace glass that is broken, chipped, cracked, or abraded or that is damaged from natural causes, accidents, and vandalism, during construction period.
- E. Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended in writing by glass manufacturer.

- END OF SECTION -

NO TEXT ON THIS PAGE

**Section 09010**  
**ROOM FINISH SCHEDULE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the room finish schedule for the buildings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03350 – Concrete Finishes
- B. Section 07210 - Building Insulation
- C. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

**PART 2 PRODUCTS****2.01 MATERIALS**

- A. Materials associated with this schedule are described in other sections.

**PART 3 EXECUTION****3.01 COORDINATION**

- A. Coordinate use of this room finish schedule with door and hardware schedules.

**SOUTHWEST BROOKLYN TRANSFER STATION**

-END OF SECTION-

**Section 09260**  
**GYPSUM BOARD ASSEMBLIES**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Interior gypsum for ceilings and soffits.
  - 2. Non-load-bearing steel framing.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05400 "Cold-Formed Metal Framing" for load-bearing steel framing.
- B. Section 07210 "Building Insulation"
- C. HVAC related Sections for air distribution components pertinent to ceiling system.
- D. Electrical related Sections for lighting components pertinent to ceiling system.
- E. Plumbing related Sections for fire sprinklers

**1.03 DEFINITIONS**

- A. Gypsum Board Terminology: Refer to ASTM C 11 for definitions of terms for gypsum board assemblies not defined in this Section or in other referenced standards.

**1.04 SUBMITTALS**

- A. Product Data: Submit manufacturer's descriptive literature indicating material composition, thickness, sizes and fire resistance for each type of product indicated.
- B. Shop Drawings: Show locations, fabrication and installation of control and expansion joints including plans, elevations, sections, details of components and attachments to other units of Work.
- C. Samples: For the following products:
  - 1. Trim Accessories: Full-size sample in 12-inch- long length for each trim accessory indicated.
  - 2. Textured Finishes: Manufacturer's standard size for each textured finish indicated and on same backing indicated for Work.
- D. Submit manufacturer's written certification that product meets specified requirements.

## 1.05 QUALITY ASSURANCE

- A. Fire-Test-Response Characteristics: For gypsum board assemblies with fire-resistance ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Fire-Resistance-Rated Assemblies: Indicated by design designations from UL's "Fire Resistance Directory".
- B. Finish Mockups: Before finishing gypsum board assemblies, install mockups of at least 100 sq. ft. in surface area to demonstrate aesthetic effects and qualities of materials and execution.
  - 1. Install mockups for the following applications:
    - a. Surfaces with texture finish
    - b. Surfaces indicated to receive non-textured paint finishes
    - c. Surfaces indicated to receive textured paint finishes.
  - 2. Simulate finished lighting conditions for review of mockups.

## 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer or supplier and the type and thickness of the gypsum board. Stamped with an Underwriters Laboratories, Inc. label documenting UL Classification for fire resistance, surface burning characteristics and non-combustibility.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat to prevent sagging.

## 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Steel Framing and Furring:
  - 1. Clark Steel Framing Systems
  - 2. Consolidated Systems, Inc.
  - 3. Unimast, Inc.
  - 4. Western Metal Lath & Steel Framing Systems

## B. Gypsum Board and Related Products

1. American Gypsum Co.
2. G-P Gypsum Corp.
3. National Gypsum Company
4. United States Gypsum Co.

## 2.02 STEEL SUSPENDED CEILING AND SOFFIT FRAMING

A. Components, General: Comply with ASTM C 754 for conditions indicated. Provide components approved for use in New York City by the NYC Building Code.

B. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.0625-inch-diameter wire, or double strand of 0.0475-inch- diameter wire.

## C. Hanger Attachments to Concrete:

1. Anchors: Fabricated from corrosion-resistant materials with holes or loops for attaching hanger and capable of sustaining, without failure, a load equal to 5 times that imposed by construction as determined by testing according to ASTM E 488 by a qualified independent testing agency.

a. Type: Post-installed, chemical anchor, Post-installed, expansion anchor.

2. Powder-Actuated Fasteners: Suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other devices for attaching hangers of type indicated, and capable of sustaining, without failure, a load equal to 10 times that imposed by construction as determined by testing according to ASTM E 1190 by a qualified independent testing agency.

## D. Hangers

1. Rod Hangers: ASTM A 510, mild carbon steel.

a. Diameter: 1/4-inch

b. Protective Coating: ASTM A 153/A 153M, hot-dip galvanized

2. Flat Hangers: Commercial-steel sheet, ASTM A 653/A 653M, G60, hot-dip galvanized.

a. Size: 1 by 3/16 inch by length indicated

3. Angle Hangers: ASTM A 653/A 653M, G60, hot-dip galvanized commercial-steel sheet.

a. Minimum Base Metal Thickness: 0.0312 inch

b. Size: 1-5/8 by 1-5/8 inches

- E. Carrying Channels: Cold-rolled, commercial-steel sheet with a base metal thickness of 0.0538 inch, a minimum 1/2-inch- wide flange, with, ASTM A 653/A 653M, G60, hot-dip galvanized zinc coating.

1. Depth: 1-1/2 inches

- F. Furring Channels (Furring Members): Commercial-steel sheet with ASTM A 653/A 653M, G60, hot-dip galvanized.

1. Cold Rolled Channels: 0.0538-inch bare steel thickness, with minimum 1/2-inch- wide flange, 3/4 inch deep.

2. Steel Studs: ASTM C 645. Size and spacing to comply with requirements for indicated spans.

a. Minimum Base Metal Thickness: 0.0312 inch

b. Depth [1-5/8 inches, 2-1/2 inches, 3-5/8 inches

3. Hat-Shaped, Rigid Furring Channels: ASTM C 645, 7/8 inch deep

a. Minimum Base Metal Thickness: 0.0312 inch

- G. Grid Suspension System for Interior Ceilings: ASTM C 645, direct-hung system composed of main beams and cross-furring members that interlock.

1. Products: Subject to compliance with requirements, provide by one of the following:

a. Armstrong World Industries, Inc.; Furring Systems/Drywall

b. Chicago Metallic Corporation Drywall Furring 640 System

c. USG Interiors, Inc.; Drywall Suspension System

## 2.03 TRIM ACCESSORIES

- A. Interior Trim: ASTM C 1047

1. Material: aluminum-coated steel sheet

a. LC bead: J shaped; exposed long flange receives joint compound

b. L Bead: L shaped; exposed long leg receives joint compound

c. U Bead: J shaped; exposed short flange does not receive joint compound; use at exposed panel edges.

- B. Zinc Expansion (Control) Joint: Use where indicated.

## 2.04 JOINT TREATMENT MATERIALS

- A. General: Comply with ASTM C 475.
- B. Joint Tape
  - 1. Interior Gypsum Soffit Board: Paper
- C. Joint Compound for Interior Gypsum: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
  - 1. Prefilling: At open joints and damaged surface areas, use setting-type taping compound.
  - 2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use setting-type taping compound.
    - a. Use setting-type compound for installing paper-faced metal trim accessories.
  - 3. Fill Coat: For second coat, use drying-type.
  - 4. Finish Coat: For third coat, use drying-type.
  - 5. Skim Coat: For final coat of Level 5 finish, use drying-type.

## 2.05 ACOUSTICAL SEALANT

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Acoustical Sealant for Exposed and Concealed Joints
    - a. Pecora Corp.; AC-20 FTR Acoustical and Insulation Sealant
    - b. United States Gypsum Co.; SHEETROCK Acoustical Sealant
- B. Acoustical Sealant for Exposed and Concealed Joints: Nonsag, paintable, nonstaining, latex sealant, with a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24), complying with ASTM C 834 that effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.
- C. Acoustical Sealant for Concealed Joints: Nondrying, nonhardening, nonskinning, non-staining, gunnable, synthetic-rubber sealant, with a VOC content of 250 g/L or less when calculated according to 40 CFR 59, recommended for sealing interior concealed joints to reduce airborne sound transmission.

## 2.06 AUXILIARY MATERIALS

- A. General: Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.
- B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
  - 1. Use adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
  - 1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
  - 2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- D. Sound Attenuation Blankets: ASTM C665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool or rock wool.
  - 1. Fire Resistance Rated Assemblies: Comply with mineral fiber requirements of assembly.
- E. Thermal Insulation: As specified in Section 07210 "Building Insulation".

## 2.07 TEXTURE FINISHES

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Polystyrene Aggregate Ceiling Finish
    - a. G-P Gypsum Corp.; GyProc Ceiling Texture/Polystyrene
    - b. National Gypsum Company; Gold Bond Perfect Spray
    - c. United States Gypsum Co.; SHEETROCK Ceiling Spray Texture, QT Polystyrene
- B. Primer: As recommended by textured finish manufacturer.
- C. Polystyrene Aggregate Ceiling Finish: Water-based, job-mixed, polystyrene aggregate finish with flame-spread and smoke-developed indices of not more than 25 when tested according to ASTM E 84.
  - 1. Texture: Fine

## 2.08 GYPSUM BOARD

- A. Products: Subject to have a non-combustible, moisture and mold-resistant gypsum core. UL classified for fire resistance (Type X).
  - 1. Provide "Humitek Gypsum Panels" by USG or comparable products by Georgia Pacific and National Gypsum.
  - 2. Provide 5/8" thickness unless otherwise indicated.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Suspended Ceilings: Coordinate installation of ceiling suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive ceiling hangers at spacing required to support ceilings and that hangers will develop their full strength.
  - 1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.
- B. Coordination with Sprayed Fire-Resistive Materials
  - 1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed-on fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches o.c.
  - 2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of gypsum board assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.

### 3.03 INSTALLING STEEL FRAMING, GENERAL

- A. Installation Standards: ASTM C 754, and ASTM C 840 requirements that apply to framing installation.

- B. Isolate steel framing from building structure at locations indicated to prevent transfer of loading imposed by structural movement.
  - 1. Isolate ceiling assemblies where they abut or are penetrated by building structure.
- C. Do not bridge building control and expansion joints with steel framing or furring members. Frame both sides of joints independently.

### 3.04 INSTALLING STEEL SUSPENDED CEILING AND SOFFIT FRAMING

- A. Suspend ceiling hangers from building structure as follows:
  - 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means. Space hangers to comply with referenced Standards but not to exceed 48 inches on center.
  - 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
  - 3. Secure rod hangers to structure, including intermediate framing members, by attaching to inserts, eyescrews, or other devices and fasteners that are secure and appropriate for structure and hanger, and in a manner that will not cause hangers to deteriorate or otherwise fail.
  - 4. Do not support ceilings directly from permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
  - 5. Do not attach hangers to steel deck tabs.
  - 6. Do not attach hangers to steel roof deck. Attach hangers to structural members. Coordinate hanger roof attachment with Structural drawings and consult with the Commissioner.
  - 7. Do not connect or suspend steel framing from ducts, pipes, or conduit.
- B. Installation Tolerances: Install steel framing components for suspended ceilings so members for panel attachment are level to within 1/8 inch in 12 feet measured lengthwise on each member and transversely between parallel members.
- C. Sway-brace suspended steel framing with hangers used for support.

- D. Wire-tie or clip furring channels to supports, as required to comply with requirements for assemblies indicated.
- E. Install suspended steel framing components in sizes and spacings indicated, but not less than that required by the referenced steel framing and installation standards.
  - 1. Carrying Channels (Main Runners): 48 inches
  - 2. Furring Channels (Furring Members): 16 inches
- F. Grid Suspension System: Attach perimeter wall track or angle where grid suspension system meets vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

### 3.05 APPLYING AND FINISHING PANELS, GENERAL

- A. Gypsum Board Application and Finishing Standards: ASTM C 840 and GA-216.
- B. Install sound attenuation blankets before installing gypsum panels, unless blankets are readily installed after panels have been installed on one side.
- C. Install ceiling board panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in the central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- D. Install gypsum panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.
- E. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.
- F. Attach gypsum panels to steel studs so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- G. Attach gypsum panels to framing provided at openings and cutouts.
- H. Form control and expansion joints with space between edges of adjoining gypsum panels.
- I. Cover both faces of steel stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
  - 1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. in area.

2. Fit gypsum panels around ducts, pipes, and conduits.
3. Where partitions intersect open concrete coffer, concrete joists, and other structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by coffer, joists, and other structural members; allow 1/4- to 3/8-inch- wide joints to install sealant.

### 3.06 PANEL APPLICATION METHODS

#### A. Single-Layer Application

1. On ceilings, apply gypsum panels before wall/partition board application to the greatest extent possible and at right angles to framing, unless otherwise indicated.
2. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.

#### B. Multilayer Application on Ceilings: Apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints 1 framing member, 16 inches minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.

1. Z-Furring Members: Apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.

#### C. Single-Layer Fastening Methods: Apply gypsum panels to supports with steel drill screws.

#### D. Multilayer Fastening Methods: Fasten base layers and face layers separately to supports with screws. Fasten base layers with screws; fasten face layers with adhesive and supplementary fasteners.

### 3.07 INSTALLING TRIM ACCESSORIES

- A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.
- B. Control Joints: Install control joints according to ASTM C 840 and in specific locations approved by the Commissioner for visual effect.

### 3.08 FINISHING GYPSUM BOARD ASSEMBLIES

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare

gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.

- B. Prefill open joints beveled edges, and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below, according to ASTM C 840, for locations indicated:
  - 1. Level 1: Embed tape at joints in ceiling plenum areas, concealed areas, and where indicated, unless a higher level of finish is required for fire-resistance-rated assemblies and sound-rated assemblies.
  - 2. Level 2: Embed tape and apply separate first coat of joint compound to tape, fasteners, and trim flanges where panels are substrate for tile and where indicated.
  - 3. Level 3: Embed tape and apply separate first and fill coats of joint compound to tape, fasteners, and trim flanges where indicated.
  - 4. Level 4: Embed tape and apply separate first, fill, and finish coats of joint compound to tape, fasteners, and trim flanges, and apply skim coat of joint compound over entire surface where indicated.

### 3.09 FIELD QUALITY CONTROL

- A. Above-Ceiling Observation: Before Contractor installs gypsum board ceilings, the Commissioner will conduct an above-ceiling observation and report deficiencies in the Work observed. Do not proceed with installation of gypsum board to ceiling support framing until deficiencies have been corrected.
  - 1. Notify the Commissioner seven days in advance of date and time when Project, or part of Project, will be ready for above-ceiling observation.
  - 2. Before notifying the Commissioner, complete the following in areas to receive gypsum board ceilings:
    - a. Installation of 80 percent of lighting fixtures, powered for operation.
    - b. Installation, insulation, and leak and pressure testing of water piping systems.
    - c. Installation of air-duct systems.
    - d. Installation of air devices.

- e. Installation of mechanical system control-air tubing.
- f. Installation of ceiling support framing.

-END OF SECTION -

**Section 09265**  
**GYPSUM BOARD SHAFT-WALL ASSEMBLIES**

**PART 1 GENERAL****1.01 SUMMARY**

A. This Section includes the following:

1. Shaft wall enclosures
2. Chase enclosures
3. Soffit enclosures

**1.02 RELATED SPECIFICATIONS**

- A. Section 05400 - Cold-Formed Metal Framing, for load-bearing steel framing
- B. Section 07811 - Sprayed Fire-Resistive Materials
- C. Section 09260 - Gypsum Board Assemblies, for applying and finishing panels in gypsum board shaft-wall assemblies

**1.03 DEFINITIONS**

- A. Gypsum Board Construction Terminology: Refer to ASTM C 11 for definitions of terms for gypsum board construction not defined in this Section or in other referenced standards.

**1.04 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide gypsum board shaft-wall assemblies capable of while maintaining an airtight and smoke-tight seal. Evidence of failure includes deflections exceeding limits indicated, bending stresses causing studs to break or to distort, and end-reaction shear causing track (runners) to bend or to shear and studs to become crippled.

**1.05 SUBMITTALS**

- A. Product Data: For each gypsum board shaft-wall assembly indicated.
- B. Fire-Test-Response Reports: From a qualified independent testing and inspecting agency substantiating each gypsum board shaft-wall assembly's required fire-resistance rating.
- C. Research/Evaluation Reports: Evidence of compliance with building code in effect for Project, from a model code organization acceptable to authorities having jurisdiction that substantiate required fire-resistance rating for each gypsum board shaft-wall assembly.

- D. Acoustical-Test-Response Reports: From a qualified independent testing agency substantiating required STC rating for each gypsum board shaft-wall assembly.

#### 1.06 QUALITY ASSURANCE

- A. Fire-Resistance-Rated Assemblies: Provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Fire-Resistance-Rated Assemblies: Indicated by design designations from UL's "Fire Resistance Directory."
- B. STC-Rated Assemblies: For gypsum board shaft-wall assemblies indicated to have STC ratings, provide assembly materials and construction complying with requirements of assemblies whose STC ratings were determined according to ASTM E 90 and classified according to ASTM E 413 by a qualified independent testing agency.
- C. Pre-installation Conference: Review methods and procedures for installing work related to gypsum board shaft-wall assemblies including, but not limited to, the following:
  - 1. Fasteners proposed for anchoring steel framing to building structure
  - 2. Sprayed fire-resistive materials applied to structural framing
  - 3. Wiring devices in shaft-wall assemblies
  - 4. Doors and other items penetrating shaft-wall assemblies
  - 5. Items supported by shaft-wall-assembly framing
  - 6. Mechanical work enclosed within shaft-wall assemblies

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages, containers, and bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat on leveled supports off the ground to prevent sagging.

#### 1.08 PROJECT CONDITIONS

- A. Comply with requirements for environmental conditions, room temperatures, and ventilation specified in Section 09620 - Gypsum Board Assemblies

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

A. Provide the named product or a comparable product by one of the following:

1. American Gypsum Co.
2. G-P Gypsum Corp.
3. National Gypsum Company
4. United States Gypsum Co.

## 2.02 ASSEMBLY MATERIALS

A. General: Provide materials and components complying with requirements of fire-resistance-rated assemblies indicated.

1. Provide panels in maximum lengths available to eliminate or minimize end-to-end butt joints.
2. Provide auxiliary materials complying with gypsum board shaft-wall assembly manufacturer's written recommendations.

B. Steel Framing: ASTM C 645.

1. Protective Coating: ASTM A 653/A 653M, G40, hot-dip galvanized coating

C. Gypsum Liner Panels: Manufacturer's proprietary liner panels in 1-inch thickness and with moisture-resistant paper faces.

D. Gypsum Wallboard: ASTM C 36, core type as required by fire-resistance-rated assembly indicated.

1. Edges: Tapered for prefilling

E. Gypsum Base for Gypsum Veneer Plaster: ASTM C 588, core type as required by fire-resistance-rated assembly indicated, with edges as standard with manufacturer.

F. Water-Resistant, Gypsum Backing Board: ASTM C 630/C 630M, core type as required by fire-resistance-rated assembly indicated.

G. Cementitious Backer Units: ANSI A118.9, in manufacturer's standard thickness, but at least 1/2 inch thick.

H. Accessories: Cornerbead, edge trim, and control joints of material and shapes specified in Section 09260 - Gypsum Board Assemblies that comply with gypsum board shaft-wall assembly manufacturer's written recommendations for application indicated.

- I. Gypsum Wallboard Joint-Treatment Materials: ASTM C 475 and as specified in Section 09620 - Gypsum Board Assemblies.
- J. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
  - 1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
  - 2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- K. Track (Runner) Fasteners: Power-driven fasteners of size and material required to withstand loading conditions imposed on shaft-wall assemblies without exceeding allowable design stress of track, fasteners, or structural substrates in which anchors are embedded.
  - 1. Powder-Actuated Fasteners: Provide powder-actuated fasteners with capability to sustain, without failure, a load equal to 10 times that imposed by shaft-wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 1190.
  - 2. Postinstalled Expansion Anchors: Where indicated, provide expansion anchors with capability to sustain, without failure, a load equal to 5 times that imposed by shaft-wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 488.
- L. Acoustical Sealant: As recommended by gypsum board shaft-wall assembly manufacturer for application indicated.

## 2.03 GYPSUM BOARD SHAFT WALL

- A. Basis-of-Design Product: As indicated on Drawings by design designation of a qualified testing and inspecting agency.
- B. Deflection Limit:  $L/360$
- C. Studs: Manufacturer's standard profile for repetitive members and corner and end members and for fire-resistance-rated assembly indicated.
  - 1. Depth: 2-1/2 inches
  - 2. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.
- D. Track (Runner): Manufacturer's standard J-profile track with long-leg length as standard with manufacturer, but at least 2 inches, in depth matching studs.
  - 1. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.

## 2.04 TEXTURE FINISHES

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Polystyrene Aggregate Ceiling Finish:
    - a. G-P Gypsum Corp.; GyProc Ceiling Texture/Polystyrene
    - b. National Gypsum Company; Gold Bond Perfect Spray
    - c. United States Gypsum Co.; SHEETROCK Ceiling Spray Texture, QT Polystyrene
- B. Primer: As recommended by textured finish manufacturer.
- C. Polystyrene Aggregate Ceiling Finish: Water-based, job-mixed, polystyrene aggregate finish with flame-spread and smoke-developed indices of not more than 25 when tested according to ASTM E 84.
  - 1. Texture: Fine

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates to which gypsum board shaft-wall assemblies attach or abut, with Installer present, including hollow-metal frames, elevator hoistway door frames, cast-in anchors, and structural framing. Examine for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Sprayed Fire-Resistive Materials: Coordinate with gypsum shaft-wall assemblies so both elements of Work remain complete and undamaged. Patch or replace sprayed fire-resistive materials removed or damaged during installation of shaft-wall assemblies to comply with requirements specified in Section 07811 - Sprayed Fire-Resistive Materials.
  - 1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches o.c.
  - 2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of gypsum board assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-

resistance rating indicated. Protect remaining fire-resistive materials from damage.

### 3.03 INSTALLATION

- A. General: Install gypsum board shaft-wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated, manufacturer's written installation instructions, and the following:
  - 1. ASTM C 754 for installing steel framing
  - 2. Section 09260 - Gypsum Board Assemblies for applying and finishing panels
- B. At penetrations in shaft wall, maintain fire-resistance rating of shaft-wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.
- C. Isolate gypsum finish panels from building structure to prevent cracking of finish panels while maintaining continuity of fire-rated construction.
- D. Install control joints to maintain fire-resistance rating of assemblies.
- E. Seal gypsum board shaft walls with firestopping sealant at perimeter of each assembly where it abuts other work and at joints and penetrations within each assembly. Install firestopping sealant to withstand dislocation by air-pressure differential between shaft and external spaces; maintain an airtight and smoke-tight seal; and comply with manufacturer's written instructions or ASTM C 919, whichever is more stringent.
- F. Shaft walls Finish Levels: Finish panels to levels indicated below, according to ASTM C 840, for locations indicated:
  - 1. Level 1: Embed tape at joints in ceiling plenum areas, concealed areas, and where indicated, unless a higher level of finish is required for fire-resistance-rated assemblies and sound-rated assemblies.
  - 2. Level 2: Embed tape and apply separate first coat of joint compound to tape, fasteners, and trim flanges where panels are substrate for tile and where indicated.
  - 3. Level 3: Embed tape and apply separate first and fill coats of joint compound to tape, fasteners, and trim flanges where indicated.
  - 4. Level 4: Embed tape and apply separate first, fill, and finish coats of joint compound to tape, fasteners, and trim flanges, and apply skim coat of joint compound over entire surface where indicated.

-END OF SECTION-

**Section 09310**  
**CERAMIC TILE**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Porcelain mosaic tile
  - 2. Waterproof membrane for thin-set tile installations
  - 3. Crack-suppression membrane for thin-set tile installations
  - 4. Metal edge strips installed as part of tile installations

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 "Cast-in-Place Concrete" for monolithic slab finishes specified for tile substrates
- B. Section 04201 "Unit Masonry"
- C. Section 07921 "Interior Sealants" for sealing of expansion, contraction, control, and isolation joints in tile surfaces
- D. Section 09010 "Room Finish Schedule"

**1.03 DEFINITIONS**

- A. Facial Dimension: Nominal tile size as defined in ANSI A137.1.

**1.04 REFERENCES**

- A. ANSI A108.5 – Installation Specification for Ceramic Tile Installed with Dry-Set Portland Cement Mortar or Latex-Portland Cement Mortar
- B. ANSI A118.1 – Specifications for Dry-Set Portland Cement Mortar
- C. ANSI A137.1 – Specification for Ceramic Tile
- D. Tile Council of America, Inc. (TCA) – Handbook for Ceramic Tile Installation.

**1.05 SUBMITTALS**

- A. Product Data and Tile Layout Drawings: For each type of product indicated.
- B. Samples for Initial Selection: For each type of tile and grout indicated. Include Samples of accessories involving color selection.
- C. Master Grade Certificate signed by the tile manufacturer and Contractor certifying grade, class, kind, type and quality of tile which grade certificate applies and

containing adequate information for identification of packages of the tile to be delivered for work

D. Certificates from manufacturers of mortars, adhesives, grouts and sealant attesting that materials meet the requirements of the work.

E. Samples for Verification:

1. Assembled samples with grouted joints for each type and composition of tile and for each color and finish required, at least 4 inches square and mounted on rigid panel. Use grout of type and in color or colors approved for completed work.

F. Qualification Data: For Installer.

#### 1.06 QUALITY ASSURANCE

A. Provide tile, grout and setting materials from one source. Additives, dry-set mortars, installation materials and grouts shall be from the same manufacturer.

1. Obtain tile from same production run and of consistent quality in appearance and physical properties for each contiguous area.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirement in ANSI A137.1 for labeling grade-sealed tile packages.

B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.

C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

D. Store liquid latexes and emulsion adhesives in unopened containers and protected from freezing.

#### 1.08 PROJECT CONDITIONS

A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

## 2.02 PRODUCTS, GENERAL

- A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1, "Specifications for Ceramic Tile," for types, compositions, and other characteristics indicated.
  1. Provide tile complying with Standard grade requirements, unless otherwise indicated.
- B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI standards referenced in "Setting and Grouting Materials" Article.
- C. Colors, Textures, and Patterns: Where manufacturer's standard products are indicated for tile, grout, and other products requiring selection of colors, surface textures, patterns, and other appearance characteristics, provide specific products or materials complying with the following requirements:
  1. As selected by Commissioner from manufacturer's full range.
- D. Factory Blending: For tile exhibiting color variations within ranges selected during Sample submittals, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.
- E. Mounting: For factory-mounted tile, provide back- or edge-mounted tile assemblies as standard with manufacturer, unless otherwise indicated.
  1. Where tile is indicated for installation in wet areas, do not use back- or edge-mounted tile assemblies unless tile manufacturer specifies in writing that this type of mounting is suitable for installation indicated and has a record of successful in-service performance.

## 2.03 TILE PRODUCTS

- A. Manufacturers
  1. American Olean
  2. Daltile; Div. of Dal-Tile International Inc.
  3. Lone Star Ceramics Company
  4. Metropolitan Ceramics
  5. Summitville Tiles, Inc.
  6. United States Ceramic Tile Company

B. Unglazed Ceramic Mosaic Tile: Factory-mounted flat tile as follows:

1. Composition: Porcelain
2. Surface: Smooth, Slip-resistant, with abrasive admixture
3. Module Size: 2 by 2 inches
4. Nominal Thickness: 1/4 inch
5. Face: Plain with cushion edges
6. Face: Plain
7. Use at: floors

C. Glazed Ceramic Mosaic Tile: Factory-mounted flat tile as follows:

1. Composition: Porcelain
2. Surface: Smooth glazed
3. Module Size: 2 by 2 inches
4. Nominal Thickness: 1/4 inch
5. Face: Plain with cushion edges
6. Face: Plain
7. Use at: Walls

D. Ceramic Mosaic Trim Units for thin-set Mortar Installations: Matching characteristics of adjoining flat tile and coordinated with sizes and coursing of adjoining flat tile where applicable. Provide shapes as necessary selected from manufacturer's standard shapes as follows but not limited to

1. Base Cove: Cove, module size 2 by 2 inch
2. Base Cap for Thin-Set Mortar Installations: Surface bullnose, module size 2 by 2 inches
3. Wainscot Cap for Thin-Set Mortar Installations: Surface bullnose, module size 2 by 2 inches
4. External Corners for Thin-Set Mortar Installations: Surface bullnose, module size 2 by 2 inches

2.04 THRESHOLDS

A. General: Fabricate to sizes and profiles indicated or required to provide transition between adjacent floor finishes.

1. Bevel edges at 1:2 slope, aligning lower edge of bevel with adjacent floor finish. Limit height of bevel to 1/2 inch or less, and finish bevel to match face of threshold.

- B. Solid Polymer Thresholds: Made from homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6, without pre-coated finish.

- a. Avonite, Inc.
- b. DuPont Polymers
- c. Formica Corporation
- d. Nevamar; International Paper; Decorative Products Division

2.05 WATERPROOFING AND CRACK-SUPPRESSION MEMBRANES FOR THIN-SET TILE INSTALLATIONS

- A. General: Manufacturer's standard product that complies with ANSI A118.10.
- B. Polyethylene-Sheet Product: Polyethylene faced on both sides with fleece webbing for adhering to latex-portland cement mortar; 39 inches wide by 0.008-inch nominal thickness.

1. Product: Schluter Systems L.P.; KERDI

2.06 SETTING AND GROUTING MATERIALS

- A. Manufacturers:

1. LATICRETE International Inc.
2. MAPEI Corporation
3. Southern Grouts & Mortars, Inc.
4. Summitville Tiles, Inc.

- B. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4, consisting of the following:

1. Prepackaged dry-mortar mix containing dry, redispersible, ethylene vinyl acetate additive to which only water must be added at Project site.

- a. For wall applications, provide nonsagging mortar that complies with Paragraph F-4.6.1 in addition to the other requirements in ANSI A118.4.

- C. Standard Unsanded Cement Grout: ANSI A118.6, color as indicated

2.07 ELASTOMERIC SEALANTS

- A. General: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated that comply with applicable requirements in Section 07921 – Interior Sealants.

- B. Colors: Provide colors of exposed sealants to match colors of grout in tile adjoining sealed joints, unless otherwise indicated.

- C. One-Part, Mildew-Resistant Silicone Sealant: ASTM C 920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide, intended for sealing interior ceramic tile joints and other nonporous substrates that are subject to in-service exposures of high humidity and extreme temperatures.

1. Products

- a. Dow Corning Corporation; Dow Corning 786
- b. GE Silicones; Sanitary 1700
- c. Pecora Corporation; Pecora 898 Sanitary Silicone Sealant
- d. Tremco, Inc.; Tremsil 600 White

2.08 MISCELLANEOUS MATERIALS

- A. Trowelable Underlayments and Patching Compounds: Latex-modified, portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.
- B. Metal Edge Strips: Angle or L-shape, height to match tile and setting-bed thickness, metallic or combination of metal and PVC or neoprene base, designed specifically for flooring applications, stainless steel; ASTM A 666, 300 Series exposed-edge material.
- C. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.
- D. Grout Sealer: Manufacturer's standard product for sealing grout joints that does not change color or appearance of grout or tile.

1. Custom Building Products; Grout Sealer
2. MAPEI Corporation; KER Tile Grout 004, Keraseal Penetrating Sealer for Unglazed Grout and Tile
3. Southern Grouts & Mortars, Inc.; Silicone Grout Sealer
4. Summitville Tiles, Inc.; SL-15, Invisible Seal Penetrating Grout and Tile Sealer

2.09 MIXING MORTARS AND GROUT

- A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.
- B. Add materials, water, and additives in accurate proportions.

- C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
  - 1. Verify that substrates for setting tile are firm; dry; clean; free of oil, waxy films, and curing compounds; and within flatness tolerances required by referenced ANSI A108 Series of tile installation standards for installations indicated.
  - 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed before installing tile.
  - 3. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Commissioner.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Remove coatings, including curing compounds and other substances that contain soap, wax, oil, or silicone, that are incompatible with tile-setting materials.
- B. Provide concrete substrates for tile floors installed with thin-set mortar that comply with flatness tolerances specified in referenced ANSI A108 Series of tile installation standards.
  - 1. Fill cracks, holes, and depressions with trowelable leveling and patching compound according to tile-setting material manufacturer's written instructions. Use product specifically recommended by tile-setting material manufacturer.
  - 2. Remove protrusions, bumps, and ridges by sanding or grinding.
- C. Blending: For tile exhibiting color variations within ranges selected during Sample submittals, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

### 3.03 INSTALLATION, GENERAL

- A. ANSI Tile Installation Standards: Comply with parts of ANSI A108 Series "Specifications for Installation of Ceramic Tile" that apply to types of setting and grouting materials and to methods indicated in ceramic tile installation schedules.
- B. TCA Installation Guidelines: TCA's "Handbook for Ceramic Tile Installation." Comply with TCA installation methods indicated in ceramic tile installation schedules.
- C. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions, unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- D. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- E. Jointing Pattern: Lay tile in grid pattern, unless otherwise indicated. Align joints when adjoining tiles on floor, base, walls, and trim are same size. Lay out tile work and center tile fields in both directions in each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths, unless otherwise indicated.
- F. Expansion Joints: Locate expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.
  - 1. Locate joints in tile surfaces directly above joints in concrete substrates.
  - 2. Prepare joints and apply sealants to comply with requirements in Section 07921 – Interior Sealants.
- G. Grout tile to comply with requirements of the following tile installation standards:
  - 1. For ceramic tile grouts portland cement; comply with ANSI A108.10.

### 3.04 WATERPROOFING AND CRACK-SUPPRESSION MEMBRANE INSTALLATION

- A. Install waterproofing to comply with ANSI A108.13 and waterproofing manufacturer's written instructions to produce waterproof membrane of uniform thickness bonded securely to substrate.
- B. Install crack-suppression membrane to comply with manufacturer's written instructions to produce membrane of uniform thickness bonded securely to substrate.

- C. Do not install tile over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

### 3.05 FLOOR TILE INSTALLATION

- A. General: Install tile to comply with requirements in the Floor Tile Installation Schedule, including those referencing TCA installation methods and ANSI A108 Series of tile installation standards.
  - 1. For installations indicated below, follow procedures in ANSI A108 Series tile installation standards for providing 95 percent mortar coverage.
    - a. Tile floors in wet areas
- B. Joint Widths: Install tile on floors with the following joint widths:
  - 1. Ceramic Mosaic Tile: 1/8 inch
  - 2. Set thresholds in latex-portland cement mortar for locations where mortar bed would otherwise be exposed above adjacent nontile floor finish.
- C. Metal Edge Strips: Install at locations indicated or where exposed edge of tile flooring meets carpet, wood, or other flooring that finishes flush with top of tile.
- D. Grout Sealer: Apply grout sealer to cementitious grout joints according to grout-sealer manufacturer's written instructions. As soon as grout sealer has penetrated grout joints, remove excess sealer and sealer that has gotten on tile faces by wiping with soft cloth.

### 3.06 WALL TILE INSTALLATION

- A. Install types of tile designated for wall installations to comply with requirements in the Wall Tile Installation Schedule, including those referencing TCA installation methods and ANSI setting-bed standards.
- B. Install metal lath and scratch coat for walls to comply with ANSI A108.1A, Section 4.1.
- C. Joint Widths: Install tile on walls with the following joint widths:
  - 1. Porcelain Mosaic Tile: 1/8 inch.

### 3.07 CLEANING AND PROTECTING

- A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.
  - 1. Remove latex-portland cement grout residue from tile as soon as possible.

2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions, but no sooner than 10 days after installation. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.
- B. When recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors. Protect installed tile work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear.
  - C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.
  - D. Before final inspection, remove protective coverings and rinse neutral cleaner from tile surfaces.

### 3.08 FLOOR TILE INSTALLATION SCHEDULE

- A. Tile Installation FTI-1: Interior floor installation on concrete; thin-set mortar.
  1. Tile Type: Unglazed porcelain mosaic
  2. Thin-Set Mortar: Latex- portland cement mortar
  3. Grout: Unsanded cement grout
- B. Tile Installation FTI-2: Interior floor installation on waterproof crack-suppression membrane over concrete; thin-set mortar.
  1. Tile Type: Unglazed porcelain mosaic
  2. Thin-Set Mortar: Latex-portland cement mortar
  3. Grout: Polymer-modified sanded grout

### 3.09 WALL TILE INSTALLATION SCHEDULE

- A. Tile Installation WTI-1: Interior wall installation over masonry or concrete; thin-set mortar.
  1. Tile Type: Glazed procelain mosaic tile
  2. Thin-Set Mortar: Latex- portland cement mortar
  3. Grout: Sanded cement grout

B. Tile Installation WTI-2: Interior wall and shower-receptor installation over solid backing, thin-set mortar.

1. Tile Type: Glazed porcelain mosaic tile
2. Thin-Set Mortar: Latex- portland cement mortar
3. Grout: Sanded cement grout

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 09513**  
**ACOUSTICAL SNAP-IN METAL PAN CEILINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes interior plank and panel type ceiling system assemblies, consisting of pre-finished aluminum pans mounted to carrier system and incorporating lighting fixtures and air handling components for ceilings.
  - 1. Metal ceiling panels
  - 2. Suspension assemblies
  - 3. Perforations
  - 4. Sound absorbing materials
  - 5. Accessories; provide all other necessary items including devices for attachments to overhead construction, secondary members, splines, splices connecting clips, wall connectors, wall angles and all other devices required for a complete installation.
  - 6. Coordinate items penetrating or being integrated into ceiling systems with responsible trades.

**1.02 RELATED SPECIFICATIONS**

- A. Sections related to Plumbing for fire suppression
- B. Sections related to HVAC for mechanical equipment and air distribution components pertinent to integrated ceiling system.
- C. Sections related to Electrical for lighting components pertinent to integrated ceiling system.

**1.03 DEFINITIONS**

- A. CAC: Ceiling Attenuation Class
- B. LR: Light Reflectance coefficient
- C. NRC: Noise Reduction Coefficient

**1.04 PERFORMANCE REQUIREMENTS**

- A. ASTM C635 Specification for Metal Suspension for Acoustical tile and Lay-In Panel ceiling

- B. ASTM C636 Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.
- C. Seismic Performance: Provide acoustical snap-in metal pan ceilings designed and installed to withstand the effects of earthquake motions according to the following:
  - 1. Standard for Ceiling Suspension Systems Requiring Seismic Restraint: Comply with ASTM E 580.
  - 2. Building Code of The City of New York
- D. ASTM C423: Test Method for Sound Absorption coefficients by the Reverberation Room Method.

#### 1.05 SUBMITTALS

- A. Product Data: Submit catalog cuts or standard drawings showing details of system with project conditions clearly identified and manufacturer's recommended installations for each type of product indicated.
  - 1. Ceiling suspension members
  - 2. Method of attaching hangers to building structure
  - 3. Ceiling perimeter and penetrations through ceiling
- B. Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of size indicated below.
  - 1. Metal Pan: Set of 12-inch-long Samples of each type, finish, color, pattern, and texture
  - 2. Exposed Moldings and Trim: Set of 12-inch- long Samples of each type, finish, and color.
  - 3. Sound Absorber: Match size of Sample metal pan.
- C. Shop Drawings
  - 1. Reflected ceiling plans (1/4"=1'-0" minimum scale): Contractor shall indicate layout arrangement of ceiling design, dimensions and location of related integrated lighting and air distribution components. Show all locations, markings, quantities, materials, sizes and shapes. Indicate all method of connecting, anchoring, fastening, bracing and attaching to work of other trades.
  - 2. Installation drawings: Detail complete installation including carrier system, connections between carriers and pans, details of level changes and/or changes in pattern, installation of related lighting and air distribution components, access requirements, sound absorption requirements.

- D. Qualification Data: For professional engineer and testing agency.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each acoustical snap-in metal pan ceiling.
- F. Research/Evaluation Reports: For acoustical snap-in metal pan ceiling and components.
- G. Maintenance Data: For finishes to include in maintenance manuals.

#### 1.06 QUALITY ASSURANCE

- A. Materials shall be installed in accordance with procedures recommended by the manufacturer and shall meet the requirement of the regulatory agencies: Building Code of the City of New York
- B. Acoustical Testing Agency Qualifications: An independent testing laboratory or an NVLAP-accredited laboratory with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548. NVLAP-accredited laboratories must document accreditation, based on a "Certificate of Accreditation" and a "Scope of Accreditation" listing the test methods specified.
  - 1. Changes from system: System performance following any substitution of materials or change in assembly design must be certified by the manufacturer.
- C. Source Limitations: Obtain each set of acoustical snap-in metal pans and concealed suspension systems from one source with resources to provide products of consistent quality in appearance, physical properties, and performance.
- D. Fire-Test-Response Characteristics: Provide acoustical snap-in metal pan ceilings with surface-burning characteristics complying with ASTM E 1264 for Class A materials as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- E. Mockups: Build mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- F. Pre-installation Conference: Conduct conference at Project site prior to final installation.
- G. The contractor responsible for the work of this section shall be qualified and experienced in performance of this work and done so for no less than a period of three (3) years.

## 1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver acoustical snap-in metal pans, suspension system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.

## 1.08 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install acoustical snap-in metal pan ceilings until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, work above ceilings is complete, and ambient temperature range of 60 degree F to 85 degree F and humidity of not more than 70% are maintained at the levels indicated for Project when occupied for its intended use.

## 1.09 COORDINATION

- A. Coordinate layout and installation of acoustical snap-in metal pans and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.
  - 1. Mechanical Work: Ductwork above ceiling will be complete, and permanent heating and cooling systems operation to climate conditions prior to installation of linear metal ceiling components
  - 2. Electrical Work: Installation of conduit above the ceiling shall be completed before installation of linear metal ceiling components.
  - 3. Fire protection: Fire protection lines and/or equipment occurring above ceiling shall be completed and tested before linear metal ceiling components are installed.

## PART 2 PRODUCTS

### 2.01 ACOUSTICAL SNAP-IN METAL CEILING PANS

- A. Sheet Metal Characteristics: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, roughness, stains, or discolorations.
  - 1. Aluminum Sheet: Rolled-formed aluminum sheet, complying with ASTM B209 (ASTM B209M); alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
  - 2. The ceiling panels are to be brake die formed from a single sheet and formed with a min. 1-1/4" integral return edge on all panel sides. No indentations,

marks or defacing of the exposed surface of the metal ceiling panel will be allowed.

3. No fasteners of any kind shall be visible on exposed face surfaces of ceiling panels or support tees. Down light openings and sprinkler openings shall be factory precision cut as required.
4. The plenum shall be 100% accessible. Every panel must be removable. Heavy duty torsion springs and clip assemblies to be mounted to every panel for downward access, without potential for damage to panel face or hinge assembly. Hinge assembly shall be attached to panel with min. 2 flush fasteners. Attaching torsion spring directly to panel with fastener will not be accepted.
5. Sound absorbing material to be a gray or black, non-woven fabric with Class 1 fire rating. Perforated panels with absorbing material to achieve an N.R.C. of .70-.80 min. with a min. 7" clear plenum.
6. Perforation pattern to be selected by architect from manufacture's catalog. Panels to have a solid margin, non-perforated on all sides.

## 2.02 METAL SUSPENSION SYSTEMS, GENERAL

- A. Metal Suspension Systems Standard: Provide ceiling manufacturer's standard metal suspension systems of types and finishes indicated that comply with applicable ASTM B209 (ASTM B209M) requirements.
  1. Comply with requirements of NYC Building Code for Primary Suspension System.
  2. Primary Suspension System consisting of 1 1/2" cold-rolled carrier channels at 4'-0" on center suspended from building structure by 1/4" diameter rods at 4'-0" on center (max.) connected with approved devices.
- B. Suspension Systems: Provide systems complete with snap-in carriers, splice sections, connector clips, alignment clips, leveling clips, hangers, molding, trim, retention clips, load-resisting struts, fixture adapters, and other suspension components required to support ceiling units and other ceiling-supported construction.
- C. Supporting grid system shall consist of straight, factory formed tee in adequate thickness, to support loads. Finish tee to match modular ceiling panels where exposed. Tee shall be factory slotted to accept torsion spring attachment.
- D. Tolerance: Maximum deflection of ceiling panels from edge to edge in width shall not exceed 1/4" in 10'-0" when measured with a straightedge placed at any directional location on the finished surfaces. Maximum deviation shall not exceed 1/4" from level in any area or room.

## 2.03 INDIRECT-HUNG METAL SUSPENSION SYSTEMS

- A. System designed to support metal pans that snap into main runners, consisting of main runners connected to carrying channels that are attached by hangers to building structure, and complying with the following requirements:
  - 1. Wire Hangers, Braces, and Ties: Provide wire complying with the following requirements:
    - a. Nickel-Copper-Alloy Wire: ASTM B 164, nickel-copper-alloy UNS No. N04400.
  - 2. Main Runners: Formed from the following metal:
    - a. Main tee, 25-gauge commercial quality cold rolled steel; face-capped during forming; factory finished in baked enamel paint finish
    - b. Carrying Channels: Aluminum channel shape, each leg notched for locating attaching pans.

## 2.04 ALUMINUM PANS AND SUSPENSION SYSTEM FOR ACOUSTICAL SNAP-IN METAL PAN CEILING

- A. Products
  - 1. Alcan Building Products: Planar
  - 2. Ceilingplus – Illusion and Mirra Metal Ceiling System
  - 3. Hunter Douglas: Linear Metal Ceiling Type 84R Linear
  - 4. USG Interiors, Inc.
  - 5. Or approved equal
- B. Classification: Units complying with ASTM E 1264 for Type VI, perforated aluminum (pan) with mineral- or glass-fiber-base backing
  - 1. Pattern: A (perforated, regularly spaced large holes), arranged in parallel alignment to pan edge with uniform perforations of 0.109-inch diameter, 1800 holes/sq. ft., and 11.8 percent open area.
- C. Pan Thickness: Not less than 0.0250 inch.
- D. Pan Edge Detail: Beveled.
- E. Pan Size: 12 in wide face for linear panel type, 2 ft by 2 ft for square panel type.
- F. Suspended ceiling Type 1: square panel
- G. Suspended ceiling Type 2: Linear panel
- H. Pan Face Finish: Baked enamel paint finish

- I. NRC: Not less than 0.75.
- J. Suspension-System Installation Method: Indirect-hung snap-in suspension system.
- K. Suspension-System Classification: Snap-tee, intermediate.

## 2.05 ACOUSTICAL SEALANT

### A. Acoustical Sealant for Exposed and Concealed Joints

- 1. Pecora Corp; AC-20 FTR Acoustical and Insulation Sealant
- 2. United States Gypsum Co.; SHEETROCK Acoustical Sealant
- 3. Or approved equal

### B. Acoustical Sealant for Concealed Joints

- 1. OSI Sealants, Inc.; Pro-Series SC-170 Rubber Base Sound Sealant
- 2. OSI Sealants, Inc.; Pro-Series SC-175 Rubber Base Sound Sealant
- 3. Pecora Corp.; BA-98
- 4. Tremco, Inc.; Tremco Acoustical Sealant
- 5. Or approved equal

## 2.06 ACCESSORIES

- A. Access Panels: For access at locations indicated, provide acoustical snap-in metal pan ceiling units, accessible by two access knobs; place one access knob at each end of panel near corners.
- B. Access Tool: Provide manufacturer' standard tool for opening access panels.

## 2.07 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## 2.08 FABRICATION

- A. Pans: Edges formed to snap onto carrier members and provide positive locking mechanism with no additional fasteners; factory-finished to match approved samples. Manufacturer's standard units of size, profile, and edge treatment indicated, formed from metal indicated with dimples or continuous beads on flanges for snap-in engagement with concealed suspension system.

- B. Support System: Formed and fabricated for mechanical connection with adjoining section and pre-punched holes for direct suspension.
- C. Lighting components: Fabricate in accordance with UL classification as specified.
- D. Air distribution components: Formed to provide airtight assembly and positive connection to mechanical equipment components.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, including structural framing and substrates to which acoustical snap-in metal pan ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical snap-in metal pan ceilings.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Measure each ceiling area and establish layout of acoustical snap-in metal pans to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width pans at borders, and comply with layout shown on reflected ceiling plans.

### 3.03 INSTALLATION

- A. General: Install acoustical snap-in metal pan ceilings to comply with ASTM C 636 and seismic requirements indicated, per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
  - 1. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate both for structure to which hangers are attached and type of hanger involved. Install hangers in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
  - 2. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, post-installed mechanical or adhesive anchors that extend through forms into concrete.
  - 3. Do not attach hangers to steel deck tabs.
  - 4. Do not attach hangers to steel roof deck. Attach hangers to structural members.

5. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.
- B. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical snap-in metal pans.
1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
  2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.
  3. Do not use exposed fasteners, including pop rivets, on moldings and trim.
- C. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- D. Cut acoustical snap-in metal pans for accurate fit at borders and at interruptions and penetrations by other work through ceilings. Stiffen edges of cut units as required to eliminate evidence of buckling or variations in flatness exceeding referenced standards for stretcher-leveled metal sheet.
- E. Install acoustical snap-in metal pans in coordination with suspension system and exposed moldings and trim.
1. Align joints in adjacent courses to form uniform, straight joints parallel to room axis in both directions, unless otherwise indicated.
  2. Fit adjoining units to form flush, tight joints.
  3. Install sound-absorbent fabric layers in perforated metal pans.
  4. Install sound-absorbent pads in metal pans.
- F. Install linear panels leaving a 3/4" gap in between to allow air to flow through the entire ceiling.

3.04 CLEANING

Clean exposed surfaces of acoustical snap-in metal pan ceilings, including trim and edge moldings after removing strippable, temporary protective covering if any. Comply with manufacturer's written instructions for stripping of temporary protective covering, cleaning, and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage, including dented and bent units.

-END OF SECTION-

**Section 09671**  
**RESINOUS FLOORING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes resinous flooring systems with epoxy resin body coat.
  - 1. Application Method: Troweled

**1.02 RELATED SPECIFICATIONS**

- A. Section 07921 - Joint Sealants for sealants installed at joints in resinous flooring systems.
- B. Section 09010 - Room Finish Schedule

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include manufacturer's technical data, application instructions, and recommendations for each resinous flooring component required.
- B. Samples for Initial Selection: For each type of exposed finish required.
- C. Samples for Verification: For each resinous flooring system required, 6 inches square, applied to a rigid backing by Installer for this Project.
  - 1. Provide sample of integral cove base with floor to wall and wall to wall corner condition.
- D. Product Schedule: Use resinous flooring designations indicated in Part 2 and room designations indicated on Drawings and in Section 09010 - Room Finish Schedule.
- E. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
- F. Material Test Reports: For each resinous flooring component.
- G. Material Certificates: For each resinous flooring component, signed by manufacturer.
- H. Maintenance Data: For resinous flooring to include in maintenance manuals.

**1.04 QUALITY ASSURANCE**

- A. Installer qualifications: Engage an installer who employs trained applicators, approved by resinous flooring manufacturer for installing resinous flooring systems specified.

**B. Pre-Installation Conference**

1. The Contractor shall arrange a meeting less than thirty days prior to starting work, comply with requirements of Section 01310 - Project Coordination.
2. Attendance
  - a. General Contractor
  - b. Commissioner/City Representative
  - c. Manufacturer/Installer's Representative

C. ISO 9002: All materials, including primers, resins, curing agents, finish coats; aggregates and sealants are manufactured and tested under ISO 9002 registered quality system.

D. Concrete substrate must be properly cured for a minimum of 30 days.

E. Protection of finished floor from damage by subsequent trades to be responsibility of General Contractor.
