F. Single Source: Obtain primary resinous flooring materials including primers, resins, hardening agents, finish or sealing coats from a single manufacturer with not less than three (3) years of successful experience in manufacturing and installing principal materials described in this section. Engage an installer who has completed at least three projects of similar size and complexity. Provide secondary material only of type and from source recommended by manufacturer of primary materials only.

G. Mockups: Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Apply full-thickness mockups on 48-inch- square corner floor area selected by Commissioner.
  - a. Include 48-inch length of integral cove base on each wall.
2. Simulate finished lighting conditions for Commissioner's review of mockups.
3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

**1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage and mixing with other components.
- B. Store materials to prevent deterioration from moisture, heat, cold, direct sunlight, or other detrimental effects.

## 1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with resinous flooring manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous flooring application.
- B. Lighting: Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during resinous flooring application.
- C. Close spaces to traffic during resinous flooring application and for not less than 24 hours after application, unless manufacturer recommends a longer period.
  - 1. Protect areas from dust during installation and curing.

## PART 2 PRODUCTS

### 2.01 RESINOUS FLOORING

- A. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Crossfield Products Corp., Terracolor;
  - 2. General Polymers Corporation, a division of the Sherwin-Williams Company, Ceram #100;
  - 3. Stonhard, Inc., Stoneblend GSI
  - 4. Or approved equal
- B. System Characteristics:
  - 1. Color and Pattern: As selected by Commissioner from manufacturer's full range
  - 2. Wearing Surface: Smooth
  - 3. Integral Cove Base: 8 inches high
  - 4. Overall System Thickness: 3/16 inch
- C. System Components: Manufacturer's standard components that are compatible with each other and as follows:
  - 1. Body Coat(s)
    - a. Resin: Epoxy
    - b. Formulation Description: 100 percent solids
    - c. Application Method: Screed applied and Finished Troweled
      - (1) Thickness of Coats: 3/16 inch
      - (2) Number of Coats: One

- d. Aggregates: Colored quartz (ceramic-coated silica)
- 2. Primer: Type recommended by manufacturer for substrate and body coat(s) indicated.
  - a. Formulation Description: 100 percent
- 3. Topcoat: Chemical-resistant
  - a. Resin: Epoxy
  - b. Formulation Description: 100 percent solids
  - c. Type: Clear
  - d. Finish: Matte
  - e. Number of Coats: Two
- 4. Final Topcoat: Chemical and UV-resistant
  - a. Resin: Urethane
  - b. Formulation Description: 100 percent solids
  - c. Type: Clear
  - d. Finish: Matte
  - e. Number of Coats: Two
- D. System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
  - 1. Compressive Strength: 6000 psi per ASTM C 579
  - 2. Tensile Strength: 1500 psi per ASTM C 307
  - 3. Flexural Modulus of Elasticity:  $5.0 \times 10^5$  psi per ASTM C 580
  - 4. Water Absorption: 0.2% per ASTM C 413
  - 5. Coefficient of Thermal Expansion:  $1.8 \times 10^{-5}$  in/in  $^{\circ}\text{C}$  per ASTM C 531
  - 6. Impact Resistance: >160 in. lbs. per ASTM D-4226
  - 7. Heat Resistance Limitation:  $140^{\circ}\text{F}$  (for continuous exposure) and  $200^{\circ}\text{F}$  (for intermittent spills)
  - 8. Abrasion Resistance: 0.006 gm maximum weight loss per ASTM D 4060, CS-17 wheel
  - 9. Flammability: Self-extinguishing per ASTM D 635

10. Hardness: 85-90, Shore D per ASTM D 2240

11. Bond Strength: >400 psi, 100 percent concrete failure per ASTM d-4541

## 2.02 ACCESSORY MATERIALS

- A. Patching and Fill Material: Resinous product of or approved by resinous flooring manufacturer and recommended by manufacturer for application indicated.
- B. Joint Sealant: Type recommended or produced by resinous flooring manufacturer for type of service and joint condition indicated.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. General: Prepare and clean substrates according to resinous flooring manufacturer's written instructions for substrate indicated. Provide clean, dry, and neutral Ph substrate for resinous flooring application.
- B. Concrete Substrates: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous flooring.
  - 1. Roughen concrete substrates as follows:
    - a. Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
    - b. Comply with ASTM C 811 requirements, unless manufacturer's written instructions are more stringent.
  - 2. Repair damaged and deteriorated concrete according to resinous flooring manufacturer's written recommendations.
  - 3. Verify that concrete substrates are dry.
    - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.
    - b. Perform plastic sheet test, ASTM D 4263. Proceed with application only after testing indicates absence of moisture in substrates.
    - c. Perform additional moisture tests recommended by manufacturer. Proceed with application only after substrates pass testing.

4. Verify that concrete substrates have neutral Ph and that resinous flooring will adhere to them. Perform Ph test per ASTM E1907-97. Proceed with application only after substrates pass testing.
- C. Resinous Materials: Mix components and prepare materials according to resinous flooring manufacturer's written instructions.
- D. Use patching and fill material to fill holes and depressions in substrates according to manufacturer's written instructions.
- E. Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through resinous flooring according to manufacturer's written recommendations.

### 3.02 APPLICATION

- A. General: Apply components of resinous flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
  1. Coordinate application of components to provide optimum adhesion of resinous flooring system to substrate, and optimum intercoat adhesion.
  2. Cure resinous flooring components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
  3. At substrate expansion and isolation joints, provide joint in resinous flooring to comply with resinous flooring manufacturer's written recommendations.
    - a. Apply joint sealant to comply with manufacturer's written recommendations.
- B. Apply primer over prepared substrate at manufacturer's recommended spreading rate.
- C. Integral Cove Base: Apply cove base mix to wall surfaces before applying flooring. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, and top coating of cove base. Round internal and external corners.
- D. Apply troweled or screeded coat(s) in thickness indicated for flooring system. Hand or power trowel and grout to fill voids. When cured, sand to remove trowel marks and roughness.
- E. Apply epoxy grout (double coat), of type recommended by resinous flooring manufacturer to fill voids in surface of final body coat and to produce wearing surface indicated.

- F. Apply Polyurethane topcoat(s) (double coat) indicated for flooring system and at spreading rates recommended in writing by manufacturer.

### 3.03 FIELD QUALITY CONTROL

- A. Core Sampling: At the direction of City and at locations designated by City, take 1 core sample per 1000 sq. ft. of resinous flooring, or portion of, to verify thickness. For each sample that fails to comply with requirements, take two additional samples. Repair damage caused by coring and correct deficiencies.
- B. Material Sampling: City may at any time and any numbers of times during resinous flooring application require material samples for testing for compliance with requirements.
  - 1. The City will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Contractor.
  - 2. Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
  - 3. If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

### 3.04 CLEANING AND PROTECTING

- A. Protect resinous flooring from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by resinous flooring manufacturer.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 09911**  
**EXTERIOR PAINTING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes surface preparation and field application of exterior paint/high-performance coating systems to the following exterior items and surfaces.
  - 1. Bollards, fences and railings
  - 2. Exposed structural steel
  - 3. Exposed metal fabrications
  - 4. Exposed concrete
  - 5. Exposed electrical panel covers and devices
  - 6. Miscellaneous surfaces and substrates that would otherwise be exposed in the completed work

**1.02 RELATED SPECIFICATIONS**

- A. Section 02821 - Metal Fence
- B. Section 02822 - Ornamental Fences and Gates
- C. Section 03300 - Cast-In-Place Concrete
- D. Section 05120 - Structural Steel
- E. Section 05500 - Metal Fabrications
- F. Section 09912 - Interior Painting
- G. Section 09967 - Coatings For Steel Waterfront Structures
- H. Sections related to Electrical Work

**1.03 DEFINITIONS**

- A. Standard coating terms defined in ASTM D 16 apply to this Section.
- B. Gloss ranges used in this Section include the following:
  - 1. Semigloss refers to medium-sheen finish with a gloss range between 30 and 65 when measured at a 60-degree meter.
  - 2. High gloss refers to high-sheen finish with a gloss range more than 65 when measured at a 60-degree meter.
- C. Environments: The following terms are used in Part 2 of this Section to distinguish between different corrosive exposures:

1. "Severe Environments" are highly corrosive industrial atmospheres with sustained exposure to high humidity and condensation and with frequent cleaning using strong chemicals. Environments with heavy concentrations of strong chemical fumes and frequent splashing and spilling of harsh chemical products are severe environments.

#### 1.04 SUBMITTALS

- A. Product Data: For each coating system indicated. Include block fillers and primers.
  1. Material List: An inclusive list of required coating materials. Indicate each material and cross-reference the specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.
  2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each material specified.
- B. Certification by manufacturer that products supplied comply with requirements indicated that limit the amount of VOCs in coating products.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for each type of finish-coat material indicated.
  1. After color selection, Commissioner will furnish color chips for surfaces to be coated.
- D. Samples for Verification: For each color and material to be applied, with texture to simulate actual conditions, on representative samples of the actual substrate.
  1. Provide stepped Samples defining each separate coat, including block fillers and primers. Use representative colors when preparing Samples for review. Resubmit until required sheen, color, and texture are achieved.
  2. List of material and application for each coat of each sample. Label each sample for location and application.
  3. Submit samples on the following substrates for Commissioner's review of color and texture:
    - a. Ferrous and Nonferrous Metal: Provide two 4-inch- square samples of flat metal and two 8-inch- long samples of solid metal for each color and finish.
- E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects

with project names and addresses, names and addresses of architects and owners, and other information specified.

#### 1.05 QUALITY ASSURANCE

- A. Applicator Qualifications: Engage an experienced applicator who has completed high-performance coating system applications similar in material and extent to those indicated for Project and whose work has a record of successful in-service performance.
- B. Source Limitations: Obtain primers and undercoat materials for each coating system from the same manufacturer as the finish coats.
- C. Benchmark Samples (Mockups): Provide a full-coat benchmark finish sample of each type of coating and substrate required. Comply with procedures specified in PDCA P5. Duplicate finish of approved sample Submittals.
  - 1. Commissioner will select one area, or surface to represent surfaces and conditions for application of each type of coating and substrate.
    - a. Fence Surfaces: Provide samples on at least 100 sq. ft. of fence surface.
    - b. Small Areas and Items: Commissioner will designate items or areas required.
    - c. After finishes are accepted, Commissioner will use the surface to evaluate coating systems of a similar nature.
  - 2. Final approval of colors will be from benchmark samples.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label with the following information:
  - 1. Name or title of material
  - 2. Product description (generic classification or binder type)
  - 3. Manufacturer's stock number and date of manufacture
  - 4. Contents by volume, for pigment and vehicle constituents
  - 5. Thinning instructions
  - 6. Application instructions
  - 7. Color name and number
  - 8. Handling instructions and precautions
- B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F. Maintain containers used in storage in a clean condition, free of foreign materials and residue.

1. Protect materials from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily. Take necessary measures to ensure that workers and work areas are protected from fire and health hazards resulting from handling, mixing, and applying coatings.

#### 1.07 PROJECT CONDITIONS

- A. Apply coatings only when temperature of surfaces to be coated and surrounding air temperatures are between 45 and 95 deg F.
- B. Do not apply coatings in snow, rain, fog, or mist; when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.
  1. Allow wet surfaces to dry thoroughly and attain temperature and conditions specified before proceeding with or continuing coating operation.
  2. Work may continue during inclement weather only if areas and surfaces to be coated are enclosed and temperature within the area can be maintained within limits specified by manufacturer during application and drying periods.

#### 1.08 EXTRA MATERIALS

- A. Furnish extra high-performance coating materials from the same production run as materials applied and in quantities described below. Package coating materials in unopened, factory-sealed containers for storage and identify with labels describing contents.
  1. Quantity: Furnish extra coating materials in quantities indicated below:
    - a. Semigloss, Aliphatic Polyurethane Enamel: 5 gallons of each color applied

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products indicated in the coating system descriptions.
  1. Carboline Company (Carboline)
  2. Rust-Oleum Corporation (R-O)
  3. Tnemec Company, Inc. (Tnemec)
  4. Benjamin Moore & Company (Moore)
  5. Sherwin-Williams Company (S-W)
  6. Modac Products Company, Inc. (Modac)

## 2.02 COATINGS MATERIALS, GENERAL

- A. Material Compatibility: Provide primers, undercoats, and finish-coat materials that are compatible with one another and substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.
- B. Material Quality: Provide manufacturer's highest grade of the various high-performance coatings specified. Materials not displaying manufacturer's product identification are not acceptable.
  - 1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.
- C. VOC Classification: Provide high-performance coating materials, including primers, undercoats, and finish-coat materials, that have a VOC classification of 450 g/L or less.

## 2.03 COLORS

- A. Match Commissioner's samples.

## 2.04 EXTERIOR HIGH-PERFORMANCE COATING SYSTEMS

- A. Ferrous Metal: Provide the following finish systems over exterior ferrous-metal surfaces:
  - 1. Severe Environment (Semigloss Finish): One finish coat over an intermediate coat and a primer.
    - a. Primer: Epoxy primer applied at spreading rate recommended by manufacturer.
      - (1) Carboline: 893 2-Component Cross-Linked Epoxy
      - (2) Tnemec: Series 27 F. C. Typoxy Polyamide Epoxy
      - (3) Rust-Oleum: Ply Tile 520-W-45
      - (4) International: Intercure 420
    - b. Intermediate Coat: Epoxy applied at spreading rate recommended by manufacturer to achieve a dry film thickness of 3.0 to 5.0 mils.
      - (1) Carboline: 890 2-Component Epoxy
      - (2) Tnemec: Series 66 Hi-Build Epoxoline
      - (3) Rust-Oleum: Ply Tile 520
      - (4) International: Intercure 420

- c. Topcoat: Aliphatic polyurethane enamel applied at spreading rate recommended by manufacturer to achieve a dry film thickness of 1.5 to 4.0 mils.
  - (1) Carboline: 133-HB 2-Component Aliphatic Polyurethane
  - (2) Tnemec: Series 75 Endura-Shield
  - (3) Rust-Oleum: Ply Thane 890
  - (4) International: Interfine 870
- B. Nonferrous Metal: Provide the following finish systems over exterior nonferrous-metal surfaces:
  - 1. Severe Environment (Semigloss Finish): One finish coat over an intermediate coat and a primer.
    - a. Primer: Epoxy primer applied at spreading rate recommended by manufacturer.
      - (1) Carboline: Rustbond Penetrating Sealer SG
      - (2) Tnemec: Series 27 F. C. Typoxy Polyamide Epoxy
      - (3) Rust-Oleum: Ply Tile 520-W-45
      - (4) International: Intercure 420
    - b. Intermediate Coat: Epoxy applied at spreading rate recommended by manufacturer to achieve a dry film thickness of 3.0 to 8.0 mils.
      - (1) Carboline: 890 2-Component Epoxy
      - (2) Tnemec: Intermediate coat not required
      - (3) Rust-Oleum: Ply Tile 520
      - (4) International: Intermediate coat not required
    - c. Topcoat: Aliphatic polyurethane enamel applied at spreading rate recommended by manufacturer to achieve a dry film thickness of 1.5 to 4.0 mils.
      - (1) Carboline: Carboline 133 HB Aliphatic Polyurethane
      - (2) Tnemec: Series 75 Endura-Shield
      - (3) Rust-Oleum: Ply Thane 890
      - (4) International: Interfine 870
- C. Concrete: Provide the following finish systems over exterior concrete surfaces:
  - 1. Severe Environment (Flat Finish): Two finish coat of self-priming, high build, solvent-acrylic based, waterproof, pigmented sealer/paint.

- a. Finish Coats: Solvent/acrylic coating applied at spreading rate recommended by manufacturer to achieve a dry film thickness of 8.0 mils per coat.

- (1) Modac: Modac F - 019 Line
- (2) Moore: Moorelastic 048
- (3) S-W: Ultra-Crete Solvent Coating A46

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. With Applicator present, examine substrates and conditions under which high-performance coatings will be applied, for compliance with coating application requirements.
  1. Apply coatings only after unsatisfactory conditions have been corrected and surfaces to receive coatings are thoroughly dry.
  2. Start of application is construed as Applicator's acceptance of surfaces within that particular area.
- B. Coordination of Work: Review other Sections in which primers or other coatings are provided to ensure compatibility of total systems for various substrates. On request, furnish information on characteristics of specified finish materials to ensure compatible primers.
  1. If a potential incompatibility of primers applied by others exists, obtain the following from the primer Applicator before proceeding:
    - a. Confirmation of primer's suitability for expected service conditions.
    - b. Confirmation of primer's ability to be top coated with materials specified.
  2. Notify Commissioner about anticipated problems before using the coatings specified over substrates primed by others.

#### 3.02 PREPARATION

- A. General: Remove plates, machined surfaces, and similar items already in place that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating.
  1. After completing coating operations, reinstall items that were removed; use workers skilled in the trades involved.

- B. **Cleaning:** Before applying high-performance coatings, clean substrates of substances that could impair bond of coatings. Remove oil and grease before cleaning.
1. Schedule cleaning and coating application so dust and other contaminants from cleaning process will not fall on wet, newly coated surfaces.
- C. **Surface Preparation:** Clean and prepare surfaces to be coated according to manufacturers written instructions for each substrate condition and as specified.
1. Provide barrier coats over incompatible primers or remove primers and reprime substrate.
  2. **Ferrous-Metal Substrates:** Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with SSPC recommendations.
    - a. Blast-clean steel surfaces as recommended by coating manufacturer and according to SSPC-SP 10/NACE No. 2.
    - b. Treat bare and sandblasted or pickled clean metal with a metal treatment wash coat before priming.
    - c. Touch up bare areas and shop-applied prime coats that have been damaged. Wire brush, solvent clean, and touch up with same primer as the shop coat.
  3. **Nonferrous-Metal Substrates:** Clean nonferrous and galvanized surfaces according to manufacturer's written instructions for the type of service, metal substrate, and application required.
    - a. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.
- D. **Material Preparation:** Carefully mix and prepare coating materials according to manufacturers written instructions.
1. Maintain containers used in mixing and applying coatings in a clean condition, free of foreign materials and residue.
  2. Stir materials before applying to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into the material. Remove film and, if necessary, strain coating material before using.
  3. Use only the type of thinners approved by manufacturer and only within recommended limits.

- E. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of the same material are to be applied. Tint undercoats to match color of finish coat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.

### 3.03 APPLICATION

- A. General: Apply high-performance coatings according to manufacturer's written instructions.
  - 1. Use applicators and techniques best suited for the material being applied.
  - 2. Do not apply high-performance coatings over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to forming a durable coating film.
  - 3. Coating colors, surface treatments, and finishes are indicated in the coating system descriptions.
  - 4. Provide finish coats compatible with primers used.
  - 5. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, covers, grilles and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.
    - a. Coat surfaces behind movable equipment and removable covers and grilles the same as similar exposed surfaces. Before final installation, coat surfaces behind permanently fixed equipment with prime coat only.
    - b. Coat back side of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.
- B. Scheduling Coating: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for coating as soon as practicable after preparation and before subsequent surface deterioration.
  - 1. The number of coats and film thickness required is the same regardless of application method.
    - a. Omit primer on metal surfaces that have been shop primed and touchup painted.
    - b. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer.
    - c. Where manufacturer's written instructions require sanding, sand between applications to produce a smooth, even surface.

- d. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until coating has dried to where it feels firm, does not deform or feel sticky under moderate thumb pressure, and application of another coat does not cause undercoat to lift or lose adhesion.
  2. If undercoats or other conditions show through final coat, apply additional coats until cured film has a uniform coating finish, color, and appearance. Give special attention to edges, corners, crevices, welds, exposed fasteners, and similar surfaces to ensure that they receive a dry film thickness equivalent to that of flat surfaces.
- C. Application Procedures: Apply coatings by brush, roller, spray, or other applicators according to manufacturer's written instructions.
1. Brush Application: Use brushes best suited for material applied and of appropriate size for the surface or item being coated.
    - a. Apply primers and first coats by brush unless manufacturer's written instructions permit using roller or mechanical applicators.
    - b. Brush out and work brush coats into surfaces in an even film.
    - c. Eliminate cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections. Neatly draw glass lines and color breaks.
  2. Rollers: Use rollers of carpet, velvet back, or high-pile sheep's wool as recommended by manufacturer for the material and texture required.
  3. Spray Equipment: Use mechanical methods to apply coating if permitted by manufacturer's written instructions and governing regulations.
    - a. Use spray equipment with orifice size recommended by manufacturer for material and texture required.
    - b. Apply each coat to provide the equivalent hiding of brush-applied coats.
    - c. Do not double back with spray equipment building-up film thickness of two coats in one pass, unless recommended by manufacturer.
- D. Minimum Coating Thickness: Apply each material no thinner than manufacturer's recommended spreading rate. Provide total dry film thickness of the entire system as recommended by manufacturer.
- E. Prime Coats: Before applying finish coats, apply a prime coat of material, as recommended by manufacturer, to material required to be coated or finished that has not been prime coated by others.

1. Recoat primed and sealed substrates if there is evidence of suction spots or unsealed areas in first coat, to ensure a finish coat with no burn-through or other defects caused by insufficient sealing.
- F. Completed Work: Match approved Samples for color, texture, and coverage. Remove, refinish, or recoat work that does not comply with specified requirements.

### 3.04 FIELD QUALITY CONTROL

- A. City reserves the right to invoke the following procedure at any time and as often as City deems necessary during the period when coatings are being applied:
  1. City will engage the services of a qualified testing agency to sample coating material being used. Samples of material delivered to Project site will be taken, identified, sealed, and certified in presence of Contractor.
  2. Testing agency will perform appropriate tests for the following characteristics as required by City:
    - a. Quantitative materials analysis
    - b. Absorption
    - c. Accelerated weathering
    - d. Accelerated yellowness
    - e. Color retention
    - f. Alkali and mildew resistance
    - g. Abrasion resistance
    - h. Apparent reflectivity
    - i. Washability
    - j. Dry opacity
    - k. Recoating
    - l. Skinning
  3. City may direct Contractor to stop applying coatings if test results show materials being used do not comply with specified requirements. Contractor shall remove noncomplying coating materials from Project site, pay for testing, and recoat surfaces coated with rejected materials. If necessary, Contractor may be required to remove rejected materials from previously coated surfaces if, on recoating with specified materials, the two coatings are not compatible.

### 3.05 CLEANING

- A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
- B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

3.06 PROTECTION

- A. Protect work of other trades, whether being coated or not, against damage from coating operation. Correct damage by cleaning, repairing, replacing, and recoating, as approved by Commissioner, and leave in an undamaged condition.
  - 1. Provide "Wet Paint" signs to protect newly coated finishes. After completing coating operations, remove temporary protective wrappings provided by others to protect their work.
  - 2. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces. Comply with procedures specified in PDCA P1.

-END OF SECTION-

**Section 09912**  
**INTERIOR PAINTING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes surface preparation and field painting of exposed and interior items and surfaces.
  - 1. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.
  - 2. Follow Finish Schedule for floor, wall and ceiling surfaces to receive paint finish.
- B. Paint exposed surfaces, except where these Specifications indicate that the surface or material is not to be painted or is to remain natural. If an item or a surface is not specifically mentioned, paint the item or surface the same as similar adjacent materials or surfaces. If a color of finish is not indicated, Commissioner will select from standard colors and finishes available.
  - 1. Painting includes field painting of non-stainless steel stair framing, steel lintels, interior concrete walls, beams, and ceilings, interior concrete block, gypsum wallboard, exposed bare and covered pipes and ducts (including color coding), hangers, exposed steel and iron supports, and surfaces of mechanical and electrical equipment that do not have a factory-applied final finish.
  - 2. Interior pavement striping
- C. Do not paint fire protected steel, prefinished items, concealed surfaces, finished metal surfaces, finish flooring, operating parts, and labels.
  - 1. Prefinished items include the following factory-finished components:
    - a. Galvanized steel floor deck
    - b. Galvanized cold formed metal framing
    - c. Stainless steel stairs, floor grating and checkered plate
    - d. Aluminum floor grating and checkered plate
    - e. Acoustical panel ceiling
    - f. Metal toilet enclosures
    - g. Metal urinal screens
    - h. Metal cabinets and personnel lockers

- i. Casework
  - j. Diffusers, Registers, Grilles, Fans, Air Handling Unit, Unit Heaters, Air Cooled Condensating Unit, Radiant Heaters
  - k. Water Heater
  - l. Domestic Water Pumps, Sewage Pumps, Drainage Pumps
  - m. Oil/Water Separators
  - n. Fire Pumps, Jockey Fire Pumps
  - o. Floor Drains, Trench Drains
  - p. Finished Mechanical and Electrical Equipment
  - q. Light fixtures
  - r. Transformers
  - s. Panel Boards
  - t. Motor Control Center
  - u. Switchgears
  - v. Automatic Transfer Switches
  - w. Disconnect Circuit Breakers
  - x. Control Panels
2. Concealed surfaces include walls or ceilings in the following generally inaccessible spaces:
- a. Furred areas
  - b. Ceiling plenums
  - c. Utility tunnels
  - d. Pipe spaces
  - e. Duct shafts
3. Finished metal surfaces include the following:
- a. Galvanized steel
  - b. Stainless steel
  - c. Chromium plate
  - d. Copper and copper alloys

- e. Brass
  - f. Pipe Insulation
4. Operating parts include moving parts of operating equipment and the following:
- a. Valve and damper operators
  - b. Linkages
  - c. Sensing devices
  - d. Motor and fan shafts
5. Labels: Do not paint over UL, FMG, or other code-required labels or equipment name, identification, performance rating, or nomenclature plates.

#### 1.02 RELATED SPECIFICATIONS

- A. Section 05120 Structural Steel for shop priming structural steel.
- B. Section 05500 Metal Fabrications for shop priming ferrous metal.
- C. Section 07811 Sprayed Fire Resistive Materials for fire-protected structural steel coatings.
- D. Section 09260 Gypsum Board Assemblies for surface preparation of gypsum board.
- E. Section 09265 Gypsum Board Shaft Wall for surface preparation of gypsum board.
- F. Section 09010 Room Finish Schedule for typical painting application.
- G. Sections related to Plumbing
- H. Sections related to HVAC
- I. Sections related to Electrical
- J. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

#### 1.03 DEFINITIONS

- A. Standard coating terms defined in ASTM D 16 apply to this Section.
  - 1. Flat refers to a lusterless or matte finish with a gloss range below 15 when measured at an 85-degree meter.
  - 2. Eggshell refers to low-sheen finish with a gloss range between 20 and 35 when measured at a 60-degree meter.
  - 3. Semigloss refers to medium-sheen finish with a gloss range between 35 and 70 when measured at a 60-degree meter.

4. Full gloss refers to high-sheen finish with a gloss range more than 70 when measured at a 60-degree meter.

#### 1.04 SUBMITTALS

- A. Product Data: For each paint system indicated. Include block fillers and primers.
  1. Material List: An inclusive list of required coating materials. Indicate each material and cross-reference specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.
  2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.
- B. Samples for Initial Selection: For each type of finish-coat material indicated.
  1. After color selection, Commissioner will furnish color chips for surfaces to be coated.
- C. Samples for Verification: For each color and material to be applied, with texture to simulate actual conditions, on representative Samples of the actual substrate.
  1. Provide stepped Samples, defining each separate coat, including block fillers and primers. Use representative colors when preparing Samples for review. Resubmit until required sheen, color, and texture are achieved.
  2. Provide a list of materials and applications for each coat of each Sample. Label each Sample for location and application.
  3. Submit 2 Samples on the following substrates for Commissioner's review of color and texture only:
    - a. Concrete: 4-inch- square Samples for each color and finish.
    - b. Concrete Unit Masonry: 4-by-8-inch Samples of masonry, with mortar joint in the center, for each finish and color.
    - c. Ferrous Metal: 3-inch- square Samples of flat metal and 6-inch- long Samples of solid metal for each color and finish.
- D. Qualification Data: For Applicator.

#### 1.05 QUALITY ASSURANCE

- A. Applicator Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project,

whose work has resulted in applications with a record of successful in-service performance.

- B. Source Limitations: Obtain block fillers and primers for each coating system from the same manufacturer as the finish coats.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:

1. Product name or title of material
2. Product description (generic classification or binder type)
3. Manufacturer's stock number and date of manufacture
4. Contents by volume, for pigment and vehicle constituents
5. Thinning instructions
6. Application instructions
7. Color name and number
8. VOC content

- B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F. Maintain storage containers in a clean condition, free of foreign materials and residue.

1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily.

#### 1.07 PROJECT CONDITIONS

- A. Apply waterborne paints only when temperatures of surfaces to be painted and surrounding air are between 50 and 90 degrees F.
- B. Apply solvent-thinned paints only when temperatures of surfaces to be painted and surrounding air are between 45 and 95 degrees F.

#### 1.08 EXTRA MATERIALS

- A. Furnish extra paint materials from the same production run as the materials applied and in the quantities described below. Package with protective covering for storage and identify with labels describing contents. Deliver extra materials to City.

1. Quantity: Furnish City with an additional not less than 5 gal. of each material and color applied.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one of the products listed in other Part 2 articles.
- B. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:
  - 1. Benjamin Moore & Co. (Benjamin Moore)
  - 2. Kelly-Moore Paint Co. (Kelly-Moore)
  - 3. M. A. Bruder & Sons, Inc. (M. A. B. Paint)
  - 4. PPG Industries, Inc. (Pittsburgh Paints)
  - 5. Sherwin-Williams Co. (Sherwin-Williams)

## 2.02 PAINT MATERIALS, GENERAL

- A. Material Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.
- B. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Paint-material containers not displaying manufacturer's product identification will not be acceptable.
  - 1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.
- C. Chemical Components of Interior Paints and Coatings: Provide products that comply with to the following chemical restrictions:
  - 1. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight of total aromatic compounds (hydrocarbon compounds containing one or more benzene rings).
  - 2. Restricted Components: Paints and coatings shall not contain any of the following:
    - a. Acrolein
    - b. Acrylonitrile
    - c. Antimony
    - d. Benzene
    - e. Butyl benzyl phthalate

- f. Cadmium
- g. Di (2-ethylhexyl) phthalate
- h. Di-n-butyl phthalate
- i. Di-n-octyl phthalate
- j. 1,2-dichlorobenzene
- k. Diethyl phthalate
- l. Dimethyl phthalate
- m. Ethylbenzene
- n. Formaldehyde
- o. Hexavalent chromium
- p. Isophorone
- q. Lead
- r. Mercury
- s. Methyl ethyl ketone
- t. Methyl isobutyl ketone
- u. Methylene chloride
- v. Naphthalene
- w. Toluene (methylbenzene)
- x. 1,1,1-trichloroethane
- y. Vinyl chloride

D. Colors: As selected by Commissioner from manufacturer's full range.

## 2.03 CONCRETE UNIT MASONRY BLOCK FILLERS

A. Concrete Unit Masonry Block Filler: Factory-formulated latex block fillers.

- 1. Benjamin Moore; Block Filler No. M 88: Applied at a dry film thickness of not less than 8.0 mils.
- 2. Kelly-Moore; 521 Fill and Prime Acrylic Block Filler: Applied at a dry film thickness of not less than 10.0 to 12.0 mils.
- 3. M. A. B.; Block Filler No. 2000: Applied at a dry film thickness of not less than 12.0 to 15 mils.
- 4. Pittsburgh Paints; Pitt-Glaze No. 60-90 Block Filler: Applied at a dry film thickness of not less than 6.2 to 13.0 mils.
- 5. Sherwin-Williams; PrepRite Block Filler B25W25: Applied at a dry film thickness of not less than 8.0 mils.

B. Concrete Unit Masonry Block Filler: Factory-formulated high-performance epoxy block filler.

- 1. Benjamin Moore; Block Filler No. M31/M32: Applied at a dry film thickness of not less than 10.0 mils.

2. Kelly-Moore; Poly-Chem PC 145: Applied at a dry film thickness of not less than 10.0 mils.
3. M. A. B.; Block Filler Ply-Tile No. 161135/761188: Applied at a dry film thickness of not less than 5.0 to 10.0 mils.
4. Pittsburgh; Aquapon Epoxy Block Filler 97-685: Applied at a dry film thickness of not less than 12.0 to 24.0 mils.
5. Sherwin-Williams; Block Filler Kem-Cati HS No. B42W400/B42V401: Applied at a dry film thickness of not less than 10.0 mils.

## 2.04 INTERIOR PRIMERS

### A. Interior Concrete and Masonry Primer: Factory-formulated alkali-resistant acrylic-latex interior primer for interior application.

1. Benjamin Moore; Moorcraft Super Spec Latex Enamel Undercoater & Primer Sealer No. 253: Applied at a dry film thickness of not less than 1.2 mils.
2. Coronado; 40-11 Super Kote 5000 Latex Primer-Sealer: Applied at a dry film thickness of not less than 1.2 mils.
3. Kelly-Moore; 971 Acry-Prime Interior Latex Primer/Sealer: Applied at a dry film thickness of not less than 1.6 mils.
4. M. A. B. Paint; Rich Lox Prime Fast 037-138: Applied at a dry film thickness of not less than 1.5 mils.
5. Pittsburgh Paints; 6-2 SpeedHide Interior Quick-Drying Latex Sealer: Applied at a dry film thickness of not less than 1.0 mil.
6. Sherwin-Williams; PrepRite Masonry Primer B28W300: Applied at a dry film thickness of not less than 3.0 mils.

### B. Interior Gypsum Board Primer: Factory-formulated latex-based primer for interior application.

1. Benjamin Moore; Moorcraft Super Spec Latex Enamel Undercoater & Primer Sealer No. 253: Applied at a dry film thickness of not less than 1.2 mils.
2. Kelly-Moore; 971 Acry-Prime Interior Latex Primer/Sealer: Applied at a dry film thickness of not less than 1.6 mils.
3. M. A. B. Paint; Rich Lux Prime Fast037-138: Applied at a dry film thickness of not less than 1.5 mils.

4. Pittsburgh Paints; 6-2 SpeedHide Interior Quick-Drying Latex Sealer: Applied at a dry film thickness of not less than 1.0 mil.
  5. Sherwin-Williams; PrepRite 200 Latex Wall Primer B28W200 Series: Applied at a dry film thickness of not less than 1.6 mils.
- C. Interior Ferrous-Metal Primer: Factory-formulated quick-drying rust-inhibitive alkyd-based metal primer.
1. Benjamin Moore; Moore's IMC Alkyd Metal Primer No. M06: Applied at a dry film thickness of not less than 2.0 mils.
  2. Kelly-Moore; Chemical Mastic CM-15: Applied at a dry film thickness of not less than 5.0 mils.
  3. M. A. B. Paint; Rust-O-Lastic Anti-Corrosive Primer 073-132: Applied at a dry film thickness of not less than 2.0 mils.
  4. Pittsburgh Paints; 90-709 Pitt-Tech One Pack Interior/Exterior Primer/Finish DTM Industrial Enamel: Applied at a dry film thickness of not less than 1.5 mils.
  5. Sherwin-Williams; Chembond-HS Metal Primer B-50 Series: Applied at a dry film thickness of not less than 2.0 mils.
- D. Interior Zinc-Coated Metal Primer: Factory-formulated galvanized metal primer.
1. Benjamin Moore; Moore's IMC Acrylic Metal Primer No. M04: Applied at a dry film thickness of not less than 2.0 mils.
  2. ICI Dulux Paints; 4160-6130 Devguard Multi-Purpose Tank & Structural Primer: Applied at a dry film thickness of not less than 2.0 mils.
  3. Kelly-Moore; 1722 Kel-Guard Acrylic Galvanized Iron Primer: Applied at a dry film thickness of not less than 1.8 mils.
  4. M. A. B. Paint; Rust-O-Lastic Hydro-Prime II Acrylic (DTM) Maintenance Primer 073-189: Applied at a dry film thickness of not less than 2.0 mils.
  5. Pittsburgh Paints; 90-709 Pitt-Tech One Pack Interior/Exterior Primer/Finish DTM Industrial Enamel: Applied at a dry film thickness of not less than 3.0 mils.
  6. Sherwin-Williams; ProCryl Primer B66-310 Series: Applied at a dry film thickness of not less than 3.0 mils.

## 2.05 INTERIOR FINISH COATS

- A. Interior Low-Luster Acrylic Enamel: Factory-formulated eggshell acrylic-latex interior enamel.
  - 1. Benjamin Moore; Moorcraft Super Spec Latex Eggshell Enamel No. 274: Applied at a dry film thickness of not less than 1.3 mils.
  - 2. Kelly-Moore; 1610 Sat-N-Sheen Interior Latex Low Sheen Wall and Trim Finish: Applied at a dry film thickness of not less than 1.6 mils.
  - 3. Kelly-Moore; 1686 Dura-Poxy Eggshell Acrylic Enamel: Applied at a dry film thickness of not less than 1.6 mils.
  - 4. M. A. B. Paint; Rich Lux Latex Eggshell Enamel 405 Line: Applied at a dry film thickness of not less than 1.5 mils.
  - 5. Pittsburgh Paints; 6-400 Series SpeedHide Eggshell Acrylic Latex Enamel: Applied at a dry film thickness of not less than 1.25 mils.
  - 6. Sherwin-Williams; ProMar 200 Interior Latex Egg-Shell Enamel B20W1200 Series: Applied at a dry film thickness of not less than 1.6 mils.
- B. Interior Epoxy Enamel for Masonry and Concrete: Factory-formulated epoxy interior enamel.
  - 1. Benjamin Moore; Epoxy Enamel No. M45/M46: Applied at a dry film thickness of not less than 3.0 to 5.0 mils.
  - 2. Kelly-Moore; CM15 Hi-Build Epoxy Mastic: Applied at a dry film thickness of not less than 5.0 to 7.0 mils.
  - 3. M. A. B. Paint; Hippopoxy 52 Series: Applied at a dry film thickness of not less than 5.0 to 7.0 mils.
  - 4. Pittsburgh Paints; Aquapon High Build Epoxy 97-130: Applied at a dry film thickness of not less than 4.0 to 6.0 mils.
  - 5. Sherwin-Williams; Epolon Multi-II Series: Applied at a dry film thickness of not less than 4.0 to 5.0 mils.
- C. Interior Semigloss Acrylic Enamel: Factory-formulated semigloss acrylic-latex enamel for interior application.
  - 1. Benjamin Moore; IronClad Low Lustre Super Spec Latex Semi-Gloss Enamel No. 363: Applied at a dry film thickness of not less than 1.2 mils.

2. Kelly-Moore; 1685 Dura-Poxy Semi-Gloss Acrylic Enamel: Applied at a dry film thickness of not less than 1.5 mils.
  3. M. A. B. Paint; Fresh Kote Latex Semi-Gloss 410 Line: Applied at a dry film thickness of not less than 1.5 mils.
  4. Pittsburgh Paints; Minor Hall Semi-Gloss 87-6 Interior Semi-Gloss Latex: Applied at a dry film thickness of not less than 1.0 mils.
  5. Sherwin-Williams; ProMar 200 Interior Latex Semi-Gloss Series: Applied at a dry film thickness of not less than 1.3 mils.
- D. Interior Pavement Striping: Factory-formulated semigloss acrylic-latex enamel for interior application.
1. Benjamin Moore; Safety Zone marking, Latex M58.
  2. Sherwin-Williams; Traffic Marking Paint: Set Fast Acrylic, Latex TM2160

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for paint application.
1. Proceed with paint application only after unsatisfactory conditions have been corrected and surfaces receiving paint are thoroughly dry.
  2. Start of painting will be construed as Applicator's acceptance of surfaces and conditions within a particular area.
- B. Coordination of Work: Review other Sections in which primers are provided to ensure compatibility of the total system for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.
1. Notify Commissioner about anticipated problems when using the materials specified over substrates primed by others.

### 3.02 PREPARATION

- A. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or impossible because of size or weight of the item, provide surface-applied protection before surface preparation and painting.
1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.

- B. Cleaning: Before applying paint or other surface treatments, clean substrates of substances that could impair bond of the various coatings. Remove oil and grease before cleaning.
1. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.
- C. Surface Preparation: Clean and prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition and as specified.
1. Provide barrier coats over incompatible primers or remove and reprime.
  2. Cementitious Materials: Prepare concrete, concrete unit masonry, cement plaster, and mineral-fiber-reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation.
    - a. Use abrasive blast-cleaning methods if recommended by paint manufacturer.
    - b. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause the finish paint to blister and burn, correct this condition before application. Do not paint surfaces if moisture content exceeds that permitted in manufacturer's written instructions.
    - c. Clean concrete floors to be painted with a 5 percent solution of muriatic acid or other etching cleaner. Flush the floor with clean water to remove acid, neutralize with ammonia, rinse, allow to dry, and vacuum before painting.
  3. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with SSPC's recommendations.
    - a. Treat bare and sandblasted or pickled clean metal with a metal treatment wash coat before priming.
    - b. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by paint manufacturer, and touch up with same primer as the shop coat.
  4. Galvanized Surfaces: Clean galvanized surfaces with nonpetroleum-based solvents so surface is free of oil and surface contaminants. Remove

pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods check for chromates.

- D. Material Preparation: Mix and prepare paint materials according to manufacturer's written instructions.
1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.
  2. Stir material before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into material. If necessary, remove surface film and strain material before using.
  3. Use only thinners approved by paint manufacturer and only within recommended limits.
- E. Tinting: Tint each undercoat a lighter shade to simplify identification of each coat when multiple coats of same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

### 3.03 APPLICATION

- A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.
1. Paint colors, surface treatments, and finishes are indicated in the paint schedules.
  2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
  3. Provide finish coats that are compatible with primers used.
  4. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, grilles, convactor covers, covers for finned-tube radiation, and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.
  5. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces. Before final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
  6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.
  7. Paint backsides of access panels and removable or hinged covers to match exposed surfaces.

8. Finish exterior doors on tops, bottoms, and side edges the same as exterior faces.
  9. Finish interior of wall and base cabinets and similar field-finished casework to match exterior.
  10. Sand lightly between each succeeding enamel or varnish coat.
- B. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
1. The number of coats and film thickness required are the same regardless of application method. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.
  2. Omit primer over metal surfaces that have been shop primed and touchup painted.
  3. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance. Give special attention to ensure that edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.
  4. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure, and until application of another coat of paint does not cause undercoat to lift or lose adhesion.
- C. Application Procedures: Apply paints and coatings by brush, roller, spray, or other applicators according to manufacturer's written instructions.
1. Brushes: Use brushes best suited for type of material applied. Use brush of appropriate size for surface or item being painted.
  2. Rollers: Use rollers of carpet, velvet-back, or high-pile sheep's wool as recommended by manufacturer for material and texture required.
  3. Spray Equipment: Use airless spray equipment with orifice size as recommended by manufacturer for material and texture required.
- D. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve dry film thickness indicated. Provide total dry film thickness of the entire system as recommended by manufacturer.

- E. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed in equipment rooms and occupied spaces, including material installed under requirements of Specification sections related to Plumbing, HVAC, and Electrical work.
- F. Mechanical items to be painted include, but are not limited to, the following:
  - 1. Uninsulated metal piping
  - 2. Uninsulated plastic piping.
  - 3. Pipe hangers and supports
  - 4. Tanks that do not have factory-applied final finishes
  - 5. Visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets
  - 6. Duct, equipment, and pipe insulation having "all-service jacket" or other paintable jacket material.
  - 7. Mechanical equipment that is indicated to have a factory-primed finish for field painting.
- G. Electrical items to be painted include, but are not limited to, the following:
  - 1. Electrical equipment that is indicated to have a factory-primed finish for field painting.
- H. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.
- I. Prime Coats: Before applying finish coats, apply a prime coat, as recommended by manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no burn-through or other defects due to insufficient sealing.
- J. Pigmented (Opaque) Finishes: Completely cover surfaces as necessary to provide a smooth, opaque surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.
- K. Transparent (Clear) Finishes: Use multiple coats to produce a glass-smooth surface film of even luster. Provide a finish free of laps, runs, cloudiness, color irregularity, brush marks, orange peel, nail holes, or other surface imperfections.
  - 1. Provide satin finish for final coats.

- L. Stipple Enamel Finish: Roll and redistribute paint to an even and fine texture. Leave no evidence of rolling, such as laps, irregularity in texture, skid marks, or other surface imperfections.
- M. Interior Pavement Striping: Stripe and mark paving that is clean and dry and by method recommended by the manufacturer.
- N. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

### 3.04 FIELD QUALITY CONTROL

- A. The City of New York reserves the right to invoke the following test procedure at any time and as often as City deems necessary during the period when paint is being applied:
  - 1. The City of New York will engage a qualified independent testing agency to sample paint material being used. Samples of material delivered to Project will be taken, identified, sealed, and certified in the presence of Contractor.
  - 2. Testing agency will perform appropriate tests for the following characteristics as required by The City of New York:
    - a. Volume Solids
    - b. Dry Film Thickness
    - c. Type of Resin
    - d. Gloss or Sheen as per ASTM D523
  - 3. The City of New York may direct Contractor to stop painting if test results show material being used does not comply with specified requirements. Contractor shall remove noncomplying paint from Project site, pay for testing, and repaint surfaces previously coated with the noncomplying paint. If necessary, Contractor may be required to remove noncomplying paint from previously painted surfaces if, on repainting with specified paint, the two coatings are incompatible.

### 3.05 CLEANING

- A. Cleanup: At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from Project site.
  - 1. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping without scratching or damaging adjacent finished surfaces.

### 3.06 PROTECTION

- A. Protect work of other trades, whether being painted or not, against damage from painting. Correct damage by cleaning, repairing or replacing, and repainting, as approved by Commissioner.
- B. Provide "Wet Paint" signs to protect newly painted finishes. After completing painting operations, remove temporary protective wrappings provided by others to protect their work.
  - 1. After work of other trades is complete, touch up and restore damaged or defaced painted surfaces. Comply with procedures specified in PDCA P1.

### 3.07 INTERIOR PAINT SCHEDULE

- A. Concrete: Provide the following paint systems over interior concrete:
  - 1. Low-Luster Acrylic-Enamel Finish: Two finish coats over a primer
    - a. Primer: Interior concrete and masonry primer
    - b. Finish Coats: Interior low-luster acrylic enamel
  - 2. Epoxy Enamel Finish: Two finish coats over a primer
    - a. Primer: Interior concrete and masonry primer
    - b. Finish Coats: Interior epoxy enamel
- B. Concrete Unit Masonry: Provide the following finish systems over interior concrete masonry:
  - 1. Low-Luster Acrylic-Enamel Finish: Two finish coats over a block filler
    - a. Block Filler: Concrete unit masonry block filler
    - b. Finish Coats: Interior low-luster acrylic enamel
  - 2. Epoxy-Enamel Finish: Two finish coats over a block filler
    - a. Block Filler: Concrete unit masonry block filler
    - b. Finish Coats: Interior epoxy enamel
- C. Gypsum Board: Provide the following finish systems over interior gypsum board surfaces:
  - 1. Low-Luster Acrylic-Enamel Finish: Two finish coats finish coats over a primer
    - a. Primer: Interior gypsum board primer.
    - b. Finish Coats: Interior low-luster acrylic enamel.

- D. Ferrous Metal: Provide the following finish systems over ferrous metal:
  - 1. Semigloss Acrylic-Enamel Finish: Two finish coats over a primer
    - a. Primer: Interior ferrous-metal primer, alkyd based
    - b. Finish Coats: Interior semigloss acrylic enamel
- E. Zinc-Coated Metal: Provide the following finish systems over interior zinc-coated metal surfaces:
  - 1. Semigloss Acrylic-Enamel Finish: Two finish coats finish coats over a primer
    - a. Primer: Interior zinc-coated metal primer
    - b. Finish Coats: Interior semigloss acrylic enamel
- F. All-Service Jacket over Insulation: Provide the following finish system on cotton or canvas insulation covering:
  - 1. Primer as recommended by manufacturer and finish to match adjacent surface.
  - 2. Flat Acrylic Finish: Two finish coats. Add fungicidal agent to render fabric mildew proof.
    - a. Finish Coats: Interior flat latex-emulsion

-END OF SECTION-

**Section 09967**  
**COATING FOR STEEL WATERFRONT STRUCTURES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Under this Section, the Contractor shall coat steel fender piles, sheet piles, king piles, exterior ladders, trench drain frames and fender frame assemblies.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 - Regulated Materials Control
- B. Section 01356 - Safe and Healthful Working Conditions
- C. Section 01733 - Construction Waste Management

#### 1.04 SUBMITTALS

- A. Prior to commencement of the work, the Contractor shall submit to the Commissioner for approval, in accordance with the General Conditions and Section 01330 - Shop Drawings, the following information at least 3 weeks prior to the start of work:
  1. Qualifications: Submit evidence documenting qualifications meeting the requirements of Article 1.05.

---

<sup>1</sup> Formerly Steel Structures Painting Council

- a. Identification of coating applicator and documentation of his/her qualifications.
- b. Testing Technicians and Testing Agency: Submit data on qualifications of the Contractor's proposed testing agency and technicians

2. Product Data

- a. Three copies of manufacturer's Material Safety Data Sheets (MSDS) for coatings, solvents and other potentially hazardous materials.
- b. Manufacturer's catalog cuts showing conformance to the requirements herein and recommendations for product application. Submittal shall note if thinners are proposed and shall include information required by paragraph 3.03A.

3. Quality Control Submittals

- a. Test Reports and Records:
  - (1) Submit record of established "surface standard" and record of pre-preparation testing as specified in Article 3.02 entitled "CLEANING AND PREPARATION OF SURFACES".
  - (2) Submit reports by the Contractor's Independent Testing Laboratory as specified in Article 3.06 entitled FIELD QUALITY CONTROL.

1.05 QUALITY ASSURANCE

- A. The Contractor shall conform to all applicable manufacturers' recommendations. Arrange for the coating manufacturer's representative to be present and to furnish applicable supervision and reports at times specified in this Section.
- B. Testing Agency/Laboratory: Engage the services of an independent testing laboratory approved by Commissioner to perform testing of coating samples and abrasive for compliance with specification requirements to be performed by the Contractor. Testing shall be performed by an approved accredited laboratory regularly engaged in testing of paint samples and abrasive.
- C. Coating Applicator Qualifications:
  1. The surface preparer and coating applicator shall be SSPC QP 1 certified while accomplishing any surface preparation or coating application.
    - a. Should the applicator's SSPC certification expire, the firm will not be allowed to perform any work until the certification is re-issued.

Requests for extension of time due to inactive certification will not be considered.

2. For each entity performing coating, submit evidence that the coating applicator has satisfactorily applied coating at structures similar in size, nature and complexity as the proposed work and has a minimum of 3 years of documented experience in their respective fields. Indicate the names and locations of the structure, type and design of the equipment used and the applicator's facilities.
3. Pre-application Meeting: Convene a pre-application meeting at least 2 weeks before start of application of coating systems on fabricated/constructed items of the Project. Require attendance of parties directly affecting work of this Section, including the Contractor, fabricator, the Commissioner, applicator, and coating manufacturer's representative. Review the following:
  - a. Environmental requirements
  - b. Protection of surfaces not scheduled to be coated
  - c. Surface preparation
  - d. Application, including review of field samples/mock-ups
  - e. Repair
  - f. Field quality control
  - g. Cleaning
  - h. Protection of coating systems
  - i. One-year inspection
  - j. Coordination with other work

#### 1.06 ENVIRONMENTAL CONDITIONS

- A. Start coating work only when ambient and curing temperatures and relative humidity are within limits of coating manufacturer's recommendations and the surface temperature of the steel is at least 5° F. above dew point temperature.
- B. Apply coatings only be when the steel surfaces are perfectly dry. Do not prepare surfaces or apply coatings in rain, snow, fog, or mist.
- C. Do not spray coatings if wind velocity is above manufacturer's limit.
- D. Provide ventilation during coating evaporation stage in confined or enclosed areas in accordance with manufacturer's instructions.
- E. Dust and Contaminants
  1. Schedule coating work to avoid excessive dust and airborne contaminants.
  2. Protect work areas and surfaces from excessive dust and airborne contaminants during coating application and curing.

## 1.07 SAFETY AND HEALTH PRECAUTIONS

- A. Materials listed in this section contain ingredients which are toxic. Follow safety procedures as recommended by manufacturer MSDS. Work in a well ventilated area. Provide, and require workers to use, impervious clothing, gloves, face shields (8 inch minimum), and other appropriate protective clothing necessary to prevent eye and skin contact with coating materials. Keep coatings away from heat, sparks and flame.

## 1.08 MATERIALS HANDLING AND STORAGE

- A. Handling, storage and disposal of coating shall strictly conform to the manufacturer's recommendations, Section 01355, and Section 01733. A list of minimum handling and storage requirements follows.
- B. All liquid epoxy components to be used in the work shall be delivered to the jobsite in tightly sealed unopened containers, clearly labeled to indicate:
  - 1. Name of manufacturer
  - 2. Manufacturer's product name and component designation
  - 3. Manufacturer's lot number and "Use before" date
  - 4. ANSI (American National Standards Institute) hazardous material rating and handling precautions
- C. Epoxy liquid epoxy components shall be stored in a covered, well ventilated space. The storage temperature of the liquid components shall not exceed 90° F nor be less than 40° F at any time after receipt by the Contractor, unless otherwise specified by the manufacturer.
- D. Containers containing liquid epoxy components shall always be sealed and air tight from time of receipt by contractor until entering the proportioning and blending process. When containers are opened for sampling or other purposes and containers remain partially filled, their lids will be tightly closed to prevent contamination by moisture or other substances. After the seal has been broken on a container, its contents must be used within seven (7) days or removed from the project, unless the manufacturer has more stringent requirements.
- E. All project personnel handling coatings shall be properly alerted to the Epoxy Safety Requirements supplied by the manufacturer. MSDSs shall be supplied with each shipment of liquid epoxy materials. Copies thereof shall be distributed to project personnel and the requisite copies as required by Paragraph 1.04A.2.a shall be submitted to the Commissioner.

**1.09 REGULATORY REQUIREMENTS**

- A. Lead Content: Do not use coatings having a lead content over 0.06 percent by weight of nonvolatile content.
- B. Chromate Content: Do not use coatings containing zinc-chromate or strontium-chromate.
- C. Asbestos Content: Materials shall not contain asbestos.

**1.10 WARRANTY PROVISIONS**

- A. The Commissioner will set a meeting date for an on-site inspection of coating systems within a month prior to expiration of the Project guaranty period specified in Section 01781.
- B. The Contractor, the Contractor's coating applicator, the Commissioner, and coating manufacturer's representative shall attend the scheduled coating inspection meeting.
- C. The Contractor shall repair deficiencies in coating systems as determined by the Commissioner's observation in accordance with manufacturer's instructions as approved by the Commissioner. Repair of coating deficiencies by the Contractor shall be completed prior to the City of New York's acceptance of the Contractor's Contract obligations.

**PART 2 PRODUCTS****2.01 COATING SYSTEMS**

- A. Finish coating for steel fender piles and sheet piles shall be a Coal Tar Epoxy-Polyamide system conforming to:
  - 1. System: SSPC PS 11.01
  - 2. Paints: SSPC Paint 16
  - 3. Color shall be as specified in Paragraph 3.04F
- B. Finish coating for fender panels and exterior ladders shall be an
  - 1. An Epoxy-Polyamide system conforming to:
    - a. System: SSPC PS 13.01
    - b. Paints: SSPC Paint 22
    - c. Color: Black
  - 2. Ladder Rungs shall additionally be coated with an ablative anti-fouling coating such as C-Flex 1-2-3 by Carboline Co. or approved equal. Color shall be red.

## C. Finish Coating for Trench Drain Frames

1. Furnish an elastomeric urethane coating system with a tan color. Acceptable products include the following or approved equal:

- a. Polibrid 705-E by International Protective Coatings
- b. Polibrid 705 by Carboline
- c. Sherflex by Sherwin Williams

- D. Provide catalyst components for coatings specific for resin components provided. When allowed by coating manufacturer, use thinners compatible with the coating.

## 2.02 SOLUBLE SALTS TEST KITS

- A. Test Kit for Measuring Chlorides on Steel Surfaces: Provide test kits such as CHLOR\*TEST, as manufactured by CHLOR\*RID International Inc. of Chandler, Arizona ([www.chlor-rid.com](http://www.chlor-rid.com)) or approved equal meeting the following requirements:

1. Kit contains all materials, supplies, tools and instructions for field testing and on site quantitative evaluation;
2. Kit extract solution is acidic, factory pre-measured, pre-packaged, and of uniform concentration;
3. Kit components and solutions are mercury free and environmentally friendly;
4. Kit contains a factory sealed titration device;
5. Kit contains new materials and solutions for each test;
6. Test container (vessel, sleeve, cell. etc.) creates a sealed, encapsulated environment during chloride ion extraction;
7. Test container is suitable for testing the following steel surfaces: horizontal (up/down configuration), vertical, flat, curved, smooth, pitted, and rough;
8. Kit uses test container, with resulting chloride ion extract solution, as the titration container;
9. Chloride ion concentration is directly measured in micrograms per square centimeter without using either conversion charts or tables.

## 2.03 ABRASIVE

- A. The referenced abrasive specifications have maximum limits for soluble salts contamination; however, this maximum level of contamination does not guarantee

that contamination will not be transferred to the steel surface during abrasive blasting. Other factors such as on site handling and recycling can allow contamination of abrasive. The Contractor is cautioned to verify that the chosen abrasive, along with work and storage processes, allow the final surface cleanliness requirements to be achieved. Successful testing of chlorides in abrasive does not negate the final acceptance testing of steel surfaces.

- B. Non-metallic Abrasive: Conform to SSPC AB 1, Type I or II, Class A. Make adjustments to processes or abrasive gradation to achieve specified surface profile. Recycled non-metallic abrasive shall meet all requirements of the specification each time that it is placed in the blast pot.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Protection of Area and Spaces: Prior to surface preparation and coating applications, remove, mask, or otherwise protect surfaces adjacent to the work. Design and provide a containment system for the capture, containment, collection, storage and disposal of the waste materials generated by the work under this Section, to meet the requirements of SSPC PA Guide 6, Class 4. Waste materials covered by this paragraph shall not include any material or residue from removal of coatings containing lead, chromium, cadmium, PCB, or any other hazardous material. It is the Contractor's responsibility to insure the feasibility and workability of the containment system. The Contractor shall perform its operations and work schedule in a manner as to minimize leakage of the containment system. Properly maintain the containment system. If at any time during the execution of the work, the containment system fails to function satisfactory, suspend all operations, except those required to minimize adverse impact on the environment or property. Do not resume operations until modifications have been made to correct the cause of the failure.

### 3.02 CLEANING AND PREPARATION OF SURFACES

- A. General: Sequence surface cleaning and preparation as follows:
  - 1. Solvent Clean Surfaces
  - 2. Establish Surface Standard for blast cleaning
  - 3. Perform Pre-preparation Testing for Surface Contamination"
  - 4. Blast Clean Surfaces
  - 5. Test for Surface Contamination and Cleanliness
- B. Accomplish surface preparation as directed and as specified by the cited SSPC references. All surfaces prepared for coating shall be to the satisfaction and approval of the Commissioner and the Coating Manufacturer's representative.

- C. Solvent Cleaning: Conform to SSPC SP 1. Remove visible oil, grease, and drawing and cutting compounds by solvent cleaning.
- D. Surface Standard: Inspect surfaces to be coated, and select plate with similar properties and surface characteristics for use in establishing a surface standard. Blast clean one or more 1-foot square steel panels as specified herein. Include sequenced testing for surface contamination.
  - 1. Record blast nozzle type and size, air pressure at nozzle and compressor, distance of nozzle from panel, and angle of blast to establish procedures for blast cleaning.
  - 2. Measure surface profile in accordance with ASTM D4417. When the surface standard complies with all specified requirements, seal with a clearcoat protectant.
  - 3. Use the surface standard for comparison to abrasive blasted surfaces throughout the course of work.
- E. Pre-Preparation Testing for Surface Contamination: Comply with testing sequence specified for surface cleaning and preparation.
  - 1. Pre-Preparation Testing for Oil and Grease Contamination:
    - a. Inspect all surfaces for oil and/or grease contamination using two or more of the following inspection techniques:
      - (1) Visual inspection
      - (2) Water Break Test: Spray atomized mist of distilled water onto surface, and observe for water beading. If water "wets" surface rather than beading up, surface can be considered free of oil or grease contamination. Beading of water (water forms droplets) is evidence of oil or grease contamination.
      - (3) Cloth Rub Test: Rub a clean, white, lint free, cotton cloth onto surface and observe for discoloration. To confirm oil or grease contamination in lightly stained areas, a non staining solvent may be used to aid in oil or grease extraction. Any visible discoloration is evidence of oil or grease contamination.
    - b. Reject oil and/or grease contaminated surfaces, clean using water based pH neutral degreaser in accordance with SSPC SP 1, and recheck for contamination until surfaces are free of oil and grease.
  - 2. Pre-Preparation Testing for Soluble Salts Contamination:

- a. Test surfaces for soluble salts, and wash as required, prior to abrasive blasting. Soluble salt testing is also required in Paragraph 3.02G.2 as a final acceptance test of prepared surfaces after abrasive blasting, and successful completion of this test does not negate that requirement. This phase is required since pre preparation washing is generally more effective than attempting to remove soluble salt contamination after abrasive blasting.
  - b. Effective removal of soluble salts will require removal of any barrier to the steel surface, including rust. This procedure may necessitate combinations of wet abrasive blasting, high pressure water rinsing, and cleaning using a solution of water washing and soluble salts remover.
  - c. The soluble salts remover shall be acidic, biodegradable, nontoxic, non-corrosive, and after application, shall not interfere with adhesion of the first coat. Delays between testing and preparation, or testing and coating application may allow for the formation of new contamination.
  - d. Use potable water, or potable water modified with soluble salt remover, for all washing or wet abrasive blasting.
  - e. Test methods and equipment used in this phase are selected at the Contractor's discretion.
- F. Blast Cleaning: Conform to SSPC SP 10. After solvent cleaning, complete surface preparation by near-white blast cleaning. Remove residual dust from blasted surface by blowing with dry, oil-free air, vacuuming, or sweeping. For trench drain frame, provide angular surface profile of at least 4 mils, but no greater than 4-1/2 mils. For other items, provide angular surface profile of at least 2-1/2 mils, but no greater than 3 mils. Prepared surfaces shall conform to SSPC VIS 1 and SSPC Guide to VIS 1 and shall match the previously prepared and established "surface standard" test panels. Abrasive shall be a mineral grit meeting the requirements of Article 2.03.
1. Abrasive Blasting Equipment: Use abrasive blasting equipment of conventional air, force feed, or pressure type. Maintain a minimum pressure of 95 psig at nozzle. Confirm that air supply for abrasive blasting is free of oil and moisture when tested in accordance with ASTM D4285. Test air quality at each startup, but in no case less often than every five operating hours.
  2. Provide the mil surface profile specified herein. Reject profile greater than maximum specified, discontinue abrasive blasting, and modify processes and materials to provide the specified profile. Measure surface profile in accordance with ASTM D4417.
    - a. Measure profile at rate of:

- (1) Sheet Piles (AZ Shapes): Three (3) tests for the first 1,000 square feet prepared plus one test for each additional 1,000 square feet or part thereof.
  - (2) Fender Piles (HP shapes) and King Piles (HZ Shapes): One test each for the first three (3) piles prepared, one test per each additional three (3) piles.
  - (3) Fender Panels: Three (3) tests for first panel prepared, one test for each additional panel.
  - (4) Exterior Ladders: Three (3) tests for first ladder prepared, one test for each additional ladder.
  - (5) Trench Drain Frames: One test for each 25' length of trench.
- b. Provide two (2) additional measurements for each non-compliant measurement. When surfaces are re-blasted for any reason, retest profile as specified.
  - c. If Method C of ASTM D4417 is used to measure profile, attach test tapes to Daily Inspection Reports.
  - d. Following abrasive blasting, remove dust and debris by brushing, blowing with oil free and moisture free compressed air, or vacuum cleaning. Time interval between abrasive blasting and application of first coat shall not exceed eight (8) hours.
3. Disposal of Used Abrasive: Legally dispose of used abrasive in accordance with local mandated regulations.
- G. Pre-Application Testing for Surface Contamination: Comply with testing sequence specified for surface cleaning and preparation. Perform pre-application testing for surface contamination after abrasive blasting.
1. Pre-Application Testing for Oil and Grease Contamination: Ensure surfaces are free of contamination as described in paragraph 3.02E.1 entitled "Pre-Preparation Testing for Oil and Grease Contamination:", except that only questionable areas need be checked for beading of water misted onto surface.
  2. Pre-Application Testing for Soluble Salts Contamination: Test steel surfaces for chloride contamination using the Test Kit described in Article 2.02.
    - a. Test surfaces at rate of:

- (1) Sheet Piles (AZ Shapes): Three (3) tests for the first 1,000 square feet prepared plus one test for each additional 2,000 square feet or part thereof.
  - (2) Fender Piles (HP shapes) and King Piles (HZ Shapes): One test each for the first three piles prepared, one test per each additional five (5) piles.
  - (3) Fender Panels: Three (3) tests for first panel prepared, one test for each additional panel.
  - (4) Exterior Ladders: Three (3) tests for first ladder prepared, one test for each additional ladder.
  - (5) Trench Drain Frames: Two (2) tests for frame on each side of trench.
- b. One or more readings greater than 5 micrograms of chlorides per square centimeter are evidence of chloride contamination. Reject contaminated surfaces, wash as specified in Paragraph 3.02E.2, allow surfaces to dry, and re test until all required tests show allowable results. Re-blast tested and cleaned areas as required.
- c. Label all test tubes and retain for test verification.
3. Pre-Application Testing for Surface Cleanliness: Apply coatings to dust free surfaces. To test for dust free surfaces, apply strip of clear adhesive tape to surface and rub onto surface with finger. When removed, the tape should show little or no dust, blast abrasive, or other contaminant.
- a. Test surfaces at rate of:
- (1) Sheet Piles: Three (3) tests for the first 1000 square feet plus one test for each additional 1000 square feet or part thereof.
  - (2) Piles: One test each for the first three (3) piles prepared, one test per each additional three (3) piles.
  - (3) Fender Panels: Three (3) tests for first panel prepared, one test for each additional panel.
  - (4) Exterior Ladders: Three (3) tests for first ladder prepared, one test for each additional ladder.
  - (5) Trench Drain Frames: Two (2) tests for frame on each side of trench.

- b. Reject contaminated surfaces and retest. Provide two (2) additional tests for each failed test or questionable test.
- c. Attach test tapes to Daily Inspection Reports.

### 3.03 PROPORTIONING AND MIXING OF COATING SYSTEMS

- A. Proportioning and mixing of coatings shall be in full conformance with recommendations of coating manufacturer. Reduce coatings to proper consistency by adding fresh coating, except when thinning is mandatory for the type of coating being used in accordance with the manufacturer's instructions. Obtain written permission from the Commissioner to use thinners. In the submittal for written permission, include description of application and quantities and types of thinners to be used. Do not use mixed coatings beyond pot life limits. Keep containers closed when not in use to avoid contamination.
- B. Proportioning of Coal Tar Epoxy-Polyamide System: Coal tar epoxy-polyamide consists of a two-component system. Component A contains a refined coal tar pitch, polyamide resin, and a polyamine promoter to accelerate curing rate. Component B is an epoxy resin. Mix both components in a ratio specified by manufacturer. Do not thin coatings when doing so will result in total volatile organic compounds exceeding limits enacted by local air pollution control districts. Thin materials in accordance with manufacturer's recommendations when thinning is allowed by manufacturer and is approved by the Commissioner.
- C. Proportioning of Epoxy-Polyamide System: Epoxy-polyamide coatings consist of a two-component system that includes a pigmented polyamide resin, Component A and an epoxy resin, Component B. Mix both components in a ratio of 1 to 1 by volume, unless otherwise directed by the manufacturer. Do not thin coatings when doing so will result in total volatile organic compounds exceeding limits enacted by local air pollution control district. When thinning is allowed and is necessary, such as during cold temperature application or to improve application characteristics, add no more than one pint of ethylene glycol monoethyl (EGM) ether for each gallon of the coating unless otherwise directed by the manufacturer.
- D. Mixing of Paint Systems: Power stir components to a smooth, uniform consistency. Stir coating periodically during induction period. Follow coating manufacturer's requirements for induction time and pot life of mixed batches.

### 3.04 COATING APPLICATION

- A. General: Apply first coat to dry surfaces not more than 4 hours after near-white blast cleaning and/or before any signs of flash rusting or visual contamination. Apply coatings with approved brushes, approved rollers, or approved spray equipment, unless specified or recommended otherwise. Spray areas inaccessible to brushing. Apply coats of each system so that finished surfaces are free from runs, sags, brush marks, drops, ridges, waves, laps, and variations in color. Stripe paint

with brush critical locations on steel such as welds, corners, and edges using specified coatings.

- B. Apply coating materials in accordance with SSPC PA 1 and manufacturer's instructions. SSPC PA 1 methods are applicable to all substrates, except as modified herein. The colors of immediately adjacent coats must be different. Thoroughly work coating materials into joints, crevices, and open spaces. Touch up damaged coatings before applying subsequent coats. Uniformly apply coatings at spreading rate required to achieve specified dry film thicknesses.
- C. Determine dry film thickness using a magnetic gage. Use application equipment, tools, pressure settings, and techniques in accordance with manufacturer's instructions.
- D. First and Intermediate Coats: Do not allow first or intermediate coats to dry more than 30 days, or longer than recommended by the manufacturer, before applying subsequent coats. Follow manufacturer's recommendations for surface preparation if first or intermediate coat is allowed to dry longer than recommended by manufacturer of coating. Each successive coat shall cover the surface of the preceding coat or surface completely and there shall be a visually perceptible difference in shades of successive coats.
- E. Dry Film Thickness: Measure using a magnetic gage. Measurement shall be conducted in accordance with SSPC PA-2.
- F. Coating Systems
  - 1. Coal Tar Epoxy-Polyamide System: Apply two coats, each coat at a dry film thickness of not less than 8 mils. The first coat shall be red and the second coat shall be black. Application of a single black coat at a minimum dry film thickness of 16 mils (0.40 mm) is acceptable. Unless otherwise specified by manufacturer's recommendations, do not allow drying time between coats to exceed 24 hours. Under conditions of direct sunlight or elevated ambient temperatures of 90° F. or greater, limit intercoat drying period to a maximum of 6 hours unless otherwise specified by manufacturer's recommendations.
  - 2. Epoxy-Polyamide System: Apply three coats, each coat at a dry film thickness of between 3 mils and 4 mils. Unless otherwise specified by manufacturer's recommendations, allow previous coat to dry to tack-free condition but not more than 72 hours before applying next coat. If more than 72 hours elapses between coats, clean surface, apply a 2 mil wet film thickness of previous coat, allow to cure to a tacky film, and apply a full thickness of next coat.
  - 3. Ablative Anti-fouling Coating: Apply two coats at a dry film thickness of 3 to 4 mils over epoxy polyamide in accordance with manufacturer's recommendations.

4. Elastomeric Urethane Coating: Coat rear surfaces to be embedded in concrete to a dry film thickness of 30 to 40 mils. Coat exposed surfaces to a dry film thickness of 60 to 80 mils, extending this thickness of coating around the top and bottom edges by ½" onto the rear surfaces to be embedded in concrete.
  - G. Drying Time: Allow time between coats as recommended by the coating manufacturer for the temperature range encountered. Provide each coat in specified condition to receive the next coat.
  - H. Repair of Defects: Repair detected coating holidays, thin areas, and exposed areas damaged prior to or during installation by surface treatment and application of additional coating or by manufacturer's recommendations.
    1. Touch-up of minor damage shall be acceptable where result is not visibly different from adjacent surfaces. Recoat entire surface where touch-up would result in a visibly different appearance, either in sheen, texture, or color.
    2. Where welding or fastenings are to be accomplished during installation of steel, field applied protective coats shall be made after completion of connections.
  - I. Complete shop applied coating system shall be allowed to cure for a minimum of eight (8) days prior to installation of the coated steel.
- 3.05 SURFACES TO BE COATED
- A. Coat steel fender piles from the cut-off elevation to a minimum of 15 feet below the proposed dredge depth or mudline, whichever is deeper.
  - B. Coat exposed face of steel sheet and king piles from butt to a minimum of 10 feet below the dredge depth on front side and the existing mudline on the back side.
  - C. Coat all exposed steel surfaces of fender panels and ladders after completion of steel fabrication, including surfaces to receive timber contact panels.
  - D. Coat exposed and embedded surfaces of trench drain frames, including shear studs.
  - E. Concrete-filled steel pipe piles installed in on-shore applications to support land-based structures shall not be coated.

3.06 FIELD QUALITY CONTROL

- A. Inspection and Testing as specified herein shall be performed by the Contractor's Testing Laboratory. Any test not meeting the requirements specified shall be re-performed at the Contractor's expense. Should any test yield results not meet the requirements of these specifications, the Contractor shall re-coat deficient elements

and perform additional testing directed by the Commissioner at no additional cost to the City of New York.

- B. Conduct testing in presence of the Commissioner or his representative.
- C. Tests: Inspection and testing agency shall be responsible for quality control checking, including visual inspection and coating thickness measurements. Inspection and Testing Agency shall keep and submit records of the results of all testing and inspections in a form suitable to the Commissioner including:
  - 1. Holiday Testing: Prior to installation, test for holidays in total coating system in conformance with ASTM D5162. Use a low voltage holiday detector of less than 90 volts in accordance with manufacturer's instructions. Retest, after repair of holidays by surface treatment and application of additional coating or by manufacturer's recommendation.
  - 2. Dry Film Thickness: After repair of holidays, measure dry film thickness in accordance with SSPC PA-2 using a magnetic dry film thickness gage in accordance with ASTM D7091 and ASTM E376. Verify that the dry film thickness of each coat and total dry film thickness of each coating system are as specified using dry film gauges. Re-measure after an additional coat is applied, and add it to meet minimum thickness requirements.
- D. Perform tests in conformance with all applicable standards with the coating manufacturer, with the Contractor and the Commissioner's representative present.
  - 1. Select elements to be tested as directed by the Commissioner's representative.
  - 2. Verify that coatings and other materials are as specified.
  - 3. Verify that surface preparation and application are as specified.
- E. Report
  - 1. Submit written reports describing inspections made and actions taken to correct nonconforming work.
  - 2. Report nonconforming work not corrected.
  - 3. Submit copies of report to the Contractor and the Commissioner.
- F. Manufacturer's Field Services: Coating manufacturer's representative shall provide technical assistance and guidance for surface preparation and application of coating systems. The manufacturer's representative shall be present during the first day of surface preparation and application of first coat.

-END OF SECTION-

**Section 10125**  
**BULLETIN BOARDS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Tackable bulletin boards.

**1.02 RELATED SPECIFICATIONS**

- A. Section 04201 "Masonry"

**1.03 DEFINITIONS**

- A. Bulletin Board: Tackable surface

**1.04 REFERENCE STANDARDS**

- A. ASTM 84 Standards Test Method for Surface Burning Characteristics for Building Materials.
- B. ASTM B221 Standard Specifications for Aluminum and Aluminum Alloy Extruded Bars, Rods, Wires, Profiles and Tubes.

**1.05 SUBMITTALS**

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for bulletin boards and display cases.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Show location of tack assembly seams and joints.
  - 2. Include sections of typical trim members.
- C. Samples for Initial Selection: Provide Manufacturer's color charts and composition samples of face, core, backing and trim to illustrate finish, color and texture.
  - 1. Actual sections of tack assembly.
  - 2. Fabric swatches of vinyl and polyester-fabric-faced tack assemblies.
  - 3. Section of header panel for color selection.
- D. Samples for Verification: For each type of product indicated as follows:
  - 1. Tack Assembly: Not less than 8-1/2 by 11 inches, mounted on substrate indicated for final Work. Include one panel for each type, color, and texture required.

2. Trim: 6-inch- long sections of each trim profile including corner section.

E. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for surface-burning characteristics of vinyl and polyester fabrics.

F. Manufacturer's instructions: Provide manufacturer's installation instruction.

#### 1.06 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of bulletin boards are based on the specific system indicated.

1. Do not modify intended aesthetic effects, as judged solely by Commissioner, except with Commissioner's approval. If modifications are proposed, submit comprehensive explanatory data to Commissioner for review.

B. Fire-Test-Response Characteristics: Provide fabrics with the surface-burning characteristics indicated, as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.

C. Operation and Maintenance: Include data on regular cleaning, stain removal and precautions.

#### 1.07 DELIVERY, STORAGE AND HANDLING

A. Deliver materials in original, unopened, undamaged containers with identification labels intact.

B. Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

#### 1.08 PROJECT CONDITIONS

A. Field Measurements: Verify recessed openings by field measurements before fabrication and indicate measurements on Shop Drawings.

B. Comply with manufacturer's recommendation for climatizing area for interior moisture and temperature to approximate normal occupied condition.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

A. Hardboard: AHA A135.4, tempered.

B. Hardwood Plywood: HPVA HP-1, made with adhesive containing no urea formaldehyde.

- C. Plastic-Impregnated Cork Sheet: MS MIL-C-15116-C, Type I, seamless, homogeneous, self-sealing sheet consisting of granulated cork, linseed oil, resin binders, and dry pigments that are mixed and calendared onto burlap backing; with washable vinyl finish and integral color throughout.
- D. Vinyl Fabric: FS CCC-W-408, Type II, burlap weave; weighing not less than 13 oz./sq. yd.; with flame-spread index of 25 or less when tested according to ASTM E 84.
- E. Extruded Aluminum Bars and Shapes: ASTM B221, Alloy 6063
- F. Fasteners: Provide types, sizes, and lengths to suit installation conditions. Use security fasteners where exposed to view.

## 2.02 TACK ASSEMBLIES

- A. Vinyl-Fabric-Faced Tack Assembly: 1/4-inch- thick, vinyl-fabric-faced cork sheet factory laminated to 1/4-inch- thick hardboard backing.
- B. Panel Size: 3 ft high by 4 ft wide.
- C. Panel Color: Commissioner to select a color from the manufacturer's standard color chart.
- D. Edge Trim: Factory-built extruded aluminum trim. Finish: Satin anodize

## 2.03 WALL-MOUNTED BULLETIN BOARD

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. APCO Graphics, Inc.
  - 2. Bass Bulletin and Directory Board Co.; Div. of Bass Industries Inc.
  - 3. Claridge Products & Equipment, Inc.
  - 4. Marsh Industries, Inc.
  - 5. Nelson-Harkins Industries

## 2.04 ALUMINUM FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in

appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

- D. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine walls, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of work.
- B. Examine walls and partitions for proper backing for bulletin boards.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 INSTALLATION

- A. General: Install units in locations, indicated on Drawings. Keep perimeter lines straight, plumb, and level. Install units so top edge is 7 feet above finish floor.
- B. Bulletin Boards: Attach units to wall surface with manufacturer's standard concealed hardware.

#### 3.03 ADJUSTING AND CLEANING

- A. Verify that all accessories are installed as required for each unit.
- B. At completion of work, clean surfaces and trim in accordance with manufacturer's recommendations.

-END OF SECTION-

**Section 10155**  
**TOILET COMPARTMENTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes solid phenolic core toilet partitions, hardware and accessories as follows:
  - 1. Toilet Enclosures: Ceiling anchored.
  - 2. Entrance Screens: Ceiling anchored.
  - 3. Urinal Screens: Wall hung.
  - 4. Shower partition door: Wall hung.
  - 5. Shower partition divider: Wall hung.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05500 "Metal Fabrications" - supports for ceiling-anchored units to overhead structural system.
- B. Section 10801 "Toilet and Bath Accessories"

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes. Manufacturer's catalog cuts of typical panel, pilaster, door, hardware and fastenings.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Show locations of reinforcements for compartment-mounted grab bars.
- C. Samples for Initial Selection: For each type of unit indicated.
- D. Samples for Verification: Of each type of color and finish required for units, prepared on 6-inch square Samples of same thickness and material indicated for Work.

**1.04 QUALITY ASSURANCE**

- A. Comply with requirements in CID-A-A-60003, "Partitions, Toilets, Complete."

**1.05 PROJECT CONDITIONS**

- A. Field Measurements: Verify actual locations of walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication and indicate measurements on Shop Drawings.

## PART 2 PRODUCTS

## 2.01 SOLID PHENOLIC CORE

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Bradley Corporation; Mills Partitions
  2. Comtec Industries
  3. General Partitions Mfg. Corp.
  4. Metpar Corp.
  5. Santana Products, Inc.
  6. Weis-Robart Partitions, Inc.
- B. Door, Panel, and Pilaster Construction: Solid, phenolic core with a high pressure decorative matte surface finish as an integral part of the core material. Door and panel edges shall be machined and finished smooth with a beveled edge. Pilasters shall be attached to the ceiling using a lead anchor and fastened to provide vertical and horizontal adjustment.
1. Color and Pattern: One color and pattern in each room as selected by Commissioner from manufacturer's full range of colors and patterns.
- C. Pilaster Sleeves (Caps): Manufacturer's standard design; stainless steel shall be secured by head fasteners.
- D. Hardware: Cast stainless steel with satin brushed finish hardware and stainless steel one way fasteners necessary to complete an installation shall be provided.
1. Hinges shall be wraparound and thru-bolted to the pilasters with gravity cams.
  2. Surface-mounted slide latch shall provide emergency egress and shall be ADA compliant.
  3. Strike and Keeper shall be thru-bolted.
  4. Stirrup Type: Ear or U-bracket shall be stainless steel.
  5. Fasteners for hinges, slide latch and keeper shall be stainless steel with one way heads.
  6. Coat hooks and wall bumpers shall be provided for in-swing doors. Door pulls shall be added for out-swing doors.
- E. Heat-Sink Strip: Manufacturer's standard continuous, extruded-aluminum strip fastened to exposed bottom edges of solid-polymer components to prevent burning.

## 2.02 ACCESSORIES

- A. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories.
  - 1. Material: Chrome-plated, nonferrous, cast zinc alloy (zamac) or clear anodized aluminum.
- B. Overhead Bracing: Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile and in manufacturer's standard finish.
- C. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use hot-dip galvanized or other rust-resistant, protective-coated steel.

## 2.03 FABRICATION

- A. Ceiling-Anchored Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with leveling adjustment. Provide sleeves (caps) at pilasters to conceal anchorage.
- B. Doors: Unless otherwise indicated, provide 24-inch- wide in-swinging doors for standard toilet compartments and 36-inch- wide out-swinging doors with a minimum 32-inch- wide clear opening for compartments indicated to be accessible to people with disabilities.
  - 1. Hinges: Manufacturer's standard self-closing type that can be adjusted to hold doors open at any angle up to 90 degrees.
  - 2. Latch and Keeper: Manufacturer's standard surface-mounted latch unit designed for emergency access and with combination rubber-faced door strike and keeper. Provide units that comply with accessibility requirements of authorities having jurisdiction at compartments indicated to be accessible to people with disabilities.
  - 3. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent door from hitting compartment-mounted accessories.
  - 4. Door Bumper: Manufacturer's standard rubber-tipped bumper at out-swinging doors and entrance screen doors.
  - 5. Door Pull: Manufacturer's standard unit at out-swinging doors that complies with accessibility requirements of authorities having jurisdiction. Provide units on both sides of doors at compartments indicated to be accessible to people with disabilities.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
  - 1. Maximum Clearances:
    - a. Pilasters and Panels: 1/2 inch
    - b. Panels and Walls: 1 inch
  - 2. Stirrup Brackets: Secure panels to walls and to pilasters with not less than three brackets attached at midpoint and near top and bottom of panel.
    - a. Locate wall brackets so holes for wall anchors occur in masonry or tile joints.
    - b. Align brackets at pilasters with brackets at walls.
- B. Ceiling-Anchored Units: Secure pilasters to supporting construction and level, plumb, and tighten. Hang doors and adjust so doors are level and aligned with panels when doors are in closed position.
- C. Wall-Hung Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb and to resist lateral impact.

### 3.02 ADJUSTING

- A. Hardware Adjustment: Adjust and lubricate hardware according to manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors and doors in entrance screens to return doors to fully closed position.

-END OF SECTION-

**Section 10200**  
**LOUVERS AND SCREENS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
  - 1. Fixed, extruded-aluminum louvers
  - 2. Fixed, formed galvanized steel louvers

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 - Plant-Precast Architectural Concrete
- B. Section 05120 - Structural Steel
- C. Section 05400 - Cold Formed Metal Framing
- D. Section 05500 - Metal Fabrications
- E. Section 07920 - Exterior Joint Sealants
- F. Sections related to HVAC Work
- G. Transformer Building: Within this structure, Consolidated Edison Co. specifications and drawings take precedence over other contract documents.

**1.03 DEFINITIONS**

- A. Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

**1.04 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide louvers and screens capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of metal components, noise or metal fatigue caused by component rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act on vertical projection of each assembly.
  - 1. Wind Loads: 40 psf
- B. Seismic Performance: Provide louvers and screens capable of withstanding the effects of earthquake motions determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 9, "Earthquake Loads."

- C. Seismic Design Criteria: Provide metal wall panel assemblies capable of withstanding the effects of earthquake motions determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 9, "Earthquake Loads" unless otherwise required by applicable code requirements.
- D. Thermal Movements: Provide louvers and screens that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- E. Air-Performance, Water-Penetration, Air-Leakage, and Wind-Driven Rain Ratings: Provide louvers complying with performance requirements indicated, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

#### 1.05 SUBMITTALS

- A. Product Data: For each type of product indicated. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.
- B. Shop Drawings: For louvers, sun screens and accessories. Include plans, elevations, sections, details, and attachments to other Work. Show each component of each assembly; including rafters, blade profiles, angles, and spacing.
  - 1. For installed assemblies indicated to comply with design loads, include structural analysis data/calculations signed and sealed by a Structural Engineer responsible for their preparation, and licensed in New York.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of metal finish required.
- E. Qualification Data: For professional engineer.
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver.

#### 1.06 QUALITY ASSURANCE

- A. Source Limitations: Obtain louvers and screens through one source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

1. Source shall have not less than three (3) years successful experience in the design and manufacturing of work similar to the assemblies indicated on the Drawings, and as required for this Project.
- B. Welding: Qualify procedures and personnel according to the following:
  1. AWS D1.2, "Structural Welding Code--Aluminum"
  2. AWS D1.3, "Structural Welding Code--Sheet Steel"
- C. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

#### 1.07 PROJECT CONDITIONS

- A. Field Measurements: Verify louver openings, and other materials/systems which support, anchor and interface with the assemblies specified herein by field measurements before fabrication and indicate measurements on Shop Drawings.

#### 1.08 WARRANTY

- A. Special Warranty on Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace louver and screen assemblies that show evidence of deterioration of factory-applied finishes within specified warranty period.
  1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
    - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
    - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
    - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
  2. Finish Warranty Period: 20 years from date of Substantial Completion.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  1. Construction Specialties, Inc.
  2. Airolite
  3. Or approved equal

## 2.02 MATERIALS

- A. Aluminum Extrusions: ASTM B 221, alloy 6063-T5.
- B. Aluminum Sheet: ASTM B 209, alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
- C. Galvanized Steel Sheet: ASTM A 653, G90 zinc coating, mill phosphatized.
- D. Fasteners: Provide fasteners of the types required for each specific application; fasteners shall be of 316 Series stainless steel. Do not use metals that are incompatible with joined materials.
  - 1. Use types and sizes to suit unit installation conditions.
  - 2. Use hex-head or Phillips pan-head screws for exposed fasteners, unless otherwise indicated.
- E. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
- F. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

## 2.03 FABRICATION, GENERAL

- A. General: Assemble louvers and screens in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- B. Vertical Assemblies: Where height of louver and screen assemblies exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates.
  - 1. Continuous Assemblies: Fabricate units without interrupting blade/fin-spacing pattern unless horizontal mullions are indicated.
  - 2. Horizontal Members: Provide horizontal members at joints where indicated.
- C. Maintain equal component spacing, including separation between blades and frames at head and sill, to produce uniform appearance.
- D. Maintain equal component spacing of each louver and sunscreen assembly to produce uniform appearance; unless otherwise indicated on the approved Shop Drawings.

- E. Fabricate frames, sills, rafters, and other supports to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.
    - 1. Louver Frame Type: Channel, unless otherwise indicated.
  - F. Include supports, anchorages, and accessories required for complete assembly. Where assemblies are indicated to comply with structural performance requirements, ensure such assemblies are fabricated and installed in accordance with the approved Shop Drawings.
  - G. Provide exposed vertical louver mullions for drainable blade louvers only of type and at spacings indicated.
    - 1. Exterior Corners: Prefabricated corner units with mitered and welded blades and with corner mullion configurations as indicated on the approved Shop Drawings.
  - H. Where indicated, provide subsills made of same material as louvers for recessed louvers.
  - I. Join frame and support members to each other and to fixed louver blades with fillet welds concealed from view, unless otherwise indicated or size of each different assembly; make bolted connections between frame members only where indicated on the approved Shop Drawings.
    - 1. Where the size of each louver and sunscreen assembly makes welded construction/connections impossible, provide bolted connections between members with concealed threaded fasteners (or a combination of concealed mechanical fasteners and welds. Such conditions are subject to the Commissioner's acceptance.
- 2.04 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Louver Type 1 - Horizontal Drainable Blade, Aluminum Louvers:

- 1. Selected Products:
  - a. Airolite K6774
  - b. Construction Specialties, Inc. A4097
- 2. Louver Depth: 4 inches, unless otherwise indicated.
- 3. Frame and Blade Nominal Thickness: As required to comply with structural performance requirements, but not less than 0.080 inch.

4. Performance Requirements:
    - a. Free Area: Not less than 50% for 48-inch- wide by 48-inch- high louver.
    - b. Air Performance: Not more than 0.29 inches wg static pressure drop 1250 FPM free-area velocity.
  5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.
- B. Louver Type 2 - Horizontal Storm Resistant Aluminum Louvers:
1. Selected Products
    - a. Airolite SCC875
    - b. Acceptable equal
  2. Louver Depth: 8.25 inches, unless otherwise indicated.
  3. Frame and Blade Nominal Thickness: As required to comply with structural performance requirements, but not less than 0.080 inch.
  4. Performance Requirements
    - a. Free Area: Not less than 50% for 48-inch- wide by 48-inch- high louver
    - b. Air Performance: Not more than 0.30 inches wg static pressure drop at 1250 FPM free-area velocity
    - c. Wind Driven Rain Water Penetration Test Results: Class B or better
  5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.
- C. Louver Type 3 - Horizontal Straight Blade Aluminum Louvers:
1. Selected Products
    - a. Airolite K609
  2. Louver Depth of Straight Blade: 4 inches, unless otherwise indicated.
  3. Frame and Blade Nominal Thickness: As required to comply with structural performance requirements, but not less than 0.080 inch.
  4. Performance Requirements
    - a. Free Area: Not less than 47.6% for the 48-inch-wide by 48-inch-high louver

- b. Air Performance: Not more than 0.33 inches wg static pressure drop at 1250 FPM free-area velocity
  - c. Wind Driven Rain Water Penetration Test Results: Class B, or better.
- D. Louver Type 4 – Fixed, Formed Horizontal Drainable Steel Louvers:
  - 1. Selected Products
    - a. Airolite 6774
    - b. Construction Specialties, Inc. GS-407
  - 2. Louver Depth: 4 inches, unless otherwise indicated.
  - 3. Frame and Blade Material and Nominal Thickness: Galvanized steel sheet, of thickness required to comply with structural performance requirements, but not less than 0.063 inch for frames and blades.
  - 4. Mullion Type: Exposed, unless otherwise indicated.
  - 5. Performance Requirements
    - a. Free Area: Not less than 50% for 48-inch- wide by 48-inch- high louver.
    - b. Air Performance: Not more than 0.13 inches H<sub>2</sub>O static pressure drop at 0.01oz./ft<sup>2</sup> free-area velocity.
  - 6. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

## 2.05 LOUVER SCREENS

- A. General: Provide screen at each exterior louver.
  - 1. Screen Location for Fixed Louvers: Interior face.
  - 2. Screening Type: Bird screening.
- B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.
- C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.
  - 1. Metal: Same kind and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
  - 2. Finish: Same finish as louver frames to which louver screens are attached.
  - 3. Type: Non-rewirable, U-shaped frames for permanently securing screen mesh.

- D. Louver Bird Screening: Stainless steel, 1/2-inch- square mesh, 0.047-inch wire.

## 2.06 LOUVER BLANK-OFF PANELS

- A. Uninsulated, Blank-off Panels: Provide where blank-off is required and where no duct or plenum is attached to louver.
1. Aluminum sheet for aluminum louvers, not less than 0.050-inch nominal thickness, unless otherwise indicated.
  2. Galvanized steel sheet for steel louvers, not less 0.052-inch nominal thickness, unless otherwise indicated.
  3. Panel Finish: Same type of finish applied to louvers, but black color.
  4. Attach blank-off panels to back of louver frames with stainless-steel, sheet metal screws.
- B. Insulated, Blank-off Panels: Laminated metal-faced panels consisting of insulating core surfaced on back and front with metal sheets. Provide where blank-off is required and where duct or plenum is attached to louver.
1. Thickness: 2 inches, unless otherwise indicated.
  2. Metal Facing Sheets, Aluminum Assemblies: Aluminum sheet, not less than 0.032-inch nominal thickness.
  3. Metal Facing Sheets, Steel Assemblies: Galvanized steel sheet, not less than 0.032-inch nominal thickness.
  4. Insulating Core: Unfaced mineral-fiber rigid insulation board.
  5. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames, not less than 0.080-inch nominal thickness, with corners mitered and with same finish as panels.
  6. Seal perimeter joints between panel faces and louver frames with 1/8-by-1-inch PVC compression gaskets.
  7. Panel Finish: Same type of finish applied to louvers, but black color.
  8. Attach blank-off panels to back of louver frames with stainless-steel, sheet metal screws.

## 2.07 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

- B. Finish louvers after assembly.

## 2.08 ALUMINUM FINISHES

- A. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finishes.
- B. High-Performance Organic-Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - 1. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
    - a. Color and Gloss: Match Commissioner's sample; Pantone "Cool Gray No. 9U."

## 2.09 GALVANIZED STEEL SHEET FINISHES

- A. Surface Preparation: Clean surfaces of dirt, grease, and other contaminants. Clean welds, mechanical connections, and abraded areas and repair galvanizing according to ASTM A 780. Apply a clean galvanized heat-treated surface prior to the application of the inhibitive primer and specified high-performance organic coating/finish.
- B. High-Performance Organic-Coating Finish: AA-C12C42R1x. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - 1. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
    - a. Color and Gloss: Match Commissioner's sample.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

### 3.03 INSTALLATION

- A. Locate and place louvers and screens level, plumb, and at indicated alignment with adjacent work.

1. Variations from Level:  $\pm 1/8$  inch maximum in any column to column space or 20' - 0", non-cumulative.

- B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

- C. Form closely fitted joints with exposed connections accurately located and secured.

- D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

- E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

- F. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

- G. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Section 07920 - Exterior Joint Sealants for sealants applied during louver and screen installation.

### 3.04 ADJUSTING AND CLEANING

- A. Clean exposed surfaces of louvers and screens that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate until final cleaning.

- B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

- C. Restore louvers and screens damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Commissioner, remove damaged units and replace with new units.
  - 1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 10290**  
**BIRD AND PEST CONTROL**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Bird Exclusion Netting constructed of black, UV resistant polyethylene. Knotted, square mesh effective in excluding birds of all sizes.
- B. Connection hardware for securing bird netting to different surfaces and conditions.

**1.01 RELATED SPECIFICATIONS:**

- A. Section 04201 – Unit Masonry

**1.02 SUBMITTALS**

- B. Manufacturer's literature including installation instructions and other descriptive material.
- C. Samples of each type of bird netting used not less than 6" square including proposed fastening methods and hardware.
- D. Statement by official indicating that they are a certified installation company.
- E. Documentation by the manufacturer that the installation proposed for this project is equal to other installations.

**1.03 STORAGE AND HANDLING**

- A. Provide storage to keep all netting and netting hardware shipping boxes dry, clean and undamaged. Do not stack or place other packaging or objects on the bird netting shipping boxes.
- B. Keep netting hardware and surface cleaning system in original packaging until needed for installation.

**1.04 PROJECT CONDITIONS**

- A. Field Measurements: field measure before fabrication and delivery of materials.

**1.05 COORDINATION**

- A. Coordinate installation of anchorages for cables and related items with structural elements, masonry walls, ducts, pipes, lights, conduits etc.

- B. Furnish all anchoring device required to fasten system to and around building structure and or ducts, pipes conduits etc.

1.06 WARRANTY

- A. 10-year guarantee against U.V breakdown.
- B. 1 year guarantee for installation.

1.07 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Installer must be familiar with the building and areas to protect with the bird netting.
- C. Installer should contact manufacturer for any updated or newly developed planning or procedural information that may be pertinent to the bird netting installation
- D. Installer must be completely familiar with the proper installation procedures for the bird netting hardware
- E. Source Limitations: Obtain all parts and accessories through one source from a single manufacturer.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Nixalite of America Inc.
  - 2. ABC Advanced Bird Control
  - 3. Bird-B-Gone, Inc.
  - 4. Or approved equal

2.02 MATERIALS

- A. Bird Netting Materials
  - 1. Bird net Material: Black, UV resistant polyethylene.
  - 2. Bird net Construction: knotted seamless netting with 40 lb. breaking strength minimum per strand. Finished edges and load bearing seams to run full length of stock size netting pieces. All knots to be steam set.

3. Mesh size: 3/4" square
4. Bird net size: Provide net in the standard manufacturer size to fit the conditions of the job.

B. Bird Netting Hardware

1. Installer to contact manufacturer for up-to-date information and recommendations for bird netting hardware applications, item combinations and new items and procedures.
2. Installer to use tensioned cable hardware and or other hardware he knows best suits the netting installation and conditions.
3. Tensioned cable hardware: Choose the connection, anchoring, cable guide and finishing hardware that best suits the installation surface and conditions. Hardware combinations can be mixed to suit changing surface materials and conditions.

C. Connection Hardware

1. Net Cable: Aircraft grade 302/304 stainless steel 7x7, 49 strand, 3/32" diameter cable. 900 lb. breaking strength. In 250' and 500' spool lengths. Hardware determines max cable run lengths.
2. Turnbuckles: Forged stainless steel, hook and eye turnbuckles sized to withstand the specific conditions of the job.  
Small: Max cable run: 25 feet Safe working load 360 lbs.  
Medium: Max cable run: 50 feet Safe working load 500 lbs.
3. Ferrules: Zinc plated copper, double sleeve ferrules for 3/32" cable. Acceptable connection for cable runs up to 25' max. Always use 2 ferrules per connection. Always use in conjunction with Cable Thimble.
4. Wire Rope Clamps: Galvanized or 302 stainless steel for 1/16" to 3/32" diameter cable and rope. Preferred connection for cable runs up to 50' max. Always use 2 clamps per connection. Always use in conjunction with Cable Thimble.
5. Cable Thimble: 316 stainless steel, drop forged cable thimble. For 1/16" to 3/32" (1.5mm to 2.2mm) diameter cable and rope. Prevents cable fraying and creasing when tensioning cable system.

**D. Cable Anchoring Hardware**

1. Eyebolts: for steel, iron, and heavy gauge sheet metal. Extreme duty stainless steel eyebolt, 2" long, 9/16" I.D. with 1/4-20 stainless steel hex nut. Max spacing between eyebolts: as recommended by manufacturer.
2. Screw Eyes: for heavy to medium gauge sheet metal surfaces. Extreme duty stainless steel screw eyes 2" long, 17/32" I.D. Pilot holes recommended for all surfaces. Max spacing between screw eyes: as recommended by manufacturer
3. Eyebolts and Machine Screw Anchors: for concrete, masonry block, and pre-cast surfaces. Eyebolt specs are same as above. Machine Screw Anchor: Zinc plated anchor – 1/2" diameter x 1" deep with 1/4-20 threads inside. Setting tool included with anchors.

**E. Cable Guide Hardware**

1. Cotter Pin & Nylon Anchor: for concrete, masonry block, pre-cast. Cotter Pin: 1/8" x 1" (3 x 25.4mm) 302 stainless steel. Nylon Anchor: 1/4" x 1" (6.3 x 25.4mm) nylon expansion anchor. Max spacing (center-to-center): 24"(61cm)
2. Small Screw Eyes: for medium/light gauge sheet metal and wood core surfaces. Heavy-duty stainless steel, 1-3/16" long x 7/32" I.D. Max spacing (center-to-center): 24".
3. Small Eyebolts: for steel, iron, and heavy gauge sheet metal. Heavy-duty stainless steel, 1 3/8" long x 9/32" I.D. Max spacing (center-to-center): 24".
4. Sidewinders: for heavy gauge sheet metal and structural steel up to 1/2" thick. Self-drilling, self-tapping, stainless, no pilot required. . Max spacing (center-to-center): 24". Requires 1 driver socket per 100.

**F. Finishing Hardware**

1. Net Rings: Stainless steel, 11/16" ring blank with 5/16" I.D.
2. Netting to cable: Use 16 net rings per foot (each netting mesh). Lapped seams: Use 32 net rings per foot (1 per mesh each side of seam). Zipper Installation: Use 32 net rings per foot (1 per mesh each side of zipper).
3. Poly Clip: can be used in place of Net Rings when attaching the netting to the cable system. Made from UV stabilized black polypropylene. Max. Spacing (center-to-center): 12".
4. Net Zipper: 4 ft. lengths. Heavy-duty marine grade black zipper with 3/4" to allow access to areas behind the bird netting installation.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. Visually inspect the surfaces that will receive the netting hardware and all areas that will end up behind or inside the netting installation. Note damaged surfaces or incomplete construction that could compromise the bird netting installation.
- B. Note all areas, surfaces or objects that may require maintenance or periodic replacement after the bird netting is installed (i.e. lights, electrical equipment, etc.). Plan on using the appropriate netting hardware to allow access after installation.
- C. Note any objects or conditions that could damage the installed bird netting. Plan on installing the net in such a manner as to avoid these conditions.

### 3.02 PREPARATION

- A. Field Measurements: Verify dimensions of the areas to be enclosed. Make sure there is sufficient quantity of bird netting, netting hardware and surface cleaning products to properly install the bird netting system.

### 3.03 SURFACE CLEANING

- A. All surfaces to be clean dry and free of obstructions before bird control is installed.
- B. If bird waste is present: Treat, neutralize and safely remove all bird waste from installation surfaces. Installer must follow all city, state and federal regulations regarding the proper removal and disposal of bird droppings.
- C. Allow all surfaces to air-dry completely before proceeding.
- D. Installer to use anti-bacterial soap and lotion to help prevent disease transmittal when working around surfaces contaminated with bird droppings.

### 3.04 INSTALLATION

- A. Install the bird netting hardware as recommended by manufacturer. General order of installation: install perimeter and support netting hardware; attach bird netting to installed hardware; install access or additional support hardware as specified.
- B. Install bird netting as recommended by the manufacturer. If necessary cut the net to fit the area. Strictly follow the manufacturer's instructions for cutting the net. If multiple pieces are needed, join the pieces together with the recommended seam fastening hardware.

- C. Install the bird netting to avoid contact with machinery, vehicles, extreme heat, etc. Make necessary adjustments to keep netting a sufficient distance from these objects or conditions.
- D. Finished bird netting installation to be taut, free of wrinkles, gaps and openings.

3.05 ADJUSTMENT AND CLEANING

- A. Remove debris and waste materials from project site.
- B. Inspect finished installation. Make any adjustments needed to conform to manufacturer recommendations.

-END OF SECTION-

**Section 10350  
FLAG POLES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes ground-set flagpoles made from stainless steel

**1.02 RELATED SPECIFICATIONS:**

- A. Section 03300 -Cast-in-Place Concrete.
- B. Section 07920 -Joint Sealants.

**1.03 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide flagpole assemblies, including anchorages and supports, capable of withstanding the effects of wind loads, determined according to NAAMM FP 1001, "Guide Specifications for Design of Metal Flagpoles."
  - 1. Base flagpole design on nylon or cotton flags of maximum standard size suitable for use with flagpole or flag size indicated, whichever is more stringent.
  - 2. Basic Wind Speed: 90 mph; 3-second gust speed at 33 feet aboveground.

**1.04 SUBMITTALS**

- A. Product Data: For each type of flagpole required.
- B. Shop Drawings: Include elevations and details showing general arrangement, jointing, fittings and accessories, grounding, and anchoring and supporting systems.
  - 1. Include details of foundation system for ground-set flagpoles.
- C. Structural Calculations: For flagpoles indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- D. Finish Samples for Verification: For each finished material used for flagpoles and accessories.
- E. Qualification Data: For professional engineer.

## 1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain each flagpole as a complete unit, including fittings, accessories, bases, and anchorage devices, from a single manufacturer.

1. Obtain flagpoles through one source from a single manufacturer.

## 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Spiral wrap flagpoles with heavy paper and enclose in a hard fiber tube or other protective container.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. American Flagpole; a Kearney-National Inc. Company
2. Concord Industries, Inc.
3. Pole-Tech Company Inc.

## 2.02 FLAGPOLES

- A. Flagpole Construction, General: Construct flagpoles in one piece if possible. If more than one piece is necessary, comply with the following:

1. Fabricate shop and field joints without using fasteners, screw collars, or lead calking.
2. For tapered flagpoles, provide flush hairline joints using self-aligning, snug-fitting, internal sleeves.
3. For stepped-sectional flagpoles, provide self-aligning, snug-fitting joints.

- B. Exposed Height: As shown in the drawings

- C. Stainless-Steel Flagpoles: Provide cone-tapered flagpoles fabricated from pipe, tube, or plate complying with ASTM A 312, ASTM A 269, or ASTM A 666, alloy UNS S31603.

- D. Foundation Tube: Galvanized corrugated-steel foundation tube, 0.064-inch-minimum nominal wall thickness. Provide with 3/16-inch steel bottom plate and support plate; 3/4-inch diameter, steel ground spike; and steel centering wedges all welded together. Galvanize steel parts, including foundation tube, after assembly. Provide loose hardwood wedges at top of foundation tube for plumbing pole.

1. Provide flashing collar of same material and finish as flagpole.
2. Provide steel ground protectors extending 12 inches aboveground and 6 inches belowground for steel flagpoles where flashing collars are not provided.

## 2.03 FITTINGS

- A. Finial Ball: Manufacturer's standard flush-seam ball, sized as indicated or, if not indicated, to match flagpole-butt diameter.
  1. Spun stainless steel, finished to match flagpole.
- B. Internal Halyard, Winch System: Manually operated winch with control stop device and removable handle, stainless-steel cable halyard, and concealed revolving truck assembly with plastic-coated counterweight and sling. Provide flush access door secured with cylinder lock. Finish truck assembly to match flagpole.
- C. Halyard Flag Snaps: Provide two stainless-steel swivel snap hooks per halyard.
  1. Provide with neoprene or vinyl covers.
- D. Plastic Halyard Flag Clips: Made from injection-molded, UV-stabilized, acetal resin (Delrin). Clips attach to flag and have two eyes for inserting both runs of halyards. Provide two flag clips per halyard.
  1. Product: Subject to compliance with requirements, provide "Quiet Halyard Flagclasp" by Lingo Inc.; Acme Flagpole Division.

## 2.04 MISCELLANEOUS MATERIALS

- A. Concrete: Provide concrete composed of portland cement, coarse and fine aggregate, and water mixed in proportions to attain a 28-day compressive strength of not less than 3000 psi, complying with ASTM C 94/C 94M.
- B. Sand: ASTM C 33, fine aggregate
- C. Elastomeric Joint Sealant: Single-component neutral-curing silicone joint sealant complying with requirements in Division 7 Section "Joint Sealants" for Use NT (nontraffic) and for Use M, G, A, and, as applicable to joint substrates indicated, O joint substrates.

## 2.05 FINISHES

- A. Metal Finishes, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

- B. Stainless Steel: Grind and polish surfaces to produce uniform, bright, directional polished finish (No. 4 finish), free of cross scratches. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Prepare uncoated metal flagpoles that are set in foundation tubes by painting below-grade portions with a heavy coat of bituminous paint.
- B. Foundation Excavation: Excavate to neat clean lines in undisturbed soil. Remove loose soil and foreign matter from excavation and moisten earth before placing concrete.
- C. Provide forms where required due to unstable soil conditions and for perimeter of flagpole base at grade. Secure and brace forms and foundation tube, sleeve, or anchor bolts in position, to prevent displacement during concreting.
- D. Place concrete immediately after mixing. Compact concrete in place by using vibrators. Moist-cure exposed concrete for not less than seven days or use nonstaining curing compound.
- E. Trowel exposed concrete surfaces to a smooth, dense finish, free of trowel marks, and uniform in texture and appearance. Provide positive slope for water runoff to perimeter of concrete base.

### 3.02 FLAGPOLE INSTALLATION

- A. General: Install flagpoles where shown and according to Shop Drawings and manufacturer's written instructions.
- B. Foundation-Tube Installation: Install flagpole in foundation tube, seated on bottom plate between steel centering wedges. Plumb flagpole and install hardwood wedges to secure flagpole in place. Place and compact sand in foundation tube and remove hardwood wedges. Seal top of foundation tube with a 2-inch layer of elastomeric joint sealant and cover with flashing collar.
- C. Baseplate Installation: Install baseplate on washers placed over leveling nuts on anchor bolts and adjust until flagpole is plumb. After flagpole is plumb, tighten retaining nuts and fill space under baseplate solidly with nonshrink, nonmetallic grout. Finish exposed grout surfaces smooth and slope 45 degrees away from edges of baseplate.

-END OF SECTION-

**Section 10436**  
**EXTERIOR SIGNS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
1. Exterior, porcelain enamel, panel-type signs and support frames, as indicated.
  2. Dimensional characters and logos for exterior use, as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03450 - Plant-Precast Architectural Concrete
- B. Section 05120 - Structural Steel
- C. Section 05500 - Metal Fabrications
- D. Section 08630 - Translucent Insulating Panels
- E. Section 09911 - Exterior Painting

**1.03 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Provide panel signs capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated, determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures".
1. Wind Loads: Determine loads based on a uniform pressure of 40 lbs/sq.ft.; acting in any direction.
- B. Thermal Movements: Provide panel signs that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- C. Design: The drawings indicate minimum dimensions and thickness for components. Where performance requirements require thickness of material to be increased or additional reinforcing to be added such revisions shall be made without changing the visible profiles of sign elements. Where changes cannot be made without changing visible profiles they shall be made only with approval by the Commissioner.

- D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

#### 1.04 DEFINITIONS

- A. Porcelain Enamel: Porcelain enamel on steel is a substantially vitreous, or glassy, inorganic coating bonded to metal by fusion at temperatures above 1400° Fahrenheit.
  - 1. Baked paints or organic enamels will not be considered equivalent sign materials/finishes.
- B. Frits/Glazes/Oxides: Only specially formulated porcelain enamel frits, glazes and oxides as supplied by Ferro, Chivit, APEC or Cerdek. These materials when combined and processed in final form shall be acid resistant in order to achieve an A or AA acid resistance rating.
- C. Art/Graphics: The graphic material and images including logos, mechanicals, text, photographs and other graphic source materials.

#### 1.05 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes. Include manufacturer's written instructions for maintaining and cleaning sign surfaces.
- B. Shop Drawings: Show fabrication and installation details for bracket supported panel signs, and exterior pin-mounted dimensional character signage. Include plans, elevations, and large-scale sections of typical members and other components. Show mounting methods, grounds, mounting heights, layout, spacing, reinforcement, accessories, and installation details.
  - 1. Plans and elevations shall be drawn at 3/4-inch scale (minimum); include sections of typical members and other components.
  - 2. Provide message list for each sign, including large-scale details of wording, lettering, artwork, and braille layout.
  - 3. Include DSNY seal list, with details of wording and lettering layout, at least half size. Include full-size details of graphics.
    - a. Include full-size templates for characters and graphic symbols.
- C. Samples for Initial Selection: Manufacturer's color charts consisting of actual units or sections of units showing the full range of colors available for the following:
  - 1. Porcelain enamel steel sheet.

- D. Samples for Verification: For each type of product indicated, of size below:
1. Aluminum: For each form, finish, and color, on 6-inch- long sections of extrusions and squares of sheet at least 4 by 4 inches.
  2. Porcelain Enamel Panel: 8 by 10 inches for each color required.
    - a. Include a sample of graphic-image process. Show graphic style and colors and finishes of letters, numbers, and other graphic devices.
  3. Dimensional Characters: Full-size Samples of each type of dimensional character (letter and number) required. Show character style, material, finish, and method of attachment.
- E. Calculations: Submit calculations, signed and sealed by a Professional Engineer licensed in the State of New York. Calculations shall indicate the basis of design and all resulting loading. Design connections in accordance with the requirements for building design as required by local code. Include certification by design engineer of the adequacy of design.
- F. Welder certificates signed by Contractor certifying that welders comply with requirements specified under the "Quality Assurance" Article.
- 1.06 QUALITY ASSURANCE
- A. Installer Installer/Fabricator Qualifications: Engage an experienced installer who is also the manufacturer of the signs and who has completed manufacturer and installation of signs similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
1. The Installer/Fabricator shall be capable of providing replacement signs within 10 working days of receipt of an order.
  2. Prior to fabrication of Work, submit references of at least 3 clients who have used their services.
  3. Prior to fabrication of work, submit proof of sufficient experience subject to approval of the Commissioner and The City of New York. Submit experience is defined as follows:
    - a. Minimum of three (3) years experience.
    - b. Successful completion of 3 projects of similar size and scope to this project.
- B. Source Limitations: Obtain custom panel signs through one source from a single manufacturer.

- C. Product Options: Drawings indicate size, profiles, and dimensional requirements of bracket supported panel signs.

- 1. Do not modify intended aesthetic effects, as judged solely by Commissioner, except with Commissioner's approval. If modifications are proposed, submit comprehensive explanatory data to Commissioner for review.

#### 1.07 DELIVERY AND HANDLING

- A. Deliver bracket supported panel signs in protective covering and crating to protect sign components and surfaces against damage.

#### 1.08 COORDINATION

- A. Coordinate installation of anchorages for bracket supported panel signs. Furnish setting drawings, templates, and directions for installing anchorages and other items that are to be supported by building superstructure. Deliver such items to Project site in time for installation.
- B. For signs supported by or anchored to permanent construction, advise installers of anchorage devices about specific requirements for placement of anchorage devices and similar items to be used for attaching signs.
  - 1. For signs supported by or anchored to permanent construction, furnish templates for installation of anchorage devices.
- C. Coordinate delivery time so signs can be installed within 24 hours of receipt at Project site.

#### 1.09 WARRANTY

- A. Porcelain Enamel Panel Sign Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace bracket supported porcelain panels that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
  - 1. Coating degradation
  - 2. Chalking
  - 3. Fading
  - 4. Enamel delamination, chipping, cracking and crazing
  - 5. Rusting
  - 6. UV degradation
- B. Dimension Character/Medallion Sign Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.

C. Warranty Period

1. Porcelain Enamel Sign Failures: Twenty-five years from date of Substantial Completion.
2. Dimensional Character/Medallion Failures: Fifteen years from date of Substantial Completion.
3. Workmanship: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Porcelain Enamel Signage
  - a. Letterbank, Inc.
  - b. The Wallbridge Corp.
  - c. KVO Industries
  - d. Or approved equal
2. Aluminum Pin-Mounted Signage
  - a. American Graphics Inc.
  - b. Metal Arts; Div. of L&H Mfg.
  - c. Signature Sign Signs, Inc.
  - d. Or approved equal

2.02 MATERIALS

- A. General: For surfaces exposed to view or coated in the completed Work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, roughness, or, for steel sheet, variations in flatness exceeding those permitted by referenced standards for stretcher-leveled sheet.
- B. Steel and Iron: Provide steel and iron in the form indicated complying with the following requirements:
1. Steel Pipe: ASTM A 53, standard weight (schedule 40), unless otherwise indicated, or another weight required by structural loads. Galvanized finish unless otherwise indicated.
  2. Steel Plate, Shapes, and Bars: ASTM A 36. Galvanized finish unless otherwise indicated.

- C. Steel for Porcelainizing: For purposes of this specification, steel is special purpose "vitreous or enameling iron or steel" as defined by ASTM A 424 Type 1, tensioned leveled and especially manufactured for the purpose of porcelain enameling with total additions of copper and aluminum no greater than .002. Gauges of base metal as required to meet the tolerances specified.
- D. Aluminum Plate: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than the strength and durability properties of 5005-H15.
  - 1. Graphic Content and Style: Provide sign copy (artwork) that complies with requirements indicated on the Drawings, and on the approved shop drawings for size, style, spacing, content, mounting height and location, material, finishes, and colors of signage.
- E. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers.
  - 1. Finish: Hot-dip zinc-coating, ASTM A 153, Class C
- F. Colored Pigments: Nonfading pigments. Use coatings that are recommended by manufacturers for color fastness and durability.

## 2.03 ACCESSORIES

- A. Mounting Methods: Use concealed fasteners fabricated from materials that are not corrosive to sign material and mounting surface.
- B. Anchors and Inserts: Provide stainless steel or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or lead expansion-bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.
- C. Fasteners: Use concealed fasteners fabricated from stainless steel that are noncorrosive to sign material and mounting surface.
- D. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AWS specifications, and as required for color match, strength, and compatibility in the fabricated items.
- E. Galvanizing Repair Paint: High-zinc-dust-content paint for reglazing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, complying with DOD-P-21035 or SSPC-Paint 20.
- F. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers.

## 2.04 FABRICATION, GENERAL

- A. Provide manufacturer's standard bracket supported panel signs of configurations indicated.
1. Welded Connections: Comply with AWS standards for recommended practices in shop welding. Provide welds behind finished surfaces without distortion or discoloration of exposed side. Clean exposed welded surfaces of welding flux and dress exposed and contact surfaces.
  2. Mill joints to tight, hairline fit. Form joints exposed to weather to exclude water penetration.
  3. Preassemble signs in the shop to greatest extent possible. Disassemble signs only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation, in location not exposed to view after final assembly.
  4. Conceal fasteners if possible; otherwise, locate fasteners where they will be inconspicuous.

## 2.05 SIGN PANELS

- A. General: Provide smooth sign panel surfaces constructed to remain flat under installed conditions within a tolerance of plus or minus 1/16 inch measured diagonally from corner to corner.
1. Coordinate dimensions and attachment methods to produce message panels with closely fitting joints. Align edges and surfaces with one another in the relationship indicated.
- B. Porcelain Enamel Panels Signs:
1. Panel Face: Seamless, 0.0677" (14 gage minimum), cold-rolled, stretched leveled steel sheet
  2. Panel Finish: Gloss porcelain enamel, 0.010" thick (minimum) fused coating/finish. Finished panel assemblies shall be free of burn-off, exposed substrate edges and other such defects.
  3. Panel Frame Material: Matching panel face, unless otherwise recommended by the manufacturer and acceptable to the Commissioner. Provide panel flange dimensions of the size, configuration and profile as indicated on the approved Shop Drawings.
    - a. Frame Finish: Gloss porcelain enamel, 0.012" thick (minimum) fused coating/finish. Finished frame assemblies shall be free of burn-off, exposed substrate edges and other such defects.

- b. Corner Condition: Corners rounded to radius indicated.
- 4. Cutting, tooling, welding, cutting, grinding and other modifications to each panel sign must be completed prior to application/firing of the porcelain enamel coating/finish system.

## 2.06 DIMENSIONAL CHARACTERS

- A. Aluminum Castings: Provide aluminum castings of alloy and temper recommended by sign manufacturer for casting process used and for type of use and finish indicated.
- B. Aluminum Extrusions: ASTM B 221, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than the strength and durability properties of 6063-T5.
- C. Cutout Characters: Cut characters from solid aluminum plate of thickness indicated. Produce precisely cut characters with square cut, smooth, eased edges. Comply with requirements indicated for finish, style, and size.

## 2.07 GRAPHICS

- A. Projecting Characters: Provide projecting characters that are formed from laser cut cold rolled steel, properly prepared finished and secured to back-up/substrate panel as indicated on the approved Shop Drawings

## 2.08 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- C. Porcelain Enameling: Provide porcelain enamel finishes that comply with the minimum requirements of ASTM C 703, and ASTM C 448, and other requirements as recommended by the Porcelain Enamel Institute (PEI).
  - 1. All necessary holes and cutouts shall be drilled or punched and welded in advance of enameling, with edges sufficiently ground to hold a porcelain coating.
  - 2. All panels shall be degreased by immersion in an approved degreasing fluid. The panels shall then be rinsed in a heated water bath.
  - 3. After the first rinse, panels shall be immersed in a caustic solution sufficient to provide an "etched" surface capable of good porcelain adherence. The panels shall then be rinsed.

4. After the third rinse, the chemical action shall be neutralized in a soda ash solution then dried rapidly.
  5. A porcelain enamel ground coat shall be applied to all areas of each unit, including backside and flanges, by spraying methods recognized by PEI and VEDC. At least one additional separately fired cover-coating shall be applied to the face side and flanges of each unit. For corrosion protection and flatness, one additional coating shall be applied to the backside of each panel. Provide approved graphics.
    - a. Continuity of Coating: Visual inspection of each unit shall reveal no visible breaks, gas bubbles, scumming, hairlines, stress lines or surface defects in the cover coat.
    - b. The color and finish shall match a color sample previously submitted by supplier and approved by Commissioner and The City of New York within 1 NBS unit (1-2 NBS unit variation is barely perceptible to the human eye.)
    - c. Ground and cover coat thickness shall be applied in accordance with PEI recommendations to a thickness range between 0.004 to 0.020", as required by the manufacturer to suit the intended use.
    - d. Panels shall be fired in a furnace custom designed for the purpose, at temperatures above 1400 Fahrenheit. After firing, every panel is submitted to a visual inspection for color consistency against the control panel as approved by the designer/client.
    - e. Colors and Textures: For exposed sign material that requires selection of materials with integral or applied colors, textures, or other characteristics related to appearance, provide color matches as selected by Commissioner from manufacturer's standards.
- D. High-Performance Organic Finish (Pin-Mounted Signage): AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
1. Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
  2. Color and Gloss: Matching Commissioner's sample.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Coordinate sign supports with other trades. Provide installation details for coordination.
- B. Sign Supports: Locate sign units and accessories where indicated, using mounting methods of type described and complying with manufacturer's written instructions.
  - 1. Set anchor bolts and other embedded items required for installation. Use templates, setting drawings, diagrams, instructions, and directions provided by suppliers of items to be attached.
- C. Dimensional Characters: Mount characters using standard fastening methods recommended in writing by manufacturer for character form, type of mounting, wall construction, and condition of exposure indicated. Provide heavy paper template to establish character spacing and to locate holes for fasteners.
  - 1. Projected Mounting: Mount characters at projection distance from wall surface indicated utilizing the manufacturer's aluminum pin-mounting method. Exposed pin-mount assemblies shall be finished with a high-performance organic coating system matching the dimensional character type signage.
  - 2. Color: Provide pin-mount hardware finished in black, unless otherwise directed to match color of actual dimensional characters.
- D. Install signs level, plumb, and at height indicated, with surfaces free from distortion or other defects in appearance.

### 3.02 CLEANING

- A. At completion of installation, clean soiled surfaces of sign units according to manufacturer's written instructions.

-END OF SECTION-

**Section 10440**  
**INTERIOR SIGNS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

A. This Section includes the following:

1. Panel signs
2. Cast-metal plaque
3. Safety stripes tape
4. Signage accessories

**1.02 RELATED SECTIONS**

- A. Section 09010 - Room Finish Schedule.
- B. Section 10436 - Exterior Signs.
- C. Section 15076 - Piping and Equipment Identification.

**1.03 REFERENCES**

- A. ASTM B209- Aluminum and Aluminum-Alloy Sheet and Plate
- B. ASTM B221- Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
- C. ASTM B584- Copper Alloy Sand Castings for General Applications
- D. NFPA 101 - National Fire Protection Association Life Safety Code
- E. NFPA 170 - National Fire Protection Association Standard for Fire Safety Symbols
- F. NYC Building Code Chapter 27
- G. OSHA 1910.144 - Safety Color Code for Marking Physical Hazards
- H. OSHA 1910.145 - Specification for Accident Prevention Signs and Tags
- I. OSHA 1910.157 - Portable Fire Extinguishers

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.

- B. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of sign.
- C. Shop Drawings: Include location plan for all sign types, elevations, and large-scale sections of typical members and other components. Show mounting methods, grounds, mounting heights, layout, spacing, reinforcement, accessories, and installation details.
  - 1. Provide message list for each sign, including large-scale details of wording, size and style of lettering, colors and braille layout.
- D. Samples for Initial Selection: For each type of sign material indicated that involves color selection
- E. Samples for Verification: For each type of sign, include the following samples to verify color selected:
  - 1. Panel Signs: Full-size samples of each type of sign required
  - 2. Casting: Show representative texture, character style, spacing, finish, and method of attachment.
  - 3. Approved samples will not be returned for installation into Project.
- F. Qualification Data: Submit qualifications of proposed installer.
- G. Maintenance Data: Submit signage cleaning and maintenance requirements to include in maintenance manuals.

#### 1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Installer shall be an employer of workers trained and approved by signage manufacturer.
- B. Source Limitations: Obtain each sign type through one source from a single manufacturer.
  - 1. Interior Code Signage: Provide signage as required by requirements of authorities having jurisdiction.

#### 1.06 PROJECT CONDITIONS

- A. Field Measurements: Where sizes of signs are determined by dimensions of surfaces on which they are installed, verify dimensions by field measurement before fabrication and indicate measurements on Shop Drawings.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers of the various types of signs are listed in the following subsections. Other manufacturers may be submitted for approval provided their products comply with the requirements of these specifications.

## 2.02 PANEL SIGNS

- A. General: Provide panel signs that comply with requirements indicated for materials, thicknesses, finishes, colors, designs, shapes, sizes, and details of construction.

- 1. Produce smooth panel sign surfaces constructed to remain flat under installed conditions within tolerance of plus or minus 1/16 inch measured diagonally.

- B. Manufacturers

- 1. ASI Sign Systems, Inc.
  - 2. Best Sign Systems, Inc.
  - 3. Brady Signmark Division.
  - 4. Innerface Sign Systems, Inc.
  - 5. Mohawk Sign Systems
  - 6. Seton Identification Products

- C. Cast-Acrylic Sheet: Manufacturer's standard and as follows:

- 1. Color: As selected by the Commissioner from manufacturer's full range.

- D. Plastic Laminate: Provide high-pressure laminate engraving stock with face and core plies in contrasting colors as selected by the Commissioner from manufacturer's full range.

- E. Aluminum Sign Panels

- 1. Aluminum sheets and plates shall conform to ASTM B209, Alloy 6061-T6.
  - 2. Fabricate panels from standard sheet widths. The thickness for panel sizes of 30 inches by 30 inches or smaller shall be 0.080 inch and the thickness of larger panels shall be 0.125 inch unless otherwise shown on the Contract Drawing M-640.
  - 3. The panel blanks shall be free from laminations, blisters, open seams, pits, holes, or defects that may affect their strength, appearance or use. The thickness shall be uniform and the blanks shall be commercially flat.

- F. Unframed Panel Signs: Fabricate signs with edges mechanically and smoothly finished to comply with the following requirements:
1. Edge Condition: Square cut
  2. Corner Condition: Square
- G. Laminated Panels: Permanently laminate face panels to backing sheets of material; use manufacturer's standard process.
- H. Brackets: Fabricate brackets and fittings for bracket-mounted signs from extruded aluminum to suit panel sign construction and mounting conditions indicated. Paint brackets in factory in color matching background color of panel sign. Aluminum extrusions shall meet the requirements of ASTM B221. Alloy and temper shall be as recommended by the aluminum producer and finisher for the type of use and finish indicated, and with not less than the strength and durability properties of Alloy 6063.T5.
- I. Graphic Content and Style: Provide sign copy that complies with requirements indicated in the Sign Schedule in Subsection 3.04 and on the Contract Drawings for size, text, colors, location, mounting height and material.
- J. Engraved Copy: Machine engrave letters, numbers, symbols, and other graphic devices into panel sign on face indicated to produce precisely formed copy, incised to uniform depth.
1. Engraved Plastic Laminate: Engrave through exposed face ply of plastic-laminate sheet to expose contrasting core ply.
  2. Engraved Opaque Acrylic Sheet: Fill engraved copy with enamel.
  3. Face-Engraved Clear Acrylic Sheet: Fill engraved copy with enamel. Apply opaque background color coating to back face of acrylic sheet.
- K. Subsurface Copy: Apply minimum 4-mil- thick vinyl copy to back face of clear acrylic sheet forming panel face to produce precisely formed opaque image. Image shall be free from rough edges.
- L. Subsurface Engraved Acrylic Sheet: Reverse-engrave back face of clear acrylic sheet. Fill resulting copy with enamel. Apply opaque background color coating over enamel-filled copy.
- M. Colored Coatings for Acrylic Sheet: For copy and background colors, provide Pantone Matching System (PMS) colored coatings, including inks and paints, that are recommended by acrylic manufacturers for optimum adherence to acrylic surface and are non-fading for application intended.

## 2.03 CAST-METAL PLAQUES

- A. General: Provide castings free from pits, scale, sand holes, and other defects. Comply with requirements specified for metal, border style, background texture, and finish and in required thickness, size, shape, and copy.
- B. Manufacturers
  - 1. American Graphics Inc.
  - 2. Matthews International Corporation; Bronze Division
  - 3. Metal Arts; Div. of L&H Mfg.
  - 4. York Bronze/Bryan
- C. Bronze Castings: ASTM B 584, alloy UNS No. C83600 (No. 1 manganese bronze).
- D. Border Style: None (straight)
- E. Background Texture: Matte finish
- F. Mounting: Rosettes and fasteners matching plaque finish

## 2.04 PANEL SIGN TYPES

- A. Room Signs
  - 1. Material: Cast acrylic sheet with reverse screen text and back spray color.
  - 2. Perimeter: Unframed
  - 3. Copy: Subsurface
  - 4. Character Style: Helvetica medium upper case
  - 5. Text: Room name and number as indicated in the Room Finish Schedule
  - 6. Message: Fixed
  - 7. Sizes:
    - a. Sign: 8-inch wide by 6-inch high
    - b. Character: 1 inch high room number, and 5/8-inch high room name
  - 8. Colors
    - a. Character: white
    - b. Background: black
- B. Toilet Room Signs
  - 1. Material: Cast acrylic sheet with reverse screen text and back spray color.
  - 2. Perimeter: Unframed

3. Copy: Subsurface
4. Character Style: Helvetica medium upper case
5. Graphics: International symbol for men and or women toilets
6. Text: Room name as indicated in the Room Finish Schedule
7. Message: Fixed
8. Sizes
  - a. Sign: 6 inches wide by 8 inches high. Height can be increased to fit large room names
  - b. Character: 1 high room # and 5/8" high room name
9. Colors
  - a. Character: White
  - b. Background: Black

C. Floor Diagram Signs

1. Material: Cast acrylic sheet with reverse screen text and back spray color. Screening in two colors.
2. Perimeter: Unframed
3. Character Style: Helvetica medium upper case
4. Text
  - a. "Evacuation Plan" located above plan layout
  - b. "No Smoking" text with no smoking symbol located below plan layout
5. Message: Fixed.
6. Size
  - a. Sign: 17-1/2" wide by 13-1/2" high
  - b. Character: Sized to be legible from 2 feet
7. Colors
  - a. Character: Black
  - b. Background: White

**D. Stair Identification Signs**

1. Material: Cast acrylic sheet with reverse screen text and back spray color.
2. Perimeter: Unframed
3. Copy: Subsurface
4. Character Style: Helvetica medium upper case
5. Text
  - a. "STAIR A" (insert appropriate stair identification letter)
  - b. "A" (insert appropriate stair identification letter) located in the middle of the lower half part of the sign.
  - c. "1 THROUGH 3" (insert appropriate stair level numbers) located under stair identification letter.
6. Message: Fixed
7. Sizes
  - a. Sign: 12inches wide by 12inches high
  - b. Character: 5inches high stair identification letter and 1inch high other characters
8. Colors
  - a. Character: Black
  - b. Background: White

**E. Safety Signs**

1. Signs are classified as follows:
  - a. Danger sign: Indicate immediate danger and that special precaution are necessary. Color scheme to be a red panel with white letters on a black background. Min. size 14" w x 10" h.
  - b. Caution sign: Warn against potential hazards or caution against unsafe practices. Color scheme to be yellow background with a black panel with yellow letters. Min. size 14" w x 10" h.

- c. Safety instruction sign: Conveys general instructions and suggestions relative to safety measures. Color scheme to be white background with a green panel with white letters. Min. size 14" w x 10" h.
  - d. Fire Prevention Sign: Fire prevention signs indicate the location of exits or emergency fire fighting equipment. Color scheme to be white background with red letters. Fire extinguisher sign to show type of fire on which it is to be used, with letter and graphically. Min. size 10"w x 14"h.
  - e. Directional Signs: Indicate path of travel, other than for motorist traffic. Color scheme to be white with a black panel and with directional symbol. Any additional wording on the sign shall be black letters on the white background. Min. size 12"w x 3" h.
  - f. Notice Sign: Conveys general information or instructions. Color scheme shall white background with a cyan panel with white letters. Min size 14" w x 10" h.
  - g. Material: Fiberglass
- 2. Perimeter: Unframed
  - 3. Character Style: Helvetica medium upper case
  - 4. Text: As indicated in the Sign Schedules
  - 5. Message: Fixed
  - 6. Sizes
    - a. Sign: see 2.04.E-1
    - b. Character: Conform to OSHA Regulations 1910.145
  - 7. Colors
    - a. Character: As specified and conform to OSHA Regulations 1910.145
    - b. Background: As specified and conform to OSHA Regulations 1910.145
  - 8. Copy: Subsurface
- F. Safety Stripes Tape: Provide in accordance with the requirements of OSHA 1910.144 and as follows:
- 1. Provide 2-inch wide pressure sensitive reinforced vinyl tape, white with black stripes.

2. Provide and install a minimum of 50 yards of the tape as directed by the Commissioner.

## 2.05 ACCESSORIES

- A. Mounting Methods: Use double-sided vinyl tape fabricated from materials that are not corrosive to sign material and mounting surface.
- B. Anchors and Inserts: Provide nonferrous-metal or stainless steel anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or lead expansion-bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.

## 2.06 FINISHES, GENERAL

- A. Protect mechanical finishes on exposed surfaces from damage by applying strippable, temporary protective covering before shipping.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of range of approved samples. Noticeable variations in same piece are not acceptable. Variations in appearance of other components are acceptable if they are within range of approved samples and are assembled or installed to minimize contrast.

## 2.07 COPPER-ALLOY FINISHES

- A. Cast-Bronze Plaque Finishes: Exposed surfaces shall be free from porosity, burrs, and rough spots, with returns finished with fine-grain air blast.
  1. Raised Areas: Hand-tool and buff borders and raised copy to produce manufacturer's standard satin finish.
  2. Background finish: Dark oxidized

# PART 3 EXECUTION

## 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Verify that items, including anchor inserts, provided under other sections of Work are sized and located to accommodate signs.

- C. Examine supporting members to ensure that surfaces are at elevations indicated or required to comply with requirements of authorities having jurisdiction and are free from dirt and other deleterious matter.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. Install all materials specified herein in compliance with NYC Building Code, OSHA, NFPA regulations and approved manufacturer's printed specifications.
- B. Install signs after final field finish has been applied and thoroughly dried.
- C. General: Locate signs and accessories where indicated, using mounting methods of types described and in compliance with manufacturer's written instructions. Commissioner will determine the final location of each sign.
  - 1. Install signs level, plumb, and at heights indicated, with sign surfaces free from distortion and other defects in appearance.
  - 2. Interior Wall Signs: Install signs on walls adjacent to latch side of door where applicable, with top sign edge at 5'6" above finish floor. Where not indicated or possible, such as double doors, install signs on nearest adjacent walls. Locate to allow approach within 3 inches of sign without encountering protruding objects or standing within swing of door.
- D. Wall-Mounted Panel Signs: Attach panel signs to wall surfaces using methods indicated below:
  - 1. Vinyl-Tape Mounting: Use double-sided foam tape to mount signs to smooth, nonporous surfaces. Do not use this method for vinyl-covered or rough surfaces.
  - 2. Silicone-Adhesive Mounting: Use liquid-silicone adhesive recommended in writing by sign manufacturer to attach signs to irregular, porous, or vinyl-covered surfaces. Use double-sided vinyl tape where recommended in writing by sign manufacturer to hold sign in place until adhesive has fully cured.
  - 3. Shim Plate Mounting: Provide 1/8-inch thick, concealed aluminum shim plates with predrilled and countersunk holes, at locations indicated, and where other mounting methods are not practicable. Attach plate with fasteners and anchors suitable for secure attachment to substrate. Attach panel signs to plate using method specified above.
  - 4. Mechanical Fasteners: Use non-removable mechanical fasteners placed through predrilled holes. Attach signs with fasteners and anchors suitable for

secure attachment to substrate as recommended in writing by sign manufacturer.

5. Where panel signs are scheduled or indicated to be mounted on glass, provide matching plate on opposite side of glass to conceal mounting materials.

E. **Bracket-Mounted Units:** Provide manufacturer's standard brackets, fittings, and hardware as appropriate for mounting signs that project at right angles from walls and ceilings. Attach brackets and fittings securely to walls and ceilings with concealed fasteners and anchoring devices to comply with manufacturer's written instructions.

1. **Flush Mounting:** Mount characters with backs in contact with wall surface.
2. **Projected Mounting:** Mount characters at projection distance from wall surface indicated.

F. **Cast-Metal Plaques:** Mount plaques using standard fastening methods recommended in writing by manufacturer for type of wall surface indicated.

1. **Concealed Mounting:** Mount plaques by inserting threaded studs into tapped lugs on back of plaque. Set in predrilled holes filled with quick-setting cement.
2. **Face Mounting:** Mount plaques using exposed fasteners with rosettes attached through face of plaque into wall surface.

### 3.03 CLEANING AND PROTECTION

- A. After installation, clean soiled sign surfaces according to manufacturers written instructions. Protect signs from damage until acceptance by City.

### 3.04 SIGN SCHEDULE

Sign Number	Type	Text	Location
1	Fire prevention	Fire extinguisher	At each portable extinguisher location
2	Fire prevention	Not an Exit	At Doors 110-2, 127-4, 124-2, 127-3, 127-2, 128-2, 128-3, 205-1 and 402-1
3	Danger	High voltage	At Doors 120-1, 120-2, 310-1, and 310-2.
4	Danger	High voltage	At battery rack area.
5	Danger	No smoking	At Rooms 112, 115, 118, 120, 121, 216, and 310.
5	Danger	Confined space	At access doors in Rooms 112

Sign Number	Type	Text	Location
		Do not enter	and 215
6	Notice	No food or drinks beyond this point	At door 106-1
7	Safety instruction	Eye wash station	At every eye wash station
8	Caution	Watch your head Clearance 6'-4"	At Door 202-2
9	Caution	Watch your head Clearance 5'-0"	In Room 202 at beams B/16-17, 14/A-B, and 16/A-B
10	Caution	Clearance 17'-7"	At Door 216-1 lintel
12	Caution	Carbon monoxide may be present	At Room 216
13	Caution	Welding fumes may be present	At Room 216
14	Caution	Eye protection must be worn when cleaning with compressed air	At Room 216
15	Directional	Lunch room	In Corridor 106 on wall opposite Door 124-1. In corridor 106 at right end of wall right of Door 108-1
16	Directional	Operations Room	In vestibule C on wall opposite Door 302-1
17	Identification	Room name as per room finish schedule	Top of sign is 5'-0" above finish floor on lockset wall side and 2" away from the exterior doorframe's edge.
18	Identification	Floor diagram	At each landing inside stairs A,B,C and D. next to exit door same as sign number 17

-END OF SECTION-

**Section 10505**  
**PHENOLIC LOCKERS AND BENCHES**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Full height door phenolic lockers
  - 2. Phenolic locker benches

**1.02 RELATED SPECIFICATIONS**

- A. Sections related to HVAC and mechanical exhaust system connection to metal lockers.
- B. Section 09310 Ceramic Tile, 09912 Interior Painting, 10155 Toilet Compartments in conjunction with color selection.

**1.03 SUBMITTALS**

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker and bench.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Show base, sloping tops, filler panels, recess trim and other accessories.
  - 2. Include locker identification system.
- C. Samples for Initial Selection: Provide actual sample of locker cutout for color finishes and material.
- D. Samples for Verification: For lockers, type of locking system, locker benches, all hardware and fasteners provided by the manufacturer.
- E. Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.

**1.04 QUALITY ASSURANCE**

- A. Installer Qualifications: An authorized representative of locker manufacturer for installation and maintenance of units required for this Project.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of lockers and are based on the specific system indicated.

**1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Do not deliver metal lockers until spaces to receive them are clean, dry, and ready for metal locker installation.

**1.06 PROJECT CONDITIONS**

- A. Field Measurements: Verify the following by field measurements before fabrication and indicate measurements on Shop Drawings:
  - 1. Concealed framing, blocking, and reinforcements that support metal lockers before they are enclosed.
  - 2. Recessed openings.
  - 3. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish recessed opening dimensions and proceed with fabricating metal lockers without field measurements. Coordinate wall and floor construction to ensure that actual recessed opening dimensions correspond to established dimensions.

**1.07 COORDINATION**

- A. Coordinate size and location of concrete bases for the lockers.
- B. Coordinate size and location of the mechanical duct for locker ventilation.
- C. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that metal lockers can be supported and installed as indicated.

**1.08 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal lockers that fail in materials or workmanship, including finish, within specified warranty period. Failures include, but are not limited to, the following:
  - 1. Structural failures
  - 2. Faulty operation of latches and other door hardware

**1.09 EXTRA MATERIALS**

- A. Furnish extra materials described below, before construction begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Full-size units of the following metal locker hardware items equal to 10 percent of amount installed for each type and finish installed, but no fewer than 5 units:
  - a. Hasps
  - b. Identification plates
  - c. Hooks
2. Warranty Period: 3 years after substantial completion

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products specified.

### 2.02 MATERIALS

- A. Solid phenolic lockers: Locker side panels, tops, bottoms, doors and shelves. Polished radius corners and edges.
  1. 3/8" thick standard insides and end-caps. Provide colored end panels.
  2. 1/2" tops, bottoms doors and shelves. Perforated tops.
  3. Locker configuration: Single tier
- B. Fasteners: #4 Satin finish stainless steel fasteners.
- C. Locking device: Stainless steel hasp system for padlock
- D. Internal accessories: Stainless steel door hooks
- E. Anchors: Select material, type, size, and finish required for secure anchorage to each substrate.
  1. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance.
  2. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.
- F. Manufacturers
  1. DeBourgh Mfg. Co.; Worley Lockers
  2. General Storage Systems, Div. of North American Steel
  3. Hadrian Inc.; Emperor Lockers
  4. Lockers USA
  5. Lyon Workspace Products; Standard Lockers
  6. Penco Products, Inc., Subsidiary of Vesper Corporation
  7. Tennsco Corp.; Tennsco Lockers

- G. Doors: Solid ½" thick, one-piece door
  - 1. Sound-Dampening Panels: Manufacturer's standard, designed to stiffen doors and reduce sound levels when doors are closed.
- H. Hinges: Self-closing; completely concealed and tamper resistant when door is closed; fabricated to swing 180 degrees.
  - 1. Manufacturer's standard, steel continuous or knuckle type.
- I. Door Handle and Latch for Box Lockers: Strike plate with integral pull; with steel padlock loop that projects through locker door.
- J. Locker Identification: Each metal locker with identification plate.
- K. Accessories:
  - 1. Continuous Sloping Tops
  - 2. Shelves: Provide 2 shelves located at 15" and 28" above floor
    - a. Closures: Hipped-end type
    - b. Sloped top corner fillers, mitered
  - 3. Filler Panels
- L. Locker Arrangement: As indicated on Drawings.

## 2.03 LOCKER BENCHES

- A. General: Provide locker benches fabricated by same manufacturer as metal lockers.
- B. Bench Tops: Manufacturer's standard 1-piece units, of the following material, 10 inches wide by ¾ inches thick, with rounded corners and edges:
  - 1. Phenolic bench top running full length of top and positioned to receive pedestal fasteners.
    - a. Color: Match lockers as selected by Architect from manufacturer's full range.
- C. Fixed Pedestals: Manufacturer's standard supports, with predrilled fastener holes for attaching bench top and anchoring to floor, complete with fasteners and anchors, and as follows:
  - 1. Tubular Steel: Stainless steel tubing, with steel flanges welded at top and base; with satin finish; anchored with exposed fasteners.
    - a. Color: As selected by Commissioner from manufacturer's full range.

## 2.04 FABRICATION

- A. General: Fabricate lockers square, rigid, and without warp; with phenolic faces flat and free of dents or distortion. Make exposed metal edges are polished and safe to touch.
  - 1. Form body panels, doors, shelves, and accessories from one-piece phenolic, unless otherwise indicated.
  - 2. Provide fasteners, filler plates, supports, clips, and closures as required for a complete installation.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine walls, floors, and support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General: Install level, plumb, and true; shim as required, using concealed shims.
  - 1. Anchor locker runs at ends and at intervals recommended by manufacturer
  - 2. Anchor single rows of lockers to walls
  - 3. Anchor back-to-back metal lockers to floor
- B. Equipment and Accessories: Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.
  - 1. Attach hooks with at least two fasteners.
  - 2. Attach door locks on doors using security-type fasteners.
  - 3. Identification Plates: Identify lockers with identification indicated on Drawings.
    - a. Attach plates to each locker door, near top, centered, with at least two aluminum rivets.
  - 4. Attach filler panels with concealed fasteners. Locate fillers panels where indicated on Drawings.
  - 5. Attach sloping top units to lockers, with closures at exposed ends.

6. Attach boxed end panels with concealed fasteners to conceal exposed ends of nonrecessed lockers.
  7. Attach finished end panels with fasteners only at perimeter to conceal exposed ends of nonrecessed lockers.
- C. Fixed Locker Benches: Provide not less than 2 pedestals for each bench, uniformly spaced not more than 72 inches apart. Securely fasten tops of pedestals to undersides of bench tops, and anchor bases to floor.

### 3.03 ADJUSTING, CLEANING, AND PROTECTION

- A. Clean, lubricate, and adjust hardware. Adjust doors and latches to operate easily without binding. Verify that integral locking devices operate properly.
- B. Protect lockers and benches from damage, abuse, dust, dirt, stain, or paint. Do not permit locker use during construction.
- C. Touch up marred finishes, or replace lockers and benches that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

-END OF SECTION-

**Section 10520**  
**FIRE PROTECTION SPECIALTIES**

**PART 1 GENERAL****1.01 SUMMARY**

A. This Section includes the following:

1. Portable fire extinguishers as shown on the drawings and scheduled herein
2. Fire-protection cabinets for portable fire extinguishers
3. Mounting brackets for fire extinguishers

**1.02 RELATED SPECIFICATIONS**

- A. Section 07842 - Fire -Resistive Joint Systems, for firestopping sealants at fire-rated cabinets.
- B. Section 10440 - Interior Signs, for directional signage to out-of-sight fire extinguishers and cabinets.

**1.03 SUBMITTALS**

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fire-protection cabinets.
1. Fire Extinguishers: Include rating and classification.
  2. Fire-Protection Cabinets: Include roughing-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type, trim style, and panel style.
- B. Samples for Initial Selection: For fire-protection cabinets with factory-applied color finishes.
- C. Samples for Verification: For each type of exposed factory-applied color finish required for fire-protection cabinets, prepared on samples 6 inches square.
- D. Maintenance Data: For fire extinguishers and fire-protection cabinets to include in maintenance manuals.

**1.04 QUALITY ASSURANCE**

- A. Source Limitations: Obtain fire extinguishers and fire-protection cabinets through one source from a single manufacturer.
- B. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."

- C. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

- 1. Provide fire extinguishers approved, listed, and labeled by FMG.

#### 1.05 COORDINATION

- A. Coordinate size of fire-protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.

#### 1.06 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of portable fire extinguishers that fail in materials or workmanship within specified warranty period.

- 1. Failures include, but are not limited to, the following:
    - a. Failure of hydrostatic test according to NFPA 10
  - 2. Warranty Period: Six years from date of Substantial Completion

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B
- B. Stainless-Steel Sheet: ASTM A 666, Type 304
- C. Wire Glass: ASTM C 1036, Type II, Class 1, Form 1, Quality q8, Mesh m1 (diamond), 6 mm thick

#### 2.02 PORTABLE FIRE EXTINGUISHERS

- A. Manufacturers
  - 1. Ansul Incorporated
  - 2. Badger Fire Protection
  - 3. Buckeye Fire Equipment Company
  - 4. Fire End & Croker Corporation
  - 5. General Fire Extinguisher Corporation
  - 6. JL Industries, Inc.
  - 7. Kidde Fyrnetics
  - 8. Larsen's Manufacturing Company
  - 9. Modern Metal Products; Div. of Technico
  - 10. Potter Roemer; Div. of Smith Industries, Inc.
  - 11. Watrous; Div. of American Specialties, Inc.

- B. General: Provide fire extinguishers of type, size, and capacity for each fire-protection cabinet and mounting bracket indicated.
  - 1. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B and bar coding for documenting fire extinguisher location, inspections, maintenance, and recharging.
- C. ABC Multi-Purpose Dry Chemical, 10 lbs, UL Rating 4A:80B:C Red glossy polyester coated steel cylinder with pressure gauge, mount and hose. Model No. 3010 as manufactured by Potter Roemer or approved equal.
- D. ABC Multi-Purpose Dry Chemical, 20 lbs, UL Rating 20A:120B:C Red glossy polyester coated steel cylinder with pressure gauge, mount and hose. Model No. 3020 as manufactured by Potter Roemer or approved equal.

## 2.03 FIRE-PROTECTION CABINET

- A. Manufacturers
  - 1. Fire End & Croker Corporation
  - 2. General Accessory Mfg. Co.
  - 3. JL Industries, Inc.
  - 4. Kidde Fynetics
  - 5. Larsen's Manufacturing Company
  - 6. Modern Metal Products; Div. of Technico
  - 7. Potter Roemer; Div. of Smith Industries, Inc.
- B. Cabinet Type: Surface mount - suitable for fire extinguisher
- C. Cabinet Construction: 1-hour fire rated
- D. Cabinet Material: Stainless-steel sheet
- E. Cabinet Trim Material: Same material and finish as door.
- F. Door Material: Stainless steel sheet
- G. Door Glazing: Wire glass
- H. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
  - 1. Provide manufacturer's standard.
  - 2. Provide continuous hinge, of same material and finish as trim, permitting door to open 180 degrees.

## I. Accessories

1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire-protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
2. Lettered Door Handle: One-piece, cast-iron door handle with the word "FIRE" embossed into face.
3. Door Lock: Cam lock that allows door to be opened during emergency by pulling sharply on door handle.
4. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Commissioner.
  - a. Identify fire extinguisher in fire-protection cabinet with the words "FIRE EXTINGUISHER".
    - 1) Location: Applied to cabinet door
    - 2) Application Process: Pressure-sensitive vinyl letters
    - 3) Lettering Color: Black
    - 4) Orientation: Horizontal

## J. Finish: Brushed satin

## 2.04 MOUNTING BRACKETS

## A. Manufacturers

1. Amerex Corporation
2. Ansul Incorporated
3. Badger Fire Protection
4. Buckeye Fire Equipment Company
5. Fire End & Croker Corporation
6. General Fire Extinguisher Corporation
7. JL Industries, Inc.
8. Larsen's Manufacturing Company
9. Potter Roemer; Div. of Smith Industries, Inc.

- B. Mounting Brackets: Manufacturer's standard stainless steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated.

- C. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Commissioner.

1. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied horizontally to mounting surface.

## 2.05 FABRICATION

- A. Fire-Protection Cabinets: Provide manufacturer's standard box (tub), with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.
  - 1. Weld joints and grind smooth.
  - 2. Construct fire-rated cabinets with double walls fabricated from 0.0428-inch-thick, cold-rolled stainless steel sheet lined with minimum 5/8-inch-thick, fire-barrier material.
    - a. Provide factory-drilled mounting holes.
- B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles selected.
  - 1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch thick.
  - 2. Miter and weld perimeter door frames.
- C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

## 2.06 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Finish fire-protection cabinets after assembly.
- D. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## 2.07 STAINLESS-STEEL FINISHES

- A. General: Remove tool and die marks and stretch lines or blend into finish.
  - 1. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. Satin, Directional Polish: No. 6 finish.

- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine walls and partitions for suitable framing depth and blocking where recessed cabinets will be installed.
- B. Examine fire extinguishers for proper charging and tagging.
  - 1. Remove and replace damaged, defective, or undercharged units.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 INSTALLATION

- A. General: Install fire-protection specialties in locations and at mounting heights indicated or, if not indicated, at heights acceptable to authorities having jurisdiction.
  - 1. Fire-Protection Cabinets: 54 inches above finished floor to top of cabinet.
  - 2. Mounting Brackets: 54 inches above finished floor to top of fire extinguisher.
- B. Fire-Protection Cabinets: Fasten fire-protection cabinets to structure, square and plumb.
  - 1. Provide inside latch and lock for break-glass panels.
  - 2. Fasten mounting brackets to inside surface of fire-protection cabinets, square and plumb.
- C. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.
- D. Identification: Apply decals at locations indicated.

#### 3.03 ADJUSTING AND CLEANING

- A. Remove temporary protective coverings and strippable films, if any, as fire-protection specialties are installed, unless otherwise indicated in manufacturer's written installation instructions.
- B. Adjust fire-protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.
- C. On completion of fire-protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.

- D. Touch up marred finishes, or replace fire-protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire-protection cabinet manufacturer.
- E. Replace fire-protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

3.04 FIRE EXTINGUISHER SCHEDULE

- A. Provide fire extinguishers, cabinets and mounting brackets as specified herein and shown on the Contract Drawings.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 10801**  
**TOILET AND BATH ACCESSORIES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Public-use washroom accessories
- B. Public-use shower room accessories
- C. Private-use bathroom accessories
- D. Warm-air dryers
- E. Underlavatory guards
- F. Custodial accessories

**1.02 RELATED SPECIFICATIONS**

- A. Section 10155 - Toilet Compartments
- B. Sections related to Plumbing Work

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include the following:
  - 1. Construction details and dimensions.
  - 2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
  - 3. Material and finish descriptions.
  - 4. Features that will be included for Project.
  - 5. Manufacturer's warranty.
- B. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.
  - 1. Identify locations using room designations indicated on Drawings.
- C. Maintenance Data: For toilet and bath accessories to include in maintenance manuals.

#### 1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

#### 1.05 COORDINATION

- A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

#### 1.06 WARRANTY

- A. Special Mirror Warranty: Manufacturer's standard form in which manufacturer agrees to replace mirrors that develop visible silver spoilage defects and that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period: 15 years from date of Substantial Completion.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. Stainless Steel: ASTM A 666, Type 304, 0.0312-inch minimum nominal thickness, unless otherwise indicated.
- B. Steel Sheet: ASTM A 1008/A 1008M, Designation CS (cold rolled, commercial steel), 0.0359-inch minimum nominal thickness.
- C. Galvanized Steel Sheet: ASTM A 653/A 653M, with G60 hot-dip zinc coating.
- D. Galvanized Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.
- E. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.
- F. Mirrors: ASTM C 1503, Mirror Glazing Quality, clear-glass mirrors, nominal 6.0 mm thick.

#### 2.02 PUBLIC-USE WASHROOM ACCESSORIES

- A. Basis-of-Design Product: The design for accessories is based on products indicated. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

1. A & J Washroom Accessories, Inc.
2. American Specialties, Inc.
3. Bobrick Washroom Equipment, Inc.
4. Bradley Corporation
5. General Accessory Manufacturing Co. (GAMCO)

B. Toilet Tissue (Jumbo-Roll) Dispenser with Stainless Shelf

1. Shelf fabricated of Type 304
2. Description: Two-roll unit with sliding panel to expose other roll
3. Mounting: Surface mounted
4. Capacity: 9- or 10-inch-diameter rolls
5. Material and Finish: 18 gauge Stainless steel, No. 4 finish (satin)
6. Quantity/Location: Provide one (1) per stall. As indicated on Drawings.

C. Combination Towel (Roll) Dispenser/Waste Receptacle

1. Description: Combination unit for dispensing preset length of roll paper towels, with removable waste receptacle.
2. Mounting: Recessed
3. Minimum Towel-Dispenser Capacity: 1100 single-fold, 800 multi-fold or 600 c-fold towel
4. Minimum Waste Receptacle Capacity: 5.75 gal.
5. Material and Finish: Stainless steel, No. 4 finish (satin)
6. Lockset: Tumbler type for towel dispenser compartment and waste receptacle
7. Quantity/Location: As indicated on Drawings.

D. Liquid-Soap Dispenser

1. Description: Designed for dispensing soap in liquid with tow soap valves.
2. Mounting: Deck mounted on
3. Capacity: 80 oz.
4. Materials: 20-gauge stainless steel with satin finish.
5. Lockset: Tumbler type
6. Refill Indicator: Window type
7. Quantity/Location: As indicated on Drawings.

## E. Grab Bar

1. Mounting: Flanges with concealed fasteners
2. Material: Stainless steel, 0.05 inch thick
  - a. Finish: Smooth, No. 4, satin finish
3. Outside Diameter: 1-1/2 inches
4. Configuration and Length: As indicated on Drawings.
5. Quantity/Location: As indicated on Drawings.

## F. Vendor

1. Type: Sanitary napkin and tampon
2. Mounting: Surface mounted
3. Capacity: 20
4. Operation: Two coin (50 cents)
5. Exposed Material and Finish: Stainless steel, No. 4 finish (satin)
6. Lockset: Tumbler type with separate lock and key for coin box
7. Quantity/Location: Provide one (1) per Women's Toilet Room. As indicated on Drawings.

## G. Sanitary-Napkin Disposal Unit

1. Mounting: Surface mounted
2. Door or Cover: Self-closing disposal-opening cover and hinged face panel with tumbler lockset
3. Receptacle: Removable
4. Material and Finish: Stainless steel, No. 4 finish (satin)
5. Quantity/Location: Provide one (1) per stall in Women's Toilet Room. As indicated on Drawings.

## H. Seat-Cover Dispenser

1. Mounting: Surface mounted
2. Minimum Capacity: 500 seat covers

3. Exposed Material and Finish: Stainless steel, No. 4 finish (satin)
4. Lockset: Tumbler type
5. Quantity/Location: Provide one (1) per stall. As indicated on Drawings.

I. Mirror Unit

1. Frame: Stainless-steel angle, 0.05 inch thick
  - a. Corners: Welded and ground smooth
2. Hangers: Produce rigid, tamper- and theft-resistant installation, using method indicated below.
  - a. Wall bracket of galvanized steel, equipped with concealed locking devices requiring a special tool to remove.
3. Size: As indicated on Drawings.
4. Quantity/Location: Provide one (1) per lavatory. As indicated on Drawings.

2.03 SHOWER ROOM ACCESSORIES

- A. Basis-of-Design Product: The design for accessories is based on products indicated. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

1. A & J Washroom Accessories, Inc.
2. American Specialties, Inc.
3. Bobrick Washroom Equipment, Inc.
4. Bradley Corporation
5. General Accessory Manufacturing Co. (GAMCO)

B. Towel Hook

1. Description: No.8 polished stainless steel double towel hook
2. Mounting: Surface mounted. Secure mounting bracket to wall with concealed screws.
3. Location/Quantity: Provide one (1) per shower stall. As indicated on Drawings.

C. Liquid Soap Dispenser

1. Basis-of-Design Product: Bradley - Bradex Model
2. Description: Shelf Type Dispenser - Two Soap Valves
3. Mounting: Surface mounted
4. Material and Finish: Stainless steel, No. 4 finish (satin).

5. Location/Quantity: Provide one (1) per shower stall. As indicated on Drawings.

#### 2.04 WARM-AIR DRYERS

- A. Basis-of-Design Product: The design for accessories is based on products indicated. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

1. A & J Washroom Accessories, Inc.
2. American Dryer, Inc.
3. American Specialties, Inc.
4. Bobrick Washroom Equipment, Inc.
5. Bradley Corporation
6. Excel Dryer Corporation
7. General Accessory Manufacturing Co. (GAMCO)
8. World Dryer Corporation

B. Description

1. Mounting: Surface mounted
2. Operation: Place hands 3-6 inches below nozzle to activate dryer.
  - a. Operation Time: Switch off delay of 2 seconds max. and 80 second timeout function.
3. Cover Material and Finish: Cast iron, with porcelain enamel finish in color selected by Architect.
4. Electrical Requirements: 115 V, 20 A, 2300 W.
5. Location/Quantity: As indicated on Drawings.

#### 2.05 UNDERLAVATORY GUARDS

- A. Basis-of-Design Product: The design for accessories is based on products indicated. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

1. Plumberex Specialty Products, Inc.
2. TCI Products
3. Truebro, Inc.
4. Description: Insulating pipe covering for supply and drain piping assemblies, that prevent direct contact with and burns from piping, and allow service access without removing coverings.

5. Material and Finish: Antimicrobial, molded-plastic, white
6. Location/Quantity: Provide one (1) per lavatory.

## 2.06 CUSTODIAL ACCESSORIES

- A. Basis-of-Design Product: The design for accessories is based on products indicated. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

1. A & J Washroom Accessories, Inc.
2. American Specialties, Inc.
3. Bobrick Washroom Equipment, Inc.
4. Bradley Corporation
5. General Accessory Manufacturing Co. (GAMCO)

B. Utility Shelf

1. Description: With exposed edges turned down not less than 1/2 inch and supported by two triangular brackets welded to shelf underside.
2. Size: 16 inches long by 6 inches deep.
3. Material and Finish: Not less than nominal 0.05-inch- thick stainless steel, No. 4 finish (satin).
4. Location/Quantity: Provide one (1) per Janitor's Closet. As indicated on Drawings.

C. Mop and Broom Holder

1. Description: Unit with shelf, hooks, holders, and rod suspended beneath shelf
2. Length: 36 inches
3. Hooks: Three
4. Mop/Broom Holders: Four , spring-loaded, rubber hat, cam type
5. Material and Finish: Stainless steel, No. 4 finish (satin)
  - a. Shelf: Not less than nominal 0.05-inch- thick stainless steel
  - b. Rod: Approximately 1/4-inch- diameter stainless steel
6. Location/Quantity: Provide one (1) per Janitor's Closet. As indicated on Drawings.

**D. Paper Towel (Roll) Dispenser**

1. Description: Lever-actuated mechanism permits controlled delivery of paper rolls in preset lengths per stroke
2. Mounting: Surface mounted
3. Minimum Capacity: 8-inch wide, 800-foot long roll
4. Material and Finish: Stainless steel, No. 4 finish (satin)
5. Lockset: Tumbler type
6. Location/Quantity: Provide one (1) per Janitor's Closet. As indicated on Drawings.

**E. Liquid-Soap Dispenser**

1. Description: Designed for dispensing soap in liquid or lotion form
2. Mounting: Vertically oriented, surface mounted
3. Capacity: 80 oz.
4. Materials: Stainless steel, No. 4 finish (satin)
5. Lockset: Tumbler type
6. Refill Indicator: Window type
7. Location/Quantity: Provide one (1) per Janitor's Closet. As indicated on Drawings.

**2.07 FABRICATION**

- A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.
- B. Keys: Provide universal keys for internal access to accessories for servicing and re-supplying. Provide minimum of six keys to Owner's representative.

**PART 3 EXECUTION****3.01 INSTALLATION**

- A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.

- B. Grab Bars: Install to withstand a downward load of at least 250 lbf, when tested according to method in ASTM F 446.

3.02 ADJUSTING AND CLEANING

- A. Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.
- B. Remove temporary labels and protective coatings.
- C. Clean and polish exposed surfaces according to manufacturer's written recommendations.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 10881**  
**VEHICLE SCALES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Vehicle scales shall include weighbridges, load cells, scale control units, junction boxes, cabling, embedments, and all necessary appurtenances required for a complete installation.
- B. Vehicle scales will be used to weigh sanitation trucks entering and leaving the station.
- C. Products supplied but not installed under this section:
  - 1. Embedments: Pit coping, foundation bolts, nuts, checking plates, checking bolts, and other embedments required for the vehicle scales. Embedments shall meet the requirements of, and be installed under, Section 05500 - Metal Fabrications.
  - 2. Cable: The cable between the pit power supply and the scale control unit. The cable shall meet the requirements of, and shall be installed under, Section 16121 - Wires and Cables - 600 Volts and Below.
- D. Products installed but not supplied under this section:
  - 1. Driver Interface Panels: Supplied by others as part of the scale data management system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03200 - Concrete Reinforcement
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 05500 - Metal Fabrications
- D. Section 09912 - Painting
- E. Section 16055 - Electrical Requirements for Shop-Assembled Equipment

**1.03 SYSTEM DESCRIPTION**

- A. Scale Performance Requirements
  - 1. Truck Design Criteria
    - a. GVWR: 78,000 lbs
    - b. GAWR (front): 20,000 lbs
    - c. GAWR (tandem rear axles): 58,000 lbs

2. Average Loading Frequency: Up to 320 trucks per day during two eight-hour shifts
  3. Peak Loading Frequency: Up to 30 trucks per hour at peak delivery times.
- B. Design scales in accordance with Section 16055 - Electrical Requirements for Shop-Assembled Equipment of the Electrical Contract.

#### 1.04 SUBMITTALS

- A. Contractor shall submit working drawings, shop drawings, and material specifications for the approval of the Engineer in accordance with Section 01300 – Shop Drawings.
- B. Shop Drawings
1. Product information for all equipment
    - a. Manufacturer's product name and model number
    - b. Manufacturer's standard catalog product data
    - c. Manufacturer's specification data
    - d. Description of construction features
    - e. Performance and operation data
    - f. Installation and mounting details, instructions and recommendations
    - g. Service and calibration requirements
    - h. Dimensions
  2. Arrangement and erection drawings of the equipment and controls
  3. Schematic control diagrams
  4. Electrical connection diagrams
  5. Complete description of the control systems
- C. Provide Operation and Maintenance manuals in accordance with Section 01831 – Operation and Maintenance Manuals.

#### 1.05 QUALITY ASSURANCE

- A. General: The manufacturer shall have ISO 9001 certification or shall maintain a quality assurance program verified by a third party inspection agency.
- B. Reference Standards
1. The following organizations have generated standards that are to be used as guides in assuring quality and reliability of components and systems; govern

nomenclature; and define parameters of configuration and construction, in addition to specific details in this specification:

- a. AASHTO, American Association of State Highway and Transportation Officials
- b. NCWM, National Conference on Weights and Measures
- c. NIST, National Institute of Standards and Technology
- d. NTEP, National Type Evaluation Program

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, and handle all products and materials as specified in Section 01651 - Transportation and Handling of Material and Equipment, and Section 01661 - Protection of Material and Equipment.
- B. Inspect all materials and equipment against approved shop drawings at time of delivery. Immediately return for replacement or repair any equipment or materials damaged or not meeting the requirements of the approved shop drawings.
- C. Label all equipment and materials after they have been inspected. Store all equipment and materials in dry, covered, ventilated location. Protect from harm in accordance with the manufacturer's recommendations.

#### 1.07 PROJECT CONDITIONS

- A. Project Environmental Requirements: Design and construct the system for continuous operation under the following temperature and humidity conditions:
  - 1. Control Rooms
    - a. Air conditioned and heated
    - b. Ambient Temperature: Normal range is 65 to 80 degrees F
    - c. Relative Humidity: Normal range is 40 to 60 percent
  - 2. Indoor locations
    - a. Tipping Floor: Similar to outdoor locations
  - 3. Outdoor locations
    - a. Ambient Temperature: -10 to 120 degrees F
    - b. Relative Humidity: 100 percent maximum

4. Where required, provide thermal enclosures equipped with thermostatically controlled space heaters.

## 1.08 MAINTENANCE

### A. Spare Parts

1. Provide spare part in accordance with Section 01750 - Spare Parts and Maintenance Materials.
2. Furnish and deliver spare parts as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification Section.
3. The following shall constitute the minimum spare parts:
  - a. All standard recommended spare parts, as indicated in the equipment manufacturer's instructions manual for each component of the system.
  - b. Furnish the following complete spare units:
    - (1) Two load cells of each type supplied
    - (2) One dozen of each type and size of fuse used

- B. Warranty: Load cells shall have a five year warranty against failure of all types, including defects in material and workmanship, lightning and surge voltage, water damage and corrosion. The warranty shall cover all costs associated with replacement parts, travel, mileage, and on-site labor.

- C. Maintenance Service: The Contractor shall provide, at no additional cost to the City, a one-year service agreement from the manufacturer of the vehicle scale system, under which, at a minimum, the manufacturer shall inspect, calibrate, check and report to the City on the system every three months. The inspection shall include all equipment provided as part of the system, and shall include witnessing of in-service operation.

## PART 2 PRODUCTS

### 2.01 WEIGHBRIDGE

- A. Maximum Capacity: 100 tons
- B. Scale Accuracy: Plus or minus 0.1 %
- C. Type: Fully electronic. Mechanical weighing elements, check rods or check stays are prohibited.

- D. Nominal Size: Clear and unobstructed weighing surface of 30-feet long and 10-feet wide.
- E. Deck Surface
  - 1. Field-placed concrete, 4500 psi, at least 6-inches thick.
  - 2. Steel bottom liner for deck pan.
  - 3. Provide full size reinforcing mat. Concrete reinforcement shall be epoxy coated in accordance with Section 03200 - Concrete Reinforcement.
  - 4. Meet the requirements of Section 03300 - Cast-in-Place Concrete.
- F. Number of Sections: Two
- G. Capacity: Dual tandem axle (4-foot centers) loading of at least 70,000 lbs.
- H. Construction
  - 1. Heavy duty. Maximum deflection at rated DTAC shall not exceed 1/900.
  - 2. Modular construction.
  - 3. Protected with one coat of epoxy ester paint, applied to a minimum thickness of 3 mils.
- I. Checking: Bumper plate.
- J. Manholes: Provide where shown.
  - 1. Quantity: Two
  - 2. Size: 2-foot diameter
  - 3. Location: Approximate center of each section.
- K. Access: Complete top access to load cells via access openings in the weighbridge.
- L. Painting
  - 1. Meet the requirements of Section 09912 - Painting as modified herein.
  - 2. Clean steel to SSPC-SP6 finish.
  - 3. Apply two coats of epoxy-modified alloyed enamel.
  - 4. Total dry thickness: 6 mils

## M. Manufacturers

1. Fairbanks Scale
2. Cardinal Scale
3. Or approved equal

## 2.02 LOAD CELLS

- A. Type: Rocker column or double-end beam cell
- B. Materials of Construction: Stainless steel
- C. Hermetically Sealed
- D. Enclosure Rating: NEMA 6P
- E. Cable: Stainless steel braided sheath or rigid and flexible steel conduit
- F. Provide pit-mounted sectional controllers, junction boxes and pit power supplies as required. Provide all cabling between pit-mounted devices.
- G. Furnish cable between pit-mounted equipment and scale control unit.
- H. Provide sufficient lengths of cabling for all devices and installations.
- I. Furnish sufficient length of all cabling

## 2.03 SCALE CONTROL UNIT

- A. The scale control unit shall receive the load cells output, and output the calculated weight.
- B. The unit shall have the capability to perform calibration, span, zero, and shift adjustment at the scale control unit. These functions shall not require work at the scale.
- C. Load Cell Capacity: Minimum of at least 16
- D. Memory
  1. Size: Minimum 64K, expandable to 320K
  2. Type: Battery backed (2-year battery life)
- E. Communication: Scale control unit shall be capable of communicating using each of the following:
  1. 4-20 mAdc

- 2. Serial communication
  - a. RS-485
  - b. RS-232 (4-wire)
  - c. RS-232 (9-pin)
- F. Accuracy: Plus or minus 0.01%
- G. Display
  - 1. Resolution: 10,000 divisions
  - 2. Character Size: 0.5 inch
  - 3. Update Rate: Programmable, 0.1 to 10 seconds
- H. Digital Diagnostics
  - 1. Fault detection of any individual load cell.
  - 2. Identification of the failed cell.
  - 3. Capability to predict future cell failure.
- I. Mounting: Wall
- J. Power: 120 Vac
- K. Certification: NTEP
- L. Manufacturers
  - 1. Fairbanks Scale 2500 Series with Intalogix Technology
  - 2. Mettler Toledo Jaguar
  - 3. Or approved equal

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Interface with Other Work
  - 1. The weighbridge and load cell assembly shall fit in the space indicated on the Contract Drawings. Coordinate to precisely locate and size load piers.
  - 2. The scale control unit shall interface with the scale data management system provided by others (PIN 82704RR00033). The unit shall interface over an RS232 communication link, sending weight information continuously, with a carriage return at the end of the string. Other communication settings shall be coordinated during construction.

### 3.02 FIELD QUALITY CONTROL

#### A. Field Testing

1. Provide field testing in accordance with Section 01811 - Preliminary and Final Field Tests.
2. System Checkout and Startup: The Contractor, under the supervision of the Supplier, and other suppliers as applicable, shall perform the following:
  - a. Check and approve the installation of all components and all cable and wiring connections between the various system components prior to placing the equipment into operation.
  - b. Conduct a complete system checkout and adjustment, including calibration, tuning, checking, and testing. When there are future operational functions included in this work, they should be included in the system checkout. All problems encountered shall be promptly corrected to prevent any delays in start-up.
  - c. Supplier shall certify the scale in accordance with New York State Bureau of Weights and Measures. Certification documentation shall be forwarded to the State and the DSNY.
  - d. The Contractor shall provide all test equipment necessary to perform the testing during system checkout and start-up.
  - e. The Contractor and Supplier shall be responsible for initial operation of the system and shall make any required changes, adjustment or replacements for operation and equipment necessary to perform the functions intended.
  - f. The Contractor shall furnish to the Engineer certified calibration reports.
  - g. The Contractor shall furnish the Engineer an installation inspection report certifying that all equipment has been installed correctly and is operating properly. Authorized representatives of both Contractor and the Supplier shall sign the report.

- B. Manufacturer's Field Services: The Contractor shall retain the services of the Supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

**Section 11010**  
**FALL RESTRAINT SYSTEMS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes the design, engineering, fabrication and installation of the fall restraint systems, as follows:
  - 1. Permanent steel tie-back/anchoring point assemblies (Type 1)
  - 2. Sliding lanyards, intermittent stabilizers, and cable system (Type 2)
  - 3. Components of this section required for completion of a complete fall restraint system including, but not limited to brackets, runners, locking runners, pre-tensioners, shock absorbers, intermediate supports, corner supports, swaged and swageless tensioners and end fittings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05120 - Structural Steel
- B. Section 05500 - Metal Fabrications
- C. Section 07610 - Sheet Metal Roofing
- D. Section 07920 - Exterior Joint Sealants

**1.03 SYSTEM DESCRIPTIONS**

- A. It is the intent of this specification to provide the design criteria which will provide for two separate types of fall arrest systems; that upon design, engineering, fabrication and installation will result in systems which will permit a safe means by which one can horizontally negotiate the building roof by means of a permanently fixed set of anchoring points (Type 1) by which a workman can secure his/her life safety line, and a proprietary cable and lanyard/lifeline systems (Type 2) by which a workman can negotiate the roof without ever uncoupling/disconnecting their life safety line.
- B. The Contractor shall provide the required engineering services associated with the fall arrest systems. Engineering services shall include the design, structural weldments, reactions and other such computations required to analyze the proposed systems and all its components.
  - 1. The structural computations and calculations and Drawings shall be signed and sealed by the engineer responsible for their preparation.

2. Include details of structural steel supports/stub columns and base plate assemblies, which are to be attached to the steel roof purlins, unless otherwise indicated.

C. Design Requirements

1. The equipment shall be designed by or under the direction of a Professional Engineer registered in the State of New York. Equipment not manufactured domestically shall be subject to acceptance of the Professional Engineer registered in the State of New York.
2. Structural assemblies and components shall be designed with a safety factor of 4 to 1 against failure as a minimum based on ultimate strength and normal operating conditions, and be so certified. All stresses and deflections shall be limited in accordance with governing codes and regulations.
3. The fall arrest system (Type 2) located along the roof ridge and along each gutter shall incorporate intermediate supports which allow for the working/negotiating of roof areas without disconnecting the safety line.

1.04 QUALITY ASSURANCE

- A. Qualifications: The Contractor shall submit evidence which shall show successful experience in fall restraint systems, including not less than three (3) years continuous experience in the design, engineering, fabrication and installation of systems similar in scope any type to the work required for this project.

B. Codes and Standards

1. Design and erection shall comply with the current requirements or a specific variance granted therefrom, of all governing codes and regulatory agencies, including, but not limit to the following:
  - a. Occupational Safety and Health Act (OSHA)
  - b. American National Standards Institute (ANSI)
  - c. American Society of Mechanical Engineers (ASME): ASME A39.1, "Safety Requirements for Window Washers"
  - d. American Institute of Steel Construction (AISC)
  - e. AISC "Load and Resistance Factor Design Specification for Structural Steel Buildings," including the "Commentary" thereto
  - f. AISC "Code of Standard Practice for Steel Buildings and Bridges", including the "Commentary" thereto

3.03 TRAINING

- A. Provide training as specified in Section 01821 – Start-up and Training.

-END OF SECTION-

NO TEXT ON THIS PAGE

- g. American Welding Society (AWS): AWS D1.1 "Structural Welding Code, Steel"
  - h. State and Local Building Codes and other authorities having jurisdiction in the Project location
- C. Permits, Inspections and Approvals: The Contractor shall apply, secure and maintain the necessary permits and approvals required by governing regulatory agencies.
  - 1. The work of this Section shall include obtaining and paying for any necessary inspection permits as required by the local and State inspection authorities and making such tests as are called for by the regulations of such authorities.
  - 2. Required tests shall be made in the presence of the authorized representative of such local authorities. A certificate of adequacy of the entire installation, and of the testing performed, shall be issued by the qualified Contractor.
- D. Coordination: The Contractor shall coordinate related work and surfaces to ensure successful completion of work specified in this section.
- E. Single-Source Responsibility: Subject to compliance with requirements, fall arrest systems (Type 1 & Type 2) shall be obtained from a single manufacturer.

#### 1.05 SUBMITTALS

- A. Shop Drawings: Before beginning fabrication of each different fall arrest system, provide detailed shop drawings of each different component of the proposed systems. Shop drawings shall clearly identify each component of the system; showing actual locations, positions, attachments, material sizes and configurations.
  - 1. Load Requirements: All loads imposed on the building structure shall be shown. The equipment shall be designed by, or under the direction of a Professional Engineer registered in jurisdiction of the Project location.
- B. Parts Catalogue: Listing replacement parts, including identifying numbers and ordering instructions.
- C. Operating and Maintenance Instruction Manuals
  - 1. Obtain and hand over three complete sets of operating and maintenance instructions for each item incorporated in the works.
- D. Lubrication charts shall be furnished, indicating all equipment lubrications points, the frequency of lubrication required, and type of lubricant for all equipment.

- E. Inspection Log: An inspection log shall be furnished to the City for the purpose of recording inspections.
- F. Instruction Plates: Drawings and metallic illustration plates which are to be printed or etched, of a non-corrosive material, to be supplied and installed on tie-back/anchoring posts. The posts shall also be provided with a name plate which includes the following ANSI/OSHA data:
  - 1. Name of Manufacturer
  - 2. Name or Number of Model
  - 3. Serial Number
  - 4. Maximum load which may be so suspended in pounds.
  - 5. Year of Manufacture
- G. Record Drawings: The Contractor shall submit, within six (6) weeks prior to the issue of the Certificate of Completion to the Commissioner, record drawings of the work comprising plans, sections and elevations to a scale of 1/8 and 1/4.
  - 1. Moment reaction at permanent supports, and other anchoring points.
  - 2. Reactions at anchors due to the intermittent stabilization tie-in devices.
  - 3. Catalog describing major items of equipment.
- H. Samples: Samples shall be submitted for approval, of any fall arrest equipment, hardware (bolts, inserts, mounting brackets, etc.), lanyards/cables and fittings to be permanently fixed to the building.
- I. Certification: Provide a written letter of certification, signed by the manufacturer, installer and the Contractors Engineer stating that the fall restraint systems have been successfully designed, fabricated and installed in accordance with the Contract Documents, and will perform in accordance with the intent of this design.

#### 1.06 WARRANTY

- A. Provide a one-year warranty against defects in material, workmanship, or installation for all components, providing for repair or replacement for a minimum period of one year, including material and labor.
- B. The following types of failure will be adjudged as defective work:
  - 1. Abnormal aging or deteriorating of materials
  - 2. Failure or defects in materials, workmanship or installation of all or any components of the exterior maintenance equipment

C. Warranty Service

1. Maintenance Contract: Submit a one-year maintenance contract to provide maintenance services four (4) times in one year.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering fall restraint assemblies/systems that may be incorporated in the work include the following or an approved equal:
  1. Tractel Ltd. - Swingstage Division
  2. Pro-Bel Enterprises
  3. Spider; Div. of SafeWorks L.L.C.
  4. Or approved equal
- B. Basis-of-Design: The design for the fall restraint system (Type 2) is based upon the "Hands Free Horizontal Cable System" as designed/manufactured by Pro-Bel Enterprises Limited. Subject to compliance with requirements, provide the named fall restraint system or an equivalent system as acceptable to the Commissioner, by one of the specified manufacturers.

2.02 GENERAL REQUIREMENTS

- A. All exterior components shall be constructed of high strength stainless steel.
  1. Protect dissimilar metals from electrolytic (galvanic) action.
- B. Connectors shall be of non-corrosive stainless steel; alloys of the type acceptable to the Commissioner. All welds shall be made by certified welders and shall be examined by non-destructive testing.
- C. The surface finish of all stainless steel components, permanently fixed to the structure, shall be a bright (non-polished) 2B finish, unless otherwise directed by the Commissioner.
- D. Obtain mill test reports on stainless steel wire cables/lanyards.
- E. The material sizes and thickness shown on the drawings are for conceptual design purposes. The manufacturer shall provide the final design and detailing of the equipment.

## 2.03 COMPONENTS OF THE WORK

- A. The Contractor shall furnish and install each different fall arrest system in accordance with the approved Shop Drawings; and in accordance with the manufacturer's instructions and recommendations.

## 2.04 ATTACHMENT POINT FALL ARREST SYSTEM (TYPE 1)

- A. Provide an all stainless steel, vertical steel support post/base assemblies. Assemblies will be supplied and permanently mounted to the steel roof purlin/structure by means of full penetration welds. The assemblies will be accurately fabricated to accommodate the steel roof structure components indicated. Each support will be factory fitted with a continuous fully welded ring/hoop assembly of the size, strength and configuration indicated on the approved shop drawings. Ring/hoop assemblies shall be for the sole purpose of securing the worker's safety lines (attachment points) when negotiating the building's roof. All components of the fall arrest system including, but not limited to the mechanical fasteners, and other such hardware shall be fabricated from Type 316 stainless steel; with a bright (non-polished) 2B finish, unless otherwise directed by the Commissioner.

## 2.05 HANDS FREE HORIZONTAL FALL ARREST SYSTEM (TYPE 2)

- A. General: The fall arrest system will be supplied the system manufacturer's high performance, proprietary runners, shock absorbers, pretensioners, modular intermediate supports (including corners), and other such guide components adapted and modified for the projects specific conditions. Each component of the guides and fittings will be fabricated from Type 316 stainless steel.
- B. Cables and Lanyards: Provide cables and lanyards, complete with high strength ends, turnbuckles, tensioners and other fittings. Cables and lanyards shall be fabricated from a minimum of 5/16 inch diameter stainless steel (type 316) wire rope. Cables and lanyards shall be one-piece assemblies of the lengths required.
  - 1. Provide tie-in lanyards for intermittent stabilization of the suspension cables, complete with stainless steel quick connect devices for attachment to the building anchoring points and permanent steel support posts/hoop assemblies.

## 2.06 LIFE SAFETY LINES AND ACCESSORIES

- A. Provide 5/16 inch diameter, stainless steel wire rope life safety (static) lines; for the attachment of the lanyards from the worker's fall protection equipment. The static line shall be secured to structural members as indicated on the approved shop drawings.
  - 1. The connections shall be capable of sustaining a minimum of 5,000 pounds before failure. Rope clips shall not be used.

## 2.07 FINISHES

- A. Provide fall restraint systems which are entirely fabricated from Type 316 stainless steel; including, but not limited to system components, accessories and assemblies with an as fabricated or bright (non-polished) 2B finish as acceptable to the Commissioner.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Fall arrest systems shall be installed by, or under the direct field supervision of the equipment manufacturer.
- B. The Contractor shall examine all aspects of the construction and immediately call to the attention of the Commissioner any conditions detrimental to a proper installation. The Contractor shall immediately correct all problems.
- C. Provide fall arrest systems complete with all miscellaneous and accessory components in strict accordance with the approved shop drawings; and at such time when construction and finishing of adjoining systems will permit. Install systems in sufficient time to avoid delays to the construction process. Fall arrest systems shall be secured in place as indicated on the approved Shop Drawings.
  - 1. Install each component of the fall arrest systems with full penetrating welds. Welds shall be of the types, sizes and strengths indicated on the approved Shop Drawings. Refer to Section 05120 – Structural Steel for additional welding requirements.

### 3.02 FIELD QUALITY CONTROL

- A. After completion of the installation, conduct full live load tests in accord with applicable standards and requirements of authorities having jurisdiction.
- B. Conduct tests in presence of the Commissioner and/or The City of New York's Representative, and under maximum design live loading conditions at typical service drop positions.
- C. Repair or replace all components, and correct deficiencies observed during testing/demonstration. Retest systems as required by the Commissioner and/or The City of New York's Representative to assure compliance with the Contract Documents.
  - 1. Costs related to repairs/replacements and re-testing of systems as a result of system/component failures shall be borne solely by the Contractor.

3.03 OPERATOR'S TRAINING

- A. Provide specified operator's training to ensure the safe use of the fall arrest systems in accordance with the requirements of Section 01821 – Equipment Start-Up and Training.

-END OF SECTION-

## 3.02 FIELD TESTS

- A. Test the equipment to demonstrate the following:
  - 1. Equipment has not been damaged by transportation or installation.
  - 2. Equipment has been properly lubricated.
  - 3. Equipment is not overheating
  - 4. Equipment is free of overloading of any part
  - 5. Equipment has no electrical or mechanical defects
  - 6. Compliance with the performance and design parameters
  - 7. System operability under all control schemes
- B. A qualified manufacturer's representative shall perform a full operating test in the presence of Commissioner. Contractor shall furnish all labor, materials and equipment required for such test and shall correct any deficiencies noted.
- C. Defects: Promptly correct any defects in the equipment or failure to meet the requirements of the specifications.

## 3.03 START-UP SERVICES

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the pressure washing equipment manufacturer to inspect the installation of the pressure washing equipment, place it in operation, make any necessary adjustments and instruct the operating personnel in its operation and maintenance.

-END OF SECTION-

NO TEXT ON THIS PAGE

pivoting stainless steel spray wand, a 25 degree power nozzle, and a 50 ft swiveling high-pressure hose.

## 2.02 MANUFACTURER

- A. The equipment covered by these specifications shall be standard equipment of proven performance as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practice of the trade, and shall operate satisfactorily.
- B. Provide one of the following:
  - 1. Jenny Products, Inc., Somerset, Pa., Model No. E-2000-C
  - 2. Karcher, Duluth, GA, Model No. HDS 1195
  - 3. Or approved equal

## 2.03 PRESSURE WASHER UNIT

- A. Pump: The pump shall be a three piston, axial pump with stainless steel valves and pistons with ceramic sleeves.
- B. Accumulator: The pump shall be provided with an accumulator specially designed to absorb hydraulic shock and assure smooth, powerful, high impact spray.
- C. Heater: The heater shall be copper electric resistance wire wound within steel tubing. A thermostat shall be provided to prevent the coil from overheating. The heater shall operate on 480-volt, 3 phase, 60 hertz current and shall draw not more than 94 amperes.
- D. Controls
  - 1. Controls shall be panel mounted for simple and easy operation. Separate motor and heater switches shall be provided. An indicator light shall show when the heater is energized. A detergent metering valve shall control the amount of concentrated detergent solution used and a float valve shall be provided on the inlet of a contamination-proof water system. A heavy duty water pressure relief valve and drain valve shall be provided.
  - 2. A warning sign shall be provided on the panel stating that the unit is to be plugged into the electric circuit only when the room is adequately ventilated and when there is no evidence of the presence of explosive gases. The word WARNING shall be in red letters not less than 1-1/2 inches high.
- E. Motor: The electric motor shall be a minimum of 5 hp and shall meet the requirements of Section 16220, Electric Motors of the Contract. The electric motor shall be designed for 480-volt, 3-phase, 60-hertz operation and shall be of the

capacitor start induction type with built-in overload protection. 50 feet of electrical cord shall be provided.

- F. Wheel Kit: A hand operated wheel kit shall be provided to fit the washer with detergent solution tank and rubber tire, ball bearing wheels.
- G. Hose: Provide pressure washer with 50 feet of 3/8-inch I.D. hose with quick-coupling connection. Water inlet shall have a high capacity in-line strainer. Also provide a 100-foot extension hose, with quick-coupling end connections and a hose reel of sufficient capacity to hold the extension hose.
- H. Nozzle Control System: A nozzle control system shall be provided for the unit with a switch recessed in the gun handle which will permit the operator to stop restart the washer and select detergent spray or clear water rinse. The control system shall operate on a 24-volt circuit and a transformer shall be provided in each unit for operation of the system.
- I. Standard Accessories: Standard accessories furnished for the unit shall include 40 feet of cleaning hose, detergent inlet hose with strainer and coupling for attachment to the hose reel furnished under another section, one 40-degree stainless steel washing and rinsing gun tip, and one 7-1/2 degree stainless steel degreasing tip.

#### 2.04 MANUFACTURER'S SERVICES

- A. Furnish the services of a qualified manufacturer's service representative to make any necessary adjustments, observe and assist initial operations and field testing, and train the plant operations and maintenance staff in the care, operation and maintenance of the equipment.
- B. Provide training services in accordance with Section 01821 - Training.
- C. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, instructions and other pertinent information.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install pressure washing equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Section 01732 - Installation of Equipment.

**Section 11011**  
**PRESSURE WASHING EQUIPMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Contractor shall provide the labor, materials, equipment and supervision for the furnishing, testing and training of pressure washing equipment as specified herein. Locate the pressure washing equipment in the Maintenance Bay.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 01431 - Quality Assurance Inspection
- C. Section 01732 - Installation of Equipment
- D. Section 01750 - Spare Parts and Maintenance Materials
- E. Section 01821 - Training
- F. Section 01831 - Operation and Maintenance Manuals
- G. Section 16220 - Electric Motors

**1.03 QUALITY ASSURANCE**

- A. The pressure washing system shall be a single unit, completely factory-assembled, and furnished by a single supplier. Quality assurance shall be provided in accordance with Section 01431 – Quality Assurance Inspection.

**1.04 SUBMITTALS**

- A. Shop Drawings: Submit for approval the following:
  - 1. Equipment catalog cuts, specifications and data sheets identifying all materials used and methods of fabrication. Information submitted shall be in accordance with Section 01330 – Shop Drawings.
  - 2. Weights of all component parts, assembled weight of units and approximate total shipping weight
  - 3. List of spare parts
  - 4. List of special tools
  - 5. List of recommended lubricants
  - 6. Operation and maintenance manuals: Submit Operation and Maintenance (O & M) instructions for the Pressure Washing Equipment in accordance with Section 01831 - Operation and Maintenance Manuals.

**1.05 SPARE PARTS, TOOLS AND SUPPLIES**

- A. Contractor shall furnish all special tools necessary to service, disassemble, repair, and adjust the equipment.
- B. The Contractor shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in the General Requirements Section 01750 - Spare Parts and Maintenance Materials.

**1.06 DELIVERY, STORAGE AND HANDLING****A. Delivery of Materials and Equipment**

- 1. Equipment shall not be delivered to the project site until the time set forth in the approved construction schedule for delivery and installation. Equipment furnished with no requirement for permanent installation shall be delivered near the end of the construction period.

**B. Storage of Materials and Equipment**

- 1. Materials and equipment shall be delivered in original, undamaged packaging with manufacturer's labels and seals intact.
- 2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow. Materials shall be protected from extreme heat and direct sunlight.
- 3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the job-site before being incorporated into the work

**PART 2 PRODUCTS****2.01 GENERAL**

- A. Contractor shall provide one portable cold/hot/steam electric high-pressure washer, capable of delivering water at 2000 psi. The washer shall consist of a pump powered by a direct drive electric motor, hose reel, hose, wheel kit with detergent solution tank, accumulator, nozzle control system, heater suction and discharge hose, motor, controls, electrical cord, and all accessories necessary for a complete system. System components shall be mounted on a heavy-duty welded steel frame with pneumatic wheels with ball bearings and wheel brakes.
- B. The pressure washer shall be designed to operate with 480 Vac/3-phase/60 Hz power supply. The pressure washer shall operate no less than 3.0 gallons/minute (GPM). The max water temperature shall be 175 degrees/285 degrees (Infinitely Variable). Standard accessories shall include an on/off trigger gun, a 40 inch

**Section 11140**  
**VEHICLE EXHAUST SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Section Includes: System consisting of Exhaust Extraction Hose Reel for Diesel Smoke Removal with high-pressure exhaust fan, high temperature flex duct and connection nozzle.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15071 - Vibration Control
- B. Section 16055 - Electrical Requirements for Shop-Assembled Equipment

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. AMCA - B - Construction for Spark Resistant Fans

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Submit catalog product data indicating dimensions, general assembly, specialties and accessories, weights, rated capacities, performance ratings, materials and finishes, controls, electrical requirements, and wiring diagrams.
- C. Shop Drawings: Submit shop drawings indicating components, assembly, equipment locations, dimensions, weights and loadings, required clearances, and location and size of field connections. Include layout drawings showing field location of hose reel, duct diameters and hanger details.
- D. Operations and Maintenance Manuals: Submit Operations and Maintenance Manuals as specified in Section 01831 including manufacturer's descriptive literature including installation and operation instructions, controls, accessories, maintenance and repair data, and parts lists.

**1.05 QUALITY ASSURANCE**

- A. General: Provide equipment from a company specializing in the design and manufacture of vehicle exhaust systems which has a minimum of three (3) years experience, and issues complete catalog data on these products.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.
- B. Shipping and Handling: Comply with the manufacturer's instructions for rigging, unloading and transportation of units.
- C. Storage and Protection: Store equipment in its original shipping crates or containers, with labeling in place until time of installation. Store equipment in clean, dry place and protect equipment from physical damage.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Plymovent Corp
  - 2. CAR-MON Products, Inc.

## 2.02 MATERIALS

- A. Remote Control Motor Operated Hose Reel Hose Storage System
  - 1. Model MER-1250-200+CB, or approved equal, for 8-inch diameter hose storage reel hose with 30 feet hose length
  - 2. Power Supply: 460 Vac, 3-phase
  - 3. Hose reel shall be provided with a 1/2 HP TEFC winch motor assembly with a 920 RPM operating speed.
  - 4. Provide a worm reduction gear (1:80 @ 15.3RPM).
  - 5. Hose uncoiling speed shall not exceed 1.2 feet per second.
  - 6. Winch motor assembly shall be housed in a completely sealed cabinet and attached directly to the hose reel.
  - 7. The switch operated electrical control assembly shall operate on a 460V, 3 phase voltage. Control voltage for limit switches shall be 24V.
  - 8. Switch operation shall allow for hose positioning from either the control panel or the pendant switch. Three micro-switches shall control the adjustment of the hose position. Each micro switch shall be adjustable through the use of

pegs located on the unibody screw gear. The upper limit switch shall have the ability to control the on/off mode of the exhaust fan and shall be routed through the fan's starter. Micro switches operated either through the hose or hose stop impact will not be allowed.

9. Control panel shall be supplied with all required circuitry to control the positioning of the hose, operate the fan, and have the ability to control air make-up dampers via 2 auxiliary contacts. The control box shall have a master power switch and UP and DOWN pushbuttons on the door. A motor overload relay and circuit breaker (for the drive motor) shall be included inside the drive box.
10. Provide fan starter Model ES-90 as manufactured by Plymovent, or approved equal, and mount it next to the control panel.
11. Provide an up/down pendant control transmitter for motor driven hose reel, independent of control panel.
12. The motor drive for the recoil system shall be a .37kW/ .5hp continuous duty (460V, 3-phase, 60 Hz), 90 degree, gear driven motor/gear box combination unit with build in adjustable limit switches for the up/down rotational limits. Plastic gears, chain drive and non-continuous duty drive systems are not acceptable.
13. The drive motor shall be bolted directly to the end frame of the hose reel and covered with painted steel.
14. The motor drive system shall be able to lift 110 lbs of hose/nozzle up and around the hose reel drum.
15. Include with each hose reel two plated steel U-bolts installed onto the drum. These U-bolts shall act as a hose guides to help the coiled hose wind evenly around the drum. Plastic tubing type hose guides are unacceptable.
16. Hose Reel Construction and Components
  - a. All steel components shall be electro zinc plated steel except for the hose storage drum end plates, which will be powder coated yellow.
  - b. Provide four angle clips, one at each corner for mounting reel to walls or building steel.
  - c. Provide two adjustable side support tie bars that both connect the side plates together and act as the hose stop bar. Field adjust locations of bar to match hose diameter used if required.

- d. Access slot in hose reel drum shall be covered with a sheet metal cover made from the same thickness steel as drum. Cover any exposed edges of drum access slot with a heavy molded trim channel that covers the entire edge.
- 17. Provide Exhaust Gas Hose of two types. For first 5 feet before safety disconnect use 1200 degree F rated hose with no sewn or glued seams. Construction shall be of double walled high temp fabric with special heat stabilizer and reinforced by stainless wire held together with Stainless Steel Helix. After safety disconnect, hose shall be 25 feet of 660 degree F rated polyamide high temperature non-silicone fabric held together with stainless steel helix.
  - 18. Provide Stacker-2 Exhaust Nozzle for diesel or gas operations including finger for rain caps and adjustable telescopic fiberglass lifting pole. Single nozzle with stainless steel cone and internal protection grid shall be designed to suit tail pipe up to 8-inch diameter for use in continuous high temperatures with 8-inch diameter flex.
  - 19. Provide high-pressure fan with metal wheel construction meeting AMCA-B requirements. Fan to be certified by AMCA testing labs for performance. Include round 10-inch inlet and 10-inch outlet connections and vibration mounts. Fan cabinet shall be made of sheet metal. Provide fan's wheel and cabinet protected inside and outside with factory applied protective coating. Supply fan bracket for wall mounting.
  - 20. Provide 8-inch Safety Disconnect unit of steel coupling halves with adjustable spring clips built to be reassembled if uncoupled by emergency separation.
  - 21. Provide On/Off control for fan with motor overload protection, push button on/off switch and running light.
  - 22. Protective Coating: Provide protective coating meeting the following requirements:
    - a. Air-Dried Phenolic Coating: Where an air-dried phenolic corrosion-resistant coating is required, thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer and at least two coats of Heresite, or approved equal, air-dry phenolic corrosion-resistant coating to obtain a minimum total dry film thickness of 4 to 6 mils.
    - b. Manufacturer Recommendation: Perform cleaning and coating procedures as specified and in accordance with the coating manufacturers published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. General: Examine vehicle exhaust system at the time of delivery for damaged or missing components. Do not proceed with installation of units until all items found defective have been corrected.

#### 3.02 INSTALLATION

- A. Install all units in accordance with manufacturer's instructions. Make all necessary adjustments to equipment to provide complete and satisfactory operation upon completion of installation.
- B. Connect to electrical service.
- C. Install fan on vibration isolation. Refer to Section 15071 - Vibration Control.

#### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Services: Provide the services of a qualified representative of the manufacturer to inspect the installation of the vehicle exhaust system, certify that it meets the manufacturer's recommendations, and instruct the operating personnel in their operation and maintenance.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 11141**  
**DIESEL FUEL DISPENSING SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. A Diesel Fuel Dispensing System shall be provided to supply the waste processing equipment vehicles on the loading floor, maintenance equipment, and the emergency generator on the pier level with diesel fuel as needed.
- B. Contractor shall furnish and install an automatic remote fuel port, all single and double containment piping, a single product twin hose fuel dispenser with integral pumps and meters, 6000 gallon double wall fuel storage tank, fuel management system, leak and inventory control system, leak detection equipment, and all required trim for a complete and operational system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 – Shop Drawings
- B. Section 01431 – Quality Assurance Inspection
- C. Section 01651 – Transportation and Handling of Materials and Equipment

**1.03 Governing Standards:**

- A. FDNY Rules
- B. NYC Fire Code
- C. NYC Mechanical Code
- D. UFC – Uniform Fire Code

- E. NFPA 30 - Flammable and Combustible Liquids Code
- F. NFPA 30A- Motor Fuel Dispensing Facilities and Repair Garages
- G. NFPA 31 – Installation of Oil-Burning Equipment
- H. NFPA 54 - National Fuel Gas Code
- I. NFPA 70 - National Electrical Code
- J. UL 87 - Power Operated Dispensing Devices for Petroleum Products
- K. UL 142 – Underwriters Laboratories (UL), Steel Above Ground Tanks for Flammable and Combustible Liquids
- L. UL 330 - Hose and Hose Assemblies for Dispensing Flammable and Combustible Liquids
- M. UL 842 – Underwriters Laboratories (UL) Standard for Valves for Flammable Fluids
- N. UL 2085 – Underwriters Laboratories Inc., 2 Hour Fire Rating's Standard for Insulated Aboveground Storage Tanks for Flammable and Combustible Liquids
- O. API Standards for Installation of Fuel Dispensers

#### 1.04 DESIGN REQUIREMENTS

##### A. General

1. Design a diesel fuel dispensing system including an automatic remote fuel port, double containment piping, transition sumps, dispenser with sump, leak detection, a fuel management system, leak and inventory control system and all other appurtenances required for a complete and operational system. Except where noted, all system components shall be compatible with diesel fuel, gasoline, 85% ethanol (E85), and biodiesel (B20).
2. Install this system with all appropriate valves and appurtenances for a complete and operational system.

##### B. Standards

1. Provide system that meets the above referenced codes and City of New York regulation requirements. Each component of the system shall be listed by an independent testing laboratory and shall bear labels showing appropriate conformance to aforementioned codes, regulations and Section 15076, Piping and Equipment Identification.

2. The diesel fuel dispensing system shall be compatible with the equipment requirements currently utilized by the Department of Sanitation for:
  - a. Receiving piping connections from service/supply trucks
  - b. Distribution of product to facility equipment.

C. Construction

1. The dispenser shall be compatible with an FRP sump below to accommodate a flanged, sealed, and bolted connection between the two components.
2. Piping shall be a double walled system per the requirements of Section 15191 – Diesel Fuel Piping. Piping shall be double wall between sumps and equipment. Piping shall be single wall within sumps and equipment where confines act as secondary containment and have provisions for leak detection.
3. Double containment piping located inside the MTS or above ground shall be encased in concrete and separate from any other piping system.
4. The Contractor shall supply appropriate electrical raceways to the dispenser and dispenser area. The internal and external electrical requirements for a fully operating dispenser system shall be provided by and wired by the dispenser manufacturer, including the connection between the fuel management panel and the telephone/SCADA local outlets.
5. The Contractor shall supply appropriate electrical raceways and wiring to the leak and inventory control system panel, allowing for the connection to the fuel management system and all system sensors.

1.05 SUBMITTALS

- A. Provide shop drawing in accordance with the General Conditions, Section 01330 – Shop Drawings and as specified herein.
- B. Submit shop drawings and accessory cut sheets for approval. The design drawings shall show principal dimensions, size, type and locations of all connections and fittings and locations of all options/accessories. Design drawings shall also include catalog cut sheets for associated accessory items and subassemblies. Shop drawings and accessory cut sheets shall be submitted together as a single submittal package. Items not submitted in the package shall be identified in the transmittal letter and a schedule provided detailing forthcoming submittals on remaining components.
- C. Submit copies of the system installation, operation and maintenance manual prior to delivery.

- D. Submit copies of all quality control testing documentation, installation inspection documentation, and written warranty in accordance with the General Conditions and Section 01831 – Operation and Maintenance Manuals.
- E. Submit UL files identifying each component as being UL listed and approved and the fuel compatibility of each. Listings and approvals from other independent testing laboratories are acceptable if not available from UL. Any items not approved by independent testing laboratories shall be clearly identified.
- F. Submit a spare parts list as specified in Section 01750 - Spare Parts and Maintenance Materials.

#### 1.06 SPARE PARTS

- A. The contractor shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in the General Conditions.
- B. The spare parts list shall include a current unit prices and sources of supply for each item.
- C. The following spare parts shall be provided:
  - 1. Twelve (12) replacement dispenser filters or one year's supply, whichever is greater
  - 2. One (1) of each of the following:
    - a. Hose break-away valve
    - b. Swivel
    - c. Dispensing hose
    - d. Hose retractor
    - e. Each type of nozzle and receiver
    - f. Submersible turbine pump
    - g. Line leak detector
    - h. Any additional item recommended by the manufacturer.

#### 1.07 QUALITY ASSURANCE

- A. Quality Assurance shall be in accordance with Section 01431 – Quality Assurance Inspection, and as stated below.
- B. The manufacturer shall have a minimum of three (3) years experience in producing specified equipment for commercial use.
- C. Contractor shall be a licensed NYC installer.

- D. The installer must have taken, if applicable, manufacturer's training courses on the installation of piping, leak detection, and tank management systems and meet the licensing requirements in the State of New York.

#### 1.08 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Section 01651 - Transportation and Handling of Materials and Equipment and Section 01661 - Protection of Materials and Equipment.
- B. Care: Use every precaution to prevent damage to the equipment during transportation and delivery to the site. Take extreme care in loading and unloading equipment and accessories.
  - 1. Do not allow the equipment to be dropped, bumped, dragged, pushed, rolled or moved in any way which will cause damage.
  - 2. If, in the process of transportation or handling, any equipment is damaged, replace or repair such equipment or accessories. Make all required repairs.
- C. Delivery: Ship all equipment complete, with minimal or no field assembly or fabrication required.

#### 1.09 WARRANTY

- A. System warranty shall be in conformance with Article 24 - Maintenance and Guaranty of the Standard Construction Contract.
- B. Diesel Fuel Piping shall have a lifetime warranty against faulty workmanship or materials. Defective product shall be replaced free of charge including shipping charges.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Equivalent products of other manufacturers may be submitted for approval.
  - 1. Dispenser
    - a. Gasboy
    - b. Dresser Wayne
    - c. Or Approved Equal

2. Containment Sumps
  - a. Bravo
  - b. OPW
  - c. Fibrelite
  - d. Or Approved Equal
3. Leak and Inventory Control and Management Systems
  - a. Veeder-Root
  - b. Gasboy
  - c. Or Approved Equal
4. Fuel Port
  - a. Simplex, Inc.
  - b. Or Approved Equal
5. Tank
  - a. Convault
  - b. Highland
  - c. Modern Welding
  - d. Or Approved Equal
6. Accessories
  - a. Red Jacket
  - b. FE Petro
  - c. Gasboy
  - d. EBW
  - e. Simplex, Inc.
  - f. Veeder-Root
  - g. Adel-Wiggins
  - h. OPW
  - i. Dresser Wayne

## 2.02 AUTOMATIC REMOTE FUEL PORT

### A. General

1. Automatic remote fuel port shall be designed to contain fuel spillage during truck fueling operations.
2. Connections shall consist of two (2) cam-lock couplings accessible from inside the fuel port cabinet. One coupling shall be used to supply fuel to the

emergency generator tank; the other coupling shall be used to supply fuel to the fuel storage tank. A single common coupling is not acceptable.

3. Connections and all other appurtenances shall be compatible with the fuel truck per Section 11563 - Fuel Tank Truck.
4. Fill lines shall transport product to either the dispenser or the emergency generator.
5. The automatic remote fuel port shall be mounted to an equipment pad as shown on contract drawings.
6. Automatic remote fuel port shall have both visual and audible alarms to alert operator when tank being filled is at the 90% level and lockout filling operations at the 95% level.

**B. Automatic Remote Fuel Port Features**

1. Weatherproof with lockable hinged doors and be capable of 20 gallon spill containment.
2. Two cam-lock quick disconnect coupling with dust cap and integral angle check valve.
3. External ground stud for connection to earth ground for attachment of delivery truck ground cable.
4. Pre-piped before installation.
5. Manual ball, shutoff valves for each line per Section 15112 - Valves Smaller than 4 Inches.
6. One (1) gpm hand pump for spill removal from containment, with shutoff and check valve.
7. Tank level indicator with 90% full alarm and lockout at 95% full.

**C. Construction**

1. All 316L stainless steel construction
2. Piping shall exit from the back of the cabinet
3. Integral flanges for pad mounting

## 2.03 DISPENSER

## A. General

1. The dispenser shall be a single product, twin hose type with a breakaway and swivel on each dispensing hose. The dispenser shall be compatible with diesel fuel, gasoline, 85% ethanol (E85) and biodiesel (B20) and include provisions for a bolted, sealed, flanged connection to the containment sump.
2. Dispenser shall have a maximum Working Pressure of 50 psi and a maximum flow rating of 22 gpm.
3. Dispenser shall use remote pumps located at the fuel storage tank.
4. Approvals – UL Listed. FCC sealable by U.S. Weight and Measures for the resale of fuel for applications involving the contracted periodic billing of the fuel dispensed.
5. Dispenser shall be placarded in accordance with all applicable codes and laws and conform to Section 10440 - Interior Signs.

## B. Dispenser Features

1. Registers: Volume only (gallons) displays. Display shall be back-lighted. Maximum 999.000 gallons.
2. Totalizer – Non-resettable accumulative totalizer. Reads up to 999999.
3. Pulser – 10:1
4. Meter – A minimum of two piston, nickel-plated aluminum with stainless steel sleeves and Teflon piston cups, positive displacement. Tested and calibrated for accuracy at any speed or pressure.
5. Voltage – Electronic register: 230VAC, 60 Hz.
6. DC Conduit – DC conduit and junction box in lower cabinet for wiring connections to fuel control systems.
7. Filter Kits – will be internal and must be upstream of valve and meter, shall be one micron and 85% ethanol rated.
8. Diesel hoses shall be hard wall, furnished with breakaway connections and swivels.
9. Emergency shear valves in fill line at the dispenser sump.

10. For additional dispensing system accessory components see subsection 2.08, Accessories.

C. Construction

1. Frame shall be G90 galvanized, heavy duty 13 gauge or greater. Side and Top Panels shall be stainless steel for rust resistance and replaceable. Access door shall be API Color Coded, fully removable, and furnished with thirty-six inch (36") Agency Logo. Hinges on access door shall not be acceptable.
2. Cabinet shall have approximate Dimensions of 53 3/4"H X 28 1/2"W X 18 1/2"D.

2.04 FUEL STORAGE TANK

A. General

1. Provide one (1) NYC approved aboveground storage tank, as shown, and as specified herein. Tank storage volume shall be 6000 gallons and shall be designed for aboveground storage of flammable and combustible liquids at atmospheric pressure.
2. Tank shall include emergency vents, normal vents, level gauge, overfill containment, overfill valve, vent riser pipe, sensors, pump containment box, and all other appurtenances for a complete system.
3. Tank shall be approved for listed and approved by an independent testing laboratory and shall comply with UFC, NYC standards and have COA and MEA numbers.
4. The tank including all accessories shall be installed in strict accordance with the manufacturer's recommendations and applicable fire and environmental codes.
5. Stairs shall be provided by the tank manufacturer to grant access to the top of the tank for maintenance and inspection. Stairs shall be located at the end nearest the fill box for ease of manual filling of the tank.
6. Tank shall be designed and tested to provide two (2) hour fire protection for the primary tank.

B. Tank Features

1. Pump Containment Box
2. Emergency shutoff switch
3. Seven (7) gallon spill containment fill box

4. Tank level and leak detection sensors
5. Access Stairs

C. Construction

1. Tanks shall be double wall in design and tested at 20 psi primary tank pressure and 5 psi secondary tank pressure.
2. Secondary tank shall be a steel tank. A two (2) inch monitoring tube shall be located between the primary and secondary tank.
3. All steel exterior to the concrete encasement shall be anti-oxidant powder coated to inhibit corrosion and meet ASTM B117.
4. Tank shall include a pump containment box to house turbine pumps, valves, and all other pump related appurtenances. The containment box shall be manufactured as an integral part of the primary tank and shall have provisions to seal and terminate secondary containment pipe within the box. Piping annular space shall drain into the confines of the box. Containment box shall have an anti-oxidant powder coated finish to inhibit rust.
5. The tank shall include a UL listed 7 gallon spill/overflow container manufactured as an integral part of the primary tank, surrounding the manual fill pipe, providing a 2 hour fire rating. The spill/overflow container shall include a stick port and normally closed valve to release spilled product into the main tank. Exterior steel shall be anti-oxidant powder coated to inhibit rust.
6. Tank shall include a two (2) inch atmospheric vent and emergency venting in accordance with NFPA 30.
7. Tank shall be electrically grounded in accordance with NFPA 78.
8. Tank shall be secured to the pad in accordance to applicable codes and per manufacturer's recommendations.

2.05 CONTAINMENT SUMPS

A. General

1. Containment sumps shall be furnished and installed at locations shown in Contract Drawings. Each sump shall be factory assembled, pre-piped, liquid tight and constructed of fiberglass reinforced polymer.
2. Containment sumps shall have provisions to seal and terminate secondary containment pipe within. Piping annular space shall drain into the confines of the sump.

3. Fuel oil extraction: In the event of a leak, the fuel oil shall be emptied from the sump by means of a vacuum truck and disposed of according to applicable city codes.
4. Containment sumps shall be listed and approved by an independent testing laboratory.
5. Containment sumps shall be equipped with leak detection equipment as specified herein.

**B. Dispenser Sump/Pan**

1. Shall provide access to and secondary containment of dispenser plumbing and breakaway and shear valves.
2. Shall be monitored with leak detection equipment.
3. Shall incorporate provisions for a flanged, sealed and bolted connection with the dispenser.
4. Contractor shall coordinate dispenser sump/pan with dispenser make/model and structure to ensure dispenser sump/pan is the proper size and depth.
5. Shall be listed and approved for use with gasoline including ethanol blends up to 85% (E85) and biodiesel blends up to 50% (B50).

**C. Transition Sumps**

1. Contractor shall provide transition sumps at locations shown to allow piping to transition from below ground to above. All shall provide access to and secondary containment of piping as shown. Transition sumps shall be monitored with leak detection equipment.
2. Transition sumps shall have a water tight diamond plate access cover capable of withstanding H20 axle loads.
3. Transition sumps shall incorporate provisions to support a pipe rack system. Pipe rack systems shall be provided where shown, specified or as needed to support above ground piping exiting transition sumps.
4. Positive concrete anchoring shall be incorporated as an integral part of the sump design.
5. Transition sumps shall include 2-inch rigid pipe fittings where pipes exit sump above the ground.

6. Transition sumps shall include above ground factory-sealed electric connections.

## 2.06 PIPING

- A. All piping shall be labeled in accordance to Section 15076, Piping and Equipment Identification.
- B. A vapor recovery line shall be installed from the fuel storage tank transition sump to the dispenser sump to accommodate potential future requirements for diesel fuel dispensing requiring venting. Both primary carrier and secondary containment ends shall be capped inside the sumps to prevent moisture contamination.
- C. Piping shall conform to Section 15052, Steel and Stainless Steel Pipe and Section 15191, Diesel Fuel Piping.
- D. Multiple Double containment pipes shall be separated three inches (3") wall to wall.
- E. Connections shall be made in accordance with manufacturer's recommendations and Section 15191, Diesel Fuel Piping.
- F. Pipe connections shall not be flanged.
- G. Piping shall slope toward tank s and sumps to allow any leakage captured by secondary containment pipe to drain back to leak detection equipment.
- H. Pipe Hangers and Supports: Pipe hangers and supports shall be provided and installed in accordance with Section 15060, Hangers and Supports, and Section 15191, Diesel Fuel Piping.

## 2.07 LEAK AND INVENTORY CONTROL AND FUEL MANAGEMENT SYSTEMS

### A. Leak and Inventory Control System

#### 1. General

- a. Provide a complete monitoring system to monitor fuel and fluid storage tanks, piping, containment sumps, emergency generator, automatic remote fuel port and related equipment as required and as specified herein. System shall include fuel monitoring panels, communication interface cards, sensors, probes, wiring, and all other appurtenances required for a complete and operable system.
- b. At a minimum the system shall monitor the following:
  - (1) Storage tank interstitial space for leakage

- (2) Storage tank liquid level
  - (3) Diesel fuel density
  - (4) Containment sumps for leakage; including pump enclosures, transition sumps, dispenser sumps/pans and as shown on contract drawings.
  - (5) Emergency generator tank interstitial space for leakage
  - (6) Emergency generator tank liquid level
  - (7) Emergency generator fuel consumption
  - c. System shall perform Business Inventory Reconciliation (BIR) and shall include all wiring, sensors, modules/cards, software, etc. required.
  - d. System shall include emergency generator applications.
2. Equipment
- a. Monitoring Panel:
    - (1) Shall be Veeder-Root model TLS-450 or approved equal.
    - (2) Shall be wall-mounted as shown in contract drawings.
    - (3) Shall be equipped to communicate with fuel management system.
    - (4) Contractor shall provide a minimum of one (1) monitoring panel and shall provide additional panels or card expansion bays if required to facilitate the number of required modules/cards.
    - (5) Shall include Total Access, Total Control, L2 Storage, Dual RS232 Module, and USB/Ethernet Dual Interface Module as standard features.
    - (6) Shall include AccuChart II/BIR EDIM to track all fuels and fluids that enter or exit each storage tank. System shall collect metered dispensing information from Fuel Management System and Fluid Dispensing System and shall provide accurate delivery and reconciliation reports.
    - (7) Shall include Universal Sensor/Probe Interface Modules, Universal I/O Modules or other modules/cards as required.

- (8) Shall include the following standard features/capabilities:
- (a) Comprehensive compliance reports
  - (b) Inventory and delivery monitoring and reporting
  - (c) Supports up to 32 probes
  - (d) Interstitial and sump monitoring capabilities
  - (e) Dispenser sump monitoring capabilities
  - (f) Audible and visual alarm capabilities
  - (g) Customizable alarms
  - (h) Email notification and reporting
  - (i) Fax notification and reporting
  - (j) Continuous statistical leak detection software capable of 0.2 GPH for both single and manifolded tanks.
  - (k) 3.0 GPH, 0.1 GPH and 0.2 GPH in tank leak detection
  - (l) 3.0 GPH, 0.1 GPH and 0.2 GPH line leak detection capabilities
  - (m) Sensor status reports
  - (n) Sensor status history reports
  - (o) 7.4-inch full VGA LCD touch screen
  - (p) High resolution, high speed 80 column thermal printer
  - (q) Universal compartments support universal sensor and probe module and input output interface module
  - (r) Built-in relay for overfill alarm
  - (s) Remote web access
  - (t) TLS-450 Direct Access software
  - (u) Up to nine (9) communication ports

- (v) Internal auto-dial fax modem communications SiteFax
- (w) Ethernet communications
- (x) RS-232 data communications
- (y) RS-485 data communications
- (z) USB port for software upgrade and data back up

b. Sensors, Probes, and Meters

- (1) System shall be connected to the emergency generator level and leak detection sensors.
- (2) Sensors, probes and meters shall be provided as shown, specified herein or as required for the leak and inventory control system to monitor the parameters described above and to perform BIR. All sensors, probes, and meters shall be listed and approved by an independent testing laboratory and shall be listed for the corresponding liquid type.
- (3) Storage tanks shall be equipped with magnetostrictive inventory probes capable of 0.1 GPM volumetric tank tightness testing as well as 0.2 GPH monthly and continuous testing.
- (4) Diesel fuel storage tank shall be equipped with magnetostrictive inventory probes compatible and equipped with float kits to monitor fuel density.
- (5) The emergency generator fuel supply line shall be equipped with a fuel flow meter or other means to measure generator fuel consumption for BIR.
- (6) System shall interface with the Fluid Dispensing System and monitor dispensing fluid volumes, incorporating data into BIR reports.

c. Overfill Alarm and Acknowledgement Device:

- (1) Each tank shall be equipped with an overfill alarm. Alarm shall be connected to an alarm relay in the system monitoring panel. System monitoring panel shall activate alarm when tank level reaches a preset level to warn of a potential tank bulk delivery overfill. Alarm trigger level shall be settable from the system monitoring panel. Alarm device shall include both audible and

visual alarms. Audible alarm shall be adjustable to have duration of 0 to 60 seconds and a noise level of 78 to 103 dB (at 10-feet).

- (2) Each overfill alarm shall include an acknowledgement device allowing delivery personnel to shut off audible alarm. Visual alarm shall remain illuminated until system monitoring panel prints an inventory increase report.
- (3) Overfill alarms and acknowledgement devices shall be located near fill port locations and by the waste oil disposal.

## B. Fuel Management System

### 1. General

- a. Provide a complete fuel management system capable of controlling dispensing operations of each dispensing hose to maintain 24-hour controlled access.
- b. The fuel management system shall include one (1) fuel island terminals, site controller, pump interface cards, fleet head office software and all other appurtenances for a complete and operable system. System shall be expandable for future expansions in the number of fuel sites, vehicles, drivers, dispensers, and nozzles.
- c. Access to product shall be restricted to personnel holding valid magnetic strip cards and who perform a two stage authorization process which shall include identification of both the driver and the vehicle.
- d. The system shall store transaction data as well as driver and vehicle records into its database using the internal FLASH disk. The electronic database shall also store fueling limits and restrictions determined by the City of New York for either driver or vehicle.
- e. Management system shall be listed and approved by a third party testing laboratory.
- f. Equipment shall be hardwired with rigid conduit between components, dispensers, pumps, and interconnections with other systems as shown on Contract Drawings.

### 2. Features

- a. Management System shall interface and communicate with the Leak and Inventory Control System to allow fuel management capabilities and Business Inventory Reconciliation (BIR). The system shall capture or

provide any necessary information to/from the Leak and Inventory Control System via TCP/IP communications port or RS-232 port.

- (1) At a minimum, the management system shall collect the following data from the Leak and Inventory Control System:
  - (a) 12:00 midnight shift inventory volume for tanks.
  - (b) Tank inventory level; CSLD (leak detection) status – Pass/Fail
  - (c) Fuel delivery information; water level.
  - (d) Water levels, temperature alarms (leak, overfill, sump, sensor, etc).
- (2) At a minimum, the management system shall provide the following data to the Leak and Inventory Control System:
  - (a) Fuel dispensed from each dispenser hose.
- b. The system shall include one (1) fuel island terminal with integrated site controller. Terminals shall communicate via CAT5 cable.
  - (1) Fuel island terminals shall include:
    - (a) LCD graphic display
    - (b) 16 metal piezoelectric keys
    - (c) Magnetic card reader
    - (d) Alphanumeric keypad
    - (e) Outdoor receipt printer with 1,000 ft paper roll including automatic paper cutter and alarms indicating low-paper and paper-out.
- c. The fuel island terminal integrated site controller shall have the following characteristics:
  - (1) Weather proof and water tight unit suitable for outdoor use.
  - (2) Capable of controlling up to 32 mechanical hoses and 64 electronic hoses at a single site.
  - (3) Shall communicate with dispenser via 485 pulse output.

- (4) Shall store up to 25,000 transactions and 50,000 vehicles/devices with the ability to set limitations and restrictions.
  - (5) Shall use a solid state flash disk and Real Time Clock (RTC) with backup, along with surge suppressors for transient and noise immunity.
  - (6) Shall support mechanical and electronic dispensers with all links protected and isolated.
- d. Site controller software shall be based on web server technology and enable easy secured (SSL) remote access through the network using a standard PC with an internet browser, without the need for any other software application. The browser interface shall allow control and monitoring, maintenance activities, report generations with advanced filters and templates, graphical monitoring of fuel levels, on-line pump monitoring, etc.
- e. The host computer shall collect the transactions and Leak and Inventory Control System information for centralized fuel management activities including required deliveries, forecasting and reconciliation. System shall consolidate data and generate reports including exception reports, reconciliation reports, trends, forecasts, consumption, tank capacity, etc and shall be capable of generating custom reports. The host software shall:
  - (1) Communicate with all sites to provide 24/7 on-line access through the network and shall support multiple fuel site controllers, fleet and departments (districts) and shall allow data consolidation.
  - (2) Use SSL security for its Web interface.
  - (3) Provide secure log-in through the Web for each fleet manager, for monitoring, control and report generation.
  - (4) Allow customizable vehicle and driver limits and restrictions including:
    - (a) Limit of daily, weekly and monthly refueling volume in gallons as well as in currency.
    - (b) Enable or disable vehicle refueling on specific days and/or specific time slots within a day
    - (c) Limit the maximum refueling session for a specific vehicle per transition, per day, week, or month.

- (d) Block specific station for a specific vehicle.
  - (e) Restriction of specific fuel types for refueling of a specific vehicle.
- 3. Provide a complete fuel management system to maintain 24 hour controlled access to fuel dispensing, activated by valid operator access card.
  - 4. Fuel management system shall be Gasboy Series 1000 Fuel Management System or approved equal.
  - 5. System shall be a two hose outlet, one card type.
  - 6. System shall prompt operator for a personal identification number (PIN), equipment identification, and hour meter entry.
  - 7. System shall limit amount of fuel dispensed to predetermined operator allocated amounts. Allocation shall be determined by DSNY.
  - 8. Management system shall be equipped to communicate with Leak and Inventory Control System.
  - 9. System shall be equipped with an internal modem for direct data transmission over phone lines.
  - 10. System shall include Gasboy MCE Plus magnetic card encoder or approved equal to allow for encoding of employee magnetic stripe cards.

## 2.08 ACCESSORIES

A. The following accessory components shall be furnished and installed.

- 1. Submersible Pumps
  - a. Provide two (2) submersible turbine pumps for the diesel fuel storage tank.
  - b. Pumps shall be listed and approved by an independent testing laboratory and shall be listed for use with diesel including biodiesel up to 20 percent (B20) and gasoline including ethanol blends up to 85 percent (E85).
  - c. Pumps shall be designed for class 1, group D hazardous locations
  - d. Pumps shall be 1-1/2 hp, 208-230 VAC, 60Hz, 1-phase.

- e. Provide line leak detection device and any accessory required which is compatible with the submersible turbine pump. Line leak detection device shall be compatible with ethanol blends up to 85 percent (E85). Contractor shall provide documentation from the manufacturer stating fuel compatibility.
- 2. High Hose Retrievers: High hose retrievers shall be provided for each dispensing hose. High hose retrievers shall be mounted on schedule 160 pipe, 10 feet above grade. Contractor shall provide all breakaways, swivels, whip hoses, and other accessories as shown or as required by code.
- 3. Emergency Shut-off Push Buttons: Emergency shut-off push buttons shall be located as shown and as required. Push buttons shall disconnect power to all dispensing devices, pumps, and all other electrical equipment in the fueling area. All push buttons shall be interconnected and require manual intervention to reset. Pushbuttons shall be suitable for use in class 1, group D hazardous locations.
- 4. Overfill prevention valves shall be provided for the aboveground diesel fuel storage tank and shall include drop tubes as shown on Contract Drawings or as required. Overfill prevention valves shall provide positive shut-off of product delivery during gravity filling or pressurized filling operations. Overfill prevention valves shall be designed for use in aboveground storage tanks and listed and approved by an independent testing laboratory.
- 5. Nozzles: The dispenser shall be equipped with a diesel fuel dispensing nozzle and high flow nozzle as specified herein.
  - a. One dispensing hose shall be equipped with a diesel/lead style fuel dispensing nozzle with the following characteristics:
    - (1) Spout retaining ring.
    - (2) Two-Stage lever.
    - (3) 50 psi maximum pressure
    - (4) Replaceable spout
    - (5) 1-inch NPT inlet
    - (6) Green hand insulator
    - (7) Capable of at least 10 gpm
  - b. One dispensing hose shall be equipped with a high-flow nozzle. High-flow nozzle shall be capable of dispensing at a rate of 18 gpm. High-flow nozzle shall be Wiggins ZZ9A1 or approved equal.
- 6. Signage
  - (1) Identification signs shall be provided and installed as shown, specified, as required by Code and by New York City regulations.

Signs shall also meet the requirements of Section 10440 – Interior Signs. Provide as a minimum the following:

- (a) In the remote fuel port, each connection port shall be clearly labeled with the appropriate identity, “DIESEL FUEL STORAGE TANK” and “GENERATOR DIESEL STORAGE TANK”.
- (b) Any required safety labels on the dispenser and in the dispensing area.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. All equipment and system components shall be installed in strict accordance with the most recent installation instructions provided by the manufacturer, NFPA, DEC Standards, local ordinance, recognized engineering procedure, and other applicable codes.
- B. Contractor shall be trained by manufacturer, the state, or other approved agency.
- C. All containment sumps shall be hydrostatically tested for leakage prior to concrete pour.

#### 3.02 TESTING

- A. System tests shall be according to manufacturer’s guidelines at time of installation.
- B. Manufacturer’s Services: The contractor shall retain the services of the supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the supplier shall include for those equipment items not manufactured by him, the services of an authorized manufacturer’s representative to check the equipment installation and place the equipment in operation. The manufacturer’s representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.
- C. A factory trained representative shall be present at the first tank filling and dispensing operation at the facility.
- D. Field Test: Provide field testing in accordance with Section 01811 - Preliminary and Final Field Tests.

#### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer’s Services: The Contractor shall retain the services of the Supplier to supervise and/or perform checkout and start-up of all system components. As part

of these services, the Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

- B. A factory trained representative shall be present at the first tank filling and dispensing operation at the facility.

### 3.04 TRAINING

- A. Provide training in accordance with Section 01821 – Start-Up and Training.
- B. The manufacturer of the fuel dispensing system shall include one day of on-site classroom and hands-on training at the facility. The day is one session of 8 hours.
  - 1. Maintenance: Training shall include operation of the system and regular maintenance (electrical, and mechanical). Additionally the City of New York key maintenance personnel shall be allowed to “shadow” the installation process whenever possible.
  - 2. Supervisors: Training shall include operation of the system and basic troubleshooting as a minimum.
  - 3. Operators Training: Operator training shall provide use skills along with safety training.

-END OF SECTION-

**Section 11142**  
**FLUID DISPENSING SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. A Fluid Dispensing System shall be provided to supply bulk motor oil and hydraulic fluid for use in the Maintenance Bay for servicing the facility's motorized equipment. A Waste Oil Collection system shall be provided for the collection of used fluids.
- B. Contractor shall furnish and install pumps, dispensing hose reels, dispensing nozzles, leak and level monitoring equipment, moisture separators, pressure regulators, pneumatic hoses, piping, waste oil drain receiver, valves, fittings, and accessories as shown, specified and required for a complete and fully operational system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01831 – Operation and Maintenance Manuals
- B. Section 02505 – Leakage Tests
- C. Section 09911 – Exterior Painting
- D. Section 10436 – Exterior Signs
- E. Section 10440 – Interior Signs
- F. Section 11141 – Diesel Fuel Dispensing System
- G. Section 11377 – Compressed Air Equipment
- H. Section 15052 – Steel and Stainless Steel Pipe
- I. Section 15060 – Hangers and Supports
- J. Section 15076 – Piping and Equipment Identification
- K. Section 17320 – SCADA System - Control Panels and Enclosures
- L. Section 17330 – SCADA System – Panel Mounted Instruments and Devices

**1.03 REFERENCES**

- A. FDNY Rules
- B. NYC Fire Code
- C. NYC Mechanical Code
- D. UFC – Uniform Fire Code
- E. UL – Power Operated Dispensing Devices for Petroleum Products
- F. NFPA 30 – Flammable and Combustible Liquids Code

- G. NFPA 30A – Code for Motor Fuel Dispensing Facilities and Repair Garages
- H. NFPA 31 – Installation of Oil-Burning Equipment

#### 1.04 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Submit shop drawings and accessory cut sheets for approval. The design drawings shall show principal dimensions, size, capacities, performance, type, system pressures and locations of all connections and fittings and locations of all options/accessories. Design drawings shall also include catalog cut sheets for associated accessory items and subassemblies.
- C. Submit copies of the system installation, operation and maintenance manual prior to delivery.
- D. Submit copies of all quality control testing documentation, installation inspection documentation, and written warranty to the Commissioner at time of documentation completion.
- E. Shop Drawings: Submit working drawings, including arrangement and erection drawings of the piping, tanks, equipment and control equipment; schematic control diagrams; electrical connection diagrams; and complete description of the control system.
- F. Provide Operation and Maintenance (O & M) manuals in accordance with Section 01831 – Operation and Maintenance Manuals.

#### 1.05 SPARE PARTS

- A. The contractor shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in the General Conditions.

- B. The spare parts list shall include a current unit prices and sources of supply for each item.
- C. The following spare parts shall be provided:

<u>PART</u>	<u>QUANTITY</u>
1. Air Pump	1
2. Hose Reel	1
3. 50ft. of ½"ID Air Hose	2
4. Metering Nozzle	1 of each type

#### 1.06 QUALITY ASSURANCE

- A. Quality Assurance shall be in accordance with Section 01431 – Quality Assurance Inspection, and as stated below.
- B. The manufacturer shall have a minimum of three (3) years experience in producing specified equipment for commercial use.
- C. Contractor shall be a licensed NYC installer.
- D. The installer must have taken, if applicable, manufacturer's training courses on the installation of piping, leak detection, and tank management systems and meet the licensing requirements in the State of New York.
- E. All like components within the fluid system such as pump and pump controls, reels, hoses, valves, connectors, volume meters, etc., shall be the products of a single manufacturer.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Care: Use every precaution to prevent damage to the tanks during transportation and delivery to the site. Take extreme care in loading and unloading tanks and accessories. Do such work slowly with skids and suitable power equipment and keep tanks under control at all times.
- C. Do not allow the tank to be dropped, bumped, dragged, pushed, rolled or moved in any way which will cause damage. Lift tanks only by lifting lugs provided, never by chains or slings around the tank shell.
- D. If, in the process of transportation or handling, any tank is damaged, replace or repair such tank or tanks. Make all required repairs.

- E. Delivery: Ship each tank complete, with no field assembly or fabrication required.

## 1.08 WARRANTY

- A. The Warranty shall be in conformance with Article 24 – Maintenance and Guaranty of the Standard Construction Contract.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Equivalent products of other manufacturers may be submitted for approval.

- 1. Tanks

- a. Highland Tank
- b. Modern Welding Company
- c. ConVault
- d. Or approved equal

- 2. Lubrication Equipment

- a. Lincoln Industrial Corporation
- b. Graco, Inc.
- c. Or Approved Equal

- 3. Accessories

- a. Lincoln Industrial Corporation
- b. Graco, Inc.
- c. Morrison Bros. Co.
- d. Krueger Sentry Gauge Co., Inc.

### 2.02 FLUID STORAGE TANKS

- A. General

- 1. Furnish and install three (3), thermally insulated, double-wall steel aboveground storage tanks, as shown and specified herein. Each tank shall have a storage volume of 500 gallons. Tank shall fit the space provided.
- 2. The tanks shall be designed for aboveground storage of flammable and combustible liquids at atmospheric pressure and suitable for use outdoors. Tanks shall include integral steel secondary containment and thermal insulation that provides a minimum two-hour fire rating.

3. Tanks shall be supplied with emergency venting for the primary and the secondary containment tanks. Emergency venting by "form of construction" will not be permitted.
4. The tank system shall meet the requirements of the New York City Building Department and shall be so labeled.
5. Fluid storage tanks shall be monitored for leakage and level by the Leak and Inventory Control System as specified in Section 11141 – Diesel Fuel Dispensing System.

B. Construction

6. Lifting lugs shall be provided at balancing points to facilitate handling and installation.
7. As a minimum, the following threaded fittings with thread protectors shall be supplied with all fittings located on the tank top:
  - a. Two (2) 2 inch – NPT Interstitial Monitoring
  - b. One (1) 2-inch – NPT Normal Vent, Primary Tank
  - c. One (1) 4 inch – NPT Emergency Vent, Primary Tank
  - d. One (1) 4 inch – NPT Emergency Vent, Secondary Tank
  - e. One (1) 2 inch – NPT Product Fill
  - f. One (1) 4 inch - NPT Product Fill
  - g. One (1) 2 inch – NPT Product Pump/Supply
  - h. One (1) 2 inch – NPT Product Return/Auxiliary
  - i. One (1) 2 inch – NPT Liquid Level Gauge
  - j. One (1) 2 inch – NPT Level Switch
8. For additional Tank accessory components see subsection 2.04 Accessories.

2.03 FLUID DISPENSING EQUIPMENT

A. General:

1. Contractor shall provide motor oil and hydraulic oil dispensing systems which will dispense product in the maintenance bay at the locations shown on Contract Drawings. Each system shall store product in an aboveground storage tank. Systems shall be equipped with a wall mounted air powered oil pump, hose reels and nozzles as described below. Each pump shall include a dedicated regulator/dryer/lubricator and shall be connected to the building compressed air system. Each hose reel shall be outfitted with 50 ft of dispensing hose. Dispensing shall be controlled by a centrally located electronic dispensing control console fluid inventory control and management system as described below. Contractor shall supply all piping, hangers,

placards, containment sumps, vents, monitoring equipment, and other accessories for a complete and operational system.

2. Contractor shall provide a waste oil collection system allowing storage of waste product. System shall include an aboveground storage tank, a waste oil receiver located in the maintenance bay as shown on Contract Drawings, all single and double wall piping, tank monitoring equipment including a high level sensor and alarm, waste oil extraction port, stick ports, and all other accessories needed for a complete and operational system. Waste oil shall drain by gravity from the receivers in the maintenance bay to the storage tank. See Contract Drawings for receiver details.

## B. Construction

### 1. Pumps

- a. Contractor shall supply one (1) wall mounted positive displacement oil pump for each oil to be dispensed. Pump shall have a 6-inch pumping stroke and cycle on demand only.
- b. Pumps shall include a pneumatically operated 4-1/4 inch diameter air motor. Air motor and lower pump section shall be of an in-line design.
- c. Air Motor shall include a grounding lug and be equipped an external muffler operating below OSHA noise standards.
- d. Air Motor shall include a non-metallic poppet valve.
- e. Pump assembly shall have the following characteristics:

(1) Pump Ratio:	12:1
(2) Fluid outlet size:	3/4 inch NPTF
(3) Air inlet size:	1/2 inch NPT
- f. Contractor shall supply any accessory components required for proper pump operation including but not limited to thermal relief kit, wall mount bracket, low level cut-off kit, bleed type air shut-off valve, air filter/regulator/lubricator, automatic drain valve for filter, fluid shut-off valve, suction kit, run-away valve, etc.
- g. Pump shall include an integral air break automatic air shutoff to prevent a runaway condition

## 2. Hose Reel Assemblies

- a. Contractor shall supply wall mounted hose reels as indicated on Contract Drawings for motor oil and hydraulic oil. Reels shall have a minimum capacity of 50 feet of  $\frac{1}{2}$  inch ID hose.
- b. Reel construction: Reel base shall be a double pedestal design. The reel shall incorporate a fully ported hub, adjustable guide-arms supporting hose guides on both sides, and external swivel housing. The hose guide roller assembly shall be the full width of the spool.
- c. Hose reels shall have the following characteristics:
  - (1) Reel outlet :  $\frac{1}{2}$  inch NPSM
  - (2) Reel inlet:  $\frac{1}{2}$  inch NPSM
  - (3) Pressure rating (oil): 1,500 psi
- d. Contractor shall supply any accessory components required for proper reel operation including but not limited to hose inlet kit and fluid shut-off valve.
- e. Contractor shall supply a minimum of 50 feet of hose per reel so nozzle is reachable from the ground.

## 3. Dispensing Nozzles

- a. Motor oil and hydraulic oil dispensing systems shall be equipped with non-metered dispensing nozzles.
- b. Dispensing nozzles shall have a locking trigger for hands free operation.
- c. Nozzles shall include: valve handle, rigid nozzle wand, lockable trigger, inlet filter, and swivel.
- d. Dispensing nozzles shall have the following characteristics:
  - (1) Maximum Flow Rate: 5 gpm
  - (2) Maximum Operating Pressure: 1,015 psi
  - (3) Nozzle Inlet:  $\frac{1}{2}$  npt
  - (4) Outlet:  $\frac{1}{2}$  npt

## 4. Fluid Inventory Control And Management System:

- a. Contractor shall provide an operator programmable fluid inventory control and management system as described on contract drawings and as specified herein. System shall have a 32-fluid, 300-dispensing point, 200-user capacity and shall control dispensing of motor oil and

hydraulic oil. System shall include but not be limited to dispenser units, keypad, fluid shut-off solenoids with integral pulse meters, master air shut-off solenoid, ready light, fluid filters, check valves, pressure relief kit, thermal relief kit, wall mount brackets, software, communications interfaces and any signal and electrical wiring required for an complete and operable system.

- b. System Operation: The operator shall select the type of fluid, station, and quantity to be dispensed. The controller energizes respective air and fluid solenoid valves. A ready light adjacent to the dispensing station illuminates indicating the system is ready for dispensing. As fluid is dispensed, the pulse meter sends a signal to the controller corresponding to the amount of flow. When the designated amount of fluid has been dispensed, the controller de-energizes the solenoids preventing further dispensing.
- c. The fluid inventory control and management system shall interface with the leak and inventory control system as required by Section 11141 – Diesel Fuel Dispensing System. The interface shall allow the fluid inventory control and management system to capture tank inventory information and report dispensed volumes and any other parameter required by the leak and inventory control system to generate reports including Business Inventory Reconciliation (BIR).
- d. Contractor shall provide a desktop PC with flat-panel monitor, keyboard, optical mouse, operating system, and other required software for a complete and operable system. Computer shall be installed in the Foreman's Office and shall serve as the Fluid Dispensing Control System master PC. Computer shall be capable of running and include necessary accessories to run the fluid dispensing system software and have an Ethernet connection.
- e. Dispensing Unit shall be mounted on the hose reel support structure as shown on Contract Drawings. Dispensing units shall be hard wired to each other and all ancillary components with wires run within rigid conduit, wireless communication is not be acceptable. Dispensing units shall have the following characteristics:
  - (1) Input voltage: 90 to 240 VAC 50/60 Hz
  - (2) Solenoid Output Voltage: 24 VDC
  - (3) Power Cord: 7 ft
  - (4) Dispense Point Connections: 6
  - (5) Ethernet Connections: 4

- f. Keypads shall be mounted under each pair of dispensing reels as shown on Contract Drawings and shall have the following characteristics:

- |                                  |                        |
|----------------------------------|------------------------|
| (1) Input voltage:               | 90 to 264 VAC 50/60 Hz |
| (2) Power Cord:                  | 6 ft                   |
| (3) Parallel Port:               | 1                      |
| (4) Bar Code Scanner Connection: | 1                      |
| (5) Network Connection:          | 1                      |

- g. Fluid Shut-off Solenoid units shall include integral pulse meters and fluid filters. Fluid shut-off solenoids shall be mounted on the hose reel support structure as close to the hose reel as practical. Fluid shut-off solenoids shall have the following characteristics:

- |                             |                      |
|-----------------------------|----------------------|
| (1) Electrical Rating:      | 24 VDC, 17w, 0.7 amp |
| (2) Filter:                 | 150 Micron           |
| (3) Ready Light Connection: | 1                    |

- h. Ready lights shall be green LED and shall be direct surface mountable onto the hose reel. Ready lights shall have a NEMA 4X housing and a 3-foot cord.

- i. Master air solenoid shall be located with the fluid pumps as shown on Contract Drawings. The master air solenoid shall have the following characteristics:

- |                        |               |
|------------------------|---------------|
| (1) Electrical Rating: | 24 VDC, 1.8 w |
| (2) Inlet/Outlet:      | 3/4-inch NPT  |
| (3) Flow Factor:       | 9cv           |

## 5. Piping

- a. Piping shall be of size and type specified in section 15120 – Interior and Exposed Piping Schedule.
- b. Pipe hangers and supports shall be furnished and installed as required and in accordance with Section 15060 – Hangers and Supports.

## 2.04 ACCESSORIES

- A. Motor oil and hydraulic oil storage tanks shall be fitted with a 7.5 gallon overflow spill container. The spill container shall be of steel construction with a hinged lockable cover. The container and cover shall be powder coated white inside and out and shall be fitted with a push-type drain with an elastomer o-ring.

- B. Each tank shall be equipped with a direct reading tank gauge to provide at-a-glance reading of the tanks liquid level. The gauge shall be a swing-arm type gauge used for measuring all types of liquid levels.

C. Signage

1. Identification signs shall be furnished and installed as shown, specified, and as required by Code and by New York City Building Department regulations. Signs shall also meet the requirements of Section 10436 – Exterior Signs, and Section 10440 – Interior Signs. Provide, as a minimum, the following:

a. At Tanks: (Outside)

	<u>Quantity</u>	<u>Description</u>
(1)	2	MOTOR OIL (on tanks long side)
(2)	2	HYDRAULIC OIL (on tanks long side)
(3)	2	WASTE OIL (on tanks long side)
(4)	3	FLAMMABLE NO SMOKING OR OPEN FLAMES (on wall next to each tank)

b. In Maintenance Bay: (Inside)

(1)	1	MOTOR OIL (next to reel on wall)
(2)	1	HYDRAULIC OIL (next to reel on wall)
(3)	1	WASTE OIL DISPOSAL (on wall above waste oil receptor)
(4)	1	MOTOR OIL PUMP (on wall next to pump)
(5)	1	HYDRAULIC OIL PUMP (on wall next to pump)

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. All equipment and system components shall be installed in strict accordance with the most recent installation instructions provided by the manufacturer, NFPA, local ordinance, recognized engineering procedure, and other applicable codes.
- B. Contractor shall be trained by manufacturer, the state, or other approved agency.

### 3.02 TESTING

- A. System tests shall be according to manufacturer's guidelines at time of installation.
- B. Manufacturer's Services: The contractor shall retain the services of the supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the supplier shall include for those equipment items not

manufactured by him, there services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

- C. A factory trained representative shall be present at the first tank filling and dispensing operation at the facility.
- D. All product piping shall be pressure tested prior to being put into service. Contractor shall plan field tests carefully and carry them out with all due precautions. Pressurizing equipment should be suited to the size of the system and the pressure required and shall be operated by qualified and experienced personnel only. Pressure sources shall be capable of approaching test pressure gradually. Use gauges with a full-scale reading of no more than twice the test pressure. Use reliable gauges calibrated against a dead weight tester zeroed for atmospheric pressure. Should gauge reading fail to remain stable, a soap solution shall be used to locate leakage.
- E. Field Test: Provide field testing in accordance with Section 01811 – Preliminary and Final Field Tests.
- F. Leakage tests shall be performed on all fluid dispensing piping carrying both air and fluids in accordance with Section 02505 – Leakage Tests.

### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Services: The Contractor shall retain the services of the Supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

### 3.04 TRAINING

- A. Provide training in accordance with Section 01821 – Start-Up and Training.
- B. The manufacturer of the Fluid Dispensing System shall include one day of on-site classroom and hands-on training at the station. The day is one session of 8 hours.
  - 1. Maintenance: (2 hours) of training shall be included. Training to include operation of the system and regular maintenance (electrical, pneumatic and mechanical). Additionally the City Of New York key maintenance personnel shall be allowed to "shadow" the installation process whenever possible. By "shadowing" the equipment installation, the highest level of practical knowledge can be obtained.

2. Supervisors: (2 hours) of training shall be included. Training shall include operation of the system and basic troubleshooting as a minimum.
3. Operators' Training: (4 hours) of on-site training shall be included. Operator training shall provide use skills along with safety training.

**-END OF SECTION-**

**Section 11211**  
**SERVICE WATER SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Service water system comprising the following:
  - 1. End suction pumps with motors
  - 2. Variable frequency drives
  - 3. System control panel
  - 4. Stainless steel system base
  - 5. Hydropneumatic tank
  - 6. Piping, tubing, fittings, valves and appurtenances
  - 7. System controls including all switches, gages and meters
  - 8. All other accessories required to produce a complete working system

**1.02 RELATED SPECIFICATIONS**

- A. Division 1 – General Requirements
- B. Section 09912 – Painting
- C. Section 15076 – Piping and Equipment Identification
- D. Section 16050 – Basic Electrical Materials and Methods
- E. Section 16055 – Electrical Requirements for Shop-Assembled Equipment
- F. Section 16491 – Control Components and Devices
- G. Section 17320 – Control Panels and Enclosures

**1.03 SUBMITTALS**

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Shop Drawings: Submit working drawings, including arrangement and erection drawings of the piping, equipment and control equipment; schematic control diagrams; electrical connection diagrams; and complete description of the control system.
- C. Provide manufacturer's data showing pump performance, motor horsepower, system pressures and other operational parameters.
- D. Operation and Maintenance: Submit operation and maintenance manuals for the service water equipment.

**1.04 SYSTEM DESCRIPTION**

- A. The service water system manufacturer shall provide a package type system with all equipment and component parts completely mounted and assembled on the skid, piped and pre-wired requiring only external power for operation. The skid mounted system shall be used to provide water to the hose bib locations in the marine transfer station. The hose bibs will be used to clean the floors in the marine transfer station after the municipal solid waste has been removed from the area.

**1.05 QUALITY ASSURANCE**

- A. The service water system manufacturer shall have a minimum of three (3) years experience and shall have service water systems in operation for at least two years.

**1.06 SPARE PARTS**

- A. Provide the following spare parts:
  - 1. One impeller
  - 2. One set of mechanical seals

**1.07 WARRANTY**

- A. The Warranty shall be in conformance with Article 24 – Maintenance and Guaranty of the Standard Construction Contract.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.
  - 1. Metropolitan Industries
  - 2. USEMCO

**2.02 MATERIALS**

- A. Provide three end suction type pumps for each service water system, each pump with rated capacity of not less than 100 gpm at total dynamic head of 130 feet. Provide pumps rated for continuous use. Provide overall efficiency at rated point of 60 percent. Provide pumps of bronze fitted construction. Provide flanged pump connections with 125 lb ANSI bolt patterns. Provide a casing with a tapped drain connection. Provide an enclosed type impeller. Provide John Crane Type 21 mechanical seals with carbon versus ceramic faces and stainless steel hardware. Directly connect pumps to AC motors of squirrel cage induction design. Design the motors to match the variable frequency drive control. Provide motors capable of

meeting all speeds from zero to maximum flow without exceeding the nameplate horsepower rating of the motor. Provide 7.5 horsepower, 3500 rpm, 3-phase, 60 hertz, 480-volt motors with a 1.15 service factor.

- B. Provide a hydropneumatic tank meeting the requirements of ASME code for Unfired Pressure Vessels. Design the tank for 125 psig maximum working pressure and test at 1.5 times the maximum working pressure. Perform the test after assembly, but before painting with all openings closed. Continue testing until all seams and joints have been demonstrated to be thoroughly tight. Furnish all necessary equipment, material and labor for conducting the test. Provide tank which has been stamped to show compliance with ASME code. Internally divide tanks into air compartment and water compartment by flexible diaphragm to prevent air and water from mixing. Provide diaphragms which flex but do not stretch or crease during drawdown or filling operations. Provide water compartment of adequate volume to provide minimum of 15 gallons of drawdown between 60 psig and 30 psig. Precharge air compartment with dry air to 60 psig at factory. Coat or line interior of tank so as to prevent rust and corrosion. Provide tank of welded construction and built of copper bearing steel 1/4-inch thick unless greater thickness is required by code. Do not exceed 30 inches in diameter and 7 feet in height for overall tank dimensions. Acceptable manufacturers for the hydropneumatic tanks are as follows:
1. Amtrol
  2. Wessels
- C. Mount the pumps, motors, control panel, and associated components for the service water system on a stainless steel skid equipped with vibration mounts and suitable for bolting to a concrete pad. Situate skid components to allow easy access for maintenance. Provide stainless steel construction for the skid chassis including all brackets, supports, screws and other components.
- D. Provide 4-inch suction and discharge headers and 3-inch intermediate piping constructed of steel. Provide Class 150 and Class 300 steel flanges conforming to ASTM A-105 and faced and drilled per ANSI B16.5.
- E. Provide butterfly valves conforming to AWWA C-504 for Class 150B. Construct valve bodies of cast iron per ASTM A126, Class B. Provide flanged valves of the short body design with 125 lb flanged ends faced and drilled per ANSI B16.1. Provide mechanical joint ends meeting the requirements of AWWA C110. Provide offset discs to allow an uninterrupted 360 degree seating edge. Construct the disc of cast iron per ASTM A-48. Construct the disc seating edge of 316 stainless steel.
- F. Provide check valves of the nonslam silent operating type with internal spring loading. Provide check valves of the wafer style designed for installation between ANSI B16.1 Class 125 or Class 250 iron flanges or ANSI 16.5 Class 150 or Class 300 steel flanges. Construct the valve body of ASTM A126 Class B cast iron.

Construct the seat and disc of ASTM B584 cast bronze. Construct the compression spring of stainless steel.

- G. Furnish and install pressure gauges at suction and discharge of each pump and on each hydropneumatic tank. Provide pressure gauges of ANSI Grade 2A "Process Gauges" having integral partition between the measuring element and window, and employing pressure relieving back. Provide gauges of bourdon tube actuated with case material of black finished cast aluminum, black phenolic, or polished stainless steel having a corrosion resistant ring and gasketed glass or acrylic window. Furnish pressure snubbers or liquid filled gauges as required to dampen pressure pulsations. Provide gauges for pumps with 4-1/2-inch dials with a pressure range of 30" Hg to 15 psig for suction and 0 to 100 psig for discharge. Provide gauges for hydropneumatic tanks with 6-inch dials with a pressure range of 0-125 psig. Equip gauges with gauge cocks.
- H. Provide variable torque, adjustable frequency drives (AFDs) to vary the speed of the end suction pumps in response to system requirements. Provide a NEMA 1 enclosure, UL listed, completely assembled and tested by the manufacturer. Provide separate motors and AFDs as specified.
- I. Provide a local control panel housed in a NEMA 250 Type 1 enclosure. Construct the enclosure of stainless steel. Provide the following operator controls and indicators:
  - 1. Pump Hand/Off/Auto selector switch
  - 2. Pump RUN pilot lights
  - 3. Pump FAIL pilot lights
  - 4. Low suction pressure alarm pilot light
  - 5. High system pressure alarm light
  - 6. Audible alarm device
  - 7. Alarm silence push-button

In "Off" status, system shuts off. In "Auto" status, the AFD responds to the preset signal from the pressure transducer. Arrange transducer to start lead pump at 30 psig and stop it at 70 psig, and start the lag pump at 25 psig and stop it at 65 psig. Arrange the transducer to stop pumps at increasing pressure of 80 psig. In "Hand" status, the AFD responds to the set-point controller to adjust system pressure.

- J. Furnish and install all small metal piping, valves and accessories as required for complete installation.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install equipment at locations in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.

- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on the proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1.
- C. Tests: After installation of the service water system equipment, controls and all appurtenances, subject the units to a field running test, as specified in Division 1, under actual operating conditions. Demonstrate that under all conditions of operation service water equipment:
  - 1. Has not been damaged by transportation or installation
  - 2. Has been properly installed
  - 3. Has no mechanical defects
  - 4. Is in proper alignment
  - 5. Has been properly connected
  - 6. Is free of overheating of any parts
  - 7. Is free of all objectionable vibration
  - 8. Is free of excessive noise
  - 9. Is free of overloading of any parts
  - 10. Operate as specified with control system

### 3.02 CLEANING AND PAINTING

- A. Paint service water equipment as specified in Section 09912 – Interior Painting of the Structures and Equipment Contract. Do not paint stainless steel components.

-END OF SECTION-

**Section 11311**  
**OIL WATER SEPARATOR**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Provide oil-water separator as shown and specified per Contract Documents, including, but not limited to:
  - 1. Double wall, underground oil-water separator (OWS)
  - 2. Access manways, portals, risers, and covers
  - 3. Monitoring instrumentation floats and controls
  - 4. Ancillary electrical connections and equipment
  - 5. Vent piping and inlet/outlet piping connections
  - 6. Portable steel manual hand operated winch

**1.02 RELATED SPECIFICATIONS**

- H. UL 2215 - Outline of Investigation for Oil Water Separators
- I. New York City Department of Environmental Protection (NYCDEP)
- J. New York City Building Code

#### 1.04 DESIGN REQUIREMENTS

- A. Design separator for gravity separation of sand, grit, settleable solids, or semisolids, and free oils (hydrocarbons and other petroleum products) from wastewater associated with floor wash down operations, including floor wash down runoff, cleanup of hydrocarbon spills, and/or cleaning/maintenance operations.
- B. Provide separator designed for intermittent and variable flows of water, oil, or any combination of non-emulsified oil-water mixtures ranging from zero to 200 gal/min. Minimum separator retention time shall be 10 minutes. Operating temperatures of the influent oil in water mixture shall range from 40 degrees F. to 80 degrees F. The specific gravity of the oils at operating temperatures shall range from 0.71 to 0.92. The specific gravity of the fresh water at operating temperatures shall range from 1.00 to 1.03.
- C. The free oil and grease concentration in the effluent from the separator shall not exceed 15 mg/l (15 PPM). Design the separator in accordance with Stokes Law and the American Petroleum Institute Publication 421, "Monographs on Refinery Environmental Control - Management of Water Discharges; Design and Operation of Oil/Water Separators" to achieve the specified effluent quality.
- D. Provide separator meeting the requirements of Underwriters Laboratories, Inc (UL) 2215 and NFPA 30.
- E. Design the separator to withstand an internal load test of 5-psig air pressure with a 5:1 safety factor.
- F. Design separator to be buried in ground with 7 feet of overburden, the hole fully flooded, with a safety factor of 5:1 against general buckling. Tanks shall support accessory equipment without undue strain.
- G. Design separator to withstand surface H-20 axle loads when properly installed according to manufacturer's installation guidelines.

#### 1.05 SUBMITTALS

- A. Submit shop drawings and accessory cut sheets for formal approval by the Commissioner, and await written approval from the Commissioner prior to initiating OWS fabrication activities. The OWS design drawings shall show principal dimensions, size, type and location of all connections, and location of all options/accessories. Design drawings shall also include OWS and instrumentation

catalog cuts, and vendor cuts for associated accessory items and subassemblies used in OWS manufacture, including the leak detection system, corrosion protection system, and high level switch, and high level alarm, and control panel.

- B. Submit copies of the system installation, operation and maintenance manual prior to OWS delivery.
- C. Submit copies of all quality control testing documentation, installation inspection documentation, and written warranty to the Commissioner at time of documentation completion.

#### 1.06 QUALITY ASSURANCE

- A. Construct storage tank in compliance with specifications and dimensions listed herein, and as shown on Contract Drawings. Written approval from the Commissioner is required for any exceptions, changes, or modifications to the specifications. Provide materials specified or implied as being necessary to complete Work, unless specifically noted otherwise.
- B. OWS shall be standard product of manufacturer regularly engaged in production of large 2,000 gallons or more underground coalescing OWSs, having three (3) years minimum experience. Documentation certifying this experience must accompany the bid submittal. No subcontracting of tank fabrication shall be permitted.
- C. OWS shall be fabricated, inspected and tested for leakage before shipment from the factory in accordance with PART 2 of these specifications.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Handling of OWS shall be in strict accordance with manufacturer's recommendations to avoid damage to tank and accessories. OWS shall be moved by lifting lug only - chains or cables shall not be wrapped around tank.
- B. Protect tank and fittings from being scratched or otherwise damaged during delivery, storage and handling. Replace or repair materials damaged during transport.
- C. Provide temporary storage of OWS on site prior to installation - storage location shall be free of rocks and debris.
- D. Non-compliance with any of the specifications listed herein or variation from approved construction drawing details, including dimensional data, will be sufficient cause for rejection of OWS.

**1.08 WARRANTY**

- A. The manufacturer shall warrant its products to be free from defects in material and workmanship for a period of one year from the date of shipment. The warranty shall be limited to repair or replacement of the defective parts.

**1.09 SYSTEM START-UP**

- A. Upon completion of OWS installation, the Contractor shall startup and test piping, valves, and level and control instrumentation. The Contractor shall be responsible for calibration, adjustment and/or repair of system components as necessary for proper operation of system. Provide minimum 5-day notice to the Commissioner prior to system startup.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

- A. Acceptable manufacturers are listed below. Equivalent products of other manufacturers may be submitted for approval.

1. Highland Tank
2. Modern Welding Co., Inc.

**2.02 OIL WATER SEPARATOR**

- A. Provide a double-walled oil water separator (F-OWS-01) for below-ground installation, complete with all piping, accessories, and control panel. Separator shall be standard prefabricated, inclined parallel-corrugated plate, gravity displacement type unit with integral sediment/grit chamber and removable top covers. The oil water separator shall be a special purpose factory assembled unit which is a standard product of a manufacturer regularly engaged in the production of such equipment.
- B. Provide oil/water separator having a nominal volume of 2,000 gallons and a sediment/grit chamber having a volume of at least 500 gallons. The sizing of this oil/water separator is consistent with industry protocols for complying with the minimum federal spill and discharge regulations therefore a separator of smaller volume is not permissible.
- C. Separator shall be a cylindrical steel vessel intended for the separation and storage of flammable and combustible liquids. The separator shall have the structural strength to withstand static and dynamic hydraulic loading while empty and during operating conditions.
- D. Separator shall have an oil storage capacity equal to about 30% of the total vessel volume and an emergency oil spill capacity equal to 60% of the total vessel volume.

- E. Separator capacities, dimensions, construction, and thickness shall be in strict accordance with UL 58.
- F. Double Wall construction with 360 degree Steel Secondary Containment: The separator shall be double-walled with an interstitial space between the primary and secondary walls for containment of leaked product from the primary tank. The inner steel tank shall be completely contained within the outer steel tank, enclosing 100% of the tank volume. The space between the inner and outer steel walls shall be monitored with an approved electronic leak detection device through a pipe that extends vertically to the top of the tank from a small sump at the bottom. Tank construction using thin walled primary tank with external fiberglass jacket shall not be permissible.
- G. Separator shall be fabricated, inspected, and tested for leakage before shipment from the factory by manufacturer as a completely assembled vessel ready for installation.
- H. The separator shall be a pre-packaged, pre-engineered, ready to install unit consisting of:
  - 1. An 8-inch flanged influent connection (150 lbs. F.F.)
  - 2. An internal influent nozzle at the inlet end of the separator. Nozzle discharge to be located at the furthest diagonal point from the effluent discharge opening
  - 3. A Sediment Chamber to disperse flow and collect oily solids and sediments
  - 4. A sludge baffle to retain settleable solids and sediment and prevent them from entering the separation chamber
  - 5. An Oil/Water Separation Chamber containing a removable, inclined parallel corrugated plate coalescer, with removable corrugated plates sloped downward toward the sediment chamber
  - 6. An oil dam with effluent transfer pipes
  - 7. An effluent clearwell
  - 8. An internal effluent downcomer at the outlet end of the separator, to allow for discharge from the bottom of the effluent clearwell only
  - 9. An 8-inch flanged effluent connection (150 lbs. F.F.)
  - 10. Fittings for vent, interface/level sensor, waste oil pump-out, sampling, and gauge

11. Three (3) 24-inch diameter manways, UL approved, complete with bolt-on extension, cover, gasket, and bolts:
  - a. One manway shall be placed to provide access to the sediment chamber.
  - b. One manway shall be placed between the inlet and the parallel-corrugated plate coalescer to facilitate access into sediment chamber for solids removal.
  - c. One manway shall be placed between the parallel-corrugated plate coalescer and outlet to facilitate access into the oil water separation chamber for oil removal.
12. Lifting lugs at balancing points for handling and installation
13. Identification plates: Plates to be affixed in prominent location and be durable and legible throughout equipment life
- I. Corrosion Protection: Provide a Corrosion Control System for the oil/water separator in strict accordance with UL 1746 and A100-U® External Corrosion Protection Specifications as applied by a licensee of the Steel Tank Institute. Manufacturer must be a licensee of Steel Tank Institute. The A100-U® Corrosion Protection System consists of:
  1. Isolation Spool Pieces
  2. Dielectric Isolation Gaskets and Bushings
  3. External surfaces commercial grit blast, coated 15 mils DFT heavy duty Polyurethane
  4. Cathodic Protection System using Zinc/Magnesium Anodes
  5. PPII Protection Prover
  6. 30-year Limited Warranty
- J. Internal Coatings and Linings: Provide separator with internal surfaces commercial grit blast and coated with heavy duty polyurethane.

## 2.03 ACCESSORIES

- A. Provide a hold-down straps anchored to an underlying concrete pad for securing the OWS in accordance with manufacturers' recommendations. Provide adjustable turnbuckles or other means of tensioning the hold-down straps. Provide either polyester straps or steel straps with neoprene rubber liners for electrical isolation and tank protection.

- B. Provide a portable hand operated steel winch for the removal of petroscreen coalescers.

## 2.04 OPERATION AND CONTROL

- A. General: Provide an audible and visual alarm system that indicates high oil level and high-high oil level (audible and visual) of oil storage in the oil/water separator and an audible and visual leak detection alarm system that indicates hydrocarbon and/or water in the interstice. Provide control components in accordance with Section 16491 – Control Components and Devices of the Electrical Contract. All alarm conditions shall be relayed to the transfer station SCADA system.
- B. Level Sensors: Provide liquid level controls consisting of UL listed, intrinsically safe sensor floats. Provide floats of corrosion-resistant material. Position float switches to activate warning alarms in the control panel as follows:
  - 1. High Level Oil - when oil/water interface reaches a point indicating that oil occupies 20% of OWS volume (or other volume as recommended by the OWS manufacturer)
  - 2. High-High Level Oil - when oil/water interface reaches a point indicating that oil occupies 43% of OWS volume (or other volume as recommended by the OWS manufacturer)
- C. Leak Monitoring System: Provide a leak detection probe to activate warning alarms in the Control Panel if hydrocarbons and/or water is detected in the interstice between the primary and secondary tank walls.
- D. Control Panel: Provide prewired, three (3) channel alarm/control panel in accordance with Section 17320 - SCADA System Control Panels and Enclosures. The control panel must interface with the transfer station SCADA system in accordance with Section 17101 – SCADA System General Requirements. Power to the control panel is to be 120 volt, single phase. Control Panel includes the following:
  - 1. UL approved, side-hinged NEMA 4X, gasketed, watertight, locking enclosure to be mounted on the exterior wall of the Transfer Station building.
  - 2. Alarm lights for each circuit:
    - a. High Level Oil
    - b. High-High Level Oil
    - c. Leak

3. Audible alarm for the following circuits:
  - a. High-High Level Oil
  - b. Leak
4. Alarm silencer
5. Auxiliary contacts for interface with building SCADA system to relay all alarm conditions as a single grouped "Trouble" alarm signal. Contacts shall be SPDT, rated at 5 A at 120 VAC. Include the following alarm conditions:
  - a. High oil level
  - b. High-high oil level
  - c. Leak detected

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: The Contractor shall have New York State approval for installation of underground petroleum bulk storage tanks, and shall install OWS in accordance with manufacturer's recommendations. Where a conflict exists between manufacturer's instructions and those listed herein, manufacturer's installation instructions shall take precedence, although the Contractor must notify the Commissioner of conflict and action(s) taken. The Contractor shall also comply with NYCDEP guidelines and the New York City Building Code
- B. Testing: Prior to installation, visually inspect and test the OWS at job site to confirm tank integrity. This is in addition to testing performed by manufacturer, and is to confirm that OWS was not damaged during transit. Perform an air pressure test in the presence of the Commissioner at an internal pneumatic pressure of 5 psig. Paint all joints, seams, and connections with a soap solution, and hold the test pressure without a leak for at least one hour. In the event of test failure, the Contractor is prohibited from performing any repairs. The OWS manufacturer must be contacted to provide repairs.
- C. Anchor Pad and Hold Down System: Install reinforced concrete anchor pad with embedded anchor bolts as shown on the Contract Drawings and in accordance with Section 03300 – Cast-in-Place Concrete. Provide a tank hold down system as specified and in accordance with manufacturer's recommendations.
- D. Excavation and Backfill: Perform excavation and backfill in accordance with Sections 02316 and 02317. Provide a minimum of 12" inches of pipe bedding material (conforming to the pipe bedding requirements in Section 02317 – Backfilling) between the underlying concrete pad and the OWS. Backfill the remainder of the excavation with select fill conforming to the requirements or Section 02317 – Backfilling.

- E. Piping and Accessories: install all piping connections and accessories, as specified or shown on Contract Drawings, in accordance with respective manufacturer's recommendations.
  - 1. Provide vents to atmosphere for the inlet, manways, and outlet. The manway vents can be manifolded together to one common vent line. Inlet and outlet vents must have separate, dedicated vent lines.
  - 2. Prior to installation of piping, inspect all openings to assure that the dielectric nylon bushings are in place. Where flanged openings have been used (i.e., for the OWS inlet and outlet), confirm the dielectric isolation with a continuity tester. Make any necessary repairs to assure that current does not pass across the dielectric flanges.
- F. Top Slab and Access Covers: Install reinforced concrete top slab as shown on the Contract Drawings and in accordance with Section 03300 – Cast in Place Concrete. Provide heavy duty, H-20 rated, metal access covers for the tank manways as shown on the Contract Drawings and in accordance with Section 05561 – Miscellaneous Metal Castings.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 11377**  
**COMPRESSED AIR EQUIPMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Description of Work: Furnish and install a compressed air system with all Piping, accessories and appurtenances necessary for a complete installation. Locate the equipment in the Secure Storage Room of the Maintenance Bay and include one (1) air compressor unit, one (1) refrigerated air dryer, three (3) air tool stations, and three (3) hose reels each with air hose and filter, regulator, lubricator assembly wall mounted in the maintenance bay, as shown. This compressed air system shall also supply air to the Fluid Dispensing System as shown.

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
1. ASME Boiler and Pressure Vessel Code, Sec. VIII, Div 1 - Pressure Vessels
  2. ANSI B93.45 (NFPA T3.27.3) - Pneumatic Fluid Power - Compressed Air Dryers - Methods for Rating and Test
  3. AFBMA9-Load Ratings and Fatigue Life for Roller Bearings
  4. AFBMA11-Load Ratings and Fatigue Life for Ball Bearings

## 1.04 SYSTEM DESCRIPTION

- A. Compressor Unit: Supply a splash lube-tank mounted reciprocating air compressor under the following conditions with the specified characteristics:

1. Inlet air conditions
  - a. Temperature range, degrees F 50 to 100
  - b. Relative humidity, percent 1 to 100
  - c. Pressure, psia 14.7
2. Stages Two
3. Mounting Horizontal
4. Rated discharge pressure, psig 175
5. Relief valve setting psig 200
6. Minimum capacity at rated discharge pressure, scfm 72.0
7. Maximum motor speed, rpm 1800
8. Maximum compressor speed, rpm 670
9. Motor horsepower, minimum 20
10. Motor enclosure TEFC
11. Power Supply 460V/3 pH/60 Hz

- B. Receiver

1. Minimum capacity, gallons 120
2. Diameter, feet 2
3. Position Horizontal
4. Working pressure, psig 190

- C. Refrigerated Air Dryer: Rate air dryer in accordance with the standard rating conditions of the National Fluid Power Association for Class H Dryers, i.e. 33 to 39 degrees F pressure dew point range at 100 psig and 100 degrees F inlet air, and 100 degrees F ambient air with a maximum pressure drop of 5 psi. Under this rating, provide the dryer with a capacity not less than 75 scfm.

## 1.05 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Contractor's Drawings: Submit working drawings, including arrangement and erection drawings of the compressed air equipment and control equipment; installation templates; schematic control diagrams, electrical connection diagrams, and complete description of the control system. Information submitted shall be in accordance with Section 01330 - Shop drawings.

- C. Quality Control Submittals: Submit the following:
  - 1. Manufacturer's certified performance and material records as specified.
  - 2. Manufacturer's certified copies of Field Test Reports.
- D. Operation and Maintenance Manuals: Submit Operation and Maintenance (O&M) instructions for the compressed air equipment. Operation and Maintenance (O&M) instructions shall be in accordance with Section 01831 - Operation and Maintenance Manuals.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle compressed air equipment as specified in Division 1 and as follows:
  - 1. Protect all electrical equipment from the weather during transit and storage by suitable means, including shrink wrapping or hand wrapping and taping.

#### 1.07 SPARE PARTS

- A. The equipment manufacturer shall submit for approval a spare parts list in accordance with the requirements set forth in Section 01750 - Spare Parts and Maintenance Materials.
- B. The following minimum spare parts for the compressed air equipment shall be provided and be packaged separately for each of the two Stations:
  - 1. One set of V-belts for the compressor
  - 2. One set of replacement filters for the compressor
  - 3. One set of intake and discharge valves for the compressor
  - 4. One air hose valve assembly
  - 5. One filter regulator and lubricator

### PART 2 PRODUCTS

#### 2.01 MANUFACTURER

- A. The equipment covered by these Specifications shall be standard equipment of proven performance as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed in accordance with the best practices of the trade and as shown on the Contract Drawings.
- B. The compressor, dryer and ancillary equipment shall be provided by the Contractor through a single vendor. The Contractor, through the vendor, shall have the responsibility of matching all components and providing equipment which function together as a system.

C. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Compressor Units

- a. Ingersoll-Rand Company, Model No. 2000E20 FP
- b. Gardner Denver Company
- c. Quincy Compressor
- d. Or approved equal

2. Refrigerated Air Dryer

- a. Ingersoll-Rand Company, Model No. DS75
- b. Hankinson
- c. Arrow
- d. Or approved equal

3. Flexible Connectors for Compressor

- a. Anaconda
- b. Metraflex
- c. Gardner Denver Company
- d. Quincy Compressor
- e. Or approved equal

4. Filter/Regulator/Lubricator – Combination Unit

- a. Ingersoll-Rand Company, Model No. 38328951
- b. Gardner Denver Company
- c. Quincy Compressor
- d. Chicago Pneumatic
- e. Parker-Hannifin Corporation
- f. Or approved equal

5. Hose Reel Assembly

- a. Reelcraft, Columbia City, IN, Model No. 7800-OLS
- b. Hannay Reels
- c. Or approved equal

6. Automatic Drain Valve

- a. Ingersoll-Rand Company, Model No. EDV 2000
- b. ASCO Valves
- c. Magnatrol Valve
- d. Or approved equal

## 2.02 AIR COMPRESSOR UNIT

- A. General: Assemble air compressor unit to include a compressor, electric motor with starter, V-belt drive with belt take-up and suitable belt guard, air receiver tank, inlet air filter and silencer, adjustable pressure switch for stop-start control, safety relief valve, check valve, pressure gauge, vibration isolators, flexible pipe connection, and aftercooler.
- B. Design: Provide air compressor of the oil-lubricated, reciprocating, air cooled, horizontal, two-stage, tank mounted type, equipped with an automatic pressure regulator, automatic pressure unloader providing no load starting, and oil level or oil pressure protection. Provide two stages with an intercooler and interstage safety valve.
- C. Tank Mounted: Mount compressor with its motor on a common structural steel base plate which is mounted on a minimum 120-gallon air receiver tank.
- D. Relief Valve: Install an ASME safety relief valve as an integral part of the compressor or between the compressor and discharge check valve.
- E. Inlet Filter and Silencer: Provide compressor inlet with an air filter and silencer of the dry filter, radially pleated type enclosed in a steel housing, adequately sized for the capacity of the compressor.
- F. Vibration Isolators: Set air compressor on a minimum of four vibration isolators attached to the base plate. Provide each isolator with steel springs, steel top and bottom plates, leveling bolts and resilient chocks. Design the isolators to control oscillation and to withstand all lateral forces.
- G. Pipe and Connections: Provide pipe connection from the air compressor to three air tool stations, and fluid dispensing pumps (See Section 15195 – Fluid Dispensing System), and as indicated on the Contract Drawings. Each air tool station shall include a combination filter/regulator/lubricator unit and hose reel with hose and outlet. Compressed air piping shall be stainless steel meeting the requirements of Section 15052 - Steel and Stainless Steel Pipe, Section 15076G - Piping and Equipment Identification, and Section 15060 - Hangers and Supports.
- H. Low Oil Level Switch: Switch shall be provided to prevent the compressor from operating when oil level is low.
- I. High Dust Air Filter: A heavy duty, 10-micron, high dust inlet filter with built-in centrifugal pre-cleaner and automatic dust ejector valve shall be provided.
- J. E-Series Starter (Mounted and Wired): E-Series starter (mounted and wired) shall be provided for full voltage control of the electric motor. Thermal relays shall be provided to protect the motor windings from currents and resultant temperature rise

caused by overloaded motor, low line voltage or stalled rotor. Reset button mounted and wired to the NEMA 4X Stainless Steel enclosure shall be included.

- K. Automatic Drain Valve: Provide automatic drain valve that effectively removes condensate from the air compressor. The drain valve shall be 120-volt electric condensate drain valves (receiver mounted/with 6-foot power cord). The drain valve shall be incorporated with a solenoid valve and an electric timer, and be 1" NPT. The timer shall contain the following settings: 0.5 - 10 second purge duration, and 0 - 45 minute drain cycle, and "Push To Test" button. The drain valve shall include a manual by pass and a strain/ball valve assembly. The drain valve shall be made of Type 304 stainless steel. Pipe and pipe connections shall be provided under this contract as indicated on the Contract Drawings. Valves shall be in accordance with Section 15112 - Valves Smaller Than Four (4) Inches.

## 2.03 AFTERCOOLER

- A. General: Equip the air compressor unit with an OSHA Compliant beltguard, aftercooler integrally mounted with the compressor and belt drive.
- B. Beltguard Type: Provide beltguard aftercooler with a capacity and pressure rating adequate for the compressor. Design aftercooler for an approach temperature not to exceed 25 degrees F (temperature difference between air leaving the aftercooler and ambient air). Provide a mechanical moisture separator and automatic float type condensate drain on the aftercooler discharge. Size the separator inlet and the aftercooler outlet to be identical.

## 2.04 RECEIVER

- A. General: Construct air receiver tank of welded steel meeting the requirements of the ASME Boiler and Pressure Vessel Code, Section VIII, for unfired pressure vessels and bearing an ASME stamp. Provide the tank with dished ends and with feet or a base for mounting in a horizontal position.
- B. Appurtenances: Equip air receiver with a pressure gauge, plugged inspection openings, an automatic drain valve, an ASME pressure relief valve, and all necessary pipe connections.
  - 1. Fit air receiver with an automatic moisture eliminator to remove condensate at each starting of the compressor.

## 2.05 REFRIGERATED AIR DRYER

- A. General: Equip refrigerated air dryer with a condensing unit, refrigerant evaporator, mechanical separator automatic condensate discharge valve, high discharge air temperature alarm light and switch for actuating a remote alarm, prefilter and afterfilter.

- B. Filter: Equip dryer with filters to remove oil carryover, oil aerosols and other foreign matter. Install a prefilter near the dryer inlet and install an afterfilter near the dryer discharge. Design the prefilter for mechanical removal of solid and liquid particles, and equip prefilter with a porous bronze filter element with a 5 micron rating. Provide an afterfilter of the coalescing type with a 0.5 micron rating.
- C. Power: Design dryer for a 115-volt, single-phase, 60-hertz power supply. Provide air dryer as a wall-mounted unit.
- D. Automatic Drain Valve: Provide automatic drain valve that effectively removes condensate from the air compressor. The drain valve shall be 120-volt electric condensate drain valves (receiver mounted/with 6-foot power cord). The drain valve shall be incorporated with a solenoid valve and an electric timer, and be 3/8" NPT. The timer shall contain the following settings: 0.5 - 10 second purge duration, and 0 - 45 minute drain cycle, and "Push To Test" button. The drain valve shall include a manual by pass and a strain/ball valve assembly. The drain valve shall be made of 304 stainless steel. Pipe and pipe connections shall be provided under this contract as indicated on the Contract Drawings and in accordance with Section 15052 - Steel and Stainless Steel Pipe.

## 2.06 PRESSURE RELIEF VALVE

- A. General: Provide threaded pressure relief valve of the spring-loaded, bronze, pop-safety type designed for compressed air service. Design the valve to "pop" open at the specified set pressure of 200 psig and be capable of relieving the specified air flow capacity of the compressor at 220 psig. Mount the pressure relief valve on the air receiver. Furnish valve meeting the requirements of the ASME Code for unfired pressure vessels and bearing the Code stamp.

## 2.07 GAUGES

- A. Provide pressure gauges of the Bourdon tube type with minimum 6-inch diameter dials, plainly marked. Connect each gauge with red brass pipe, fittings and isolating stopcocks. Equip each gauge with a snubber and threaded protective diaphragm seal. Furnish gauges with a range of 0 to 300 psig.

## 2.08 BEARINGS

- A. General: Manufacture the compressor with bearings of the antifriction ball or roller type of ample size to carry the loads imposed under continuous service without overheating.
- B. Radial and Thrust: Equip compressor with radial and thrust bearings. One of the bearings in each case may be combined with the thrust bearing.

- C. Life: Design all bearings to be accessible and located for convenient repair or replacement with an average B-10 operating life of not less than 100,000 hours according to AFBMA 9 and AFBMA 11.

## 2.09 LUBRICATION

- A. General: Provide oil lubricated compressor bearings.
- B. Reservoir: Use a reservoir system or other approved method. Provide all bearings with oil reservoirs to insure a constant supply of clean oil and with suitable gauges to give visual indication that an adequate supply of lubricant is available and is being supplied to the bearings.
- C. Drip and Drain: Make provisions to prevent throwing or dripping of lubricant from the bearings and properly drain all oil sumps and pockets.
- D. Oil Supply: Supply such oil of the kind and quality specified by the compressor manufacturer as is necessary to place the compressor unit in regular operation for a period of one year.

## 2.10 PRESSURE REDUCING STATIONS

- A. General: Provide each tool station with a pressure reducing station consisting of a line filter, pressure regulating valve, bypass, pressure gauge and pressure relief valve. Arrange the pressure reducing station to reduce the supply air pressure to a minimum downstream pressure of zero (0) PSI.
- B. Pressure Regulating Valves: Provide direct acting, spring loaded, diaphragm operated, single seated pressure regulating valves designed for compressed air service. Design the valves to maintain the selected downstream pressures with inlet pressures up to 175 psig. Provide downstream pressure settings to be field adjustable.
- C. Other Requirements: Provide pressure gauges as specified in Subsection 2.07. Provide pressure relief valves as specified in Subsection 2.06. Equip line filters with a porous bronze filter element with a 5-micron rating and a manual drain valve.

## 2.11 AIR TOOL STATIONS

- A. General: Construct each air tool station to include a filter and moisture separator, pressure regulator, lubricator, and an air hose assembly. Equip the filter and moisture separator with a manual drain valve designed for a maximum pressure of 300 psi. Equip the pressure regulator with a pressure gauge and provide a pressure regulator of the self-relieving type designed for a maximum pressure of 400 psi. Design the lubricator for a maximum pressure of 300 psi.

- B. Air Hose Valve Assembly: Provide air hose valve assemblies consisting of a 1/2-inch globe valve designed to operate satisfactorily at a pressure of 175 psig, adapted to a 1/2-inch safety quick-detachable steel hose coupling to prevent airflow until the coupling is fully engaged and locked, and a steel threaded 1/2-inch quick-detachable male hose coupling attached to the safety coupling.
1. Furnish three 50-foot lengths of 1/2-inch air hose with quick pressure couplings at each end. In addition, furnish three air guns with nozzles and self-closing valves.
  2. Furnish three stainless steel hose reels capable of holding 50-foot length of 1/2-inch air hose.

## 2.12 ACCESSORIES

- A. Control Panel: Provide a local control panel from the compressor manufacturer located near the compressor. Manufacture the control panel to include, but not be limited to, the following equipment:
1. ON-OFF/LOCKOUT switch for the compressor
  2. Low oil level or pressure indicating light for the compressor
  3. Low system pressure indicating light
  4. Discharge pressure gauge
  5. Aftercooler discharge temperature gauge
- B. Safety Requirements for Control Panel: Provide all accessories and appurtenances required for the safe, proper operation of the air compressor equipment as described herein whether or not such components have been specifically shown or specified. Provide compressor controls, control panel and wiring meeting applicable requirements of Section 16445 - Motor Control Centers and Section 16055 - Electrical Requirements for Shop-Assembled Equipment, of the Electrical Contract.
- C. Motor: Design air compressor drive motor for operation at 460 volts, 3 phase, 60 hertz. Motors shall be in accordance with Section 16220 - Electric Motors of the Electrical Contract.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Install compressed air equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Section 01732 - Installation of Equipment.

### 3.02 FIELD TESTS

- A. Provide Field-Testing in accordance with Section 01811 - Preliminary and Final Field Tests.
- B. Testing: After the installation of the air compressor and all appurtenances, subject the compressor to a field running test under actual operating conditions. Perform field test as directed and in the presence of the Commissioner. Compressed air equipment shall be in accordance with Section 01431 - Quality Assurance Inspection. Perform the field test to demonstrate that under all conditions of operation the unit:
  - 1. Has not been damaged by transportation or installation
  - 2. Has been properly installed
  - 3. Has no mechanical defects
  - 4. Has been properly connected
  - 5. Is in proper alignment
  - 6. Is free of overheating of any parts
  - 7. Is free of all objectionable vibration
  - 8. Is free of excessive noise
  - 9. Is free of overloading of any parts
  - 10. Operates as specified with the control system
- C. Defects: Promptly correct any defects in the equipment or failure to meet the requirements of the Specifications.

### 3.03 MANUFACTURERS' FIELD SERVICES

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the compressed air equipment manufacturer to inspect the installation of the compressed air equipment, place it in operation, make any necessary adjustments, and instruct the operating personnel in its operation and maintenance.
- B. Six hours of training shall be provided in accordance with Section 01821 - Training.

### 3.04 CLEANING AND PAINTING

- A. Paint the compressed air equipment as specified in Section 09912 - Interior Painting.

-END OF SECTION-

**Section 11451**  
**DOMESTIC TYPE EQUIPMENT**

**PART 1 GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

**1.02 SUMMARY**

- A. This Section includes the following:
  - 1. Microwave ovens
  - 2. Refrigerator/freezers
- B. Related Sections include the following:
  - 1. Division 06 Section "Architectural Woodwork / Casework"

**1.03 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include operating characteristics, dimensions of individual appliances, and finishes for each appliance.
- B. Warranties: Special warranties specified in this Section.

**1.04 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 30 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.
- B. Source Limitations: Obtain residential appliances through one source from a single manufacturer.
- C. Product Options: Information on Drawings and in Specifications establishes requirements for product's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.

- D. Regulatory Requirements: Comply with provisions of the following product certifications:
  - 1. UL and NEMA: Provide electrical components required as part of residential appliances that are listed and labeled by UL and that comply with applicable NEMA standards.
  - 2. NAECA: Provide residential appliances that comply with NAECA standards.
- E. AHAM Standards: Provide appliances that comply with the following AHAM standards:
  - 1. Household Refrigerators: AHAM HRF-1
- F. Energy Ratings: Provide residential appliances that carry labels indicating energy-cost analysis (estimated annual operating costs) and efficiency information as required by the FTC Appliance Labeling Rule.
  - 1. Provide appliances that qualify for the EPA/DOE ENERGY STAR product labeling program.

#### 1.05 WARRANTY

- A. Special Warranties: Manufacturer's standard form in which manufacturer of each appliance specified agrees to repair or replace residential appliances or components that fail in materials or workmanship within specified warranty period.
  - 1. Microwave Oven: Five-year limited warranty for defects in the magnetron tube.
  - 2. Refrigerator/Freezer: Five-year limited warranty for the sealed refrigeration system.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Basis-of-Design Product: The design for each appliance is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified.

**B. Microwave Oven**

1. Basis-of-Design Product: Frigidaire PLMB209D C – 2.0 Cu. Ft. Countertop Microwave Oven or a comparable product by one of the following:
  - a. Amana Appliances
  - b. Maytag
  - c. General Electric
2. Oven: Standard features include the following:
  - a. Oven Capacity: 2.0 cu. ft.
  - b. Oven Features: Digital control panel with timer display, turntable and stainless steel finish.
  - c. Mounting: Countertop.
  - d. Electrical Power: 1200 W.
  - e. Oven Door: stainless steel finish with observation window.

**2.02 REFRIGERATION APPLIANCES****A. Refrigerator:**

1. Basis-of-Design: Product: PLRU1778ES0 -16.7 cu.ft. Stainless Steel All Refrigerator or a comparable product by one of the following:
  - a. Amana Appliances
  - b. Maytag
  - c. General Electric
2. Type: Freestanding, one-door, frost-free, refrigerator only.
3. Storage Capacity
  - a. 16.7 cu ft
4. Refrigerator Features
  - a. 1 Fixed Glass Shelf
  - b. 3 Cantilever Glass Shelves
  - c. 1 Fixed White Gallon Door Bin
  - d. 2 Clear Crispers
  - e. 4 Clear Adjustable Door Bins
  - f. Clear Dairy Door
  - g. Clear Dairy Drawer

- h. Interior light.
- i. Stainless steel finish

5. Front Panel: Stainless-steel door front and lower access panel.

6. Appliance Color: Stainless steel

## 2.03 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Stainless-Steel Finish: Provide appliances with manufacturer's standard finish complying with manufacturer's written instructions for surface preparation including ground and polished stainless-steel surfaces for uniform, directionally textured finish.

## PART 3 EXECUTION

### 3.1 EXAMINATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION, GENERAL

- A. General: Comply with manufacturer's written instructions.
- B. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.

### 3.03 CLEANING AND PROTECTION

- A. Test each item of residential appliances to verify proper operation. Make necessary adjustments.
- B. Verify that accessories required have been furnished and installed.
- C. Remove packing material from residential appliances and leave units in clean condition, ready for operation.

3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain appliances.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 11501  
SAFETY EQUIPMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall furnish, install and store the safety equipment required and in the quantities specified in accordance with the requirements specified herein.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 01732 - Installation of Equipment
- C. Section 01831 - Operation and Maintenance Manuals
- D. Section 15076 - Piping and Equipment Identification

**1.03 REFERENCES**

- A. ANSI Z87.1 - Practice for Occupational and Educational Eye and Face Protection
- B. ANSI S12.6 - Method for the Measurement of the Real-Ear Attenuation of Hearing Protectors
- C. ANSI-ISEA 107 - High-Visibility Safety Apparel

**1.04 SUBMITTALS**

- A. Provide all submittals, including the following, as specified in Division 1.
- B. The Contractor shall submit shop drawings, catalog cuts, and data sheets for approval by the Commissioner in accordance with Section 01330 - Shop Drawings.
- C. The Contractor shall submit operation and maintenance manuals for approval by the Commissioner in accordance with Section 01831 - Operation and Maintenance Manuals.

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. Delivery of Materials and Equipment: Equipment shall not be delivered to the project site until the time set forth in the approved construction schedule for delivery and installation. Equipment furnish with no requirement for permanent installation shall be delivered near the end of the construction period

**B. Storage of Materials and Equipment**

1. Materials and equipment shall be delivered in original, undamaged packaging with manufacturer's labels and seals intact.
2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow. Materials shall be protected from extreme heat and direct sunlight.
3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the job-site before being incorporated into the work.

**PART 2 PRODUCTS****2.01 FIRST AID KITS**

- A. First aid kit shall be of the industrial type and shall consist of a balanced assortment of first aid supplies adequate to administer first aid for a minimum of twenty-five (25) people. Each kit shall contain adhesive bandages, gauze pads and tape, elastic bandages, first aid cream, burn cream, cold pack, eye solution, pain reliever, scissors, tweezers, disposable gloves and First Aid Guide. Quantity of kits shall be as listed in the Summary Schedule.
- B. First aid supplies shall be furnished in a sturdy, weatherproof, dustproof and rust resistant case with a carrying handle and wall brackets.
- C. Products
  1. North, Model 019703
  2. Northern Safety Co. Inc., Item # 253-6443
  3. or approved equal
- D. Location: First aid kits shall be wall mounted where shown on the Contract Drawings.

**2.02 STRETCHER AND CASE**

- A. Stretcher shall have a minimum capacity of 350 pounds and be of the folding pole type, with aluminum poles and vinyl-coated nylon fabric.
- B. Stretcher shall be provided in a steel, wall-mountable storage case.

## C. Products

## 1. Stretcher

- a. Junkin, Model # JSA-655-NA
- b. FERNO, Lab Safety Supply Item # 4CF-11366
- c. Or approved equal

## 2. Stretcher Case

- a. Junkin, Model #JSA-600
- b. FERNO, Lab Safety Supply
- c. Or approved equal

- D. Location: The stretcher shall be enclosed in a stretcher case and shall be wall mounted near the west access to the pier, as shown on the Contract Drawings.

## 2.03 EMERGENCY BLANKETS

- A. Emergency blanket shall have a surface of a minimum of 70 percent wool. Blanket shall be furnished in a wall-mountable case. Quantity of blankets shall be as listed in the Summary Schedule.

- B. Size: Approximate size of blanket shall be 62 inches by 82 inches.

## C. Products

1. Lab Safety Supply, Item # 16901
2. Steiner, Model BTPCO
3. Or approved equal

- D. Location: Emergency blankets shall be wall mounted near the access to the pier, as shown on the Contract Drawings.

## 2.04 RESPIRATORS

- A. Full-face respirator shall consist of a soft silicone face piece with a wraparound polycarbonate lens with a 200-degree field of vision. Impact resistant lens shall meet requirements of ANSI Z87.1. Respirator shall be provided with a multi-strap head harness, nose cup and speaking diaphragm. Package of filter/cartridge suitable for organic vapors and package for dusts, fumes and mists shall be provided with the respirator. Spare cartridges, filters, accessories, and cleaning supplies shall be provided.

- B. Size and quantity of respirators shall be as listed in the Summary Schedule.

## C. Products

1. North, Model 7600-8A (medium/large) / 7600-8AS (small)
2. 3M, Model 7800S
3. Or approved equal

- D. Location: Respirators shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

## 2.05 DISPOSABLE PARTICULATE RESPIRATORS

- A. Disposable particulate respirator shall consist of a lightweight moisture resistant filter media with an adjustable nosepiece and cushioned seal conforming to facial contours. Quantity of respirators shall be as listed in the Summary Schedule.

## B. Products

1. WILSON SAF-T-FIT, Model No. N9510M
2. North Particulate, Model No. 7130N95
3. Or approved equal

- C. Location: Disposable particulate respirators shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

## 2.06 RING PRESERVERS

- A. Ring preserver shall be 30 inches in diameter with a polyethylene shell (polyurethane float) resistant to chemicals and ultra-violet deterioration. Ring preserver shall be provided with braided polypropylene grab line and 30 feet of heaving line. Quantity of preservers shall be as listed in the Summary Schedule.

- B. A rack shall be provided for hanging each ring preserver, and brackets shall be provided to hold the heaving line.

## C. Products

1. West Marine- Model # 257873
2. Taylor, Model 571
3. Or approved equal

- D. Location: Ring preservers shall be evenly dispersed around the outside of the transfer station at the pier level, as shown on the Contract Drawings.

**2.07 RING PRESERVER RACKS**

- A. Roughneck ring preserver rack shall be heavy-duty, welded stainless steel rack that cradles the ring preserver at three points. Holes shall be pre-drilled for bulkhead mounting. U-bolts shall be provided for rail mounting. One rack shall be provided for each ring preserver.
- B. Ring Preserver Racks shall be 30 inches.
- C. Products
  - 1. West Marine, Model # 491632
  - 2. Jim-Buoy, Model # Jim-Lrr-1123-30
  - 3. Or approved equal

**2.08 OVER BOOTS**

- A. Over boots shall be one piece, molded polyvinyl and shall be waterproof and suitable for contamination protection. Boots shall fit over work shoes, be 10 inches high, and have a stepped snap closure to adjust fit and anti-skid tread for traction. Size and quantity of over boots shall be as listed in the Summary Schedule.
- B. Products
  - 1. Tingley, Lab Safety Supply No. 4CF-13135
  - 2. Talon Trax, Model No. 3XE87
  - 3. Or approved equal
- C. Location: Over boots shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

**2.09 HEARING PROTECTION EARMUFFS**

- A. Earmuffs for hearing protection shall comply with the requirements of ANSI S12.6 for high noise environments; padded stainless steel headband shall allow for convenient, comfortable alignment on head, with earmuffs providing an NRR:29dB. Earmuffs shall be provided with a hygiene kit for cleaning after use. Quantity of earmuffs shall be as listed in the Summary Schedule.
- B. Products
  - 1. Howard Leight- Thunder 29, Model QM29
  - 2. Bilsom- Viking 29, Model 2318-02
  - 3. Or approved equal
- C. Location: Hearing protection earmuffs shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

**2.10 NITRILE GLOVES**

- A. Nitrile gloves shall be flock-lined with pebble pattern on palms and fingers. Gloves shall be approximately 13 inches in length and have a flared gauntlet to fit over sleeves. Quantity and size of gloves shall be as listed in the Summary Schedule.
- B. Products
  - 1. Ansell, Model 117275
  - 2. Best, Model 730
  - 3. Or approved equal
- C. Location: Nitrile gloves shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

**2.11 PERSONAL FLOTATION DEVICES**

- A. Personal flotation devices shall be a Type III PFD approved by the United States Coast Guard. The PFD shall be a vest in a comfortable style that is designed for continuous wear. The vest shall be flexible and waterproof and shall include, S.O.L.A.S. approved reflective tape for visibility, side adjustment straps, and D-rings for lanyard attachment. Size and quantity of PFDs shall be as listed in the Summary Schedule.
- B. Products
  - 1. Mustang, Model MV3128T2
  - 2. West Marine, Model 196750
  - 3. Or approved equal
- C. Location: PFDs shall be located in two (2) personal flotation device storage cabinets as described below.

**2.12 PERSONAL FLOTATION DEVICE STORAGE CABINETS**

- A. Cabinets shall be manufactured with high quality materials and designed to shield personal flotation devices from UV rays, chemicals, moisture, dust, salt air, insects, and temperature extremes.
- B. Cabinets shall be wall or floor mounted.
- C. Products
  - 1. Thomas Products, Model: LJC-72
  - 2. JoBird
  - 3. Or approved equal

- D. Location: A total of two (2) cabinets shall be provided. Each cabinet shall hold 12 personal flotation devices. One cabinet shall be located near the west access to the pier and the other cabinet shall be located near the east access to the pier, as shown on the Contract Drawings.

#### 2.13 REFLECTIVE VESTS

- A. Reflective vest shall meet ANSI-ISEA 107 Class 1 standard for safety garments. The vest shall have a front zipper and a minimum of two pockets. Quantity of vests shall be as listed in the Summary Schedule.
- B. Size: Reflective vests shall be standard size.
- C. Products
  - 1. Services and Materials Company, Model 2080626
  - 2. Glo-Lite, Model HVWB3/2BZ
  - 3. Or approved equal
- D. Location: Reflective vests shall be located in the Safety Equipment Cabinets as described herein. See Contract Drawings for location of cabinets.

#### 2.14 CONVEX MIRRORS

- A. Convex mirror shall provide 160° of viewing and shall be made of a break-resistant material.
- B. Size: The mirror shall be 26 inches in diameter and shall be suitable for both indoor and outdoor use.
- C. Products
  - 1. L.K. Goodwin Co., Model PLXR-26
  - 2. Lab Safety Supply, Item # 4CF-14118
  - 3. Or approved equal
- D. Location: Convex mirrors shall be located at the where shown on the Contract Drawings. Convex mirrors shall be installed at a standard height.

#### 2.15 SAFETY EQUIPMENT CABINETS

- A. Safety equipment cabinets shall be heavy duty, heavy load storage cabinets. Cabinets are furnished with stainless steel doors. Doors shall operate on three semi-concealed stainless steel hinges. Cabinets shall be 'key' locked.
- B. Size: Cabinets shall be 60 inches high by 47 inches wide by 18 inches deep, shall be weathered iron in color, and have 3 stainless steel shelves.

## C. Products

1. Medical Resource USA, Model No. ES47.
2. Lab-Gear
3. Or approved equal

## D. Location: See Contract Drawings for location of each cabinet.

## E. Cabinets A and B shall each contain:

1. 8 Respirators
2. 4 Boxes of disposable particulate respirators
3. 4 Pairs of over boots
4. 8 Pairs of hearing protection earmuffs
5. 24 Pairs of nitrile gloves
6. 8 Reflective vests

## F. Cabinets C and D shall each contain:

1. 10 Pairs of over boots
2. 4 Pairs of hearing protection earmuffs
3. 24 Pairs of nitrile gloves
4. 8 Reflective vests

## 2.16 SUMMARY SCHEDULE

- A. This schedule summarizes the quantities of each type of safety equipment described in the preceding subsections and is presented here for convenience. Provide the specified safety equipment in the following quantities.

1. First Aid Kits	-	10
2. Stretcher	-	1
3. Stretcher Case	-	1
4. Emergency Blankets	-	2
5. Respirators	-	16(12 med/large, 4 small)
6. Disposable Particulate Respirators	-	8 boxes of 20
7. Ring Preservers	-	12
8. Ring Preserver Racks	-	12
9. Overboots	-	28 pairs
		(2 small, 4 medium, 6 large, 8 XL, 8 XXL)
10. Hearing Protection Earmuffs	-	24 pairs
11. Nitrile Gloves	-	96 pairs
		(12 medium, 36 large, 36 XL, 12 XXL)
12. Personal Flotation Devices	-	24
		(2 small, 4 medium, 8 large, 10 XL)
13. Personal Flotation Device Storage Cabinets	-	2
14. Reflective Vests	-	32

- |                               |   |   |
|-------------------------------|---|---|
| 15. Convex Mirrors            | - | 2 |
| 16. Safety Equipment Cabinets | - | 4 |

2.17 EQUIPMENT IDENTIFICATION

- A. Furnish and install equipment nameplates for the equipment in conformance with Section 15076 – Piping and Equipment Identification.

PART 3 EXECUTION

3.01 INSTALLATION AND STORAGE

- A. Equipment cabinets, racks and brackets to be furnished and installed shall be positioned plumb and true, securely anchored in place with proper clips, brackets and bolts for the type of installation required, and as specified in Section 01732 – Installation of Equipment.
- B. Equipment to be furnished and stored shall be stored in accordance with the manufacturer's directions.
- C. Installation and storage of equipment will be at locations shown on the Contract Drawing or as directed by the Commissioner.

3.02 PROTECTION

- A. Safety equipment shall be protected from all damage and abuse until Final Acceptance by the City of New York.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 11510**  
**MAINTENANCE BAY, SHOP AND STORAGE EQUIPMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This specification describes the specific requirements for furnishing and installing maintenance bay, machine shop and storage equipment with all accessories necessary for a complete installation as well as metal storage shelving for storage rooms and machine shop room. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install the maintenance bay equipment.

**1.02 RELATED SECTIONS**

- |    |               |   |                                       |
|----|---------------|---|---------------------------------------|
| A. | Section 01330 | - | Shop Drawings                         |
| B. | Section 01431 | - | Quality Assurance Inspection          |
| C. | Section 01732 | - | Installation of Equipment             |

| E. | Section 01811 | - | Preliminary and Final Field Tests     |
| F. | Section 01821 | - | Training                              |
| G. | Section 01831 | - | Operation and Maintenance Manuals     |
| H. | Section 09912 | - | Interior Painting                     |

**1.03 SUBMITTALS**

- A. The Contractor shall submit the following in accordance with General Conditions; and as per Detailed Specification Section 01330 - Shop Drawings.
1. Working Drawings: Working drawings shall be submitted, including complete layout and configuration of the shop equipment and all other components and accessories. The drawings shall include all necessary restrictive and non-restrictive working usage notes and general safety notes.
  2. List of spare parts
  3. Operation and maintenance manuals: Submit Operation and Maintenance (O & M) instructions for the Maintenance Bay Shop and Storage Equipment in accordance with Section 01831 – Operation and Maintenance Manuals.

**1.04 QUALITY ASSURANCE**

- A. Quality assurance shall be in accordance with Section 01431 – Quality Assurance Inspection.

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. Delivery of Materials and Equipment: Equipment shall not be delivered to the project site until the time set forth in the approved construction schedule for delivery and installation. Equipment furnished with no requirement for permanent installation shall be delivered near the end of the construction period.
- B. Storage of Materials and Equipment
  - 1. Materials and equipment shall be delivered in original, undamaged packaging with manufacturer's labels and seals intact.
  - 2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow. Materials shall be protected from extreme heat and direct sunlight.
  - 3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the job-site before being incorporated into the Work.
- C. Handling of Materials and Equipment
  - 1. Materials and equipment shall be handled carefully in order to avoid damage or breakage.
  - 2. Materials and equipment shall not be exposed to detrimental conditions or physical damage. Materials and equipment that are so exposed shall be removed from the job-site and shall not be incorporated into the Work. If incorporated into the Work, they shall be removed and replaced, up to and including the time of final inspection, at no additional expense to the City of New York.
  - 3. Packages or containers shall not be opened until all necessary preparatory work is complete and installation is to begin immediately. Materials and equipment shall not be allowed to become wet or soiled or covered with ice or snow.

**1.06 SPARE PARTS, TOOLS AND SUPPLIES**

- A. The equipment manufacturer shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in the General Requirements Section 01750 – Spare Parts and Maintenance Materials.

## PART 2 PRODUCTS

## 2.01 EQUIPMENT

- A. The equipment covered by these specifications shall be standard equipment of proven performance as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed in accordance with the best practices of the trade and as shown on the Contract Drawings.
- B. Subject to compliance with requirements, provide equipment of one of the following manufacturers or an approved equivalent in accordance with Section 01631 – Equivalent Materials and Equipment.
- C. Provide the following equipment for the **MAINTENANCE BAY**:

1. **Portable Grease System**

- a. Shall include heavy duty wheeled cart and reel with 55 gallon drum capacity and 1/4"x50' hose reel. The grease system shall include a 60:1 grease pump, drum cover, follower plate, control valve with rigid tube, grease connection hose and air filter/regulator with gauge, and Grease Gun.
- b. Manufacturer: LiquiDynamics, or equivalent
- c. Model: 13070-S3
- d. Approximate Size: 36"x36"x44.5"(WxLxH)
- e. Quantity: One (1)

2. **Steel Drum Dolly**

- a. Shall have 1000 lbs capacity and be able to maneuver a 55-gallon metal drum.
- b. Manufacturer: Global Industrial Equipment, or equivalent
- c. Model: 233880
- d. Size: 24" Diameter
- e. Weight: 22 lbs
- f. Quantity: Two (2)

3. **Rolling Oil Drain Pan**

- a. Shall have 30-gallon capacity with splash guard screen. Shall include 3/4 in. threaded pipe plug for drain or pump valve.
- b. Manufacturer: Bend-Pak Inc., or equivalent
- c. Model: 144720
- d. Size: 34"x23"x7"(WxLxH)

- e. Weight: 100 lbs
- f. Quantity: One (1)

**4. Oil Drain Pump, Low Profile**

- a. Shall include air-powered evacuation kit that is compatible with rolling oil drain pan.
- b. Manufacturer: Bend-Pak Inc., or equivalent
- c. Model: 145996
- d. Weight: 5 lbs
- e. Quantity: One (1)

**5. Drum Wrench**

- a. Shall be corrosion resistant, able to remove any plug, and include 1" wrench for tightening faucets or pumps.
- b. Manufacturer: Global Industrial equipment, or equivalent
- c. Model: 227201
- d. Quantity: One (1)

**6. Drum Opener, Standard**

- a. Shall incorporate sharp edge steel blade that is capable of opening any size and gauge steel drum.
- b. Manufacturer: Global Industrial Equipment, or equivalent
- c. Model: 226376
- d. Quantity: One (1)

**7. Spigot Pump, pneumatic**

- a. Shall be an air-operated positive displacement piston pump capable of transferring and dispensing low to medium viscosity fluids from a 55-gallon drum.
- b. Manufacturer: Lincoln, or equivalent
- c. Model: 4480
- d. Quantity: Three (3)

**8. Vacuum**

- a. Shall function as a wet and dry shop vacuum with a tank capacity of 22 gallons.
- b. Manufacturer: Dayton, or equivalent
- c. Model: 1UG91
- d. Size: 24-1/2" Diam x 32-1/2"
- e. Motor: 6.5Hp, 120V, 60Hz., 1 Phase
- f. Quantity: One (1)

**9. Heavy-Duty Storage Rack**

- a. Shall include, 14-gauge steel shelves with a capacity of 3000 lbs each. Unit shall have no side or back panels.
- b. Manufacturer: Global Industrial, or equivalent
- c. Model: 236608
- d. Size: 18"x60"x72" (WxLxH)
- e. Weight: 228 lbs
- f. Shelf Capacity: 3000 lbs.
- g. Quantity: Three (3)
- h. Color: Gray

**10. Drum Funnel, self closing**

- a. Shall thread into 2" bung opening, have a 10.75" funnel mouth, a pad lockable cover, and a 32" shaft.
- b. Manufacturer: Global Industrial Equipment, or equivalent
- c. Model: 440128
- d. Size: 32" shaft, 10.75" funnel mouth
- e. Weight: 13 lbs
- f. Quantity: Four (4)

**11. Portable Welding Machine**

- a. Provide Model No. XMT Series 350 VS portable welding machine.
- b. Manufacturer: Miller Welds
- c. Voltage: 460V, 13.6Kw, 60Hz, 3 Phase
- d. Wire Feeder: 22A
- e. MIG Gun: Bernard Q-400 MIG Gun
- f. Consumables: .035 and .045 in drive roll kit
- g. Provide: Regulator/flow gauge with gas hose
- h. Provide: Factory-installed running gear/cylinder rack
- i. Quantity: One (1)

**12. Portable Oil Filtration System**

- a. Provide Model No. 10M40SA-10, portable oil filtration system.
- b. Manufacturer: Parker Filtration
- c. Primary Filtration: 40-micron synthetic polyester inlet filter
- d. Final Filtration: 10-micron cellulose filter
- e. Flow Rate: 10 GPM
- f. Motor: ¾ HP, 115 V, 10 amp, Thermal Overload
- g. Fluid Viscosity: 500 SUS
- h. Mounting: Two wheeled cart
- i. Hoses: Two 1" dia. X 7-ft. hoses
- j. Wands: Two 3" Wands

- k. Controls: Cart mounted ON/OFF switch
- l. Quantity: One (1)

D. Provide the following equipment for **STORAGE ROOM 3**

1. **Heavy-Duty Storage Rack**

- a. Shall include, 14-gauge steel shelves with a capacity of 3000 lbs each. Unit shall have no side or back panels.
- b. Manufacturer: Global Industrial, or equivalent
- c. Model: 236608
- d. Size: 18"x60"x72" (WxLxH)
- e. Weight: 228 lbs
- f. Shelf Capacity: 3000 lbs.
- g. Quantity: Twenty (20)
- h. Color: Gray

E. Provide the following equipment for **MACHINE SHOP ROOM**

1. **Heavy-Duty Storage Rack**

- a. Shall include, 14-gauge steel shelves with a capacity of 3000 lbs each. Unit shall have no side or back panels.
- b. Manufacturer: Global Industrial, or equivalent
- c. Model: 236608
- d. Size: 18"x60"x72" (WxLxH)
- e. Weight: 228 lbs
- f. Shelf Capacity: 3000 lbs.
- g. Quantity: Twelve (12)
- h. Color: Gray

2. **Portable Welding Machine**

- a. Provide Model No. XMT Series, # 350 VS portable welding machine.
- b. Manufacturer: Miller Welds
- c. Wire Feeder: 22A
- d. MIG Gun: Bernard Q-400 MIG Gun
- e. Consumables: .035 and .045 in drive roll kit
- f. Provide: Regulator/flow gauge with gas hose
- g. Provide: Factory-installed running gear/cylinder rack
- h. Quantity: Two (2)

3. **Metal Cut-off Saw**

- a. Provide Model No. 3400, 6" x 10" Metal Cutting Band Saw
- b. Manufacturer: Wilton
- c. Model: 3410

- d. Size: 50"x18"x41" (WxLxH)
- e. Weight: 343 lbs
- f. Quantity: One (1)
- g. Motor: ¼ Hp, 115/230V, 60Hz, 1 phase
- h. Provide: Wet kit for use with Band Saws, Stock No. 4Z402

#### 4. Drill Press

- a. Provide Model No. 6W281, 20" Floor Drill Press
- b. Manufacturer: Dayton
- c. Model: 6W281
- d. Size: 19" x 34" x 68" (WxDxH)
- e. Weight: 425 lbs
- f. Quantity: One (1)
- g. Motor: 1 Hp, 120/230V, 60Hz.

#### 5. Parts Washer

- a. Provide Model No. 800A, 50 – 85 gallon parts washer
- b. Manufacturer: Graymills
- c. Model: 6H013
- d. Size: 41-3/8" x 29-3/8" x 34" (LxWxH)
- e. Weight: 300.0 lbs
- f. Quantity: One (1)

#### 6. Portable Air Compressor

- a. Provide Model No. 4B228, 20 gallon portable air compressor
- b. Manufacturer: Speedaire
- c. Model: 4B228
- d. Motor: 3.1Hp, 230V, 60Hz, 3Phase
- e. Size: 33" x 19 ½" x 31" (LxWxH)
- f. Weight: 151 lbs
- g. Max psi: 135 psi
- h. Tank Size: 20 gallons
- i. Quantity: Two (2)

#### 7. Work Bench Vises

- a. Provide Model No. F60/66997, bench vises
- b. Manufacturer: Rigid vises
- c. Model: 4WN29
- d. Weight: 63 lbs
- e. Max opening: 8.8 inches
- f. Quantity: Five (5)

**8. Ladders (6ft. & 10ft.)**

- a. Provide 6ft. and 10ft. ladders each as follows:

	6' ladder	10' ladder
Manufacturer	Werner	Werner
Model	7406	7410
Stock No	4XN72	4XN74
Weight (lbs)	26	44
Base width (in)	24 5/8	31 5/8
Spread (in)	42 7/8	79 7/8
Quantity	Two (2Ea.)	Two (2Ea.)

**9. 20 Ton Jacks & Stands**

- a. Provide 20 ton hydraulic jacks and stands
- b. Manufacturer: Marquette
- c. Model: W93233
- d. Height (closed): 10 3/4"
- e. Maximum Height: 18 1/2"
- f. Power Raise: 7 3/4 "
- g. Base Size: 5 1/2 " x 7"
- h. Weight: 43 lbs
- i. Quantity: Two (2 Ea.)

**10. Rotating Bin**

- a. Provide a rotating bin
- b. Manufacturer: Frick – Gallagher
- c. Model: 1308
- d. Number of Shelves: 8
- e. Load Capacity: 500 lbs
- f. Size: 21" x 15" x 7" (W x D x H)
- g. Quantity: One (1)

**11. Battery Charger**

- a. Provide wheel type 24V battery chargers
- b. Manufacturers: Dayton
- c. Model: 3LE82
- d. UL Rated Amps: 60 (6V), 60/40 (12V), 30 (24V)
- e. Voltage: 120V, 60Hz, 1Phase
- f. Start Amps: 225
- g. AC Amps Input: 12
- h. Size: 16" x 28 1/2 " x 15" (W x H x D)

- i. Weight: 76 lbs
- j. Quantity: Four (4)

**12. Fans**

- a. Provide a high-volume fan
- b. Manufacturer: Dayton
- c. Model: 3C995
- d. Blade Diameter: 36"
- e. Motor: ½ Hp, 120V, 60HZ, 1Phase
- f. CFM: 9280
- g. RPM: 825
- h. Size: 40 ½" x 39 ½" x 14" (H x W x D)
- i. Weight: 90 lbs
- j. Quantity: Two (2)

**13. Bench Grinder**

- a. OSHA compliant heavy duty bench grinder
- b. Manufacturer: Dayton
- c. Model: 4Z909
- d. Motor: ¾ HP
- e. Voltage: 115V, 60Hz, 1-Ph
- f. Amp Draw: 7.0
- g. Maximum RPM: 3450
- h. Quantity: One (1)
- i. Unit to include tool rests, spark arrestors, eye shields and 6ft. 3-conductor power cord
- j. Grinding Wheels: One (1) 36-grit and One (1) 60-grit
- k. Tool rests: Large cast-aluminum and tilts for angle grinding
- l. Wheel diameter: 8-inch
- m. Wheel face: 1-inch
- n. Dust collection: Vacuum attachment

**14. Tool Stand for Bench Grinder**

- a. Construction: Heavy cast iron with 3 ½ inch steel column
- b. Manufacturer: Dayton
- c. Model: 4Z154
- d. Overall Height: 31 ¾ inches
- e. Top of Stand: Cast slots and holes to mount grinder
- f. Base of Stand: Heavy cast iron 14 ½ x 16 ½ inches minimum
- g. Accessories: Cast iron water pot removable for cleaning
- h. Quantity: One (1)

**15. Arbor Press**

- a. Construction: Cast Iron
- b. Manufacturer: Dayton
- c. Model: 4Z328
- d. Quantity: One (1)
- e. Anvil: Slotted removable 4-position
- f. Ram: Steel with heavy large-toothed rack. Ram shall have a hole with hex head bolt for inserting special punches or tools.
- g. Base: Drilled for bolting to pedestal
- h. Force (Tons): 1 Ton
- i. Swing: 8 inches
- j. Table Dimensions: 5 x 4 ½ inches
- k. Anvil Diameter: 4 ½
- l. Ram Dimensions: 1 x 1

**16. Arbor Press Floor Stand**

- a. Construction: Welded Steel
- b. Manufacturer: Dayton
- c. Model: 1UH15 (ST100)
- d. Quantity: One (1)
- e. Size (In.): 18W x 24D x 33H
- f. Base (In.) 20L x 15W
- g. Top Size (In.) 16L x 9W

**17. Floor Sander**

- a. Construction: Heavy -gauge steel cabinet
- b. Manufacturer: Dayton
- c. Model: 4TJ97
- d. Quantity: One (1)
- e. Size: 12 inch Disc, 6 x 48 belt sander
- f. Voltage: 120 V, 60 Hz. 1 Ph.
- g. Motor: 1 ½ HP
- h. Table Tilt: 0 – 45 Degrees, with graduated scale angle of tilt
- i. Belt Adjustment: Fine thread adjustment with locking mechanism for accurate tracking
- j. Accessories: One (1) medium grit belt, One (1) medium grit disc, miter gauge and 3-conductor power cord
- k. Features: Belt oscillating feature, 3 inch idler drum and 4 inch dust collection port on both belt and disc housing

**18. Workbench**

- a. Shall include, extra heavy-duty workbenches with a capacity of 10,000 lbs each.
- b. Manufacturer: Global Industrial, or equivalent
- c. Model: 579315
- d. Size: 34"x72"x34" (WxLxH)
- e. Weight: 380 lbs
- f. Quantity: Five (5)
- g. Color: Gray

**F. Provide the following equipment for DRUM STORAGE ROOM:****1. Drum Rack**

- a. Shall be constructed of steel and store up to twelve 55-gallon drums, with a total capacity of not less than 15,000 lbs.
- b. Manufacturer: Modern Equipment, or equivalent
- c. Model: 793200
- d. Size: 36"x105"x84" (WxLxH)
- e. Weight: 515 lbs
- f. Quantity: Four (4)
- g. Color: Gray

**2. Drum Truck**

- a. Shall accept 55-gallon drums and include hook to securely engage rim of drum and kickstand for upright storage. Drum truck shall be constructed of heavy-duty steel with 1000 lbs. capacity and include a floating axle.
- b. Manufacturer: Global Industrial Equipment, or equivalent
- c. Model: 975273
- d. Approximate Size: 55-gallon drum
- e. Quantity: One (1)

**PART 3 EXECUTION****3.01 EXAMINATION**

- A. The Contractor shall verify that areas to receive shop equipment are properly prepared and completed prior to the delivery and setup of the listed equipment.

**3.02 INSTALLATION**

- A. Shop equipment shall be installed in accordance with approved Working Drawings, Contract Specifications, and the manufacturer's instructions.

- B. All equipment shown on plans shall be installed true, level, tightly fitted, and flush to adjacent surfaces where required for installation. All anchorage and mounting devices required for the installation of each product shall be provided. Any contact between dissimilar metals shall be protected as specified in Section 09912 – Interior Painting.

### 3.03 FIELD TESTS

- A. Test the equipment to demonstrate the following:
  - 1. Equipment has not been damaged by transportation or installation.
  - 2. Equipment has been properly lubricated.
  - 3. Equipment is not overheating.
  - 4. Equipment is free of overloading of any part.
  - 5. Equipment has no electrical or mechanical defects.
  - 6. Compliance with the performance and design parameters.
  - 7. System operability under all control schemes.
- B. A qualified manufacturer's representative shall perform a full operating test in the presence of Commissioner. Contractor shall furnish all labor, materials and equipment required for such test and shall correct any deficiencies noted.
- C. Defects: Promptly correct any defects in the equipment or failure to meet the requirements of the specifications.

### 3.04 PROTECTION

- A. All components of the Work shall be protected from detrimental weather and damage until construction operations are completed and acceptable to Commissioner.
- B. Shop equipment shall be protected from all damage and abuse from all other contractors and installers involved in the Work until Final Acceptance by the City.

### 3.05 ADJUSTMENT

- A. The Contractor shall verify that all work performed under this section of the Specifications has been completed correctly and that all products function properly. Where necessary, items shall be adjusted to provide satisfactory operation.

### 3.06 PAINTING

- A. Paint color shall be as specified, and where not indicated, shall be the manufacturer's standard factory finish.

-END OF SECTION-

**Section 11570**  
**DUST SUPPRESSION SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES****A. High-pressure, fogging-type, dust suppression system comprising the following:**

1. Plunger pumps with motors
2. Variable frequency drives
3. Nozzles
4. Piping, tubing, fittings, valves and appurtenances
5. Stainless Steel bases
6. Inlet water filters
7. Control valves
8. Air Purge System
9. Heat Tracing and Insulation
10. System controls including all switches, gages and meters
11. All other accessories required to produce complete working system

**1.02 RELATED SPECIFICATIONS****A. Related Work specified in other sections includes, but is not limited to, the following:**

- |                   |   |   |
|-------------------|---|---|
| 1. Division 1     | - | General Requirements                          |
| 2. Section 02505  | - | Leakage Tests                                 |
| 3. Section 09912  | - | Interior Painting                             |
| 4. Section 15052  | - | Steel and Stainless Steel Pipe                |
| 5. Section 15060  | - | Hangers and Supports                          |
| 6. Section 15071  | - | Vibration Control                             |
| 7. Section 15076  | - | Piping and Equipment Identification           |
| 8. Section 15081  | - | Piping Insulation                             |
| 9. Section 15771  | - | Electric Heat Tracing Systems                 |
| 10. Division 16   | - | Electrical                                    |
| 11. Section 17212 | - | SCADA System - Programmable Logic Controllers |
| 12. Section 17320 | - | SCADA System - Control Panels and Enclosures  |
| 13. Section 17600 | - | SCADA System - Control Strategies             |

**1.03 SUBMITTALS**

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.**
- B. Shop Drawings:** Submit working drawings, including arrangement and erection drawings of the piping, equipment and control equipment; schematic control

diagrams; electrical connection diagrams; and complete description of the control system.

- C. Provide manufacturer's data showing pump performance, nozzle performance, motor horsepower, system pressures and other operational parameters.
- D. Operation and Maintenance: Submit operation and maintenance manuals for the dust suppression equipment.

#### 1.04 SYSTEM DESCRIPTION

- A. The dust suppression system manufacturer shall provide a package type system with all equipment and component parts completely mounted and assembled on the skid, piped and pre-wired requiring only external power for operation. The skid mounted system shall be used to control dust emission due to unloading, pushing and loading of municipal solid waste inside the transfer station. The piping and nozzle arrays in the transfer station will be located in an unheated area subject to freezing temperatures. Provide heat tracing and pipe insulation to protect the system from freezing as shown and specified in Specification Sections 15081 - Piping Insulation and 15771 - Electric Heat Tracing System. Provide purge air compressor system to purge complete system after an adjustable time delay after the drain valves are placed in the drain position. The dust suppression system is divided into nine zones, as shown on the Contract Drawings. Provide each zone with a control valve to safely put zones into or out of dust suppression service. Provide automatic draining of zones that are taken out of service to prevent dripping. Provide adjustable frequency drives to adjust pump discharge in response to manual selection of in-service zones and adjustable system pressure. Provide systems that can be totally drained and purged of water, including the pump heads and all piping.

#### 1.05 QUALITY ASSURANCE

- A. The dust suppression system manufacturer shall have a minimum of three (3) years experience.

#### 1.06 SPARE PARTS

- A. For each dust suppression system, provide the following spare parts:
  - 1. Fifty (50) nozzles
  - 2. Five Hundred (500) replacement polypropylene nozzle filters
  - 3. Thirty (30) replacement one (1) micron filter cartridges for low pressure twin filter
  - 4. Two (2) motorized 120 VAC, 1Ph. 3-way drain valves

5. Twelve (12) 21oz. bottles of pump oil

6. Two (2) Pump rebuild kits

#### 1.07 WARRANTY

- A. The Warranty shall be in conformance with Article 24 – Maintenance and Guaranty of the Standard Construction Contract.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.

1. Atomizing Systems, Inc.
2. Fogco Systems, Inc.
3. Johnson-March Systems, Inc.

#### 2.02 MATERIALS

- A. Provide nozzles capable of producing droplets mostly in the range of 5 to 20 microns at operating pressures of 500 to 1,200 psi. Each nozzle shall include a replaceable polypropylene filter element. Provide nozzles to produce enough fog to effectively control dust generated by the handling of municipal solid waste at the transfer stations, but as a minimum provide nozzles with a flow rate of 0.05 gpm at 1,200 psi system pressure. Provide nozzles of type 316 stainless steel construction, with NPT tapered thread connections.
- B. For nozzle manifolds, provide 1/2-inch O.D. type 316 stainless steel tubing with welded nozzle fittings rated for pressures up to 3,000 psi. Provide ASME certified welds. Provide nozzle fittings at not greater than 7'-6" spacing along manifold lines. Locate nozzles at required spacing adequate to produce and disperse enough fog to effectively control dust, but as a minimum locate nozzles at not greater than 15-feet spacing along manifold lines unless shown differently on the Contract Drawings. Plug any initially unused nozzle fittings to prevent leakage during operation. Provide valves that will allow the system to totally drain, without retaining water in the nozzle fittings.
- C. For system piping, provide 1/2-inch and 3/4-inch type 316 stainless steel tubing and compression fittings rated for pressures up to 3,000 psi.
- D. For zone control valves, provide 1/2-inch NPT, type 316 stainless steel, motorized ball valves rated at 3,000 psi, and suitable for 120 volt, 1Ph. operation. Provide 3-way ball valves to drain upon valve shutdown. Provide slow-acting ball valves with actuation time of five seconds minimum. Ball valves shall have totally enclosed

actuator gear train, factory lubricated. Motorized ball valves shall be Swagelok Whitey, or equal. Provide a manually-operated, ½-inch type 316 stainless steel two-way ball valve, rated at 3,000 psi, upstream of each motorized valve. The 3-way motorized zone control ball valves and 2-way manual ball valves shall be skid mounted, piped and pre-wired by the dust suppression equipment manufacturer.

- E. One air purge system (Compressor with Control Panel, Motor Starters and Controls) shall be provided to purge the remaining water in the Dust Suppression System after an adjustable time delay so that the drain valves have sufficient time to allow the long runs of tubing to drain. Once the purge air compressor is started, the system shall purge water by zones for an adjustable time period.
1. The purge air compressor shall include the following features:
    - a. Type: Two stage stationary vertical tank compressor
    - b. HP: 5
    - c. Max. Pressure: 175 PSI
    - d. Max. Air Capacity: 15 CFM minimum
    - e. Tank Capacity: 80 gallons
    - f. Power: 480v/60hz/3ph
    - g. Quantity: One (1)
  2. The air purge system local control panel shall include:
    - a. Enclosure: NEMA 4
    - b. Disconnect switch: Face panel mounted
    - c. PLC: 12 I/O
    - d. Relays: DPDT, 24v
    - e. Time Delay: Purge time period shall be adjustable from the panel front.
  3. The panel front shall contain the following items:
    - a. Low Temperature indicating light.
    - b. Running and Stopped indicating lights for the air compressor.
    - c. Open and Closed indicating lights for the three-way purge ball valve.
    - d. Open and Close push buttons for the three-way purge ball valve.
    - e. Auto Purge On-Off selector switch.
  4. All indicating lights shall be of the push-to-test LED indicating lamp type.
  5. When the Auto Purge selector switch is in the OFF Position, purging of the dust suppression system will be manually controlled by the operator, using the push buttons on the dust suppression system local control panel for control of the zone valves, and the push buttons on the purge control panel for the three-way purge ball valve.

6. When the Auto Purge selector switch is in the ON position, purging of the dust suppression system shall be automatic, triggered by a temperature sensor. Automatic Purging shall override other zone valve control commands, whether manual or remote. Purging shall start when the temperature decreases to a value approaching the freezing point, initially set at 35 degrees F. The sensor shall be mounted as shown.
  7. The temperature sensor shall be as follows:
    - a. Accuracy: Plus or minus 1 percent of span
    - b. Enclosure: NEMA 4X
    - c. Materials of Construction: Type 316 stainless steel
- F. Provide heavy-duty, direct drive, triplex plunger pumps with stainless steel wetted parts. Provide pumps to deliver enough water at sufficient pressure to the nozzles to effectively control dust generated by the handling of municipal solid waste at the transfer stations, but as a minimum provide pumps with a flow rate of 5.8 gpm at 1,200 psi system pressure. Size each pump to provide the entire system requirements. For each pump provide inlet solenoid valve to close on pump shut down, inlet water low-flow shut-off switch, stainless steel pulsation dampener, high temperature thermal water discharge valve, 2 1/2-inch diameter inlet and discharge oil-filled type pressure gauges, inlet and discharge isolation valves, discharge water pressure regulator, 4-20mA stainless steel pressure transducer rated at 2,000 psi minimum, pressure relief valve, dump solenoid valve to relieve system pressure on pump shut down, discharge check valve and discharge flex rubber hose pressure rated at 2,000 psi minimum. For each pump provide a drain valve with connection capable of fully draining the system, including the pump head. The pump motors shall be TEFC, minimum 5 HP and shall operate at 460-volt, 3-phase, 60-hertz.
1. Acceptable manufacturers for the plunger pumps are listed below.
    - a. General Pump
    - b. Cat Pumps Corporation
    - c. AR North America
    - d. Or approved equal
  2. Provide an inlet water low-pressure shut-off switch and a discharge high-pressure shut-off function controlled by the PLC controller for the plunger pumps.
- G. Provide industrial, multi-stage, polypropylene cartridge-type water filtration for the dust suppression systems to ensure 5-micron, minimum, filtration and appropriate flow to the pump units. Housings shall be stainless steel with replaceable cartridges. Provide inlet pressure regulator, inlet, outlet, air bleed and drain valves for the filtration unit. Components shall be mounted to skid and easily accessible. Provide a 2 1/2-inch diameter oil-filled type pressure gauge with isolation valves on the inlet and outlet to the filtration system.

- H. Mount the pumps, motors, control panel, filtration system, purge air system, motorized zone control valves, motor starters and associated components for each dust suppression system on a stainless steel skid equipped with vibration mounts and suitable for bolting to a concrete pad. Vibration control equipment shall meet the requirements of Section 15071 – Vibration Control. Situate skid components to allow easy access for maintenance. Provide stainless steel construction for the skid chassis including all brackets, supports, screws and other components. Size and install all structural components to comply with the requirements of the equipment being supported.
- I. Provide one constant torque, adjustable frequency drive (AFD) for each pump in the dust suppression systems to vary the speed of the corresponding plunger pump in response to system requirements. Normal operating pressure shall be as set at the pressure transducer when all zones are on-line. When zones are taken off-line, the AFD will decrease pump speed and output to maintain the normal operating pressure. Provide a set-point controller to adjust the system pressure. A minimum 4:1 turndown ratio shall be provided for the pump discharge flow. Provide AFD operation status indication including “Ready”, “Power On”, “Run” and “Fault” L.E.D. pilot lights.
- J. Adjustable Frequency Drive Requirements
  - 1. Provide adjustable frequency drives to vary the speed of NEMA standard, 3-phase, 460-volt, induction motors and driven equipment by varying the frequency and voltage applied to the motors.
  - 2. Provide adjustable frequency drives that automatically restart when power is restored after a power outage. Provide control logic so the drive is allowed to restart when power is restored.
  - 3. Rated Output Power: Provide adjustable frequency drives with an output that is at least 3 percent greater than the driven motor’s full nameplate rating.
  - 4. Torque Output: Provide variable torque or constant torque output drives as required by driven equipment.
  - 5. Provide adjustable frequency drives that utilize 6-pulse drive technology.
  - 6. Operate at a minimum efficiency of 95 percent at rated load.
  - 7. Operate from a 460-volt, 3-phase, 60-hertz supply with a voltage variation of plus or minus 10-percent and a frequency variation of plus or minus 2-hertz.
  - 8. Input power factor: Maintain a 95 percent minimum power factor over a 20 to 100 percent speed range.

9. Operate an induction motor as specified, including a high-efficiency, high-power factor, premium-duty motor, with no detriment to motor life.
10. Operate an induction motor without exceeding a motor sound and power level of 96-decibels, A-weighted, when measured in accordance with IEEE 85.
11. Operate under the following ambient conditions:
  - a. Ambient Temperature: 0 to 40 degrees C
  - b. Humidity: 0 to 95 percent
12. UL Label: Provide a UL Inc. Label or certification of listing by C.S.A. or other recognized testing organization for each adjustable frequency drive.
13. Manufacturers: Acceptable manufacturers are listed below.
  - a. Robicon
  - b. Cutler-Hammer
  - c. Toshiba
  - d. Or approved equal
14. Input Disconnect: Provide an input circuit breaker with an interrupting rating of 65,000 rms symmetrical amperes.
15. Input Reactor: Provide input reactor or isolation transformer, if required.
16. Converter Section: Provide input section that converts 460-volts, 60-hertz, 3-phase input to a fixed dc voltage using diodes.
17. Filter Sections: Provide dc link reactor and filter capacitors as required.
18. Inverter Section: Provide adjustable frequency drive inverter section that converts the fixed dc voltage to an adjustable frequency output utilizing a pulse-width modulation inverter. Maintain a constant volts per hertz ratio on the output with voltage boost for startup as required.
19. Control Devices: Provide a digital operator keypad located on the front door to allow setting of all programmable parameters and the following control functions:
  - a. Start push button
  - b. Stop push button
  - c. "Local-Remote" control selection
  - d. Speed control settings
  - e. Speed meter with hertz and 0-100 percent scales
  - f. Diagnostics package with fault indication and reset push button

- K. Provide local control panel at the pumps in a stainless steel, NEMA 4X enclosure with AFD and all control devices required to provide a complete functioning system. The control devices shall include but not be limited to the following:
1. Disconnect switch
  2. Hand-Off-Auto (H-O-A) selector switch for each pump
  3. Programmable logic controller, micro type, meeting the applicable requirements of Section 17212, Programmable Logic Controllers, Ethernet capable
  4. Pump 1-Pump 2 selector switch
  5. Off-Running indicating lights for each pump
  6. Local - Off- Remote selector switch for each zone valve
  7. On-Drain push buttons for each zone valve
  8. On-Drain indicating lights for each zone valve
  9. Pressure setpoint and drain time periods shall be adjustable from the panel front
- L. All indicator lights shall be of the push-to-test LED indicating lamp type.
- M. From the H-O-A selector switch, "Off" mode shuts pump off. In "Auto" mode, the AFD controls pump speed in response to pressure setpoint controller. In "Hand" mode, pump runs and allows operator to manually adjust speed. The Pump 1 - Pump 2 selector switch allows selection of the duty pump.
- N. Each zone control ball valve shall be controlled by a Local-Off-Remote selector switch located on the control panel. "Off" mode prohibits valve operation. In "Local" mode, each valve shall be operated by "On" and "Drain" push buttons mounted on the control panel. In "Remote" mode, each valve shall be operated by the SCADA system, as specified in Section 17600 – SCADA System – Control Strategies. Communication between the PLC and the SCADA system shall be via Ethernet. Coordinate with SCADA system supplier to provide complete operating controls with bumpless transfer.
- O. Ethernet communications to the SCADA system shall include, as a minimum, the following status information:
1. Pump Run (for each pump)
  2. Pump Fail (for each pump)
  3. Compressor Failure

4. System Fault (Comprised of the following)
    - a. Inlet Water Low Flow
    - b. Inlet Water Low Pressure
    - c. Discharge High Pressure
  5. Remote Mode (for each zone valve)
  6. Valve Open (for each zone valve)
  7. Valve Closed (for each zone valve)
  8. Low Temperature
  9. All of the above alarms including each condition that causes a system fault shall be separately displayed on the system control panel.
- P. Ethernet communication from the SCADA system shall include, as a minimum, the following commands:
1. Open valve (each zone valve)
  2. Close valve (each zone valve)
- Q. Provide all electrical and control components to meet the requirements of Division 16.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install dust suppression equipment in accordance with the manufacturer's recommendations and approved shop drawings, and as specified in Division 1.
- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on the proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1.
- C. Tests: After installation of the dust suppression equipment, controls and all appurtenances, subject the units to a field running test, as specified in Division 1, under actual operating conditions.
- D. Additional Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to inspect the completed installation, under actual operating conditions, after the system has been in operation for 60-days. Make any necessary adjustments.

3.02 CLEANING AND PAINTING

- A. Paint dust suppression equipment as specified in Section 09912 – Interior Painting. Do not paint stainless steel components.

3.03 TRAINING

- A. Provide training in accordance with Section 01821 – Start-up and Training.
- B. The manufacturer of the Dust Suppression System shall include one day of on-site classroom and hands-on training at the station. The day is on session of 8 hours.
  - 1. Maintenance – (2 hours) of training shall be included. Training to include operation of the system and regular maintenance (electrical, pneumatic and mechanical). Additionally the City of New York key maintenance personnel shall be allowed to “shadow” the installation process whenever possible. By “shadowing” the equipment installation, the highest level of practical knowledge can be obtained.
  - 2. Supervisors – (2 hours) of training shall be included. Training shall include operation of the system and basic trouble-shooting as a minimum.
  - 3. Operators Training – (4 hours) of on-site training shall be included. Operator training shall provide use skills along with safety training.

-END OF SECTION-

**Section 12484  
FLOOR MATS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
  - 1. Roll-up aluminum-tread rail floor mats with aluminum hinges
  - 2. Rubber and vinyl mats

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast in Place Concrete

**1.03 SUBMITTALS**

- A. Product Data: Include manufacturer's specifications and installation instructions, construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of floor mat and frame specified.
- B. Shop Drawings: For floor mats and frames. Show assembly, joint locations, installation details, layout, plans, elevations, sections, details of patterns or designs, accessories, anchors, and attachments to other Work.
- C. Samples for Initial Selection: For each type of floor mat and frame indicated.
- D. Samples for Verification: 12-inch- square assembled sections of floor mats, frame members, and tread rails with selected tread surface showing each type of metal finish and color of exposed floor mats, tread rails, frames, and accessories required.
- E. Maintenance Data: For cleaning and maintaining floor mats to include in maintenance manuals.

**1.04 QUALITY ASSURANCE**

- A. Accessibility Requirements: In addition to requirements of authorities having jurisdiction, provide installed floor mats that comply with Section 4.5 in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

**1.05 PROJECT CONDITIONS**

- A. Field Measurements: Verify sizes by field measurements before fabrication and indicate measurements on Shop Drawings.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

#### A. Surface Roll-up Aluminum Rail Hinged Mats:

1. Construction Specialties, Inc.
2. J. L. Industries, Inc.
3. Musson, R. C. Rubber Co. (The).
4. Reese Enterprises, Inc.

#### B. Rubber and Vinyl Mats:

1. Musson, R. C. Rubber Co. (The).
2. Tennessee Mat Company, Inc.
3. Tepromark International, Inc.

### 2.02 METAL FRAME MATERIALS

- #### A. Extruded Aluminum: ASTM B 221, alloy 6061-T6 or alloy 6063-T5, T6, or T52 as standard with manufacturer.

### 2.03 FLOOR MATS

- #### A. General: Provide colors, patterns, and profiles of materials, including metals and metal finishes indicated or specified. If not indicated, provide colors, patterns, and profiles selected by the Commissioner from manufacturer's standards.
- #### B. Roll-up Aluminum Rail Hinged Mats: Clear-anodized finish, extruded-aluminum tread rails sitting on continuous vinyl cushions with 1-1/2-inch- wide by 3/8-inch-thick, tread rail modules. Provide aluminum hinges and plain serrated aluminum treads.
1. Locations: Entrances as indicated on drawings.
  2. Tapered Rigid Frame: Tapered extruded-aluminum frame members, not less than 2-1/2 inches wide, with mitered corners and finish to match tread-slat extrusions.
- #### C. Rubber and Vinyl Mats (Roll style): Shower mats shall be 1/2-inch- mats with beveled edges for surface applications and perforated, with non slip surface with standard spaced grid design and multidirectional drainage.(Teproflow by Tepromark Intern.) Electrical mat shall be narrow-wale corrugated top profile, and low-rib, narrow-wale corrugated bottom surface with beveled edges for surface applications. (Switchboard Runner Matting by The R. C. Musson, Rubber Co.).

## 1. Locations

- a. Shower Rooms: Vinyl Mats, as indicated on drawings. Perforated style runner mats.
- b. Electrical Rooms 1 and 2: Rubber mats, as indicated on drawings. Corrugated switchboard runner style mats conforming to ANSI/ASTM D178-77 Type 1 Class II. All rubber construction, stays in place, is slip resistant. With care, lightweight carts can be used over this runner. Meets Dielectric Test RMS AC 30,000; Proof Test Volt, Volt, RMS AC 20,000. Recommended maximum use, Volt RMS AC 17,000.

## 2.04 FABRICATION

- A. General: Verify sizes by field measurement before shop fabrication.
- B. Floor Mats: Shop fabricate units to greatest extent possible in sizes as indicated. If not otherwise indicated, provide single unit for each mat installation; do not exceed manufacturer's recommended maximum sizes for units that are removed for maintenance and cleaning. Where joints in mats are necessary, space symmetrically and away from normal traffic lanes. Miter corner joints in framing elements with hairline joints or provide prefabricated corner units without joints.
- C. Surface-Mounted Metal Mat Frames: Tapered rigid frames fabricated from extruded aluminum and specified with floor mats in Part 2 "Floor Mats" Article, in lengths to fit floor mat type specified, for permanent surface-mounted installation, and complete with corner connectors, splice plates or connecting pins, and postinstalled expansion anchors.
- D. With manufacturer's standard protective coating, coat surfaces of aluminum frames that will contact cementitious material.

## 2.05 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

## 2.06 ALUMINUM FINISHES

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.

1. Color: As selected by the Commissioner from the full range of industry colors and color densities.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates and floor conditions for compliance with requirements for location, sizes, and other conditions affecting installation of floor mats and frames.
  1. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 INSTALLATION

- A. Install necessary shims, spacers, and anchorages for proper location and secure attachment of frames.
- B. Install grout and fill around frames and, if required to set mat tops at proper elevations, in recesses under mats. Finish grout and fill smooth and level.
- C. Install surface-type units to comply with manufacturer's written instructions at locations indicated; coordinate with entrance locations and traffic patterns.
- D. Anchor fixed surface-type frame members to floor with devices spaced as recommended by manufacturer.

#### 3.03 PROTECTION

- A. Defer installation of floor mats until Project is near Substantial Completion.

-END OF SECTION-

**Section 12491**  
**HORIZONTAL LOUVER BLINDS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following types of venetian blinds and accessories:

1. Miniblinds with aluminum louver slats

**1.02 RELATED SPECIFICATIONS**

- A. Section 08520 - Aluminum Windows

**1.03 DEFINITIONS**

- A. Miniblind: Venetian blind with nominal 1-inch- wide louver slat.

**1.04 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include styles, material descriptions, construction details, dimensions of individual components and profiles, features, finishes, and operating instructions.
- B. Shop Drawings: Show location and extent of horizontal louver blinds. Include elevations, sections, details, and dimensions not shown in Product Data. Show installation details, mountings, attachments to other Work, operational clearances, and relationship to adjoining work.
- C. Samples for Initial Selection: For each colored component of each type of horizontal louver blind indicated.
1. Include similar Samples of accessories involving color selection.
- D. Samples for Verification: For the following products, prepared on Samples from the same material to be used for the Work.
1. Horizontal Louver Blind: Full-size unit, not less than 16 inches wide by 24 inches long.
- E. Window Treatment Schedule: Include horizontal louver blinds in schedule using same room designations indicated on Drawings.
- F. Product Certificates: For each type of horizontal louver blind product, signed by product manufacturer.
- G. Product Test Reports: For each type of horizontal louver blind product.

- H. Maintenance Data: For horizontal louver blinds to include in maintenance manuals. Include the following:

1. Methods for maintaining horizontal louver blinds and finishes
2. Precautions about cleaning materials and methods that could be detrimental to finishes and performance
3. Operating hardware

#### 1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain horizontal louver blinds through one source from a single manufacturer.
- B. Fire-Test-Response Characteristics: Provide horizontal louver blinds with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
1. Flame-Resistance Ratings: Passes NFPA 701
- C. Corded Window Covering Product Standard: Provide horizontal louver blinds complying with WCMA A 100.1.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver blinds in factory packages, marked with manufacturer and product name, fire-test-response characteristics, lead-free designation, and location of installation using same room designations indicated on Drawings and in a window treatment schedule.

#### 1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install horizontal louver blinds until construction and wet and dirty finish work in spaces, including painting, is complete and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- B. Field Measurements: Where horizontal louver blinds are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operable glazed units' operation hardware throughout the entire operating range. Notify Commissioner of discrepancies. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Horizontal Louver Blinds, Aluminum Louver Slats:
  - a. Hunter Douglas Window Fashions
  - b. Levolor Contract; a Newell Company; Levolor
  - c. Springs Window Fashions Division, Inc.; Bali
  - d. Springs Window Fashions Division, Inc.; Graber

### 2.02 COMPONENTS

- A. Louver Slats: Aluminum, alloy and temper recommended by producer for type of use and finish indicated; with crowned profile and radiused corners.
1. Nominal Slat Width: 1 inch for miniblinds
  2. Nominal Slat Thickness: Not less than 0.008 inch
  3. Slat Finish: One color as indicated
    - a. Reflective Coating: Manufacturer's special coating enhancing the reflection of solar energy on the outside-facing slat surface.
- B. Headrail: Formed steel or extruded aluminum; long edges returned or rolled; fully enclosing operating mechanisms on three sides and ends; capacity for one blind per headrail, unless otherwise.
1. Finish Color Characteristics: Match color, texture, pattern, and gloss of louver slats
- C. Bottom Rail: Formed-steel or extruded-aluminum tube, sealed with plastic or metal capped ends bottom contoured for minimizing light gaps; with enclosed and protected ladders and tapes to prevent their contact with sill.
- D. Tilt Control: Consisting of enclosed worm gear mechanism, slip clutch or detachable wand preventing overrotation, and linkage rod, for the following operation:
1. Tilt Operation: Manual with clear plastic wand
  2. Length of Tilt Control: Length required to make operation convenient from floor level

## 3. Tilt: Full

- E. Lift Operation: Manual, top-locking cord lock; locks pull cord to stop blind in either fully opened or fully closed position only and is equipped with a ring pull not more than 4 inches long.
- F. Tilt-Control and Cord-Lock Position: Right side and left side of headrail, respectively unless otherwise indicated.
- G. Ladders: Evenly spaced to prevent long-term louver sag.
  - 1. For Blinds with Nominal Slat Width 1 inch or Less: Braided string
- H. Mounting: Ceiling mounting permitting easy removal and replacement without damaging blind or adjacent surfaces and finishes; with spacers and shims required for blind placement and alignment indicated.
  - 1. Provide intermediate support brackets if end support spacing exceeds spacing recommended by manufacturer for weight and size of blind.
- I. Hold-Down Brackets and Hooks or Pins: Manufacturer's standard, as indicated.
- J. Colors, Textures, Patterns, and Gloss: As selected by Commissioner from manufacturer's full range.

## 2.03 FABRICATION

- A. Product Standard and Description: Comply with AWCMA Document 1029, unless otherwise indicated, for each horizontal louver blind designed to be self-leveling and consisting of louver slats, rails, ladders, tapes, lifting and tilting mechanisms, cord, cord lock, tilt control, and installation hardware.
- B. Concealed Components: Noncorrodible or corrosion-resistant-coated materials.
  - 1. Lifting and Tilting Mechanisms: With permanently lubricated moving parts.
- C. Unit Sizes: Obtain units fabricated in sizes to fill window and other openings as follows, measured at 74 deg F:
  - 1. Blind Units Installed between (Inside) Jambs: Width equal to 1/4 inch per side or 1/2 inch total, plus or minus 1/8 inch, less than jamb-to-jamb dimension of opening in which each blind is installed. Length equal to 1/4 inch, plus or minus 1/8 inch, less than head-to-sill dimension of opening in which each blind is installed.
  - 2. Blind Units Installed Outside Jambs: Width and length as indicated, with terminations between blinds of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.

- D. Installation Brackets: Designed for easy removal and reinstallation of blind, for supporting headrail and operating hardware, and for hardware position and blind mounting method indicated.
- E. Installation Fasteners: Not fewer than two fasteners per bracket, fabricated from metal noncorrosive to blind hardware and adjoining construction; type designed for securing to supporting substrate; and supporting blinds and accessories under conditions of normal use.
- F. Color-Coated Finish:
  - 1. Metal: For components exposed to view, apply manufacturer's standard baked finish complying with manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.
- G. Component Color: Provide rails, cords, ladders, and exposed-to-view metal and plastic matching or coordinating with slat color, unless otherwise indicated.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 INSTALLATION

- A. Install blinds level and plumb at every window with the exception of toilets and lockers rooms and aligned with adjacent units according to manufacturer's written instructions. Install intermediate support as required to prevent deflection in headrail. Allow clearances between adjacent blinds and for operating glazed opening's operation hardware, if any.
- B. Head Mounted: Install headrail on face of opening head.

#### 3.03 ADJUSTING

- A. Adjust horizontal louver blinds to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

#### 3.04 CLEANING AND PROTECTION

- A. Clean blind surfaces after installation, according to manufacturer's written instructions.

- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that horizontal louver blinds are without damage or deterioration at time of Substantial Completion.
- C. Replace damaged blinds that cannot be repaired, in a manner approved by the Commissioner, before time of Substantial Completion.

-END OF SECTION-

**Section 12500**  
**FURNITURE**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section Includes: Requirements for furnishing and installing office furniture, accessories, and appurtenances.
- B. Furniture shall be provided, assembled as necessary, and installed where shown on the Contract Drawings or as required for a complete installation.

**1.02 SUBMITTALS**

- A. Provide all submittals, including the following, as specified in Division 1.
  - 1. Catalog Cuts: Submit complete catalog cuts with manufacturers' descriptions and information for each item of office equipment specified. Manufacturer's data substantiating that the materials comply with the requirements shall be included.
  - 2. Samples: Submit three samples of baked enamel finishes, fabrics and plastic laminate for selection and approval.

**1.03 DELIVERY, STORAGE AND HANDLING**

- A. All furniture materials and appurtenances shall be properly protected in accordance with the manufacturer's requirements so that damage or deterioration will occur from the time of shipment until installation is completed.
- B. Delivery of Materials
  - 1. Materials shall not be delivered to the project site before the time of installation.
  - 2. Materials shall be delivered in sufficient quantities to allow continuity of the Work.
  - 3. Factory assembled parts and components shall not be dismantled for shipment.
- C. Storage of Materials
  - 1. Materials shall be stored in original, undamaged containers with manufacturer's labels and seals intact.

2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.
3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the job-site before being incorporated into construction systems.

D. Handling of Materials

1. Materials shall be handled carefully in order to avoid damage or breakage.
2. Materials shall not be exposed to detrimental conditions or physical damage.
3. Materials which are so exposed shall be removed from the jobsite and shall not be incorporated into the Work. If incorporated into the Work, they shall be removed and replaced, up to and including the time of final inspection, at no additional expense to the City.
4. Packages or containers shall not be opened until all necessary preparatory Work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.
- B. Office Furniture
  1. Steelcase Inc., Grand Rapids, MI; Avenir Systems Furniture and Office Chairs
- C. Lunch Room Tables
  1. Maywood Furniture Corp., Maywood, NJ; Original Series folding banquet table.
- D. Lunch Room Chairs
  1. Steelcase Inc., Grand Rapids, MI; MaxStacker II, 473 Series

### 2.02 MATERIALS

- A. Office Furniture: Provide office furniture of steel construction and contemporary design and rectilinear lines with all exposed metal having a painted finish as selected by Commissioner. Top surfaces colors for desks and tables will be

selected by the Commissioner and shall be coordinated with the consoles to be installed in the operations room and foreman's office.

B. Single or Double Pedestal Desks: Where desks are shown to be furnished as a stand-alone desk, double pedestal type shall be provided. Desks shown to be furnished with returns shall be single pedestal types. Desks shall be constructed to include the following:

1. Desks shall be of thermal-fused laminate construction.
2. Work surfaces ends shall have a rounded profile.
3. Desks shall include a full-height back panel.
4. Desk pedestals shall be  $\frac{3}{4}$  height, and each shall be provided with one box drawer and one file drawer.
5. All drawers shall ride on heavy-duty ball bearing suspension glides.
6. File drawers shall be full extension type.
7. File drawers shall be equipped with a hanging file folder frame accommodating letter or legal size files.
8. Desks shall be furnished with randomly keyed locks.
9. Desks shall be furnished with plastic leveling glides.

C. Single Pedestal Returns: Returns shall be constructed to include the following:

1. Returns shall be of thermal-fused laminate construction.
2. Work surfaces ends shall have a rounded profile.
3. Returns shall include a full-height back panel.
4. Return pedestals shall be  $\frac{3}{4}$  height, and each shall be provided with one box drawer and one file drawer.
5. All drawers shall ride on heavy-duty ball bearing suspension glides.
6. File drawers shall be full extension type
7. File drawers shall be equipped with a hanging file folder frame accommodating letter or legal size files.

8. Returns shall be furnished with randomly keyed locks.
  9. Returns shall be furnished with plastic leveling glides.
- D. High-back Desk Chairs: High-back Desk chairs shall be constructed to include the following:
1. Chair shall be provided with pneumatic height adjustment with a minimum adjustment range of 5 inches.
  2. Overall height of chair shall be adjustable from 40-1/2 inches to 48-1/2 inches.
  3. Overall width of chair shall be 26-1/2 inches and the overall depth shall be 23 inches.
  4. Chair shall be a tilt tension chair and shall be provided with a variable back stop.
  5. Chair shall be provided with arms as indicated on drawings.
  6. Chair shall be provided with fabric upholstered seat, back, and outer back.
  7. Chair shall be provided with hard dual-wheel casters.
- E. Guest Chairs: Guest Chairs shall be constructed to include the following:
1. Chair shall include a sled-base frame and arms and shall be of a design complementing the specified desk chairs.
  2. Overall height of chair shall be 33 inches. Overall width of chair shall be 22-1/2 inches and the overall depth shall be 23 inches.
  3. Chair shall be provided with fabric upholstered seat, back and outer back.
  4. Chair shall be provided with hard plastic glides.
- F. Stackable Chairs: Stackable chairs shall be constructed to include the following:
1. Chair shall be provided with frame of steel finish.
  2. Chair seat and back shall be of plastic.
  3. Overall height of chair shall be 33-1/4 inches. Overall width of chair shall be 19-3/4 inches and the overall depth shall be 22-3/4 inches.
  4. Chair shall be provided with soft plastic glides.

G. Tables: Tables shall be constructed to include the following:

1. Table shall be provided with a laminate top with soft vinyl edge.
2. Table size shall 36-inches by 36-inches.
3. Table shall be provided with foldable 1-1/2 inch square, 20 gauge steel tube folding legs.
4. Table shall be provided with adjustable plastic leveling glides.

K. Other items of furniture, such as credenzas, lateral files, and the like, shall be as specified on the drawings.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. The Contractor shall verify that areas to receive furniture are properly prepared and completed. The rooms in which furniture is to be installed shall have all Work of all other trades completed so as to minimize the possibility of soil or damage to the furniture.

#### 3.02 INSTALLATION

- A. Office furniture shall be uncrated, assembled as necessary, and placed where indicated on the Contract Drawings and as directed. All crating and shipping materials shall promptly be removed and properly discarded.

#### 3.03 PROTECTION

- A. All furniture items shall be protected from soil, damage, and abuse from all other contractors and installers involved in the Work until Final Acceptance by the City.

#### 3.04 ADJUSTMENT

- A. Furniture components which are dislodged, damaged, expanded, broken, penetrated or crushed by subsequent installation operations or damaged by detrimental weather shall be immediately replaced with undamaged material in compliance with the Specifications and properly protected as specified.

#### 3.05 CLEANING

- A. After installation, furniture shall be cleaned and left in a neat condition. Units shall be cleaned using materials and processes as recommended by the manufacturer.

**Section 13100**  
**LIGHTNING PROTECTION SYSTEM**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for providing, and testing of a complete lightning protection system for buildings and structures.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods
- B. Section 16060 - Grounding
- C. Section 16075 - Electrical Identification
- D. Section 16080 - Electrical Testing Requirements
- E. Section 16121 - Wires and Cables - 600 Volts and Below
- F. Section 16130 - Electrical Raceway System

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NFPA 780 - Lightning Protection Code
  - 2. UL 96 - Lightning Protection Components
  - 3. UL 96A - Installation Requirements for Lightning Protection Systems
  - 4. NYCBC - New York City Building Code

**1.04 SYSTEM DESCRIPTION**

- A. Label: Provide a master labeled lightning protection system in accordance with UL 96, 96A and NFPA 780.

**1.05 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's product data showing dimensions and materials of each component and include listing in accordance with UL 96.
  - 1. Furnish manufacturer's installation instructions.

- C. Shop Drawings: Submit Shop Drawings showing layout of air terminals, grounding electrodes, routing of conductors, and bonding connections to structure and other metal objects. Include terminal electrode and conductor sizes, connection and termination details and penetration of structures.

- 1. Furnish record drawings and documents on completion of Work as specified in Section 01332 – Record Drawings.

## 1.06 QUALITY ASSURANCE

- A. Codes: Provide lightning protection system components that are designed, manufactured and tested in accordance with the latest UL 96 standard and meet the requirements of NFPA 780, Lightning Protection Institute (LPI), and NYCBC.
- B. Regulatory Requirements: Provide a lightning protection system that is in accordance with the requirements of UL 96A and NYCBC.
- C. Installation shall be inspected and accepted by the party that will supply the Master Label for the system.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Harger Lightning Protection and Grounding Inc.
  - 2. Independent Protection Co. Inc.
  - 3. Thompson Protection Inc.
  - 4. Heary Brothers Lightning Protection Co. Inc.
- B. Standard of Quality: Label all materials used for the lightning protection system with UL factory inspection labels. The catalog numbers herein refer to the Harger Lightning Protection, Inc. numbers. The numbers are shown solely for the purpose of indicating the type and quality of equipment desired. Equivalent products of other manufacturers may be submitted for review.

### 2.02 COMPONENTS

- A. Air Terminals: Provide safety tip air terminals as follows:
  - 1. Standing Seam Roofs: Provide Cat. No. 5818ASTAT, 5/8-inch diameter and 18-inch long, solid-aluminum air terminals with ALSB standing seam bases for mounting Air Terminals on standing seam roofs with ALS12M Swivel Adaptor and two (2) SSSC2 clamps.

2. Through Roofs: Provide Cat. No. 5818ASTAT, 5/8-inch diameter and 18-inch long, solid-aluminum air terminals with Cat. No. A121 air terminal adapter and Cat. No. A1585/8-18 concealed bases for through the roof mounting.
- B. Conductors: Provide conductors as follows.
1. Main Conductors on the Roof: Provide Cat. No. A37, Class II, main conductors having 37 strands of No. 13 AWG aluminum wire weighing not less than 190 pounds per 1,000 feet.
  2. Main Conductors below Roof: Provide Cat. No. 28, Class II, main conductors having 28 strands of No. 14 AWG copper wire weighing not less than 375 pounds per 1,000 feet.
  3. Down Conductors: Within the building footprint the Building steel shall be used for this function. Where this is not suitable appropriate down conductors shall be provided.
- C. Ground Electrodes: Building and outdoor ground electrodes shall be Cat. 3410SS, ground electrodes that are 3/4-inch diameter and 10-foot long stainless-steel rods, or alternate electrodes made necessary or desirable by conditions of the site and/or construction. Any alternate must be submitted for approval.
- D. Roof Penetrations: Provide roof penetrations as follows.
1. Through-Roof/Wall Connectors: Provide Cat. No. RATW1/2BM-12 through-roof/wall aluminum to copper connectors.
- E. Accessories: Provide accessories as follows:
1. Standing Seam Conductor Clamp: Provide Cat. No. ALSC standing seam clamp with Cat No. ACC3 cable clips.
  2. Bi-metal Conductor Connector: Provide Cat. No. 211XL bi-metal lightning cable connectors.
  3. Bonding Plate: Provide Cat. No. A217, bonding plate.
  4. Ground Access Well: Provide Cat. No. 36PS12CILS80 heavy-duty PVC schedules 80 well with cast iron grated cover Cat No.12PBG.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all lightning protection system components in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1 and meeting the requirements of UL 96A, NYCBC and NFPA 780.
- B. Coordination: Coordinate with other work including roofing, exterior and interior finishing and electrical grounding and bonding as necessary to interface the installation of the lightning protection system with other work.
- C. Air Terminal Spacing: Install air terminals at intervals not exceeding 20 feet around the perimeter of flat roofs as shown.
- D. Watertight Roof Penetrations: Provide watertight roof penetrations using either concealed base for through-roof mounting of through roof/wall connector assemblies.
- E. Conductor Bases: Install all conductors on bases.
- F. Bonding: Bond all metallic bodies of appreciable size that are within six feet of the lightning protection system to the system. Bond cold water piping to the nearest down-conductor.
- G. Outdoor Lighting Standard: Ground outdoor lighting standards using copper conductors bonded to nearest available driven ground rods or structural steel.
- H. Outdoor Flag Poles: Ground outdoor flag poles using copper conductors bonded to driven ground rods.
- I. Main Conductors: Roof main conductors shall be aluminum and shall be securely supported to a vertical surface. They shall not be installed where subject to damage. In building main conductors shall be copper and shall also not be installed where subject to damage.
- J. Provide suitable dielectric protection where dissimilar metals are in contact.

### 3.02 CERTIFICATIONS AND TESTS

- A. Inspection and Certification: Furnish the services of UL for inspection and certification of the system in accordance with the provisions of UL 96A.

B. Test: Test the dry season resistance of the lightning protection system. Provide a system that does not exceed five ohms at any point of test. Provide all test equipment as specified and required.

1. Provide additional ground electrodes and/or connections to ensure the five-ohm resistance, regardless of prior shop drawing approvals of the system.

3.03 UL MASTER LABEL

A. UL Master Label: Upon completion of the installation of this system, furnish UL Master Label and deliver it to the City for attachment to the building.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 13111**  
**IMPRESSED CURRENT CATHODIC PROTECTION**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for providing complete, automatically controlled, impressed current cathodic protection system. The impressed current cathodic protection systems include but are not limited to: electrical services, disconnect switches, rectifiers, cabling, anodes and mounting hardware for all equipment. Also required under this section is the cathodic protection system supplier's design of the systems, submittals, installation, testing, start-up, commissioning and training of operations and maintenance staff.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02364 – Steel Pipe Piles
- B. Section 02390 – Fender Piles
- C. Section 02396 – Marine Fendering
- D. Section 02457 – Steel Sheet Piling
- E. Section 02920 – Soil Mixes
- F. Section 09967 – Coatings for Steel Waterfront Structures
- G. Section 16050 – Basic Electrical Materials and Methods
- H. Section 16055 – Electrical Requirements For Shop Assembled Equipment
- I. Section 16060 – Grounding
- J. Section 16075 – Electrical Identification
- K. Section 16080 – Electrical Testing Requirements
- L. Section 16121 – Wires and Cables – 600 Volts and Below
- M. Section 16130 – Electrical Raceway System
- N. Section 16411 – Disconnect Switches
- O. Section 16443 – Panelboards
- P. Section 16460 – General Purpose Dry Type Transformers
- Q. Section 16491 – Control Components and Devices

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. NEC - National Electrical Code
  - 2. NYCEC - Electrical Code for the City of New York
  - 3. NACE - National Association of Corrosion Engineer
  - 4. UL, Inc – Underwriters Laboratories, Inc.

5. NACE Standard RP0169 – Control of External Corrosion on Underground or Submerged Metallic Piping Systems

1.04 SYSTEM DESCRIPTION

- A. Design Requirements: Design the impressed current cathodic protection system for the Southwest Brooklyn Marine Transfer Station in accordance with NACE design criteria and to protect new and existing steel sheet piling, steel fender piles and steel fender frames, steel pipe piles and all associated structural and supporting materials. Refer to Sections 02364 – Steel Pipe Piles, 02390 Fender Piles, 02396 Marine Fendering, 02457 – Steel Sheet Piling, 02920 – Soil Mixes and 09967 – Coatings for Steel Waterfront Structures for information. Design the system for a 20 year life of the anodes considering the element surfaces in the splash zone, tidal zone, submerged zone, below the mudline and in the case of sheet steel piling, the back side. To compensate for the inefficiency of the distribution current, use an efficiency factor of not greater than 70% in calculating the current requirements. Size all rectifiers and current carrying materials for 150 percent of the calculated needs.

The design of the impressed current cathodic protection system includes, but is not limited to the following design calculations, installation drawings and testing:

1. Load calculations
  2. Layout and sizing of rectifiers and cabling
  3. Routing and support for cabling
  4. Anode sizing, material selection and mounting including junction boxes
  5. System monitoring and alarms
  6. Structural bonding
  7. System testing including permanent reference electrodes and test wiring.
- B. Cathodic Protection System Design Requirements for the Southwest Brooklyn Marine Transfer Station
1. Provide a cathodic protection system for the Southwest Brooklyn Marine Transfer Station covering, but not be limited to, the following structural items:
    - a. The east bulkhead which consist of approximately 233 feet of type HZ575A and AZ26 steel sheet pilings and approximately 60 feet of type HZ775C and AZ26 steel sheet pilings.
    - b. The north bulkhead which consist of approximately 333 feet of type PZ35 steel sheet pilings.
- C. Electrical Supply: Under the Division 16 work, two 480-volt, three-phase feeders are provided to power the impressed current rectifiers at the location indicated on the E drawings.

## 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Division 1.
- B. Quality Control: Furnish a signed and sealed certification from a professional engineer registered in the state of New York and certified by NACE stating that the design calculations and drawings for the impressed current cathodic protection systems were prepared by that person or under his or her direct supervision.
- C. Product Data and Information: Furnish manufacturer's catalog data for the following:
  - 1. Panelboards
  - 2. Transformers
  - 3. Rectifiers
  - 4. Disconnect switches
  - 5. Electrical wire
  - 6. Electrical connections
  - 7. Anodes
  - 8. Test boxes
  - 9. Junction boxes
  - 10. Mounting hardware
- D. Shop Drawings: Furnish shop drawings showing the following:
  - 1. Complete calculations for the design of each system including anode design life and coating deterioration assumptions
  - 2. Locations, size and mounting of each anode
  - 3. Diagrams for all cabling
  - 4. Cable raceway details including mounting
  - 5. Electrical load calculations
- E. Quality Control: Submit certified test reports

## 1.06 QUALITY ASSURANCE

- 1. Codes and Standards: Construct complete corrosion protection systems in accordance with applicable NACE, ANSI, IEEE Standards and the Electrical Code for the City of New York.
- 2. Designer: The impressed current cathodic protection systems are to be designed by a NACE Certified Registered Professional Engineer with experience in the design of systems similar to that required for this project.
- 3. Installation: The installation of each cathodic protection system is to be supervised by personnel trained and experienced in the installation of such systems.

4. Testing: Submit for approval field tests and test procedures as defined by NACE that are to be conducted to verify the satisfactory performance of each cathodic protection system. After completion of a system installation, perform all proposed tests including the following. Correct any deficiencies determined during testing.
  - a. Continuity of circuits to each anode
  - b. Current flow to 20 percent of the anodes to determine conformance to the design calculations
  - c. Potential difference to a predetermined reference at 20 percent of the anodes to determine conformance to the design calculations
  - d. Input and output current at each rectifier

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.

### PART 2 PRODUCTS

#### 2.01 SYSTEM SUPPLIERS

- A. Acceptable system suppliers to design and furnish a fully functional impressed current cathodic protection system are listed below. Other equivalent system suppliers may be submitted for review.
  1. CP Masters, Inc.
  2. Corpro Companies Inc.
  3. MATCOR, Inc.

#### 2.02 RECTIFIERS

- A. Provide rectifier units with a rated input voltage of 480 volts, three phase, 60 hertz. Provide with output voltage and current rating as determined from the engineered design.
- B. Provide air cooled transformers and rectifying stacks.
- C. Provide silicon, bridge connected rectifying stacks.
- D. The DC output shall have a minimum of 25 tap adjustment bars suitable for fine tuning the output.
- E. Provide control panel with input circuit breakers, rectifier fuses, tap adjustment bars, voltmeter, ammeter and DC output terminals.

- F. Provide lightning protection both the input (AC) and output (DC) using high energy metal oxide varistor arrestors.
- G. Provide rectifiers suitable for operation in ambient of -50 degrees to 45 degrees C with natural air convection cooling.
- H. Provide NEMA 3RX (ventilated corrosion resistant) stainless steel enclosures with quick opening latches on hinged covers suitable for wall or floor mounting.

## 2.03 ANODES

- A. Provide anodes of the material type, weight and dimensions as determined for the application as determined by the engineered design.
- B. Wire to Anode Connection: Provide a special low resistance connection, completely sealed against water with a special sealing compound that forms a watertight bond with the anode surface and wire insulation.

## 2.04 ANODE AND RECTIFIER JUNCTION BOXES

- A. Provide NEMA 4X easy access fiberglass enclosures with hinged covers, stainless steel locking latches and padlockable hasp.
- B. Provide anode boxes with shunts, terminals and copper bus bars mounted on insulated interior back panels to accommodate anode wires.
- C. Provide rectifier boxes with positive and negative copper bus bars and terminals mounted on insulated interior back panels for terminating negative return structure wires, structural test wires, reference electrode wires and cables from the anode junction boxes.
- D. Provide junction boxes suitably sized to accommodate the size and quantities of conduits and conductors required by design.

## 2.05 PERMANENT REFERENCE ELECTRODE

- A. Provide permanent reference electrodes having copper/copper sulfate cells consisting of pure copper coiled elements surrounded by a super saturated solution of copper sulfate and constructed in a Schedule 80 PVC tube.
- B. Provide lead wire consisting of No. 14 AWG stranded copper conductor with type high molecular weight polyethylene, HMWPE insulation sized per the application. Route the lead wire continuous without splices from the electrode to the rectifier junction box.
- C. Solder and mechanically bond the lead wire to the copper element and thoroughly seal inside the electrode tube to prevent moisture penetration.

**2.06 CATHODIC SYSTEM WIRE AND CABLE**

- A. Provide structure negative return cables, test wires and bonding wires shall be stranded copper conductors with type high molecular weight polyethylene HMWPE insulation and sized per the application. Route the negative return and test wires continuous without splice to the rectifier junction box. Route bonding wires between points of connection on the structure continuous without splice.
- B. Anode Wires: Provide a minimum of No. 8 AWG stranded copper conductors with a dual insulation consisting of Halar polyolefin primary insulation and an external jacket of high molecular weight polyethylene, HMWPE.

**2.07 THERMITE WELDING EQUIPMENT**

- A. Provide thermite welding equipment specifically designed for the wire size and structure to be welded. All welding materials shall be a coordinated system by one manufacturer.

**2.08 BASIC ELECTRICAL MATERIALS**

- A. Branch Wiring: Provide branch wiring meeting the requirements of Section 16121 – Wires and Cables – 600 Volts and Below.
- B. Conduit, Junction Boxes and Fittings: Provide conduit, junction boxes and fitting meeting the requirements of Section 16130 – Electrical Raceway System.
- C. Disconnect Switches: Provide disconnect switches meeting the requirements of Section 16411 – Disconnect Switches.
- D. Panelboards: Provide panelboards meeting the requirements of Section 16443 – Panelboards.
- E. Dry Type Transformers: Provide dry type transformers meeting the requirements of Section 16460 – General Purpose Dry Type Transformers.
- F. Control Components and Devices: Provide all controls and equipment meeting the requirements of Section 16491 – Control Components and Devices.

**PART 3 EXECUTION****3.01 INSTALLATION**

- A. General: Install all impressed current cathodic protection system components in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1 and meeting the requirements of NACE and NEC.
- B. Coordination: Coordinate with other work including steel pipe piles, steel sheet piling, exterior and interior finishing as necessary to interface the installation of the impressed current cathodic protection system with other work.

**C. Anode Assembly Installation**

1. Install the anode assemblies at the locations shown on the impressed current cathodic protection system supplier's design drawings.
2. Exercise care in the handling of anodes so as not to damage casings, stabilizers or lead wires.
3. Support anode casings as required to prevent shifting of position due to dredging or other means of disruption.

**D. Anode Wire Installation**

1. Route anode wires from the anode assemblies in accordance with impressed current cathodic protection system supplier's design drawings requirements allowing sufficient slack to prevent tension on the wires to anode connections. Route groups of wires together.
2. Where cables are run along the river bottom, weigh the cables down in accordance with impressed current cathodic protection system supplier's design drawings to keep the cables close to the river bottom.
3. Tag each wire end with the anode number associated with each cable.
4. Route the anode wires in conduit to the anode junction boxes as shown on the impressed current cathodic protection system supplier's design drawings.

**E. Pile Bonding**

1. Bond all piles together using thermite welds performed on dry surfaces above the mean high water line in accordance with the impressed current cathodic protection system supplier's instructions.
2. Test all thermite welds for continuity and soundness and redo where found unacceptable.
3. Coat all satisfactory completed welds with a suitable mastic as recommended by the supplier of the system. Coat all exposed copper conductors and the metal surface surrounding the welded area.
4. Secure all bond wires with suitable non-metallic clips, anchors and other devices to prevent mechanical damage caused by ice, debris and wave action.
5. Structure negative return cables and test wires shall be similarly attached to piles where shown on the system supplier's design drawings.

6. Clearly identify the structure negative return cables and route in a separate conduit from the supply wires to the anode junction box and through to the rectifier junction box.

F. Sheet Pile Bonding

1. Electrically bond all adjoining sheet pile segments by attaching bonding jumpers across joints where shown on the impressed current cathodic protection system supplier's design drawings.
2. Test all thermite welds for continuity and soundness and redo where found unacceptable.
3. Coat all satisfactory completed welds with a suitable mastic as recommended by the supplier of the system. Coat all exposed copper conductors and the metal surface surrounding the welded area.

G. Reference Electrode Installation

1. Install the reference electrodes in PVC casings where shown on the system impressed current cathodic protection system supplier's drawings.
2. Position reference electrodes with the bottom of the electrode 2 feet below the mean low water line or as recommended by the impressed current cathodic protection system supplier.
3. Route the reference electrode lead wire inside the reference electrode casing and on to the anode junction box as shown on the impressed current cathodic protection system supplier's design drawings.

H. Anode Junction Box Installation

1. Mount anode junction boxes in accessible locations not subject to possible damage from vehicular or operations traffic.
2. Carefully pull and terminate anode wires on the appropriate terminals of the junction box panel. Clearly identify the anode numbers on the panel with terminations made systematically from the lowest to the highest number.

I. Main Rectifier Junction Box Installation

1. Mount the rectifier junction box adjacent to the rectifier as shown on the impressed current cathodic protection system supplier's design drawings.
2. Carefully pull, terminate and identify all wires from the anode junction boxes and negative structure connections.

3. Terminate and clearly identify structure test wires and reference electrode wires at terminals on the junction box panel.

J. Rectifier Installation

1. Install the rectifier and connect the input power supply to the unit as shown.
2. Install the positive and negative output conductors to the rectifier junction box and terminate at the positive and negative copper bus bars.

3.02 FIELD QUALITY CONTROL

- A. Tests: The entire system shall be inspected and tested in accordance with NACE Standard RP0169. The registered professional Commissioner that seals and signs the system design documents shall select the criteria for determining the adequacy of protection. Tests shall be performed by a certified corrosion protection engineer from the system supplier in the presence of the Commissioner. Any visual inspection method available may be used to verify proper installation of anodes at the station.
- B. Test and Inspection Notification: The Contractor shall notify the City of New York and the Commissioner when the systems are ready for operation. The City of New York will provide the Contractor with dates as to when the testing and inspection may begin. Upon completion of all inspections and tests, submit a detailed report for each site documenting all inspections and test results. The Contractor shall correct all deficiencies noted and arrange for the system(s) to be retested where necessary. Any additional costs are the responsibility of the Contractor. Re-submit revised final detailed reports. The final detailed reports shall include: As Built drawings for the installed systems, field testing results, discussions of the installation and recommendations for operating and maintaining the system.
- C. Training: Following completion of the installations and field testing provide training for (12) employees of the City of New York in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the City's facilities at a time agreeable to the City of New York:
  1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
- D. Warranty: The systems supplier shall inspect, test and adjust the cathodic protection system quarterly for one year (4 inspections) to ensure continued compliance with the final detailed reports test results. The warranty period for these tests shall commence upon acceptance of the systems by the City. Ten (10)

copies of the final detailed reports certified by the corrosion protection engineer shall be provided by the Contractor to the City of New York.

**-END OF SECTION-**

**Section 13125**  
**RESIDENT ENGINEER'S FIELD OFFICE TRAILER**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The Contractor shall furnish, install and equip one new Resident Engineer's field office trailer complex. The enclosed area shall be heated, air conditioned, insulated, and paneled. The total enclosed area shall be approximately 1500 square feet minimum. The field office trailer shall be fully functional before any permanent construction work commences at the site and until all work including the final project closeout procedures are completed.
- B. Electrical and Telephone Services: Installation of electrical power supply and telephone service to the trailer shall be in accordance with Section 01513 - Temporary Light and Power Facilities.
- C. At the completion of all work under this Contract as stipulated herein, subject to the approval of the engineer, the field office trailer and controls shall be removed and the facilities restored to their original condition.
- D. All costs associated with the field office trailer and controls including, but not be limited to, installation, maintenance, relocation, and removal shall be borne by the contractor at no additional cost to the owner.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01513 - Temporary Light and Power Facilities

**1.03 REFERENCES**

- A. Resident Engineer's Trailer shall comply with the latest applicable provisions and recommendations of the following:
  - 1. New York City Building Code
  - 2. New York City Electrical Code
  - 3. National Sanitation Foundation (NSF) Standard 42 (Class II)

**1.04 SUBMITTALS**

- A. Furnish all working drawings and specifications in accordance with Article 4 of the General Conditions within 14 days of the Commissioner's order to commence work.
- B. Furnish drawing showing layout of rooms and furnishings.

- C. Furnish drawing showing location of trailer on the site and location of external connections for power, telephone, water supply and sanitary drainage. Also show the enclosed areaway between the trailers.
- D. Furnish manufacturers' catalog cuts, specifications, and other data in sufficient detail for the proposed trailer and equipment to be compared to the specified requirements.

#### 1.05 MAINTENANCE AND UTILITIES

- A. The Contractor shall provide and pay in full for all electric service, heat, data communication services, telephone services for calls within New York City as well as business calls outside the City of New York limits, heat, water, and daily janitor service including mopping and vacuuming of the trailer.
- B. The Contractor shall furnish, replace and replenish electric light bulbs and fluorescent tubes, toilet paper, cloth and paper towels, soap, water, fuel and all else required to maintain the trailer in a clean and perfect condition. The trailer's floors shall be washed and waxed at least once per week.
- C. The Contractor shall furnish all office supplies, including copy paper, stationary supplies, printer cartridges, and all other supplies normally associated with the functioning of an office as required by the Resident Engineer.
- D. The Contractor shall maintain and repair the trailer and its equipment and services, as stipulated, to the satisfaction of the Commissioner during the performance of the work under this Contract and for a period of 180 calendar days after the Contract is completed as evidenced by the issuance of the Final Certificate.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURED UNITS

- A. Trailer: The Resident Engineer's trailer shall be new office type, fully insulated, approximately 60 feet long and 25 feet wide overall. The trailer shall be similar or equal to that manufactured by Miller Building Systems, 64 Hess Road, Leola, PA 17540 or by Williams Scotsman, 46 Windsor Place, Central Islip, NY 11722-3302 with the following minimum requirements:
  - 1. The exterior of the trailer and the wheel rims shall be given an approved prime coat of paint followed by one coat of approved exterior enamel. The enamel finish coat shall be DuPont Lacquer, or approved equal, color to be furnished upon award of Contract. The trailer shall be lettered on the side with black block lettering having white borders as follows or as otherwise directed by the Commissioner:

CITY OF NEW YORK  
DEPARTMENT OF SANITATION

(2-1/2" letters)  
(3-1/2" letters)

Resident Engineer's Field Office Trailer  
13125-2

RESIDENT ENGINEER'S FIELD OFFICE (2-1/2" letters)

On the front end of the trailer in block letters:

TRAILER NO. \_\_\_\_ (3-1/2" letters)

The number shall be painted in as directed.

2. All windows and doors shall have expanded metal security screens.
3. All windows shall have blinds.
4. Interior shall be finished in 1/4-inch paneling. All walls shall be insulated; interior walls shall be insulated for soundproofing.
5. The interior of the trailer shall be divided by partitions with doors as shown on the Contract Drawings. The Commissioner shall determine final dimensions for all rooms. All partition doors shall be furnished with an integral lock.
6. Lavatory
  - a. Each lavatory shall be equipped with one (1) low flow flush toilet, wash basin with faucet, a first aid kit as manufactured by Johnson & Johnson, No. JOJ 8144, or by MFASCO No. 4825, or approved equal, a paper towel dispenser and a roll toilet tissue holder for the toilet. A 6-gallon capacity under the sink type automatic electric hot water heater shall be furnished and installed in each lavatory.
  - b. A power exhaust fan shall be installed in the ceiling of each washroom. The fan shall be an 8-inch fan equal to DOMEX Model No. DX08S as manufactured by Penn Ventilation Co., North Wales, PA 19454.
  - c. A stainless steel grab bar shall be installed by each toilet for handicap use, 1-1/2 inch outside diameter, 51 inches long, fastened at ends and center to support a 250 pound load, Bobrick B-6806 Series with concealed anchors, or approved equal.
7. Plumbing and fixtures shall be approved house type. Each appliance shall be trapped and vented. The trailer shall have a single discharge connection.
8. The heating system shall consist of thermostatically controlled built-in electric baseboard heaters capable of maintaining 70° Fahrenheit temperature in all rooms when the exterior air temperature reaches 0° Fahrenheit.

9. The air conditioning units located in each room of the trailer shall be capable of maintaining a temperature of 75° Fahrenheit in all rooms when the exterior air temperature reaches 95° Fahrenheit. The units shall be installed at such a height as not to interfere with the placement of file cabinets or other furnishings.
10. The trailer shall be equipped with an armored cable wiring system conforming to the requirements of the Electrical Code of the City of New York. The wiring shall be complete with a service entrance rated, 200 Ampere circuit breaker panel. Provide a panelboard with a 200 Ampere main circuit breaker and 24 circuit capacity. Separate circuits shall be provided for lighting and the various other electrically operated items furnished by the Contractor. Circuit size shall be adequate to operate the central heating and air conditioning system, the lighting system, computers, and the copying machines. The entire trailer and electrical system shall be properly grounded.
11. Interior lighting shall be provided using 4-foot fluorescent fixtures, each with an electronic ballast and two (2) or three (3) 32-Watt T-8 lamps. Provide light fixtures that are U.S. EPA Energy Star labeled. Design light fixture layout to provide an average illumination level of 70 footcandles in the office areas and 20 footcandles in the lavatories. Fixtures located in the lavatories shall be UL Listed for damp locations. Wall switches shall be provided for all light fixtures.
12. A minimum of two (2), 120 Volt, 20 Ampere, duplex convenience receptacles shall be installed for each computer work station, four (4) duplex outlets each in the conference rooms, and one single convenience outlet in each entrance way and lavatory. These outlets shall be in addition to connections and outlets for the water heaters, kitchenette unit with appliances and the water cooler. Each receptacle in the kitchenette and lavatories shall be of the GFCI type. All outlets shall be of the grounded type.

## 2.02 EQUIPMENT

- A. Built-In Equipment: In addition to the lavatories, partitions and closets, the following items shall be built into the trailer:
  1. Security Systems: The trailer shall be provided with an approved Fire, Panic, and Intrusion alarm system. The alarm system shall be connected via the telephone service in the trailer complex to an approved central monitoring station so that continuous monitoring will be in effect.
  2. Fire System: In each of the offices in the trailer, heat detectors rated 135°F and smoke detectors shall be located in the ceiling and as close to the middle of the room as possible. The fire system shall be wired directly to a central control panel located in the field office trailer. Upon activation of the fire

system, sirens with a steady tone shall sound the fire alert. All sirens shall automatically shut down and re-arm after ten minutes.

3. Intrusion and Panic Alarm System: Each door and window in the entire trailer shall be protected so that if it is opened while the system is activated, an alarm condition will result. Upon activation of the intrusion system, sirens with a modulating tone shall sound an alert. All sirens shall automatically shut down and re-arm after ten minutes.
  - a. Panic alarm units shall be installed in two locations as designated by the Resident Engineer. When this system is activated, there shall not be a siren response; this system shall be activated in the silent mode.
  - b. A remote tamperproof turn-off switch shall be installed on the outside of the trailer at a location designated by the Commissioner so that the intrusion system can be shut down before entering the trailer. The remote turn-off switch shall not affect the fire or panic system; turn-off switches for these systems shall be located as directed by the Commissioner. The intrusion and panic system shall be connected to the central control panel located in the field office trailer.
4. Control Equipment
  - a. All wiring shall meet current standards being used in the alarm industry, and, where possible, all wires shall be hidden.
  - b. All contacts shall be recessed and moisture proof.
  - c. The single unit smoke and heat detectors shall be of a photoelectric type that provide quick response to flaming and smoldering fires and designed to permit easy entry of smoke from any direction. The heat detector portion of this unit shall be activated at 135°F. The combined unit shall also have an LED pulse located on the face of the unit to indicate that power is on. NO RADIOACTIVE materials will be permitted in this fire alarm sensor.
  - d. An 8-ohm siren shall be provided. The siren shall be installed in a tamperproof steel siren box located on the exterior of the trailer at least 10 feet above the top of the trailer roof. The external siren shall be of 30-watt capacity with two separate and distinct alarm signals for both warble and continuous tone selections so as to differentiate between fire and burglar alarm. It shall be Ademco Model No. 715 "Blaster" electronic siren in tamperproof cabinet or equal. There shall be an amber strobe light attached to or adjacent to the siren box, wired so that it is activated when the siren is activated.

- e. The control panel shall be provided and installed in the field office trailer. The control panel shall be equipped with at least three channels - one for fire, second for intrusion and third for panic. The control panel shall also have DC batteries that will supply back-up power in the event that AC power is interrupted. Each channel of the control panel shall be wired directly to a digital communicator. The control panel shall have one delay entrance exit channel. The control panel and system shall be a twelve-volt system. The control panel shall have a switch for bell/battery test and fire reset, and shall have indicating lights that indicate the mode of the:

- (1) Protective circuit
- (2) Alarm memory
- (3) AC power on
- (4) Armed

- f. The digital communicator shall be provided and installed adjacent to the control panel in the field office trailer. It shall be a type that will notify the approved central station of the specific alarm condition (fire, intrusion, or panic). The digital communicator shall also inform the approved central station of low power on the system. The Contractor shall arrange through Verizon for the necessary interconnect equipment so that the digital communication can be connected to the telephone service at the field office trailer. The connection of Verizon shall have line seizure so that the outgoing signal from the digital communicator cannot be interrupted. The current standards used by the approved central station regarding "call back to verify" alarm conditions shall be employed.

- g. Area Lighting: The Contractor shall install a minimum of four external floodlights to illuminate the Resident Engineer's trailer and surrounding walkways. They shall be activated by a photoelectric unit with a backup timer.

B. Moveable equipment shall be furnished, including the following:

1. As manufactured by the HON Company, 200 Oak Street, Muscatine, IA 52761 or approved equal:
  - a. Ten desks with locks, 60" x 30", Model No. 34962, color: walnut
  - b. Ten swivel chairs with arms, Model No. 6003, upholstered with Camel FQ26 fabric.
  - c. Ten guest chairs, Model No. 6008, Black frame and Camel FQ26 fabric.

- d. Ten book cases 72"H x 36"W and 12-5/8"D, Model No. S72ABC, color: Putty.
  - e. Seven 5-drawer lateral legal size filing cabinets with locks, Model No. HON Series 600 42" wide, color: Putty.
- 2. As manufactured by the HON Company, 200 Oak Street, Muscatine, IA 52761 or approved equal:
  - a. Two reference tables, 5'-0" x 2'-5", Product No. UTM3060, color: walnut.
  - b. Two reference tables 6'-0" x 2'-5", Product No. UTM3072, color: walnut. One for conference table and one for plan reference.
  - c. One printer table 3'-4" x 1'-8". Product No. UTM2040, color: walnut.
  - d. Fourteen waste paper baskets, 11" x 15-1/4" x 20", Blue, No. 2806, as manufactured by Rubbermaid, or 15-1/2" x 11" x 20", Black, No. 16041, by Tenex Corp., Elk Grove, IL, 60007, or approved equal.
- 3. As manufactured by Quartet or approved equal:
  - a. Two 8' x 4' white marker board with oak frame, No. S578
  - b. Two 4' x 3' corkboards with oak frame, No. 304.
- 4. Two dry chemical, 5 lb. rechargeable fire extinguishers, U.L. listed 3A-40BC, as manufactured by Atlas Fire Equipment Company, or Model No. 466143, by Kidde Safety, or approved equal.
- 5. One copying machine as manufactured by Xerox Corp., Document Centre 470ST Digital Copier with Fax Accessory, or approved equal. The Contractor shall maintain the machine for the duration of the Contract and provide all ancillary supplies.
- 6. One digital camera model Sony DSC-H10 or equal.
- 7. One laser printer, 10/100 Base-T, 1200 dpi quality, 600 x 600 dpi, 128 MB RAM, model HP 8150hn or equal.
- 8. One printing calculator with internal paper roll, equal to Monroe 7140 Heavy Duty Calculator as manufactured by Monroe Systems for Business, Inc.
- 9. One telephone system that includes twelve (12) telephone numbers with automatic switchgear, voice mail, and twelve (12) extension phones. One (1) telephone number shall be dedicated to the fax machine.

10. One desk top plain-paper, facsimile transmitter receiver, Brother Intellifax FAX4100E, or approved equal, with all necessary plugs, jacks, etc., to ensure system operation, in accordance with the manufacturer's recommendations. The Contractor shall maintain the machine for the duration of the Contract and provide all ancillary supplies.
11. Twelve (12) two-way portable radios. The units shall be Motorola T9500XLR or approved equal.
12. Provide a surge protector for each copy machine, laser printer, fax machine and two-way radio base station (total of 4). Surge protectors shall be a 7 outlet model with 480 Joules surge rating, APC model NET7 or equal.

C. Kitchenette Accessories

1. One kitchenette, sink and an 18-cubic foot refrigerator with outside water as manufactured by Frigidaire, Model No. PHT189WHS, Michigan City, IN 46360, or approved equal. It shall be installed where shown, complete with plumbing, sanitary and electric connections. Provide base cabinets, upper cabinets, and countertops as shown on the Contract Drawings.
  - a. The unit shall have a water filter. Filter shall be periodically changed per manufacturer's recommendations. The Contractor shall furnish all labor, materials, tools and equipment necessary for furnishing, installing, connecting, testing and placing into satisfactory operation, a cold water, under counter filter which utilizes its own spout. The filter shall be an Aqua-Pure AP-200 with Aqua-Pure AP-217 taste/odor cartridge, as manufactured by Cuno, 400 Research Parkway, Meriden, CT 06450, or approved equal, and conform and be listed under NSF Standard 42 (Class II). The replacement cartridges for the AP-217 are to be supplied and delivered as directed by the Commissioner.
2. Provide a dual warmer pour-over brewer coffee machine. Stainless steel cabinet, top and bottom warmers and lighted on/off switch. Manufactured by Mr. Coffee Inc., or equal.
3. One over the range microwave oven with exhaust hood, Model MH6130XE, Black, as manufactured by Whirlpool, or approved equal.
4. One 6-slice toaster oven, Black, Oster Model No. 6290, or approved equal.

**D. Computers and Associated Software**

1. The Contractor shall supply ten identical, complete personal computers, with consumable supplies and software. The computer systems shall be delivered to the Resident Engineer's Trailer at a time determined by the Commissioner. Personal computer shall meet the following minimum specifications:
  - a. Case: Mini-tower
  - b. CPU: Intel Core 2 Quad
  - c. CPU Speed: 2.4 GHz or greater
  - d. RAM: No less than 1GB ; RAM Type: SDRAM
  - e. Monitor: 19" color, flat screen, LCD type
  - f. Video Card: 128MB DDR SDRAM
  - g. Hard Disk Drive: No less than 100 GB
  - h. Optical Drive: DVD-R
  - i. Keyboard: 104-key
  - j. Point Device: PS2 Intellimouse Explorer Optical Mouse
  - k. Network Interface: 10/100 Base T
  - l. Operating System: Windows, Professional Edition, latest version
  - m. Surge Protection: 7 outlets, 480 Joules surge rating, APC model NET7, or equal
  - n. Accessories: Patch cable for network connections, 15 feet long
2. Provide the following pre-installed software with each personal computer:
  - a. Microsoft Office, Professional Edition, latest version
  - b. Microsoft Internet Explorer, latest version
  - c. Microsoft Outlook, latest version
  - d. Microsoft Net Meeting, latest version
3. Provide personal computer systems from the following manufacturers:
  - a. Gateway
  - b. Dell
  - c. Hewlett Packard
  - d. Or equal
4. Additional Software: Provide the following software licenses:
  - a. Ten pack client licenses for Microsoft Exchange
  - b. Ten pack user licenses for Lexign Icxpertflow (Keyflow software)
5. Maintenance and Support: The Contractor shall furnish for the duration of the Contract, a renewable service contract for on-site maintenance of all hardware and software. The maintenance response time for the hardware and software shall be not more than 24 hours from the time of notification of a

service related problem. The Contractor shall furnish any item inadvertently omitted from this specification that is required to insure the proper operation of the personal computer system and software as specified above.

6. Each trailer shall be wired with Cat 6 cable to a centrally located patch panel adjacent to the telephone peripheral node and connected to a new Ethernet switch provided with telephone system and fiber optically connected to all other trailers switches.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

##### A. Trailer Installation

1. Trailer shall be located and installed as shown on the contract drawings.
2. Concrete block foundation walls and concrete footings shall be constructed as directed. The walls and footings shall completely enclose the bottom of the trailer and shall extend below the frost line. Wood stairs, platform and railing shall be constructed at each door.
3. Trailer shall be placed on a concrete pad as shown.
4. All exterior items not factory painted shall be painted by the Contractor as directed by the Commissioner.

##### B. Trailer Services

###### 1. Plumbing

- a. Plumbing work shall include all water supply, drainage, pumping, and piping required for a complete operating installation. A temporary water service shall be provided from the existing water main and extended into the trailer, and all fixtures requiring water supply shall be properly connected. All necessary soil, waste, vent, and drainage piping shall be provided and connected to the existing plant sewer system.
- b. All water pipes shall be frost proofed with heat tracing to prevent freezing.
- c. The plumbing work shall be maintained and shall be repaired when and as directed by the Commissioner and as required, and kept in perfect condition during the performance of the work under the Contract.

2. Heating and Air-Conditioning Systems

- a. The Contractor shall place in operation and maintain the entire central heating system and air conditioning units for the trailer.
- b. The central heating system and air conditioning units shall be maintained, repaired and kept in perfect condition during the performance of the work.

3. Computers and Associated Software

- a. Install each item in accordance with the manufacturers' recommendations and in accordance with the Contract Documents.
- b. Provide all supports, bracing, wiring, and incidental hardware required for a complete and sound installation.
- c. All software required for these units shall be loaded, configured and fully tested as part of this contract. Provide all drivers required to connect to the network.

-END OF SECTION-

**Southwest Brooklyn Marine Transfer Station**

**FMS No. S216-399A**

NO TEXT ON THIS PAGE

**Section 13287****ENVIRONMENTAL WASTE TRANSPORTATION AND DISPOSITION****PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for transportation and disposition of waste materials generated as a result of the environmental remediation work.
- B. Recordkeeping requirements.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01355 – Regulated Materials Control
- B. Section 01356 – Safe and Healthful Working Conditions
- C. Section 01733 – Construction Waste Management
- D. Section 02225 – Impacted Soil Handling
- E. Section 02316 – Excavation

**1.03 PAYMENT**

- A. All costs associated with the characterization, profiling, disposal acceptance, regulatory compliance, loading, containerizing, transportation, and disposition of the environmental waste materials, including excavated materials, shall be borne by the Contractor and shall be included in Contractor's lump sum bid price for Bid Item 1.
- B. Final payment shall not be made if the copies of manifests, bills of lading, and certificates of disposal/recycling/reclamation are not received by the City of New York for all wastes transported offsite.

**1.04 DEFINITIONS**

- A. Environmental waste shall mean waste generated as a result of implementing the environmental remediation work identified in the related specifications.

**1.05 WORK SPECIFIED**

- A. The Contractor shall provide all labor, equipment, materials, and services necessary to characterize, profile, load, containerize, transport, and dispose of/reclaim/recycle all waste materials generated during implementation of the environmental remediation work. Such materials include, but may not be limited to, fluorescent and HID lamps, fluorescent and HID lamp ballasts, refrigerant, mercury-containing devices, batteries, containerized chemicals, various oils, asbestos-containing materials (ACMs), loose paint, bird excrement, arsenic impacted wood, microwave ovens, disposable equipment and personal protective equipment (PPE),

decontamination waste, and staging/decontamination area construction materials. This Section does not include dredge spoil which is covered in Section 02325 - Dredging and Dredged Material Disposal.

- B. The Contractor shall provide all labor, equipment, materials, and services necessary to profile, load, transport, and dispose of excavated material.

#### 1.06 MINIMUM EXPERIENCE REQUIREMENTS

- A. The entity performing the work under this section must demonstrate at least three (3) years of experience in waste transportation and disposition.

#### 1.07 RESPONSIBILITIES

- A. The Contractor shall be directly responsible for compliance with all applicable federal, state, and local laws, rules, and regulations governing the storage, handling, manifesting, transportation, and disposal/reclamation/recycling of waste materials generated as a result of work activities under the Contract.

#### 1.08 SUBMITTALS

- A. At least 30 calendar days prior to the commencement of the environmental waste transportation and disposition work, the successful Contractor shall submit the following items for review in accordance with the requirements specified in Section 01355 - Regulated Materials Control:
  - 1. Estimated quantities of each type of waste material to be generated as a result of the environmental remediation work specified in the following Sections, and anticipated number and type of containers to be utilized to transport each waste stream.
    - a. Section 01355 – Regulated Materials Control
    - b. Section 02225 – Impacted Soil Handling
    - c. Section 02316 - Excavation
  - 2. Inaccuracies in the Contractor's estimate will not entitle the Contractor to additional compensation under this Contract.
  - 3. A list of proposed transporters for all waste materials generated during implementation of the environmental remediation work and for surplus excavated materials that require offsite disposal (if any). All transporters must possess a valid transporter permit for handling the waste(s), as applicable.
  - 4. A list of disposal/reclamation/recycling facilities for all anticipated environmental waste streams (i.e., regulated/hazardous materials) and for excavated materials that require offsite disposal. All

disposal/reclamation/recycling facilities must be permitted in accordance with applicable regulations.

- B. Submit executed copies of waste manifests, bills of lading and verification of disposal/recycling/reclamation within 30 days of disposal/recycling/reclamation.

## PART 2 PRODUCTS

### 2.01 CONTAINERS

- A. The Contractor shall provide United States Department of Transportation-(USDOT-) approved containers for containerizing all waste materials generated as a result of the environmental remediation work. If the containers are to be disposed with the waste they contain, the Contractor shall include costs for such containers in its bid.
- B. The Contractor shall provide USDOT-approved containers for containerizing surplus excavated materials that require offsite disposal (if any).
- C. All containers shall be labeled by the Contractor in accordance with applicable laws, rules, and regulations.

## PART 3 EXECUTION

### 3.01 GENERAL

- A. All environmental waste streams and excavated materials shall be transported to disposal/reclamation/recycling facilities that are permitted to accept such types of waste. The disposal/recycling/reclamation facilities shall be proposed by the Contractor and reviewed by the Commissioner. Review by the Commissioner will not release the Contractor from its obligation to comply with all applicable laws, rules, and regulations and shall not constitute a relief from the requirements of the Contract.

### 3.02 DISPOSITION OF MATERIALS

- A. The following materials shall be transported for offsite disposal/recycling/reclamation by the Contractor:
  - 1. ACMs
  - 2. Loose paint chips. The loose paint collected from the transfer station shall be handled and disposed as a Resource Conservation and Recovery Act (RCRA) hazardous waste due to assumed lead and cadmium toxicity (EPA hazardous waste numbers D008 and D006, respectively).
  - 3. Bird excrement

4. Fluorescent and HID lamps. All fluorescent and HID lamps shall be disposed of as a RCRA hazardous waste due to assumed mercury and lead toxicity (EPA hazardous waste numbers D009 and D008, respectively). The Contractor may elect to manage the fluorescent and HID lamps as a universal waste within states that have adopted the United States Environmental Protection Agency's (USEPA's) Universal Waste Rule.
5. Lamp ballasts. Leaking PCB-containing (or assumed to be PCB-containing) ballasts and any material that comes in contact with leaking material shall be transported to a Toxic Substance Control Act- (TSCA-) compliant incinerator for disposal. Intact, non-leaking ballasts shall be disposed of in accordance with applicable regulations.
6. Mercury-containing devices. All mercury-containing devices shall be disposed of as a RCRA hazardous waste due to assumed mercury toxicity (EPA hazardous waste number D009). The Contractor may elect to manage the mercury-containing thermostats as a universal waste within states that have adopted the USEPA's Universal Waste Rule.
7. Refrigerants. Used chlorofluorocarbon (CFC) refrigerants from totally enclosed heat transfer equipment are excluded from hazardous waste regulations, provided the refrigerant is reclaimed for future use. CFC refrigerants recovered from air conditioning (AC) units, drinking water fountains, beverage vending machines, and refrigerators shall be transported to a reclamation facility.
8. Various oils
9. Microwave ovens
10. Containerized chemicals
11. Decontamination waste (including liquid and solid decontamination waste) and decontamination areas.
12. All other wastes generated during implementation of the environmental remediation work.
13. Regulated/hazardous wastes generated during implementation of non-environmental remediation activities (i.e., general construction).
14. Excavated materials
15. Arsenic-impacted wood. Arsenic-impacted wood (i.e., wood that failed the Toxicity Characteristic Leaching Procedure [TCLP] test for arsenic) shall be disposed of as a hazardous waste at a Subtitle C (hazardous) waste disposal facility.

- B. Should minimal demolition of building components (e.g., suspended ceilings, interior partition walls) be required during the performance of the pre-demolition environmental remediation activities (i.e., to gain access to regulated/potentially regulated materials/equipment that shall be addressed prior to initiating the transfer station demolition activities), the Contractor shall move and stage demolition debris generated as a result of such minimal demolition activities. Location of the demolition debris staging area(s) shall be proposed by the Contractor and reviewed by the Resident Engineer. The demolition debris staging area(s) shall be located onsite in area(s) sheltered from the elements (e.g., building interior) to minimize the potential for dispersing the debris by erosion and wind forces.

### 3.03 RECORD KEEPING

- A. The Contractor shall be responsible for waste characterization and profiling of the environmental waste materials. All disposal-associated documentation for the environmental waste shall be submitted to the Commissioner for review prior to submittal to the disposition facility.
- B. The Contractor shall prepare the waste manifests and bills of lading for the transport and offsite disposal/reclamation of all environmental waste materials. The DSNY and/or the Resident Engineer will review, and sign the waste manifests and bills of lading as Generator of the waste, prior to offsite transport of waste materials. The following address shall be specified as a "Waste Generator" on the manifests and bills of lading:

New York City Department of Sanitation  
Bureau of Long Term Export – Engineering Unit  
44 Beaver Street, 7<sup>th</sup> Floor  
New York, New York 10004  
Telephone: (212) 437-4520

- C. Modifications to waste profiles, manifests, bills of lading, or any other associated documentation shall be made by the Contractor at the request of the DSNY and/or the Commissioner at no additional cost to the City of New York.
- D. The Contractor shall coordinate with disposal/recycling/reclamation facilities for a timely receipt of executed copies of hazardous waste manifests, non-hazardous waste manifests, bills of lading, and certificates of disposal/recycling/reclamation and shall provide original copies of these documents to the DSNY to the address specified in Paragraph 3.03B of this Section for all environmental wastes transported offsite. In addition, the Contractor shall submit copies of the above-referenced documents to the Resident Engineer. Copies must be received within 30 days of disposal/recycling/reclamation.
- E. The Contractor shall submit executed copies of the waste manifests, bills of lading, and verification of disposal/recycling/reclamation to the Resident Engineer to assure proper project close-out and final payment.

- F. The Contractor shall be responsible for providing the generator state (i.e., New York State) and disposal state (if different than New York) with executed copies of hazardous waste manifests, as required.

3.04 POST-WASTE SHIPMENT ACTIVITIES

- A. Any disposable material not used or shipped offsite during waste shipment operations (e.g., paper, food containers) that have not come in contact with impacted site materials shall be placed into a Contractor-provided sealable container, removed from the site, and properly disposed of by the Contractor at no additional cost to the City of New York.

3.05 HEALTH AND SAFETY PROTOCOLS

- A. The Contractor shall comply with all applicable federal, state, and local regulations, including, but not limited to, Occupational Safety and Health Administration regulations, during the implementation of the work. The work described in this Section shall be conducted in accordance with the Contractor's site-specific Health and Safety Plan, which is described in Section 01356 – Safe and Healthful Working Conditions.

-END OF SECTION-

**Section 13851**  
**FIRE ALARM AND DETECTION SYSTEM**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Furnish and install a complete fire alarm and detection system including fire alarm control panel, printer, fire alarm annunciator panel, purge panel, fan control panels, signal initiating devices, notification devices, raceways, boxes, wires and cables.

**1.02 RELATED SPECIFICATIONS**

- A. Section 08331 - Overhead Coiling Doors
- B. Section 11141 - Diesel Fuel Dispensing System.
- C. Section 13915 - Fire Suppression Piping.
- D. Section 13921 - Electric Drive, Centrifugal Fire Pumps
- E. Section 13953 - Foam-Water Fire Suppression System
- F. Section 15900 - HVAC Controls
- G. Section 15820 - Ductwork Accessories
- H. Section 16050 - Basic Electrical Materials and Methods
- I. Section 16121 - Wires and Cables - 600 Volts and Below
- J. Section 16130 - Electric Raceway System
- K. Section 16411 - Disconnect Switches
- L. Section 16415 - Automatic Transfer Switches
- M. Section 16443 - Panelboards
- N. Section 16491 - Control Components and Devices

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. NYCBC - New York City Building Codes
  - 2. NFPA 72 - National Fire Alarm Code
  - 3. NFPA 90A - 1999 Air Conditioning Systems
  - 4. NFPA 101 - Life Safety Code
  - 5. UL 864 - Control Units for Fire Protective Signaling Systems
  - 6. UL 268 - Smoke Detectors for Fire Protective Signaling Systems
  - 7. UL 268A - Smoke Detectors for Duct Applications
  - 8. UL 464 - Audible Signaling Appliances
  - 9. UL 38 - Manually Actuated Signaling Boxes for Use with Fire-Protective Signaling Systems
  - 10. UL 346 - Waterflow Indicators for Fire Protective Signaling Systems
  - 11. UL 1971 - Signaling Devices for the Hearing-Impaired
  - 12. UL 1481 - Power Supplies for Fire Protective Signaling Systems
  - 13. FM - Factory Mutual Approval

14. OTCR - Office of Technical Certification and Research (NYC)
15. Federal Codes and Regulations
16. (ADA) - Americans with Disabilities Act
17. Rules and Regulations of the NYC Fire Department

#### 1.04 SUBMITTALS

A. General: Furnish all submittals, including the following, as specified in Division 1:

1. Each submittal shall include a cover letter providing a list of each variation that the submittal may have from the requirements of the Contract Documents. In addition the Contractor shall provide specific notation on each shop drawing, sample, catalog cut, data sheet, installation manual, etc. submitted for review and approval, of each such variation.
2. All drawings and diagrams shall include the Contractor's title block, complete with drawing title, Contractor's name, address, date including revisions, and preparer's and reviewers initials

B. Product Data: Manufacturer data sheets indicating the type, size, rating, style, and catalog number for all items proposed to meet the system performance detailed in this specification. The proposed equipment shall be subject to the approval of the Commissioner. No product data will be reviewed for any substitution before the floor plans referenced in C4 below are received.

C. Shop Drawings: A complete set of shop drawings shall be supplied. The shop drawings shall be reproduced electronically in digital format. This package shall include but not be limited to:

1. Control panel wiring and interconnection schematics
2. Complete point to point wiring diagrams
3. Riser diagrams
4. Complete floor plans locating all system devices as well as raceway size and routing, junction boxes, conductor size, quantity, and color in each raceway.
5. Detailed system operational description. Any Specification differences and deviations shall be clearly noted and marked.
6. Complete system bill of material
7. All drawings shall be reviewed and signed off by an individual having a minimum of a NICET certification in fire protection engineering technology, sub-field of fire alarm systems. This signoff shall indicate correctness of the proposed installation for the purpose intended by this specification. It will

also verify the proposed installation conformance to applicable codes and standards.

- D. Samples: A sample of each device - smoke and heat detector, intelligent modules, horn, strobes, and manual pull stations shall be provided to the City for its familiarization.
- E. Installer's Certification: The engineered systems distributor must be licensed in the State of New York and have been incorporated in the business in that state for a minimum of three (3) years. Submit a copy of the installer's training certification issued by the manufacturer of the system. Installers shall be licensed with the State of NY. Provide a copy of the installing technician's NICET certification.
- F. Complete calculations shall be provided which show the electrical load on the following system components:
  - 1. Each system power supply, including stand alone booster supplies
  - 2. Each standby power supply (batteries)
  - 3. Each notification appliance circuit
  - 4. Each auxiliary control circuit that draws power from any system power supply
- G. The close out submittals shall include:
  - 1. Project specific operating manuals covering the installed system. A generic or typical owner's instruction and operation manual shall not be acceptable to fulfill this requirement.
  - 2. As-Built drawings and information consisting of scaled plans of each building describing and depicting the entire system(s) as installed, including all information necessary for maintaining, trouble-shooting, and/or expanding the system(s) at a future date.
  - 3. Complete documentation of system(s) testing. Certification that the entire system(s) has/have been inspected and tested, is installed entirely in accordance with the applicable codes, standards, rules and regulations of the New York City Fire Department, manufacturer's recommendations and UL listings, and is/are in proper working order. Contractor shall use "Fire Alarm System Certification and Description" as required by NFPA 72 - 2002 edition as per the NYC Building Code modifications.
  - 4. Name, address and telephone of the authorized factory representative.

## 1.05 QUALITY ASSURANCE

### A. Qualification of Installers

1. The installer shall have successfully installed similar system fire detection, signaling control components on a previous project of comparable size and complexity.
2. Qualified and approved representatives of the system manufacturer shall produce all panel and equipment drawings and operating manuals. The Contractor is responsible for retaining qualified and approved representative(s) of those system manufacturers specified for detailed system design and documentation, coordination of system installation requirements, and final system testing and commissioning in accordance with these specifications.

- B. Pre-installation Requirements: All equipment and components shall be installed in strict compliance with each manufacturer's recommendations. Consult the manufacturer's installation manuals for all wiring diagrams, schematics, physical equipment sizes, etc. before beginning system installation. Refer to the manufacturer's riser/connection diagram and details for all specific system installation/termination/wiring data.

## 1.06 SYSTEM DESCRIPTION

### A. General

1. The Contractor shall furnish all labor, services and materials necessary to furnish and install a complete, functional NYC code compliant and approved fire alarm system. The system shall comply in respects with all pertinent codes, rules, regulations and laws of the local jurisdiction, the NYC Building Code and all rules and regulations of the New York City Fire Department. The system shall comply in all respects with the requirements of the specifications, manufacturer's recommendations and Underwriters Laboratories Inc. (UL) listings.
2. Provide and install a new fire detection and alarm system that shall consist of:
  - a. Fire Alarm Control Panel located as shown on the Contract Drawings.
  - b. LCD remote annunciator panel located as shown on the Contract Drawings.
  - c. Manual pull stations located as shown on the Contract Drawings.
  - d. Area smoke and heat detectors located as shown on Contract Drawings.

- e. Duct smoke detectors located as shown on the Contract Drawings.
- f. Smoke vent detectors and control where indicated on Contract Drawings.
- g. Sprinkler system waterflow, pressure, valve supervisory and alarm switches located as shown on the Contract Drawings.
- h. Audible notification appliances located as shown on the Contract Drawings.
- i. Synchronized visual notification appliances located as shown on the Contract Drawings.
- j. Overhead door related fire detection system.
- k. Fan control relays and control panels
- l. Connection to a central station. The City of New York shall arrange for two dedicated phone lines to be terminated as directed by the Contractor.

**B. Sequence of Operations**

- 1. Upon alarm activation of any area smoke detector, manual pull station, fire door heat sensor, deluge system release or sprinkler water flow device the following functions shall automatically occur:
  - a. The internal audible device shall sound at the control panel and remote annunciator.
  - b. The LCD display shall indicate all applicable information associated with the alarm condition including; device type, device location and time/date.
  - c. All system activity/events shall be documented in system history and on the system printer.
  - d. Any remote or local annunciator LCD/LEDs associated with the alarm shall be illuminated.
  - e. Activate notification audible appliances
  - f. Activate visual strobes notification appliances. The visual strobe shall continue to flash until the system has been reset. The visual strobe shall not stop operating when the "Alarm Silence" is pressed.

- g. Transmit an alarm signal to the central station.
- h. All automatic events programmed to the alarm point shall be executed and the associated outputs activated.
- i. A signal shall be sent to the building access control (security) system to unlock all stairwell/exit doors throughout the building over which it has control.
- j. All self-closing fire/smoke doors held open shall be released.
- k. A signal shall be sent to the building Temperature Control Panel (A-TCP-01) and to the Motor Control Centers in Electric Rooms 1 & 2 to shut down fans. Also send a signal to the building SCADA System.

C. Supervisory Operation

- 1. Upon supervisory activation of any sprinkler valve supervisory switch, duct, smoke vent or stair shaft smoke detector, fire smoke damper, Fire Pump monitoring function or Engine Generator Enclosure fire detection device, the following shall automatically occur:
  - a. The internal audible device shall sound at the control panel and remote annunciator.
  - b. The LCD display shall indicate all applicable information associated with the supervisory condition including; device type, device location and time/date.
  - c. All system activity/events shall be documented on the system printer and system history file.
  - d. Any remote or local annunciator LCD/LEDs associated with the supervisory activation shall be illuminated.
  - e. Transmit a supervisory signal to the central station.
  - f. The Temperature Control Panel (F-TCP-01) and SCADA System shall be notified which fan the activated detector is monitoring – so it may be shut down.

D. Trouble Operation. Upon activation of a trouble condition or signal from any device on the system, the following functions shall automatically occur:

- 1. The internal audible device shall sound at the control panel and remote annunciator.

2. The LCD display shall indicate all applicable information associated with the trouble condition including; device type, device location and time/date.
  3. All system activity/events shall be documented on the system printer and system history file.
  4. Any remote or local annunciator LCD/LEDs associated with the trouble zone shall be illuminated.
  5. Transmit a trouble signal to the central station.
- E. Monitor Activation. Upon activation of any device connected to a monitor circuit, the following functions shall automatically occur:
1. All system activity/events shall be documented on the system printer.
  2. The monitor LED will light and pre-programmed functions will activate.
- F. System Configuration
1. All system equipment shall be arranged and programmed to provide a system for the early detection of fire, the notification of building occupants, the override of the HVAC system operation, and the activation of other auxiliary systems to inhibit the spread of smoke and fire, and to facilitate the safe evacuation of building occupants.
  2. The system shall utilize independently addressed smoke detectors, heat detectors and input/output modules as described elsewhere in this specification.
  3. The system shall include a printer located where indicated on the Contract Drawings to record all events and facilitate maintenance of the system.

## 1.07 WARRANTY AND MAINTENANCE

- A. The system supplier shall maintain a service organization with adequate spare parts stock within 75 miles of the installation. Any defects that render the system inoperative shall be repaired within 24 hours of the City of New York notifying the Contractor.

## 1.08 SPARE PARTS

- A. The Contractor shall supply the following spare parts:
1. Smoke detectors - Ten (10) percent of the installed quantity of each type, but no less than four (4) devices.
  2. Manual fire alarm stations - Ten (10) percent of the installed quantity of each type, but no less than two (2) devices.

3. Glass rods or panels for break glass manual fire alarm stations - Ten percent of the installed quantity, but no less than twelve (12) devices.
  4. Audible and visible devices - Ten (10) percent of the installed quantity of each type, but no less than four (4) devices.
  5. Keys - A minimum of three (3) sets of keys shall be provided and appropriately identified.
  6. Two complete replacements for each indicator lamp.
  7. Two complete replacements for each fuse.
- B. Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

#### 1.09 ENVIRONMENTAL CONSIDERATIONS

- A. All devices, controls and panels with printed circuit board components shall have that component conformal coated, wherever it is located in a place where the environment would be otherwise deleterious to same.
- B. All equipment shall be suitable for application in the environment where it will be located.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below.
1. The fire alarm system specified is manufactured by Simplex/Grinnell, any Catalog or model number is intended to establish the type and quality of equipment and system design as well as exact operating features required. Other manufacturers are:
    - a. Fenwal/FCI
    - b. Notifier
    - c. Siemens Building Technologies
    - d. Or approved equal

## 2.02 FIRE ALARM CONTROL PANEL

## A. General

1. The fire alarm control panel shall be a multi-processor-based designed specifically for fire and releasing system applications. The control panel shall be listed and approved for the application standard(s) listed above.
2. The control panel shall include all required hardware, software and system programming to provide a complete and operational system. The control panel shall assure that life safety takes precedence among all panel activities.
3. The control panel shall include the following capacities:
  - a. Support up to 380 analog/addressable points per panel
  - b. Support up to 5 fully supervised network remote annunciators.
  - c. Support a DACT (dialer) for off premise notification
  - d. Support up to 576 chronological events in history.
  - e. Support notification of individual duct smoke detector alarms to fan control panels
  - f. Support General Fan Shutdown alarm notice to MCCs and TCPs.
4. The control panel shall include the following features:
  - a. Provide auto programming and electronic addressing and mapping of analog/addressable devices.
  - b. Provide an operator interface display that shall include functions required for annunciation, command and control system functions.
  - c. Provide a discrete system control switch provided for reset, alarm silence, local silence, drill switch, up/down switches, status switch, program switch, enable and disable switches, activate and restore switches, reports switch and test switch.
  - d. Provide system reports that provide sensitivity and history details.
  - e. Provide an authorized operator with the ability to operate or modify system functions like system time, date, passwords; and autoprogram, enable mapping, restart the system and clear control panel event history file.

- f. Provide an authorized operator to perform test functions within the installed system.
- g. Supervision of system components, wiring, initiating devices and software shall be provided by the control panel. Failure or fault of system component or wiring shall be indicated by type and location on the LCD display. Software and processor operation shall be independently monitored for failure.

**B. Annunciation**

- 1. The system shall be designed and equipped to receive, monitor, and annunciate signals from devices and circuits installed throughout the building. Manufacturer's standard control switches shall be acceptable if they provide the required operation, including performance, supervision and position indication. If the manufacturers' standard switches do not comply with these requirements, fabrication of custom manual controls acceptable to the City of New York is required.
- 2. Receipt of alarm, trouble, and supervisory signals shall activate integral audible devices at the control panel(s) and at each remote annunciation device.

**C. Power Supply**

- 1. Each system power supply shall be a minimum of 6 amps @ 24 vdc. The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 4.5A continuous for notification appliance circuits.
- 2. Auxiliary power supplies shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 6.4 continuous for notification appliance circuits. The power supply shall be capable of providing 8A to output circuits for a maximum period of 100 ms. All outputs shall be power limited.
- 3. Upon failure of normal (AC) power, the affected portion(s) of the system shall automatically switch over to secondary power without losing any alarm, trouble or operator acknowledgment signals.
- 4. Each system power supply shall be individually annunciated and shall identify the inoperable power supply in the event of a trouble condition.

5. All standby batteries shall be continuously monitored by the system. Low battery and disconnection of battery power supply conditions shall immediately annunciate as a trouble signal, identifying the deficient batteries.
6. All system power supplies shall be capable of recharging their associated batteries, from a fully discharged condition to a capacity sufficient to allow the system to perform consistent with the requirements of this section, in 48 hours maximum.
7. All AC power connections shall be connected to the FCO panel that supplies the Building Wide Alarm Systems (BWAS) of the building. All wiring and equipment shall meet the requirements of the NYCEC, the regulations of the New York City Fire Department and other referenced codes and standards. All AC power circuits shall be installed in steel raceway and shall contain a #10AWG grounding conductor as a minimum. All power disconnect switches in the AC service (Disconnect Switches, Transformers, Automatic Transfer Switches) shall be clearly labeled "Fire Alarm System". The power circuit disconnect means shall be clearly labeled and shall have a red marking. The location of the circuit disconnect shall be labeled permanently inside the each control panel.

#### D. Display

1. The display module shall be of membrane style construction with a 4 line by 20-character Liquid Crystal Display. The LCD shall use super-twist technology and backlighting for high contrast visual clarity. In the normal mode display the time, the total number of active events and the total number of disable points. In the alarm mode display the total number of events and the type of event on display. Reserve 40 characters of display space for user custom messages. The module shall have visual indicators for the following common control functions; AC Power, alarm, supervisory, monitor, trouble, disable, ground fault, CPU fail, and test.
2. There shall be common control keys and visual indicators for; reset, alarm silence, trouble silence, drill, and one custom programmable key/indicator. Provide four pairs of display control keys for selection of event display by type (alarm, supervisory, monitor and trouble) and forward / backward scrolling through event listings. The operation of these keys shall be integrated with the related common control indicator that lights when an event of its type is active. Allow the first event of the highest priority to capture the LCD for display so that arriving fire fighters can view the first alarm event "hands free". Provide system function keys; status, reports, enable, disable, activate, restore, program, and test. The module shall have a numeric keypad, zero through nine with delete and enter keys.

E. System Message Processing and Display Operations

1. The system shall allow message routing to be configured to any or all annunciators.
2. All system printer port shall be configurable to output any combination of alarm, supervisory, trouble, or monitor, event messages.
3. Each LCD display on each annunciator shall be configurable to display the status of any combination of alarm, supervisory, trouble, or monitor, event messages.
4. Clear distinction shall be provided between alarm, supervisory, trouble, and monitor status messages.
5. The system shall provide the ability to retrieve data from the analog/addressable detectors to a PC while the system is on-line and operational in the protected premises. The uploaded data may then be analyzed in a diagnostic program supplied by the system manufacturer.
6. A standby power supply shall automatically supply electrical energy to the system upon primary power supply failure.

F. Dialer - DACT: The system shall provide an off premise Digital Alarm Communications Transmitter (DACT) capable of transmitting system alarm, trouble and supervisory events to a central monitoring station (CMS). The DACT shall support dual telephone lines, 20 PPS 4/2 communications, and configured for dual tone multi-frequency (DTMF) or pulse modes. It shall be possible to delay AC power failure reports, auto test call, and site program the DACT using a touch tone phone and password.

G. Field-Mounted System Components

1. Initiating Devices

- a. General: The initiating device circuits (SLC) used to monitor manual fire alarm stations, heat and smoke detectors, waterflow switches, valve supervisory switches, fire pump functions, and air pressure supervisory switches shall be Class A (Style "D" or "E").

b. Smoke Detectors & Accessories

(1) Analog Addressable Smoke General

- (a) Each smoke detector shall be addressable intelligent type with a unique address. An intelligent microprocessor shall analyze and compare sensed data to historical

readings and time patterns to make an alarm decision. A digital filter shall remove patterns not typical of fires to prevent unwanted alarms.

- (b) The detector's sensing element reference point shall automatically adjust, compensating for background environmental conditions such as dust, dirt, temperature, and humidity. Self-diagnostics shall automatically send a message if the detector is dirty or requires maintenance. Periodically, the sensing element real-time analog value shall be compared against its reference value. The detector shall provide a maintenance alert signal that 80% to 99% compensation has been used. The detector shall provide a dirty fault signal that 100% compensation has been used.
  - (c) Each analog addressable smoke detector's sensitivity shall be capable of being programmed individually as: most sensitive, more sensitive, normal, less sensitive or least sensitive. An alternate alarm sensitivity level shall be provided for each detector, which can be set to any of the five (5) sensitivity settings manually or automatically using a time of day event.
  - (d) The system shall allow for changing of detector types for service replacement purposes without the need to reprogram the system. The replacement detector type shall automatically continue to operate with the same programmed sensitivity levels and functions as the detector it replaced. System shall display an off-normal condition until the proper detector type has been installed or change in the application program profile has been made.
- (2) Smoke Detector – Photoelectric: Provide analog/addressable photoelectric smoke detectors at the locations shown on the drawings. The system shall have the ability to set the sensitivity and alarm verification of each of the individual detectors on the circuit. It shall be possible to automatically change the sensitivity of individual analog/addressable detectors for the day and night periods. Each smoke detector shall be capable of transmitting alarm signals as well as normal, trouble and need cleaning information. It shall be possible to program control panel activity to each level. Each smoke detector may be individually programmed to operate at any one of five (5) sensitivity settings. Each detector microprocessor shall contain an environmental compensation algorithm that identifies and

sets ambient environmental thresholds approximately six times an hour. The microprocessor shall monitor the environmental compensation value and alert the system operator when the detector approaches 80% and 100% of the allowable environmental compensation value.

- (3) Duct Detector Housing: Provide smoke detector duct housing assemblies to mount an intelligent analog/addressable duct smoke detector as specified above along with a standard detector mounting base. The housing shall also protect the measuring chamber from damage and insects. The housing shall utilize an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet. Drilling templates and gaskets to facilitate locating and mounting the housing shall also be provided. The housing shall be finished in baked red enamel. Remote alarm LED indicators and remote test stations shall be provided.
  - (4) Detector Bases: Provide standard detector mounting bases suitable for mounting on either, North American 1-gang, 3½ or 4 inch octagon box and 4 inch square box, or European BESA or 1-gang box. The base shall, contain no electronics and support all series detector types.
- c. Manual Station - Single Action Single Stage: Provide analog/addressable single action, single stage fire alarm stations at the locations shown on the drawings. The fire alarm station shall be of metal construction and incorporate an internal toggle switch. The station shall be finished in red with silver "PULL IN CASE OF FIRE" lettering. The manual station shall be suitable for mounting on North American 2½ (64mm) deep 1-gang boxes and 1½ (38mm) deep 4 square boxes with 1-gang covers.
- d. Heat Detectors and Accessories
1. Each heat detector shall be addressable intelligent type with a unique address. An intelligent microprocessor shall analyze and compare sensed data to historical readings and time patterns to make a maintenance advisory.
  2. Heat detectors shall be fixed temperature/rate of rise design of a rating suitable for the area protected.
  3. Detector Bases: Provide standard detector mounting bases suitable for mounting on either, North American 1-gang, 3½ or 4 inch octagon box and 4 inch square box, or European BESA or 1-gang

box. The base shall, contain no electronics and support all series detector types.

2. Notification Appliances

a. General

- (1) All appliances which are supplied for the requirements of this specification shall be UL Listed for Fire Protective Service, and shall be capable of providing the "equivalent facilitation" which is allowed under the Americans with Disabilities Act Accessibilities Guidelines (ADA(AG)), and shall be UL 1971 Listed.
- (2) All appliances shall be of the same manufacturer as the fire alarm control panel specified to insure absolute compatibility between the appliances and the control panels, and to insure that the application of the appliances are done in accordance with the single manufacturer's instructions.
- (3) Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purpose intended. All strobes shall be provided with lens markings oriented for wall mounting. All notification appliances shall be red.
- (4) 24 VDC Notification appliance circuits (NAC) shall be Class B (Style "Z"). All notification appliance circuits shall have a minimum circuit output rating of 2 amp @ 24 vdc. The notification circuits shall be power limited. Non-power limited circuits are not acceptable.
- (5) One-way audio notification appliance circuits (NAC) shall be Class B (Style "Z"). All notification appliance circuits shall have a minimum circuit output rating of 35W @70Vrms. The notification circuits shall be power limited. Non-power limited circuits are not acceptable.

- b. Horn-Strobes: Provide wall-mounted horn/strobes at the locations shown on the drawings. The horn/strobe shall provide an audible output of 84 dBA at 10 ft. when measured in reverberation room per UL-464. Strobes shall provide synchronized flash outputs. The strobe output shall be determined as required by its specific location and application from a family of 15cd, 30cd, 60cd, 75cd & 110cd devices.

The horn shall have a selectable steady or synchronized temporal output. In and out screw terminals shall be provided for wiring. Horn/strobes shall mount in a North American 1-gang box. Horn/strobes in process areas of the facility shall be waterproof type.

- c. Strobes: Provide wall-mounted strobes at the locations shown on the drawings. In and out screw terminals shall be provided for wiring. Strobes shall provide synchronized flash outputs. Strobe output shall be determined as required by its specific location and application from a family of 15cd, 30cd, 60cd, 75cd, or 110cd devices. Strobes shall mount in a North American 1-gang box.

### 3. Initiation and Control Modules

- a. Relay Module: Addressable control relay circuit modules shall each provide one (1) form C dry relay contact rated at 24Vdc @ 2 amps (pilot duty) to control external fans, appliances or equipment.
- b. Addressable Input Module: Intelligent addressable input modules shall be provided for connection of dry contact type waterflow, pressure, overhead coiling door fire safety devices and tamper switches to initiating device circuit of the fire alarm control panel. They shall also provide fan control information to TCP and MCCs.
- c. Notification Appliance Circuits: Provide addressable notification appliance circuit modules at the locations shown on the drawings. The module shall provide one (1) supervised Class B notification circuit. The module shall provide polarized audible / visual selection for 24Vdc @ 2amps, audio outputs at 25Vrms @ 50 watts or 70 Vrms @ 35 watts.

## H. CIRCUITING

### 1. Signaling Circuits

- a. The signaling line circuit shall communicate from a panel/node to analog/addressable detectors, input modules, output modules, isolation modules and notification appliance circuits.
- b. Each signaling circuit connected to addressable/analog devices shall provide a minimum of 20 spare addresses.
- c. When a signaling line circuit covers more than one fire/smoke compartments, a wire-to-wire short shall not effect the operation of the circuit from the other fire/smoke compartments.

- d. The signaling line circuit connecting to addressable/analog devices including, detectors, monitor modules, control modules, isolation modules, and notification circuit modules shall be Class A (style 6 or 7).
- e. These circuits shall serve a maximum of one floor of the building.

## 2. Notification Appliance Circuits

- a. Provide addressable notification appliance circuit modules where required.
- b. The module shall provide supervised Class B notification circuit.
- c. The module shall provide polarized audible/visual selection for 24 volt DC @ 2 amps, audio outputs at 25 volts rms @ 50 watts or 70 volt rms @ 35 watts.
- d. Adjacent devices shall be wired to alternate circuits such that a failure of one circuit does not leave an area without coverage.

## 2.03 PURGE PANEL

- A. A purge panel shall be provided to allow for fan purging by the Fire Department. The purging operation shall be manual to allow independent fan operation. The purging shall occur only when activated by fire department personnel from a master key switch. The purge panel shall include all devices required to provide a complete operating system.
- B. The purge panel shall include, but not be limited to the following front panel mounted devices:
  - 1. Master key switch with a 1620 key cylinder
  - 2. ON-OFF Selector switches, one for each supply fan, exhaust fan and return exhaust fan as shown
  - 3. Running red LED type indicating light, one for each supply fan, exhaust fan and return exhaust fan as shown
  - 4. Graphic depiction of the transfer station indicating the areas served by each supply fan, exhaust fan and return exhaust fan controlled by the purge panel
- C. The purge panel shall include, but not be limited to the following internally mounted devices:
  - 1. Control relays

## 2. Terminals

- a. All catalog numbers refer to Phoenix Contact Type for the purpose of establishing the standard of quality and general configuration desired. Equivalent products of other manufacturers may be submitted for approval.
  - b. Provide symmetrical type steel mounting rails, DIN-EN50022.
  - c. Control and Alarm Signals: Provide terminals suitable for wires from 30 to 10 AWG rated 18 amperes at 600 volts, blue body, Phoenix Contact Type UK5N BU.
  - d. 120-Volt Power Wiring: Provide terminals suitable for wires from 18 to 10 AWG rated 30 amperes at 600 volts, hot (black body), neutral (white body), ground (green body), Phoenix Contact Type UK5N BK, UK5N WH & UK5N GN, respectively.
- D. Provide all relays, selector switches and indicating lights as specified in Section 16491 – Control Components and Devices.
- E. Panel shall be constructed to meet the requirements of the NYC Fire Department and shall be suitable for the location and environment where it is installed.

### 2.04 FAN CONTROL PANELS

- A. Provide fan control panels at the locations indicated on the Contract Drawings. Generally they are located at each of the three (3) MCCs and the TCP.
- B. Panels shall contain relays and power supplies needed to provide fan shutdown when directed by intelligence from the Fire Alarm Control Panel.
- C. Panel enclosures shall be steel with back panels and a hinged door with handle and lock. Enclosure rating shall be NEMA 3R (3RX in corrosive areas).
- D. All internal components shall conform to the requirements of Section 16491 – Control Components and Devices.
- E. Panel layout shall provide a minimum 25% free area.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: All equipment shall be attached to walls and ceiling/floor assemblies and shall be mounted firmly in place. Detectors shall not be supported solely by suspended ceilings. Fasteners and supports shall be sized to support the required load.

**B. Conductors**

1. The requirement of this section apply to all system conductors, including all signaling line, initiating device, notification appliance, auxiliary function, remote signaling, AC and DC power and grounding/shield drain circuits, and any other wiring installed by the Contractor pursuant to the requirements of these Specifications.
2. All circuits shall be rated power limited in accordance with NEC Article 760.
3. All initiating circuit, signaling line circuit, AC power conductors, shield drain conductors and grounding conductors, shall be solid copper, stranded or bunch tinned (bonded) stranded copper.
4. All signaling line circuits, including all addressable initiating device circuits shall be 18 AWG minimum or as per manufacturer's requirements.
5. All non-addressable initiating device circuits, 24 VDC auxiliary function circuits shall be 14 AWG minimum or per manufacturer's requirements.
6. All notification appliance circuit conductors shall be solid copper or bunch tinned (bonded) stranded copper. Where stranded conductors are utilized, a maximum of 7 strands shall be permitted for No. 16 and No. 18 conductors, and a maximum of 19 strands shall be permitted for No. 14 and larger conductors.
7. All audible notification appliance circuits shall be 14 AWG minimum twisted pairs or twisted pairs shielded or per manufacturer's requirements.
8. All visual notification appliance circuits shall be 14 AWG minimum XHHW or twisted pairs or twisted shielded pairs or per manufacturer's requirements.

**C. Conductors and Raceway**

1. Except as otherwise required by the NYC Building Code and/or these Specifications, the installation of all system circuits shall conform to the requirements of Article 760 and raceway installation to the applicable sections of Chapter 3 of NFPA 70, National Electrical Code.
2. The entire system shall be installed in a skillful manner in accordance with approved manufacturer's installation manuals, shop drawings and wiring diagrams. The Contractor shall furnish all conduit, wiring, outlet boxes, junction boxes, cabinets and similar devices necessary for the complete installation. All wiring shall be of the type required by the NEC and approved by local authorities having jurisdiction for the purpose.

3. Any shorts, opens, or grounds found on new or existing wiring shall be corrected prior to the connection of these wires to any panel component or field device.
4. The Contractor shall neatly tie-wrap all field-wiring conductors in the gutter spaces of the control panels and secure the wiring away from all circuit boards and control equipment components. All field-wiring circuits shall be neatly and legibly labeled in the control panel. No wiring except home runs from life safety system circuits and system power supply circuits shall be permitted in the control panel enclosures. No wiring splices shall be permitted in a control panel enclosure.
5. All penetration of floor slabs and firewalls shall be fire stopped in accordance with all local fire codes.

**D. Conduit Raceway**

1. All systems and system components listed to UL864 Control Units for Fire Protective Signaling Systems maybe installed within a common conduit raceway system, in accordance with the manufacture's recommendations. System(s) or system components not listed to the UL864 standard shall utilize a separate conduit raceway system for each of the sub-systems.
2. The requirements of this section apply to all system conduits, raceways, electrical enclosures, junction boxes, pull boxes and device back boxes.
3. Provide conduits meeting the requirements of Section 16130 - Electrical Raceway Systems.
4. All system conduits, which are installed in areas, which may be subject to physical damage or weather, shall be rigid steel, 3/4 -inch minimum.
5. Conduits shall be sized according to the conductors contained therein. Cross sectional area percentage fill for system conduits shall not exceed 40%.
6. All fire alarm conduit systems shall be routed and installed to minimize the potential for physical, mechanical or by fire damage, and so as not to interfere with existing building systems, facilities or equipment, and to facilitate service and minimize maintenance.
7. All system conduits, junction boxes, pull boxes, terminal cabinets, electrical enclosures and device back boxes shall be readily accessible for inspection, testing, service and maintenance.
8. All junction and pull boxes in the fire alarm system shall be identified by having the covers painted Red.

### 3.02 FIELD QUALITY CONTROL

#### A. Test and Inspection

1. All intelligent analog addressable devices shall be tested for current address, sensitivity, and user defined message.
2. All wiring shall be tested for continuity, shorts, and grounds before the system is activated.
3. All test equipment, instruments, tools and labor required to conduct the tests shall be made available by the Contractor.
4. The system including all its sequence of operations shall be demonstrated to the City of New York and the local fire inspector. In the event the system does not operate properly, the test shall be terminated. Corrections shall be made and the testing procedure shall be repeated until it is acceptable to the City of New York and the fire inspector.
5. At the final test and inspection, a factory-trained representative of the system manufacturer shall demonstrate that the system functions properly in accordance with these specifications. The representative shall provide technical supervision, and participate during all of the testing for the system.
6. All fire alarm testing shall be in accordance with National Fire Alarm Code, NFPA 72.
7. A letter from the Contractor certifying that the system is installed entirely in accordance with the system manufacturer's recommendations and within the limitations of the required listings and approvals, that all system hardware and software has been visually inspected and functionally tested by a manufacturer's certified representative, and that the system is in proper working order.

### 3.03 TRAINING

- #### A. Following completion of installation and field testing, provide training for 12 employees of the City at the transfer station in the proper operation, trouble-shooting and maintenance of the fire alarm and detection system equipment as described in Section 01821 - Training.
1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

B. Requirements

1. The instruction shall be presented in an organized and professional manner by a person factory trained in the operation and maintenance of the equipment and who is also thoroughly familiar with the installation.
2. The instruction shall cover the schedule of maintenance required by NFPA 72 and any additional maintenance recommended by the system manufacturer.
3. Instruction shall be made available to the New York City Fire Department if requested by the City.

-END OF SECTION-

**Section 13852**  
**RADIATION DETECTION SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The radiation detection system shall consist of fixed (permanently mounted) radiation detection assemblies, detection control unit, portable radiation detection unit, and all necessary appurtenances required for a complete installation.
- B. The radiation detection system will be used to monitor and detect the presence of radiation sources embedded in sanitation trucks entering the station.

**1.02 RELATED SECTIONS**

- A. Section 16055 – Electrical Requirements for Shop-Assembled Equipment

**1.03 SYSTEM DESCRIPTION**

- A. Design Requirements
  - 1. The fixed system shall detect shielded radioactive sources in moving sanitation vehicles traveling at 5 miles per hour or less.
  - 2. The fixed system shall be in accordance with Section 16055 - Electrical Requirements for Shop-Assembled Equipment.
- B. Performance Requirements
  - 1. Monitoring Frequency: Up to 320 trucks per day during two eight-hour shifts; up to 30 trucks per hour at peak delivery times.

**1.04 SUBMITTALS**

- A. Contractor shall submit working drawings, shop drawings, and material specifications in accordance with Section 01300 - Shop Drawings.
- B. Shop Drawings
  - 1. Product information for all equipment
    - a. Manufacturer's product name and model number
    - b. Manufacturer's standard catalog product data
    - c. Manufacturer's specification data
    - d. Description of construction features
    - e. Performance and operation data

- f. Installation and mounting details, instructions and recommendations
  - g. Service and calibration requirements
  - h. Dimensions
- 2. Arrangement and erection drawings of the equipment and controls
- 3. Schematic control diagrams
- 4. Electrical connection diagrams
- 5. Complete description of the control systems
- C. Provide Operation and Maintenance manuals in accordance with Section 01831 - Operation and Maintenance Manuals.

#### 1.05 QUALITY ASSURANCE

- A. The manufacturer shall have ISO 9001 certification or shall maintain a quality assurance program verified by a third party inspection agency.
- B. The fixed system shall either be UL listed or CE marked.
- C. The manufacturer shall have a minimum of three (3) years experience in the manufacturing of substantially similar systems.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, and handle all products and materials as specified in Section 01651 - Transportation and Handling of Material and Equipment, and Section 01661 - Protection of Material and Equipment.
- B. Inspect all materials and equipment against approved shop drawings at time of delivery. Immediately return for replacement or repair any equipment or materials damaged or not meeting the requirements of the approved shop drawings.
- C. Label all equipment and materials after they have been inspected. Store all equipment and materials in dry, covered, ventilated location. Protect from harm in accordance with the manufacturer's recommendations.

#### 1.07 PROJECT CONDITIONS

- A. Project Environmental Requirements: Design and construct the system for continuous operation under the following temperature and humidity conditions:

1. Control Rooms
  - a. Air conditioned and heated
  - b. Ambient Temperature: Normal range is 65 to 80 degrees F
  - c. Relative Humidity: Normal range is 40 to 60 percent
2. Outdoor locations
  - a. Ambient Temperature: -10 to 120 degrees F
  - b. Relative Humidity: 100 percent maximum
3. Where required, provide thermal enclosures equipped with thermostatically controlled space heaters.

#### 1.08 WARRANTY

- A. The Contractor shall furnish a manufacturer's warranty that all of its equipment will be free of defects caused by faulty material and/or workmanship and shall repair or replace those parts for a period of three (3) years after completion of final acceptance testing.

#### 1.09 MAINTENANCE

##### A. Spare Parts

1. Provide spare parts in accordance with Section 01750 - Spare Parts and Maintenance Materials.
2. Furnish and deliver spare parts as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification Section.
3. Pack spare parts in containers suitable for long-term storage, bearing labels clearly designating the contents and the pieces of equipment for which they are intended.
4. The following shall constitute the minimum spare parts:
  - a. All standard recommended spare parts, as indicated in the equipment manufacturer's instructions manual for each component of the system.
  - b. Furnish the following complete spare units:
    - (1) One dozen of each type and size of fuse used
    - (2) One fixed detection assembly
    - (3) One detection control unit
    - (4) One pair vehicle presence sensors

- B. Maintenance Service: The manufacturer shall inspect, calibrate, check and report to the City of New York on the radiation detection system every six months during the warranty period. The inspection shall include all equipment provided, and shall include witnessing of in-service operation.

## PART 2 PRODUCTS

### 2.01 EQUIPMENT

#### A. Fixed Detection Units

##### 1. Detection Assemblies

- a. Quantity: Two
- b. Combined Detection Volume: Nominal 3000 cubic inches
- c. Combined Detection Area: At least 1440 square inches
- d. Detector Material: Premium plastic scintillator
- e. Radiation Detected
  - (1) Medium and high energy gamma emitters
  - (2) Neutrons
- f. Sensitivity: Detect a 5 percent increase over background radiation levels, assuming a 10  $\mu$ R/hr background.
- g. Detection Separation: As shown
- h. Detection Assembly Enclosure
  - (1) NEMA 4
  - (2) Stainless steel or nickel-plated steel with powder coat
  - (3) Aluminum access door
  - (4) Lockable 2- or 3-point latch
  - (5) Enclosure Size: Nominal 72-inches by 18-inches by 8-inches
  - (6) Mounting: I-beam mount as shown
- i. Shielding: 1/8-inch lead, within the enclosure
- j. Temperature Range: -31 to 122 degrees F.
- k. Humidity Range: 10 to 95 percent relative humidity

## 2. Detection Control Unit

- a. Wall mounted
- b. Front panel mounted items
  - (1) Ready light
  - (2) Scanning light
  - (3) Alarm light
  - (4) Alphanumeric display
  - (5) Keypad
  - (6) Horn
  - (7) Silence push button
  - (8) Power On/Off
- c. Background Radiation
  - (1) Measurement: Background radiation level is continuously monitored and updated until the vehicle activates the presence sensor.
  - (2) Compensation: Automatic compensation for the reduction of background radiation detection due to the presence of individual vehicles as they move between the detectors.
- d. Radiation Detection Interval: Calculate radiation level within 0.25 seconds of gross measurement.
- e. Speed Detection: Calculate vehicle speed from presence sensors.
- f. Alarms
  - (1) Radiation Detected. Based on statistical analysis, Sigma value
  - (2) High Speed. Vehicle exceeded speed limit.
- g. Diagnostics
  - (1) Reboot after power failure
  - (2) Continuous during power-up and normal operation
- h. Outputs
  - (1) RS-232 communication link, including as a minimum the following information:
    - (a) Radiation value
    - (b) Excessive speed alarm
    - (c) High radiation alarm

- (2) Separate relay outputs on alarms specified
  - i. Printer with the following information available
    - (1) Date and time of alarm
    - (2) Date and time of alarm acknowledge
    - (3) Background count rate
    - (4) Alarm set point
    - (5) High count rate for each detector
    - (6) Detector fault indication
  - j. Temperature Range: 40 to 95 degrees F
  - k. Telephone modem for remote diagnostics
  - l. Humidity Range: 10 to 75 percent relative humidity
  - m. Power: 120 Vac
3. Accessories
- a. Vehicle Presence Sensor
    - (1) Photo detectors (2 pairs)
    - (2) Detects the presence of a vehicle immediately adjacent to the detector
  - b. Cabling between detector units and control unit provided by system supplier.
  - c. Check Source: Minimum 8  $\mu\text{Ci}$   $^{137}\text{Cs}$ , license-free
  - d. Personal Computer with remote telephone servicing option
  - e. Alarm Assembly
    - (1) General: Provide a vertically-stacked visual and audible alarm assembly. The assembly shall provide operator notification of the following alarms:
      - (a) Speed limit exceeded
      - (b) Radiation level exceeded
    - (2) Size: Nominal 70 mm diameter

- (3) Enclosure Rating: NEMA 4X
- (4) Environment: Suitable for outdoor use
- (5) Temperature Limits: -10 to 130 degrees F
- (6) Power: 120 Vac
- (7) Mounting: Vertical, mounted on wall
- (8) Mounting Hardware: Corrosion-resistant
- (9) Visual alarms
  - (a) Lamp Type: LED
  - (b) Available Colors: Red, amber, blue, green, clear
  - (c) Quantity: 2
  - (d) Colors Provided: Red, amber
- (10) Audible alarms
  - (a) Quantity: 2
  - (b) Provide a distinct tone for each alarm.
  - (c) Volume: At least 100 dB max.
- (11) Alarm Assembly Manufacturers
  - (a) Allen-Bradley Series 855T
  - (b) Or approved equal

#### 4. Products

- a. Model ASM-3000E/II by Thermo Electron RMP
- b. Model RadSentry POV-GN by Canberra Industries
- c. Or approved equal

#### B. Portable Detection Unit

- 1. Unit used to perform survey of diverted sanitation truckload to:
  - a. Determine location of nuclide.
  - b. Determine type of nuclide.
- 2. Performs
  - a. Gamma spectrometry
  - b. Neutron detection

- c. Nuclide identification
  - d. Dose rate display
  - e. Accumulated dose display
  - f. Source finder
- 3. Consists of a LaBr scintillation detector, multi-channel analyzer, amplifier, high voltage power supply, and memory.
- 4. Display: Backlit LCD
- 5. Housing: Waterproof, dust tight
- 6. Temperature Range: 4 to 131 degrees F
- 7. Power: Batteries, rechargeable NiMH
- 8. Accessories
  - a. Personal computer-based software to allow qualitative and quantitative analysis
  - b. Battery charger
  - c. Holster
  - d. Carrying case
- 9. Products
  - a. Model identiFINDER by Thermo Electron RMP
  - b. Model InSpector 1000 by Canberra Industries
  - c. Or approved equal

## PART 3 EXECUTION

### 3.01 INSTALLATION

#### A. Interface with Other Work

- 1. The radiation detection system shall interface with the scale data management system provided by others (PIN 82704RR00033). The unit shall interface over an RS232 communication link, sending information on an event basis, with a carriage return at the end of the string. Other communication settings shall be coordinated during construction.

#### B. Sequence of Operation

- 1. Each sanitation truck will pass between the two detector assemblies. The detection control unit shall calculate the speed of the truck.

2. The detection control unit shall send the following information to the inbound scale driver interface unit for each vehicle:
  - a. Calculated radiation level
  - b. High speed alarm (if detected)
  - c. High radiation alarm (if detected)
3. The detection control unit shall also energize the alarm assembly if either of the two alarms specified above are activated.

### 3.02 FIELD QUALITY CONTROL

#### A. Field Testing

1. Provide field testing in accordance with Section 01811 - Preliminary and Final Field Tests.
2. The Contractor, under the supervision of the supplier, and other suppliers as applicable, shall perform the following system checkout and startup functions:
  - a. Check and approve the installation of all components and all cable and wiring connections between the various system components prior to placing the equipment into operation.
  - b. Conduct a complete system checkout and adjustment, including calibration, tuning, checking, and testing. When there are future operational functions included in this work, they should be included in the system checkout. All problems encountered shall be promptly corrected to prevent any delays in start-up.
  - c. The Contractor shall provide all test equipment necessary to perform the testing during system checkout and start-up.
  - d. The Contractor and supplier shall be responsible for initial operation of the system and shall make any required changes, adjustment or replacements for operation and equipment necessary to perform the functions intended.
  - e. The Contractor shall submit to the Resident Engineer certified calibration reports as soon as calibration is completed.
  - f. The Contractor shall submit to the Resident Engineer an installation inspection report certifying that all equipment has been installed correctly and is operating properly. Authorized representatives of both Contractor and the supplier shall sign the report.

**B. Manufacturer's Field Services**

1. The Contractor shall retain the services of the supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the supplier shall include for those equipment items not manufactured by it the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation.
2. In addition to the start-up services described above, the supplier shall perform a yearly calibration and operational check for the duration of the warranty. The check shall be done by a factory-trained and certified technician. The check shall include system observation during normal working hours.
3. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.
4. **Warranty Support**
  - a. Includes weekly system diagnostics from the manufacturer via the telephone modem for the warranty period at no additional cost.
  - b. The manufacturer shall have capability to have a remote terminal for accessing the radiation detection unit via telephone line.
  - c. The system shall include a modem, necessary cabling and telephone extension to support this telecommunications operation.
  - d. The manufacturer shall submit monthly reports to DSNY based on the results of the telephone diagnostics. The manufacturer shall notify DSNY immediately if any diagnostic test fails.

**3.03 CALIBRATION**

- A. Calibrate in the presence of the City of New York. Confirm that the equipment is functioning and calibrated prior to requesting City of New York to witness calibration.
- B. Calibrate using test equipment that is at least five times more accurate than instruments to be calibrated. Calibrate electronic test equipment within three months prior to testing and with accuracies traceable to NIST. Prepare calibrate reports for each device.
- C. Adjust secondary functions, such as alarm setpoints and output data, during initial calibration, and demonstrate after system is placed in service. Include this information on the calibration report.

3.04 TRAINING

- A. Provide training as specified in Section 01821 - Start-up and Training.
- B. Training shall consist of, at a minimum, an eight-hour course, comprising:
  - 1. Basic radiation concepts
  - 2. Operation and maintenance of the fixed system, including response to alarms
  - 3. Operation, use and maintenance of the portable unit, including surveying procedures and source identification

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 13861**  
**ODOR CONTROL SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. High-pressure, fogging-type, odor control system comprising the following:
1. Plunger pumps with motors
  2. Variable frequency drives
  3. Nozzles
  4. Piping, tubing, fittings, valves and appurtenances
  5. Stainless Steel bases
  6. Inlet water filters
  7. Control valves
  8. Chemical pumps
  9. Heat Tracing and Insulation
  10. System controls including all switches, gages and meters
  11. All other accessories required to produce complete working system

**1.02 RELATED SPECIFICATIONS**

- A. Related Work specified in other sections includes, but is not limited to, the following:
1. Division 1 - General Requirements
  2. Section 02505 - Leakage Tests
  3. Section 09912 - Interior Painting
  4. Section 15052 - Steel and Stainless Steel Pipe
  5. Section 15060 - Hangers and Supports
  6. Section 15071 - Vibration Control
  7. Section 15076 - Piping and Equipment Identification
  8. Section 15081 - Piping Insulation
  9. Section 15771 - Electric Heat Tracing Systems
  10. Division 16 - Electrical
  11. Section 17212 - Programmable Logic Controllers
  12. Section 17320 - Control Panels and Enclosures

**1.03 SUBMITTALS**

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Shop Drawings: Submit working drawings, including arrangement and erection drawings of the piping, equipment and control equipment; schematic control

diagrams; electrical connection diagrams; and complete description of the control system.

- C. Provide manufacturer's data showing pump performance, nozzle performance, motor horsepower, system pressures and other operational parameters.
- D. Operation and Maintenance: Submit operation and maintenance manuals for the odor control equipment.

#### 1.04 SYSTEM DESCRIPTION

- A. The odor control system manufacturer shall provide a package type system with all equipment and component parts completely mounted and assembled on the skid, piped and pre-wired requiring only external power for operation. The skid mounted system shall be used to remove volatile malodorous components characteristic of municipal solid waste. A diluted, water-based neutralizing agent, Anotec 0307 manufactured by A.T. Products Corp., will be sprayed through fog nozzles located within the ductwork on the discharge side of roof exhaust fans. Neutralizing agent will not spray over the processing floor. The piping and nozzle arrays in each transfer station will be located in an unheated area subject to freezing temperatures. Provide electric heat tracing in conformance to Section 15771 - Electric Heat Tracing Systems and insulation in conformance with Section 15081 - Piping Insulation, of the Plumbing Contract, to odor control system piping as shown on the Drawings. The odor control system discharges to multiple discharge points (exhaust ducts downstream of exhaust fans), as shown on the Drawings. Provide each discharge point with a control valve to safely put discharge points into or out of odor control service. Provide automatic draining of discharge point systems that are taken out of service to prevent dripping. Provide adjustable frequency drives to adjust pump discharge in response to manual selection of in-service discharge points and adjustable system pressure. Provide systems that can be totally drained, including the pump heads and all piping. Station exhaust fan designations, fan capacities and exhaust stack sizes are summarized as follows:

1.	F-EAF-1	38,350 SCFM	60" Dia.
2.	F-EAF-2	38,350 SCFM	60" Dia.
3.	F-EAF-3	30,350 SCFM	52" Dia.
4.	F-EAF-4	38,350 SCFM	60" Dia.
5.	F-EAF-5	30,350 SCFM	52" Dia.
6.	F-EAF-6	38,500 SCFM	60" Dia.
7.	F-EAF-7	19,500 SCFM	42" Dia.
8.	F-EAF-8	50,200 SCFM	68" Dia.
9.	F-EAF-14	16,000 SCFM	40" Dia.

## 1.05 QUALITY ASSURANCE

- A. The odor control system manufacturer shall have a minimum of three (3) years experience.

## 1.06 SPARE PARTS

- A. For each odor control system, provide the following spare parts:
  - 1. Fifty (50) nozzles
  - 2. Five Hundred (500) replacement polypropylene nozzle filters
  - 3. Thirty (30) replacement (one (1) micron filter cartridges for low pressure twin filter
  - 4. Four (4) 55-gallon drums of neutralizing agent Anotec 0307, manufactured by A.T. Products Corp., Waukesha, Wisconsin
  - 5. Two (2) motorized 120 VAC, 1PH 3-way drain valves
  - 6. Twelve (12) 21 oz. bottles of pump oil
  - 7. Two (2) pump rebuild kits

## 1.07 WARRANTY

- A. The Warranty shall be in conformance with Article 24 – Maintenance and Guaranty of the Standard Construction Contract.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.
  - 1. Johnson March, Inc
  - 2. Atomizing Systems, Inc.
  - 3. Fogco Systems, Inc.
  - 4. Or approved equal.

## 2.02 MATERIALS

- A. Provide nozzles capable of producing droplets mostly in the range of 5 to 20 microns at operating pressures of 500 to 1,200 psi. Each nozzle shall include a replaceable polypropylene filter element. Provide nozzles to produce enough fog to

effectively control odor generated by the handling of municipal solid waste at the transfer station and discharged at the exhaust fans, but as a minimum provide nozzles with a flow rate of 0.0285 gpm at 1,200 psi system pressure. Provide nozzles of type 316 stainless steel construction, with NPT tapered thread connections.

- B. For nozzle manifolds at the discharge points, provide 1/2-inch O.D. type 316 stainless steel tubing with welded nozzle fittings rated for pressures up to 3,000 psi. Provide ASME certified welds. Locate nozzle manifolds in the horizontal run of exhaust stacks, downstream of the exhaust fans. Seal around exhaust stack penetrations. Provide pipe supports in accordance with Section 15060 - Hangers and Supports. Provide and locate nozzles as required and shown to produce and disperse enough mist to effectively control odor, but as a minimum provide eight nozzles in exhaust stacks less than 50" diameter, ten nozzles in stacks 50" diameter and 12 nozzles in stacks greater than 50" diameter. Provide a minimum of two additional spare nozzle fittings at each nozzle manifold in stacks 58" diameter and smaller, four in stacks of 60" diameter and eight in stacks 68" diameter. Plug any initially unused, spare nozzle fittings to prevent leakage during operation. Provide valves that will allow the system to totally drain, without retaining water in the nozzle fittings.
- C. For system piping, provide 1/2-inch and 3/4-inch type 316 stainless steel tubing and compression fittings rated for pressures up to 3,000 psi. Piping shall be supported in accordance with the details shown on the Contract Drawings and as specified in Section 15060 - Hangers and Supports.
- D. For discharge point control valves, provide 1/2-inch NPT type 316 stainless steel, motorized ball valves rated at 3,000 psi, and suitable for 120 volt, 1Ph. operation. Provide 3-way ball valves to drain upon valve shutdown. Provide slow-acting ball valves with actuation time of five-seconds minimum. Ball valves shall have totally enclosed actuator gear train, factory lubricated. Motorized ball valves shall be Swagelok Whitey, or equal. Provide a manually-operated, 1/2-inch type 316 stainless steel two-way ball valve, rated at 3,000 psi, upstream of each motorized valve.
- E. Provide heavy-duty, direct drive, triplex plunger pumps with stainless steel wetted parts. Provide pumps to deliver enough water and chemical at sufficient pressure to the nozzles to effectively control odor generated by the handling of municipal solid waste at the transfer stations, but as a minimum provide pumps with a flow rate of 2.85 gpm at 1,200 psi system pressure. Size each pump to provide the entire system requirements. For each pump provide inlet solenoid valve to close on pump shut down, inlet water low-flow shut-off switch, stainless steel pulsation dampener, high temperature thermal water discharge valve, 2 1/2-inch diameter inlet and discharge oil-filled type pressure gauges, inlet and discharge isolation valves, discharge water pressure regulator, 4-20mA stainless steel pressure transducer rated at 2,000 psi minimum, pressure relief valve, dump solenoid valve to relieve system pressure on pump shutdown, discharge check valve and discharge flex rubber hose pressure

rated at 2,000 psi minimum. For each pump provide a drain valve with connection capable of fully draining the system, including the pump head. The pump motors shall be TEFC, minimum 5 HP and shall operate at 460-volt, 3-phase, 60-hertz.

F. Acceptable manufacturers for the plunger pumps are as follows:

1. General Pump
2. Cat Pumps Corporation
3. AR North America
4. Or approved equal

G. Provide an inlet water low-pressure shut-off switch and a discharge high-pressure shut-off function controlled by the PLC controller for the plunger pumps.

H. Provide industrial, multi-stage, polypropylene cartridge-type water filtration for the odor control systems to ensure 5-micron, minimum, filtration, inlet water pressure regulator, and appropriate flow to the pump units. Housings shall be stainless steel with replaceable cartridges. Provide inlet, outlet, air bleed and drain valves for the filtration unit. Components shall be mounted to skid and easily accessible. Provide a 2 1/2-inch diameter oil-filled type pressure gauge on the inlet and outlet to the filtration system.

I. Provide a low level switch specifically designed for monitoring level in a chemical drum. The switch shall be of the guided float type, with Type 304 stainless steel stem and float, and with a SPST contact. The switch assembly shall be provided with sufficient cable for connection to the odor control system control panel, to permit removal of the assembly for maintenance, and for drum replacement. The panel shall alarm when the level falls to the set point level, initially set at 10% full. The panel shall also send an alarm signal to SCADA for low level. The low level switch shall be a manufactured by Omega Model LVK-204, or approved equal.

J. Provide one, skid mounted, adjustable, water driven, proportioning-type chemical metering pump to deliver chemical into the plunger pump suction line at a consistent rate over varying water pressure and flow rates. Provide pumps made of chemical resistant materials able to operate at inlet water pressure of 85 psi. Pump shall have an induction range of 0.4% to 4% of water flow. Provide chemical pump with a chemical resistant flexible suction line and filter suitable for submerging into chemical. Acceptable manufacturers for the chemical pumps are as follows:

1. Dema Engineering Company
2. Dosmatic U.S.A., Inc.
3. Or approved equal

K. Mount the pumps, motors, control panel, filtration system and associated components for the odor control system on a stainless steel skid equipped with vibration mounts and suitable for bolting to a concrete pad. Vibration control equipment shall meet the requirements of Section 15071 – Vibration Control.

Situate skid components to allow easy access for maintenance. Provide stainless steel construction for the skid chassis including all brackets, supports, screws and other components. Size and install all structural components to comply with the requirements of the equipment being supported. All skid mounted equipment shall be pre-wired from the factory, requiring only external power provided by E contract.

- L. Provide one constant torque, adjustable frequency drive (AFD) for each pump in the odor control system to vary the speed of the corresponding plunger pump in response to system requirements. Normal operating pressure shall be as set at the pressure transducer when all discharge points are on-line. When discharge points are taken off-line, the AFD will decrease pump speed and output to maintain the normal operating pressure. Provide a set-point controller to adjust the system pressure. A minimum 4:1 turndown ratio shall be provided for the pump discharge flow. Provide AFD operation status indication including "Ready", "Power On", "Run" and "Fault" L.E.D. pilot lights.

M. Adjustable Frequency Drive Requirements

1. Provide adjustable frequency drives to vary the speed of NEMA standard, 3-phase, 460-volt, induction motors and driven equipment by varying the frequency and voltage applied to the motors.
2. Provide adjustable frequency drives that automatically restart when power is restored after a power outage. Provide control logic so the drive is allowed to restart when power is restored.
3. Rated Output Power: Provide adjustable frequency drives with an output that is at least 3 percent greater than the driven motor's full nameplate rating.
4. Torque Output: Provide variable torque or constant torque output drives as required by driven equipment.
5. Provide adjustable frequency drives that utilize 6-pulse drive technology.
6. Operate at a minimum efficiency of 95 percent at rated load.
7. Operate from a 460-volt, 3-phase, 60-hertz supply with a voltage variation of plus or minus 10-percent and a frequency variation of plus or minus 2-hertz.
8. Input power factor: Maintain a 95 percent minimum power factor over a 20 to 100 percent speed range.
9. Operate an induction motor as specified, including a high-efficiency, high-power factor, premium-duty motor, with no detriment to motor life.

10. Operate an induction motor without exceeding a motor sound and power level of 96-decibels, A-weighted, when measured in accordance with IEEE 85.
11. Operate under the following ambient conditions:
  - a. Ambient Temperature: 0 to 40 degrees C
  - b. Humidity: 0 to 95 percent
12. UL Label: Provide a UL Inc. Label or certification of listing by C.S.A. or other recognized testing organization for each adjustable frequency drive.
13. Manufacturers: Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for review.
  - a. Robicon
  - b. Cutler-Hammer
  - c. Toshiba
14. Input Disconnect: Provide an input circuit breaker with an interrupting rating of 65,000 rms symmetrical amperes.
15. Input Reactor: Provide input reactor or isolation transformer, if required.
16. Converter Section: Provide input section that converts 460-volts, 60-hertz, 3-phase input to a fixed dc voltage using diodes.
17. Filter Sections: Provide dc link reactor and filter capacitors as required.
18. Inverter Section: Provide adjustable frequency drive inverter section that converts the fixed dc voltage to an adjustable frequency output utilizing a pulse-width modulation inverter. Maintain a constant volts per hertz ratio on the output with voltage boost for startup as required.
19. Control Devices: Provide a digital operator keypad located on the front door to allow setting of all programmable parameters and the following control functions:
  - a. Start push button
  - b. Stop push button
  - c. "Local-Remote" control selection
  - d. Speed control settings
  - e. Speed meter with hertz and 0-100 percent scales
  - f. Diagnostics package with fault indication and reset push button

- N. Provide local control panel at the pumps in a stainless steel, NEMA 4 enclosure with AFD and all control devices required to provide a complete functioning system. The control devices shall include but not be limited to the following:
1. Disconnect switch
  2. Hand-Off-Auto (H-O-A) selector switch for each pump
  3. Programmable logic controller, micro type, meeting the applicable requirements of Section 17212, Programmable Logic Controllers, Ethernet capable
  4. Set-point controller (as discrete panel-mounted device)
  5. Local-Off-Remote selector switch for each valve
  6. Pump 1-Off-Pump 2 selector switch
  7. Off-Running indicating lights for each pump
  8. On-Drain-Auto selector switch for each valve
  9. On-Drain indicating lights for each valve
  10. Pressure set point and drain time periods shall be adjustable from the panel front
- O. All indicator lights shall be of the push-to-test LED indicating lamp type.
- P. From the H-O-A selector switch, "Off" mode shuts system off. In "Auto" mode, the AFD controls pump speed in response to pressure set-point controller. In "Hand" mode, pump runs and allows operator to manually start pump and adjust speed. The Pump 1-Off-Pump 2 selector switch allows selection of the duty pump. Provide labeled OFF-RUNNING status lights for each pump.
- Q. Each discharge point control ball valve shall be controlled by a three-position selector switch, located on the control panel. "Off" mode prohibits valve operation. In "Local" mode, the valve shall be operated by "On" and "Drain" push buttons mounted on the control panel. In "Auto" mode, interlock each motorized ball valve with its related discharge point exhaust fan motor to allow ball valve to be "on" (open) only if fan motor is running. In "Auto" mode, when the fan stops, the valve shall move to the "Drain" position. Provide nameplate indicating appropriate exhaust fan number discharge point below each selector switch.

- R. Provide dry contact closures, rated 5A at 120VAC, for remote monitoring of the following:
1. Pump Run (for each pump)
  2. Pump Fail (for each pump)
  3. System Fault (Comprised of the following)
    - a. Inlet Water Low Flow
    - b. Inlet Water Low Pressure
    - c. Discharge High Pressure
  4. Low Odor Chemical Level
  5. All of the above alarms including each condition that causes a system fault shall be separately displayed on the system control panel.
- S. Provide all electrical and control components to meet the requirements of Division 16 of the Electrical Contract.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install odor control equipment in accordance with the manufacturer's recommendations and approved shop drawings, and as specified in Division 1. Coordinate odor control equipment design and installation with the exhaust ducts.
- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on the proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1.
- C. Tests: After installation of the odor control equipment, controls and all appurtenances, subject the units to a field running test, as specified in Division 1, under actual operating conditions.
- D. Additional Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to inspect the completed installation, under actual operating conditions, after the system has been in operation for 60-days. Make any necessary adjustments.

#### 3.02 CLEANING AND PAINTING

- A. Paint odor control equipment as specified in Section 09912 – Interior Painting. Do not paint stainless steel components.

### 3.03 TRAINING

- A. Provide training in accordance with Section 01821 – Start-up and Training.
- B. The manufacturer of the Odor Control System shall include one day of on-site classroom and hands-on training at the station. The day is on session of 8 hours.
  - 1. Maintenance – (2 hours) of training shall be included. Training to include operation of the system and regular maintenance (electrical, pneumatic and mechanical). Additionally the City of New York key maintenance personnel shall be allowed to “shadow” the installation process whenever possible. By “shadowing” the equipment installation, the highest level of practical knowledge can be obtained.
  - 2. Supervisors – (2 hours) of training shall be included. Training shall include operation of the system and basic troubleshooting as a minimum.
  - 3. Operators Training – (4 hours) of on-site training shall be included. Operator training shall provide use skills along with safety training.

-END OF SECTION-

**Section 13915**  
**FIRE-SUPPRESSION PIPING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Automatic wet-type, Class I standpipe systems.
- B. Wet-pipe sprinkler systems.
- C. Dry-pipe sprinkler systems.

**1.02 RELATED SPECIFICATIONS**

- A. Section 07842 - Fire Resistive Joint System
- B. Section 09912 - Interior Painting
- C. Section 10520 - Fire-Protection Specialties
- D. Section 13851 - Fire Alarm and Detection System
- E. Section 13921 - Electric-Drive, Centrifugal Fire Pumps
- F. Section 13953 - Foam/Water Fire Suppression System
- G. Section 15052 - Steel and Stainless Steel Pipe
- H. Section 15060 - Hangers and Supports
- I. Section 15076 - Piping and Equipment ID
- J. Section 15081 - Piping Insulation
- K. Section 15110 - Plumbing Valves
- L. Section 15430 - Plumbing Specialties

**1.03 REFERENCES**

- A. Codes and NFPA Standards: Fire-suppression-system equipment, specialties, accessories, installation, and testing shall comply with the following:
  - 1. NFPA 11, "Low-, Medium-, and High -Expansion Foam"
  - 2. NFPA 13, "Installation of Sprinkler Systems"
  - 3. NFPA 14, "Installation of Standpipe, Private Hydrant, and Hose Systems"
  - 4. NFPA 16, "Installation of Foam-Water Sprinkler and Foam- Water Spray System"
  - 5. NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances"
  - 6. Welding Material - ASME Code and procedure

7. Valves - Bear UL/FM Label or Marking
8. BSA Approvals - City of New York Building Code.
9. MEA Numbers - New York City Building Code.
10. Earthquake/Seismic - International Building Code 2003 Section 1621, and ASCE 7-02 Section 9.6
11. NFPA 25, "Inspection, Testing and Maintenance of Water-Based Fire Protection System"
12. UL, "Underwriters Laboratory"
13. NFPA 54, "National Fuel Gas Code"
14. NFPA 70, "National Electrical Code"
15. NFPA 72, "National Fire Alarm Code"
16. City of New York Building Code

#### 1.04 SYSTEM DESCRIPTIONS

- A. Automatic Wet-Type, Class I Standpipe System: Includes NPS 2-1/2 inch hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.
- B. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water which is connected to water supply. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included.
- C. Dry-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing compressed air. Opening of sprinklers releases compressed air and permits water pressure to open dry-pipe valve. Water then flows into piping and discharges from opened sprinklers.

#### 1.05 PERFORMANCE REQUIREMENTS

- A. Standard Piping System Component Working Pressure: Listed for at least 175 psig. Testing Pressure: Listed for at least 300 psig.

- B. Fire-suppression standpipe system design shall be approved by authorities having jurisdiction.
1. Minimum residual pressure at each hose-connection outlet is the following:
    - a. NPS 2-1/2 Hose Connections: 65 psig
- C. Fire-suppression sprinkler system design shall be approved by authorities having jurisdiction.
1. Margin of Safety for Available Water Flow and Pressure: 20 percent, including losses through water-service piping, valves, and backflow preventers
  2. Sprinkler Occupancy Hazard Classifications
    - a. Transfer Station Areas: High Pile Storage
    - b. Storage Areas: Ordinary Hazard, Group I
    - c. Mechanical Equipment Rooms: Ordinary Hazard, Group I
    - d. Office and Locker Room Areas: Light Hazard
  3. Maximum Protection Area per Sprinkler
    - a. Office Spaces: 225 sq. ft.
    - b. Storage Areas: 130 sq. ft.
    - c. Transfer Station Areas 130 sq. ft.
    - d. Mechanical Equipment Rooms: 130 sq. ft.
    - e. Other Areas: According to NFPA 13 recommendations, unless otherwise indicated
  4. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 and NYC Fire Department requirements, unless otherwise indicated:
    - a. Light-Hazard Occupancies: 250 gpm for 30 minutes
    - b. Ordinary-Hazard Occupancies: 500 gpm per for 60 to 90 minutes
    - c. Extra Hazard Occupancies: 500 gpm for 90-120 minutes
- D. Seismic Requirements: All piping shall be provided with seismic restraints in accordance with the seismic provisions of the International Building Code (IBC) 2003, Section 1621 and ASCE 7-20, Section 9.6, in conjunction with the current City of New York Building Code to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural notes on the Structural Contract Drawings and Specifications for site and structure specific seismic design criteria.

## 1.06 SUBMITTALS

## A. Product Data: For the following:

1. Piping materials, including dielectric, flexible connections, and sprinkler specialty fittings
2. Pipe hangers and supports, and seismic restraints
3. Valves, listed fire-protection valves, unlisted general-duty valves, and specialty valves and trim
4. Air compressors and electrical data
5. Sprinklers, escutcheons, and guards. Sprinkler flow characteristics, mounting, finish, and other pertinent data
6. Hose connections, size, type, and finish
7. Hose stations, size, type, and finish of hose connections; type and length of fire hoses; finish of fire hose couplings; type, material, and finish of nozzles; and finish of rack
8. Fire department connections and roof manifolds, type, number, size, and arrangement of inlets; caps and chains; size and direction of outlet; escutcheon and marking; and finish
9. Alarm flow and supervisory devices, and electrical data

## B. Shop Drawings: Power wiring, signal, and control wiring diagrams

1. Sprinklers shall be referred to on drawings, submittals and other documentation, by the sprinkler identification or Model number as specifically published in the appropriate agency listing or approval. Trade names or other abbreviated designations shall not be allowed.
2. Grooved joint couplings and fittings shall be shown on drawings and product submittals, and be specifically identified with the applicable Victaulic style number.

## C. Fire-hydrant flow test report

## D. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, New York City Building Code and that have been approved by authorities having jurisdiction, including hydraulic calculations signed by New York State Professional Engineer, if applicable.

- E. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13, NFPA 14 and New York City Building Code Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."
- F. Welding certificates
- G. Field quality-control test reports
- H. Operation and Maintenance Data: For standpipe and sprinkler specialties to include in emergency, operation, and maintenance manuals.

#### 1.07 QUALITY ASSURANCE

- A. Installer Qualifications: Installer's responsibilities include designing, fabricating, and installing fire-suppression systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.
  - 1. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified Professional Engineer licensed in the State of New York.
- B. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
- C. Permits: Contractor shall obtain and pay for all required permits, fees, inspections and approvals by authorities having jurisdiction.
- D. The installer shall be a City of New York licensed approved contractor.
- E. The installer shall be licensed to install fire alarm fire suppression equipment in the City of New York and in New York State.
- F. Except as modified herein, conform to the required and advisory provisions of the Building Code of the City of New York and NFPA 13 for design, equipment materials, installation, workmanship, examination, inspection, and testing. Include all materials, accessories, and equipment inside and outside the building for each system to be complete and ready for use. Design and provide each system to accommodate blind spaces, beams, beam pockets, concealed spares, piping, electrical equipment, ductwork, and other construction and equipment in accordance with detailed drawings submitted for approval. Locate sprinkler heads in a consistent pattern with ceiling grid, lights, and supply air diffusers. Provide devices and equipment for fire protection service of a make or type which is UL listed or FM approved for use in sprinkler and standpipe systems. Where applicable whenever the Building Code of the City of New York references the NFPA publications, the ad-

visory provisions are considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears.

- G. The Contractor shall provide complete, new sprinkler fire protection water service connection from the backflow preventer assembly provided under the plumbing work, wet pipe alarm valve, electric alarm bell, fire department siamese connection, sprinkler head, flow switches, piping hangers, test connections and all appurtenances. It shall be understood that the final design of the wet and dry pipe sprinkler fire protection systems, including, but not limited to, the agreement, hydraulic calculations, size and location of risers, feed mains, cross mains, test connections, branch lines and drains, and the locations, spacing, number and types of heads or nozzles shall be the responsibility of the Contractor and shall conform with the requirements of the Building Code of the City of New York, the local Authorities, Standards and Codes listed in these specifications. The Contractor shall be responsible for procuring approval from the Fire Department and Building Department.
- H. To assure uniformity and compatibility of piping components in grooved piping systems, all grooved products utilized shall be supplied by a single manufacturer. Grooving tools shall be supplied from the same manufacturer as the grooved components.

#### 1.08 COORDINATION

- A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including, but not limited to, light fixtures, ductwork, HVAC equipment, large openings, catwalks, platforms, and partition assemblies.

#### 1.09 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Sprinkler Cabinets: Finished, wall-mounting, steel cabinet with hinged cover, with space for minimum of six spare sprinklers plus sprinkler wrench. Provide number of sprinklers required by NFPA 13 and sprinkler wrench. Provide separate cabinet with sprinklers and wrench for each type of sprinkler on Project.

### PART 2 PRODUCTS

#### 2.01 DUCTILE-IRON PIPE AND FITTINGS

- A. Push-on-Joint, Ductile-Iron Pipe: AWWA C151, with push-on-joint bell end and plain end.

1. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile iron, standard pattern AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern
  2. Gaskets: AWWA C111, rubber
- B. Grooved-End, Ductile-Iron Pipe: AWWA C151, with factory- or field-formed, radius-cut-grooved ends according to AWWA C606
1. Grooved-Joint Piping Systems
    - a. Manufacturer: Victaulic Co. of America or approved equal
    - b. Grooved-End Fittings: UL-Listed or FM approved, ASTM A 536, ductile-iron casting or ASTM A 48, cast-iron with OD matching ductile-iron-pipe OD.
    - c. Grooved-End-Pipe Couplings: UL-Listed AWWA C606, gasketed fitting matching ductile-iron-pipe OD. Include ductile-iron housing with keys matching ductile-iron-pipe and fitting grooves, pressure responsive synthetic rubber gasket of a FlushSeal® design with center leg, or approved equal, and steel bolts and nuts. Victaulic Style 31 or approved equal.
    - d. Grooved-End-Pipe Transition Coupling: UL-Listed or FM approved and AWWA C606, gasketed fitting with end matching ductile-iron-pipe OD and end matching steel-pipe OD. Include ductile-iron housing with key matching ductile-iron-pipe groove and key matching steel-pipe groove, pressure responsive synthetic rubber gasket listed for use with housing, and steel bolts and nuts. Victaulic Style 307 or approved equal.
    - e. Grooved-End Transition Flange: UL-Listed or FM approved, Class 125 gasketed fitting with key for ductile-iron-pipe dimensions. Include flange-type, ductile-iron housing with synthetic rubber gasket listed for use with housing and steel bolts and nuts. Victaulic Style 341 or approved equal.

## 2.02 STEEL PIPE AND FITTINGS

- A. Threaded-End, Standard-Weight Steel Pipe: ASTM A 53, Scheduled 40 with factory- or field-formed threaded ends. Provide Schedule 40 hot-dip galvanized for dry system.
1. Cast-Iron Threaded Flanges: ASME B16.1
  2. Malleable-Iron Threaded Fittings: ASME B16.3

3. Gray-Iron Threaded Fittings: ASME B16.4
  - a. Hot-dip galvanized fittings for dry system.
4. Steel Threaded Pipe Nipples: ASTM A 733, made of ASTM A 53 or ASTM A 106, Schedule 40, seamless steel pipe hot-dip galvanized. Include ends matching joining method.

**B. Grooved-Joint Piping Systems**

1. Grooved-End, Standard-Weight, Sch 40, Steel Pipe: ASTM A 53, hot-dip galvanized and with factory- or field-formed, square-cut, grooved ends.
2. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Central Sprinkler Corp.
  - b. Ductilic, Inc.
  - c. JDH Pacific, Inc.
  - d. National Fittings, Inc.
  - e. Shurjoint Piping Products, Inc.
  - f. Southwestern Pipe, Inc.
  - g. Star Pipe Products; Star Fittings Div.
  - h. Victaulic Co. of America
  - i. Ward Manufacturing
3. Grooved-End Fittings: UL-listed or FM approved, ASTM A 536, ductile-iron casting; ASTM A 234 forged steel; or ASTM A 53 fabricated from carbon steel pipe with OD matching steel-pipe OD. Hot-dip galvanized for dry system.
4. Grooved-End-Pipe Couplings: UL 213 and AWWA C606, rigid pattern with offsetting, angle-pattern bolt pads to provide rigidity and system support and hanging in accordance with NFPA 13, unless otherwise indicated; gasketed fitting matching steel-pipe OD. Include ductile-iron housing with keys matching steel-pipe and fitting grooves, pressure responsive synthetic rubber gasket listed for use with housing, and steel bolts and nuts. (Tongue and recess rigid type couplings shall not be permitted.)
  - a. Rigid Type: Housing shall be cast with offsetting, angle-pattern bolt pads to provide system rigidity and support and hanging in accordance with NFPA 13.
    - (1) 1-1/4 inch to 4 inch: "Installation Ready" stab-on design for direct 'stab' installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic FireLock Style 009H or approved equal.

- (2) 5 inch and Larger: Standard rigid couplings. Victaulic FireLock Style 005 or Style 07 or approved equal.
- b. Flexible Type: Use in seismic areas where required by NFPA 13.
  - (1) 2 inch to 8 inch: "Installation Ready" stab-on design for direct 'stab' installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic Style 177 QuickVic™ or approved equal.
  - (2) 5 inch and Larger: Standard flexible couplings. Victaulic Fire-Lock Style 75 or Style 77 or approved equal.
- 5. Grooved-End, Steel Pipe Flange Adapters: ASTM A536 ductile iron casting, flat faced, designed for incorporating flanged components with ANSI Class 125 and 150 bolt-hole patterns to a grooved piping system. Victaulic Style 741 or 744 or approved equal.

## 2.03 DIELECTRIC FITTINGS

- A. Dielectric Unions: Factory-fabricated assembly, designed for 175-psig minimum working pressure at 180 deg F. Provide insulating material that isolates dissimilar materials and ends with inside threads according to ASME B1.20.1.
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Capitol Manufacturing Co.
    - b. Central Plastics Company
    - c. Epco Sales, Inc.
    - d. Hart Industries International, Inc.
    - e. Watts Industries, Inc.; Water Products Div.
    - f. Zurn Industries, Inc.; Wilkins Div.
- B. Dielectric Flanges: Factory-fabricated companion-flange assembly, for 175-psig minimum working-pressure rating as required for piping system.
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Capitol Manufacturing Co.
    - b. Central Plastics Company
    - c. Epco Sales, Inc.
    - d. Watts Industries, Inc.; Water Products Div.

- C. Dielectric Flange Insulation Kits: Components for field assembly shall include CR or phenolic gasket, PE or phenolic bolt sleeves, phenolic washers, and steel backing washers.
1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Advance Products and Systems, Inc.
    - b. Calpico, Inc.
    - c. Central Plastics Company
    - d. Pipeline Seal and Insulator, Inc.
- D. Dielectric Couplings: Galvanized steel with inert and non-corrosive thermoplastic lining and threaded ends and 175-psig minimum working-pressure rating at 225 deg F.
1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Calpico, Inc.
    - b. Lochinvar Corp.
- E. Dielectric Nipples: Electroplated steel or ductile iron with inert and non-corrosive thermoplastic lining, with combination of plain, threaded, or grooved ends and 175-psig working-pressure rating at 230 deg F.
1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Perfection Corporation
    - b. Precision Plumbing Products, Inc.
    - c. Victaulic Co. of America

## 2.04 FLEXIBLE CONNECTORS

- A. Flexible connectors shall have materials suitable for system fluid. Include 175-psig minimum working-pressure rating and ends according to the following:
1. NPS 2 and Smaller: Threaded
  2. NPS 2-1/2 and Larger: Flanged
  3. Option for NPS 2-1/2 and Larger: Grooved for use with grooved-end-pipe couplings

- B. Acceptable manufacturers are listed below. Other manufacturers of equivalent fire protection products may be submitted for approval.

1. Anvil International
2. Anamet Inc.
3. Flex-Hose Co., Inc.
4. Flexicraft Industries
5. Flex-Pression, Ltd.
6. Flex-Weld, Inc.
7. Metraflex, Inc.
8. Proco Products, Inc.
9. Unaflex Inc.

- C. Bronze-Hose, Flexible Connectors: Corrugated, bronze, inner tubing covered with bronze wire braid. Provide copper-tube ends or bronze flanged ends, braze welded to hose.

- D. Stainless-Steel-Hose/Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Provide steel nipples or flanges, welded to hose.

- E. Stainless-Steel-Hose/Stainless-Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Provide stainless-steel nipples or flanges, welded to hose.

## 2.05 CORROSION-PROTECTIVE ENCASEMENT FOR PIPING

- A. Encasement for Underground Metal Piping: ASTM A 674 or AWWA C105, PE film, 0.008-inch minimum thickness, tube or sheet.

## 2.06 SPRINKLER SPECIALTY FITTINGS

- A. Sprinkler specialty fittings shall be UL listed or FM approved, with 175-psig minimum working-pressure rating, and made of materials compatible with piping. Sprinkler specialty fittings shall have 250-psi minimum working-pressure rating if fittings are components of high-pressure piping system.

- B. Outlet Specialty Fittings

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Central Sprinkler Corp.
  - b. Ductilic, Inc.
  - c. National Fittings, Inc.
  - d. Shurjoint Piping Products, Inc.
  - e. Star Pipe Products; Star Fittings Div.

- f. Victaulic Co. of America
  - g. Ward Manufacturing
- 2. Mechanical-T and Cross Fittings: UL 213, ductile-iron housing with synthetic rubber gaskets, bolts and nuts, and threaded or grooved outlets.
- 3. Snap-On and Strapless Outlet Fittings: UL 213, ductile-iron housing or casting with gasket and threaded outlet.
- C. Sprinkler Drain and Alarm Test Fittings: Cast- or ductile-iron body; with threaded or grooved inlet and outlet, test valve, and orifice and sight glass.
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Central Sprinkler Corp.
    - b. Fire-End and Croker Corp.
    - c. Viking Corp.
    - d. Victaulic Co. of America.
- D. Sprinkler Branch-Line Test Fittings: Brass body with threaded inlet, capped drain outlet, and threaded outlet for sprinkler.
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Elkhart Brass Mfg. Co., Inc.
    - b. Fire-End and Croker Corp.
    - c. Potter-Roemer; Fire-Protection Div.
    - d. Victaulic Co. of America.
- E. Sprinkler Inspector's Test Fitting: Cast- or ductile-iron housing with threaded inlet and drain outlet and sight glass
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. AGF Manufacturing Co.
    - b. Central Sprinkler Corp.
    - c. G/J Innovations, Inc.
    - d. Triple R Specialty of Ajax, Inc.
    - e. Victaulic Co. of America.

F. Drop-Nipple Fittings: UL 1474, adjustable with threaded inlet and outlet, and seals.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. CECA, LLC
- b. Merit Brass.

G. Dry-Pipe System Fittings: UL-Listed or FM approved listed for dry-pipe service

## 2.07 LISTED FIRE-PROTECTION VALVES

A. Valves shall be UL listed or FM approved, with 175-psig minimum working pressure rating.

B. Provide valves of same type from same manufacturer.

C. Ball Valves: Comply with UL 1091, except with ball instead of disc.

- 1. NPS 1-1/2 and Smaller: Bronze or brass body with threaded or grooved ends
- 2. NPS 2 and NPS 2-1/2: Bronze or brass body with threaded ends or ductile-iron or brass body with grooved ends
- 3. NPS 3: Ductile-iron body with grooved ends
- 4. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. NIBCO
- b. Victaulic Co. of America
- c. Kennedy Valve Div.
- d. Milwaukee Valve Co.

D. Butterfly Valves: UL Listed or FM approved

- 1. NPS 2 and Smaller: Bronze body with threaded ends.
  - a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - (1) NIBCO
    - (2) Global Safety Products, Inc.
    - (3) Milwaukee Valve Company.
    - (4) Victaulic Co. of America
    - (5) McWane, Inc.; Kennedy Valve Div.

2. NPS 2-1/2 and Larger: Bronze, cast-iron, or ductile-iron body; wafer type or with flanged or grooved ends.
  - a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - (1) NIBCO
    - (2) Central Sprinkler Corp.
    - (3) Global Safety Products, Inc.
    - (4) McWane, Inc.; Kennedy Valve Div.
    - (5) Mueller Company
    - (6) Pratt, Henry Company
    - (7) Victaulic Co. of America
- E. Check Valves NPS 2 and Larger: UL Listed or FM approved, swing type, cast-iron body with flanged or grooved ends.
  1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Central Sprinkler Corp.
    - b. Crane Co.; Crane Valve Group; Crane Valves
    - c. Crane Co.; Crane Valve Group; Jenkins Valves
    - d. Firematic Sprinkler Devices, Inc.
    - e. Globe Fire Sprinkler Corporation
    - f. Grinnell Fire Protection
    - g. Hammond Valve
    - h. McWane, Inc.; Kennedy Valve Div.
    - i. Mueller Company
    - j. NIBCO
    - k. Potter-Roemer; Fire Protection Div.
    - l. Reliable Automatic Sprinkler Co., Inc.
    - m. Star Sprinkler Inc.
    - n. Stockham
    - o. Victaulic Co. of America
    - p. Watts Industries, Inc.; Water Products Div.
    - q. Milwaukee Valve Company
- F. Gate Valves: UL Listed or FM approved, OS&Y type
  1. NPS 2 and Smaller: Bronze body with threaded ends
    - a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
      - (1) Crane Co.; Crane Valve Group; Crane Valves
      - (2) Hammond Valve

- (3) NIBCO
- (4) United Brass Works, Inc.
- (5) Victaulic Co. of America
- (6) Milwaukee Valve Company

2. NPS 2-1/2 and Larger: Cast-iron body with flanged ends

- a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- (1) Clow Valve Co.
- (2) Crane Co.; Crane Valve Group; Crane Valves
- (3) Crane Co.; Crane Valve Group; Jenkins Valves
- (4) Hammond Valve
- (5) Milwaukee Valve Company
- (6) Mueller Company
- (7) NIBCO
- (8) Red-White Valve Corp.
- (9) United Brass Works, Inc.
- (10) Victaulic Co. of America

G. Indicating Valves: UL Listed or FM approved, with integral indicating device and ends matching connecting piping.

- 1. Indicator: Electrical, 115-V ac, pre-wired, single-circuit, supervisory switch
- 2. NPS 2 and Smaller: Ball or butterfly valve with bronze body and threaded ends

- a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- (1) Milwaukee Valve Company
- (2) NIBCO
- (3) Victaulic Co. of America

3. NPS 2-1/2 and Larger: Butterfly valve with cast- or ductile-iron body; wafer type or with flanged or grooved ends

- a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- (1) Central Sprinkler Corp.
- (2) Grinnell Fire Protection
- (3) McWane, Inc.; Kennedy Valve Div.
- (4) Milwaukee Valve Company

- (5) NIBCO
- (6) Victaulic Co. of America

H. Pressure Reducing Valve (PRV): UL Listed or FM approved.

- 1. Globe or angle pattern.
- 2. Grooved or flanged ends.
- 3. Ductile iron or bronze body with epoxy coating
- 4. Provided with restriction tube fitting, pressure reducing control and flow clean strainer
- 5. Pressure gauge upstream and downstream of the PRV
  - a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval
    - (1) CLA-VAL Valves
    - (2) Viking
    - (3) Control Valves

2.08 UNLISTED GENERAL-DUTY VALVES

A. Ball Valves NPS 2 and Smaller

- 1. MSS SP-110, 2-piece copper-alloy body with chrome-plated brass ball, 600-psig minimum CWP rating, blowout-proof stem, and threaded ends.
- 2. Meets the intent of MSS SP-110, 2-piece forged brass body with chrome plated brass ball and stem, 175-psig maximum CWP rating, blow-out proof stem, and Pressfit® ends or approved equal.

B. Check Valves NPS 2 and Smaller: MSS SP-80, Type 4, Class 125 minimum, swing type with bronze body, nonmetallic disc, and threaded ends.

C. Gate Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, solid wedge, and threaded ends.

D. Globe Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, nonmetallic disc, and threaded ends.

## 2.09 SPECIALTY VALVES

## A. Sprinkler System Control Valves: UL listed or FM approved, cast- or ductile-iron body with flanged or grooved ends, and 175-psig minimum pressure rating.

## 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. Victaulic Co. of America
- b. Central Sprinkler Corp.
- c. Firematic Sprinkler Devices, Inc.
- d. Globe Fire Sprinkler Corporation
- e. Grinnell Fire Protection
- f. Reliable Automatic Sprinkler Co., Inc.
- g. Star Sprinkler Inc.
- h. Viking Corp.

## 2. Alarm Check Valves: UL Listed or FM approved, minimum 175-psig working pressure, designed for horizontal or vertical installation, with bronze or brass grooved seat with O-ring seals, single-hinge pin, and latch design. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gauges, retarding chamber and fill-line attachment with strainer. Internal components shall be replaceable without removal from installed position.

- a. Drip Cup Assembly: Pipe drain without valves and separate from main drain piping.

## 3. Dry-Pipe Valves: UL Listed or FM approved, minimum 175-psig working pressure, differential type; with bronze or brass seat with O-ring seals, single-hinge pin, and latch design. Include UL Listed, quick-opening devices, trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gauges, priming chamber attachment, and fill-line attachment. Air pressure to water pressure ratio is approximately 1 to 6. The valve shall be externally resettable and all internal components shall be replaceable without removal from installed position.

- a. Air-Pressure Maintenance Device: UL Listed, automatic device to maintain correct air pressure in piping. Include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator or switch to maintain pressure, strainer, pressure ratings with 14- to 60-psig adjustable range, and 175-psig minimum inlet pressure.

## (1) Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- (a) TYCO
- (b) Victaulic Co. of America

- (c) Central Sprinkler Corp.
- (d) General Air Products, Inc.
- (e) Globe Fire Sprinkler Corporation
- (f) Grinnell Fire Protection
- (g) Reliable Automatic Sprinkler Co., Inc.
- (h) Star Sprinkler Inc.
- (i) Viking Corp.

- b. Air Compressor: F-AIC-01, UL Listed, fractional horsepower, 460-V ac, 60 Hz, three phase

- (1) Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- (a) TYCO
    - (b) Gast Manufacturing, Inc.
    - (c) Grinnell Fire Protection
    - (d) Reliable Automatic Sprinkler Co., Inc.
    - (e) Viking Corp.
    - (f) General Air Products

- B. Automatic Drain Valves: UL Listed, NPS, ball-check device with threaded ends.

- 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. TYCO
    - b. Guardian Fire Equipment
    - c. Croker

## 2.10 SPRINKLERS

- A. Sprinklers shall be UL listed or FM approved, with 175-psig minimum pressure rating. Sprinklers shall have 250-psig minimum pressure rating if sprinklers are components of high-pressure piping system. Sprinklers shall be glass-bulb type. Body shall be die cast brass, with hex-shaped wrench boss cast into the body to facilitate installation and reduce the risk of damage during installation.
- B. Sprinklers under an uninsulated roof shall be on intermediate temperature classification.
- C. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. AFAC Inc.
  - 2. Central Sprinkler Corp.
  - 3. Firematic Sprinkler Devices, Inc.
  - 4. Globe Fire Sprinkler Corporation.

5. Grinnell Fire Protection
  6. Reliable Automatic Sprinkler Co., Inc.
  7. Star Sprinkler Inc.
  8. Victaulic Co. of America
  9. Viking Corp.
  10. TYCO
- D. Automatic Sprinklers: With heat-responsive element complying with the following:
1. UL Listed for nonresidential applications
  2. UL Listed for early-suppression, fast-response applications
- E. Sprinkler Types and Categories: Nominal 1/2-inch orifice for "Ordinary" temperature classification rating, unless otherwise indicated or required by application.
1. Open Sprinklers: UL Listed, without heat-responsive element
    - a. Orifice: 1/2 inch, with discharge coefficient K between 5.3 and 5.8
    - b. Orifice: 17/32 inch, with discharge coefficient K between 7.4 and 8.2
- F. Sprinkler types, features, and options as follows:
1. Pendent sprinklers
  2. Recessed sprinklers, including escutcheon
  3. Sidewall sprinklers
  4. Sidewall, dry-type sprinklers
  5. Upright sprinklers
- G. Sprinkler Finishes for Upright, Pendent, Recessed, and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.
- H. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers. Escutcheons shall be listed, supplied and approved for use with the sprinkler by the sprinkler manufacturer.
1. Ceiling Mounting: Chrome-plated steel, one piece, flat 1-inch vertical adjustment
  2. Sidewall Mounting: Chrome-plated steel, one piece, flat
- I. Sprinkler Guards: Wire-cage type, including fastening device for attaching to sprinkler. Guards shall be listed, supplied and approved for use with the sprinkler by the sprinkler manufacturer.

- J. Extra Heads: Provide wall-mounted cabinet, housing minimum of six extra sprinkler heads and sprinkler wrench. Extra sprinkler heads shall include two of all types used.
- K. Stainless Steel Sprinkler Fitting System: In lieu of rigid pipe offsets or return bends for sprinkler drops, the Victaulic AquaFlex® stainless steel sprinkler fittings system, or approved equal, may be used to locate sprinklers as required by final finished ceiling tiles and walls. The drop system shall consist of a braided or unbraided (corrugated) type 304 stainless steel flexible tube with union joints factory pressure tested to 400 psi (2760 kPa). The flexible drop shall attach to the ceiling grid using a one-piece open gate bracket. The AquaFlex® system, or approved equal, shall be UL 2443 listed or FM approved.

## 2.11 HOSE STATIONS AND AUXILIARY HOSE STATIONS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. AFAC Inc.
  - 2. Potter-Roemer; Fire-Protection Div.
  - 3. American Fire Hose Cabinet Co.
  - 4. Angus Fire, Inc.
  - 5. Elkhart Brass Mfg. Co., Inc.
  - 6. Fire-End and Croker Corp.
  - 7. Or approved equal.
- B. Description: UL Listed or FM approved, hose rack assembly stations. Include brass rack nipple, hose rack, and the following:
  - 1. Angle Valve: 2½" UL listed, rough brass, 300-psig minimum pressure rating, 90-degree-angle-pattern hose valve with female NPS inlet and outlet, 2½" Model 4075, Potter Roemer or approved equal
  - 2. Hose Rack: 2½" Red polyester coated steel hose rack, Model 2887, Potter Roemer or approved equal
  - 3. Hose Rack Nipple: 2½" Satin brass, Model 2756, Potter Roemer or approved equal
  - 4. Pin Lug Coupling: 2½" Satin brass, Model 2939, Potter Roemer or approved equal
  - 5. Hose: 125 Feet, 2½" UL listed or FM approved, lined 500 lb. Polyflex hose, Model 2916, Potter Roemer or approved equal
  - 6. Nozzle: 2½" Polyester coated straight stream nozzle, Model 2948, Potter Roemer or approved equal

7. Escutcheon: 2½" Model 4722, Potter Roemer or approved equal
  8. Drain Valves: UL Listed
  9. Mountings: Pipe clamp or wall bracket for freestanding units
- C. Description: UL listed or FM approved, hose cabinet/rack assembly stations. Include brass rack nipple, hose rack, recessed metal cabinet, and the following:
1. Angle Valve: 2½" UL listed, rough brass, 175-psig minimum pressure rating, 90-degree-angle-pattern hose valve with female NPS inlet and outlet, 2½" Model 4075, Potter Roemer or approved equal
  2. Hose Rack: 2½" Red polyester coated steel hose rack, Model 2887, Potter Roemer or approved equal
  3. Hose Rack Nipple: 2½" Satin brass, Model 2756, Potter Roemer or approved equal
  4. Pin Lug Coupling: 2½" Satin brass, Model 2939, Potter Roemer or approved equal
  5. Hose: 125 Feet, 2½" UL listed or FM approved lined 500 lb. Polyflex hose, Model 2916, Potter Roemer or approved equal
  6. Nozzle: 2½" Polyester coated straight stream nozzle, Model 2948, Potter Roemer or approved equal
  7. Escutcheon: 2½" Model 4722, Potter Roemer or approved equal
  8. Drain Valves: UL Listed
  9. Hose Cabinet: 2 Hours Fire Rated Stainless Steel cabinet shall be 20 gauge white glossy polyester coated steel box, 20 gauge tubular steel door with 18 gauge with continuous steel hinge, brass pin, door and frame finished with prime polyester coating, wall mounted, recessed type, full wire glass, Model 1300 Croker, Potter Roemer or approved equal.
- D. Valve Cabinet: 2 Hours fire rated, 304 Stainless steel door and frame, for 2½" fire valve, recessed type, full wire glass, UL approved, continuous steel hinge, Model 1700, Croker or approved equal.
- E. The complete fire hose racks and cabinets installation shall be in accordance with New York City Building Code.

## 2.12 FIRE DEPARTMENT CONNECTIONS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
1. Central Sprinkler Corp.
  2. Elkhart Brass Mfg. Co., Inc.
  3. Fire-End and Croker Corp.
  4. Fire Protection Products, Inc.
  5. Guardian Fire Equipment Incorporated
  6. Potter-Roemer; Fire-Protection Div.
  7. Reliable Automatic Sprinkler Co., Inc.
- B. Exposed, Freestanding-Type, Fire Department Connection: UL listed or FM approved, 175-psig minimum working pressure rating; with corrosion-resistant-metal body, brass inlets with threads according to NFPA 1963 and New York fire department threads, and bottom outlet with pipe threads. Provide brass lugged caps, gaskets, brass chains, brass lugged swivel connection and drop clapper for each hose-connection inlet; 24-inch- high, brass sleeve; and round, floor, brass escutcheon plate with marking "AUTO SPRINKLER & STANDPIPE."
1. Finish including Fire Department Connection and Sleeve: Polished brass.
  2. Model 5763-B, Potter Roemer or approved equal. Fire department connection shall be in accordance with New York City Building Code.
- C. Where applicable, install a 90-degree elbow with drain connection at each Fire Department Connection. Elbow shall be equal to Victaulic #10-DR or approved equal.

## 2.13 ALARM DEVICES

- A. Alarm-device types shall match piping and equipment connections.
- B. Water-Flow Indicator: UL Listed or FM approved, electrical-supervision, paddle-operated-type, water-flow detector with minimum 175-psig working pressure rating and designed for horizontal or vertical installation. Provide two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-Vac and 0.25 A, 24-Vdc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.
- C. Alarm check valve incorporating integral flow alarm switch and Series 752 retard-  
ing chamber are acceptable for flow detection provided its switch characteristics meet those stated for the vane-type switch specified above. The alarm valve shall be UL listed and FM approved. The alarm valve shall be equipped with a removable cover assembly and shall be suitable for installation in the vertical position. The alarm valve shall be equipped with gauge connections on the system side and supply side of the valve clapper. The piping shall be externally galvanized. Minimum

working pressure 175 psig. Valve internal parts shall be replaceable without removing the valve from the installed position. Victaulic FireLock Series 751 or approved equal.

- D. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

1. ADT Security Services, Inc.
2. Grinnell Fire Protection
3. ITT McDonnell & Miller
4. Potter Electric Signal Company
5. System Sensor
6. Viking Corp.
7. Watts Industries, Inc.; Water Products Div.
8. Victaulic Co. of America

- E. Pressure Switch: UL listed or FM approved, electrical-supervision-type, water-flow switch with retard feature. Provide single-pole, double-throw, normally closed contacts and design that operates on rising pressure and signals water flow.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

- a. Grinnell Fire Protection
- b. Potter Electric Signal Company
- c. System Sensor
- d. Viking Corp.

- F. Valve Supervisory Switch: UL listed or FM approved, electrical, single-pole, double-throw switch with normally closed contact and signals controlled valve is in other than fully open position.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

- a. McWane, Inc.; Kennedy Valve Div.
- b. Potter Electric Signal Company
- c. System Sensor

- G. Indicator-Post Supervisory Switch: UL listed or FM approved, electrical, single-pole, double-throw switch with normally closed contacts. Include design that signals controlled indicator-post valve is in other than fully open position.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

- a. Potter Electric Signal Company
- b. System Sensor

## 2.14 PRESSURE GAUGES

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

1. AGF Manufacturing Co.
2. AMETEK, Inc.; U.S. Gauge
3. Brecco Corporation
4. Dresser Equipment Group; Instrument Div.
5. WIKA Instrument Corporation

- B. Description: UL listed or FM approved, 3-1/2-inch- minimum diameter, dial pressure gauge with range of 0 to 250 psig minimum.

1. Water System Piping: Provide caption "WATER" or "AIR/WATER" on dial face.
2. Air System Piping: Provide retard feature and caption "AIR" or "AIR/WATER" on dial face.

## 2.15 ALARM BELL

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval

1. System Sensor
2. Grainger
3. Potter

- B. Description: UL Listed or FM approved, approved for indoor and outdoor use, 10-inch diameter. Operating voltage 120 VAC.

1. Weatherproof back box, when installed outdoors.
2. Bells shall be suitable for surface mounting.
3. Bells shall be located as determined by the authority having jurisdiction.

**PART 3 EXECUTION****3.01 PREPARATION**

- A. See Contract Drawings for fire-hydrant flow test,

**3.02 EARTHWORK**

- A. Refer to Section 02316 - Excavation and Section 02317 - Backfilling for excavating, trenching, and backfilling.

**3.03 EXAMINATION**

- A. Examine roughing-in for hose connections and stations to verify actual locations of piping connections before installation.
- B. Examine walls and partitions for suitable thicknesses, fire- and smoke-rated construction, framing for hose-station cabinets, and other conditions where hose connections and stations are to be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.04 PIPING APPLICATIONS-GENERAL**

- A. Do not use welded joints for galvanized steel pipe.
- B. Flanges, flanged fittings, grooved joints couplings unions, nipples, and transition and special fittings with finish and pressure ratings same as or higher than system's pressure rating shall be used in aboveground applications, unless otherwise indicated.
- C. Coordinate with piping shown in general specifications.

**3.05 STANDPIPE SYSTEM PIPING APPLICATIONS**

- A. Standard-Pressure, Wet-Type Standpipe System, 175-psig Minimum Working Pressure:
  - 1. NPS 4 and Smaller: Grooved-end, black, standard-weight, sch 40, steel pipe with square-cut, grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.
  - 2. NPS 5 and NPS 6: Grooved-end, standard-weight, sch 40, steel pipe with square-cut, grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

### 3.06 SPRINKLER SYSTEM PIPING APPLICATIONS

- A. Standard-Pressure, Wet-Pipe Sprinkler System, 175-psig Minimum Working Pressure:
1. NPS 1-1/2 and Smaller: Threaded-end, black, standard-weight, sch 40 steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
  2. NPS 2: Grooved-end, black, standard-weight steel pipe, sch 40, grooved-end fittings; grooved-end-pipe couplings; and grooved joints.
  3. NPS 4 to NPS 8: Grooved-end, black, standard-weight. Sch 40, steel pipe; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.
- B. Standard-Pressure, Dry-Pipe Sprinkler System, 175-psig Minimum Working Pressure:
1. NPS 1-1/2 and Smaller: Threaded-end, galvanized, standard-weight steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
  2. NPS 2: Grooved-end, galvanized, standard-weight, sch 40, steel pipe; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.
  3. NPS 4 to NPS 8: Grooved-end, galvanized, standard-weight, sch 40, steel pipe; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

### 3.07 VALVE APPLICATIONS

- A. Where specific valve types are not indicated, the following requirements apply:
1. Listed Fire-Protection Valves: UL listed or FM approved for applications where required by NFPA 13 and NFPA 14.
    - a. Shutoff Duty: Use ball, butterfly, or gate valves.
  2. Unlisted General-Duty Valves: For applications where UL-listed or FM-approved valves are not required by NFPA 13 and NFPA 14.
    - a. Shutoff Duty: Use ball, butterfly, or gate valves.
    - b. Throttling Duty: Use ball or globe valves.

### 3.08 JOINT CONSTRUCTION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping joint construction.
- B. Threaded Joints: Comply with NFPA 13 for pipe thickness and threads. Do not thread pipe smaller than NPS 8 with wall thickness less than Schedule 40 unless

approved by authorities having jurisdiction and threads are checked by a ring gage and comply with ASME B1.20.1.

- C. Grooved Joints: Assemble joints with listed coupling and gasket, lubricant, and bolts. All grooved couplings, fittings, valves and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded and produced by the grooved coupling manufacturer. Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove. Grooved coupling manufacturer's factory trained field representative shall provide on-site training for contractor's field personnel in the proper use of grooving tools, application of groove, and installation of grooved piping products. Factory trained representative shall periodically inspect the product installation. Contractor shall remove and replace any improperly installed products.
  - 1. Ductile-Iron Pipe: Radius-cut-groove ends of piping. Use grooved-end fittings and grooved-end-pipe couplings of the same manufacturer.
  - 2. Steel Pipe: Square-cut or roll-groove piping as indicated. Use grooved-end fittings and rigid, grooved-end-pipe couplings of the same manufacturer, unless otherwise indicated.
  - 3. All couplings must be installed in accordance with referenced standards. Follow manufacturer's instructions in all cases for all approvals and warranty enforcement.
  - 4. Dry-Pipe Systems: Use fittings and gaskets listed for dry-pipe service.
- D. Dissimilar-Metal Piping Joints: Construct joints using dielectric fittings compatible with both piping materials.
  - 1. NPS 2 and Smaller: Use dielectric unions, couplings, or nipples.
  - 2. NPS 2-1/2 to NPS 4: Use dielectric flanges.
  - 3. NPS 5 and Larger: Use dielectric flange insulation kits.
- E. Install shutoff valve, check valve, pressure gauge, and drain at connection to water service.

### 3.09 WATER SUPPLY CONNECTION

- A. Connect fire-suppression piping to building's interior water distribution piping. Refer to Section 15140 - Domestic Water Piping for interior piping.
- B. Install shutoff valve, reduced pressure zone backflow preventer, pressure gauge, drain, and other accessories indicated at connection to water distribution piping. Refer to Section 15430 - Plumbing Specialties for backflow preventers.

- C. Install shutoff valve, check valve, pressure gauge, and drain at connection to water supply.

### 3.10 PIPING INSTALLATION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping installation.
- B. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
  - 1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Engineer before deviating from approved working plans.
- C. Install underground ductile-iron service-entrance piping according to NFPA 24 and with restrained joints. Encase piping in corrosion-protective encasement.
- D. Use approved fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
- E. Install unions adjacent to each valve in pipes NPS 2 and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.
- F. Install grooved joint coupling flanges or flange adapters on valves, apparatus, and equipment having NPS 2-1/2 and larger connections.
- G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, sized and located according to NFPA 13.
- H. Install sprinkler piping with drains for complete system drainage.
- I. Install sprinkler zone control valves, test assemblies, and drain piping.
- J. Install drain valves on standpipes.
- K. Install ball drip valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.
- L. Install alarm devices in piping systems.
- M. Hangers and Supports: Comply with NFPA 13 and Specification Section 15060 for hanger materials.
  - 1. Install standpipe system piping according to NFPA 14.
  - 2. Install sprinkler system piping according to NFPA 13.

3. Victaulic Style 009H, 005, and 07 rigid coupling, or approved equal, may be used with IPS steel piping systems, which meet the support and hanging requirements of NFPA 13. An adequate number of Victaulic Style 177, 75 and 77 flexible couplings, or approved equal, shall also be used to compensate for thermal expansion/ contraction of the pipe.
  4. All hangers and supports shall be UL listed or FM approved, stainless steel and double nutted.
- N. Seismic Requirements: All piping shall be provided with seismic restraints in accordance with the seismic provisions of the International Building Code (IBC) 2003, Section 1621 and ASCE 7-02, Section 9.6, in conjunction with the current City of New York Building Code to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural notes on the Structural Contract Drawings and Specifications for site and structure specific seismic design criteria.
1. In Victaulic grooved piping systems, seismic motion shall be accommodated by installing swing joints consisting of flexible couplings, pipe nipples and elbows that provide simultaneous movement in all directions, or other seismic movement compensation devices such as loops, offsets, or Style 155 expansion joints (when an in-line device is required), to provide flexibility to the system and help reduce pipe stresses. Refer to Victaulic design submittal #26.12.
  2. All fire pipe passing through or crossing building seismic joints, shall contain a flexible expansion loop, designed for seismic movement. Flexible loops shall impart no thrust loads to building structure. Loops shall be located at, or near, the building seismic joint. Seismic bracing shall not pass through building seismic joint and shall not connect or tie together different sides or parts of building structure,. Flexible loops shall be capable of movement in the  $\pm X$ ,  $\pm Y$ ,  $\pm Z$  planes. Movement requirements and location, relative to seismic separation, shall be determined by structural. Flexible loops may be installed to accommodate thermal expansion, seismic movement, and building settlement. Unless specified otherwise by system design engineer or governing codes, all flexible loop connections to fire piping shall be installed, inspected, and tested.
- O. Install pressure gauges on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gauges with connection not less than NPS 1/4 and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gauges to permit removal, and install where they will not be subject to freezing.
- P. Drain wet and dry-pipe sprinkler piping.

- Q. Pressurize and check dry-pipe sprinkler system piping, air-pressure maintenance devices and air compressors.
- R. Fill wet-standpipe system piping with water.
- S. Fill dry-pipe sprinkler system piping with compressed air.
- T. Install flexible connectors on fire-pump and pressure-maintenance-pump supply and discharge connections and in fire-suppression piping.
- U. Pipe Expansion Provisions: Connect, support and guide piping to permit and control pipe expansion and construction and to accommodate building expansion, contraction and settling without damage.
  - 1. Providing piping expansion loops or expansion joints sized to accommodate possible expansion without exceeding allowable pipe and fittings stresses in straight sections of water piping more than 150 feet in length. Locate expansion devices midway between anchor points, and the pipes guided as recommended.
  - 2. Provide anchors for piping within a structure consisting of welded plates, angles, channels, or beams braced and securely fastened to the pipe and to structural members adequate to safely withstand resulting stresses.
  - 3. Expansion and contraction of grooved piping systems shall be provided with loops or bends consisting of (8) couplings, (4) 90 degree elbows, and (3) grooved end pipe spools in accordance with manufacturer recommendations for expansion compensation.
- V. Grooved joint piping systems shall be installed in accordance with the manufacturer's guidelines and recommendations. All grooved couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components. The gaskets style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded. Grooved end shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove for proper gasket sealing. A factory-trained field representative shall provide on-site training for Contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. Contractor shall remove and replace any improperly installed products

### 3.11 VALVE INSTALLATION

- A. Install listed fire-protection valves, unlisted general-duty valves, specialty valves and trim sets, controls, and specialties according to NFPA 13 and NFPA 14 and authorities having jurisdiction.

- B. Install listed fire-protection shutoff valves supervised-open, locate to control sources of water supply except from fire department connections. Install permanent identification signs indicating portion of system controlled by each valve.
- C. Valves for Wall-Type Fire Hydrants or Wall-Type Fire Hose Valves: Install non rising-stem gate valve in water-supply pipe.
- D. Install check valve in each water-supply connection. Install double check detector assembly instead of check valves in potable-water supply sources.
- E. Dry-Pipe Valves: Install trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gauges, priming chamber attachment, and fill-line attachment.
  - 1. Air-Pressure Maintenance Devices for Dry-Pipe Systems: Install shutoff valves to permit servicing without shutting down sprinkler system; bypass valve for quick system filling; pressure regulator or switch to maintain system pressure; strainer; pressure ratings with 14- to 60-psig adjustable range; and 175-psig maximum inlet pressure.
  - 2. Install air compressor and compressed-air supply piping.

### 3.12 SPRINKLER APPLICATIONS

- A. Drawings indicate sprinkler types to be used. Where specific types are not indicated, use the following sprinkler types:
  - 1. Rooms without Ceilings: Upright sprinklers.
  - 2. Rooms with Suspended Ceilings: Pendent sprinklers, Recessed sprinklers and Concealed sprinklers.
  - 3. Wall Mounting: Sidewall sprinklers.
  - 4. Spaces Subject to Freezing: Upright sprinklers, Sidewall dry sprinklers.
  - 5. Sprinklers listed for light hazard only shall be installed in office and Locker Room Areas.

### 3.13 SPRINKLER INSTALLATION

- A. Install sprinklers in suspended ceilings in center of narrow dimension of acoustical ceiling panels and tiles.
- B. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing. Use dry-type sprinklers with water supply from heated space.

- C. Do not install sprinklers that have been dropped, damaged, or show a visible loss of fluid. Never install sprinklers with cracked bulbs.

### 3.14 HOSE-STATION INSTALLATION

- A. Install freestanding hose stations for access and minimum passage restriction.
- B. Install NPS 2-1/2 hose connections with NPS 2½ quick-disconnect and flow-restricting device, unless otherwise indicated.
- C. Install freestanding hose stations with support or bracket attached to standpipe or substrate.
- D. Install wall-mounting, rack-type hose stations. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinet. Install valves at angle required for connection of fire hose. Cabinets are specified in Section 10520 - Fire-Protection Specialties.

### 3.15 FIRE DEPARTMENT CONNECTION INSTALLATION

- A. Install freestanding-type, fire department connections in level surface.
  - 1. Install protective pipe bollards on two sides of each fire department connection. Refer to Section 05500 - Metal Fabrications.
- B. Install ball drip valve at each check valve for fire department connection.

### 3.16 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Connect water-supply piping to fire-suppression piping. Include reduced pressure zone backflow preventer between potable-water piping and fire-suppression piping. Refer to Section 15430 - Plumbing Specialties for backflow preventers.
- D. Install ball drip valves at each check valve for fire department connection. Drain to floor drain or outside building.
- E. Connect piping to specialty valves, hose valves, specialties, fire department connections, and accessories.
- F. Connect pressure pumps to the following piping and wiring:
  - 1. Sprinkler system, hydraulically
  - 2. Pressure gauges and controls, hydraulically
  - 3. Electrical power system

4. Alarm device accessories for pump
  5. Fire alarm
- G. Connect compressed-air supply to dry-pipe sprinkler piping.
- H. Connect air compressor to the following piping and wiring:
1. Pressure gauges and controls
  2. Electrical power system
  3. Fire alarm devices, including low-pressure alarm
- I. Electrical Connections: Power wiring is specified in Division 16.
- J. Connect alarm devices to fire alarm.
- K. Ground equipment according to Section 16060 – Grounding.
- L. Connect wiring according to Section 16121 - Wires and Cables – 600 Volts and Below.
- M. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### 3.17 ROOF MANIFOLD

- A. Provide and install one or more roof manifolds where shown.
- B. All roof manifolds are 4 x 2-1/2 x 2-1/2 x 2-1/2 inches with cast brass body and three 2-1/2 inches cast brass angle hose valves. Three 2-1/2 inches cast brass cap with chain.

### 3.18 LABELING AND IDENTIFICATION

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13 and NFPA 14 and in Section 15076 - Piping and Equipment Identification.

### 3.19 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
  2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

3. Energize circuits to electrical equipment and devices.
4. Start and run pressure pumps.
5. Start and run air compressors.
6. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
7. Flush, test, and inspect standpipe systems according to NFPA 14, "System Acceptance" Chapter.
8. Coordinate with fire alarm tests. Operate as required.
9. Coordinate with fire-pump tests. Operate as required.
10. Verify that equipment hose threads are same as local fire department equipment.

- B. Report test results promptly and in writing to Commissioner and authorities having jurisdiction.

### 3.20 CLEANING AND PROTECTION

- A. Clean dirt and debris from sprinklers.
- B. Remove and replace sprinklers with paint other than factory finish.
- C. Protect sprinklers from damage until Substantial Completion.

### 3.21 DEMONSTRATION

- A. Engage a factory-authorized service representative to train DSNY's maintenance personnel to adjust, operate, and maintain specialty valves. Refer to Section 01781 - Project Closeout and Section 01821 - Training.

-END OF SECTION-

**Section 13921**  
**ELECTRIC-DRIVE, CENTRIFUGAL FIRE PUMPS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Full-service fire-pump controllers.
- B. Fire-pump accessories and specialties
- C. Pressure-maintenance pumps, controllers, accessories and specialties.
- D. Alarm panels.
- E. Flow meter systems.

**1.02 RELATED SPECIFICATIONS**

- A. Section 13851 - Fire Alarm and Detection Devices
- B. Section 13915 - Fire Suppression Piping
- C. Section 13953 - Foam/Water Fire Suppression System
- D. Section 15076 - Piping and Equipment ID
- E. Section 16060 - Grounding
- F. Section 16121 - Wires and Cables 600 Volts and Below

**1.03 REFERENCES**

- A. Codes and NFPA Standards: Fire pumps and accessories, Pressure-maintenance pumps and accessories, installation, and testing shall comply with the following.
  - 1. NFPA 20, "Installation of Stationary Pumps for Fire Protection"
  - 2. NFPA 25, "Inspection, Testing and Maintenance of Water-Based Fire Protection System"
  - 3. NFPA 70, "National Electrical Code"
  - 4. NFPA 72, "National Fire Alarm Code"
  - 5. BSA Approvals - City of New York Building Code
  - 6. MEA Numbers - New York City Building Code
  - 7. Valves - Bear UL/FM label or marking
  - 8. City of New York Building Code

## 1.04 PERFORMANCE REQUIREMENTS

- A. Pump, Equipment, Accessory, Specialty, and Piping Pressure Rating: 175-psig minimum working-pressure rating, unless otherwise indicated.

## 1.05 SUBMITTALS

- A. Product Data: For each type of product indicated, submit rated capacities, certified pump performance curves with each selection point indicated, operating characteristics, furnished accessories and specialties for each fire pump and pressure-maintenance pump.
- B. Shop Drawings: For fire pumps and drivers, fire-pump controllers, fire-pump accessories and specialties, pressure-maintenance pumps, pressure-maintenance pump controllers, and pressure-maintenance pump accessories and specialties, submit. Include plans, elevations, sections, details, and attachments to other work.
  - 1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified registered professional engineer responsible for their preparation.
  - 2. Wiring Diagrams: Power, signal, and control wiring
- C. Manufacturer Seismic Qualification Certification: Submit certification that fire pumps and drivers and fire-pump controllers, pressure-maintenance pumps, accessories, and specialties will withstand seismic forces defined in Section 15071 - Vibration Controls. Include the following:
  - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
    - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
  - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting, and anchorage provisions.
  - 3. Detailed description of equipment anchorage devices on which the certification is based and submittal installation requirements
- D. Product Certificates: For each type of fire pump and fire-pump controller, signed by product manufacturer
- E. Source quality-control test reports
- F. Field quality-control test reports

- G. Operation and Maintenance Data: Submit data for fire pumps and drivers, pressure-maintenance pumps, controllers, accessories and specialties, to include in emergency, operation, and maintenance manuals.

#### 1.06 QUALITY ASSURANCE

- A. Source Limitations: Obtain fire pumps, pressure-maintenance pumps, and controllers through one source from a single manufacturer for each type of equipment.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of fire pumps, pressure-maintenance pumps, and controllers and are based on specific systems indicated.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with standards of authorities having jurisdiction pertaining to materials, hose threads, and installation.
- E. Comply with NFPA 20, "Installation of Stationary Pumps for Fire Protection," for fire pumps, drivers, controllers, accessories, and their installation.
- F. Provide per New York City Building Code BSA approvals and MEA numbers.

#### 1.07 COORDINATION

- A. Coordinate size and location of concrete bases with the Contract Drawings.

### PART 2 PRODUCTS

#### 2.01 CENTRIFUGAL FIRE PUMP

- A. Description, General: UL listed and FM approved, factory-assembled and -tested, electric-drive, centrifugal fire pump capable of furnishing not less than 150 percent of rated capacity at not less than 65 percent of total rated head and with shutoff head limited to 140 percent of total rated head.
  - 1. Provide fire pump to automatically maintain required pressure in supplied fire protection system in event City of New York water supply pressure is insufficient.
  - 2. Provide approved means of preventing cross-contamination of primary City of New York water supply.

3. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping
  4. Nameplate: Complete with capacities, characteristics, and other pertinent data
- B. Fabricate base and attachment to fire pump, pressure-maintenance pump and controllers with reinforcement to resist movement of pumps and controllers during a seismic event when their bases are anchored to building structure.
- C. Single-Stage, Horizontally Mounted, Split-Case Fire Pump:
1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. A-C Pump; ITT Industries
    - b. Reddy-Buffaloes
    - c. Fairbanks Morse
    - d. Peerless Pump
    - e. Armstrong Darling, Inc.
  2. Pump: Axially split cast-iron casing with suction and discharge flanges machined to ASME B16.1, Class 125 dimensions, unless otherwise indicated.
    - a. Impeller: Cast bronze construction to match fire pump, statically and dynamically balanced, and keyed to shaft
    - b. Wear Rings: Replaceable, bronze
    - c. Shaft and Sleeve: Steel shaft with bronze sleeve
      - (1) Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing
      - (2) Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland
  3. Coupling: Flexible and capable of absorbing torsional vibration and shaft mis-alignment. Include metal coupling guard.
  4. Driver: UL listed, NEMA MG 1, open-drip-proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.

- a. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - (1) WEG Motors
  - (2) Lincoln Electric Company
  - (3) Marathon Electric, Inc.
- 5. Pump: Radially split cast-iron casing with suction and discharge flanges machined to ASME B16.1, Class 125 dimensions, unless otherwise indicated.
  - a. Impeller: Cast bronze of construction to match fire pump, statically and dynamically balanced, and keyed to shaft
  - b. Wear Rings: Replaceable, bronze
  - c. Shaft and Sleeve: Steel shaft with bronze sleeve
    - (1) Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing
    - (2) Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland

#### D. Fire-Pump Characteristics and Specialty Data

- 1. Fire-Pump: F-FP-01
  - a. Model: A-C Pump, ITT Industries Model 8 x 6 x 12  
F-M Series 8100 or approved equal
  - b. Rated Capacity: 1500 gpm
  - c. Total Rated Head: 150 psi
  - d. Outlet Flange Class: 125 lb.
- 2. Speed: Same as driver
- 3. Electric-Motor Driver: 200 hp, 1770 rpm, 480V, 3 phase, 60 Hz, F
- 4. Test Header Size
  - a. Hose Valves Required: Six
  - b. Hose Valve Size: NPS 2-1/2
- 5. Provide low point of pump casing with manual drain and high point with automatic air release valve.

6. Mount pump and drive motor on substantial steel or cast-iron baseplate with drip lip and drain connection.

## 2.02 FIRE-PUMP CONTROLLERS

- A. Fire-Pump Controllers, General: UL listed and FM approved and NFPA 20; listed for electric-drive, fire-pump service and service entrance; combined automatic and manual operation; factory assembled and wired; and factory tested for capacities and electrical characteristics. Soft Start/Soft Stop.
  1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Cutler-Hammer FT 90
    - b. Firetrol, Inc.
    - c. Joslyn Clark
  2. Rate controllers for 480 volt, 3 phase, 60 hertz operation and short-circuit withstand rating at least equal to short-circuit current available at controller location. Take into account cable size and distance from substation or supply transformers.
  3. Enclosure: UL 50, NEMA 12, indoor, unless special-purpose enclosure is indicated. Include manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
  4. Controls, devices, alarms, functions, and operations listed in NFPA 20 and NFPA 72 as required for drivers and controller types used, and specific items listed.
  5. Isolating Switch and circuit breaker
    - a. Motor rated combination isolating disconnect switch/ circuit breaker, mechanically interlocked and operated with a single, externally mounted handle.
    - b. The isolating disconnect/circuit breaker shall be capable of being padlocked in the OFF position for installation and maintenance safety, and shall also be capable of being locked in the ON position without affecting the tripping characteristics of the circuit breaker.
    - c. The controller door shall have a locking type handle and a three-point cam and roller vault type hardware.

- d. Handle moved from:
    - (1) ON to OFF position: The interlocking mechanism shall sequence the circuit breaker OFF first, and then the isolating disconnect switch.
    - (2) OFF to ON position: The interlocking mechanism shall sequence the isolating disconnect switch ON first, and then the circuit breaker.
  - e. The circuit breaker trip curve adjustment shall be factory set, tested and sealed for load amps of the connected motor.
- 6. "Power on" pilot lamps, 1 per phase for each source.
  - 7. LED indicators shall indicate the following: Power On, Pump Running, Alarm, Deluge Open, Phase Failure, Interlock On, Emergency Isolation Switch Open, Low System Pressure, Transfer Switch Normal, Transfer Switch Emergency and Phase Reversal.
  - 8. Fire-alarm system connections for indicating motor running condition, loss-of-line power, and line-power phase reversal.
  - 9. The digital display shall indicate text messages for the status and alarm conditions of following: Motor On, Minimum Run Time/ Off Delay Time, Fail to Start, Under Voltage, Locked Rotor Trip, Over Frequency, Motor Over 320, Motor Overload, Printer Error, Pressure Error, Sequential Start Time, Local Start, Remote Start, System Battery Low, Over Voltage, Low Suction Pressure, Emergency Start, Drive Not Installed, Disk Error and Disk Near Full. The Sequential Start Timer and Minimum Run Timer/ Off delay Timer shall be displayed as numeric values reflecting the value of the remaining time.
  - 10. Automatic and manual operation and minimum run-time relay to prevent short cycling.
  - 11. The fire pump controller operator interface shall be capable of displaying true RMS digital motor voltage and current measurements for all three phases simultaneously.
  - 12. Water-pressure-actuated switch with independent high and low calibrated adjustments responsive to water pressure in fire-suppression piping.
  - 13. Automatic and manual shutdown.
  - 14. System pressure recorder, electric ac driven with spring backup.

## 15. Solid State Pressure Transducer.

- a. The controller shall be supplied with a solid state pressure transducer with a range of 0-300psi.
- b. Solid state pressure switch shall be used for both display of the system pressure and control of the fire pump controller.
- c. Systems using analog pressure devices or mercury switches for operational control will not be accepted.
- d. The pressure transducer shall be directly pipe mounted to a bulkhead pipe coupling without any other supporting members.
- e. The pressure transducer shall be mounted inside the controller to prevent accidental damage.

## 16. Event Recording

- a. Memory – The controller shall record all operational and alarm events (up to 3000 events) to system memory. All events shall be time and date stamped and includes an index number. The user shall have the ability to scroll through the stores messages in groups of 1, 10 or 100. The controller shall include a floppy disk drive to save all operational and alarm events.
- b. Communications – The controller shall feature two independent communications ports to allow connectivity to computers, modems, or building management systems.

## 17. Nameplate: Complete with capacity, characteristics, approvals and listings, and other pertinent data.

## 18. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with non-ferrous metal sensing piping, NPS 1/2, with globe valves for testing controller mechanism from system to pump controller. Include bronze check valve with 3/32-inch orifice in clapper or ground-face union with noncorrosive diaphragm having 3/32-inch orifice.

## B. Full-Service Fire-Pump Controllers

1. Type Starting: Soft-start with direct across the line connection for running pump.
2. Mounting: Floor standing cabin type for field electrical connections.

- C. Fire Pump Controller Power Transfer Switch, General: UL1008/FM and NFPA 20; factory assembled wired and tested as a single unit with the fire pump controller. The transfer switch shall be a Cutler Hammer FT-90, or approved equal, for normal utility power and second utility emergency power.

1. Enclosure: NEMA 12, attached directly to the fire pump controller.
2. Electrically operated and mechanically held, and shall be capable of being operated by a manual transfer mechanism on the switch.

## 2.03 FIRE-PUMP ACCESSORIES AND SPECIALTIES

- A. Match fire-pump suction and discharge ratings as required for fire-pump capacity rating. Provide the following:

1. Automatic air-release valve
2. Casing relief valve
3. Suction and discharge pressure gauges
4. Eccentric-tapered reducer at suction inlet
5. Concentric-tapered reducer at discharge outlet
6. Test-Header Manifold: Ferrous body for hose valves. Manufacturer's standard finish. Include bronze or cast-iron, exposed-type valve header with nozzle outlets; and round, brass escutcheon plate with lettering equivalent to "PUMP TEST CONNECTION."
7. Hose Valves: UL Listed, straightway pattern, and bronze with cap and chain. Include NFPA 1963 hose thread that complies with local fire department standards and finish same as for test-header-manifold escutcheon plate.
8. Ball Drip Valve: UL Listed
9. Isolating OS&Y gate valve or indicating butterfly valve
10. Discharge gate valve
11. Finish: Manufacturer's standard factory-applied red paint unless brass or other finish is specified.
12. Main relief valve.
13. Flow meter

## 2.04 PRESSURE-MAINTENANCE PUMP

- A. Pressure-Maintenance Pump, General: Factory-assembled and -tested pumps with electric-motor driver, controller, accessories, specialties, cast-iron or stainless-steel casing, bronze or stainless-steel impellers, mechanical seals, and suction and discharge flanges machined to ASME B16.1, Class 125 dimensions unless Class 250 flanges are indicated and except that connections may be threaded in sizes where flanges are not available.
1. Finish: Manufacturer's standard color paint applied to factory-assembled and -tested unit before shipping.
  2. Nameplate: Complete with capacity, characteristics, and other pertinent data.
  3. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. A-C Pump; ITT Industries (ITT Goulds)
    - b. MTH, Inc.
    - c. Grundfos Pumps Corp.
    - d. Sterling Peerless Pump; Sterling Fluid Systems Group
    - e. Peerless Pumps
  4. Driver: NEMA MG 1, open drip-proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.
- B. Controllers: UL listed and FM approved, NEMA 12, factory-assembled, -wired, and -tested, across-the-line type for combined automatic and manual operation.
1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Cutler-Hammer
    - b. Firetrol, Inc.
    - c. Joslyn Clark
  2. Enclosure: UL 508 and NEMA 250, Type 2, wall-mounting type for field electrical wiring.
    - a. Finish: Manufacturer's standard color paint applied to factory-assembled and -tested unit before shipping.

3. Rate controller for scheduled horsepower and include the following:

- a. Fusible disconnect switch
- b. Pressure switch
- c. Hand-off-auto selector switch
- d. Pilot light
- e. Running period timer

C. Accessories and Specialties: Match pressure-maintenance-pump suction and discharge ratings as required for pump capacity rating. Include the following:

1. Casing relief valve
2. Suction and discharge pressure gauges

2.05 PRESSURE-MAINTENANCE PUMP CHARACTERISTICS AND SPECIALTY DATA: F-JKP-01.

- A. Rated Capacity: 10 gpm
- B. Total Rated Head: 170 psi
- C. Pump Speed: 3450 rpm
- D. Electric-Motor Driver Size: 3 hp, 480v, 3 phase, 60 Hz

2.06 PRESSURE GAUGES

- A. Description: UL listed or FM approved, 3-1/2- to 4-1/2-inch- diameter dial with range of 0- to 250-psig minimum. Include caption "WATER" on dial face.
- B. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  1. AGF Manufacturing Co.
  2. AMETEK, Inc.; U.S. Gauge
  3. Brecco Corporation
  4. Dresser Equipment Group; Instruments Div.
  5. Marsh Bellofram
  6. WIKA Instrument Corporation

2.07 GROUT

- A. Description: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
  1. Properties: Nonstaining, noncorrosive, and nongaseous
  2. Design Mix: 5000-psi, 28-day compressive strength

**2.08 SOURCE QUALITY CONTROL**

- A. Test and inspect fire pumps with their controllers according to NFPA 20 for certified shop tests.
- B. Verification of Performance: Rate fire pumps according to requirements indicated.

**2.09 BUILDING-AUTOMATION SYSTEM INTERFACE**

- A. Provide auxiliary contacts in pump controllers for interface to building SCADA system. Include the following:
  - 1. Low pressure for jockey pump
  - 2. Fire Pump Running
  - 3. Fire Pump Controller Loss of Phase
  - 4. Fire Pump Controller Phase Reversal
  - 5. Fire Pump Controller Connected to Alternate Source
  - 6. Fire Pump Controller Emergency Power Isolating Switch Open
  - 7. ATS-2 Power Source Emergency Power
  - 8. Fire Pump System Low Pressure
  - 9. Fire Pump System Trouble Alarm (grouped alarm, activated by any other fire pump alarm not previously listed)
  - 10. For 120V Alarm Bells (located inside and outside the Fire Pump Room)

**PART 3 EXECUTION****3.01 EXAMINATION**

- A. Examine areas, concrete bases, and conditions, with installer present, for compliance with requirements and other conditions affecting performance of fire pumps.
- B. Examine roughing-in for fire-suppression piping to verify actual locations of piping connections before fire-pump installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

## 3.02 INSTALLATION

- A. Install and align fire pump, pressure-maintenance pump, and controller according to NFPA 20.
- B. Install pumps and controllers to provide access for periodic maintenance including removal of motors, impellers, couplings, and accessories.
- C. Set base-mounting-type pumps on concrete bases. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.
  - 1. Support pump baseplate on rectangular metal blocks and shims or on metal wedges having small taper, at points near anchor bolts, to provide 3/4- to 1-1/2-inch gap between pump base and concrete base for grouting.
  - 2. Adjust metal supports or wedges until pump and driver shafts are level. Verify that coupling faces and pump suction and discharge flanges are level and plumb.
- D. Install suction and discharge piping equal to or greater than diameter of fire-pump nozzles.
- E. Install valves that are same size as piping connecting fire pumps, bypasses, test headers, and other piping systems.
- F. Install pressure gauges on fire-pump suction and discharge at pressure-gauge tapings.
- G. Support pumps and piping separately so weight of piping does not rest on pumps.
- H. Install piping accessories, hangers and supports, anchors, valves, meters and gauges, and equipment supports.
- I. Seismic Requirements: All piping shall be provided with seismic restraints in accordance with the seismic provisions of the International Building Code (IBC) 2003, Section 1621 and ASCE 7-02, Section 9.6, in conjunction with the current New York City Building Code to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural notes on the Structural Contract Drawings and Specifications for site and structure specific seismic design criteria.
- J. Install flow meters and sensors where indicated. Install flowmeter-system components and make connections according to manufacturer's written instructions.

- K. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted. Furnish copies of manufacturers' wiring diagram submittals to electrical installer.

### 3.03 ALIGNMENT

- A. Align split-case fire-pump and driver shafts after complete unit has been leveled on concrete base, grout has set, and anchor bolts have been tightened.
- B. After alignment is correct, tighten anchor bolts evenly. Fill baseplate completely with grout, with metal blocks and shims or wedges in place. Tighten anchor bolts after grout has hardened. Check alignment and make required corrections.
- C. Align piping connections.
- D. Align vertically mounted, split-case pump and driver shafts after complete unit has been made plumb on concrete base, grout has set, and anchor bolts have been tightened.

### 3.04 CONNECTIONS

- A. Piping installation requirements are specified in Section 13915 - Fire-Suppression Piping. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to pumps and equipment to allow service and maintenance.
- C. Connect water supply and discharge piping to fire pumps with flexible connectors. Connect water supply and discharge piping to pressure-maintenance pumps with flexible connectors. Refer to Section 13915 - Fire-Suppression Piping for flexible connectors.
- D. Connect relief-valve discharge to point of disposal.
- E. Connect controllers to pumps.
- F. Connect fire-pump controllers to building fire-alarm system. Refer to Section 13851 - Fire Alarm and Detection System.
- G. Ground equipment according to Section 16060 - Grounding.
- H. Connect wiring according to Section 16121 - Wires and Cables – 600 Volts and Below.

## 3.05 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform field tests for each fire pump when installation is complete. Comply with operating instructions and procedures in NFPA 20 to demonstrate compliance with requirements. Where possible, field correct malfunctioning equipment, then retest to demonstrate compliance. Replace equipment that cannot be satisfactorily corrected or that does not perform as indicated, then retest to demonstrate compliance. Verify that each fire pump performs as indicated.
- C. Perform the following field tests inspections and prepare test reports:
  - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
  - 2. Final Checks before Startup: Perform the following preventive-maintenance operations and checks:
    - a. Lubricate oil-lubrication-type bearings.
    - b. Remove grease-lubrication-type bearing covers, flush bearings with kerosene, and clean thoroughly. Fill with new lubricant according to manufacturer's written instructions.
    - c. Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
    - d. Verify that pump is free to rotate by hand. If pump is bound or if it drags even slightly, do not operate until cause of trouble is determined and corrected.
  - 3. Starting procedure for pumps is as follows:
    - a. Prime pump by opening suction valve and closing drains, and prepare pump for operation.
    - b. Open sealing-liquid supply valves if pump is so fitted.
    - c. Start motor.
    - d. Open discharge valve slowly.
    - e. Observe leakage from stuffing boxes and adjust sealing-liquid valve for proper flow to ensure lubrication of packing. Do not tighten gland

immediately, but let packing run in before reducing leakage through stuffing boxes.

- f. Check general mechanical operation of pump and motor.
- 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- 5. Furnish fire hoses in number, size, and length required to reach storm drain or other acceptable location to dispose of fire-pump test water. Fire hoses are for field-acceptance tests only and are not property of the City of New York.

### 3.06 DEMONSTRATION

- A. Engage a factory-authorized service representative to train DSNY maintenance personnel to adjust, operate, and maintain fire pumps, drivers, controllers, and pressure-maintenance pumps. Refer to Section 01781 - Project Closeout and Section 01821 - Training.

-END OF SECTION-

- G. Valves - Bear UL/FM Label or Marking
- H. BSA Approvals - City of New York Building Code

- I. MEA Numbers - City of New York Building Code
- J. Earthquake/Seismic - International Building Code 2003 Section 1621, and ASCE 7-02 Section 9.6
- K. NFPA 25, "Inspection, Testing and Maintenance of Water-Based Fire Protection System"
- L. UL, "Underwriters Laboratory"
- M. NFPA 70, "National Electrical Code"
- N. NFPA 72, "National Fire Alarm Code"
- O. City of New York Building Code

#### 1.04 SYSTEM DESCRIPTIONS

- A. Sprinkler system shall be an overhead deluge AFFF foam sprinkler system. System shall be designed to provide adequately proportioned foam water solution at listed water flows past proportioning device. System shall be installed in accordance with NFPA 16, NFPA 11 and NFPA 13.

#### 1.05 PERFORMANCE REQUIREMENTS

- A. Standard piping System Component Working Pressure: Listed for at least 175 psig, unless otherwise indicated.
- B. Fire-suppression sprinkler system design shall be approved by authorities having jurisdiction
  - 1. Margin of Safety for Available Water Flow and Pressure: 20 percent, including losses through water-service piping, valves, and backflow preventers.
  - 2. Sprinkler Occupancy Hazard Classifications
    - a. Transfer Station Areas: Ordinary Hazard, Group I
  - 3. Maximum Protection Area per Sprinkler
    - a. Transfer Station Areas: 100 sq. ft
    - b. Other Areas: According to NFPA 13 recommendations, unless otherwise indicated.

#### 4. Sprinkler Fire Classification

##### a. Diesel Fuel Dispensing Areas: Class B Fire

- C. Seismic Requirements: All piping shall be provided with seismic restraints in accordance with the seismic provisions of the International Building Code (IBC) 2003, Section 1621 and ASCE 7-20, Section 9.6, in conjunction with the current New York City Construction Codes to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural notes on the Contract Drawings and Specifications for site and structure specific seismic design criteria.

#### 1.06 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Shop Drawings: Submit working drawings, including arrangement and erection drawings of the piping, tanks, equipment and control equipment; schematic control diagrams; electrical connection diagrams; and complete description of the control system.
- C. Provide manufacturer's data showing capacity of the tanks, pump performance, nozzle performance, system pressures and other operational parameters.
- D. Provide Operation and Maintenance (O&M) manuals in accordance with Section 01831- Operations and Maintenance Manuals.

In addition to these, conform to specific instructions given below

- E. Product Data: For the following:
1. Piping materials, including dielectric, flexible connections, and sprinkler specialty fittings
  2. Pipe hangers and supports, and seismic restraints
  3. Valves, listed fire-protection valves, unlisted general-duty valves, and specialty valves and trim
  4. Sprinklers, escutcheons, and guards. Sprinkler flow characteristics, mounting, finish, and other pertinent data
  5. Alarm devices and electrical data

- F. Shop Drawings: Power wiring, signal, and control wiring diagrams
  - 1. Sprinklers shall be referred to on drawings, submittals and other documentation, by the sprinkler identification or Model number as specifically published in the appropriate agency listing or approval. Trade names or other abbreviated designations shall not be allowed.
  - 2. Grooved joint couplings and fittings shall be shown on drawings and product submittals, and be specifically identified with the applicable Victaulic, or approved equal, style number.
- G. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA11, NFPA 13, NFPA 16, New York City Construction Codes and that have been approved by authorities having jurisdiction, including hydraulic calculations, signed by NYC Professional Engineer, if applicable.
- H. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13, NFPA 16 and New York City Construction Codes. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."
- I. Welding certificates
- J. Field quality-control test reports
- K. Operation and Maintenance Data: For foam/water sprinkler specialties to include in emergency, operation, and maintenance manuals.

#### 1.07 QUALITY ASSURANCE

- A. Installer Qualifications: Installer's responsibilities include designing, fabricating, and installing foam/water fire-suppression systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test, if applicable.
  - 1. Commissioner Responsibility: Preparation of working plans, calculations, and field test reports by a qualified Professional Engineer licensed in the State of New York.
- B. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
- C. Permits: Contractor shall obtain and pay for all required permits, fees, inspections and approvals by Authorities having jurisdiction.
- D. The installer shall be a City of New York licensed approved Contractor.

- E. The installer shall be licensed to install fire alarm fire suppression equipment in the City of New York and in New York State.
- F. Except as modified herein, conform to the required and advisory provisions of the Construction Codes of the City of New York, NFPA 11, NFPA 13 and NFPA 16 for design, equipment materials, installation, workmanship, examination, inspection, and testing. Include all materials, accessories, and equipment inside and outside the building for each system to be complete and ready for use. Design and provide each system to accommodate blind spaces, beams, beam pockets, concealed spaces, piping, electrical equipment, ductwork, and other construction and equipment in accordance with detailed drawings submitted for approval. Locate sprinkler heads in a consistent pattern with ceiling grid, lights, and supply air diffusers. Provide devices and equipment for fire protection service of a make or type which is UL listed or FM approved for use in deluge foam sprinkler systems. Where applicable whenever the Construction Codes of the City of New York references, the NFPA publications, the advisory provisions are considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears.
- G. The Contractor shall provide complete, new deluge foam/water fire protection system, complete with UL listed or FM approved deluge valve, concentrate controller, foam bladder tank, concentrate control valve, foam concentrate, discharge devices, alarm pressure switch, system control valve, electric alarm bell, fire department Siamese connection, sprinkler heads, flow switches, piping hangers, test connections and all appurtenances. It shall be understood that the final design of the deluge foam/water fire protection system, including, but not limited to, the agreement, hydraulic calculations, size and location of risers, feed mains, cross mains, test connections, branch lines and drains, and the locations, spacing, number and types of heads or nozzles shall be the responsibility of the Contractor and shall conform with the requirements of the Construction Codes of the City of New York, the local Authorities, Standards and Codes listed in these specifications. The Contractor shall be responsible for procuring approval from the City Fire Department and Buildings Department.
- H. To assure uniformity and compatibility of piping components in grooved piping systems, all grooved products utilized shall be supplied by a single manufacturer. Grooving tools shall be supplied from the same manufacturer as the grooved components.

#### 1.08 COORDINATION

- A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including, but not limited to, light fixtures, ductwork, HVAC equipment, catwalks, and partition assemblies.

## 1.09 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Sprinkler Cabinets: Finished, wall-mounting, steel cabinet with hinged cover, with space for minimum of six spare sprinklers plus sprinkler wrench. Provide number of sprinklers required by NFPA 16 and sprinkler wrench. Provide separate cabinet with sprinklers and wrench for each type of sprinkler on Project.
  2. 3% AFFF Foam Concentrate: Stored in stainless steel, or high density cross-linked polyethylene, or reinforced fiberglass polyester with a vinyl resin internal layer coating tanks or containers which have been designed for such foam storage. The storage environment shall be within the UL-listed temperature range.

## PART 2 PRODUCTS

### 2.01 DELUGE VALVES AND RELEASE SYSTEM

- A. Deluge valve: UL listed or FM approved with ductile iron body and capable of installation in the vertical and horizontal position.
1. Externally resettable by hydraulic means.
  2. Minimum working pressure of 175 psi
  3. Valve trim shall be galvanized and compatible with the installation.
  4. Product
    - a. Viking Corp: Model F-1
    - b. Victaulic Co. of American
    - c. or approved equal
- B. Deluge Release System: Deluge valve shall utilize a listed and approved release system.
1. Method of Release: Manual release system
  2. Pull stations for manual activation shall be compatible with release control plan.

## 3. Product

- a. Viking Corp – Model B-1/Par 3 Release Control Panel
- b. Victaulic Co. of American
- c. or approved equal

## 2.02 BLADDER TANK ASSEMBLIES F-FBT-01

## A. Foam bladder tank shall be UL listed or FM listed and shall adhere to the requirements of NFPA11 and NFPA16

- 1. System shall utilize an ASME code pressure vessel listed for use with the foam concentrate and proportioning method utilized.
- 2. Vertical tank with vinyl based polymerr
- 3. Tank: SA-516-70 Carbon Steel
- 4. Minimum Working Pressure: 175 psi. Contractor shall provide required primary relief valve to protect the tank from over-pressurization.
- 5. Backflow Preventer Valve: Provide reduced pressure zone valve assembly, as specified in Section 15430 - Plumbing Specialties, for the foam system if required.
- 6. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Viking Corp
  - b. Chemguard

## 2.03 FOAM CONCENTRATE

- A. Shall be listed for protection of immiscible (hydrocarbon) flammable and combustible liquids. Shall be listed at 3 parts concentrate to 97 parts water and shall be listed for use with fresh, sea or brackish water supplies.
- B. Shall be a synthetic aqueous film forming foam (AFFF) concentration. Protein based concentrates are strictly prohibited.
- C. Concentrate shall be UL listed or FM approved.
- D. Product
  - 1. Chemguard Ultraguard CUG 3% AR-AFFF
  - 2. Ansul Corporation
  - 3. or approved equal

## 2.04 FOAM CONCENTRATE PIPING

- A. Shall be compatible with foam concentrate to be used. Foam provider shall be consulted for acceptable materials of construction.
- B. Shall be designed for the least equivalent feet of pipe run from bladder tank discharge outlet to proportioning device and water supply to bladder tank. Excessive use of elbows and tees shall be avoided.
- C. Shall be substantially secured and restrained against movement, thrust and vibration.
- D. Shall be protected from excessive heat and freezing temperatures.
- E. Shall be installed with a fitting such as a grooved coupling or union to be readily removed between proportioning assemblies and concentrate control valve.
- F. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Viking Corp.
  - 2. TYCO Corporation

## 2.05 CONCENTRATE CONTROLLER (PROPORTIONER) AND CONTROL VALVE

- A. Concentrate controller: UL listed or FM approved
  - 1. Shall be listed and approved with the foam concentrate to be proportioned and the foam bladder tank.
  - 2. Brass, wafer type device
  - 3. Shall be listed with a nominal orifice plate size for the foam concentrate to be proportioned.
  - 4. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Viking Corp.
    - b. TYCO Corporation
- B. Concentrate control valve: Deluge valves to be supplied by AFFF shall utilize a 90 degree pattern type manufactured with a corrosive resistant Halar coating.
  - 1. Working pressure of not less than 250 psi unless listed for higher pressure.

2. Valve trim shall be compatible and installed following the manufacturer's specifications.
3. Pressure operated relief valve shall be employed on the priming line to release prime pressure from the top of the deluge valve.
4. Product
  - a. Viking Corp. Model E or F
  - b. TYCO Corporation
  - c. or approved equal

## 2.06 DISCHARGE DEVICES

- A. Fire sprinklers used in foam/ water sprinkler system: UL listed or FM approved.
1. Sprinklers that have been specifically tested and found suitable for the discharge of low expansion synthetic foam/water solution shall be installed.
  2. Sprinklers shall be tested as foam/water solution discharge outlets for minimum listed densities or densities indicated by installation standards, which ever is more stringent.
  3. Fire sprinklers, foam concentrate, proportioning devices and riser components shall be of one manufacturer.
  4. Product
    - a. Viking Corp. SIN VK350, K8.0
    - b. TYCO Corporation
    - c. or approved equal

## 2.07 STEEL PIPE AND FITTINGS

- A. Threaded-End, Standard-Weight Steel Pipe: ASTM A 53 Schedule 40, hot-dip galvanized with factory- or field-formed threaded ends.
1. Cast-Iron Threaded Flanges: ASME B16.1.
  2. Malleable-Iron Threaded Fittings: ASME B16.3
  3. Gray-Iron Threaded Fittings: ASME B16.4
    - a. Hot dip galvanized fittings

4. Steel Threaded Pipe Nipples: ASTM A 733, made of ASTM A 53 or ASTM A 106, Schedule 40, seamless steel pipe hot-dip galvanized. Include ends matching joining method.

**B. Grooved-Joint Piping Systems**

1. Grooved-End, Standard-Weight, Steel Pipe: ASTM A 53, Sch 40, hot-dip galvanized and with factory- or field-formed, square-cut, grooved ends
2. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Viking Corp.
  - b. Central Sprinkler Corp.
  - c. Ductilic, Inc.
  - d. JDH Pacific, Inc.
  - e. National Fittings, Inc.
  - f. Shurjoint Piping Products, Inc.
  - g. Southwestern Pipe, Inc.
  - h. Star Pipe Products; Star Fittings Div.
  - i. Victaulic Co. of America
  - j. Ward Manufacturing
3. Grooved-End Fittings: UL-listed and FM Global-Approved, ASTM A 536, ductile-iron casting; ASTM A 234 forged steel; or ASTM A 53 fabricated from carbon steel pipe with OD matching steel-pipe OD.
4. Grooved-End-Pipe Couplings: UL 213 and AWWA C606, rigid pattern with offsetting, angle-pattern bolt pads to provide rigidity and system support and hanging in accordance with NFPA 13, unless otherwise indicated; gasketed fitting matching steel-pipe OD. Include ductile-iron housing with keys matching steel-pipe and fitting grooves, pressure responsive synthetic rubber gasket listed for use with housing, and steel bolts and nuts. (Tongue and recess rigid type couplings shall not be permitted.) Victaulic Style 005.
  - a. Rigid Type: Housing shall be cast with offsetting, angle-pattern bolt pads to provide system rigidity and support and hanging in accordance with NFPA 13.
    - (1) 1-1/4 inch to 4 inch: "Installation Ready" stab-on design for direct 'stab' installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic FireLock® Style 009H.
    - (2) 5 inch and Larger: Standard rigid couplings. Victaulic FireLock® Style 005 or Style 07.

- b. Flexible Type: Use in seismic areas where required by NFPA 13.
  - (1) 2 inch to 8 inch: "Installation Ready" stab-on design for direct 'stab' installation onto grooved end pipe without prior field dis-assembly and no loose parts. Victaulic Style 177 QuickVic.
  - (2) 5 inch and Larger: Standard flexible couplings. Victaulic Fire-Lock Style 75 or Style 77.
- 5. Grooved-End, Steel Pipe Flange Adapters: ASTM A536 ductile iron casting, flat faced, designed for incorporating flanged components with ANSI Class 125 and 150 bolt-hole patterns to a grooved piping system. Victaulic Style 741 or 744.

## 2.08 DIELECTRIC FITTINGS

- A. Dielectric Unions: Factory-fabricated assembly, designed for 175-psig minimum working pressure at 180 deg F. Provide insulating material that isolates dissimilar materials and ends with inside threads according to ASME B1.20.1.
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Viking Corp.
    - b. Capitol Manufacturing Co.
    - c. Central Plastics Company.
    - d. Epco Sales, Inc.
    - e. Hart Industries International, Inc.
    - f. Watts Industries, Inc.; Water Products Div.
    - g. Zurn Industries, Inc.; Wilkins Div.
- B. Dielectric Flanges: Factory-fabricated companion-flange assembly, for 175-psig minimum working-pressure rating as required for piping system
  - 1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
    - a. Viking Corp.
    - b. Capitol Manufacturing Co.
    - c. Central Plastics Company
    - d. Epco Sales, Inc.
    - e. Watts Industries, Inc.; Water Products Div.
- C. Dielectric Flange Insulation Kits: Components for field assembly shall include CR or phenolic gasket, PE or phenolic bolt sleeves, phenolic washers, and steel backing washers.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. Viking Corp.
- b. Advance Products and Systems, Inc.
- c. Calpico, Inc.
- d. Central Plastics Company
- e. Pipeline Seal and Insulator, Inc.

- D. Dielectric Couplings: Galvanized steel with inert and non-corrosive thermoplastic lining and threaded ends and 175-psig working-pressure rating at 225 deg F.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. Viking Corp.
- b. Calpico, Inc.
- c. Lochinvar Corp.

- E. Dielectric Nipples: Electroplated steel or ductile iron with inert and non-corrosive thermoplastic lining, with combination of plain, threaded, or grooved ends and 175-psig working-pressure rating at 230 deg F.

1. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- a. Perfection Corporation
- b. Precision Plumbing Products, Inc.
- c. Victaulic Co. of America

## 2.09 FLEXIBLE CONNECTORS

- A. Flexible connectors shall have materials suitable for system fluid. Include 175-psig minimum working-pressure rating and ends according to the following:

1. NPS 2 and Smaller: Threaded
2. NPS 2-1/2 and Larger: Flanged
3. Option for NPS 2-1/2 and Larger: Grooved for use with grooved-end-pipe couplings

- B. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Anvil
2. Flex-Hose Co., Inc.

3. Flexicraft Industries
  4. Flex-Pression, Ltd.
  5. Flex-Weld, Inc.
  6. Metraflex, Inc.
  7. Proco Products, Inc.
  8. Unaflex Inc.
- C. Bronze-Hose, Flexible Connectors: Corrugated, bronze, inner tubing covered with bronze wire braid. Provide copper-tube ends or bronze flanged ends, braze welded to hose.
- D. Stainless-Steel-Hose/Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Provide steel nipples or flanges, welded to hose.
- E. Stainless-Steel-Hose/Stainless-Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Provide stainless-steel nipples or flanges, welded to hose.

## 2.10 LISTED FIRE-PROTECTION VALVES

- A. Necessary listed fire-protection valves utilized in the foam/water sprinkler system shall be as specified in Section 13915 - Fire-Suppression Piping and Section 15110 - Plumbing Valves.
- B. Valves shall be UL listed or FM approved, with 175-psig minimum working pressure rating.
1. Ball valves
  2. Butterfly valves
  3. Check valves NPS2 and larger
  4. Gate valves
  5. Indicating valves-System control valve
- C. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
1. NIBCO
  2. Victaulic Co. of America
  3. Kennedy Valve Div.
  4. Milwaukee Valve Co.

## 2.11 UNLISTED GENERAL-DUTY VALVES

### A. Ball Valves NPS 2 and Smaller

1. MSS SP-110, 2-piece copper-alloy body with chrome-plated brass ball, 600-psig minimum CWP rating, blowout-proof stem, and threaded ends
2. Meets the intent of MSS SP-110, 2-piece forged brass body with chrome plated brass ball and stem, 175-psig maximum CWP rating, blow-out proof stem, and Pressfit® ends.

### B. Check Valves NPS 2 and Smaller: MSS SP-80, Type 4, Class 125 minimum, swing type with bronze body, nonmetallic disc, and threaded ends.

### C. Gate Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, solid wedge, and threaded ends.

### D. Globe Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, nonmetallic disc, and threaded ends.

## 2.12 ALARM DEVICES

### A. Alarm Pressure Switch: Water flow will activate an alarm by way of an alarm pressure switch.

1. UL listed or FM approved and compatible with system devices
2. Ability to be wired for Class A or Class B service
3. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Viking Corp.
  - b. Potter Electrical Signal Company

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine walls and partitions for suitable thicknesses, fire- and smoke-rated construction, and other conditions where hose connections and stations are to be installed.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 SPRINKLER SYSTEM PIPING APPLICATIONS

- A. Standard-Pressure, Deluge Foam/Water Sprinkler System, 175-psig Minimum Working Pressure:
1. NPS 1-1/2 and Smaller: Threaded-end, black, standard-weight, sch 40 steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
  2. NPS 2: Grooved-end, black, standard-weight steel pipe, sch 40, grooved-end fittings; grooved-end-pipe couplings; and grooved joints
  3. NPS 4 to NPS 6: Grooved-end, black, standard-weight. Sch 40, steel pipe; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

### 3.03 VALVE APPLICATIONS

- A. Where specific valve types are not indicated, the following requirements apply:
1. Listed Fire-Protection Valves: UL listed or FM approved for applications where required by NFPA 11, NFPA 13 and NFPA 16.
    - a. Shutoff Duty: Use ball, butterfly, or gate valves.
  2. Unlisted General-Duty Valves: For applications where UL listed or FM approved valves are not required by NFPA 11, NFPA 13 and NFPA 16.
    - a. Shutoff Duty: Use ball, butterfly, or gate valves
    - b. Throttling Duty: Use ball or globe valves

### 3.04 JOINT CONSTRUCTION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping joint construction.
- B. Threaded Joints: Comply with NFPA 13 for pipe thickness and threads. Do not thread pipe smaller than NPS 8 with wall thickness less than Schedule 40 unless approved by authorities having jurisdiction and threads are checked by a ring gage and comply with ASME B1.20.1.
- C. Grooved Joints: Assemble joints with listed coupling and gasket, lubricant, and bolts. All grooved couplings, fittings, valves and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded and produced by the grooved coupling manufacturer. Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove. Grooved coupling manufacturer's factory trained field representative shall

provide on-site training for Contractor's field personnel in the proper use of grooving tools, application of groove, and installation of grooved piping products. Factory trained representative shall periodically inspect the product installation. Contractor shall remove and replace any improperly installed products

1. Ductile-Iron Pipe: Radius-cut-groove ends of piping. Use grooved-end fittings and grooved-end-pipe couplings of the same manufacturer.
  2. Steel Pipe: Square-cut or roll-groove piping as indicated. Use grooved-end fittings and rigid, grooved-end-pipe couplings of the same manufacturer, unless otherwise indicated.
  3. All couplings must be installed in accordance with referenced standards. Follow manufacturer's instructions in all cases for all approvals and warranty enforcement.
- D. Dissimilar-Metal Piping Joints: Construct joints using dielectric fittings compatible with both piping materials
1. NPS 2 and Smaller: Use dielectric unions, couplings, or nipples.
  2. NPS 2-1/2 to NPS 4: Use dielectric flanges.
  3. NPS 5 and Larger: Use dielectric flange insulation kits.
- E. Install shutoff valve, check valve, pressure gauge, and drain at connection to water service.

### 3.05 PIPING INSTALLATION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping installation.
- B. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Engineer before deviating from approved working plans.
- C. Use approved fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
- D. Install unions adjacent to each valve in pipes NPS 2 and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.
- E. Install grooved joint coupling flanges or flange adapters on valves, apparatus, and equipment having NPS 2-1/2 and larger connections.

- F. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, sized and located according to NFPA 13, if applicable.
- G. Install sprinkler piping with drains for complete system drainage.
- H. Install sprinkler zone control valves, test assemblies, and drain piping.
- I. Install alarm devices in piping systems.
- J. Hangers and Supports: Comply with NFPA 13 and Specification Section 15060 for hanger materials.
  - 1. Install sprinkler piping according to NFPA 13 and NFPA 16
- K. Seismic Requirements: All piping shall be provided with seismic restraints in accordance with the seismic provisions of the International Building Code (IBC) 2003, Section 1621 and ASCE 7-02, Section 9.6, in conjunction with the current City of New York Construction Codes to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural notes on the Structural Contract Drawings and Specifications for site and structure specific seismic design criteria.
- L. Install pressure gauges on riser or feed main, at each sprinkler test connection. Include pressure gauges with connection not less than NPS 1/4 and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gauges to permit removal, and install where they will not be subject to freezing.
- M. Pipe Expansion Provisions: Connect, support and guide piping to permit and control pipe expansion and construction and to accommodate building expansion, contraction and settling without damage.
  - 1. Providing piping expansion loops or expansion joints sized to accommodate possible expansion without exceeding allowable pipe and fittings stresses in straight sections of water piping more than 150 feet in length. Locate expansion devices midway between anchor points, and the pipes guided as recommended.
  - 2. Provide anchors for piping within a structure consisting of welded plates, angles, channels, or beams braced and securely fastened to the pipe and to structural members adequate to safely withstand resulting stresses.

### 3.06 VALVE INSTALLATION

- A. Install listed fire-protection valves, unlisted general-duty valves, and specialty valves and trim sets, controls, and specialties according to NFPA 13 and NFPA 16 and authorities having jurisdiction.

- B. Install reduced pressure zone assembly with the bladder tank as required.

### 3.07 SPRINKLER APPLICATIONS

- A. Drawings indicate sprinkler types to be used. Where specific types are not indicated, use the following sprinkler types:
  - 1. Rooms without Ceilings: Upright sprinklers

### 3.08 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Connect piping to specialty valves and accessories.
- D. Connect air compressor to the following piping and wiring, if applicable:
  - 1. Pressure gauges and controls
  - 2. Electrical power system
  - 3. Fire alarm devices, including low-pressure alarm.
- E. Electrical Connections: Power wiring is specified in Division 16.
- F. Connect alarm devices to fire alarm.
- G. Ground equipment according to Section 16060 - Grounding.
- H. Connect wiring according to Section 16121 - Wires and Cables - 600 Volts and Below.
- I. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### 3.09 LABELING AND IDENTIFICATION

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13, NFPA 14, NFPA 16 and in Section 15076 - Piping and Equipment Identification.

### 3.10 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
  - 2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
  - 3. Energize circuits to electrical equipment and devices.
  - 4. Flush, test, and inspect foam/water systems according to NFPA 16.
  - 5. Coordinate with fire alarm tests. Operate as required.
  - 6. Coordinate with fire-pump tests. Operate as required.
- B. Report test results promptly and in writing to Commissioner and authorities having jurisdiction.

### 3.11 CLEANING AND PROTECTION

- A. Clean dirt and debris from sprinklers.
- B. Remove and replace sprinklers with paint other than factory finish.
- C. Protect sprinklers from damage until Substantial Completion.

### 3.12 DEMONSTRATION

- A. Engage a factory-authorized service representative to train DSNY's maintenance personnel to adjust, operate, and maintain specialty valves. Refer to Section 01781 - Project Closeout and Section 01821 - Training.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 14511**  
**CONTAINER TRANSPORT SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section includes the furnishing and installing of a Container Transport (Shuttle Car) System. Equipment described in this section shall be designed for heavy-duty use in material handling applications. The key requirements which shall be incorporated into the design and manufacturing of the system are as follows:
  - 1. Provide safe, stable transport of the containers without tipping or damage.
  - 2. Provide short cycles (one minute or less) with high reliability using a proven battery solution.
  - 3. Provide accurate stopping positions for crane loading and unloading of containers and lidding/unlidding operations.
  - 4. Allow Lidding Operator safe control of the shuttle car.
  - 5. Incorporate safety in all applicable operating aspects.
  - 6. Reduced maintenance costs.
- B. At the Marine Transfer Station (MTS), four shuttle cars are required, and one spare shuttle car for a total of 5 units.
- C. Each shuttle car shall be designed to carry and move a steel container filled with municipal solid waste having a total gross weight of 30 tons. Containers are 8.5 feet wide, 20 feet long, and 12 feet high, (Nominal) as specified in Section 14512.

#### 1.04 GENERAL REQUIREMENTS

- A. In order to minimize the number of stocking spare parts all shuttle cars shall share common mechanical and electrical components.
- B. The Contractor's shuttle car manufacturer shall furnish the necessary labor, materials, equipment and incidentals required to provide a completely assembled and functioning system, unless otherwise specified herein.
- C. The Contractor shall ensure that the shuttle car manufacturer complies with applicable Federal, State and Local Laws in the manufacture, testing, shipment and assembly of the equipment.

- D. The shuttle car manufacturer shall be a company specializing in manufacturing and installing container transport shuttle car systems with not less than three (3) successful installations.
- E. The usage profile for the shuttle car operation is as follows:
1. The station's maximum design throughput is met with three shuttle cars in service.
  2. The shuttle car will complete a cycle in 15 minutes.
  3. The station will be operating for two shifts (16 hours) per day.
  4. The station will be in service six days per week.
  5. A complete cycle is defined below:

Step	Description	Location of Shuttle Car	Time
1	Gantry crane operator loads empty container from barge or storage onto shuttle car.	Pier area	1.5 minutes
2	Lidding operator confirms that shuttle car has a container on board. Both lidding operators simultaneously press two Inbound push buttons, and shuttle car moves from pier to lidding area.	In motion	0.5 minute
3	Lidding operators enter the shuttle car catwalks, and remove the container lid. Operators exit the shuttle car catwalks.	Lidding area	2 minutes
4	Both lidding operators simultaneously press two Inbound push buttons, and shuttle car moves from lidding area to loading area.	In motion	0.5 minute
5	Container is loaded with solid waste.	Loading area	6 minutes
6	Lidding operator confirms that container is full. Both lidding operators simultaneously press two Outbound push buttons, and shuttle car moves from loading area to lidding area.	In motion	0.5 minute
7	Lidding operators enter the shuttle car catwalks, and reapply the lid. Operators exit the shuttle car catwalks.	Lidding area	2 minutes
8	Both lidding operators simultaneously press two Outbound push buttons, and shuttle car moves from lidding area to pier area.	In motion	0.5 minute
9	Gantry crane operator removes container from shuttle car to barge.	Pier area	1.5 minutes
<b>Total Sequence Time:</b>			<b>15 minutes</b>

## 1.05 SUBMITTALS

- A. Submit information and data to show experience in producing similar equipment, providing evidence including contact information for at least 3 installations for which the manufacturer has completed.
- B. Submit complete working drawings, including complete dimensional information, catalog cuts of component parts and materials list, showing the location of all equipment and control devices, and all other information necessary to render a totally functional container transport system to the owner. Information submitted shall be in accordance with Section 01330 – Shop Drawings.
- C. Submit the rating and description of all motors, brakes, control, protective, and safety features.
- D. Submit Operation and Maintenance (O&M) instructions in accordance with Section 01831 – Operation and Maintenance Manuals.
- E. Submit certified test reports to confirm that the units produced meet the requirements of the field tests specified in the subsection titled “Field Quality Control”.
- F. Submit Acceptance Test Plan for container transport system, identifying method and procedure for factory test and for field test. Submit certified results of factory and field tests.

## 1.06 SPARE PARTS

- A. The Contractor shall submit for approval the equipment manufacturer's spare parts list in accordance with the procedures and requirements set forth in Section 01750 – Spare Parts and Maintenance Materials.
- B. The complete list of parts and supplies shall include current unit prices and source of supply.
- C. Furnish a listing and include those parts and supplies that are either normally furnished at no extra cost with the purchase of the equipment or specified herein to be furnished as part of the Contract. Parts shall be completely identified with a numerical system to facilitate parts inventory control and stocking. A separate number shall properly identify each part. Those parts, which are identical for more than one size, shall have the same parts number.
- D. A listing of additional items recommended by the manufacturer to assure efficient operation at the particular installation.
- E. The above lists shall be submitted with the operation and maintenance manual.

F. The following minimum spare parts shall be provided with the equipment:

1. One year's supply of lubricants necessary to maintain the shuttle cars
2. One motor and drive assembly
3. (4) Spare wheel assemblies complete with all parts and ready for installation; Two assemblies to be drive wheel assemblies and two shall be idler wheel assemblies
4. Eight (8) load cells
5. One (1) complete shuttle car pendant control with cable.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

A. Acceptable manufacturers are listed below.

1. Ederer, LLC, Seattle, Washington
2. Pacific Central Steel Fabrication, Inc., Price, Utah
3. Jervis B. Webb, Farmington Hills, Michigan (formerly Mentor AGVS)
4. American Crane & Equipment Corporation, Douglassville, Pennsylvania
5. Or approved equal

### 2.02 SHUTTLE CAR SYSTEM AND COMPONENTS

A. Shuttle Car Parameters

Length:	22'-0" (maximum)
Width:	14'-0" (including 30" wide catwalks on each side of car)
Height:	13'-6" (maximum overall)
Carriage Ht.	2'-0" (maximum height load table)
Rail Spacing:	18'-0" (center of rail to center of rail)
Rail Size #	105 Lb. Crane Rail
Max Speed:	60 feet/minute bi-directional
Load Capacity:	30 tons
Catwalk Ht.:	10'- 0" above top of rail

B. Materials and Components

1. The shuttle car shall be top running type, constructed of either rolled structural shapes or built-up box section members fabricated by welding steel plates as may be required by the design into a rigid framework, properly aligned to act as a support for shuttle car transverse drive. Steel components shall be fabricated in accordance with Section 05120 - Structural Steel, and Section

05500 - Metal Fabrications, and as modified herein. The frame shall be reinforced to provide adequate support for the container including the impact load of five tons of municipal solid waste being dropped 15 feet into the container supported by the shuttle car. Box-type members shall be seal welded and all pockets and low points in the member where water can become trapped shall be provided with drain holes. Longitudinal joints of built-up members shall be made with continuous welds. The shuttle car structure shall be designed to stress levels as required by CMAA 70 Class F service. The shuttle car design shall be compatible with the runway rails.

2. Except as otherwise indicated herein, all materials furnished and work performed in connection with structural steel work shall be in conformity with the AISC "Manual of Steel Construction" latest edition. All materials shall be new and undamaged and shall conform to pertinent AISC and ASTM standard specifications and the following requirements. Structural steel shapes and plates shall conform to ASTM A36/A 36M, ASTM A 572/A572M, or ASTM A 588/A 588M
3. All fabricated materials shall conform to the tolerances specified in the AISC manual and ASTM A6. Holes and other provisions for field connections shall be accurate and shop checked so that proper fit will be provided when the units are assembled in the field.
4. Impact testing shall be performed on all steel used in the fabrication of the main load carrying members of the shuttle cars.
5. Connections: Holes for connections shall be of standard dimensions except for alignment connections where tolerance body bolts in reamed holes are used.
  - a. Shop Connections. Shop connections shall be designed for assembly by means of welding or bolting. Welding shall not be associated with bolting in the same joint. Field connections shall be designed for assembly with bolts of the type specified for the application. Riveting will not be acceptable.
  - b. Design of bolted connections shall be as follows:
    - (1) Machine bolts or fitted bolts shall be used for assembly connections on machine parts, trucks, shuttle car frames, attaching machine parts, and similar items.
    - (2) ASTM A 325 or ASTM A 490 type bolts shall be used on structural bolted connections carrying primary loads.
    - (3) ASTM A 307, ASTM A 325, or machine bolts shall be used for bolted connections on the guardrails, and similar structural items.

- (4) All speed reducers, bearing bases, and pillow blocks shall be held securely in place using machine bolts and shear bars.

## 6. Welding

- a. Welding operations shall be performed by certified welders and conform to AWS D14.1-97, Specification for Welding Industrial and Mill Shuttle cars. Welding operations for the shuttle car shall also conform to CMAA No. 70, except dimensional tolerances of AWS D14.1 shall remain applicable over CMAA No. 70 requirements.
- b. The requirements of AWS D1.1-97, Structural Welding Code, Section 4, shall apply to all welding except as modified in AWS D14.1-97 and as defined in ANSI B30.2. For the gas metal arc welding process (GMAW), the use of short-circuiting transfer mode is unacceptable. The flux-cored arc welding process (FCAW) shall use a supplemental external shielding gas. For shielded metal arc welding (SMAW), all filler metal shall be of the low hydrogen type. Low hydrogen electrodes shall be stored and handled during use in accordance with AWS D1.1-97, Part 4.5.2.
- c. Welded joints and materials shall meet the following requirements:
  - (1) Butt, grooved T, and corner joints shall be full penetration welds.
  - (2) Filler metals shall be 70,000 PSI minimum tensile strength.
  - (3) Tack welds shall be either incorporated into or removed from the final assembly. Only tack welds without defect may be incorporated into the final assembly.
  - (4) Welds shall be cleaned to remove all flux, scale, and weld spatter.
  - (5) Girder butt joint groove welds shall be 100% radio-graphed in accordance with AWS D14.1-97.
  - (6) Groove welds shall be terminated at the end of the joint by use of extension bars or runoff plates. Extension bars and runoff plates shall be removed upon completion and cooling off of the weld, and the ends of the weld shall be made smooth and flush with the edges of the abutting part.
  - (7) Welding electrodes shall be low hydrogen type.

## 7. Motors

- a. Motors shall be in accordance with Section 16220 - Electric Motors and be designed specifically for shuttle service and shall conform to the IP-67 Standards and shall be furnished with drive train, mated with flange and couplings as required for the drive train system. Motors shall be procured from domestic suppliers to assure availability of replacements. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - (1) Leeson
  - (2) General Electric
  - (3) Trust Automation
- b. Drive motors shall be 36, 48 or 72 volt, DC shunt wound, with class F insulation.
- c. Drive motors shall be TENV (Totally Enclosed Non Ventilated), wash down duty, and rated 60-minute duty, with corrosion protection.
- d. Drive motors shall be provided with anti-friction ball bearings and a normally closed thermostat.
- e. Drive motors shall be equipped with space heaters.
- f. The space heater circuit, for each motor equipped with space heaters, shall be interlocked with its associated motor starter so that the space heater circuit is energized at all times except when the mainline contactor is energized or the entire shuttle car supply circuit is de-energized.
- g. Provide thermal overload protection with automatic reset for all motors.
- h. Motors shall be capable of accelerating and running with rated load with applicable armature and field voltages up to and including 110 percent of the rated values of the selected adjustable voltage power supply.
- i. Horsepower shall be calculated for outdoor conditions as specified in Section 5.2.9.1.2.3 of CMAA 70 with a pressure due to a "typical" 35 mph wind, a friction factor of 15 lbs per ton, and a service class factor of 1.2. Wind force = 0.00256 times the wind speed, in miles per hour, squared (see CMAA 70). Controls shall also provide for operation in the occasional 50 mph head wind, while overloaded, as allowed per CMAA 70.
- j. The capacity of the shuttle car travel motor shall be sufficient to provide the specified performance without exceeding its full-load torque rating

including the torque required to overcome the operating wind loading of the shuttle car and container. The tractive effort, used to overcome the rolling friction of the wheels and mechanical losses of the drive, as specified in CMAA for the diameter of wheel utilized.

- k. The motor and drive shall be furnished as a system to provide variable speed and positioning control as required for operation of the shuttle car. The drive shall be located on the shuttle car and shall control the speed of the system. The drive controller shall operate on the supplied battery voltage and use voltage control for the speed of the motor from park through acceleration to running speed. The motor shall use electric braking from running speed to zero speed. The drive shall protect the motor from overload.
- l. The motor and drive shall be suitable for the usage profile specified and as required by system operation.

#### 8. Shuttle Car Drive System

- a. The shuttle car shall have a minimum of two (2) driven wheels, in a CMAA (Fig. 4.10.1-1) A-1 drive configuration. The drive shall consist of a fabricated steel gear reducer, a DC disc brake flange mounted to the motor and flexible drive shafts driving the wheels. The disc brake shall be sized for 100% of the full load motor torque.
- b. The shuttle car gear reducers shall be foot mounted off the shuttle car frame. The drives shall be designed so that the travel motion will be steady and have a minimum of vibration or racking while moving at rated speed, with a maximum rated load. Drives shall have the following features:
  - (1) Provide electronic shuttle car drive power control system. Provide the ability to smoothly accelerate to operating speed with power flow control.
  - (2) Provide brake control - provide the ability to reverse plug the drive.
  - (3) Oversize drive 300% based on motor current rating for continuous starting and stopping.
  - (4) Provide drive, which shall require no jumpers or potentiometer for set up.
  - (5) Provide a totally modular design.
  - (6) Provide brake contactors.

- c. Mechanical Efficiencies: The mechanical efficiencies used for calculating the required transverse horsepower shall be as a minimum shown in Section 5.2.9.1.2.3 of the CMAA 70 Specification.
- d. The efficiencies used for worm gear reductions, if used, shall not exceed those determined by AGMA 6017-E and AGMA 6034-B, with efficiencies of bearings and seals taken as not greater than 99 percent per pair of bearings.

9. Gearing and Speed Reducers

a. General

- (1) All gear reductions shall be contained in speed reducer. Speed reducers shall be finished to AGMA No. 12 quality or better.
- (2) All gearing and speed reducers shall be designed in accordance with the applicable AGMA Standard. The design of the gearing and speed reducers in accordance with other standards such as FEM or DIN is unacceptable.

- b. Gears: The reducer assemblies shall be rated in accordance with AGMA Standards. The design of gears for built-up speed reducers shall be in accordance with the requirements of CMAA 70 for Class F service. The rating of commercial speed reducers shall be based either on the AGMA catalog rating of the speed reducer with a 1.5 service factor applied or the shuttle car manufacturer's calculated durability and strength rating of the gears. If the rating is based on the durability and strength rating of the gears, the design of the gears shall be in accordance with the requirements of CMAA 70 for Class F service, and the manufacturer shall submit gear design computations in accordance with AGMA Standards for approval. Overhung gears or pinions shall not be permitted. Pinions shall be forged integral with the shaft where practicable. Gears shall be pressed or shrunk on the shaft. Welding of defective gear teeth will not be permitted. All gearing shall be fully enclosed in speed reducers and provided with a means of lubrication.

c. Speed Reducers

- (1) Speed reducers may be a standard catalog product of a speed reducer manufacturer (commercial speed reducer) or of special design for the specific application (built-up speed reducer).
- (2) Speed reducers shall be entirely self-contained in an oil-tight, fabricated steel housing designed to maintain shafts and bearings in accurate alignment. Reducers will be split along the gear line for ease of maintenance. Gear reducers shall be mounted such that

the split along the gear line is horizontal. The vertical mounting of speed reducers shall not be permitted. All bearings shall be heavy-duty, anti-friction, roller type, with a minimum L-10 bearing life of 40,000 hours. Bearing caps/retainers will be provided on all bearings to permit inspection. All high-speed gearing shall operate in an oil bath. Oil gauges shall be conveniently located. The design of the speed reducers shall provide for draining, oil level indication, and ventilation of each speed reducer. Speed reducers shall be bolted and provided with alignment bars to assure they are securely mounted.

#### 10. Gear Cases

- a. All gears shall be enclosed in oil-tight cases unless otherwise specified. The cases shall be provided with seals compatible with the lubricant suggested, drain plugs, breathers, oil level dip stick or sight glass, lifting lugs, and an oil-tight inspection cover which can be removed for inspection of the gears. Gear cases shall be provided with means of cleaning and draining without dismantling the equipment. Drain plugs shall be accessible, and, where necessary, shall be piped to convenient locations. Gear cases shall be of steel or ductile-iron construction and shall be designed to be sufficiently rigid to maintain proper alignment of the gearing under all load conditions. Gear cases shall be horizontally split along the gear line. Bearings shall be mounted in machined surfaces with removable bearing retainers for inspection. Each gear case shall be provided with a strip heater.
- b. External Gears: External gears and pinions are not permitted.

#### 11. Bearings

- a. Except where otherwise specified, bearings may be of the roller or ball type. Bearings shall be so designed as to be easily replaceable and shall be placed as close as possible to the points of loading. Pillow blocks shall mount to solid bases and be securely bolted in place.
- b. Antifriction bearings shall be of standard types most suitable for the respective application and shall have both inner and outer races. Ball and roller bearings shall conform to the applicable requirements of the ABMA 9 and ABMA 11. The manufacturer's published rating shall be used in determining the bearing capacity. Bearings, except as noted below, shall have a minimum L-10 life of 40,000 hours for CMAA Class F service, and shall be designed for the loads and speeds resulting from the specified shuttle car performance.
- c. For wheel bearings, half of the total wheel load shall be applied to each bearing. Wheel bearings shall also be sized for the thrust loads as

specified by CMAA 70. Wheel bearings shall be designed for axial loads of not less than 15 percent of the radial wheel load. The wheel bearings shall be heavy-duty; lifetime lubricated Timken AP-2 railroad tapered roller bearings. As an alternate to the AP-2 bearings and to facilitate replacement, the shuttle car manufacturer can choose to supply tapered bore spherical roller bearings with a hydraulic removal feature, similar to that supplied to the steel mill industry to allow easy removal of the wheel bearings. The manufacturer shall also supply the hydraulic removal tools necessary to change the spherical roller bearings.

- d. Bearings shall have oil-tight enclosures and shall have synthetic rubber spring-loaded seals with one element to retain the grease and another synthetic rubber element to exclude foreign matter.
12. Couplings: Flexible couplings shall be of the gear type and have a sufficient capacity to develop the full strength of the shafting that they connect. Flexible couplings shall be pressed and keyed thereon. In determining the coupling capacity, the manufacturer's published rating shall be divided by a service factor recommended by the coupling manufacturer. Couplings with sleeves held in place or retained by snap rings are not permitted. A flexible coupling shall be provided at the motor to the reducer connection. Rigid steel plate guards shall be provided for all exposed couplings, and shall be easily removable for maintenance.
13. Wheels, Axles and Wheel Loads
- a. Shuttle car wheels shall be double flanged and shall be made from solid wheel blanks with a hardness of at least 60 RC via the deep hardening carbonizing heat treatment process. The wheels shall be turned or ground to true and uniform diameter and shall have straight treads. Tread diameters on drive wheels shall be matched to 0.001" per inch of diameter. Wheels shall be pressed and keyed to the wheel axles. Wheel sizing shall be per CMAA guidelines for the loading, class of service, and shuttle car rail size, except that for the purpose of wheel size selection, the charts and formula for a 320 BHN wheel shall be followed.
  - b. Wheel Loads: The static design load on any shuttle car wheel shall be taken as the load resulting from the rated live load of the loaded container and any applicable dead loads. Loads resulting from the maximum torque of the motor, impact or wind loading need not be considered in determining the wheel sizes. The design load on any wheel shall not exceed the values given in CMAA 70 Table 4.13.3-4 for the size of rail chosen and an assumed wheel hardness of 320 BHN.
  - c. Bolted parts of the shuttle car drive shall be machine finished at the bolting surfaces. Assemblies shall be arranged to minimize the danger

of injury to the car or surroundings in case of failure of any part of the assembly or wheel. Lugs shall be provided on the assembly frames to limit the drop to not more than 1 inch in case of a broken axle.

#### 14. Lubrication

- a. Oil lubrication shall be provided for gear trains and speed reducers.
- b. Lubrication for other mechanical operating parts shall be by means of high-pressure Alemite or equal 1/8-inch button head fittings. The lubricating fittings of journals or bearings shall be readily accessible, and, where necessary, shall be piped to convenient points using stainless steel pipe of ample size, adequately fastened with grommets and clamps to prevent vibration during shuttle car operations.
- c. Drain and fill plugs of speed reducers and gear cases shall be located to be readily accessible and shall be provided with extension piping where required. The speed reducers shall have filtered breathers as recommended by the manufacturer for outdoor service.
- d. Lubricating oil for speed reducers and gear couplings shall have good resistance to foaming under normal operating conditions and shall be non-corrosive to speed reducer components. The oil shall have a pour point of -20°F or lower and shall be suitable for infrequent intermittent duty operation of the speed reducers within a temperature range from -5°F to 120°F. The oil shall be in accordance with the recommendation of the manufacturer of the speed reducers for the temperature specified.

#### 15. Stopping and Positioning

- a. Proximity magnetic plates or other devices shall be installed to control shuttle car movement in each of the three stop locations, the Outbound Pier Position, the Lidding/Delidding area, and the Inbound Loading Position, and stop the car accurately within +/- 3/8" in the same position each time. The magnets or plates shall be installed flush with the top of the slab. Install per Section 05500 – Metal Fabrications.
- b. Obstacle Detection System (ODS): Shuttle cars shall have a non-contact sensing system to stop the shuttle car when an obstacle is detected. Four (4) sensors shall be provided and mounted on the inboard and four (4) sensors mounted on the outboard side of the shuttle car. The ODS shall detect stationary and moving objects within the path of the shuttle car and bring it to a controlled stop. The devices shall emit infrared light and monitor the infrared light reflected back. The ODS shall have two zones. The first zone shall begin approximately seven (7) feet in front of the sensor. When the first zone is triggered the shuttle car drops its speed to half. The second shall begin approximately 3 to 4 feet in front of the

shuttle car. The second zone causes the shuttle car to come to a controlled stop. When the second zone is cleared (Obstacle is removed) the shuttle car can be signaled via push button command to resume operation.

The sensors detection distance shall be adjustable by turning set screws located on the face of the sensor.

- c. In addition to the pier and inside building mounted bumper end stops, shuttle car bumpers shall be provided as well as the non-contact sensing system described above; each shuttle car shall be equipped with a bumper system (described below) protecting the traveling direction of the car, mechanically connected to a switch that shall stop the shuttle car immediately when the bumper contacts an object in its path.
- d. The trip point of all limit switches shall be located to allow for maximum run out distance of the motion being stopped for the braking system being used.
- e. All directional limits may be disengaged by selecting motion in the opposite direction.

#### 16. Brakes

- a. Drive motors shall have spring applied electrically released fail-safe brakes. The brakes shall be selected and rated in accordance with Section 4.9 of CMAA 70 as a minimum unless specified otherwise herein.
- b. Magnetic holding brakes shall be of the electric released spring set type attached to the motor or reducer high speed shaft. Brakes shall be readily adjustable and equally effective in both directions. Brakes are to provide smooth, predictable operation throughout the entire range of the shuttle car motion.
- c. Brakes shall have a conduit connection box, corrosion resistant pins, and a manual release.
- d. The transverse drive shall be provided with a direct-acting DC coil brake, DTWP, disc type electric holding brakes, flange mounted to the accessory end of the motor. The disc brakes shall be sized for 100% of the full load motor torque, with thermal capacity sufficient to allow for three consecutive emergency stops with full load and an adverse operating wind, and shall not cause wheel slip upon setting. Brakes shall be capable of stopping as required by CMAA 70. All brakes shall be provided with a space heater and a manual release lever.

- e. The holding brake shall be applied automatically when power to the brake is removed. All brakes shall be released only when sufficient electric power is applied to the brake coil through the motor circuit.
- f. Select coil time rating for the duration and frequency of operation for the class of service specified. Transverse drive brakes used only for emergency stops on power losses, or setting by operator choice shall have a coil rated for continuous duty.

#### 17. Shuttle Car Bumpers

- a. Four elastomeric, hydraulic or coil spring bumpers shall be provided on the shuttle car. The bumpers shall be sized per OSHA 29 CFR Ch. XVII Section 1910.179(e)(3) criteria and be capable of stopping the shuttle car with a container (30 tons total live load) when traveling in either direction at rated speed with brakes and power off.
- b. Shuttle cars shall have, at each wheel, brushes or other mechanism to ensure rails are kept free of debris.
- c. The shuttle shall have protective side, front and rear skirts or other means to minimize the gap between the rail and the bottom of the shuttle car. This gap shall be no more than 1/2" as measured from the surface of the concrete to the bottom of the shuttle car.

18. Container cell guides shall be provided as shown at each corner of the shuttle car for container placement on the shuttle. Cone guides mounted on the load table to line up with each corner block of the container for final positioning shall also be provided. The container cell guides shall extend to a minimum height of one foot above the shuttle car walkway.

#### 19. Container Weighing System

- a. Load cells shall be mounted below the load table of each shuttle car. System shall include four (4) stainless steel load cells. Load cells shall have mechanical stops and rubber footing attached to the rocker pin, to protect them from overloading, and have a service factor of at least 2. Due to the tamping of the load in the container, the scale shall have a delay and a damping feature to allow the load to settle for an accurate reading. Furnished load cells shall have a hermetically sealed sensing unit and sealed cable entry, and cable that is either sheathed in stainless steel or run in conduit. Scale system shall be accurate, to within 3% of full load. Components used in this application shall be National Type Evaluation Program NTEP approved.
- b. Cables from each load cell shall be wired to an on-board device that will compute the total weight, and deliver this information to the Shuttle Car

Control System. The manufacturer shall include the on-board device software that, in addition to the summing of the load cell signals, includes diagnostics for each load cell, scaling factors for calibration and a local display.

- c. Provide a large wall-mounted display system above each loading slot in the Loading Area to indicate as specified. The system shall include the indicator, a "Ready" light above each shuttle car bay mounted in the lidding area, a battery-powered handheld remote controller with corresponding receiver, programming of the container transport control system to correctly display the specified information, and all gateways, programming, power supplies and appurtenances necessary to provide a complete working system. Communication between the Shuttle Car Control System and the large display shall be via the network as shown.

(1) Indicator

- (a) Number of characters: Twelve
- (b) Digit Size: At least 8 inches high
- (c) Digit Type: LED
- (d) Enclosure: NEMA 4X Stainless Steel
- (e) Lens: Acrylic
- (f) Power: 120 VAC
- (g) Input: Ethernet
- (h) Manufacturers
  - (1) Vision Information Systems, Inc.
  - (2) Electronic Displays, Addison, IL
  - (3) Or approved equal

(2) "Ready" light

- (a) Provide wall mounted LED strobe light to indicate that the shuttle car container is ready to be moved from the loading area to the lidding area.
- (b) Color: Green
- (c) Power: 120 VAC
- (d) Manufacturer: Edwards 105 Series or equal

(3) Handheld Remote Controller

- (a) Provide battery-powered handheld remote controller radio frequency transmitter capable of sending four unique digital commands to the corresponding receiver.

- (b) Enclosure: IP66
  - (c) Keypad: Sealed membrane
  - (d) Battery: AAA lithium
  - (e) Transmit Channels: Eight
  - (f) Transmit Frequency: Spread Spectrum
  - (g) Quantity: Two
  - (h) Provide battery charger and a spare set of rechargeable batteries. Provide a waterproof pouch with lanyard for each controller.
  - (i) Manufacturer: BWI Eagle Air-Eagle Transmitter or approved equal.
- (4) Remote Control Receiver
- (a) Provide radio frequency receiver with antenna, paired with the transmitter specified above, capable of receiving four unique digital commands from the transmitter.
  - (b) Power: 120 VAC
  - (c) Relay Contacts: SPDT 5 A at 120 VAC
  - (d) Enclosure: NEMA 4X
  - (e) Manufacturer: BWI Eagle Air-Eagle Receiver or approved equal.
- (5) Programming
- (a) Provide programming for the container transport control system to display the specified information on the indicator and control the "Ready" light.
  - (b) The indicator shall display the net weight of the contents of the container while a container is:
    - (1) Present on the container transport car.
    - (2) The container transport car is stopped at the loading slot.

- (c) The indicator shall display "DO NOT DUMP" if the above conditions are not met.
- (d) The "Ready" light shall be energized when the handheld remote controller button is pressed.
- (e) The "Ready" light will be de-energized when the shuttle car moves away from the loading slot.

## 20. Warning Systems

- a. Shuttle cars shall be equipped with a white highly visible flashing beacon visible to the gantry crane operator as shown in the Contract Drawings. The flashing beacon shall be mounted in an open top box configuration to provide the maximum illumination and focus the light upward. The beacon will activate only when a weight of at least 18,000 lbs is detected, and only when the shuttle car reaches the outbound pier position. Flashing beacons shall be as specified in Section 17330 – SCADA System – Panel Mounted Instruments and Devices.
- b. Near or on the electrical panel mounted on each shuttle car, the car shall include:
  - (1) Power Available Light: Provide a green "Power Available" light that will turn on when power is available at the control.
  - (2) Power On Light: Provide a red "Power On" light that will turn on when the Main contactor has energized.
  - (3) Obstacle Detection System (ODS): Provide flashing amber light that will activate when the ODS detects an obstacle in the shuttle cars travel path.
  - (4) Shuttle Car Overload: Provide flashing red light that will activate when an overload has been sensed.
- c. Each shuttle shall have a minimum of two amber flashing beacons and adjustable audible warning alarm to indicate movement of the shuttle car. The equipment shall be as specified in Section 17330 - SCADA System – Panel Mounted Instruments and Devices.

## 21. Labels

- a. Provide adequate warning labels to comply with OSHA requirements and to ensure a safe operating environment.

- b. Capacity plates on shuttle cars will indicate capacity and be sized accordingly so that the shuttle car capacity can be read clearly from the ground.
  - c. Manufacturer required service, operation or safety warnings.
- 22. Two 30-inch wide walkways/platforms with handrails shall be provided along the long sides of the car for operators to remove the container lid as shown on the Contract Drawings.
- 23. The walkways shall provide a clear passageway of no less than 30 inches, shall be floored with steel checker plate or grating, and shall be provided with a 4-inch minimum high toe plate at all open edges except ends which are to be designed to align with building mounted finger walkways. Walkway surfaces of the Shuttle Cars shall be in accordance with Section 05532 – Stainless Steel Floor Gratings and Checkered Plates.
- 24. Hand railings shall be provided along the open sides of walkways, platforms, stairs, and at other locations where required for maintenance access and safety, except ends, which are to be designed to align with building mounted finger walkways. Handrails shall be in accordance with Section 05521 - Exterior Pipe and Tube Railing, and as modified herein.
- 25. Runway Rails
  - a. Rails for the shuttle cars operation shall be placed slightly above the top of the Pier Level slab as shown.
  - b. The rails shall be connected to one another with splice bars, shall be continuously supported. (See Structural Contract Drawings for the rail support and anchoring details).
  - c. Four fixed bumper end stops shall be provided and installed as shown on the Contract Drawings.
  - d. The fixed bumper end stops shall be of steel construction, accurately installed to meet the shuttle car bumpers squarely. The centerline of contact shall not be lower than the centerline of the wheel axles.
- 26. Given the height of the container cell guides, the possibility exists to derail the shuttle car when lifting or lowering a container into the shuttle car. An anti-derailing device shall be provided on the car to prevent the shuttle car from the possibility of derailing. The Contractor shall submit details of their manufacturer's proposed anti-derailing device with its Shop Drawing submittal.

27. The Contractor shall provide an Emergency Pullout System. The system is shown on the Contract Drawings. Its purpose is to pull a car and loaded container out of the station in the event of a mechanical breakdown of the shuttle car. Four, swivel hoist rings as manufactured by Crosby Group, Tulsa, OK or approved equal, shall be provided by the Container Transport System equipment manufacturer and be mounted on the shuttle cars as shown. The swivel hoist rings shall also be used as lifting rings for placement of the shuttle car on the rails, and shall be of the capacity necessary to lift the weight of a fully assembled shuttle.

## 2.03 SHUTTLE POWER AND ELECTRICAL REQUIREMENTS

- A. The electrical equipment contained in this specification is intended to cover a floor running traveling shuttle car for operation with a direct current power supply.
- B. The shuttle car manufacturer shall furnish and mount on the shuttle cars all electrical equipment, control panels, conduit and wiring, unless otherwise specified. If it is necessary to partially disassemble the shuttle car for shipment, all conduit and wiring affected shall be cut to length and identified to facilitate re-assembly.
- C. Wiring and equipment shall comply with Article 610 of the National Electrical Code (NEC), and Section 16121 – Wires and Cables – 600 Volts and Below.
- D. Electrical components shall be designed and rated in accordance with the applicable NEMA standard. The use of design standards other than NEMA such as IEC is unacceptable. All electrical components used shall be readily available from third party distributors and electrical wholesalers located in the Eastern United States.
- E. A shuttle car disconnecting means, either a current-rated circuit breaker or motor rated switch, lockable in the open position, located in an easily accessible location on the side of the car, shall be provided in the leads from the battery.
- F. The continuous rating of the switch or circuit breaker shall not be less than 100% of the combined short time motor full load currents, plus any additional loads fed by the device.
- G. Power circuit fault protection devices shall be furnished in accordance with NEC Section 110-9 Interrupting Rating. The shuttle car manufacturer shall state the interrupting rating being furnished.
- H. Branch circuit protection shall be provided per NEC Section 610-42 Branch Circuit Protection.
- I. Magnetic mainline contactors, shall be as shown in Tables 5.6.6-1 and 5.6.6-2 of CMAA 70. The size shall not be less than the rating of the largest primary contactor used on any one motion.

- J. Motor running overload protection shall be provided in accordance with NEC Section 610-43 Motor Running Overload Protection.
- K. Control circuits shall be protected in accordance with NEC Section 610-53 Over-current Protection.
- L. Under-voltage protection shall be provided as a function of each motor controller, or an enclosed protective panel, or a magnetic mainline contactor, or a manual-magnetic disconnect switch.
- M. Operator controls with the exception of local controls shall utilize momentary contact push buttons.
- N. Motor control equipment shall provide under voltage and overload protection for all motors.
- O. All motor and control terminals, upon which field connected circuits are to be terminated, shall be clearly and permanently identified. Terminal identification shall correspond with that indicated on schematic wiring diagrams. Electrical items used shall be in accordance with Section 16075 - Electrical Identification.
- P. Electrical design and installations shall be in accordance with the requirements of NEC Article 610, ANSI, NEMA, NFPA 70 standards, and with applicable state and local codes. Electrical components shall be shipped pre-wired to the largest extent practical. Wiring diagrams and tagged cables shall be provided for all items to be wired at the site.
- Q. Motors, controls, and other electrical devices shall be furnished in accordance with Section 16220 - Electric Motors, and Section 16491 - Control Components and Devices.
- R. A manual magnetic disconnect switch shall be provided. The switch shall be operable by handle at the control panel mounted on the shuttle car or remotely from the Lidding Operator's station. The main disconnect switch shall be capable of being padlocked in the "off" position.
- S. All junction boxes and control panels shall be outdoor rated, stainless steel NEMA 4X rated construction, meeting the requirements of Section 17320 - Control Panels and Enclosures.
- T. Battery Type And Charging System
  - 1. The shuttle cars will be in operation on an intermittent basis over a daily 16-hour waste handling period. Each shuttle car shall be battery powered with a single sealed gel electrolyte battery system. The battery system shall be maintenance free, never needing electrolyte or water to be added. The electrolyte shall be immobilized within each battery cell; the system shall

include valve-regulated or Absorbed Glass Mat (AGM) technology which shall replace traditional vent caps, making the battery system leak proof/spill proof and environmentally safe. Flooded cell lead acid batteries are not acceptable. These sealed battery systems shall prevent exposure to the hazards of hydrogen gas which is generated during recharge on standard flooded batteries. The battery system shall be as manufactured by a manufacturer regularly engaged in the manufacture of gel-electrolyte battery systems. The battery system shall be as manufactured by Storage Battery Systems, Inc., or other battery manufacturer regularly engaged in the manufacture of gel-electrolyte battery systems. -

2. The system shall be designed to operate in a temperature range of  $-5^{\circ}\text{F}$  to  $+120^{\circ}\text{F}$ . A detailed amp/hour demand study shall be completed and submitted for approval to show the batteries ability to meet the 16-hour handling period with or without "Opportunity Charging" at the most extreme temperature conditions. The charger shall monitor the battery cell temperature and automatically compensate the charging algorithm based on cell and ambient temperature. The gel-electrolyte battery system shall also be sized with sufficient number of cells to operate for the full 16 hours of operation and only have been discharged less than 30%.
3. Battery capacity shall be sized according to industry standard and manufacturer's recommendations on depth of discharge. The depth of discharge for the 16-hour operational shift shall not exceed 20% on gel cell batteries (80% capacity remaining).
4. The battery shall be protected from UV exposure when mounted on the shuttle car. If the mounting does not provide UV protection for the battery and case, the battery shall be furnished with a UV resistant housing, and designed specifically for use with gel-electrolyte battery systems
5. 'Opportunity Charging' shall allow for automatic recharging of the shuttle car batteries as the shuttle car stops at a fixed position under the Loading Slot. Each shuttle car shall have its own battery charging system, which shall consist of a wall mounted battery charger, charging shoe, and collection plate (Shuttle car mounted), located as shown. Power shall flow only upon contact and the system be designed to charge each shuttle cars batteries. Recharging the batteries shall be accomplished without removing them from the shuttle car.
6. The Opportunity Charging system shall be an intelligent microprocessor controlled charger with diagnostic features. The charging system shall have the ability to be used in a float charge, a deep discharge "swap" fashion or in an opportunity charge fashion. Charging and cool-down time for a full charge shall not exceed 8 hours. During the eight-hour period the equipment is not in use, the shuttle car shall be parked under the Loading Slot, where the batteries will receive their full charge. The battery charger shall compensate for battery

cool-down and shall monitor battery cell conditions including temperature and voltage. The battery chargers shall be "Eclipse II" series as manufactured by AMETEK, or approved equal.

7. The equipment manufacturer shall provide two (2) additional batteries as spares including a stand-alone spare battery charging system and two (2) battery storage racks.
8. Battery mounting shall be designed to allow easy removal and replacement of the battery using the forklift specified in Section 11562.
9. The charging system shall be able to charge the battery provided automatically with no programming required. Software shall be provided to monitor the charge current, battery voltage, cell temperature, voltage per cell; charge time elapsed, charge time remaining and the amps returned. The system software shall continually diagnose the battery and stop only when the battery is fully charged.
10. The charging system shall also include state of the art diagnostics that include:
  - a. Self-check during start up
  - b. Faults in AC service or DC output
  - c. Over-discharged battery
  - d. Battery fault
  - e. Cell temperature
  - f. Ambient Temperature
11. A Battery Status Indicator panel shall be provided and located next to the battery storage rack. The panel shall be at an easy viewing level for operators.
12. Conduit and wiring to connect electrical devices, electrical equipment and control panels furnished and installed by the shuttle car manufacturer that are not mounted to the shuttle car, will be provided by the Contractor.

## 2.04 SHUTTLE CONTROL SYSTEM

- A. The operator shall have the ability to control the shuttle cars from either of two areas, based on a local/remote selector switch on the outboard lidding area control panels. The areas where control shall be provided are the shuttle car pendant and lidding area.
- B. Control of the shuttle car from other than the pendant shall require the controls to be transmitted via the wireless network. The shuttle car manufacturer shall supply the digital communication equipment for all shuttle communication requirements. All drivers, cables, converters and ancillary equipment necessary for a complete system shall be provided.

C. Shuttle Car Control: A pendant-style control station shall be provided on each shuttle car. The control station cable shall be attached to the car with a quick disconnect coupling. The station shall have the following controls:

1. E-Stop mushroom head-style push button (operable in any mode).
2. Controls for Inbound, Stop, and Outbound movement, operable in local mode. Controls shall require constant operator pressure to maintain movement of the shuttle car. For example, if a joystick is used, the joystick shall spring-return to the STOP position. The joystick shall control the speed of the shuttle car as well as the direction of travel. The distance that the joystick is displaced from the STOP position shall translate into the speed of motion in the direction displaced.

D. Lidding Area Control

1. Wall-mounted NEMA 4x stainless steel control panels, on the inboard and outboard sides of the lidding area, shall be provided and located as shown. When the selector switch on the outboard lidding area control panel is in the Remote position, the lidding area control panels shall control the shuttle car. See Section 14601 – Container Lidding System for additional system operating features.
2. Two outboard control panels shall be provided as shown per station. Each of these panels shall control two Container Transport Systems, and contain the controls for the high-speed roll-up doors. Four inboard control panels shall be provided as shown per station. Each of these panels shall control one Container Transport System. The panels shall include the following controls:
  - a. Local/Remote selector switches (outboard panels only).
  - b. E-Stop mushroom head-style push button (operable in any mode).
  - c. Push buttons for shuttle car movement shall be provided at each control panel. Where noted below for operator safety, both inboard and outbound mounted push buttons must be pressed simultaneously before the shuttle can move to its next position. Provide the following push buttons:
    - (1) Pier area to lidding area (Outboard control panels only)
    - (2) Lidding area to loading area (Both panel push buttons simultaneously)
    - (3) Loading area to lidding area (Inboard control panels only)
    - (4) Lidding area to Pier area (Both panel push buttons simultaneously)

- d. Indicating lights for each inboard and outboard control panel. Location indicating lights will energize when the shuttle car is stopped at that location. Both lights will energize when the shuttle car is between two locations.
    - (1) Pier area
    - (2) Lidding area
    - (3) Loading area
    - (4) Trouble
  - e. Push buttons (Hardwire to door control panel) for open and close operation of the high-speed roll-up doors (Outboard panels only).
  - f. The shuttle system control panels shall be in accordance with Section 17320 – SCADA System – Control Panels and Enclosures. The shuttle car equipment manufacturer shall program the shuttle car system.
- E. Shuttle Car Interlocks: Provide the following interlocks:
- 1. Obstacle Detection System (ODS): Regardless of control station commands, detection of an obstacle shall stop the shuttle car.
  - 2. Bumpers: Regardless of control station commands, detection of an obstacle shall stop the shuttle car.
  - 3. End stop points: Regardless of control station commands, the shuttle car shall detect the end point and stop.
  - 4. Area stop point: Regardless of control station commands, the shuttle car shall stop at the Outbound Pier Position stop point, the Lidding area stop point, and the Loading area stop point. After stopping, a subsequent command to move shall activate the shuttle car.
  - 5. For remote operation, the door shall be opened and closed automatically from signals from the container transport system via the outboard control panel. The shuttle control system shall monitor the position/location of the shuttle car at all times. Based on the position of the car, the system shall open the door immediately prior to moving a shuttle car into or out of the building, and shall close the door immediately after the shuttle car passes through the door. See Section 08342 – Overhead High Speed Fabric Doors for additional description and requirements.
  - 6. Power fail protection: The shuttle car control system shall be designed such that the system shall fail to a safe state in the event of a power failure. Upon loss of network communications to any component, the shuttle car control system shall abort its operation and fail to a safe state.

## 2.05 SHUTTLE CAR CONTROL

- A. Provide two (2) identical "System Control" Personal Computer (PC) Systems. The Container Transport System Control Computers shall be provided in accordance with Section 17210 – SCADA System – Operator Workstation, and as modified herein.
- B. One system shall act as a backup system in the event of an equipment failure, allowing for continued use of the Container Transport System.
- C. The Container Transport System Computers shall, to the maximum extent possible, provide information displayed in a graphical format. The system shall display, monitor and control as a minimum, the following system functions and events:
  - 1. Monitoring
    - a. Motor failure
    - b. Brake system failure
    - c. Inferred sensors: obstacle detected
    - d. Mechanical bumper: obstacle detected
    - e. Shuttle car failure
    - f. Weighing system failure
    - g. Battery recharging system failure
    - h. Wireless network failure
    - i. Battery voltage level
    - j. Container weight
    - k. High speed door trouble
    - l. High speed door open
    - m. High speed door closed
    - n. Mode selector switch position (local/remote)
  - 2. Control
    - a. Control shuttle car movement based on push button contacts on lidding area control panels when in Remote mode. The control system shall stop each shuttle car at each defined point. The control system shall ramp up, drive, and ramp down the speed of the car automatically.
    - b. A stop soft push button shall be provided on each display screen. Activation of this button will override local push buttons and auto controls.
  - 3. Display
    - a. Shuttle cars location: Provide a display showing all shuttle car bays, tracks and cars. Show actual position of each car on display.

- b. Show all monitored data listed above.
- c. Calculate and show total run time for each shuttle car.
- d. Determine final rollout weight for each shuttle car trip.\
  - (1) Record and display final rollout weight.
  - (2) Totalize all final rollout weights by bay per day.
  - (3) Totalize all final rollout weights by station per day.
  - (4) Alarm on high rollout weight (over 22 tons).
  - (5) Display loading weight as container is filled.
- D. The Container Transport System computers shall have the ability to have certain signals and information monitored by the building's SCADA System. Shuttle car monitored signals forwarded to the SCADA system shall include the following:
  - 1. Failure of Each Shuttle Car (4)
  - 2. Shuttle Bay Door (4) Open.
  - 3. Shuttle Car Safety Stop Command Given (4)
- E. Provide a UPS unit sized for 30 minutes running the control system. The unit shall be per Section 16264 – Uninterruptible Power Supplies.
- F. Provide 802.11g Ethernet wireless set working cards to transfer information between each shuttle car and the control system as shown.
- G. Wireless communication system shall include all mounting and wiring. The radio shall operate in a manner that provides seamless and continuous communications between the shuttle cars and the System Control PC via the wireless network.
- H. The shuttle car radio communications system shall conform to FCC regulations and CE regulations for noise generation and immunity.
- I. Furnish and install on each system control computer the software necessary to provide a fully functional system as specified. Configure system, setup and demonstrate system software. Two software packages and two user licenses shall be provided for each station.

## 2.06 PAINTING OF EQUIPMENT

- A. The shuttle car equipment shall be painted in accordance with Section 09911-Exterior Painting.
- B. Purchased equipment such as motors, brakes, etc. shall be left with the manufacturer's standard finish, which shall be specified for a marine environment.

## 2.07 SOURCE QUALITY CONTROL

### A. General

1. Factory tests shall be run on one container transport system. Tests shall be conducted at the manufacturer's shop, and shall be witnessed by the Engineer.
2. Factory test methods, procedures and scheduling shall be submitted for approval. Approval of the factory test plan is a prerequisite for conducting the test.
3. Factory test shall be run only after all major shop drawings have been approved.
4. The Contractor shall submit a report of the results of the factory test for approval. The report shall include all test results, including malfunctions, failures, and any remedial actions.
5. No component or system shall be delivered to the site until the factory test report submitted has been approved.
6. Acceptance of any factory test shall not relieve the Contractor of responsibility for complying with the Contract Documents.

### B. Factory Tests

1. Fit and Alignment: The structural frame shall be fully assembled, and checked for fit and alignment prior to shipping. The fit of all equipment such as shuttle car, drive, etc. shall be verified. The test shall demonstrate that the various parts and components are correctly fabricated, assembled, and fitted. A container shall be placed on the car to inspect clearances between the container and the car, and cell guides and cone guides placement. Container shall be provided by the Contractor. The contractor will be responsible for the shipping, handling, and removal of container during the process of the factory test.
2. Safety Devices Test
  - a. Test all safety devices in both directions of travel, including mechanical bumpers, obstacle detection sensors, emergency stop push buttons, and control network stop commands.
  - b. All safety devices shall stop the shuttle car immediately, with no abnormal noise, vibration, or brake overheating.
  - c. The safety devices test shall be conducted with the shuttle car fully loaded.

### 3. Weigh Test

- a. A container shall be loaded from empty to full capacity while on the shuttle car. Real-time monitoring of the weight, derived from the shuttle car weighing system, and sent via the wireless network to the display, shall be recorded.
- b. Weight values from the system shall be compared to actual weight of the full material to calculate accuracy.
- c. This test shall be conducted before and after the impact test.

### 4. Impact Test

- a. The shuttle car shall be impact-tested to simulate dropping five tons of material from 15 feet above the bottom of the container. The manufacturer shall provide and load a container into the shuttle car. This test shall be completed three (3) times, the load shall be dropped at the extreme right, left and center of the car.
- b. After each test the car shall be checked to verify that it does not derail. After the completion of the three-drop tests the structure of the car shall be visually inspected to verify no damage to the car has occurred. Impact absorbers such as sand bags can be used to prevent damage to the container.

### 5. Control System Failure Tests

- a. Provide a demonstration of system failure scenarios and the system's response to each failure including, but not limited to the following:
  - (1) Loss of Wireless Network
  - (2) Loss of PLC
  - (3) Loss of LAN

### 6. Operational Simulation Tests

- a. The Container Transport System shall be operationally tested. The test shall include the shuttle car, control panels, wireless network, computer control system, and all appurtenances required for a complete test.
- b. Shuttle car rails and three area stop points shall be provided, dimensionally equivalent to the project site, at the manufacturer's site.

- c. Operational testing shall simulate expected cycle frequencies and times during operation.
  - (1) A cycle is defined, for the purpose of this specification, as a complete round-trip of the shuttle car from the pier area to the lidding area, then to the loading area, back to the pier area.
  - (2) Under normal operation, the complete cycle is expected to take 15 minutes.
  - (3) Shuttle car movement between any two-area stop points shall not exceed 30 seconds.
- d. Testing shall be conducted with a fully loaded container in the shuttle car.
- e. Testing shall be conducted in two parts, with opportunity charging and without opportunity charging.
  - (1) With opportunity charging, the shuttle car shall run a complete cycle every 15 minutes for sixteen hours.
  - (2) Without opportunity charging, the shuttle car shall run a complete cycle every 15 minutes for sixteen hours. Recharge upon completion.
  - (3) Monitor and record battery condition throughout the test and recharge period.
  - (4) Inspect stopping accuracy at each area stop point throughout the test period.
  - (5) Monitor and record the charging system parameters throughout the test and recharge period.

C. Factory Tests Monitoring Requirements

- 1. This testing shall be in accordance with the requirements of Section 16080 – Electrical Testing Requirements, ASME B30.2 Section 2-2.2, and as specified herein.
- 2. The shuttle car manufacturer shall provide all personnel and equipment necessary to conduct the tests including, but not limited to shuttle car operators, trouble shooters, riggers, and rigging gear. Shuttle Car Shop Tests shall be in accordance with Section 01431 – Quality Assurance Inspection.

3. **Test Data:** Operating current measurements shall be recorded for electrical equipment using appropriate instrumentation. Speed measurements shall be recorded. Recorded values shall be compared with design specifications or manufacturer's recommended values; abnormal differences shall be explained in the remarks and submitted for approval or appropriate adjustments performed. In addition, high temperatures or abnormal operation of any equipment or machinery shall be noted, investigated, and corrected.
4. **Equipment Monitoring:** During the shop test, improper operation or poor condition of safety devices, electrical components, mechanical equipment, and structural assemblies shall be monitored. Observed defects critical to continue testing shall be reported immediately and testing shall be suspended until the deficiency is corrected. During and immediately following each test, the following inspections shall be made:
  - a. Inspect for evidence of bending, warping, permanent deformation, cracking, or malfunction of structural components.
  - b. Check for overheating in brake operation and for proper stopping.
  - c. Check for abnormal noise or vibration and overheating in machinery drive components.
  - d. Check electrical drive components for proper operation, freedom from chatter, noise, or overheating.

## 2.08 PREPARATION FOR SHIPMENT

- A. The shuttle car shall be disassembled only to the extent required for shipment to jobsite. All field connections shall be match marked, and a match mark drawing shall be furnished. Bolts for field connections shall be supplied, with each size separately packaged and identified, and keyed to the match mark drawings for each connection. A shuttle car erection drawing shall be furnished, showing the arrangement, weights, and assembly of all shipped assemblies and subassemblies to be installed on the completed shuttle car.

## 2.09 PHONE SUPPORT

- A. The shuttle car manufacturer shall provide free-of-charge telephone support to the DSNY during normal business hours, for one year from the date of Final Acceptance of the system, for warranty related issues.

## PART 3 EXECUTION

## 3.01 INSTALLATION OF CONTAINER TRANSPORT SYSTEM

- A. The shuttle car manufacturer shall provide detailed imbed requirements for locating any required limit switch tripper plates or targets. The manufacturer shall also provide the imbed requirements for the location of bumper stops furnished and installed by the Contactor.
- B. The Contractor under the direction of the field supervisor provided by the shuttle car manufacturer shall install the end of travel limit switch striker plates as well as the wall mounted battery charging system equipment.

## 3.02 FIELD QUALITY CONTROL

- A. Provide field-testing in accordance with Section 01811 – Preliminary and Final Field Tests.
- B. Preliminary Field Tests
  - 1. Preliminary Tests shall be performed to determine the Container Transport System meets the specifications, and can successfully show the following:
    - a. That each shuttle responds to commands from both the local control pendant and from the Lidding area control panels.
    - b. Stops quickly and accurately at each required stopping point.
    - c. Stops quickly when sensing an obstruction by the mechanical bumper system and the Laser detection system.
    - d. Warning lights and audible alarm operate as specified.
    - e. Battery charging system can fully charge the shuttle battery in not more than eight (8) hours.
    - f. Container load cells and display operate as specified.
    - g. Shuttle computer system is programmed to display and monitor system operation.
    - h. Wireless communication between shuttle cars, controls and computer system operate with no dead zones.

### C. Field Tests

1. Field Tests shall be conducted on the Container Transport System after Preliminary and Final Field Testing has been completed on the Gantry Crane. The Contractor shall perform Field Tests using a test container and lid placed in the Container Transport System. The container shall meet the requirements of Section 14512 – Containers.
  - a. The Gantry Crane shall be use to load the container car/s with an empty container first. The shuttles shall be moved from station stop to station stop.
  - b. The Gantry Crane will also place a container, which has been filled to weigh 30 tons on the shuttle car. This test container will be placed in the shuttle car to test the load cells and weight display. Only clean reusable material shall be placed in the container, such as sand or concrete blocks. With the loaded container, the Container Transport System shall be operated to demonstrate all system design functions as if in full processing operation.
  - c. The Contractor and manufacturer shall correct any defects found, and retest until the system is fully operational. Once fully operational, each bay shall repeat for 10 successive cycles without a malfunction. Testing shall be repeated until this can be achieved.
2. A Field Test shall be performed only after the installation and the Contractor has performed commissioning of the system. Once it has been proven that the supplied equipment meets the specified performance requirements and when all defects and faults found during commissioning have been corrected and upon completion of training, the system shall be accepted.
3. The equipment manufacturer and Contractor shall develop and submit for approval a Final Field Test Plan.

### 3.03 TRAINING

- A. The manufacturer shall provide two 8-hour days of training in accordance with Section 01821 – Training.

-END OF SECTION-

## Section 14512 CONTAINERS

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. This section covers and includes the furnishing of two (2) Intermodal Municipal Solid Waste (MSW) Containers per Marine Transfer Station. The containers shall be 20 foot long, by 8 foot 6 inches wide, by 12 foot high, 62 cubic yard Intermodal, watertight containers to be used for Field Testing by the Contractor. Following successful Field Tests, the containers shall be turned over to the City of New York for use at the Marine Transfer Station.
- B. The following specifications describe the containers to be provided for Field Testing the Gantry Cranes, Container Transport System and the Lidding Systems. The same containers as specified herein, shall be provided by separate Contract for processing waste after the MTS is in operation, and be used for rail, barge, or truck transport of solids.

#### 1.02 RELATED SPECIFICATIONS

- A. Section 01330 – Shop Drawings
- B. Section 09911 – Exterior Painting
- C. Section 14511 - Container Transport System
- D. Section 14601 – Container Lidding System
- E. Section 14640 – Container Gantry Crane

#### 1.03 REFERENCES

- A. Codes and Standards referred to in this Section are:
  - 1. (ABS) – American Bureau of Shipping
  - 2. (AAR) M930-98 - American Association of Railroads
  - 3. (ISO) – International Standards Organization
  - 4. (CSC) – International Convention for Safe Containers
  - 5. ASTM A588 – Standard Specification for High-Strength Low-Alloy Steel
  - 6. ASTM A36 – Standard Specification for Carbon Structural Steel

#### 1.04 GENERAL REQUIREMENTS

- A. The containers provided shall be suitable for use by rail, barge, or truck transport of solids.
- B. Sufficient documentation must be produced for each container to satisfy the requirements of the Quality Assurance Program and this specification.

- C. The Contractor shall comply with applicable Federal, State and Local Laws in the manufacture, testing, and shipment of the containers.

#### 1.05 DESIGN REQUIREMENTS

- A. The design is based upon solid waste container systems as manufactured by Wastequip Accurate and the terminology used herein may include reference to that manufacturer's proprietary product. Such reference shall be construed only as establishing the quality of materials and workmanship to be used under this section, and equivalent products of other manufacturers may be submitted for approval. The design shall be verified by an independent verification agency; such as The American Bureau of Shipping.
- B. The MSW containers specified herein are an Accurate Industries I-62/OT production unit design.

#### 1.06 SUBMITTALS

- A. Submit information and data to show experience in producing similar equipment, providing evidence including contact information for installations which the manufacturer has completed.
- B. Submit a complete written description of the container in sufficient detail to permit comparison with the technical specification herein.
- C. The Contractor shall submit complete working drawings, including complete dimensional information and materials list. Information submitted shall be in accordance with Section 01330 – Shop Drawings.

#### 1.07 QUALITY ASSURANCE

- A. The container manufacturer shall show evidence of a Quality Assurance Program. The container manufacturer must have three (3) years of experience building intermodal containers of a similar size and design for transport of Municipal Solid Waste. No prototypes will be accepted.
- B. The manufacturer shall have field proven performance in design and manufacturing similar type intermodal waste containers.
- C. The manufacturer must have the capabilities in house of performing the AAR, AAR Marine and CSC Prototype Tests. Prototype Testing shall be supervised and certified by an independent agency, such as The American Bureau of Shipping (ABS). An ABS Prototype Test Certificate shall be provided to the DSNY.
- D. Production must be inspected at each stage of manufacture by an independent verification agency, such as ABS, who shall issue a "Cargo Container Production Certificate" to the owner upon the completion of this job.

- E. Production Testing shall be as described in Article 2.03 of this specification.

## 1.08 WARRANTY

- A. The Warranty shall be in conformance with Article 24 – Maintenance and Guaranty of the Standard Construction Contract.

## PART 2 PRODUCTS

### 2.01 ACCEPTABLE MANUFACTURERS

- A. Subject to compliance with requirements, provide containers of one of the following manufacturers:
  - 1. Wastequip Accurate
  - 2. McLain Industries
  - 3. Or approved equal

### 2.02 CONTAINER SYSTEM AND COMPONENTS

- A. Containers shall meet the current applicable requirements of the American Association of Railroads, AAR M930-98 / ABS Rules, AAR Marine, and CSC, and be certified by an independent agency such as the American Bureau of Shipping.
- B. The containers shall be 62 cubic yard net inside capacity. The outside dimensions shall meet the AAR tolerances on length, width, and diagonal measurements for a nominal 20-foot long x 8 foot 6 inch wide AAR container. Height shall be 12 foot maximum.
- C. The containers shall be fitted with eight (8) ISO corner castings and shall be located to meet AAR and CSC standards. There shall be no protrusion of any kind, including hardware, doors lids, etc., past the outer envelope of the corner castings.
- D. Documentation of materials will conform to "Material Identification" form submitted and approved by ABS. Structural steel tubing shall be ASTM A588, minimum. Full length, no splits or joints. Steel 7 Ga. and lighter shall be ASTM A588, minimum. Hinged plate and flapper plate steel 1 inch and heavier shall be ASTM A-36, minimum. Round bars shall be ASTM A-36, minimum. Detailed specifications are minimum only, heavier and / or stronger specifications are acceptable.
- E. Floor shall be 7 Ga. steel, and shall have 5 ½ inch formed 10 Ga. steel channel cross-members on approximately 16 inch spacing. Side sills shall be a minimum of 3 inch x 8 inches x 11 Ga. structural tubing. Floor joints shall be located over a cross-member and spaced so a weld can be applied to joint and cross-member and full seam welded to assure structural integrity and watertight capabilities.

- F. Non-laden fork pockets shall be installed in floor to meet AAR design requirements; 81 inch centers, 14-inch wide minimum, 4½-inch high minimum. Fork pockets for empty container use only.
- G. Sides shall be 12 Ga. steel. Structural side supports shall be 11 Ga. steel, 2¾-inch deep minimum. Side supports shall be full welded to side sheets. Bottom of sidewall and bottom of formed tubes are full welded to floor and bottom rail on outside and inside. Top horizontal structural welded tubing shall be 8 inch x 4-inch x ¼ inch minimum. Side sheet shall be full welded to top tube on outside and stitch welded on the inside. Sidewall shall be designed to withstand the stresses developed during the loading and discharge of the container.
- H. The eight (8) corners shall have vertical structural welded tubing, between and supporting, the top and bottom corner castings. These tubes shall be designed structurally to meet the AAR M930-98 / ABS Rules / CSC requirements for stacking loaded containers with a gross weight of 35 tons gross load, during barge haul operations.
- I. As an important safety item the operator must be able to open the door from the side of the container allowing him to be clear of the door and the load when the lock is released.
- J. Liquids present in the loads to be hauled are considered to be a Contaminated Waste. Therefore, it is imperative to have a proven watertight seal system in addition to the CSC weatherproof seal. A proven design of a neoprene gasket sealed with a "knife edge" shall be provided between the door and door-jamb mating face to guarantee a watertight seal, so that no liquids from the waste material can leak out of the containers. The gasket shall be made of durable material and easily replaceable. The Manufacturer shall provide design details, sample and evidence of successful field usage. No prototype designs are acceptable. The gasket and seal design shall be approved by the Engineer before fabrication, and be of the "knife edge" design to ensure a positive seal. Compression gaskets will not be accepted.
- K. The door shall have two (2) horizontal and two (2) vertical ¼ inch steel plate formed channel frames, plus two (2) 7Ga. steel vertical members. The door shall be 11Ga. steel. Four (4) hinges shall be installed on top of door so door opens at bottom. Hinge pins shall be stainless steel. Interior and exterior of door shall be full welded.
- L. A neoprene gasket shall be provided on the doorjamb mating face to guarantee a watertight seal. Gasket shall be 1-inch x 1-1/2 inch and shall be made of 30 to 45 durometer solid neoprene, and be easily replaceable. Gasket shall be of knife-edge design.
- M. The end door is to be locked into place by four ratchet binders for watertight security; one on each side with a "V" chain to the door, and one on each side at the floor to operate a bottom flapper system. This system must have field proven

durability in previous container operations and shall consist of a full width bar between the bottom castings and four (4) one inch thick flappers that press on the bottom of the door. Ratchet binders shall be 1-inch x 10-inch. Chain shall be G-70 transport chain. Each individual chain assembly shall be pull tested to a minimum of 13,200 lbs.

- N. The bulkhead shall be 11 Ga. sheet steel and shall have two (2) vertical members, welded to bulkhead sheet. Top horizontal tube shall be 6-inch x 4-inch x 3/16-inch structural tube minimum. Bulkhead shall be fully welded.

## 2.03 PRODUCTION TESTING

- A. Internal Water Test: The containers shall be watertight welded and tested in accordance with the following. Every container shall be fully welded on all joints and seams on the inside. A Water Test Certificate shall be provided for each container stating the internal test procedure and signed by the Quality Control Inspector. The procedure is to fill the containers to 24-inches and let stand for 30 minutes and inspect for no leaks. Repair if leaks are found and retest. Continue retesting until watertight.
- B. Vertical Lifting from the Top at Three (3) Times Rated Capacity: Each container shall be tested and certified by the manufacturer that every top and bottom corner casting has been tested to three (3) times the rated capacity. The procedures shall be –pull assembly to three (3) times capability and hold for five (5) minutes while visually inspecting welds.

## 2.04 PREPARATION, BLASTING & PAINTING

- A. Painting shall be performed in accordance with Section 09911 – Exterior Painting and as modified below.
- B. Containers shall be scraped and ground to remove sharp edges. The complete exterior and interior surfaces shall be cleaned.
- C. Containers shall be shot blasted or sand blasted on four (4) exterior sides to SSPC-SP7 standards.
- D. Exterior – Shall be primed with 1 coat, 5 mils, series N69 Epoxoline (polyamidoamine Epoxy), VOC-2.11 or equal. The topcoat shall be Polyamideoamne Epoxy Primer with Polyamidoamine Epoxy of Aliphatic Acrylic Polyurethane Enamel Finish Coats or equal. Interior shall be 2 coats of Coal Tar Epoxy or equal.
- E. Paint color shall be determined by the DSNY.
- F. Caulking shall be gray Silkaflex No. 221, or equal.

## 2.05 LABELING

- A. Numbering system: Letters and numerical decals 6-inches high to meet AAR Requirements shall be furnished and installed by the container manufacturer on all four (4) sides. Number sequence to be provided by the manufacturer.
- B. AAR Plate shall be furnished and installed by the container manufacturer.
- C. CSC Plate shall be furnished and installed by the container manufacturer.
- D. ABS Decal shall be furnished and installed by the container manufacturer.
- E. DSNY decals shall be provided by the City of New York and installed by the manufacturer.
- F. No placard holders or paperwork holders or other mounting brackets shall be installed.

## 2.06 CONTAINER LID AND VENT

- A. The container lid shall be designed using 12 Ga. steel with a formed steel perimeter with internal tubing structure (11 Ga.), and fully welded for water tightness.
- B. The lid shall be fabricated from corrosion resistant high tensile steel meeting the requirements of ASTM A588.
- C. The container lid shall be fully gasketed, with a 30 to 45 durometer solid Neoprene Gasket.
- D. The container lid shall be designed to work in conjunction with the mechanism described herein, and as specified in Section 14601 – Container Lidding System.
- E. The lid shall not hinder the operation of the rear door.
- F. Four (4) Twist Locks per Wastequip Accurate Industries patented design shall hold down the container lid.
- G. The lid shall also have the provision to be lifted via magnet, spreader or forklift.
- H. The vent shall be closed to the outside while automatically allowing air into the container during dumping.

2.07 DOCUMENTATION

- A. The manufacturer shall submit Production Certification report meeting AAR M930-98, ABS rules, CSC and AAR Marine. This report includes the ABS provided "PRODUCTION CERTIFICATE".

PART 3 EXECUTION (Not Used)

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 14601**  
**CONTAINER LIDDING SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Container Lidding System shall be complete with an electric hoist, electric spreader, control panels, and all other controls, connections, and appurtenances as shown, specified and as required for a complete installation. Equipment described in this section shall be designed for heavy use in material handling marine applications.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 01431 - Quality Assurance Inspection
- C. Section 01750 - Spare Parts and Maintenance Materials
- D. Section 01811 - Preliminary and Final Field Tests
- E. Section 01821 - Training
- F. Section 01831 - Operation and Maintenance Manuals
- G. Section 09911 - Exterior Painting
- H. Section 14511 - Container Transport System
- I. Section 14512 - Containers
- J. Section 14640 - Container Gantry Crane
- K. Section 16220 - Electric Motors
- L. Section 17320 - SCADA System - Control Panels and Enclosures
- M. Section 17330 - SCADA System - Panel-Mounted Instruments and Devices

**1.03 GENERAL REQUIREMENTS**

- A. The Contractor shall furnish the necessary labor, materials, equipment and incidentals required to provide a complete and functioning system.
- B. The system manufacturer shall be a company specializing in manufacturing and installing container lifting systems with not less than three (3) years successful experience.
- C. All fabricated materials shall conform to the tolerances specified in the AISC manual and ASTM A6, Holes and other provisions for field connections shall be accurate and shop checked so that proper fit will be provided when the units are assembled in the field.

#### 1.04 DESIGN REQUIREMENTS

- A. The key requirements which shall be incorporated into the design and manufacture of the Lidding Equipment are:
1. The mounting of the electric hoist assembly shall be by bolting the hoist frame to the top flange of the supporting I-beams. Each Container Lidding Station incorporates two supporting I-beams mounted to the structure above the Lidding Area.
  2. Provide safe, stable lifting of the container lids without tipping, dropping or damage.
  3. Provide capability for operations with short cycles with high reliability using an electric operating system.
  4. Allow Lidding Operator safe control of the hoist and spreader mechanism.
  5. Incorporate safety in all applicable operating aspects.
  6. Ease of maintenance.
  7. Compatibility with the containers lid locking system.

#### 1.05 PERFORMANCE REQUIREMENTS

- A. Each lidding system shall be designed to accurately attach the spreader to the container lid, hold the lid securely, unlock it from the container, lift, hold, suspended and return to the container the steel container lid it has removed, and lock it again. Containers will be 8.5 ft. wide, 20 ft. long, 12 ft. high (nominal). The containers provided will be designed for heavy-duty municipal solid waste (MSW) handling service. The lidding system shall be compatible with the container lid and locking system is a patented system by Wastequip Accurate, which is the system proposed by this design. The container manufacturer will specify and provide the exact dimensions of the lid and locking assembly locations. The weight of the lid shall be approximately 1200 lbs.

#### 1.06 SUBMITTALS

- A. Submit information and data to show experience in producing similar equipment, providing evidence including contact information for at least 3 installations for which the manufacturer has completed.
- B. Submit a complete written description of the container lidding system in sufficient detail to permit comparison with the technical specifications herein.
- C. Submit wiring diagrams for all electric equipment. Use manufacturer's standards.

- D. Submit and clearly note any deviations from the Contract Drawings or specifications herein.
- E. Submit complete working drawings, including complete dimensional information, catalog cuts of component parts and materials list, showing the location of all equipment and control devices, and all other information necessary to render totally functional system to the owner. Information submitted shall be in accordance with Section 01330 – Shop Drawings.
- F. Provide Operation and Maintenance manuals in accordance with Section 01831 - Operation and Maintenance Manuals.

#### 1.07 QUALITY ASSURANCE

- A. Quality Assurance shall be in accordance with Section 01431 - Quality Assurance Inspection.
- B. The lidding hoist and spreader shall be tested to show compliance with the requirements of this specification. A witnessed factory test shall be performed to show the following:
  - 1. Ability to match the twist lock spacing pattern of the proposed container lid.
  - 2. Ability to lock/unlock the containers four twist locks both in automatic and manual modes.
  - 3. Show the operation of the eight indicating LED lights both successfully operating, and in various failure modes.
  - 4. Show the operation of control panels to perform as specified.
  - 5. Show that the hoist and spreader can center itself over the container using the fixed guides.
  - 6. Show ability to prevent lid from accidentally being released from the spreader when removed from the container.
  - 7. Demonstrate that when the hoist is placed in the maintenance mode/position, the spreader can be lowered to the Pier Level floor below for maintenance or repair.
  - 8. Demonstrate that when the spreader is locked on to a container lid and lifted away from the container, the lid cannot be released accidentally.

## 1.08 SPECIAL TOOLS AND SPARE PARTS

- A. The Contractor shall obtain from the equipment manufacturer and submit for approval the following spare parts lists in accordance with Section 01750 - Spare Parts and Maintenance Materials.
1. A complete list of parts and supplies with current unit prices and source of supply.
  2. A list of parts and supplies that are either normally furnished at no extra cost with the purchase of the equipment or specified herein to be furnished as part of the Contract.
  3. A list of additional items recommended by the manufacturer to assure efficient operation at the particular installation. Parts shall be completely identified with a numerical system to facilitate parts inventory control and stocking. A separate number shall properly identify each part. Those parts, which are identical for more than one size, shall have the same parts number.
  4. The following minimum spare parts shall be provided with the equipment, and be packaged separately for each of the two stations:
    - a. One year's supply of lubricants necessary to maintain all supplied units.
    - b. One hoist motor assembly
    - c. Eight linear actuator assemblies for the spreader
    - d. Eight spreader twist-loc pins
    - e. Two (2) LED lamps of each color
    - f. Sufficient wire rope lifting cable to completely replace cable on each unit one time
    - g. Any additional spare parts recommended by the manufacturer
    - h. The manufacturer shall furnish one set of all special tools required to disassemble, service, repair, and adjust the container lidding system. Tools shall be provided in a lockable metal toolbox.

## PART 2 GENERAL

## 2.01 MANUFACTURERS

## A. Acceptable Hoist Manufacturers

1. Sissco Material Handling Equipment, Hillsborough, NJ
2. Yale Hoist, Muskegon, MI
3. Acco, York, PA
4. Chester Hoist, Lisbon, OH
5. Or approved equal

## B. Acceptable Spreader Manufacturer:

1. Greenfield Products, Markham, IL
2. Or approved equal

## 2.02 CONTAINER LIDDING SYSTEM AND COMPONENTS

## A. Hoist

1. A framed hoist assembly shall be provided and mounted (bolted) to the supporting I-beams.
2. The hoist assembly shall consist of four drums with independent payouts sized with a total travel of 30 feet.
3. The hoist shall be deck mounted, worm drive with four lifting hooks and a single electric motor.
4. The hoist shall lift the container lid 3 feet above the container and hold it there until the container is returned for relidding.
5. The hoist shall be designed and furnished in accordance with ASME HST-4-1999, Performance Standard for Overhead Electric Wire Rope Hoists, and as specified in this section.
6. All motors shall be variable frequency, squirrel cage, high starting torque, totally enclosed type, reversible, wound for 480 volts, 60 hertz, 3 phase service. Motors shall have time ratings in accordance with ASME HST-4-1999, and a temperature rise of 105oC maximum, above 40oC ambient with NEMA Class F insulation.
7. Hoist shall be designed for service in a wet environment protected from direct weather exposure.
8. Capacity of the hoist shall not be less than 5 tons.

9. The hook pattern for the hoist should be oriented to attach to each lifting hook on spreader.
10. Hoist Classification: Normal industrial service, HMI Class H3.
11. Hoist shall be designed to raise and lower at a speed of 30 feet per minute.
12. Hoist motor shall be at least 15 horsepower. Motor speed shall be 1800 RPM. Motor type shall be TENV, with Class F insulation high slip, high torque, suitable for variable frequency control.
13. The hoisting mechanisms shall be of worm gear reduction type, and all gearing shall be provided with adequate means of lubrication. Lowering shall be only by means of continuous application of power to the hoist motor. The hoist shall be provided with one holding brake consisting of an automatic electric brake capable of stopping the rated load of the hoist while in motion. The hoist shall be provided with an upper and lower geared limit switch to stop the hoist as shown in the highest and lowest preset operating position in addition to a final upper block operated limit switch. Motors, starters and transformers shall be furnished and mounted on the hoist frame.
14. The drum shall be fabricated from steel tubing and grooved to guard against the rope jumping out of the groove. The drum shall be sized for the wire rope to be in a single wrap in the high hook position and for two wraps remaining with the hook in the low Pier Deck position.
15. The lifting tackle shall consist of a safety type lower block and hooks with necessary sheaves and wire rope. The hooks shall be forged steel. The wire rope lifting cable shall be of flexible steel. Lifting cable shall be of sufficient length for the hook to reach lowest lifting point at pier level for servicing the spreader.
16. The hoist shall be provided with grating covering the top of the assembly for servicing the equipment by maintenance personnel. Grating shall be locked in place with suitable fasteners to prevent movement. Grating shall allow access to all component parts.
17. OSHA type handrail shall be provided around the top of the assembly on three sides, and be open to side facing service walkway as shown.
18. Power
  - a. Electric Power: Electric power available for hoist operation shall be a single 480 V, 60 Hz, 3-phase service. Provide motor starters in NEMA 4X stainless steel enclosures mounted to the equipment. Provide a transformer in a NEMA 4X stainless steel enclosure to provide 24Vdc power for control circuits to the spreader. Provide branch circuit fuses

for all motors and control circuits. All wiring and equipment shall conform to the applicable provisions of the National Electrical Code.

- b. Motors shall be suitable for hoist service. Motors shall be rated on not less than 30-minute basis with temperature rise in accordance with NEMA standards.
- c. Provide a heavy-duty cable reel system to feed control/power cable to the spreader. The cable reel shall be spring payout and return type, and be fabricated from stainless steel. The lidding system manufacturer shall determine the minimum number of conductors and AWG cable size and overall length of the cable/s feeding the spreader system. Cable/s attached to the spreader shall have a quick disconnect connection. The cable/s shall be of sufficient length to reach the pier deck in the event the operator fails to disconnect it from the spreader. The cable reel system shall be as manufactured by Aeromotive, Gleason Reel, Hannay Reels Inc., Nordic Systems Corporation, or approved equal.
- d. Cable reel system shall include the following features:
  - (1) Spring motors shall be linked so that the reel will continue to function should one spring break. Springs shall have broken spring indicators.
  - (2) Gear enclosures shall be water and dust tight.
  - (3) Cable guides shall be provided to direct cable onto the spool for even wrap.
  - (4) Slip rings and slip ring enclosure shall be easily removable. Slip rings shall be provided with as many conductors necessary and required to operate the spreader.
  - (5) Slip rings shall be suitable for 35 to 200 AMPS, or as recommended by the lidding equipment manufacturer.
  - (6) The reel shall be provided with a positive, extra heavy spool lock to prevent spool freewheeling during maintenance to the reel or cable.
  - (7) Junction boxes shall be oversized to allow ease of wiring.
  - (8) Gear drives shall be heavy-duty and include a detensioning device for de-energizing spring during cable replacement or other maintenance.

- e. The cable reel and cable shall be designed that under normal lidding and de-lidding operation (raising and lowering a container lid), the cable/s will have sufficient slack to raise and lower the spreader approximately three (3) feet without having to pay out cable from the cable reel. A stop ball on the cable/s shall be provided for this purpose.
- f. Control/ Power cables to the spreader shall be supplied with strain relief cable grips at quick-disconnect points on the spreader. Cable grips shall be as manufactured by Amtec Corporation, Appleton Electric, Woodhead Industries, Inc. or approved equal.

#### 19. Controls

- a. All hoist controls shall be 120 volts, 60 hertz single phase. The hoist shall be controlled from both a remote wall-mounted control panel, and a railing mounted push-button control having the same function as the wall-mounted control. Panels shall be located as shown on the Contract Drawings. Panels shall meet the requirements of Section 17320 – SCADA System – Control Panels and Enclosures, and Section 17330 – SCADA System – Panel-Mounted Instruments and Devices.
- b. Lidding Hoist Wall-Mounted Control Panel
  - (1) Push buttons for each of the following operations:
    - (a) Up push button
    - (b) Down push button
    - (c) Power on indicating light.
    - (d) Two-position selector switch. In the "Operate" mode the operator controls the system with safety interlocks in control. In the "Maintenance" position interlocks are overridden and the spreader can be lowered to the pier deck for maintenance, or raised above the normal operating height.
  - (2) Lidding Hoist Railing-Mounted Control Panel
    - (a) Up push button
    - (b) Down push button
    - (c) Power on indicating light
- c. The control unit for the hoist motion shall consist of a variable frequency drive controller, overload and under voltage protection. Overload protection shall be the automatic reset type. A main line

magnetic contactor shall be included as an emergency stop safety feature. All control equipment shall be housed in NEMA 4X stainless steel enclosures.

- d. Hoist Overload Cut-Off Device: Provide overload device designed to interrupt the lifting circuit of the hoist, without affecting the lowering circuit, when the load exceeds the hoist capacity. This interlock operates in either the "Operate" or "Maintenance" mode.
- e. Control enclosures and motors shall be provided with a 120-volt space heater.
- f. Provide fused motor and control circuits.

**B. Lidding Spreader**

- 1. The twist lock spacing pattern shall match that of the container lid. This shall be coordinated with the -City of New York after equipment selection.
- 2. Overall length and width of the spreader shall not be greater than that shown on contract drawings.
- 3. The locking mechanism of the spreader shall be capable of unlocking/locking and lifting a lid at four fixed locations on the container lid through multiple mechanisms. The locking mechanism shall be electrically actuated. Item 'b' below, shall be considered a backup system to item 'a', which shall be the primary operating system. Both systems shall be built into the design of the spreader. The spreader manufacturer shall coordinate both systems with the approved container manufacturer.
  - a. An automatic system coordinated with the container manufacturer to provide for compatibility of the container lid castings with the lid holding mechanism.
  - b. A manual system shall be provided where the spreader can lift and hold a lid through the use of manual quarter turn lever or handle at each attachment point.
- 4. The spreader assembly shall be constructed of steel, and meet ISO standards.
- 5. Removable fixed guide arms shall be provided on four sides to position the spreader onto the container and align it with the locking mechanism on the lid as shown.
- 6. Grab handles shall be provided at the corners of the spreader for manual positioning of the spreader onto the lid as shown.

7. Four lifting eyes or other means shall be provided to allow for raising and lowering of the spreader assembly by the hoist assembly.
8. Eight indicating lights shall be mounted on the spreader assembly as shown to signal the operators on the platform when the latching/locking mechanism is engaged, released, or malfunctioned.
9. Controls
  - a. The lidding operator shall direct and control the lidding system from the lidding area work platforms.
  - b. A wall-mounted control panel shall be provided for each lidding position, located on the inbound side of the lidding area as shown.
  - c. The panel shall control the spreader mechanism.
  - d. Provide a lowering interrupt signal to the electric hoist to shut down the hoist motor when all spreader twist locks are seated. This will prevent paying out additional cable unnecessarily.
  - e. Provide a lift interrupt signal to the electric hoist to keep the hoist from lifting the spreader before the twist locks are in "locked" position.
  - f. The spreader control panel shall meet the requirements of Section 17320 – SCADA System – Control Panels and Enclosures, and Section 17330 – SCADA System – Panel-Mounted Instruments and Devices, and shall include the following controls:
    - (1) Locking of lid onto spreader/unlocking lid from container.
    - (2) Unlocking of lid from spreader/locking of lid onto container.
  - g. Each of the spreaders shall be equipped with two (2) LED light bar assemblies, each consisting of four (4) LED lights. Each assembly shall be located as shown, and shall consist of the following:
    - (1) Two (2) yellow LED indicating lights, each interlocked with a corner twist-loc. The light shall energize when the spreader locking system is fully seated and positioned on the corresponding twist lock latch on the container lid.
    - (2) One (1) red LED indicating light shall be provided. The light shall energize when all four of the spreader twist lock latches are not locked to the lid.

(3) One (1) green LED indicating light shall be provided. The light shall energize when all four (4) twist lock latches are locked to the lid.

h. The manufacturer shall design into the system the means of preventing the lid being accidentally released from the spreader when removed from the container. Pressure on the lid by the spreader against the container shall be required in order for the lock/unlock push buttons to operate.

## 2.03 PAINTING OF EQUIPMENT

- A. Painting shall be performed in accordance with Section 09911 - Exterior Painting and as modified below.
- B. The container lidding equipment shall be painted using a three-coat system, which consists of an inorganic zinc primer with epoxy intermediate and polyurethane finish.
- C. Metal surfaces shall be cleaned with finishes applied over SSPC-SP10 sandblast cleaning.
- D. The prime coat shall be Carboline Carbo Zinc 11, an inorganic zinc primer or approved equal. The primer shall be applied at a minimum coating thickness of 2-3 mils on flat surfaces. Note that some surfaces in corners and open structure may require excess spot thickness to achieve a proper coating.
- E. The intermediate coat shall be Carboline 890 Epoxy or approved equal hi-build epoxy, which offers oil, acid, and salt resistance, and mechanical strength. Dry film thickness shall be not less than 5 -7 mils.
- F. The finish coat shall be Carbothane 134HS or approved equal acrylic aliphatic polyurethane, which offers high gloss retention, oil, acid, and salt resistance, mechanical strength, and long life under a wide range of conditions. Dry film thickness shall not be less than 2 mils.
- G. Purchased equipment such as motors, brakes, etc. shall be left with the manufacturer's standard finish, which shall be specified for a marine environment.

## PART 3 GENERAL

### 3.01 FIELD QUALITY CONTROL

- A. Provide field-testing in accordance with Section 01811 - Preliminary and Final field tests.

- B. Preliminary Tests shall be performed to determine the lidding system meets the specifications, and can successfully show the following:
1. Hoist has the ability to raise and lower the spreader within operating parameters utilizing interlocks and set limits of operation.
  2. Hoist cables pay out evenly and the spreader is level.
  3. In "Maintenance" position, the hoist can lower the spreader to the Pier Level floor, and raise the spreader above set operating limits.
  4. Demonstrate all push buttons, lights and controls operate on each control panel.
  5. Spreader lights function as specified.
  6. Spreader controls operate as designed.
  7. Power cord reel pays out and rewinds power cord without binding or undue sag repeatedly.
- C. A Final Field Test shall be performed only after the installation and the contractor has performed commissioning of the system. Once it has been proven that the supplied equipment meets the specified performance requirements and when all defects and faults found during commissioning have been made good or otherwise agreed upon in writing; and upon completion of training, the system shall be deemed to have been accepted.
- D. Final Field Tests shall be conducted on the lidding system after Preliminary and Final Field Testing has been completed on the Gantry Crane and Container Transport System. Per Section 14512 – Containers, the Contractor shall perform Final Field Tests using a test container and lid placed in the Container Transport System. The Gantry Crane shall be used to load the container car/s with and empty container. The container car/s shall move the container into each Lidding Bay. At this point the lidding system shall be operated to demonstrate all system design functions as if in full processing operation. The contractor and equipment supplier shall correct any defects found, and retest until the system is fully operational. Once fully operational, each bay will repeat for 10 successive cycles without a malfunction. Testing shall be repeated until this can be achieved.
- E. The equipment manufacturer and contractor shall develop and submit for approval a Field Test Plan.

### 3.02 TRAINING

- A. The manufacturer shall provide two 8-hour days of training in accordance with Section 01821 – Training.

-END OF SECTION-

**Section 14630**  
**MAINTENANCE BAY BRIDGE CRANE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section includes the requirements for design, manufacturing, installation and testing of an electric-powered, rail-mounted, top running single girder crane for operation in the maintenance bay. The maintenance crane shall be designed in accordance with The Crane Manufacturers Association of America # 70, Class C, Moderate Industrial Service, and as described herein.

**1.02 RELATED SECTIONS**

- A. General Conditions, Article 13 – General Electrical and Mechanical Requirements
- B. Section 01330 - Shop Drawings
- C. Section 01431 - Quality Assurance Inspection
- D. Section 01732 - Installation of Equipment

- G. Section 01831 - Operation and Maintenance Manuals
- H. Section 05081 - Galvanizing
- I. Section 09912 - Interior Painting
- J. Section 16055 - Electrical Requirements for Shop-Assembled Equipment
- K. Section 16220 - Electric Motors

**1.03 REFERENCES**

- A. Codes and standards referred to in this section are:
1. AISC - American Institute of Steel Construction
2. AGMA - American Gear Manufacturers Association
3. ASME B30.2 - Overhead Gantry Cranes(Top Running Bridge, Single or Multiple Girders, Top Running Trolley Hoist)
4. ASME B30.16 - Overhead Hoists (Underhung)
5. ASME B30.17 - Overhead and Gantry Cranes (Top Running Bridge, Single Girder, Underhung Hoist)
6. ASME-HST-4M - Performance Standard for Overhead Electric Wire Rope Hoists.

7. CMAA Spec No. 70 - Specification for Top Running Bridge and Gantry Type Multiple Girder Electric Overhead Traveling Cranes
8. CMAA Spec No. 74 - Specification for Top Running and Under Running Types of Single Girder Electric Overhead Traveling Cranes Utilizing Under Running Trolley Hoist
9. HMI - 100 - Hoist Manufacturers Institute
10. New York City Building Code
11. NEC - National Electrical Code
12. NEMA - National Electrical Manufacturers Association

#### 1.04 SYSTEM DESCRIPTION

- A. Type: The crane shall be a 5-ton, top running, single girder, pendant-controlled, overhead traveling bridge crane system with motor-operated bridge, motor-operated under hung trolley operating on the bottom flange of the bridge girder, and motor-operated wire rope hoist, located in the maintenance bay of the transfer station.
- B. Performance Requirements: Provide bridge crane equipment meeting the following performance requirements:

- |   |           |
|---|-----------|
| 1. Capacity, tons   | 5         |
| 2. Span center-to-center of crane rails   | 24'-0"    |
| 3. Elev. of top of crane rails  | El. 52.00 |
| 4. Elev. of highest point of equipment - not higher than  | El. 54.00 |
| 5. Elev. of hook in highest position - not lower than   | El. 47.50 |
| 6. Elev. of hook in lowest position - not higher than   | El. 27.50 |
| 7. Elev. of operating floor   | El. 27.00 |
| 8. Bridge travel speed ft/min. (approx.)  | 75        |
| 9. Trolley travel speed ft/min (approx.)  | 45        |
| 10. Trolley horsepower  | 1/2       |
| 11. Hoisting speed ft/min (max.)  | 30        |
| 12. Hoist Horsepower  | 7.5       |
| 13. Min. end clearance - bridge travel - hook to crane stop - not more than                             | 3'-6"     |
| 14. Min. distance at outside wall - trolley travel - hook to centerline of crane girder - not more than | 3'-6"     |
| 15. Min. distance at inside wall - trolley travel - hook to centerline of crane girder - not more than  | 2'-2"     |

- |  |               |
|--|---------------|
| 16. Bridge truck projection - beyond crane rail -<br>not more than | 8"            |
| 17. Size of crane runway rails                                     | 40# ASCE Rail |

#### 1.05 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Submit catalog data and information for each unit.
- C. Shop Drawings: Submit shop drawings, including arrangement and erection drawings of the equipment and control equipment, templates, schematic control diagrams, electrical connection diagrams, and complete description of the control system. Information submitted shall be in accordance with Section 01330 – Shop Drawings.
- D. Quality Control: Submit the following documents:
  - 1. Manufacturer's certified performance and materials records
  - 2. Manufacturer's certified copies of Field Test Reports
- E. Operation and Maintenance Manuals: Submit Operation and Maintenance (O&M) instructions for the bridge crane. Operation and Maintenance (O&M) instructions shall be in accordance with Section 01831 – Operation and Maintenance Manuals.

#### 1.06 QUALITY ASSURANCE

- A. Qualifications: Provide completely assembled bridge crane of standard manufacture made by a company which has had equipment of equivalent capacity and design giving satisfactory service in similar installations, and which can furnish replacement parts which are completely interchangeable within the original hoist assembly.
- B. The crane manufacturer shall submit a certificate of compliance for the crane stating that design and fabrication of the crane is in accordance with the following applicable standards and specifications.
  - 1. ASME Safety Standards B30.16 and B30.17.
  - 2. Crane Manufacturers Association, Inc.
    - a. CMAA Specification No. 70, for top running bridge and gantry type multiple girder electric overhead traveling cranes
    - b. CMAA Specification No. 74 for top running and under running single girder electric overhead traveling cranes

3. ASME/HST Hoist Performance Standard: ASME HST-4M for electric wire rope hoists

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle all products and materials as specified in Division 1 and as follows:

1. Protect all electric equipment from the weather during transit and storage by suitable means, including shrink wrapping or hand wrapping and taping.

#### 1.08 SPARE PARTS

- A. The Contractor shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in Section 01750 – Spare Parts and Maintenance Materials.

- B. The following minimum spare parts shall be provided with the equipment:

1. One set of bridge truck bearing assemblies
2. One set of trolley bearing assemblies
3. One contactor assembly of each type
4. One push button assembly for pendant push button control station
5. One year supply of lubricants

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Ederer - Seattle, WA
2. Harrington Hoists - Manheim, PA
3. Shepard Niles, Inc. - Montour Falls, NY
4. Yale Lift-Tech - Muskegon, MI

#### 2.02 MATERIALS

- A. General: Design structural components in accordance with AISC standards. Design all load bearing parts with a safety factor of at least five at rated capacity loads, based on the ultimate strength of the materials used. Arrange bridge crane to operate within the space shown with adequate clearances, with minimum clearance to the nearest obstruction not less than 3 inches vertical and 2 inches horizontal.

1. Arrange all working parts for convenient inspection, lubrication, adjustment, repair, or replacement. Assemble, paint, test, and adjust the equipment in the shop as far as practicable before shipment.
  2. Suitably house the operating machinery and other exposed parts; fabricate the exterior of the unit to have smooth surfaces of pleasing appearance.
  3. Design the hoist with an overload limit device to prevent damage to the equipment or structure if loads in excess of the specified capacity of the hoist are applied.
  4. Place an inscription, easily readable from the operating floor, on the bridge crane showing the rated capacity of the equipment and control identification. Provide all appurtenances, caution markers, and appliances necessary to comply with applicable safety laws and codes.
  5. Unless otherwise specified, provide all hoisting equipment suitable for normal indoor service, as shown, designed for the following service classification:
    - a. Top running single girder electric overhead traveling crane is Moderate Industrial Service Classification of CMAA Spec. No. 74.
    - b. Motorized hoist Class H-3 of Hoist Manufacturers Institute HMI-100.
- B. Crane Bridge: Provide cranes bridge of single girder type and top running as specified.
1. Single Girder: Fabricate bridge of a single girder of suitable size and section properly braced to withstand all strains of loading and impact during operation. Where necessary, provide an auxiliary girder to support over-hanging loads to prevent detrimental torsional and lateral deflections.
  2. Design Loads: The combination of loads to be used in design is the sum of the maximum stresses due to dead load, trolley weight, rated load and impact. Include an impact allowance of 15 percent of the rated load. Design girder so that maximum stresses produced in the lower flange do not exceed  $1/5$  of the ultimate strength of the material, while the stresses in the top flange are limited to the crippling formula employed for compression members and by lateral strains due to starting and stopping of the bridge suddenly when fully loaded. Provide girder whose maximum vertical deflection under full load does not exceed 0.00125-inch per inch of span. Do not consider impact in determining this deflection.
  3. Alignment: Rigidly connect girder with the end trucks and provide connections in both vertical and horizontal planes and of such design and construction as to keep the entire bridge structure square and in alignment under all operating conditions.

4. Bridge and Trolley Stops: Bridge stops shall be furnished and installed by the Contractor in accordance with the design shown on the structural drawings. Equip trolley with suitable and adequate stops. Provide stops which do not engage the tread of the wheel, designed in accordance with CMAA Spec. No. 74, Subsection 4.8.
5. Bridge Trucks: Provide bridge trucks of structural steel construction with bracing, stiffeners or diaphragms, jig welded and designed to provide true alignment of wheels, axles and drive shafts. Securely attach the bridge trucks to the bridge girder with turned bolts, with all holes drilled and reamed to match fit up before final assembly and welding.
6. Wheels: Provide substantial rail sweeps in front of each outside wheel which project below the top of the runway rail. Manufacture bridge trucks with ball or roller bearings and fixed or rotating type steel axles. Provide axles of medium or high carbon steel or high strength alloy steel, as required. Make provision for easy removal of wheels and axles. Machine the entire truck as a unit to provide proper alignment.
  - a. Provide bridge truck wheels of double flanged, rolled, forged or cast steel with hardened treads, designed to carry the maximum wheel load under normal conditions without undue wear, with diameter no less than that shown for maximum load in Table 4.7.1.2 of CMAA Specification No. 74 for 40 lb. ASCE crane rail.
  - b. Bridge Drive: Provide bridge drive arrangement A4 of CMAA Specification No. 70 - 4.8 Bridge Drives, consisting of a cushioned start motor with self-contained gear reduction unit at each end of the bridge, driving the bridge wheels by suitable shafts and couplings. Arrange gearing to operate in an oil bath. Provide the drive with a mechanical brake for positive but soft cushioned braking.

C. Underhung Trolley Wire Rope Hoist

1. Trolley Frame: Provide trolley frame of welded rolled steel or cast steel construction, or a combination of both.
2. Hoisting Drum: Fabricate the hoisting drum of high-grade cast iron or steel to withstand the maximum bending and crushing loads. Design the drum so that not less than two complete wraps of hoisting rope remain in the grooves when the hook is in the lowest position, and there is no overlapping when the hook is in the highest position. Turn drum grooves from solid metal, grooved right- and left-hand for double reeving, and provide grooves not less than one half the nominal wire rope diameter in depth. Provide the pitch diameter of the drum and running sheave not less than 24 times the nominal rope diameter. Equip the drum with shrouded flanges or the equivalent to prevent cable override. Install an adjustable geared limit switch at the upper and lower

limits of the hook travel, and an overload cutoff to prevent application of forces greater than the specified capacity of the hoist.

3. Drive: Provide a trolley of the electric motor-operated type with electric motor-operated wire rope hoist.
- D. Hoisting Wire Rope: Design hoisting rope especially for crane service and consisting of 6 x 37 type preformed improved plow steel strands over a fiber core.
1. Wire Size: Size the hoisting wire rope in accordance with OSHA requirements and the crane manufacturer's recommendation, and provide the rated load plus block weight divided by the number of parts of rope not to exceed 20 percent of the nominal breaking strength of the rope.
- E. Bearings: Provide bearings of the ball or roller type, conforming to the standards of the Anti-friction Bearing Manufacturers Association. Bearing housings shall be split or otherwise designed to permit easy removal of the shafts. Prelubricate and seal bearings for life.
1. Design bearings in the crane wheels, drive shaft bearings and gear reduction shaft bearings for a minimum B10 bearing life of 5,000 hours.
- F. Hoisting Blocks: Provide hoisting blocks of enclosed steel construction with forged steel hooks with spring-operated safety latches, supported on ball or roller bearings. Design hooks to rotate freely 360 degrees on the bearing support.
- G. Gears: Design gearing to meet the requirements of Section 4.2 of CMAA Specification No. 74 and AGMA Standards, and of helical or spur type constructed of heat-treated steel. Provide worm gears of bronze and with precision machined cut teeth. Provide pinions of heat-treated alloy steel. Enclose or guard gearing and provide either oil bath or splash lubrication.
1. Design the gear reducer or gear motor specifically for crane service with minimum classification of Moderate Shock service and with minimum service factor of 1.0.
- H. Brakes: Equip the hoist with a Weston or multiple disc type mechanical brake which shall automatically hold the load indefinitely in any position and permit it to be lowered without acceleration under full control. In addition, provide a dc magnetic brake, spring set and magnetically released or solenoid-operated shoe type motor brake acting directly on the motor pinion shaft the instant power is shut off, equally effective in both directions. Provide brakes which are adequate to sustain the capacity load, capable of at least fifteen operations per minute, and permit smooth operation for inching.

## 2.03 ELECTRIC MOTORS

- A. Provide motors meeting the requirements of Section 16220 except as modified below.
  - 1. Design hoisting equipment drive motors specifically for hoist service, conforming to NEMA Standards Part 18 - Subsection "Integral-horsepower AC Crane Motors". Provide horizontal shaft, totally-enclosed, non-ventilated, Class B insulated, 30 minute duty rated, high torque, high slip, induction motors, 1800 rpm maximum speed, suitable for operation at 480 volts, 3-phase, 60 hertz. Provide motors with lifetime lubricated ball bearings. Design motor and gear assembly for the crane application and provide Type D motors flange mounted to the gear reducer or integral motor and gear reducer. Provide motors whose maximum noise level measured 5 feet from each motor does not exceed 90 dBa.

## 2.04 OPERATION AND CONTROLS

- A. Provide operation and control equipment meeting the requirements of Section 16055 – Electrical Requirements for Shop-Assembled Equipment.
- B. Starters: Provide each bridge crane motor with an integral reversing starter, complete with automatic reset overload relays in NEMA 4X stainless steel enclosure. Arrange all components for positive starting in each direction.
- C. Standards: Provide components complying with the NEMA Standards for Industrial Control for Cranes and Hoists, NEC, and ASME B30.16.
- D. Limit Switches: Provide hoisting controls which include an adjustable limit switch to limit the normal up and down travel of the hook with a second factory set fixed switch operated by the hook or block to stop the hoist when the highest safe point is reached. Furnish adjustable limit switches of the heavy-duty control circuit or power circuit type and factory set fixed limit switches of the power circuit type. Connect limit switches to open the motor circuit and apply the brake, but not to prevent lowering by operation of the appropriate push button. Provide switches in enclosures of the same NEMA rating as the associated motor starter, and designed and installed so that they will not be damaged by swinging of the hook.
- E. Pendant Push Button Control Station: Support pendant push button control stations by a Type 304 stainless steel cable or chain paralleling the control cable sized to withstand any effort to pull the hoist with the cable. Provide control transformers for operating the pendant controller at 120 volts ac. Provide each control cable of NEC Type S0 and to include the required number of flexible No. 14 AWG copper conductors, all cabled with necessary fillers and tape, and a tough polyvinyl chloride sheath of at least 45 mils thickness. Ensure they are in one piece, without flaws, and supported by a Kellems type safety grip.

1. Locate the pendant push button controller approximately three feet six inches above the operating floor similar to No. 2 of Figure 4 of Recommended Arrangement of Controllers, ASME B30.2 Section 2-1.10.3 Controller (k). Provide an indicating light to show that power is available. Furnish two push buttons for each motor, one for each direction of travel. Provide all push buttons of the momentary contact maintained pressure type, automatically de-energizing when the contact pressure is relieved. Enclose pendant controllers in the same type of NEMA enclosures as specified for the associated motor starters. Manufacture the pendant controller push-button station of weatherproof nitrile-vinyl rubber or light-weight resilient molded Lexan for nonexplosion-proof enclosures.

## 2.05 POWER SUPPLY

- A. General: Provide all electric power supply equipment suitable for 480-volt, 3-phase, 60-hertz electric service. Provide all hoisting equipment with suitable junction boxes for connection of field services and complete with a ground pad.
- B. Conductor Bar Type: Provide power supply consisting of the single conductor bottom entry electrification type to include a system of safety shielded covered conductors, one set extending the length of the room along the crane rail support beam, as shown, and a second set to extend the length of the bridge for the trolley hoist electrification.
  1. Provide conductors of galvanized steel, figure 8 construction with rigid polyvinyl-chloride covers, rated at not less than 90 amperes continuous. Securely support conductors with hanger clamps and end covers, with pickups firmly held by collector arms. Provide the power supply originating at a junction box located as shown.

## 2.06 SHOP PAINTING

- A. Clean and prime coat ferrous metal surfaces of equipment in the shop in accordance with the requirements of Section 09912 – Interior Painting.
- B. Finish paint ferrous metal surfaces in the shop using the manufacturer's approved standard finish system. Finish system shall be compatible with the primer specified in Section 09912 – Interior Painting.
- C. Coat machined, polished, and non-ferrous metal surfaces and similar unpainted surfaces with corrosion prevention compound, which shall be maintained during storage and until equipment begins operation.
- D. Stainless Steel: Do not paint stainless steel.

**2.07 SOURCE QUALITY CONTROL**

- A. The crane shall be fully assembled at the manufacturer's facility prior to shipment. The manufacturer shall provide adequate tests to demonstrate the capability of crane components, and compliance with this specification.
- B. Members of the City of New York and the Commissioner shall be allowed to witness any and all tests performed at their discretion.
- C. The crane shall be installed in accordance with an Installation Procedure compliant with Section 01732 - Installation of Equipment.
- D. The crane manufacturer shall prepare a Recommended Installation Procedure. This procedure shall be incorporated into the Contractor's final installation procedure.
- E. The crane manufacturer shall submit a Test and Inspection Plan that ensures full compliance with Section 01811 - Preliminary and Final Field Tests and Section 01431 - Quality Assurance Inspection.
- F. The Contractor shall review and approve the crane manufacturer's plan before submittal to the City of New York for approval, including designated hold/witness points. Upon approval by the City of New York, it shall constitute a part of this specification and shall be implemented by all responsible personnel involved in the manufacturing, inspection or testing of items covered by this specification.
- G. All tests shall be performed according to written test procedures referenced in the Test and Inspection Plan. The Contractor shall review and approve all manufacturer test procedures and data sheets to verify adequacy of the test results. Manufacturer shall document all inspection and test results in Inspection and Testing Reports. These reports shall be submitted to the Contractor for evaluation and approval. After review and approval, the Contractor shall submit the reports to the City of New York for review and approval.

**2.08 SHOP TESTS**

- A. Test the hoisting equipment in the shop for static and dynamic loads in accordance with manufacturer's approved testing protocol.
- B. Certified Shop Tests
  - 1. Certified shop tests shall be performed in accordance with General Conditions, Article 13 - General Electrical and Mechanical Requirements, and Section 16220 - Electric Motors.
  - 2. Shop tests shall also be performed in accordance with the requirements of ASME B30.17.

3. Shop load test certificates shall be submitted prior to equipment delivery.
4. Quality Assurance shall be in accordance with Section 01431 - Quality Assurance Inspection.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install the bridge cranes in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Section 01732 – Installation of Equipment.
- B. The Contractor shall verify all field dimensions for the top-running crane to be installed and correct conditions detrimental to the proper and timely completion of work. The Contractor shall not proceed with installation of the crane until unsatisfactory conditions have been corrected.
- C. Furnish and install all required lubricants for initial operation.

#### 3.02 FIELD PAINTING

- A. Provide field touch-up painting of scratched or damaged surfaces, using primer, intermediate and finish paints provided by the manufacturer in accordance with Section 09912 – Interior Painting.

#### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Furnish the services of a qualified representative of the manufacturer to provide instruction on the proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the start-up of the equipment, participate in the field testing of the equipment, and place it in initial trouble-free operation as specified in Division 1.
- B. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction, and all other pertinent information.
- C. Field Tests
  1. After installation of the bridge crane, control equipment and all appurtenances, subject the unit to a field running test, as specified in Section 01811 – Preliminary and Final Field Tests, under actual operating conditions. Test the bridge crane in accordance with ASME B30.16 specifications, CMAA Standards, and NYC Building Code requirements. Operate the hoist through a complete lift and lowering cycle and through complete travel of the

bridge and trolley to determine that the equipment will perform the function of hoisting, braking and traveling quietly, smoothly and safely without failure of any parts. Test the hoisting equipment to as near capacity as possible with available loading facilities such as material or equipment which is readily available within the area served that can be used for producing the loads. Promptly correct defects in the equipment indicated by the tests.

- a. Prior to applying electrical power to any motor-driven equipment, the drive motor shall be rotated by an external source to demonstrate free operation of all mechanical parts.
  - b. Contractor shall provide all necessary instruments, labor, tools, and materials to conduct the field tests.
2. In the event that the Contractor is unable to demonstrate that the equipment meets the requirements of the above-described tests, the deficient equipment will be rejected and Contractor shall adjust and/or modify and retest the equipment as often as necessary to meet the specified requirements.

#### 3.04 TRAINING

- A. Training shall be performed in accordance with Section 01821 – Training.
- B. The crane manufacturer shall provide a minimum of 8 hours of on-site training at the transfer station for crane operation and maintenance personnel.

-END OF SECTION-

**Section 14640**  
**CONTAINER GANTRY CRANE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This specification defines the requirements for the design, manufacture, installation, performance and testing of two electric powered rail mounted double-cantilevered container gantry cranes (the "cranes") and spreader assembly for barge loading/unloading of refuse containers at one (1) transfer station for the City of New York. The container gantry cranes furnished shall be designed and conform to all local applicable codes and requirements as outlined in this specification. This specification provides the minimum requirements for the cranes. The Contractor is responsible for the sizing, selection and installation of equipment to provide optimal performance under the conditions described in this specification. Any deviations from these specifications and/or the standards cited herein shall be clearly delineated and rationale for the deviation provided.
- B. Cranes shall be installed as shown on the Contract Drawings.
- C. The principal items of work include the following: Design, manufacture, installation, and testing of double cantilevered container gantry cranes, electrical power conductor rails, including all appurtenances specified and required for a complete installation.

**1.02 PAYMENT**

- A. Payment for all work described in this specification will be included in the lump sum bid for Bid Item 1, with the exception of the service agreement described in Article 1.12 below.
- B. Payment for the service agreement will be made at the unit price bid as shown on the bid form.

**1.03 RELATED SPECIFICATIONS**

- A. Section 01415 - Miscellaneous Requirements
- B. Section 01451 - Contractors Quality Control
- C. Section 01811 - Preliminary and Field Tests

#### 1.04 REFERENCES

- A. The crane manufacturer shall meet or exceed the requirements of the codes, standards, regulations, and procedures, as currently published at the time of manufacture, referenced in this specification for the design, manufacture, installation and testing of the cranes. In the event of conflict between the specification and the codes, the more stringent requirement shall govern and be used. Specific codes and standards to be met are given below:

1. Crane Manufacturers Association of America (CMAA): CMAA Specification No. 70, Class F, (Continuous Severe Service) Revised 2000, "Crane Manufacturers Association of America, Inc., Specifications for Top Running Bridge & Gantry Type Multiple Girder Electric Overhead Traveling Cranes."
2. American Society of Mechanical Engineers (ASME): ASME B30.2-1996, "Overhead and Gantry Cranes," Top Running Bridge, Single or Multiple Girder, Top Running Trolley Hoist.
3. National Electric Code (NEC), Latest Edition including Article 610 Cranes and Hoists.
4. Society for Protective Coatings (SSPC)
5. Occupation Safety and Health Administration (OSHA)
6. American Society for Testing and Materials (ASTM)
7. American Society of Mechanical Engineers (ASME)
8. Institute of Electrical and Electronics Engineers (IEEE)
9. American Welding Society (AWS)
10. American Gear Manufacturers Association (AGMA)

11. National Electrical Manufacturer's Association (NEMA)
12. National Fire Protection Association (NFPA)
13. Universal Building Code (UBC)
14. International Building Code (IBC)

#### 1.05 SYSTEM DESCRIPTION

- A. The cranes shall be of a double cantilevered design. Two (2) cranes will be required, configured as shown on the Contract Drawings and in this specification. The transfer station shall be furnished with a "Left Hand" and "Right Hand" crane as shown on the Contract Drawings. The cranes shall be designed and constructed in accordance with the Crane Manufacturers Association of America Specification No. 70, Class F, Duty cycle (Continuous Severe Service).
- B. The cranes shall be low-profile rail-mounted, top-running-type, of welded structural steel girder construction. The cranes shall be double wheel type with full equalizing end trucks (bogies), top running trolley, hoist and spreader assembly.
- C. The cranes shall be designed to lift refuse containers of 30 short tons under the spreader. The cranes shall be designed for continuous, simultaneous operation of any combination of hoisting/lowering, trolley and gantry movements. The cranes shall be designed for the gantry to travel with the maximum load at its maximum outreach at maximum speeds.
- D. Manufacturers shall have service representatives in the New York City metropolitan area.
- E. A 480 VAC power feed, with current capacity as required for proper operation of the cranes, will be provided by the City.
- F. Each crane shall be furnished with an electric powered spreader designed to handle refuse-containers 20 feet long by 12 feet high by 8.5 feet wide (Nominal). The spreader shall be capable of handling containers to and from a deck barge provided with cell guides under conditions specified in Part 2, Products, Articles 2.03 and 2.04. The spreader will also be capable of accommodating adverse inclination and alignment of the barges as specified in Part 2, Products, Articles 2.03 and 2.04.
- G. It should be noted that the gantry is continuously traveling along the length of the pier (100 – 120 feet) during normal operations, unlike a typical container crane operation where the gantry travels occasionally. The cranes will be used alternately, with one crane designated as standby.
- H. The crane hoisting equipment shall be provided with an anti-sway reeving system.
- I. The cranes and spreader shall be equipped with a height detection system.

- J. The design of the cranes shall provide easy access and provision for routine maintenance, including inspection, without the use of special tools.
- K. The cranes shall be certified by a Certification Agency Accredited by OSHA under the Regulations of Title 29, Chapter XVII, Part 1919.

#### 1.06 GENERAL REQUIREMENTS

##### A. Pre-Bid

- 1. Before bidding, prospective Contractors shall have the crane manufacturer review site plans, crane arrangement, site and dredge plans referenced in this specification for familiarization with design installation, clearances, and crane operation. The bidder shall obtain all necessary information, and make its own determinations of any and all conditions that may affect in any way the performance of its work under this Contract.
- 2. A Pre-bid Conference and tour of the existing facility will be arranged as indicated in Attachment 1 to the Construction Contract.

- B. Pre-Installation: Prior to installation of the cranes and conductor rails, the Contractor shall survey the transfer station to determine if the facility is ready for the crane delivery and the related equipment bumpers, crane rails, conductor system, and structural supports are acceptable for the crane installation.

- C. Design: The crane manufacturer shall conduct an independent site review and site survey for purposes of design and installation considerations for the crane and bus bar system.

##### D. Project Meetings

- 1. A pre-construction conference will be held prior to starting erection and/or installation and no later than 15 days after the Notice to Proceed. The meeting will be conducted to review responsibilities and personnel assignments and equipment to be used.
- 2. Pre-installation conferences will be held before each crane installation construction activity that requires coordination with other construction.

#### 1.07 SUBMITTALS

- A. In addition to the requirements of Section 01330, additional information shall be provided as outlined in this section.
- B. Submit information and data to show the proposed manufacturer's experience in producing ship-to-shore or rail-mounted gantry cranes, providing contact information for at least three (3) installations for which the crane manufacturer has completed installation.

- C. Submit a list of any items proposed that are not currently Underwriters Laboratories (UL) or Nationally Recognized Testing Laboratory (NRTL) approved. Provide date it will be approved by UL or NRTL or explain why non-approved items are being used.
- D. Submit a crane-testing program, including the hydraulic, electrical and other equipment, in sufficient detail to demonstrate no-load, load and overload tests on the entire crane and components.
- E. Mechanical Concepts: The requirements for the mechanical design of the cranes are described in Part 2, Products. Submit a description of how the Contractor intends to meet the concepts, including:
  - 1. Double-leg gantry assembly of welded steel girder construction.
  - 2. Welded steel construction gantry trucks.
  - 3. Top running trolley assembly and enclosed trolley house.
  - 4. Mechanical anti-sway main hoist assembly system for container lifts.
  - 5. Mechanical list and trim system for operation with containers inclined up to 5 degrees from the horizontal.
  - 6. Trolley and gantry drive assemblies with parking brakes.
  - 7. Festooned or cable carrier trolley power and control cable system.
  - 8. Bar type power conductors and dual-shoe collectors for supplying electric power to the crane as shown on the Contract Drawings.
  - 9. Electronic crane management system (CMS) for the crane and spreader for integration of the crane position system and diagnostic identification.
  - 10. Anti-collision system for detection of parked and operating cranes and detection of equipment, personnel or obstructions on the crane rails.
- F. Electrical Concepts: The requirements for the electrical design of the cranes are described in Part 2, Products. Submit a description of how the Contractor intends to meet the concepts, including:
  - 1. Electrical arrangement of electric room
  - 2. Electrical one line diagram
  - 3. Scheme for electrical isolation of drives
  - 4. Preliminary drive and motor sizing
  - 5. Preliminary brake sizing
  - 6. Main power disconnect
  - 7. Preliminary power demand

8. Festoon and spreader cable details and hardware
9. Maintainability
10. Bus bar conductor power pick-up system
11. Electrical interlocks and safety switches
  - a. Slowdown and stop limit switches for Trolley
  - b. Hoist Slowdown and anti-two block limit switches
  - c. Hoist lower and stop limit and overspeed switches
  - d. Crane overload capacity switch

G. Submit crane stability analysis and wheel load calculations.

H. For the installation submittals, complete manufacturer's installation instructions, including permissible tolerances, shall be furnished with each unit of equipment/crane installation or set of identical cranes/units.

#### 1.08 CRANE IDENTIFICATION

A. The cranes shall be numerically identified as indicated in Table 1.

Crane Identification No.	Type
DSNYCRANE F-CGC-01	Left Hand
DSNYCRANE F-CGC-02	Right Hand

#### 1.09 DELIVERY

- A. The preparation of the site for the arrival of the cranes shall be coordinated between the crane manufacturer and the Contractor.
- B. Crane and Equipment shall not be delivered to the site until it can be installed directly to the crane rails and to the area where the installation can be completed.
- C. All wiring, control panels, access platforms, and other permanently attached items shall be fabricated and attached prior to shipping. The cranes shall be fabricated, assembled and shipped in the largest practicable sections to minimize field erection time.
- D. If the cranes cannot be shipped fully assembled, all field connections shall be match marked, and match mark drawings shall be furnished. Bolts for field connections shall be supplied, with each size separately packaged and identified, and keyed to the match mark drawings for each connection. For each crane, a crane erection drawing shall be furnished, showing the arrangement, weights, and assembly of all shipped assemblies and subassemblies to be installed on the completed crane.

#### 1.10 SPARE PARTS

- A. The crane manufacturer shall provide spare parts in accordance with Division 1 and as specified in Part 2, Products, Article 2.10.

- B. All parts shall be identified with a numerical system to facilitate parts inventory control, stocking and location. A unique number shall properly identify each part. Identical parts shall have the same part number.
- C. Spare parts lists shall be submitted with the operation and maintenance manuals.

#### 1.11 WARRANTY

- A. The crane manufacturer shall provide to the City of New York a thirty-six (36) month unlimited warranty following final certification and acceptance. During that period, the manufacturer shall replace or repair at no additional cost any component that fails to function properly because of improper selection or application of components or as a result of defects in workmanship, material, or design. During the warranty period, the City of New York shall reserve the right to transfer the warranty to a third party.

#### 1.12 WARRANTY SERVICE

- A. The crane manufacturer shall provide a Service Agreement contract to perform periodic inspections, preventive maintenance and repairs to each crane for a period of 3 years following certification and acceptance. The Service Agreement shall be structured to meet the operating requirements detailed in this specification and the maintenance/repair schedule specified in the technical manuals.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide equipment of one of the following manufacturers or an approved equivalent in accordance with Section 01631 – Equivalent Materials and Equipment:
  - 1. American Crane & Equipment  
531 Old Swede Road  
Douglassville PA, 19518  
Contact: Jim Marmer.  
Tel: (610) 385-6061 ext 273; Fax: 1 (610) 385- 3191  
email: [jmarmer@americancrane.com](mailto:jmarmer@americancrane.com)
  - 2. Terex Port Equipment  
10401 Old Georgetown Road  
Suite 304  
Bethesda, MD 20814  
Contact: Mike Krupp  
Tel (202) 686-7672  
Fax: 301 530-7701 Email: [mike.krupp@terex.com](mailto:mike.krupp@terex.com)  
[www.terexcranes.com](http://www.terexcranes.com)

3. PaR Systems Inc.  
707 Country Road E  
West Shoreview, MN 55126-7007 USA  
Tel: (949) 360-6186  
Fax: (949) 360-6145  
Contact: Mark Price  
e-mail: [mprice@par.com](mailto:mprice@par.com)
4. Paceco Corp:  
25503 Whitesell Street  
Hayward, CA 94545  
Tel: (510) 264-9288;  
Fax: +1 (510) 264-9280

2.02 GENERAL ARRANGEMENT

A. General

1. The cranes shall be of a double-cantilevered type, designed and configured as shown on the Contract Drawings and in this specification. The transfer station will be furnished with a "Left Hand" and "Right Hand" container gantry crane as shown on the Drawings. The maximum height of the cranes measured from the top of the crane rail (pier level) to the top of the trolley house or highest part of the crane shall not exceed seventy four (74) feet. The drawings currently depict the crane structure with pin connections at the waterside legs and a top rail running trolley with the machinery house integral to the trolley. If the crane manufacturer cannot comply with this configuration, it shall advise the Contractor in advance of the change in the design and shall justify the deviation from the arrangement shown on the drawing. However, if the machinery house is fixed, it shall be located to straddle the landside legs of the crane. The machinery house shall not extend beyond the outline dimensions and shall be configured as shown on the contract drawings. The crane manufacturer shall also notify the Contractor in advance of changes in design of the drives, machinery or other components/systems to justify deviations from this specification.

2. The cranes shall be low-profile rail-mounted, top rail running type, of welded structural steel girder construction. The cranes shall be double flanged wheel type with full equalizing end trucks (bogies), top running trolley, hoist and spreader assembly.
3. The cranes shall be designed to lift 30 short tons (60,000 pounds) under the spreader. The cranes shall be designed for continuous, simultaneous operation of any combination of hoisting/lowering, trolley and gantry movement. The cranes shall be designed for the gantry to travel with the maximum load at its maximum outreach at maximum speeds.
4. The weight of the cranes shall be as light as practical without sacrificing the stability and integrity of the structural design or jeopardizing safety of operation. Design requirements for wheel loads in Part 2, Products, Articles 2.03 and 2.04 shall not be exceeded.
5. Each crane shall be designed to operate for two continuous working shifts (16 hours per day) with only one crane in service at a time. The Contract Drawings depict the operation, loading and unloading scenarios for the cranes.
6. A total crane management system (CMS) shall be provided for diagnostic checks of all components and supplying information for troubleshooting, maintenance and repairs for the cranes and spreaders. The CMS shall also be furnished with an automatic positioning and height detection system.
7. Each crane shall be furnished with an electro-hydraulic spreader with a lifting capacity of 30 short tons (60,000 pounds) to handle refuse-containers 20 feet long by 12 feet high by 8.5 feet wide (Nominal). Guidance dimensions and tolerances for the refuse containers shown on the Contract Drawings shall be used for spreader design.
8. The spreaders shall be capable of handling containers to and from a barge provided with cell guides under conditions specified in Part 2, Parts, Articles 2.03 and 2.04. In addition to the standard operating and automation features (spreader's twistlock condition indicators—locked/unlocked, positioning flippers location – horizontal / vertical), the spreaders shall be equipped with automated height detection system, side shift capability, noise reduction and other automation and control features.
9. The crane hoisting equipment shall be provided with an anti-sway reeving system, to assist the operator in controlling the load during simultaneous operations.
10. The maximum distance between the crane bumpers at the base of the gantry shall not exceed thirty-six (36) feet as depicted on the Contract Drawings. All structures, equipment and access fittings shall be within this requirement and as shown on the Contract Drawings.

11. The cranes shall be provided with an anti-collision system to prevent the operating crane from colliding with the parked crane, and detect personnel, equipment or obstructions on the crane rails. Design of the system shall be as specified in Part 2, Products, Article 2.07.
12. The spreaders shall be provided with a height detection system (encoders, lasers and geared limit switches, etc.) integrated with the CMS. The cranes shall be furnished with an automatic positioning and height sensing system for spotting and stacking containers on the shuttle cars, the pier and the barge. These systems shall also be used to pre-program automatic hoist lowering of containers to reduce impact noise levels between the containers, barge, pier and shuttle car. The distances for slowing down the cranes at designated locations shall be as shown on the Contract Drawings.
13. All electrical, control equipment and devices shall be placed and mounted inside the trolley house for ease of maintenance and trouble-shooting. The configuration of the trolley house shall be as shown on the Contract Drawings.
14. The cranes shall be provided with a small hoisting jib or davit on the back reach walkway platform for lifting light equipment/components from the pier to the crane.
15. The cranes shall be furnished with a list/trim compensation system designed to operate with the container barge at an adverse inclination of 5 degrees and skew up to 5 degrees from the pier. The skewing feature shall be designed to compensate for angular barge movement.
16. The cranes shall be provided with clearly visible label plates with the safe working load (SWL) specified. Warning plates shall also be provided as shown on the Contract Drawings. All label and warning plates shall be in accordance with OSHA and CMAA No. 70 specifications.

**B. Trolley House**

1. The trolley house shall be equipped with a powered overhead handling system or jib to install or remove the heaviest equipment from the crane to the pier.
2. An access opening with a hinged or sliding door shall be provided in the deck of the trolley house for removal of equipment onto the pier. The opening shall be sized to allow the removal of the largest piece of equipment.
3. The trolley shall be provided with a trolley house structure configured as shown on the Contract Drawings. Siding and roof materials for the trolley house shall be in accordance with Section 07410 - Metal Wall Panels and 07610 - Sheet Metal Roofing. The trolley house shall be painted in accordance with Part 2, Products, Article 2.09.

4. The trolley house shall be ventilated and grounded in accordance with Part 2, Products, Article 2.07 Electrical Equipment and Components. A climate controlled and grounded enclosure shall be provided for control systems and other sensitive components.
5. The deck of the trolley house shall be solid to prevent materials and equipment from falling down to the pier level.

C. Operator's Cab

1. The enclosed crane operator's cab shall be suspended below the trolley and oriented such that the operator's view is unobstructed and to provide optimal visibility as shown on the Contract Drawings. The equipment in the cab shall be furnished as specified in Part 2, Products Article 2.07.
2. The enclosed operator's cab shall be steel framed and equipped as follows:
  - a. Upholstered foldable, adjustable swivel seat with dual axis control console. The console shall be equipped with master controls and necessary push buttons for crane and spreader operations as specified in Part 2, Products, Article 2.07. The controls shall be furnished with "dead man" protection for safety switches, and spreader controls.
  - b. Operator's cab controls as in Part 2, Products, Article 2.07
  - c. Diagnostic monitor
  - d. HVAC with thermostatic control
  - e. Audible and visual alarm indicators/controls and safety warning devices. Audible alarm shall be provided with a manual shut-off switch
  - f. Windshield wipers and window defoggers
  - g. Electrical duplex outlet (120 VAC, 20 Amp)
  - h. Wall-mounted light switch
  - i. Fire extinguisher
  - j. Access to the cab shall be from the trolley or trolley house. Emergency egress (portable ladder) shall also be provided from the cab as required by OSHA.

- k. Full anti-glare glass enclosure all around and partially through the floor. For full visibility, back mirrors and a CCTV camera shall also be provided. The CCTV camera shall enable the crane operator to view the waterside and barge while traversing the trolley.
- l. Means shall be provided to clean the windows from inside the cab.

## 2.03 DESIGN LOADS

- A. The duty cycle of the cranes is to be based on two (2) cranes being alternately used 16 hours per day, 6 days a week for a total of 2,500 hrs/year/crane. One crane is on standby while the other is in continuous operation. The scheduling of the active and standby crane will be determined by the City of New York.
- B. The design loads shall be based on the rated capacities specified in Part 2, Parts, Articles 2.03 and 2.04. For the purpose of design, all structural and mechanical parts, loads, loading combinations, load cases and allowable stresses shall be in accordance with the latest CMAA No. 70 Specification class F (Continuous Severe Service).
- C. The maximum allowable corner loads and rail loads per foot are specified in the gantry crane requirement Part 2, Parts, Articles 2.03 and 2.04 and the Contract Drawings. The corner loads and rail loads shall be calculated using both static and dynamic forces with applicable load factors as shown Part 2, Parts, Articles 2.03 and 2.04 for guidance.
- D. The dead loads shall include all weight except the movable head block, wire ropes, spreader beam and lifted load.
- E. Wind loads specified in Part 2, Parts, Articles 2.03 and 2.04 shall be applied where applicable to the horizontally projected area of the crane and load container. No shielding effect of one element by another shall be considered where the distance between them exceeds four times the smaller projected dimension of the windward element. Appropriate shape factors shall be applied.
- F. Ice loads on the crane shall be applied as specified in Part 2, Parts, Articles 2.03 and 2.04.
- G. The gantry cranes shall have a minimum factor of safety of 1.25 against overturning under each condition of loading, including hoist Vertical Impact Force (VIF) in accordance with CMAA No. 70, travel acceleration forces and occasional operating winds from the adverse direction all considered. To prevent overturning in the parked and stowed position due to loads specified in Part 2, Parts, Articles 2.03 and 2.04, the cranes shall be provided with four (4) turnbuckle or tie-down assemblies at each of the waterside legs of the cranes and two (2) turnbuckle assemblies at each land side leg. The tie-down assembly shall be designed for the maximum load specified in Part 2, Parts, Articles 2.03 and 2.04. Padeyes for lashing to pier shall be installed in accordance with the Contract Drawings.

- H. The gantry cranes shall be seismically designed for maximum seismic load with the maximum load on the hook to survive an International Building Code (UBC) specified earthquake for the New York region. CMAA No. 70 level three (3) stress case shall be used for designing the crane for the assumed seismic load. The cranes shall not be required to hold the rated load or function during or after the earthquake however, the gantry structure shall remain intact during and after the earthquake.
- I. With the cranes in the parked and stowed position, the pin locks shall be designed to prevent movement of the cranes when:
1. The wind speeds are 100 miles per hour.
  2. The operating crane collides with the parked crane.
- J. Pier Level Load Descriptions

Table 2: Pier Load Descriptions

Load	Designation	Description
Crane Dead Load	DL	Weight of crane structure including permanently attached machinery and equipment, but excluding trolley (TL) and lifting system (LS)
Trolley Load	TL	Weight of trolley including permanently attached machinery and equipment, but excluding lifting system (LS)
Lifting System	LS	Weight of spreader, head block, lifting ropes, sheaves and other equipment which hangs from the main hoist ropes and is supported by the container when the spreader is placed on it.
Lifted Load	LL	Weight of container plus contents
Impact Load	I	Load due to barge cell Vertical acceleration of the lift as sensed by the main hoist ropes. Taken as $0.25(LS+LL)$
Lateral Trolley Load	LTL	Load due to acceleration/deceleration of $(TL+LS+LL)$ . Depends on specific crane's operating speeds. Use $0.1(TL+LS+LL)$ as a minimum.
Longitudinal Gantry Load	LGL	Load due to acceleration/deceleration of the gantry drive system. Use 150 percent of the inertia force developed by the specific system used. Use a minimum of $0.05(DL+TL+LS+LL)$ . Add a fraction of LTL acting simultaneously (minimum 25 percent), as appropriate for the specific crane operating system.

Table 2: Pier Load Descriptions

Load	Designation	Description
Operating Wind Loads	WOT, WOL	Effect of 35 mph wind on operating crane, including effects of wind on full or empty container. Consider wind in both the transverse (WOT) and longitudinal (WOL) directions.
Stowed Wind Loads	WST, WSL	Effect of 100 mph on stowed crane without container. Consider wind in both the transverse (WST) and longitudinal (WSL) directions.
Seismic Loads	EQT, EQL	Effect of design seismic event on crane. It is assumed that the crane is not in the middle of a lifting cycle during this event; therefore EQ does not apply to LL. Consider seismic excitation in both the transverse (EQT) and longitudinal (EQL) directions, and combinations thereof as required by the New York City Construction Codes.
Snag Load	SN	Load imposed on crane due to head block and empty spreader jamming in cell guide while traveling at maximum hoist speed.
Collision Load	CL	Load due to crane, traveling at full speed with power off, hitting either the crane stops or the facility's other crane.
Stall Torque Load	STL	Load developed by stalling any motor in the crane. For AC drives use stall and/or breakdown torque; for DC drive use 200 percent of rated motor torque. For main hoist, stall torque is load induced by stalling hoist motors with one end of a container dogged down.

The above loads would be used in factored load combinations shown in Table 3.

## K. Load Combinations for Crane Operating, Overload, and Stowed Conditions

Table 3: Load Combinations and Factors

Combinations:		Operating		Overload			Stowed	
Crane Dead Load	DL	1.4	1.4	1.2	1.2	1.2	0.9/1.2	0.9/1.2
Trolley Load	TL	1.4	1.4	1.2	1.2	1.2	0.9/1.2	0.9/1.2
Lifting System	LS	1.4	1.4	1.2	1.2	1.2	0.9/1.2	0.9/1.2
Lifted Load	LL	1.7	1.7		1.0			
Impact Load	I		1.4					
Lateral Trolley Load	LTL		1.4					
Longitudinal Gantry Load	LGL	1.4						
Operating Wind Loads	WOT, WOL	1.7	1.7	1.0	1.0	1.0		
Stowed Wind Loads	WST, WSL						1.6	
Seismic Loads (IBC)	EQT, EQL							1.0
Snag Load	SN					1.0		
Collision Load	CL				1.0			
Stall Torque Load	STL			1.0				

## 2.04 CRANE PERFORMANCE REQUIREMENTS

## A. Performance and Principal Characteristics

CMAA Specification 70 Service Classification	Class F (Continuous Severe Service)
Maximum load capacity under the spreader	30 short tons
Maximum duty time per one crane cycle	170 sec *
Gantry speed	230 ft/min
Gantry acceleration /deceleration rate	1.41 ft/sec <sup>2</sup>
Gantry acceleration /deceleration rate (Loaded)	0.95 ft/sec <sup>2</sup>
Trolley speed	400 ft/min
Trolley acceleration /deceleration rate	1.67 ft/sec <sup>2</sup>
Hoist speed (Empty)	340 ft/min
Hoist speed (Loaded)	170 ft/min
Hoist acceleration /deceleration rate (Empty)	1.41 ft/sec <sup>2</sup>
Electric Power supply to the crane	480V, 3 ph, 60 Hz
Gantry crane rail span (center to center)	50.00 ft

Design Requirements:	
Maximum allowable corner load (factored)	830 kips
Maximum allowable corner load (Service)	560 kips
Maximum rail loads (Per foot)	85.1 kips/ft
Crane operating temperatures	-20°F to 120°F
Maximum barge inclination	5 degrees from horizontal plane
Maximum barge skew from pier	5 degrees
Operating wind conditions	35 MPH
Storm wind conditions (stored crane)	100 MPH
Design factors of safety	In accordance with CMAA No. 70
Ice load	3 lbs/ ft <sup>2</sup>
Tie-down / turnbuckle assembly	113.50 kips (each)

\* The crane cycle is defined as removing a loaded container from the further, most shuttle car and loading it to the lowest/furthest cell on the barge, then returning the full container back to the same shuttle car.

#### B. Crane Noise Levels

- Maximum permitted noise levels at distance of 50 feet from the noise source at a height of 5 feet above grade level as indicated in the following table..

Table 5: Maximum Permissible Crane Noise Levels

Gantry Crane Spectral Noise Level	Frequency (Hz)							
	63	125	250	550	1k	2k	4k	8k
Maximum Allowable Level (dB)	79.0	82.5	81.2	72.9	69.7	64.6	60.9	55.9

### 2.05 STRUCTURAL COMPONENTS

#### A. Crane Structure

- The gantry cranes shall be of steel box section construction for bridge girders, legs, and sill beams fabricated of welded steel plates with full depth diaphragms. The gantry legs shall be supported on steel plate sill beam designed to distribute the maximum corner loads for full equalization on the end trucks.

2. The welded steel girder construction shall be designed in accordance with CMAA No. 70. Allowable girder deflection along the span between the gantry leg supports shall be in accordance with CMAA No. 70 Specifications.
3. The drawing currently depicts two land side legs as a shear leg design and the two waterside legs of pivot type. Alternative structural arrangements may be proposed by the Contractor provided the manufacturer justifies the changes to the design and provided supporting rationale in advance.
4. Connections
  - a. If the cranes are assembled on site, the gantry legs, bridge and end truck shall use field bolted connections with high strength bolts in accordance with the "Specification for Structural Joints Using ASTM A325 or A490 Bolts."
  - b. Shop connections shall be designed for assembly by means of welding or by bolting. Welding shall not be associated with bolting in the same joint. Field connections shall be designed for assembly with bolts of the type specified for the application. Riveting will not be acceptable.
  - c. Welded connections shall be designed in accordance with the applicable provisions of AWS D1.1-97, and provisions for repeated stress will not be required.
  - d. Bolted connections shall be designed as follows:
    - (1) Machine bolts or fitted bolts shall be used for assembly connections on machine parts, trucks, trolley frames, attaching machine parts, and similar items.
    - (2) ASTM A 325 or ASTM A 490 type bolts shall be used on structural bolted connections carrying primary loads.
    - (3) ASTM A 307, ASTM A 325, or machine bolts shall be used for bolted connections on the cab, ladders, guard rails, and similar structural items.
    - (4) Bolted connections of the gantry and trolley assemblies and trucks shall be machine finished at the mating surfaces.

## 2.06 MECHANICAL COMPONENTS

### A. Gantry Pin Locks

1. Parking lock pin assemblies (2) mounted at each side of gantry as shown on the Contract Drawings.

2. The crane pin locks shall engage into slots recessed into the pier as shown on the Contract Drawings.
  3. Pin lock sockets in the pier shall be installed by the Contractor as shown on the Contract Drawings.
- B. Trolley Pin Locks: The Trolley shall be stowed over the land side leg when not in use. Pin locks shall be used for the stowed position.
- C. Gantry Truck Assemblies
1. Each crane shall be provided with two (2) truck assemblies at each leg as shown on the Contract Drawings. Each truck shall contain a drive and an idler wheel for a total of eight (8) drives and eight (8) idler wheels. The crane shall have a total of sixteen (16) wheels.
  2. Each drive unit assembly shall consist of a motor, gear reducer and brake.
  3. The wheels shall be double flanged with machined treads, hardened to a minimum Rockwell C 68 using a deep hardening carbonized heat treated process. Wheels shall be designed in accordance with CMAA No. 70 guidelines for the loading, class of service, and rail size selected.
  4. Wheel bearings for gantry trucks shall be designed in accordance with CMAA No. 70 class F (Continuous Severe Service).
  5. Four (4) energy absorbing hydraulic bumpers designed for a sixteen (16) inch impact stroke shall be provided as shown on the Drawings. The bumper shall be capable of absorbing 100 percent of the rated gantry speed with deceleration not to exceed 16 fpsps at 50% of the full load travel speed. One bumper shall be mounted at the center of each corner (sill beam) of the crane. End force per bumper shall not exceed 215 kips at impact with motor off. The design of all bumpers shall include safety cables to prevent parts from falling to the floor. The bumper shall be located 4.75 feet above the top of the rail. The capacity and size shall be designed in accordance with the impact requirements specified in Part 1, Products, Articles 1.03 and 1.04 and OSHA CFR 1910.179(e)(2).
  6. Gantry trucks shall be designed to minimize the danger of damage to the crane or surroundings in the event of failure of any part of the truck. Lugs or bearing plates shall be provided at the bottom of each truck frame (at the centerline) to limit the drop to less than 1 inch in the event of a broken wheel axle or other failure. End trucks shall be fastened to the gantry legs in a manner that ensures rigidity and squareness.
  7. Gantry trucks shall be designed and fabricated to provide equalized wheel loads.

8. Truck wheelbase shall be as shown on the Contract Drawings.
9. Gantry trucks shall be equipped with rail sweeps which extend below the top of the rail and project in front of the truck wheels in accordance with OSHA 1910.179(e).
10. Protective wheel guards shall be provided on the gantry trucks for safety.

D. Gantry Drives

1. The gantry cranes shall have a minimum of eight (8) drive axles.
2. A gear reducer and flange mounted DC disc brake shall be provided with the drive assembly. The brake shall be sized for 200 percent of the full load motor torque, or as required to prevent wheel skid, and shall have thermal capacity sufficient for an emergency stop from full speed. The brakes shall be designed to hold the crane in position and prevent movement with a headwind pressure resulting from a 60 MPH wind. The wind force shall be applied to the exposed surfaces of the crane (in the direction of gantry travel) and with a static coefficient of friction of 0.20 between the wheels and the runway rails.
3. The speed and power output of the motors and drives shall be synchronized and driven by a common motor controller. The drives shall be designed such that the travel motion will be steady and have a minimum of vibration or racking while moving at the maximum rated speed, with a maximum rated load, plus the added horizontal headwind specified in Part 2, Products, Articles 2.03 and 2.04.
4. The capacity of the gantry travel motors shall be sufficient to provide the specified performance without exceeding their full-load torque rating at the specified operating load and wind. The tractive effort, used to overcome the rolling friction of the wheels and the mechanical losses of the drive, shall be a minimum of 12 pounds per ton or as specified in CMAA No. 70 for the diameter of wheel used.
5. The brakes shall be used for holding the crane in position for any combination of hoisting/lowering/trolley movements. The controls shall be designed to permit dynamic or regenerative braking of the gantry during all normal operations. If required, a time delay shall be integrated into the control system to permit dynamic braking and prevent skidding of the crane.

E. Trolley Assembly

1. The trolley shall be top running type, structural steel welded construction for strength and rigidity, and properly aligned to support the main hoisting machinery, trolley drive, and the suspended operator's cab. The trolley structure shall be designed to stress levels as required by, Article 3.9 of the CMAA No. 70 Specification.

2. The trolley drive assembly shall be designed in accordance with Article 4.10 of CMAA No. 70.
3. Hoist running and equalizing sheaves shall be mounted above the trolley deck or as required by the manufacturer for ease of inspection and maintenance.
4. The trolley shall be driven at each corner and have a minimum of four (4) wheels. Wheels shall be arranged to minimize the damage to the crane or surroundings in case of failure of any part of the wheel assembly. Lugs or bearing plates shall be provided under the trolley at each corner to limit the drop to not more than 1 inch in the event of a broken axle or other failure.
5. Trolley wheels shall be steel, double flanged, machined treads with treads hardened to Rockwell C 60 minimum using deep hardening carbonizing heat treatment process. Wheels shall be designed in accordance with CMAA No. 70 guidelines for the loading, class of service, and trolley rail size selected.
6. The trolley shall be provided with energy-absorbing bumpers designed in accordance with OSHA requirements.
7. The trolley shall be equipped with rail sweeps which extends below the top of the rail and project in front of the trolley in accordance with ASME B30.2-1996, "Overhead and Gantry Cranes."
8. The trolley shall be provided with rail clamps, anchor pins, or other means to prevent the trolley from tipping or leaving the rail while operating.

F. Trolley Drive

1. The drive shall consist of an AC motor/gear reducer and a flange mounted DC disc brake. The disc brake shall be sized for 150 percent of the full load motor torque.
2. The drives shall be designed such that the travel motion will be steady, smooth and have minimum vibration or racking while moving at rated speed, rated load, plus the added horizontal wind pressure specified in Part 2, Products, Articles 2.03 and 2.04 resulting from headwind, on the combined vertical projected area of the trolley structure.
3. The trolley travel motors shall be adequately sized to provide the specified performance without exceeding their full-load torque rating. The tractive effort, used to overcome the rolling friction of the wheels and mechanical losses of the drive, shall be a minimum of 12 pounds per ton or as specified in CMAA No. 70 for the diameter of wheel utilized.

**G. Trolley Rails**

1. The trolley rails shall conform to CMAA No. 70. The rails shall be accurately aligned on the girders to ensure smooth and shock-free travel.
2. Fixed end stops shall be provided at both ends of the rail girders and aligned with the trolley bumpers in accordance with CMAA No. 70.

**H. Hoist Assembly**

1. The hoist assembly shall be provided with a quick connect head block system with manual twist locks for connecting the spreader to the head block for ease of replacement.
2. The hoisting machinery shall be capable of lifting the rated load at the maximum speeds specified in Part 2, Products, Articles 2.03 and 2.04.
3. The hoist assembly shall consist of a hoisting motor, gear reducer and single type disc brakes. Disc brakes shall be Pintsch-Bubenzer or an approved equal.
4. The hoist assembly shall be provided with a manual anti-sway wire rope reeving system to the headblock. The anti-sway system shall be designed to permit limited motion of the load while the trolley and gantry are in motion.
5. The main hoisting drum shall be fabricated of welded steel plate. The drum shall have machined grooves and be provided with a flange for a secondary emergency brake.
6. If final gear reduction is made at the drum, the drum gear shall be bolted and doweled, or shrunk fit onto the drum.
7. With the headblock in its lowest position, a minimum of three wraps of wire rope shall remain on the drum. Space for one additional winding shall be provided with the headblock in its highest position.
8. The wire rope attachment to the drums shall be designed such that adjustment and replacement of rope may be accomplished without dismantling the drum assembly. The pitch diameter of the drum shall not be less than thirty (30) times the diameter of the hoisting rope.
9. The drum material shall be in accordance with the CMAA No. 70. The combined bending and crushing stress for the drums shall not exceed 20 percent of the drum material yield strength, at rated loads.
10. The drum shall be provided with drum flanges at each end to prevent the rope from jumping the drum shell.
11. A mechanical or hydraulic energy absorbing system shall be provided to protect the hoisting machinery from load hang-up and two-blocking. The

holding brake shall remain effective during the actuation of the mechanical energy-absorbing device.

12. Rope sheaves shall be forged or rolled steel construction hardened to a minimum of Rockwell C 60 using the deep hardening carbonizing heat treatment process. The sheaves shall have deep flanges, shall be properly grooved for wire rope fit, and shall be accurately machined and smoothly finished to reduce rope wear. The pitch diameter of running sheaves shall be not less than 30 times the rope diameter. The pitch diameter of equalizing sheaves shall be not less than half the diameter of the running sheaves. All sheaves shall be equipped with anti-friction roller bearings. The bearings shall either be designed for the axial thrust loads on the sheaves or suitable bronze thrust washers shall be provided. Each sheave shall be lubricated automatically by an individual grease passage located within the sheave pin, or shall be sealed type requiring no routine lubrication. The trolley sheaves shall be located above the trolley platform or be arranged to be readily accessible from the trolley platform.
- I. Wire Rope: The size of hoisting ropes shall be determined from the maximum rope tension resulting from maximum rated load of the loaded container, the container spreader assembly, and the headblock assembly used. The increased rope tension resulting from the anti-sway reeving angles shall be taken into account for wire rope size. The rope tension shall not be greater than 20 percent of the nominal breaking strength of the rope. The ropes shall be standard size, of sufficient length to provide for the specified lift, plus fill three (3) extra wraps on the drum and an adequate length for bitter end connection to the drum. Suitable bolt-on rope clamps shall attach the ropes to the circumference of the drum. Where ropes dead end other than on the drum, the rope attachment shall develop the full strength of the rope. As a minimum, rope shall be extra improved plow steel (EIPS) independent wire core (IWRC), type 6x37 strand. For ease of replacement, rope with a diameter greater than 1.25 inch shall not be used. No reverse bends in the reeving system will be permitted.
- J. Miscellaneous Machinery
  1. Gearing and Speed Reducers: All gear reductions shall be contained in enclosed housing, except the final reduction (pinion) on the main hoist unit which may be external to the speed reducer. If this arrangement is used it shall be fully guarded and provided with a means of lubrication. Gears in speed reducers shall be finished to AGMA No. 8 or higher. Gears for final reductions shall be of the spur or helical type. All gearing and speed reducers shall be designed and rated in accordance with the applicable AGMA standards.
  2. Gears: The gear reducers shall be rated in accordance with AGMA standards. The design of gears for built-up speed reducers shall be in accordance with the requirements of CMAA No. 70 for class F service. The rating of commercial speed reducers shall be based either on the AGMA catalog rating of the speed

reducer with a 1.5 service factor applied or the crane manufacturers calculated durability and strength rating of the gears. If the rating is based on the durability and strength rating of the gears, the design of the gears shall be in accordance with the requirements of CMAA No. 70 for class F service, and the manufacturer shall submit gear design analysis in accordance with AGMA standards for approval. All hoisting gearing shall be of the spur or helical type, machine cut from rolled or forged steel in accordance with Article 4.7 of CMAA No. 70. Overhung gears or pinions will not be permitted except for the rotate drive pinion. Pinions shall be forged integral with the shaft where practicable. Gears shall be pressed or shrunk fit on the shaft. Welding of defective gear teeth will not be permitted. All gearing shall be fully guarded and provided with a means of lubrication.

3. Speed Reducers: Speed reducers may be a standard catalog product of a speed reducer manufacturer (commercial speed reducer) or of special design for the specific application (built-up speed reducer). Speed reducers shall be entirely self-contained in an oil-tight, fabricated steel enclosure designed to maintain shafts and bearings in accurate alignment. Reducers shall be split along the gear line for ease of maintenance. All bearings shall be self-aligning, heavy-duty, anti-friction, roller type. Bearing caps/retainers shall be provided on all bearings to permit inspection. All high-speed gearing shall operate in an oil bath. Oil level gauges shall be provided and be conveniently located for observation by operating personnel. Provisions for draining and ventilation of each speed reducer shall be made. Speed reducers shall be securely fitted in place.
4. Gear Cases: All gears shall be enclosed in oil tight cases unless otherwise specified. The cases shall be provided with seals compatible with the recommended lubricant, drain plugs, breathers, oil level dipstick or sight glass, lifting lugs, and an oil tight inspection cover which can be removed for inspection of the gears. Gear cases shall be provided with means of cleaning and draining without dismantling the equipment. Drain plugs shall be accessible and, where necessary, shall be piped to convenient locations for collection. Gear cases shall be of welded steel plate construction and shall be sufficiently rigid to maintain proper alignment of the gearing under all load conditions. Gear cases shall be vertically or horizontally split along the gear line. Bearings shall be mounted in machined surfaces, with removable bearing retainers for inspection. Each gear case shall be provided with a strip heater.
5. External Gears: If external gears and pinions are provided for final hoist reduction, they shall either be enclosed in a housing and oil or grease lubricated, or enclosed by safety guards provided with suitable openings with covers for inspection and access for grease lubrication.
6. Bearings: Except where otherwise specified, bearings shall be of the tapered roller or ball type. Bearings shall be designed for easy replacement and shall

be placed as close as practical to the points of loading. All pillow blocks shall be mounted to solid bases and securely bolted and doweled in place.

- a. Antifriction bearings shall be of standard types most suitable for the respective application and shall have both inner and outer races. Ball and roller bearings shall conform to the applicable requirements of the ABMA 9 and ABMA 11. The manufacturer's published ratings shall be used in determining the bearing capacity. Bearings, except as noted, shall have a minimum L-10 life of 40,000 hours for CMAA No. 70 class F service, and shall be designed for the loads and speeds resulting from the specified crane performance.
  - b. For wheel bearings, half of the total wheel load shall be applied to each bearing. Wheel bearings shall also be sized for the thrust loads as specified by CMAA No 70. Wheel bearings shall be designed for axial loads of not less than 15 percent of the radial wheel load. Bearings shall have oil tight enclosures and shall have synthetic rubber, spring-loaded element to retain the grease and another synthetic rubber element to exclude foreign matter.
- K. Couplings: Flexible couplings shall be of the gear type and have a sufficient capacity to develop the full strength of the shafting that they connect. Flexible couplings shall be pressed and keyed. Couplings with sleeves held in place or retained by snap rings will not be permitted. A flexible coupling shall be provided at each motor that is not flange mounted to the reducer. Rigid steel plate guards shall be provided for all couplings, and be removable for maintenance.
- L. Lubrication
1. The cranes shall be provided with an automatic central lubrication system to lubricate all components that normally require lubrication. The system shall be equipped with an alarm to signal when replacement of lubrication is required.
  2. An automatic centralized lubrication system shall be provided in the trolley house for the main machinery and sheaves. A central lubrication system shall also be provided at each leg or bottom sill for all trucks and component fittings requiring lubrication.
  3. Oil lubrication shall be provided for gear trains, gear-type couplings, and speed reducers except that grease lubrication will be acceptable for drum gears and the final gear drive on the trolley and gantry wheels.
  4. Lubrication for other mechanical operating parts which are not automatically lubricated shall be by means of high-pressure "Alemite" or approved equal 1/8 inch button head fittings. The lubricating fittings of journals or bearings shall be readily accessible, and where necessary, shall be piped to convenient points

using copper or brass pipe of ample size, adequately fastened with grommets and clamps to prevent vibration during gantry operations.

5. Drain and fill plugs of speed reducers and gear cases shall be located so as to be readily accessible and shall be provided with extension piping where required. The speed reducers shall have pressure relief valves as recommended by the manufacturer for outdoor service.
6. Lubricating oil for speed reducers and gear couplings shall have good resistance to foaming under normal operating conditions and shall be non-corrosive to speed reducer components. The oil shall have a pour point of -20 degrees F or lower and shall be suitable for infrequent intermittent duty operation of the speed reducers within an ambient temperature range from -20 degrees F to 120 degrees F. The oil shall be in accordance with the recommendation of the manufacturer of the speed reducers for the temperature specified.
7. A list of recommended lubricants for the crane, spreader and other components requiring lubrication shall be provided.

M. Head Block Assembly

1. The hoisting wire rope cables unit shall be reeved through sheaves mounted to a head block assembly, and attached to the container spreader.
2. Standard ISO twistlocks shall be provided for securing the head block to the spreader and proof tested at twice their normal rated loading, plus a 25 percent impact factor.

N. Spreader

1. Each crane shall be provided with an electric operated 30 short ton (SWL) lifting heavy duty single lift spreader to handle 20 foot long x 12 foot high x 8.5 foot wide container.
2. The spreaders shall be furnished with twistlock sockets and interfaced with the crane head block to expedite replacement if required
3. The spreaders shall contain automatic flippers at each corner designed to actuate individually or in tandem for spotting containers onto the shuttle car on the pier and through the barge cell guides. The flippers shall be designed for the 8.50 ft wide container. The total width of the flippers shall not exceed 9.0 inches and the length shall not exceed 2.0 ft when engaged and positioned over the container. The depth of the flippers shall be as short as practical without reducing their alignment capability.

4. The spreaders shall be equipped with a longitudinal side shift feature of 12 inches in each direction to compensate for misalignment of the container into the cell guides, onto the shuttle car and for stacking containers on the pier.
5. The spreaders shall be provided with automatic twistlocks, audible alarms and visual signals and to assist operation from the operator's cab.
6. The locations of the twist locks shall comply with ISO standards for handling a 20 foot standard container with dimensions and tolerances as shown on the Contract Drawings.
7. The spreaders shall be provided with a height indication system to sense the container approach and prevent impact noise. Logic shall be interfaced with crane management system.
8. The spreaders shall be furnished with and impact noise reduction for reduced noise and improved performance.
9. The spreaders shall be furnished with an automated operating, diagnostic and monitoring system integrated into the crane management system.
10. For safety, an electrical interlock shall provided to prevent spreaders from operating the flippers when passing through the cranes legs (portals).
11. Miscellaneous
  - a. AC power and control signals shall be routed from the cranes headblock to the spreader power unit via a "Pyle" or approved equal, heavy duty, rectangular 37 pin, #12 AWG connector with 3 foot pigtail.
  - b. All electric components necessary for the proper operation of the spreader (such as solenoids, limit switches, etc.) shall be included in the spreader manufacture's scope of supply.
  - c. Four (4) lifting lugs, each rated for 10 tons lift, shall be located on the inside frame for lifting miscellaneous loads.

## 2.07 CONTAINER GANTRY CRANE ELECTRICAL EQUIPMENT AND COMPONENTS

### A. General Features

1. The City will supply actual voltage at the runway conductor supply taps not more than 105 percent and not less than 96 percent of the nominal system voltage. The crane supplier shall define the requirements of the runway conductor system to achieve an input voltage not less than 93 percent of the nominal system voltage to the crane at the point of conductor reach farthest from the runway conductor supply taps.

2. Electric power supplied to the cranes shall be 480-volt, 3-phase, 60-cycle, provided through an electrical conductor bar system "Hevi-Bar II" manufactured by "Insul-8" or approved equal. The Drawings shall be used as guidance for furnishing material and installation. Isolation conductor bar sections shall be provided at each end for crane maintenance in their parked positions as indicated on the Contract Drawings.
3. Mechanical or electronic slow down and stop limit switch cams or targets for gantry travel shall be provided and installed at each end of the piers as shown on the Drawings. The Drawings shall be used as guidance for the installation. Switches or targets shall be positioned on the cranes for ease of installation and maintenance. The cams shall be mounted from the conductor rail supports as shown on the Contract Drawings. Final adjustments shall be made during field testing of cranes.
4. Spreader lighting shall be provided for night time operation in accordance with Section 16511 – Lighting.
5. CCTV cameras shall be installed over corners of gantry legs as shown on the Drawings. CCTV monitor to barge cell View crane rails while crane is in operation.
6. Load scale and slack cable (wire rope) device with audible alarms and interlock system shall be provided for hoist overload conditions.
7. An anemometer to monitor wind speed shall be provided. A warning signal shall activate when the adjusted wind speed limit is obtained. An override switch shall also be included in the system. The actual speed and the warning signal shall be displayed in the operator's cab.
8. An intercom system shall be installed in the cab, for communication to the trolley house and loudspeaker announcements to the pier. A microphone for external communication (public address system) shall be provided, with a knee-activator, to communicate with the ground personnel through a loudspeaker mounted on the gantry.
9. Audible alarms/bells shall be provided with manual cutoff switches to override/prevent continuous annunciation when gantry is in motion.
10. Warning devices (visual and audible) for trolley house overtemperature, fire, operator signaling and wind speed.

B. Electrical equipment and components shall comply with the following requirements:

1. General

- a. The electrical equipment section of this specification is intended to cover a floor or dock running, box girder construction, gantry type, traveling crane for operation with an alternating current power supply. All wet or weather-exposed areas of the crane shall be designated Corrosive Areas as per Section 16050 - Basic Electrical Materials and Methods.
- b. The proposal of the crane manufacturer shall include the rating and description of all motors, brakes, control, protective, and safety features
- c. The crane manufacturer shall furnish and mount all electrical equipment, conduit and wiring, unless otherwise specified. If it is necessary to partially disassemble the crane for shipment, all conduit and wiring affected shall be cut to length and identified to facilitate re-assembly.
- d. Wiring and equipment shall comply with Article 610 of the National Electrical Code (NEC).
- e. Electrical components shall be designed and rated in accordance with applicable NEMA or UL standards. Refer to Division 1 - General Requirements for applicable regulatory requirements and for submittals using equivalent materials and equipment. All electrical components used shall be readily available from third party distributors and electrical wholesalers located in the Eastern United States.
- f. Electrical equipment shall comply with ANSI/ASME B30.2 Safety Standard for Overhead and Gantry Cranes.
- g. Wiring conductor sizes shall be chosen to limit voltage drop, from the runway power supply pickup shoes to any load, to 2 percent or less.
- h. Protective devices shall be selected to provide best practicable coordination with the plant feeder circuit breaker, and with any upstream crane electrical protective devices.

2. Digital Controls

- a. General: Provide variable speed, solid state AC drives for hoist, trolley, and gantry motions, which include the following features.
- b. Four quadrant (regenerative) operation features shall be provided for all crane motions. Controllers shall be arranged to feed regenerated power back into the AC power lines.

- c. Load dependent frequency increase. Allows maximum hoist speed to increase when less than full rated load is being lifted or lowered by the spreader or lifting beam.
- d. Precise hoist brake control. Motor torque is accurately monitored to eliminate load sagging due to insufficient hoisting torque being developed prior to hoist brake release.
- e. Hoist motor torque providing proving prior to brake release
- f. Oversized for continuous starting and stopping
- g. Drive shall require no jumpers or potentiometers for set-up
- h. Totally modular designs
- i. Diagnostic software
- j. Interchangeable (converter) operator control panels for parameter adjustment
- k. Alphanumeric read out displayed in English language
- l. Torque limitation settings up to 200 percent of full load motor torque
- m. Overload rating of 150 percent of full load motor torque for 60 seconds
- n. Line reactor
- o. Encoder feedback for precise hoist speed control and operation above base speed
- p. Control circuit interface boards
- q. Brake contactors
- r. NEMA 12 control enclosures in the control house
- s. Hoist brake sensing to "constantly" monitor brake for slippage
- t. Hoist load (current) limited for hoisting direction only. Lowering direction "NOT" load limited.
- u. Main Hoist enclosure space heater, with 40-80 degree F thermostat
- v. Drive enclosure space heaters, with manual ON-OFF switch, 40-80 degree F thermostat and SPACE HEATER ON indicator light.

- w. All drive enclosures shall be equipped with cooling fans where needed to extract excessive heat. Harmonic currents imposed on the power supply shall be suppressed in accordance with IEEE Std. 519. Harmonic filtering and power factor correction shall be used to ensure compliance with requirements of the local utility.
- x. Additionally, the AC digital drives for all motions shall be modular and be compatible with each other as follows:
  - 1. Identical software platforms
  - 2. Identical operator interfaces
  - 3. Identical control cards
  - 4. Identical option cards
  - 5. Identical card racks
- 3. Electrical panel specifications: The crane manufacturer shall comply with the following electrical panel wiring specifications:
  - a. Front wired control panels
  - b. Logically grouped components
  - c. Fine-stranded type SIS panel wire
  - d. Panel wiring in wiring ducts or neatly wrapped groups
  - e. Each wire labeled at each termination point
  - f. Separation between power/control wiring and signal wiring
  - g. Panel front doors shall be to be hinged with extra-flexible wiring provided around each hinge
  - h. Minimum 12 gauge power wiring and 18 gauge control wiring
  - i. Insulation rated 195 degrees F minimum, ambient temperature to be considered to be 104 degrees F
  - j. No splices
  - k. Heat shrink tubing to prevent grounds on shielded cable ends
  - l. Terminal blocks for external wiring
  - m. All components in panels shall be labeled using engraved phenolic or approved equal label plates. Labels are mounted on the panel (not on the

device) for easy identification; labels match the component identifiers on electrical drawings. Label plates shall be screw mounted.

- n. Power resistors in separate enclosures with fine-stranded high-temperature type SRML wire
  - o. All devices and wire bundles secured with screws or bolts; no self-adhesive tie downs used
  - p. Logical conduit layout relative to motors, brakes, limit switches, and other electrical components for ease of maintenance
  - q. Corrosion resistant fasteners and fittings. Steel panels shall be protected by corrosion resistant primer and paint system
  - r. Shock absorbing light mounting designed for easy bulb replacement
4. Motors
- a. Refer to Section 16220 - Electric Motors and Section 16445 - Motor Control Centers.
  - b. Main drive motors shall be 460 volt, AC squirrel cage with class H insulation, rated for inverter use.
  - c. Main Hoist motor shall be DPG-FV (Drip Proof Guarded, Force-Ventilated), and rated for Continuous duty. Trolley and gantry motors shall be rated for Continuous duty.
  - d. Main Hoist motor shall be equipped with a continuously running blower motor with space heater. Main hoist, trolley and gantry motors shall be provided with space heaters.
  - e. Motors shall be provided with anti-friction ball bearings.
  - f. The space heater circuit, for each motor equipped with space heaters, shall have a manual ON-OFF switch and SPACE HEATER ON indicator light and shall be interlocked with its associated motor starter so that the space heater circuit is energized at all times except when the corresponding mainline contactor is energized, the manual switch is in the OFF position or the entire crane supply circuit is de-energized.
  - g. Provide thermal overload protection with automatic reset for all drive motors.
  - h. Motors shall be capable of accelerating and running with rated hook load with voltages up to and including 110 percent of the rated values of the

selected adjustable voltage power supply. For power supplies, AC line voltage variation shall be between plus or minus 10 percent of rated voltage.

- i. All secondary AC drive motors (for hydraulic power, spreader rotation, etc) shall be rated 460 volts, 3-phase, 60 hertz. The rating shall not be less than 60 minutes, nor less than continuous for HVAC, blower and pump motors. All motors shall be designed to operate for the time rating indicated at design ambient temperatures. Space heaters shall be furnished for all motors.
  - j. Horsepower Calculation
    - 1. Hoist mechanical horsepower shall be calculated per Section 5.2.9.1.1.1 of CMAA No. 70.
    - 2. Required hoist horsepower equals the mechanical horsepower times a control factor (Kc). Control factor for power supplies rectified on the crane for use with magnetic or static control systems shall be determined by consultation with the motor and control manufacturers.
  - k. Gantry/Trolley Horsepower Calculation
    - 1. Gantry and trolley horsepower shall be calculated for outdoor conditions as specified in Section 5.2.9.1.2 of CMAA No. 70 with a pressure due to a "typical" 35 mph wind, a friction factor of 12 lbs per ton, and a service class factor of 1.2. Wind force = 0.00256 times the wind speed, in miles per hour, squared (see CMAA No. 70). Controls shall also provide for operation in the occasional 45 mph head wind, while overloaded, as allowed per CMAA No. 70.
    - 2. Suitable allowance shall be included for winter snow and ice loading.
5. Brakes
- a. General: Brakes shall be selected and rated in accordance with Section 4.9 of CMAA No. 70 as a minimum unless specified otherwise herein.
  - b. Magnetic holding brakes shall be of the electric released spring set type (shoe or disc as specified), attached to the motor or reducer high-speed shaft. Brakes shall be readily adjustable and equally effective in both directions. Brakes shall provide smooth, predictable operation throughout the entire range of the respective crane motions they are applied to.
  - c. The main hoist drive shall be provided with an electric shoe holding brake sized for 150 percent of the full load motor torque and be capable of holding the rated load without downward drift irrespective of electrical

component failure or power failure including loss of phase. Brake shall have conduit connection box, corrosion resistant pins, and manual release. Brakes mounted on the motor may be connected through the motor connection box.

- d. The gantry and trolley drives shall be provided with a Pintch-Bamag or approved equal, waterproof enclosed, disc type electric holding brakes, flange mounted to the accessory end of the motor. Disc brakes for the gantry and trolley shall be sized for 100 percent of the full load motor torque, with thermal capacity sufficient to allow for two consecutive emergency stops with full load and an adverse operating wind, and shall not cause wheel slip upon setting. Brakes shall be capable of stopping as required by CMAA No. 70. All brakes shall be provided with a space heater, and a manual release lever.
  - e. Holding brakes shall be applied automatically when power to the brake is removed. All brakes shall be released only when sufficient electric power is applied to the brake coil through the motor circuit on command from the operator's master switch. All brakes shall be provided with a brake release limit switch, to indicate brake condition.
  - f. Select coil time rating for the duration and frequency of operation for the class of service specified. Traverse drive brakes used only for emergency stop on power loss, or setting by operator choice, shall have a coil rated for continuous duty.
  - g. Shoe brakes for outdoor crane locations shall be provided with an outdoor rated waterproof enclosure and space heater.
6. Protection and Safety Features
- a. A crane disconnecting means, either a current-rated circuit breaker or motor rated switch complying with the applicable requirements of Section 16411 – Disconnect Switches, lockable in the open position, shall be provided in the leads from the runway power supply.
  - b. The continuous rating of the switch or circuit breaker shall not be less than 50 percent of the combined short time motor full load currents, nor less than 75 percent of the sum of the short time load currents of the motors required for any single crane motion, plus any additional loads fed by the device.
  - c. The disconnecting means shall have an operating means located where it is readily accessible to the operator's station, or a mainline contactor connected after the device may be furnished and shall be operable from the operator's station.

- d. Power circuit fault protection devices shall be furnished in accordance with NEC Sections 110-9 Interrupting Rating and Section 16443 - Panelboards. The crane manufacturer shall state the interrupting rating being furnished.
  - e. Branch circuit protection shall be provided per NEC Section 610-42 Branch Circuit Protection and Section 16443 - Panelboards.
  - f. Magnetic mainline contactors shall be as shown in Tables 5.6.6-1 and 5.6.6-2 of CMAA No. 70. The size shall not be less than the rating of the largest primary contactor used on any one motion.
  - g. Motor running overload protection shall be provided in accordance with NEC 610-43 Motor Running Overload Protection.
  - h. Control circuits shall be protected in accordance with NEC 610-53 Over-current Protection.
  - i. Under-voltage protection (UVP) shall be provided as a function of each motor controller, or enclosed protective panel, or magnetic mainline contactor, or manual-magnetic disconnect switch.
  - j. Cab controls shall utilize spring return master switches and momentary contact push buttons where required.
7. Warning Devices
- a. Refer to Section 13851 - Fire Alarm and Detection System.
  - b. Provide two 120 VAC 10 inch gong type warning bells in weatherproof box or electronic alarm; one mounted on each gantry leg assembly. Bells shall sound whenever the crane is in motion.
  - c. An operator controlled resonating horn, with swivel base, shall be mounted on the cab.
  - d. Provide an anemometer (wind speed indicator) with viewing window, cable, and a single adjustable set point with time delay, heater, and thermostat. The readout shall be mounted in the cab. System shall sound a horn and give a visual indication of the speed to the operator. System shall be adjustable and will initially be set to trip at 45 MPH.
8. Limit Switches
- a. The hoist shall be equipped with a watertight, corrosion-resistant, Cutler-Hammer or approved equal, weight activated, over travel limit switch in the raising direction, to stop the hoisting motion when the final maximum

hoisting elevation has been reached. Activation of the control circuit switch will shut down the hoist drive. Interruption of the raising motion shall not interfere with the lowering motion.

- b. The hoist shall be equipped with a watertight, corrosion-resistant, Gemco or approved equal, geared rotary, over travel limit switch for the raising and lowering direction, to stop the hoisting and lowering motion when the maximum hoisting and lowering elevations have been reached. Activation of this control circuit switch will shut down the hoist drive. Interruption of the raising motion shall not interfere with the lowering motion and vice versa.
- c. Lower limit switch shall be provided because the spreader or headblock can be lowered beyond the normal lowest ground level set-down position when picking or depositing containers from the barges.
- d. Provide a hoist drum encoder and a trolley travel encoder to monitor position of the load. The PLC that controls the hoist shall not permit lowering of the load when the center of the load is within 10.250 ft of the waterside leg (either side), nor within 11.250 ft of the waterside of the land side leg, nor within 10.333 ft of the land side of the land side leg. This will prevent stacking of containers where there is an interference with the crane or with other equipment. The encoder and PLC shall not prevent hoisting of the load.
- e. Provide watertight, corrosion-resistant control circuit limit switches to slow down and stop the trolley or gantry motion when approaching or upon reaching the maximum end of travel position. Two limit switches will be provided for each direction of travel on the trolley and gantry. Switches shall be designed and positioned to prevent gantry trucks or trolley assembly from impacting stops at full speed. Trolley switches shall be operated by steel vanes mounted along the gantry girder, and gantry truck switches shall be operated by steel vanes mounted along side the runway power conductor rail. Switches shall be heavy duty, Cutler-Hammer or approved equal, proximity type or mechanically operated, designed for high-speed operation. Gantry end-of-travel limit switches shall be Cutler-Hammer type CB or approved equal.
- f. Provide watertight, corrosion-resistant track type limit switches to limit maximum up/down travel of the List/Trim compensation system.
- g. Provide watertight, corrosion-resistant track type limit switches, to indicate that the headblock and spreader twistlocks are fully engaged.
- h. Provide an "Unbalanced Container" indication system consisting of load cell pins in two upper running sheaves. Hoisting will be prevented when the weight readings on the load cells differ by a preset amount. Lowering

will be allowed to set down the unbalanced container. Load cells when provided shall be wired with watertight Amphenol, or approved equal, pin type connectors.

- i. Provide an overweight limit switch in the hoisting motion to stop hoisting motion upon activation of a hoist overload condition. Lowering the load shall be possible while in an overloading condition.
- j. The trip point of all limit switches shall be located to allow for maximum runout distance of the motion being stopped for the braking system being used.
- k. All directional limits shall not prevent reversing by selecting motion in the opposite direction.

#### 9. Trolley Conductor Systems

- a. Crane manufacturer shall provide a main trolley festooned conductor system with 4 wheeled festoon cars running on a minimum 4 inches high I beam track. Intermediate and tow cars shall have 4 steel wheels, side guide rollers, with stainless hardware, bumpers, and upkick rollers designed for high-speed service. Tow ropes and cable organizers shall be provided between the adjacent cars. Cars shall stack up at one end of the trolleys travel.
- b. Crane manufacturer may use a cable track (or cable chain) system in lieu of the festooned cable. Cable track shall have parts readily available from suppliers in the Eastern United States. Cable track shall be selected to have at least 10 percent unused space available for future addition cables, but not less than the space used by the largest cable installed. Cable tracks shall be amply protected from the accumulation of wind-driven snow and ice.
- c. Multi-conductor festoon or track-mounted cables shall be flexible with a neoprene outer jacket. Provide 10 percent spare conductors of each size used. The minimum wire size shall be #12 AWG for power, #14 AWG for control, and #16 AWG for instrumentation.
- d. The published intermittent ratings for the various conductors shall not be less than the ampacity required for the circuit in which they are used. Conductor continuous ratings must be adequate for continuous loads (e.g. lighting, pumps, ventilation). Conductor sizes shall be chosen to avoid excessive voltage drop.

## 10. Runway Conductor System

- a. The crane manufacturer shall provide and install a runway conductor bar system. The runway conductor system shall be an Insul-8 Hevibar II type system, or approved equal, and shall consist of four bars. The bus bars of the runway conductor system will be mounted to the transfer facility roof on brackets provided by the City. Drawings shall be used as guidance for the ordering of material and installation of the collector system.
- b. The runway conductor bar system shall be divided into three conductor bar sections. The center conductor bar section shall be capable of powering either crane. The end section at either side of the center section shall be arranged to power only the crane on that side when in the parked position. Each section shall have its own feeder and pier level disconnect switch, such that the section at either end can be de-energized to remove power to the parked crane at that end, without preventing the use of the other crane.
- c. The crane manufacturer shall provide and install the runway conductor system in accordance with Article 610 of the National Electrical Code and all applicable local codes.
- d. The bus bar shall be manufactured from extruded aluminum with a 304 stainless steel contact surface. The bus bar shall be provided with a PVC cover. All hanger clamps shall be stainless steel. All connection and mounting hardware shall be stainless steel on aluminum.
- e. The collector heads shall be of tandem design and provided in sufficient number to meet the ampacity requirements of the crane. The collector heads shall be a parallelogram type device which both articulates and swivels. Each collector head shall as a minimum have 5.5 inches of vertical travel and 5 inches of horizontal travel.
- f. The runway conductors shall have sufficient ampacity to carry the required current to the crane, when all motions are operating with the maximum rated load, while the other crane is parked with only maintenance loads in operation. The conductor ratings shall be selected in accordance with Article 610 of the National Electrical Code. The ampacities of fixed loads such as heating, air conditioning, lighting, motor blowers, transformers, etc. may be computed as 2.25 times their total which will permit the application of the intermittent ampacity ratings for use with the continuous fixed loads.
- g. The crane manufacturer shall limit the voltage drops within the crane to the motors and other electrical loads to approximately 2 percent of the nominal system voltage.

- h. All voltage drops shall be computed by using main feeder currents, individual motor currents, and fixed load currents as defined by Article 610 of the National Electrical Code.
- i. Voltage drops shall be calculated during the maximum inrush (starting) conditions to insure that the crane motor drive terminal voltages are not less than 90 percent of rated voltage, and control and brake voltages are not less than 85 percent of rated voltage.
- j. The actual operating voltages at the crane motor drive terminals shall not exceed 110 percent or not drop below 95 percent of motor ratings, for rated running conditions.
- k. A footwalk with handrails shall be provided beyond the end of the girder structure to properly access the festoon cars, or cable track, for inspection and maintenance.

#### 11. Operator Controls

- a. Crane operation shall be controlled from the trolley mounted operators cab console chair, J.R. Merritt Model FSAD, or approved equal through the use of single and dual axis master switches, push buttons, selector switches, indicator lights, and a buzzer. All control devices and indicators shall be identified by suitable nameplates wherever their function is not otherwise obvious, and suitable, dimmable nighttime illumination shall be provided.
- b. The crane cab shall be provided with master switches for Hoist, Trolley, and Gantry motion that are mounted in the operators' chair, within easy reach of the operator.
- c. Cab master switches shall be provided with a spring return arrangement latch, which in the "off" position prevents the handle from being inadvertently moved to the "on" position.
- d. Crane speeds shall be proportional to the degree of travel of the master switch handle. Master switches shall be arranged such that the crane motion is in the same relative direction as the movement of the master switch handle with the cab and cab chair facing the barge.
- e. Cab controls shall be designed to permit the operator to use two hands to control the crane.
- f. External audible and visual signals shall be activated any time the crane is in operation.

12. Cab Switches: The following functions and devices shall be incorporated into the two operator chair control consoles:
- a. Start Pushbutton: Provide a "start" push button to energize the crane's main contactor. For safety, the main contactor shall not be allowed to pick up under either of the following circumstances:
    - (1) Motion commanded: Any of the master switches are not in the "OFF" position.
    - (2) Power supply fault: The Phase Failure relay has detected an over voltage, or under voltage, or phase failure.
  - b. Stop/Reset Push Button: Provide a "stop/reset" pushbutton that will stop all crane motions. The main contactor shall open, and all brakes shall set.
  - c. Hoist Master Switch: Provide a single axis master switch to control the hoist drive from 0 to 100 percent speed in the direction of desired motion (UP, or DOWN).
  - d. Trolley/Gantry Joystick Master Switches: A joystick shall be provided for the trolley and gantry motions. This switch shall have two axes, one for the trolley and one for the gantry to control their respective drives from 0 to 100 percent speed.
  - e. Cab Horn: Provide a push-button to sound the horn. The horn shall also sound when the anemometer detects a high wind speed.
  - f. Trim/List /Skew Joystick: Provide a single speed joystick master switch which moves either the long axis of the compensation system (list) or the short axis (trim). List and trim compensation system shall each be moved in the UP or DOWN direction by the action of the master switch.
  - g. Cab Defroster: Provide an ON/OFF switch with speed selection for the cab defroster fan.
  - h. Cab Wiper: Provide an ON/OFF switch with speed selection for the cab front window wiper motor.
  - i. Cab Floodlights: Provide an ON/OFF switch for the trolley floodlights.
  - j. Spreader OFF/RUN/START: Provide switch to manually "Start" and "Stop" the hydraulic pump motor which powers all spreader functions.
  - k. Twistlocks Bypass: Twistlocks must be either locked, or unlocked. In normal operation, if neither of the above lights is on, the hoist UP motion shall not be allowed. Provide a momentary contact key switch

“Twistlocks Bypass” to allow maintenance personnel to bypass this safety feature.

- l. Twistlocks Man/Auto: Provide a selector switch to choose between “Manual” and “Auto” modes.
- m. Twistlocks Unlock/Lock: Provide a “Lock”/“Unlock” selector switch that operates as follows in the manual mode, and the auto mode:
  - (1) Manual Mode: Move the switch to “Lock” to move the twistlocks in the lock direction. Move the switch to “Unlock” to move the twistlocks in the unlock direction.
  - (2) Auto Mode: Twistlocks will automatically move to the fully locked position when “container seated” is sensed. Twistlocks will automatically move to the fully unlocked position when “UNLOCK” is briefly selected.

### 13. Cab Chair Indicator Lights

- a. Power Available Light: Provide a green “Power Available” light that will turn on when 120VAC power is available at the control console.
- b. Power On Light: Provide a red “Power On” light that will turn on when the Main contactor has energized.
- c. Gantry Electrical Control Room Overtemp: Provide amber light that will turn on if a high temperature is detected in the electrical control room. The main contactor shall drop out, and will not be allowed to re-energize until the over temperature is no longer detected.
- d. Rotation End Of Travel Light: This red light will turn on to indicate the condition that the skew end-of-travel limits have tripped.
- e. Unstable Load Light: It shall be possible to lift a container, which meets the criteria for size, and center of gravity, only if the container is somewhat in line with the long axis of the head block. If a container is too far out of line when the attempt to lift occurs, one end will not lift off of the ground, and the other will go high into the air. It is assumed that the operator will notice this problem, and stop hoisting. An unstable load sensing system shall be provided to sense potential problems. Two load cells shall be installed in the load sheaves to detect a minimum load. If minimum load is not detected in either load cell, the “unstable load light” will turn on, and rotation will be disabled in the last commanded direction.

- f. The red "Unstable Load" light will turn on under the following circumstances:
  - (1) The spreader is not being lifted by the head block: The weight of the spreader is necessary to cause the minimum loading that the unstable load sensor is looking for. If the spreader is not on the head block, or is on the ground, the unstable load light will be on. Note: The light may be ignored in this circumstance.
  - (2) A container is lifted while its long axis is in line with the head blocks long axis: When an unevenly loaded container is rotated, it can be unbalanced in either direction and can approach an unstable configuration. When the unstable load is detected, rotation in that direction is stopped, and only rotation in the other (stable) direction is allowed.
- g. Container Seated: Provide an amber "Container Seated" light that will turn on when all four container seated limit switches on the spreader indicate that the container is properly seated.
- h. Twistlocks Unlocked: Provide a green "Twistlocks Unlocked" light that will turn on when both twistlock limit switches indicate that the twistlocks are unlocked.
- i. Twistlocks Locked: Provide a red "Twistlocks Locked" light that will turn on when both spreader twistlock limit switches indicate that the container twistlocks are locked.
- j. Collision Avoidance System Activated: Provide flashing amber light that will turn on when the crane approaches the bumper or other crane. The light will continue to flash until the crane has reversed direction or the crane is no longer in the collision avoidance zone.
- k. Hoist Overload: Provide flashing red light that will activate when an overload has been sensed.
- l. Limit switch actuated indicators for limit switches on main hoist, trolley travel or gantry travel. These may be omitted if condition is indicated on alphanumeric display at operator's position.
- m. Hoist Lower Prohibited indicator light when hoist lower is selected in encoder-generated lower-prohibit zones. This may be omitted if condition is indicated on alphanumeric display at operator's position.

## 14. Interlocks

- a. Hoist Interlock - Twistlocks Good: Provide a "twistlocks good" circuit to prevent the hoist from lifting under the following circumstances:
  - (1) The spreader is connected, but the head block twistlocks are not fully locked.
  - (2) The spreader twistlocks are not fully locked, or unlocked.
- b. Hoist Interlock - List/Trim: The List/Trim limits shall also cancel hoist motion in the UP direction. This interlocking shall prevent damage to the head block bearing should the operator attempt to lift a container that is frozen to the ground. This condition could cause uneven rope tension, resulting in excessive stress on the head block bearing. All directional limits may be backed out of by selecting motion in the opposite direction.
- c. Hoist Interlock - List/Trim Limit Lights: Provide a red light that will turn on to indicate that the list/trim end of travel limits have tripped. These limits shall also cancel hoist motion in the UP direction.
- d. Crane Anti-Collision: Sensors shall be provided on each crane to sense the location of either the other crane or the fixed bumpers on the end of the runway. When the moving crane is approaching either the stopped crane or the fixed bumpers, the system shall automatically slow the moving crane to a minimum speed as well as provide a visual indication to the operator that the cranes are approaching an obstacle. The anti-collision system shall allow contact with either the other crane or the fixed bumpers at minimum speed to allow the full use of the runway. Movement in the opposite direction shall restore the full speed capability to the crane. If practicable, the anti-collision detectors shall be mounted to detect other obstacles by interruption of the detection beam. The anti-collision system shall be Torq Hoist Laser Guard or an approved equal.

## 15. Electrical Equipment--Additional Requirements

- a. Motors shall be designed specifically for crane and hoist duty and shall conform to the NEMA MG-1 Standard or AISE Standards No. 1 or 1A, where applicable. Motors shall be procured from domestic suppliers to assure availability of replacements. Acceptable motor manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - (1) General Electric
  - (2) Marathon
  - (3) Reliance

- (4) Reuland
  - (5) Siemens
  - (6) Or approved equal
- b. Float switches, limit switches and other mechanically actuated electrical devices shall consist of an approved electrical system housed in rugged metal enclosures. They shall be adjustable without disturbing conduit connections. The switch actuating mechanism shall be mechanically and structurally suitable for the required service and shall not subject the electrical parts to unnecessary stress or mechanical shock. Operating shafts shall be bushed and stuffed in dust-tight cases.
- c. Electrical equipment rated greater than 1,000 watts and lighting equipment greater than 15 watts with an inductive reactance load component, shall have a power factor of not less than 85 percent under rated load conditions. Electrical equipment with a power factor less than 85 percent shall be corrected to at least 85 percent under rated load conditions. Installed power factor corrective devices shall be switched with utilization equipment.
- d. Wire terminals on manufactured assemblies such as switchboards, bench boards, control panels, alarm boards, and motor control equipment shall consist of cup terminals, pronged washers, compression type solderless connectors or pressure type terminals furnished on devices.
- e. All control and indication wires within switchboards, control centers and other panels and cabinets shall be terminated on terminal blocks provided with marking strips for wire designation. The manufacturer shall identify all wires on the marking strips. All field wires will be terminated and identified.
- f. Wire and cables installed at the plant site to be terminated with approved solderless copper alloy lugs. Lugs may be of the compression type, clamp type or screw type with internal pressure bar, or may be pressure tool applied solderless connectors. Pressure tool applied solderless connectors for wires 250 MCM or larger shall have long barrels to allow double indentation. Where clamp type or screw type lugs are installed on wires 1/0 AWG and larger, wire ends shall be filled with solder, contact surfaces of lugs shall be tinned and heat shall be applied when the lugs are tightened.
- g. Motor control equipment shall provide undervoltage and overload protection for all motors. Reference Section 16445 for applicable requirements.
- h. All motor and control terminals, upon which field connected circuits are to be terminated, shall be clearly and permanently identified. Terminal

identification shall correspond with that indicated on schematic wiring diagrams.

- i. Electrical design and installations shall be in accordance with the requirements of NEC Article 610, ANSI, NEMA, NFPA 70 standards, and with applicable state and local codes. Electrical components shall be shipped pre-wired to the greatest extent practical. Wiring diagrams and tagged cables shall be provided for all items to be wired at the site.
- j. The crane shall be furnished and installed with a source junction box that complies with outdoor requirements.
- k. A circuit breaker panel board shall be provided in the trolley house and located for ease of access. The panel board shall contain a circuit breaker for the main power supply and branch circuit breakers for each of the motors and auxiliary equipment and shall be rated for the required duty. Reference Section 16443 - Panelboards for applicable requirements. Approximately 10 percent (at least two (2)) spare circuit breakers shall be provided for future use.
- l. Motors, controls, and other electrical devices shall be directly connected to the grounding system with soft-drawn copper wire. Grounding through enclosures and frames shall not be permitted. Reference Section 16060 for applicable requirements.
- m. A manual magnetic disconnect switch shall be provided in the control house. The switch shall be operable by handle at the control panel or remotely from the operators cab. The main disconnect switch shall be capable of being padlocked in the "off" position. Reference Section 16411 - Disconnect Switches for applicable requirements.
- n. Transient voltage surge suppression (TVSS) shall be provided for the power input connections at the disconnect switch, or at the main circuit breaker panelboard. The TVSS shall comply with the requirements in Section 16445 - Motor Control Centers TVSS shall be provided for motor conductors to motors located outside the trolley house. The TVSS shall comply with the requirements in Section 16445 Motor Control Centers.
- o. Cable baskets shall be furnished on the headblock to facilitate the payout and retrieval of the power and control cables, which span between the trolley and the headblock. The baskets shall have ample capacity to store the total length of extra flexible multi-conductor cable as required for the various spreader motions. Siemens Spreaderflex or approved equal, cables shall be fitted. Cables shall be round, extra flexible, multi conductor cable with lead beads.

- p. Three (3)- 120 VAC, 20 amp outlets shall be installed for general use: one (1) each in the gantry, main hoist, and trolley control enclosures.

## 16. Lighting System

- a. Refer to Section 16511 - Lighting.
- b. The cranes shall be supplied with a permanent lighting system to cover the crane work areas, ladders, walkways, and maintenance platforms. Lighting fixtures (see following listing) shall be a combination of high intensity discharge (HID) type floodlights using either high pressure sodium (HPS) or metal-halide lamps, and fluorescent or incandescent lights, and shall be designed for outdoor crane service. Lighting fixtures shall be waterproof marine type, selected and mounted for best resistance to weather and corrosion. As a minimum, the following lighting shall be provided:
  - (1) 4 - 1000 watt HID floodlights with lamp, reflector, ballast and vibration isolation mounting along the gantry foot walks.
  - (2) 2 - 1000 watt HID floodlights with lamp, reflector, ballast, and vibration isolation mounting on the trolley.
  - (3) 3 - 1000 watt HID floodlights with lamp, reflector, ballast and vibration isolation mounting on each waterside leg. Compact fluorescent lighting for access ladders, walkways, trolley and cab access. Fluorescent and incandescent lighting for Control House and Operator Cab interior lighting. Additional lights as may be needed for nighttime access, operation or maintenance.
  - (4) Supplementary lighting, if needed, to produce the following target lighting levels:
    - (a) Container handling areas under trolley: 200 lux (20 fc)
    - (b) Areas around crane: 50 lux (5 fc)
    - (c) Inside the Control House: 200 lux (20 fc)
    - (d) Inside the Cab: 100 lux (10 fc)
- c. Lights shall be shock resistant and shall be located to provide for ease of replacement of bulbs from the ladders, walkways, and maintenance platforms. Access, foot-walk, ladder and interior lighting fixtures shall be provided with guards.
- d. Lighting must be designed and installed such that bulbs and reflectors are not visible from off of the property and light scatter in the vicinity of the plant is minimal. This requires that light fixtures be hooded and directed downward.

- e. Provide lighting transformers, as required, for 208 and 120-volt flood and area lighting. Refer to Section 16460 - General Purpose Dry Type Transformers. Provide a circuit breaker panelboard for protection of the lighting system. Refer to Section 16443 - Panelboards. If lighting contactors are used to control floodlights or other lighting, refer to Section 16491 - Control Components and Devices for applicable requirements.
- f. Receptacles - Provide 120 volt, 20 amp, weatherproof receptacles on the gantry crane as follows:
  - (1) Three (3) walkway outlets mounted along the girder footwalk
  - (2) Four (4) gantry leg outlets mounted near ground level; 1 at each end of span
  - (3) Two (2) cab mounted outlets
  - (4) One (1) trolley mounted outlet
  - 5) One (1) mounted near the runway collector system and end-of-travel limit switches.
- g. Light Switches - Provide outdoor rated light switches as follows:
  - (1) One (1) 3-way switch mounted at the bottom of the boarding ladder
  - (2) One (1) 3-way switch mounted on the trolley.
  - (3) One (1) 4-way switch mounted at the top of the boarding ladder.
  - (4) Two (2) 3-way switches (for access lighting to the cab) mounted at each end of the access.
  - (5) One (1) switch inside the cab (for overhead illumination).
  - (6) One (1) switch at each entrance to the Trolley House (for interior lights).
  - (7) Switches or remote ON-OFF controls in the operator's cab for:
    - (a) Trolley floodlights
    - (b) Gantry floodlights
    - (c) Leg floodlights

## 17. Equipment Requirements

- a. All junction boxes exposed to weather shall be outdoor rated, stainless steel construction, with steel back plates, to mount Allen Bradley or approved equal terminal strips (tubular screw type with pressure plate).
- b. Electrical power furnished for crane controls shall be nominal 120 volt AC. Provide step down transformers to convert voltages as necessary for controls, space heaters, and auxiliary equipment. Refer to Section 16460 – General Purpose Dry Type Transformers.
- c. Crane motor controls shall be mounted inside of an air-conditioned, heated, and well lighted trolley house. The trolley house air conditioner shall be a self contained, roof mounted, air cooled unit with a minimum cooling capacity of 18,000 BTUH, using R134a refrigerant, and provided with a remote pilot control, cool-fan-off switch, thermostat, integral control enclosure, aluminum fin/copper tube coil, receiver and dual pressure control. The trolley house shall have a unit heater capable of keeping the house above 50 degrees F when the crane is parked. The horizontal distance in front of the surface of any control enclosure door to the nearest metallic or other trolley house obstruction shall be a minimum of 30 inches.

## 18. CCTV System

- a. Provide a CCTV system to permit the crane operator to see any obstacles on the pier rails, behind containers that may be stacked on the pier. A solid-state, color, pan-tilt-zoom (PTZ) camera shall be located at each leg to scan the rail in the direction of forward travel of that leg. The cameras shall be mounted on pivoting arms attached to the safety handrails for the crane foot-walks, locked in place outboard of the foot-walks, but arranged to be pivoted inboard for easy maintenance. The four cameras shall be in weather-tight pressurized, sealed enclosures, with heater and cooling as recommended by the manufacturer for all-weather use. A color monitor, 14 inch minimum display size, and a switcher-PTZ controller with quad display capability shall be mounted in the cab, arranged for visibility by the operator. Refer to Section 16752 - Digital Video System. In addition to the above, a separate CCTV camera and monitor shall be provided for the crane operator to view the waterside and barge at the pier. The camera shall be located under the cab facing the waterside. The camera/monitor shall become active when the joystick is positioned to move the trolley toward the waterside.

## 19. Communication System

- a. Cab to Pier Communication System: A microphone, public address amplifier and loudspeaker shall be provided for communication to ground personnel. A knee-activator shall be provided for operator control of this system. Space and power shall be provided in the operators cab for a City supplied radio communications system. Refer to Section 16741 - Paging System.
- b. Cab to Trolley House Communication System: Provide an intercom for communication between the operator's cab and the trolley house for use during maintenance and trouble-shooting. The intercom may be integrated with the loudspeaker mounted on the bottom of the cab. Refer to Section 16741 - Paging System.
- c. UHF Antenna System: Provide UHF antennas both outside and inside the trolley house, connected to allow use of the facility UHF handheld radio system from inside the trolley house. Refer to Section 16742 - Radio Communications System.

## 20. Crane Management System (CMS): The crane shall be equipped with a computer based Crane Management System. This system shall operate on an industrial grade personal computer (PC) using a current Microsoft Windows operating system. The system shall be capable of interfacing with the PLC(s) for the crane drives and with other sensors, and shall be capable of:

- a. Storing data to track and store all operator crane commands during operation for a period of one (1) week.
- b. Monitoring crane machinery and position
- c. Monitoring the crane operating cycles
- d. Monitoring containers handled and providing production reports
- e. Displaying crane status
- f. Displaying and tracking faults
- g. Providing historic trend analysis
- h. Tracking preventative maintenance schedules
- i. Tracking maintenance performed and printing maintenance reports
- j. Displaying and printing crane diagrams and schematics

- k. Other sensors and systems shall be interfaced by the CMS, including:
  - (1) wind speed indicator and alarm sensor
  - (2) trolley house ambient temperature sensor
  - (3) fire detection system (faults and fire detection)
  - (4) collision detector system (faults and collision detection)
  - (5) status and faults for the trolley house and operator's cab HVAC systems
- l. The PLC(s) for the crane drives shall accommodate the crane management system.
- m. A remote video display and keyboard/trackball control shall be provided in the operator's cab.
- n. All collected and stored CMS data shall be transmitted via radio LAN system to a Windows operated PC located at the Operations Room in the building. Real time of movements, alarms, production and maintenance data shall be available instantaneously.
- o. The Operations Room equipment for the radio LAN and Operations Room PC shall be provided with the cranes for each site.
- p. The CMS and radio LAN equipment in the crane trolley house shall be powered from a UPS.
- q. The control room equipment for the radio LAN and control room PC shall be provided with the cranes for each site.
- r. The CMS and radio LAN equipment in the crane trolley house shall be powered from a UPS.

## 2.08 CRANE ACCESS

- A. All crane access features shall comply with OSHA requirements for safety, as a minimum. Access to the bridge girder shall be via permanent ladders and attached to gantry legs. The full length of bridge girder and trolley shall be accessible via permanent walkways. Ladders shall be arranged on the land side leg of the opposite cranes as shown on the Drawings. Walkways, handrail, caged ladders, platforms and other access features shall be provided to allow access to motors, brakes and other components requiring maintenance. All access ladders and platforms shall be as shown on the Drawings and within the crane clearance

envelope. Access to all structural and field joints shall be provided to permit periodic inspection.

- B. Walkway platform and ladder lights, bridge girder floodlights, shall be as shown on the Drawings.
- C. A one-man personnel elevator shall be installed on the land side leg as shown on the Drawing. The elevator shall be positioned such that it does not interfere with the crane ladder. The elevator shall be located such that it will not extend beyond the clearance envelope (36 feet) between bumpers at the base of the gantry. The elevator shall be in accordance with the Safety Code for Elevators and Escalators, ASME A17.1-2010/CSA B44-10.

## 2.09 COATINGS

### A. Coating/Painting

1. The crane and spreader shall be painted with a three (3) part Zinc epoxy painting system as specified herein.
2. The crane structure shall be painted with a color identical to "Benjamin Moore 2065-60, Caribbean Coast." The trolley exterior shall match "Benjamin Moore 2141-50, Horizon Gray, or color for metal wall panels, Section 07410 - Metal Wall Panels.
3. The spreader shall be painted Safety Yellow with black stripes at the lower portion of the structure.
4. The bottom sill beams and truck assemblies shall be painted Black with Safety Yellow stripes applied as shown on the Drawings.
5. Paint markings shown on the Drawings for automatic positioning of containers shall be painted High Gloss Black.
6. All paint striping and markings for safety shall be Safety Yellow and applied as specified herein.
7. Difficult to spray areas such as sharp plate edges shall be power tool broken (chamfer or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
8. The paint system shall not crack or flake off within the guarantee period.

**B. Surface Preparation**

1. Surfaces shall be thoroughly prepared in accordance with SSPC SP-10. Oils and greases shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.
2. Three types of coatings shall be used for coating the crane structures and outfit. The coatings shall consist of a primer coat, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - a. Primer: One coat of Epoxy Zinc rich primer with a dry film thickness of at least 65 microns
  - b. Intermediate: One coat of Epoxy Micaceous iron oxide applied at manufacturer's plant with a dry film thickness of at least 140 microns.
  - c. Finish: Two coats of polyurethane recoatable finish applied at manufacturer's plant with a dry film thickness of at least 40 microns each.

**C. Miscellaneous**

1. Coatings for the interior of machinery house, trolley house and electrical room shall be similar to the external surfaces except that a minimum required total dry film thickness for these parts shall be at least 155 microns.
2. Structures damaged during transportation, storage, erection and testing shall be painted on site in accordance with the requirements.
3. Non-ferrous metals, corrosion resisting steel, machined surfaces and surfaces in sliding or friction contact shall not be painted.
4. Internal accessible box sections shall be prepared as specified herein and coated with primer and intermediate coats as specified.
5. Machinery units, electrical equipment and panels, and other purchased components shall have the manufacturer's standard paint system and shall not be coated except as required to touch up paint damaged in handling or assembly. Exterior components shall be given one finish coat to color coordinate with the final crane color scheme.
6. Surfaces that do not require coating shall be protected during the coating of adjacent work. Machine finished ferrous parts and surfaces, which do not require painting, shall be coated with a suitable rust preventative compound immediately after cleaning.
7. Machined surfaces shall be coated with rust protection lacquer. For standard components, motors, gear boxes etc., the manufacturer's standard coat.

## 2.10 SPARE PARTS AND MAINTENANCE MATERIALS

- A. The crane manufacturer shall provide any special tools required, and manufacturer's recommended spare parts. At a minimum, the following spare parts or their equivalents shall be provided:

Table 6: Spare Parts List

Description of Part		Quantity
<b>Gantry Travel</b>		
Gantry Travel Reducer	PC	1
Gantry Crane Travel Drive Motor With Brake	PC	1
Gear Coupling For Gantry Drive	PC	2
Brake Pads	SET	4
Gantry Drive Wheel	PC	2
Bearings For Gearbox	SET	4
Bearings For Wheels	PC	3
Sealing Snap Rings	SET	8
Slave Wheel	PC	2
<b>Trolley Travel</b>		
Trolley Travel Reducer	PC	1
Trolley Travel Motor	PC	1
Trolley Travel Brake Assembly	PC	1
Brake Pads	SET	2
Gear Coupling For Trolley Drive	PC	1
Spherical Roller Bearing	PC	2
Rotary Shaft Seal	PC	2
Guide Roller	PC	2
Locking Ring	SET	2
Roller Bearing	PC	2
<b>Main Hoist</b>		
Hoist Reducer	PC	1
Hoist Motor	PC	1
Motor Coupling	PC	1
Disc/Drum Shoe Brake Assembly	PC	1
Brake Drum/Disc	PC	1
Brake Shoes/Pads	SET	2
Spherical Roller Bearing	PC	2
Spherical Roller Bearing	PC	2
Rotary Shaft Seal	PC	1
Rotary Shaft Seal	PC	1
Joint Bearing	PC	1
Hoist Gear Type Limit Switch	PC	1
Drive Flange For Limit Switch	PC	1
Load Cell	PC	1

Description of Part		Quantity
Load Display	SET	2
Joystick Master Switch, each type	PC	2
Intercom Indoor	PC	1
Intercom Outdoor (if different unit)	PC	1
Limit Switches Each Type Installed Set	SET	1
Fuses For AC Power And Control, each type and rating	SET	6
For each 10 fuses above first 10, each type and rating	SET	2
PLC I/O Module Each Type Installed	SET	1
Contactors, Relays, Timers For Each Type	SET	1
Touch Pad	SET	2
Printer Ribbon, toner and cartridge	SET	2
<b>Miscellaneous</b>		
Load Cell	LOT	1
AC Unit, Operator's Cabin	PC	1
AC Unit, Trolley House	PC	1
Chain	LOT	1

- B. Provide maintenance manuals in accordance with Section 01831 – Operation and Maintenance manuals.

## 2.11 CRANE OPERATIONS SEQUENCE

- A. The marine transfer station has three (3) mooring berths along the pier. Berth one (1) is provided in way of the crane operating area for unloading and loading barges. The remaining two (2) berths are available for temporary tug barge mooring/shifting. The unloading and loading sequence herein has been developed to provide the maximum operating efficiency of the crane while maintaining barge stability.
1. The operating crane sequence has been developed as guidance for the crane operator and the pier supervisor/foreman to track container movement at the station. The sequence describes the facility operations for unloading and loading two (2) container barges and operations during barge shifting. In general the operating sequence developed is diagrammatically presented herein.
    - a. The crane operating sequence for the first barge requires the removal of eight (8) empty containers from the forward most cells on the barge to commence the load-out operation. Three (3) containers will be removed and immediately transferred to waiting shuttle cars to start the operation. The remaining five (5) containers in the FWD cells will be removed and

prestaged in the designated buffer area and handled when required to complete first the barge load-out.

- b. The crane operator starts the barge unloading process by removing the innermost top container (nearest the pier) from the top tier of the first bay on the barge. The unloading sequence continues by removing containers away from the pier (outboard), until row-by-row and transferring them to the three (3) waiting shuttle cars buffer area on the pier. After the four (4) top rows of containers are removed, the crane returns to the inboard cell and starts to remove the lower tier containers. The unloading process continues outboard the lower containers are removed and the entire first bay is empty.
- c. Once the first bay is empty, the loading sequence can start. The first loaded container is placed in the lower inboard cell, after positioning this container in place, the crane proceeds to remove an empty container from the adjacent row.
- d. The sequence continues along the length of the barge until all of the empties are removed and replaced with filled containers. The remaining five (5) empty containers pre-staged earlier on the pier are loaded onto the waiting shuttle cars and are last to be loaded onto the barge when filled.
- e. To maintain barge stability, it should be noted that not more than eight (8) container positions will remain empty on the barge at any time. When eight (8) empty containers have been removed from the barge, the crane will then begin loading waste-filled containers into the empty cells in sequence as described above. Loading will occur in reverse unloading sequence, with only one transverse bay of cells being filled at a given time. Upon completion of the barge load out, the barge will be shifted from the pier. A barge with empty containers will be positioned for continued container handling operations. During barge shifting, the container crane continues to operate by loading empty and full containers from the buffered stowage area to the shuttle cars in preparation for handling containers on the second barge.
- f. The crane manufacturer shall use the following crane operation sequence as by the Diagram of Operating Sequence for Crane 1 as guidance to program/set-up the operator's touch pad screen of the crane automated positioning system.

#### B. Crane Stowage

1. Normal Operating Conditions: Under normal operating conditions or when maintenance is being performed, the parked crane shall be stowed at one end of the pier, away from the operation. The pin locks shall be engaged to secure the crane.

2. Severe Storm Conditions: Under severe storm conditions, the cranes shall be stowed nested bumper-to-bumper to prevent a run-away crane from striking the other crane. This will require that both cranes be secured, tied-down and stowed with the pin-locks engaged.

(NO FURTHER TEXT ON THIS PAGE)

Diagram of Operating Sequence for Crane 1

## Sequence 1 Crane 1 Operation with 1st Barge

STEP	OPERATION		
1	Move (EC) container from barge cell V1U to shuttle car D	V1U	→ D
2	Travel from shuttle car D to barge cell V2U	D	→ V2U
3	Move (EC) container from barge cell V2U to shuttle car C	V2U	→ C
4	Travel from shuttle car C to barge cell V3U	C	→ V3U
5	Move (EC) container from barge cell V3U to shuttle car B	V3U	→ B
6	Travel from shuttle car B to barge cell V4U	B	→ V4U
7	Move (EC) container from barge cell V4U to shuttle car buffer area TB1L	V4U	→ TB1L
8	Travel from shuttle car buffer area TB1L to barge cell V1L	TB1L	→ V1L
9	Move (EC) container from barge cell V1L to shuttle car buffer area TB2L	V1L	→ TB2L
10	Travel from shuttle car buffer area TB2L to barge cell V2L	TB2L	→ V2L
11	Move (EC) container from barge cell V2L to shuttle car buffer area TB3L	V2L	→ TB3L
12	Travel from shuttle car buffer area TB3L to barge cell V3L	TB3L	→ V3L
13	Move (EC) container from barge cell V3L to shuttle car buffer area TB4L	V3L	→ TB4L
14	Travel shuttle car buffer area TB4L to barge cell V4L	TB4L	→ V4L
15	Move (EC) container from barge cell V4L to shuttle car buffer area TB1U	V4L	→ TB1U
16	Travel from shuttle car buffer area TB1U to shuttle car D	TB1U	→ D
17	Move (FC) container from shuttle car D to barge cell V1L	D	→ V1L
18	Travel from barge cell V1L to barge cell V5U	V1L	→ V5U
19	Move (EC) container from barge cell V5U to shuttle car D	V5U	→ D
20	Travel from shuttle car D to barge cell V6U	D	→ V6U
21	Move (EC) container from barge cell V6U to shuttle car buffer area TB2U	V6U	→ TB2U
22	Travel from shuttle car buffer area TB2U to shuttle car C	TB2U	→ C
23	Move (FC) container from shuttle car C to barge cell V2L	C	→ V2L
24	Travel from barge cell V2L to barge cell V7U	V2L	→ V7U
25	Move (EC) container from barge cell V7U to shuttle car C	V7U	→ C
26	Travel from shuttle car C to barge cell V8U	C	→ V8U
27	Move (EC) container from barge cell V8U to shuttle car buffer area TB3U	V8U	→ TB3U

STEP	OPERATION		
28	Travel from shuttle car buffer area TB3U to shuttle car B	TB3U	→ B
29	Move (FC) container from shuttle car B to barge cell V3L	B	→ V3L
30	Travel from barge cell V3L to barge cell V5L	V3L	→ V5L

127	Move (FC) container from shuttle car B to barge cell V15L	B	→ V15L
128	Travel from barge cell V15L to barge cell V18L	V15L	→ V18L
129	Move (EC) container from barge cell V18L to shuttle car B	V18L	→ B
130	Travel from shuttle car B to shuttle car D	B	→ D
131	Move (FC) container from shuttle car D to barge cell V16L	D	→ V16L
132	Travel from barge cell V16L to barge cell V19L	V16L	→ V19L
133	Move (EC) container from barge cell V19L to shuttle car D	V19L	→ D
134	Travel from shuttle car D to shuttle car C	D	→ C
135	Move (FC) container from shuttle car C to barge cell V13U	C	→ V13U
136	Travel from barge cell V13U to barge cell V20L	V13U	→ V20L
137	Move (EC) container from barge cell V20L to shuttle car C	V20L	→ C
138	Travel from shuttle car C to shuttle car B	C	→ B
139	Move (FC) container from shuttle car B to barge cell V14U	B	→ V14U

STEP	OPERATION		
140	Travel from barge cell V14U to barge cell V21U	V14U	→ V21U
141	Move (EC) container from barge cell V21U to shuttle car B	V21U	→ B
142	Travel from shuttle car B to shuttle car D	B	→ D
143	Move (FC) container from shuttle car D to barge cell V15U	D	→ V15U
144	Travel from barge cell V15U to barge cell V22U	V15U	→ V22U
145	Move (EC) container from barge cell V22U to shuttle car D	V22U	→ D
146	Travel from shuttle car D to shuttle car C	D	→ C
147	Move (FC) container from shuttle car C to barge cell V16U	C	→ V16U
148	Travel from barge cell V16U to barge cell V23U	V16U	→ V23U
149	Move (EC) container from barge cell V23U to shuttle car C	V23U	→ C
150	Travel from shuttle car C to shuttle car B	C	→ B
151	Move (FC) container from shuttle car B to barge cell V17L	B	→ V17L
152	Travel from barge cell V17L to barge cell V24U	V17L	→ V24U
153	Move (EC) container from barge cell V24U to shuttle car B	V24U	→ B
154	Travel from shuttle car B to shuttle car D	B	→ D
155	Move (FC) container from shuttle car D to barge cell V18L	D	→ V18L
156	Travel from barge cell V18L to barge cell V21L	V18L	→ V21L
157	Move (EC) container from barge cell V21L to shuttle car D	V21L	→ D
158	Travel from shuttle car D to shuttle car C	D	→ C
159	Move (FC) container from shuttle car C to barge cell V19L	C	→ V19L
160	Travel from barge cell V19L to barge cell V22L	V19L	→ V22L
161	Move (EC) container from V22L to shuttle car C	V22L	→ C
162	Travel from shuttle car C to shuttle car B	C	→ B
163	Move (FC) container from shuttle car B to barge cell V20L	B	→ V20L
164	Travel from barge cell V20L to barge cell V23L	V20L	→ V23L
165	Move (EC) container from barge cell V23L to shuttle car B	V23L	→ B
166	Travel from shuttle car B to shuttle car D	B	→ D
167	Move (FC) container from shuttle car D to barge cell V17U	D	→ V17U

STEP	OPERATION		
168	Travel from barge cell V17U to barge cell V24L	V17U	→ V24L
169	Move (EC) container from barge cell V24L to shuttle car D	V24L	→ D
170	Travel from shuttle car D to shuttle car C	D	→ C
171	Move (FC) container from shuttle car C to barge cell V18U	C	→ V18U
172	Travel from barge cell V18U to shuttle car buffer area TB1U	V18U	→ TB1U
173	Move (EC) container from shuttle car buffer area TB1U to shuttle car C	TB1U	→ C
174	Travel from shuttle car C to shuttle car B	C	→ B
175	Move (FC) container from shuttle car B to barge cell V19U	B	→ V19U
176	Travel from barge cell V19U to shuttle car buffer area TB4U	V19U	→ TB4U
177	Move (EC) container from shuttle car buffer area TB4U to shuttle car B	TB4U	→ B
178	Travel from shuttle car B to shuttle car D	B	→ D
179	Move (FC) container from shuttle car D to barge cell V20U	D	→ V20U
180	Travel from barge cell V20U to shuttle car buffer area TB1L	V20U	→ TB1L
181	Move (EC) container from shuttle car buffer area TB1L to shuttle car D	TB1L	→ D
182	Travel from shuttle car D to shuttle car C	D	→ C
183	Move (FC) container from shuttle car C to barge cell V21L	C	→ V21L
184	Travel from barge cell V21L to shuttle car buffer area TB2U	V21L	→ TB2U
185	Move (EC) container from shuttle car buffer area TB2U to shuttle car C	TB2U	→ C
186	Travel from shuttle car C to shuttle car B	C	→ B
187	Move (FC) container from shuttle car B to barge cell V22L	B	→ V22L
188	Travel from barge cell V22L to shuttle car buffer area TB4L	V22L	→ TB4L
189	Move (EC) container from shuttle car buffer area TB4L to shuttle car B	TB4L	→ B
190	Travel from shuttle car B to shuttle car D	B	→ D
191	Move (FC) container from shuttle car D to barge cell V23L	D	→ V23L
192	Travel from barge cell V23L to shuttle car buffer area TB2L	V23L	→ TB2L
193	Move (EC) container from shuttle car buffer area TB2L to shuttle car D	TB2L	→ D
194	Travel from shuttle car D to shuttle car C	D	→ C
195	Move (FC) container from shuttle car C to barge cell V24L	C	→ V24L

STEP	OPERATION		
196	Travel from barge cell V24L to shuttle car buffer area TB3U	V24L	→ TB3U
197	Move (EC) container from shuttle car buffer area TB3U to shuttle car C	TB3U	→ C
198	Travel from shuttle car C to shuttle car B	C	→ B
199	Move (FC) container from shuttle car B to barge cell V21U	B	→ V21U
200	Travel from barge cell V21U to shuttle car buffer area TB3L	V21U	→ TB3L
201	Move (EC) container from shuttle car buffer area TB3L to shuttle car B	TB3L	→ B
202	Travel from shuttle car B to shuttle car D	B	→ D
203	Move (FC) container from shuttle car D to barge cell V22U	D	→ V22U
204	Travel from barge cell V22U to buffer area B1U	V22U	→ B1U
205	Move (EC) container from buffer area B1U to shuttle car D	B1U	→ D
206	Travel from shuttle car D to shuttle car C	D	→ C
207	Move (FC) container from shuttle car C to barge cell V23U	C	→ V23U
208	Travel from barge cell V23U to buffer area B1L	V23U	→ B1L
209	Move (EC) container from buffer area B1L to shuttle car C	B1L	→ C
210	Travel from shuttle car C to shuttle car B	C	→ B
211	Move (FC) container from shuttle car B to barge cell V24U	B	→ V24U

## Sequence 2 Crane 1 Operations during Shifting Of 1st Barge

STEP	OPERATION	V24U	→	B2U
1	Travel from barge cell V24U to buffer area B2U	V24U	→	B2U
2	Move (EC) container from buffer area B2U to shuttle car B	B2U	→	B
3	Travel from shuttle car B to shuttle car D	B	→	D
4	Move (FC) container from shuttle car D to shuttle car buffer area TB1L	D	→	TB1L
5	Travel from shuttle car buffer area TB1L to buffer area B2L	TB1L	→	B2L
6	Move (EC) container from buffer area B2L to shuttle car D	B2L	→	D
7	Travel from shuttle car D to shuttle car C	D	→	C
8	Move (FC) container from shuttle car C to shuttle car buffer area TB1U	C	→	TB1U
9	Travel from shuttle car buffer area TB1U to buffer area B3U	TB1U	→	B3U
10	Move (EC) container from buffer area B3U to shuttle car C	B3U	→	C
11	Travel from shuttle car C to shuttle car B	C	→	B
12	Move (FC) container from shuttle car B to shuttle car buffer area TB2L	B	→	TB2L
13	Travel from shuttle car buffer area TB2L to buffer area B3L	TB2L	→	B3L
14	Move (EC) container from buffer area B3L to shuttle car B	B3L	→	B
15	Travel from shuttle car B to shuttle car D	B	→	D
16	Move (FC) container from shuttle car D to shuttle car buffer area TB2U	D	→	TB2U
17	Travel from shuttle car buffer area TB2U to buffer area B4U	TB2U	→	B4U
18	Move (EC) container from buffer area B4U to shuttle car D	B4U	→	D
19	Travel from shuttle car D to shuttle car C	D	→	C
20	Move (FC) container from shuttle car C to shuttle car buffer area TB3L	C	→	TB3L
21	Travel from shuttle car buffer area TB3L to buffer area B4L	TB3L	→	B4L
22	Move (EC) container from buffer area B4L to shuttle car C	B4L	→	C
23	Travel from shuttle car C to shuttle car B	C	→	B
24	Move (FC) container from shuttle car B to shuttle car buffer area TB3U	B	→	TB3U
25	Travel from shuttle car buffer area TB3U to buffer area B5U	TB3U	→	B5U
26	Move (EC) container from buffer area B5U to shuttle car B	B5U	→	B

STEP	OPERATION		
27	Travel from shuttle car B to shuttle car D	B	→
28	Move (FC) container from shuttle car D to shuttle car buffer area TB4L	D	→
29	Travel from shuttle car buffer area TB4L to buffer area B5L	TB4L	→
30	Move (EC) container from buffer area B5L to shuttle car D	B5L	→
31	Travel from shuttle car D to shuttle car C	D	→
32	Move (FC) container from shuttle car C to shuttle car buffer area TB4U	C	→
33	Travel from shuttle car buffer area TB4U to buffer area B6U	TB4U	→
34	Move (EC) container from buffer area B6U to shuttle car C	B6U	→
35	Travel from shuttle car C to shuttle car B	C	→
36	Move (FC) container from shuttle car B to buffer area B4L	B	→
37	Travel from buffer area B4L to buffer area B6L	B4L	→
38	Move (EC) container from buffer area B6L to shuttle car B	B6L	→
39	Travel from shuttle car B to shuttle car D	B	→
40	Move (FC) container from shuttle car D to buffer area B4U	D	→
41	Travel from buffer area B4U to buffer area B7U	B4U	→
42	Move (EC) container from buffer area B7U to shuttle car D	B7U	→
43	Travel from shuttle car D to shuttle car C	D	→
44	Move (FC) container from shuttle car C to buffer area B3L	C	→
45	Travel from buffer area B3L to buffer area B7L	B3L	→
46	Move (EC) container from buffer area B7L to shuttle car C	B7L	→
47	Travel from shuttle car C to shuttle car B	C	→
48	Move (FC) container from shuttle car B to buffer area B3U	B	→
49	Travel from buffer area B3U to buffer area B8U	B3U	→
50	Move (EC) container from buffer area B8U to shuttle car B	B8U	→
51	Travel from shuttle car B to shuttle car D	B	→
52	Move (FC) container from shuttle car D to buffer area B7L	D	→
53	Travel from buffer area B7L to buffer area B8L	B7L	→
54	Move (EC) container from buffer area B8L to shuttle car D	B8L	→

STEP	OPERATION		
55	Travel from shuttle car D to shuttle car C	D	➡
56	Move (FC) container from shuttle car C to buffer area B7U	C	➡
57	Travel from buffer area B7U to buffer area B9U	B7U	➡
58	Move (EC) container from buffer area B9U to shuttle car C	B9U	➡
59	Travel from shuttle car C to shuttle car B	C	➡
			B

Sequence 3 Crane 1 Operation 2<sup>nd</sup> Barge Moored At Position 1

STEP	OPERATION		
1	Move (FC) container from shuttle car B to buffer area B6L	B	→ B6L
2	Travel from buffer area B6L to barge cell V1U	B6L	→ V1U
3	Move (EC) container from barge cell V1U to shuttle car B	V1U	→ B
4	Travel from shuttle car B to barge cell V2U	B	→ V2U
5	Move (EC) container from barge cell V2U to buffer area B9U	V2U	→ B9U
6	Travel from buffer area B9U to shuttle car D	B9U	→ D
7	Move (FC) container from shuttle car D buffer area B6U	D	→ B6U
8	Travel from buffer area B6U to barge cell V3U	B6U	→ V3U
9	Move (EC) container from barge cell V3U to shuttle car D	V3U	→ D
10	Travel from shuttle car D to barge cell V4U	D	→ V4U
11	Move (EC) container from barge cell V4U to buffer area B1L	V4U	→ B1L
12	Travel from buffer area B1L to shuttle car C	B1L	→ C
13	Move (FC) container from shuttle car C to buffer area B8L	C	→ B8L
14	Travel from buffer area B8L to barge cell V1L	B8L	→ V1L
15	Move (EC) container from barge cell V1L to shuttle car C	V1L	→ C
16	Travel from shuttle car C to barge cell V2L	C	→ V2L
17	Move (EC) container from barge cell V2L to buffer area B1U	V2L	→ B1U
18	Travel from buffer area B1U to shuttle car B	B1U	→ B
19	Move (FC) container from shuttle car B to barge cell V1L	B	→ V1L
20	Travel from barge cell V1L to barge cell V3L	V1L	→ V3L
21	Move (EC) container from barge cell V3L to shuttle car B	V3L	→ B
22	Travel from shuttle car B to barge cell V4L	B	→ V4L
23	Move (EC) container from barge cell V4L to buffer area B2L	V4L	→ B2L
24	Travel from buffer area B2L to shuttle car D	B2L	→ D
25	Move (FC) container from shuttle car D to barge cell V2L	D	→ V2L
26	Travel from barge cell V2L to barge cell V5U	V2L	→ V5U

STEP	OPERATION		
27	Move (EC) container from barge cell V5U to shuttle car D	V5U	→ D
28	Travel from shuttle car D to buffer area B8L	D	→ B8L
29	Move (FC) container from buffer area B8L to barge cell V3L	B8L	→ V3L
30	Travel from barge cell V3L to barge cell V6U	V3L	→ V6U
31	Move (EC) container from barge cell V6U to buffer area B2U	V6U	→ B2U
32	Travel from buffer area B2U to shuttle car C	B2U	→ C
33	Move (FC) container from shuttle car C to barge cell V4L	C	→ V4L
34	Travel from barge cell V4L to barge cell V7U	V4L	→ V7U
35	Move (EC) container from barge cell V7U to shuttle car C	V7U	→ C
36	Travel from shuttle car C to buffer area B3U	C	→ B3U
37	Move (FC) container from buffer area B3U to barge cell V1U	B3U	→ V1U
38	Travel from barge cell V1U to shuttle car B	V1U	→ B
39	Move (FC) container from shuttle car B to barge cell barge cell V2U	B	→ V2U
40	Travel from barge cell V2U to barge cell V8U	V2U	→ V8U
41	Move (EC) container from barge cell V8U to shuttle car B	V8U	→ B
42	Travel from shuttle car B to buffer area B3L	B	→ B3L
43	Move (FC) container from buffer area B3L to barge cell V3U	B3L	→ V3U
44	Travel from barge cell V3U to shuttle car D	V3U	→ D
45	Move (FC) container from shuttle car D to barge cell V4U	D	→ V4U
46	Travel from barge cell V4U to barge cell V5L	V4U	→ V5L
47	Move (EC) container from barge cell V5L to shuttle car D	V5L	→ D
48	Travel from shuttle car D to buffer area B6U	D	→ B6U
49	Move (FC) container from buffer area B6U to barge cell V5L	B6U	→ V5L
50	Travel from barge cell V5L to barge cell V6L	V5L	→ V6L
51	Move (EC) container from barge cell V6L to buffer area B3L	V6L	→ B3L
52	Travel from buffer area B3L to shuttle car C	B3L	→ C
53	Move (FC) container from shuttle car C to barge cell V6L	C	→ V6L
54	Travel from barge cell V6L to barge cell V7L	V6L	→ V7L

STEP	OPERATION	V7L	→	C
55	Move (EC) container from barge cell V7L to shuttle car C	V7L	→	C
56	Travel from shuttle car C to barge cell V8L	C	→	V8L
57	Move (EC) container from barge cell V8L to buffer area B3U	V8L	→	B3U
58	Travel from buffer area B3U to shuttle car B	B3U	→	B
59	Move (FC) container from shuttle car B to barge cell V7L	B	→	V7L
60	Travel from barge cell V7L to barge cell V9U	V7L	→	V9U
61	Move (EC) container from barge cell V9U to shuttle car B	V9U	→	B
62	Travel from shuttle car B to buffer area B6L	B	→	B6L
63	Move (FC) container from buffer area B6L to barge cell V8L	B6L	→	V8L
64	Travel from barge cell V8L to buffer area B4U	V8L	→	B4U
65	Move (FC) container from buffer area B4U to barge cell V5U	B4U	→	V5U
66	Travel from barge cell V5U to shuttle car D	V5U	→	D
67	Move (FC) container from shuttle car D to barge cell V6U	D	→	V6U
68	Travel from barge cell V6U to barge cell V10U	V6U	→	V10U
69	Move (EC) container from V10U to shuttle car D	V10U	→	D
70	Travel from shuttle car D to barge cell V11U	D	→	V11U
71	Move (EC) container from barge cell V11U to buffer area B5L	V11U	→	B5L
72	Travel from buffer area B5L to buffer area B4L	B5L	→	B4L
73	Move (FC) container from buffer area B4L to barge cell V7U	B4L	→	V7U
74	Travel from barge cell V7U to shuttle car C	V7U	→	C
75	Move (FC) container from shuttle car C to barge cell V8U	C	→	V8U
76	Travel from barge cell V8U to barge cell V12U	V8U	→	V12U
77	Move (EC) container from barge cell V12U to shuttle car C	V12U	→	C
78	Travel from shuttle car C to barge cell V9L	C	→	V9L
79	Move (EC) container from barge cell V9L to buffer area B4L	V9L	→	B4L
80	Travel from buffer area B4L to shuttle car B	B4L	→	B
81	Move (FC) container from shuttle car B to barge cell V9L	B	→	V9L
82	Travel from barge cell V9L to barge cell V10L	V9L	→	V10L

STEP	OPERATION		
83	Move (EC) container from barge cell V10L to shuttle car B	V10L	→ B
84	Travel from shuttle car B to barge cell V11L	B	→ V11L
85	Move (EC) container from barge cell V11L to buffer area B5U	V11L	→ B5U
86	Travel from buffer area B5U to shuttle car D	B5U	→ D
87	Move (FC) container from shuttle car D to barge cell V10L	D	→ V10L
88	Travel from V10L to barge cell V12L	V10L	→ V12L
89	Move (EC) container from barge cell V12L to shuttle car D	V12L	→ D
90	Travel from shuttle car D to buffer area B7U	D	→ B7U
91	Move (FC) container from buffer area B7U to barge cell V11L	B7U	→ V11L
92	Travel from barge cell V11L to barge cell V13U	V11L	→ V13U
93	Move (EC) container from barge cell V13U to buffer area B4U	V13U	→ B4U
94	Travel from buffer area B4U to shuttle car C	B4U	→ C
95	Move (FC) container from shuttle car C to barge cell V12L	C	→ V12L
96	Travel from barge cell V12L to barge cell V14U	V12L	→ V14U
97	Move (EC) container from barge cell V14U to shuttle car C	V14U	→ C
98	Travel from shuttle car C to barge cell V15U	C	→ V15U
99	Move (EC) container from barge cell V15U to buffer area B6L	V15U	→ B6L
100	Travel from buffer area B6L to shuttle car B	B6L	→ B
101	Move (FC) container from shuttle car B to barge cell V9U	B	→ V9U
102	Travel from barge cell V9U to barge cell V16U	V9U	→ V16U
103	Move (EC) container from barge cell V16U to shuttle car B	V16U	→ B
104	Travel from shuttle car B to barge cell V13L	B	→ V13L
105	Move (EC) container from barge cell V13L to buffer area B6U	V13L	→ B6U
106	Travel from buffer area B6U to buffer area B7L	B6U	→ B7L
107	Move (FC) container from buffer area B7L to barge cell V10U	B7L	→ V10U
108	Travel from barge cell V10U to shuttle car D	V10U	→ D
109	Move (FC) container from shuttle car D to barge cell V11U	D	→ V11U
110	Travel from barge cell V11U to barge cell V14L	V11U	→ V14L

STEP	OPERATION	V14L	→	D
111	Move (EC) container from barge cell V14L to shuttle car D	V14L	→	D
112	Travel from shuttle car D to barge cell V15L	D	→	V15L
113	Move (EC) container from barge cell V15L to buffer area B7L	V15L	→	B7L
114	Travel from buffer area B7L to barge cell V16L	B7L	→	V16L
115	Move (EC) container from barge cell V16L to buffer area B7U	V16L	→	B7U
116	Travel from buffer area B7U to shuttle car C	B7U	→	C
117	Move (FC) container from shuttle car C to barge cell V12U	C	→	V12U
118	Travel from barge cell V12U to barge cell V17U	V12U	→	V17U
119	Move (EC) container from barge cell V17U to shuttle car C	V17U	→	C
120	Travel from shuttle car C to shuttle car buffer area TB4U	C	→	TB4U
121	Move (FC) container from shuttle car buffer area TB4U to barge cell V13L	TB4U	→	V13L
122	Travel from barge cell V13L to shuttle car B	V13L	→	B
123	Move (FC) container from shuttle car B to barge cell V14L	B	→	V14L
124	Travel from barge cell V14L to barge cell V18U	V14L	→	V18U
125	Move (EC) container from barge cell V18U to shuttle car B	V18U	→	B
126	Travel from shuttle area B to shuttle car buffer area TB4L	B	→	TB4L
127	Move (FC) container from shuttle car buffer area TB4L to barge cell V15L	TB4L	→	V15L
128	Move (EC) container from barge cell V15L to shuttle car D	V15L	→	D
129	Move (FC) container from shuttle car D to barge cell V16L	D	→	V16L
130	Travel from barge cell V16L to barge cell V19U	V16L	→	V19U
131	Move (EC) container from barge cell V19U to shuttle car D	V19U	→	D
132	Travel from shuttle car D to barge cell V20U	D	→	V20U
133	Move (EC) container from barge cell V20U to buffer area B8L	V20U	→	B8L
134	Travel from buffer area B8L to shuttle car C	B8L	→	C
135	Move (FC) container from shuttle car C to barge cell V13U	C	→	V13U
136	Travel from barge cell V13U to barge cell V17L	V13U	→	V17L
137	Move (EC) container from barge cell V17L to shuttle car C	V17L	→	C
138	Travel from shuttle car C to barge cell V18L	C	→	V18L

STEP	OPERATION		
139	Move (EC) container from barge cell V18L to buffer area B8U	V18L	→ B8U
140	Travel from buffer area B8U to shuttle car B	B8U	→ B
141	Move (FC) container from shuttle car B to barge cell V14U	B	→ V14U
142	Travel from barge cell V14U to barge cell V19L	V14U	→ V19L
143	Move (EC) container from barge cell V19L to shuttle car B	V19L	→ B
144	Travel from shuttle car B to shuttle car buffer area TB3U	B	→ TB3U
145	Move (FC) container from shuttle car buffer area TB3U to barge cell V15U	TB3U	→ V15U
146	Travel from barge cell V15U to barge cell V20L	V15U	→ V20L
147	Move (EC) container from barge cell V20L to shuttle car buffer area TB4L	V20L	→ TB4L
148	Travel from shuttle car buffer area TB4L to shuttle car D	TB4L	→ D
149	Move (FC) container from shuttle car D to barge cell V16U	D	→ V16U
150	Travel from barge cell V16U to barge cell V21U	V16U	→ V21U
151	Move (EC) container from barge cell V21U to shuttle car D	V21U	→ D
152	Travel from shuttle car D to shuttle car buffer area TB3L	D	→ TB3L
153	Move (FC) container from shuttle car buffer area TB3L to barge cell V17L	TB3L	→ V17L
154	Travel from barge cell V17L to shuttle car C	V17L	→ C
155	Move (FC) container from shuttle car C to barge cell V18L	C	→ V18L
156	Travel from barge cell V18L to barge cell V22U	V18L	→ V22U
157	Move (EC) container from barge cell V22U to shuttle car C	V22U	→ C
158	Travel from shuttle car C to shuttle car buffer area TB2U	C	→ TB2U
159	Travel from shuttle car buffer area TB2U to barge cell V19L	TB2U	→ V19L
160	Travel from barge cell V19L to barge cell V23U	V19L	→ V23U
161	Move (EC) container from barge cell V23U to shuttle car buffer area TB4U	V23U	→ TB4U
162	Travel from shuttle car buffer area TB4U to shuttle car B	TB4U	→ B
163	Move (FC) container from shuttle car B to barge cell V20L	B	→ V20L
164	Travel from barge cell V20L to barge cell V24U	V20L	→ V24U
165	Move (EC) container from barge cell V24U to shuttle car B	V24U	→ B
166	Travel from shuttle car B to shuttle car buffer area TB2L	B	→ TB2L

STEP	OPERATION		
167	Move (FC) container from shuttle car buffer area TB2L to barge cell V17U	TB2L	↑ V17U
168	Travel from barge cell V17U to barge cell V21L	V17U	↑ V21L
169	Move (EC) container from barge cell V21L to shuttle car buffer area TB2L	V21L	↑ TB2L
170	Travel from shuttle car buffer area TB2L to shuttle car D	TB2L	↑ D
171	Move (FC) container from shuttle car D to barge cell V18U	D	↑ V18U
172	Travel from barge cell V18U to barge cell V22L	V18U	↑ V22L
173	Move (EC) container from barge cell V22L to shuttle car D	V22L	↑ D
174	Travel from shuttle car D to shuttle car buffer area TB1U	D	↑ TB1U
175	Move (FC) container from shuttle car buffer area TB1U to barge cell V19U	TB1U	↑ V19U
176	Travel from barge cell V19U to barge cell V23L	V19U	↑ V23L
177	Move (EC) container from barge cell V23L to shuttle car buffer area TB2U	V23L	↑ TB2U
178	Travel from shuttle car buffer area TB2U to shuttle car C	TB2U	↑ C
179	Move (FC) container from shuttle car C to barge cell V20U	C	↑ V20U
180	Travel from barge cell V20U to barge cell V24L	V20U	↑ V24L
181	Move (EC) container from barge cell V24L to shuttle car C	V24L	↑ C
182	Travel from shuttle car C to shuttle car buffer area TB1L	C	↑ TB1L
183	Move (FC) container from shuttle car buffer area TB1L to barge cell V21L	TB1L	↑ V21L
184	Travel from barge cell V21L to shuttle car B	V21L	↑ B
185	Move (FC) container from shuttle car B to barge cell V22L	B	↑ V22L
186	Travel from barge cell V22L to shuttle car buffer area TB2U	V22L	↑ TB2U
187	Move (EC) container from shuttle car buffer area TB2U to shuttle car B	TB2U	↑ B
188	Travel from shuttle car B to shuttle car D	B	↑ D
189	Move (FC) container from shuttle car D to barge cell V23L	D	↑ V23L
190	Travel from V23L to shuttle car buffer area TB2L	V23L	↑ TB2L
191	Move (EC) container from shuttle car buffer area TB2L to shuttle car D	TB2L	↑ D
192	Travel from shuttle car D to shuttle car C	D	↑ C
193	Move (FC) container from shuttle car C to barge cell V24L	C	↑ V24L
194	Travel from barge cell V24L to shuttle car buffer area TB4U	V24L	↑ TB4U

STEP	OPERATION			
195	Move (EC) container from shuttle car buffer area TB4U to shuttle car C	TB4U	→	C
196	Travel from shuttle car C to shuttle car B	C	→	B
197	Move (FC) container from shuttle car B to barge cell V21U	B	→	V21U
198	Travel from barge cell V21U to shuttle car buffer area TB4L	V21U	→	TB4L
199	Move (EC) container from shuttle car buffer area TB4L to shuttle car B	TB4L	→	B
200	Travel from shuttle car B to shuttle car D	B	→	D
201	Move (FC) container from shuttle car D to barge cell V22U	D	→	V22U
202	Travel from barge cell V22U to shuttle car C	V22U	→	C
203	Move (FC) container from shuttle car C to barge cell V23U	C	→	V23U
204	Travel from barge cell V23U to shuttle car B	V23U	→	B
205	Move (FC) container from shuttle car B to barge cell V24U	B	→	V24U

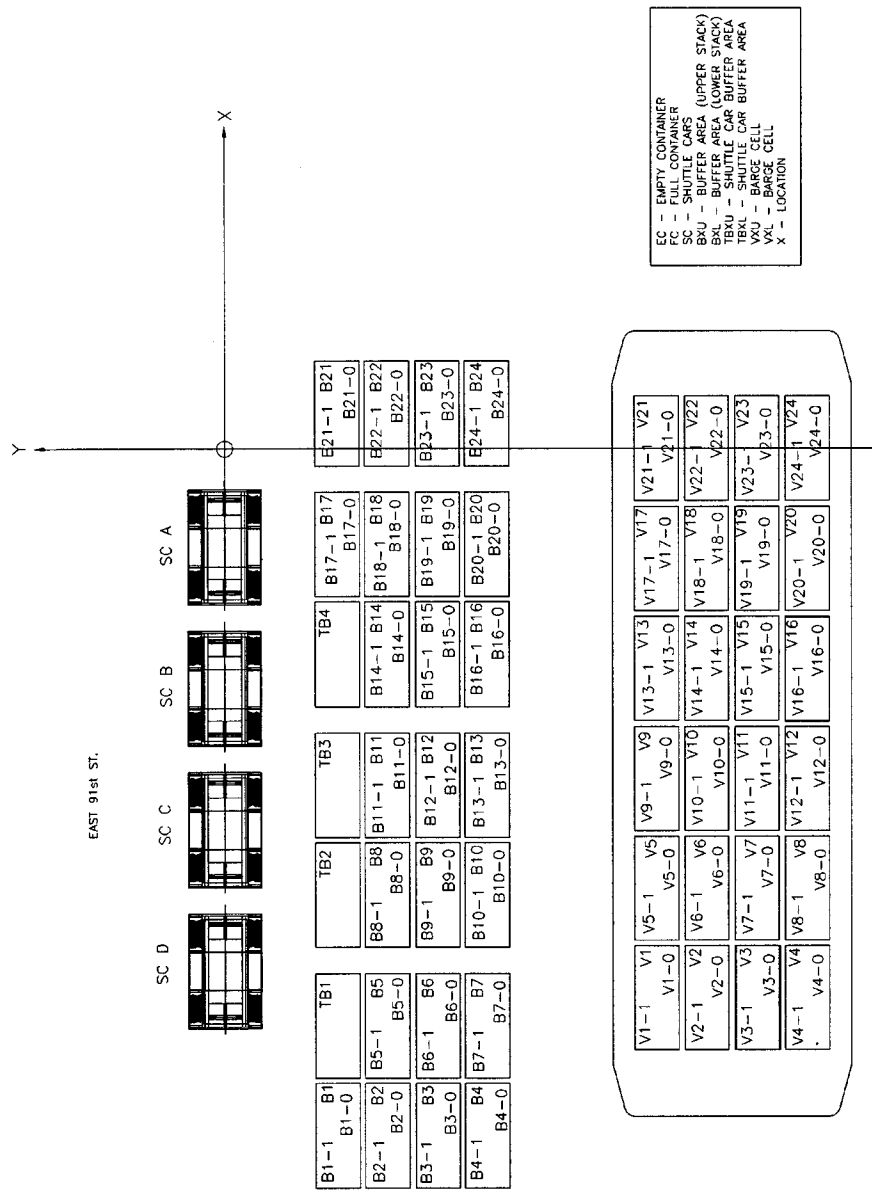

Diagram of Operating Sequence for Crane 2

## Sequence 1 Crane 2 Operation with 1st Barge

STEP	OPERATION		
1	Move (EC) container from barge cell V21U to shuttle car A	V21U	➡ A
2	Travel from shuttle car A to barge cell V22U	A	➡ V22U
3	Move (EC) container from barge cell V22U to shuttle car B	V22U	➡ B
4	Travel from shuttle car B to barge cell V23U	B	➡ V23U
5	Move (EC) container from barge cell V23U and travel to shuttle car C	V23U	➡ C
6	Travel from shuttle car C to barge cell V24U	C	➡ V24U
7	Move (EC) container from barge cell V24U to shuttle car buffer area TB1L	V24U	➡ TB1L
8	Travel from shuttle car buffer area TB1L to barge cell V21L	TB1L	➡ V21L
9	Move (EC) container from barge cell V21L to shuttle car buffer area TB2L	V21L	➡ TB2L
10	Travel from shuttle car buffer area TB2L to barge cell V22L	TB2L	➡ V22L
11	Move (EC) container from barge cell V22L to shuttle car buffer area TB3L	V22L	➡ TB3L
12	Travel from shuttle car buffer area TB3L to barge cell V23L	TB3L	➡ V23L
13	Move (EC) container from barge cell V23L to shuttle car buffer area TB4L	V23L	➡ TB4L
14	Travel from shuttle car buffer area TB4L to barge cell V24L	TB4L	➡ V24L
15	Move (EC) container from barge cell V24L to shuttle car buffer area TB4U	V24L	➡ TB4U
16	Travel from shuttle car buffer area TB4U to shuttle car A	TB4U	➡ A
17	Move (FC) container from shuttle car A to barge cell V21L	A	➡ V21L
18	Travel from barge cell V21L to barge cell V17U	V21L	➡ V17U
19	Move (EC) container from barge cell V17U to shuttle car A	V17U	➡ A
20	Travel from shuttle car A to barge cell V18U	A	➡ V18U
21	Move (EC) container from barge cell V18U to shuttle car buffer area TB3U	V18U	➡ TB3U
22	Travel from shuttle car buffer area TB3U to barge cell V19U	TB3U	➡ V19U
23	Move (EC) container from barge cell V19U to shuttle car buffer area TB2U	V19U	➡ TB2U
24	Travel from shuttle car buffer area TB2U to shuttle car B	TB2U	➡ B
25	Move (FC) container from shuttle car B to barge cell V22L	B	➡ V22L

STEP	OPERATION		
26	Travel from barge cell V22L to barge cell V20U	V22L	→ V20U
27	Move (EC) container from barge cell V20U to shuttle car B	V20U	→ B
28	Travel from shuttle car B to barge cell V17L	B	→ V17L
29	Move (EC) container from barge cell V17L to shuttle car buffer area TB1L	V17L	→ TB1L
30	Travel from shuttle car buffer area TB1L to shuttle car C	TB1U	→ C
31	Move (FC) container from shuttle car C to barge cell V23L	C	→ V23L
32	Travel from barge cell V23L to barge cell V18L	V23L	→ V18L
33	Move (EC) container from barge cell V18L to shuttle car C	V18L	→ C
34	Travel from shuttle car C to shuttle car A	C	→ A
35	Move (FC) container from shuttle car A to barge cell V24L	A	→ V24L
36	Travel from barge cell V24L to barge cell V19L	V24L	→ V19L
37	Move (EC) container from barge cell V19L to shuttle car A	V19L	→ A
38	Travel from shuttle car A to shuttle car B	A	→ B
39	Move (FC) container from shuttle car B to barge cell V21U	B	→ V21U
40	Travel from barge cell V21U to barge cell V20L	V21U	→ V20L
41	Move (EC) container from barge cell V20L to shuttle car B	V20L	→ B
42	Travel from shuttle car B to shuttle car C	B	→ C
43	Move (FC) container from shuttle car C to barge cell V22U	C	→ V22U
44	Travel from barge cell V22U to barge cell V13U	V22U	→ V13U
45	Move (EC) container from barge cell V13U to shuttle car C	V13U	→ C
46	Travel from shuttle car C to shuttle car A	C	→ A
47	Move (FC) container from shuttle car A to barge cell V23U	A	→ V23U
48	Travel from barge cell V23U to barge cell V14U	V23U	→ V14U
49	Move (EC) container from barge cell V14U to shuttle car A	V14U	→ A
50	Travel from shuttle car A to shuttle car B	A	→ B
51	Move (FC) container from shuttle car B to barge cell V24U	B	→ V24U
52	Travel from barge cell V24U to barge cell V15U	V24U	→ V15U
53	Move (EC) container from barge cell V15U to shuttle car B	V15U	→ B

STEP	OPERATION			
54	Travel from shuttle car B to shuttle car C	B	→	C
55	Move (FC) container from shuttle car C to barge cell V17L	C	→	V17L
56	Travel from barge cell V17L to barge cell V16U	V17L	→	V16U
57	Move (EC) container from barge cell V16U to shuttle car C	V16U	→	C
58	Travel from shuttle car C to shuttle car A	C	→	A
59	Move (FC) container from shuttle car A to barge cell V18L	A	→	V18L
60	Travel from barge cell V18L to barge cell V13L	V18L	→	V13L
61	Move (EC) container from barge cell V13L to shuttle car A	V13L	→	A
62	Travel from shuttle car A to shuttle car B	A	→	B
63	Move (FC) container from shuttle car B to barge cell V19L	B	→	V19L
64	Travel from barge cell V19L to barge cell V14L	V19L	→	V14L
65	Move (EC) container from barge cell V14L to shuttle car B	V14L	→	B
66	Travel from shuttle car B to shuttle car C	B	→	C
67	Move (FC) container from shuttle car C to barge cell V20L	C	→	V20L
68	Travel from barge cell V20L to barge cell V15L	V20L	→	V15L
69	Move (EC) container from barge cell V15L to shuttle car C	V15L	→	C
70	Travel from shuttle car C to shuttle car A	C	→	A
71	Move full container (FC) from shuttle car A to barge cell V17U	A	→	V17U
72	Travel from barge cell V17U to barge cell V16L	V17U	→	V16L
73	Move (EC) container from barge cell V16L to shuttle car A	V16L	→	A
74	Travel from shuttle car A to shuttle car B	A	→	B
75	Move (FC) container from shuttle car B to barge cell V18U	B	→	V18U
76	Travel from barge cell V18U to barge cell V9U	V18U	→	V9U
77	Move (EC) container from barge cell V9U to shuttle car B	V9U	→	B
78	Travel from shuttle car B to shuttle car C	B	→	C
79	Move (FC) container from shuttle car C to barge cell V19U	C	→	V19U
80	Travel from barge cell V19U to barge cell V10U	V19U	→	V10U
81	Move (EC) container from barge cell V10U to shuttle car C	V10U	→	C

<i><b>STEP</b></i>	<i><b>OPERATION</b></i>			
82	Travel from shuttle car C to shuttle car A	C	→	A
83	Move (FC) container from shuttle car A to barge cell V20U	A	→	V20U
84	Travel from barge cell V20U to barge cell V11U	V20U	→	V11U
85	Move (EC) container from barge cell V11U to shuttle car A	V11U	→	A
86	Travel from shuttle car A to shuttle car B	A	→	B
87	Move (FC) container from shuttle car B to barge cell V13L	B	→	V13L
88	Travel from barge cell V13L to barge cell V12U	V13L	→	V12U
89	Move (EC) container from barge cell V12U to shuttle car B	V12U	→	B
90	Travel from shuttle car B to shuttle car C	B	→	C
91	Move (FC) container from shuttle car C to barge cell V14L	C	→	V14L
92	Travel from barge cell V14L to barge cell V9L	V14L	→	V9L
93	Move (EC) container from barge cell V9L to shuttle car C	V9L	→	C
94	Travel from shuttle car C to shuttle car A	C	→	A
95	Move (FC) container from shuttle car A to barge cell V15L	A	→	V15L
96	Travel from barge cell V15L to barge cell V10L	V15L	→	V10L
97	Move (EC) container from barge cell V10L to shuttle car A	V10L	→	A
98	Travel from shuttle car A to shuttle car B	A	→	B
99	Move (FC) container from shuttle car B to barge cell V16L	B	→	V16L
100	Travel from V16L to barge cell V11L	V16L	→	V11L
101	Move (EC) container from barge cell V11L to shuttle car B	V11L	→	B
102	Travel from shuttle car B to shuttle car C	B	→	C
103	Move (FC) container from shuttle car C to barge cell V13U	C	→	V13U
104	Travel from barge cell V13U to barge cell V12L	V13U	→	V12L
105	Move (EC) container from barge cell V12L to shuttle car C	V12L	→	C
106	Travel from shuttle car C to shuttle car A	C	→	A
107	Move (FC) container from shuttle car A to barge cell V14U	A	→	V14U
108	Travel from barge cell V14U to barge cell V5U	V14U	→	V5U
109	Move (EC) container from barge cell V5U to shuttle car A	V5U	→	A

STEP	OPERATION	A	→	B
110	Travel from shuttle car A to shuttle car B	A	→	B
111	Move (FC) container from shuttle car B to barge cell V15U	B	→	V15U
112	Travel from barge cell V15U to barge cell V6U	V15U	→	V6U
113	Move (EC) container from barge cell V6U to shuttle car B	V6U	→	B
114	Travel from shuttle car B to shuttle car C	B	→	C
115	Move (FC) container from shuttle car C to barge cell V16U	C	→	V16U
116	Travel from barge cell V16U to barge cell V7U	V16U	→	V7U
117	Move (EC) container from barge cell V7U to shuttle car C	V7U	→	C
118	Travel from shuttle car C to shuttle car A	C	→	A
119	Move (FC) container from shuttle car A to barge cell V9L	A	→	V9L
120	Travel from barge cell V9L to barge cell V8U	V9L	→	V8U
121	Move (EC) container from barge cell V8U to shuttle car A	V8U	→	A
122	Travel from shuttle car A to shuttle car B	A	→	B
123	Move (FC) container from shuttle car B to barge cell V10L	B	→	V10L
124	Travel from barge cell V10L to barge cell V5L	V10L	→	V5L
125	Move (EC) container from barge cell V5L to shuttle car B	V5L	→	B
126	Travel from shuttle car B to shuttle car C	B	→	C
127	Move (FC) container from shuttle car C to barge cell V11L	C	→	V11L
128	Travel from barge cell V11L to barge cell V6L	V11L	→	V6L
129	Move (EC) container from barge cell V6L to shuttle car C	V6L	→	C
130	Travel from shuttle car C to shuttle car A	C	→	A
131	Move (FC) container from shuttle car A to barge cell V12L	A	→	V12L
132	Travel from barge cell V12L to barge cell V7L	V12L	→	V7L
133	Move (EC) container from barge cell V7L to shuttle car A	V7L	→	A
134	Travel from shuttle car A to shuttle car B	A	→	B
135	Move (FC) container from shuttle car B to barge cell V9U	B	→	V9U
136	Travel from barge cell V9U to barge cell V8L	V9U	→	V8L
137	Move (EC) container from barge cell V8L to shuttle car B	V8L	→	B

<b>STEP</b>	<b>OPERATION</b>		
138	Travel from shuttle car B to shuttle car C	B	→ C
139	Move (FC) container from shuttle car C to barge cell V10U	C	→ V10U
140	Travel from barge cell V10U to barge cell V1U	V10U	→ V1U
141	Move (EC) container from barge cell V1U to shuttle car C	V1U	→ C
142	Travel from shuttle car C to shuttle car A	C	→ A
143	Move (FC) container from shuttle car A to barge cell V11U	A	→ V11U
144	Travel from barge cell V11U to barge cell V2U	V11U	→ V2U
145	Move (EC) container from barge cell V2U to shuttle car A	V2U	→ A
146	Travel from shuttle car A to shuttle car B	A	→ B
147	Move (FC) container from shuttle car B to barge cell V12U	B	→ V12U
148	Travel from barge cell V12U to barge cell V3U	V12U	→ V3U
149	Move (EC) container from barge cell V3U to shuttle car B	V3U	→ B
150	Travel from shuttle car B to shuttle car C	B	→ C
151	Move (FC) container from shuttle car C to barge cell V5L	C	→ V5L
152	Travel from barge cell V5L to barge cell V4U	V5L	→ V4U
153	Move (EC) container from barge cell V4U to shuttle car C	V4U	→ C
154	Travel from shuttle car C to shuttle car A	C	→ A
155	Move (FC) container from shuttle car A to barge cell V6L	A	→ V6L
156	Travel from barge cell V6L to barge cell V1L	V6L	→ V1L
157	Move (EC) container from barge cell V1L to shuttle car A	V1L	→ A
158	Travel from shuttle car A to shuttle car B	A	→ B
159	Move (FC) container from shuttle car B to barge cell V7L	B	→ V7L
160	Travel from barge cell V7L to barge cell V2L	V7L	→ V2L
161	Move (EC) container from barge cell V2L to shuttle car B	V2L	→ B
162	Travel from shuttle car B to shuttle car C	B	→ C
163	Move (FC) container from shuttle car C to barge cell V8L	C	→ V8L
164	Travel from barge cell V8L to barge cell V3L	V8L	→ V3L
165	Move (EC) container from barge cell V3L to shuttle car C	V3L	→ C

STEP	OPERATION		
166	Travel from shuttle car C to shuttle car A	C	→ A
167	Move (FC) container from shuttle car A to barge cell V5U	A	→ V5U
168	Travel from barge cell V5U to barge cell V4L	V5U	→ V4L
169	Move (EC) container from barge cell V4L to shuttle car A	V4L	→ A
170	Travel from shuttle car A to shuttle car B	A	→ B
171	Move (FC) container from shuttle car B to barge cell V6U	B	→ V6U
172	Travel from barge cell V6U to shuttle car buffer area TB1U	V6U	→ TB1U
173	Move (EC) container from shuttle car buffer area TB1U to shuttle car B	TB1U	→ B
174	Travel from shuttle car B to shuttle car C	B	→ C
175	Move (FC) container from shuttle car C to barge cell V7U	C	→ V7U
176	Travel from barge cell V7U to shuttle car buffer area TB1L	V7U	→ TB1L
177	Move (EC) container from shuttle car buffer area TB1L to shuttle car C	TB1L	→ C
178	Travel from shuttle car C to shuttle car A	C	→ A
179	Move (FC) container from shuttle car A to barge cell V8U	A	→ V8U
180	Travel from barge cell V8U to shuttle car buffer area TB2U	V8U	→ TB2U
181	Move (EC) container from shuttle car buffer area TB2U to shuttle car A	TB2U	→ A
182	Travel from shuttle car A to shuttle car B	A	→ B
183	Move (FC) container from shuttle car B to barge cell V1L	B	→ V1L
184	Travel from barge cell V1L to shuttle car buffer area TB2L	V1L	→ TB2L
185	Move (EC) container from shuttle car buffer area TB2L to shuttle car B	TB2L	→ B
186	Travel from shuttle car B to shuttle car C	B	→ C
187	Move (FC) container from shuttle car C to barge cell V2L	C	→ V2L
188	Travel from barge cell V2L to shuttle car buffer area TB3U	V2L	→ TB3U
189	Move (EC) container from shuttle car buffer area TB3U to shuttle car C	TB3U	→ C
190	Travel from shuttle car C to shuttle car A	C	→ A
191	Move (FC) container from shuttle car A to barge cell V3L	A	→ V3L
192	Travel from barge cell V3L to shuttle car buffer area TB3L	V3L	→ TB3L
193	Move (EC) container from shuttle car buffer area TB3L to shuttle car A	TB3L	→ A

STEP	OPERATION		
194	Travel from shuttle car A to shuttle car B	A	→
195	Move (FC) container from shuttle car B to barge cell V4L	B	→
196	Travel from barge cell V4L to shuttle car buffer area TB4U	V4L	→
197	Move (EC) container from shuttle car buffer area TB4U to shuttle car B	TB4U	→
198	Travel from shuttle car B to shuttle car C	B	→
199	Move (FC) container from shuttle car C to barge cell V1U	C	→
200	Travel from barge cell V1U to shuttle car buffer area TB4L	V1U	→
201	Move (EC) container from shuttle car buffer area TB4L to shuttle car C	TB4L	→
202	Travel from shuttle car C to shuttle car A	C	→
203	Move (FC) container from shuttle car A to barge cell V2U	A	→
204	Travel from barge cell V2U to buffer area B21U	V2U	→
205	Move (EC) container from buffer area B21U to shuttle car A	B21U	→
206	Travel from shuttle car A to shuttle car B	A	→
207	Move (FC) container from shuttle car B to barge cell V3U	B	→
208	Travel from barge cell V3U to buffer area B21L	V3U	→
209	Move (EC) container from buffer area B21L to shuttle car B	B21L	→
210	Travel from shuttle car B to shuttle car C	B	→
211	Move (FC) container from shuttle car C to barge cell V4U	C	→

## Sequence 2 Crane 2 Operations during Shifting Of 1st Barge

STEP	OPERATION		
1	Travel from barge cell V4U to buffer area B22U	V4U	→ B22U
2	Move (EC) container from buffer area B22U to shuttle car C	B22U	→ C
3	Travel from shuttle car C to shuttle car A	C	→ A
4	Move (FC) container from shuttle car A to buffer area B21L	A	→ B21L
5	Travel from buffer area B21L to buffer area B22L	B21L	→ B22L
6	Move (EC) container from buffer area B22L to shuttle car A	B22L	→ A
7	Travel from shuttle car A to shuttle car B	A	→ B
8	Move (FC) container from shuttle car B to buffer area B21U	B	→ B21U
9	Travel from buffer area B21U to buffer area B23U	B21U	→ B23U
10	Move (EC) container from buffer area B23U to shuttle car B	B23U	→ B
11	Travel from shuttle car B to shuttle car C	B	→ C
12	Move (FC) container from shuttle car C to buffer area B22L	C	→ B22L
13	Travel from buffer area B22L to buffer area B23L	B22L	→ B23L
14	Move (EC) container from buffer area B23L to shuttle car C	B23L	→ C
15	Travel from shuttle car C to shuttle car A	C	→ A
16	Move (FC) container from shuttle car A to buffer area B22U	A	→ B22U
17	Travel from buffer area B22U to buffer area B24U	B22U	→ B24U
18	Move (EC) container from buffer area B24U to shuttle car A	B24U	→ A
19	Travel from shuttle car A to shuttle car B	A	→ B
20	Move (FC) container from shuttle car B to buffer area B23L	B	→ B23L
21	Travel from buffer area B23L to buffer area B24L	B23L	→ B24L
22	Move (EC) container from buffer area B24L to shuttle car B	B24L	→ B
23	Travel from shuttle car B to shuttle car C	B	→ C
24	Move (FC) container from shuttle car C to buffer area B23U	C	→ B23U
25	Travel from buffer area B23U to buffer area B17U	B23U	→ B17U

STEP	OPERATION		
26	Move (EC) container from buffer area B17U to shuttle car C	B17U	→ C
27	Travel from shuttle car C to shuttle car A	C	→ A
28	Move (FC) container from shuttle car A to buffer area B24L	A	→ B24L
29	Travel from buffer area B24L to buffer area B17L	B24L	→ B17L
30	Move (EC) container from buffer area B17L to shuttle car A	B17L	→ A
31	Travel from shuttle car A to shuttle car B	A	→ B
32	Move (FC) container from shuttle car B to buffer area B24U	B	→ B24U
33	Travel from buffer area B24U to buffer area B18U	B24U	→ B18U
34	Move (EC) container from buffer area B18U to shuttle car B	B18U	→ B
35	Travel from shuttle car B to shuttle C	B	→ C
36	Move (FC) container from shuttle car C to buffer area B17L	C	→ B17L
37	Travel from buffer area B17L to buffer area B18L	B17L	→ B18L
38	Move (EC) container from buffer area B18L to shuttle car C	B18L	→ C
39	Travel from shuttle car C to shuttle car A	C	→ A
40	Move (FC) container from shuttle car A to buffer area B17U	A	→ B17U
41	Travel from buffer area B17U to buffer area B19U	B17U	→ B19U
42	Move (EC) container from buffer area B19U to shuttle car A	B19U	→ A
43	Travel from shuttle car A to shuttle car B	A	→ B
44	Move (FC) container from shuttle car B to buffer area B18L	B	→ B18L
45	Travel from buffer area B18L to buffer area B19L	B18L	→ B19L
46	Move (EC) container from buffer area B19L to shuttle car B	B19L	→ B
47	Travel from shuttle car B to shuttle car C	B	→ C
48	Move (FC) container from shuttle car C to buffer area B18U	C	→ B18U
49	Travel from buffer area B18U to buffer area B20U	B18U	→ B20U
50	Move (EC) container from buffer area B20U to shuttle car C	B20U	→ C
51	Travel from shuttle car C to shuttle car A	C	→ A
52	Move (FC) container from shuttle car A to buffer area B19L	A	→ B19L
53	Travel from buffer area B19L to buffer area B20L	B19L	→ B20L

STEP	OPERATION		
54	Move (EC) container from buffer area B20L to shuttle car A	B20L	→ A
55	Travel from shuttle car A to shuttle car B	A	→ B
56	Move (FC) container from shuttle car B to buffer area B19U	B	→ B19U
57	Travel from buffer area B19U to buffer area B14U	B19U	→ B14U
58	Move (EC) container from buffer area B14U to shuttle car B	B14U	→ B
59	Travel from shuttle car B to shuttle car C	B	→ C

## Sequence 3 Crane 2 Operation 2nd Barge Moored At Position 1

<i>STEP</i>	<i>OPERATION</i>		
1	Move (FC) container from shuttle car B to buffer area B20L	C	→ B20L
2	Travel from buffer area B20L to barge cell V21U	B20L	→ V21U
3	Move (EC) container from barge cell V21U to shuttle car C	V21U	→ C
4	Travel from shuttle car C to barge cell V22U	C	→ V22U
5	Move (EC) container from barge cell V22U to shuttle car buffer area TB1L	V22U	→ TB1L
6	Travel from shuttle car buffer area TB1L to shuttle car A	TB1L	→ A
7	Move (FC) container from shuttle car A to buffer area B20U	A	→ B20U
8	Travel from buffer area B20U to barge cell V23U	B20U	→ V23U
9	Move (EC) container from barge cell V23U to shuttle car A	V23U	→ A
10	Travel from shuttle car A to barge cell V24U	A	→ V24U
11	Move (EC) container from barge cell V24U to shutter car buffer area TB2L	V24U	→ TB2L
12	Travel from shutter car buffer area TB2L to shuttle car B	TB2L	→ B
13	Move (FC) container from shuttle car B to shutter car buffer area TB4L	B	→ TB4L
14	Travel from shuttle car buffer area TB4L to barge cell V21L	TB4L	→ V21L
15	Move (EC) container from barge cell V21L to shuttle car B	V21L	→ B
16	Travel from shuttle car B to barge cell V22L	B	→ V22L
17	Move (EC) container from barge cell V22L to shuttle car buffer area TB1U	V22L	→ TB1U
18	Travel from shuttle car buffer area TB1U to shuttle car C	TB1U	→ C
19	Move (FC) container from shuttle car C to barge cell V21L	C	→ V21L
20	Travel from barge cell V21L to barge cell V23L	V21L	→ V23L
21	Move (EC) container from barge cell V23L to shuttle car C	V23L	→ C
22	Travel from shuttle car C to barge cell V24L	C	→ V24L
23	Move (EC) container from barge cell V24L to shuttle car buffer area TB2U	V24L	→ TB2U
24	Travel from shuttle car buffer area TB2U to shuttle car A	TB2U	→ A
25	Move (FC) container from shuttle car A to barge cell V22L	A	→ V22L

STEP	OPERATION		
26	Travel from barge cell V22L to barge cell V17U	V22L	→ V17U
27	Move (EC) container from barge cell V17U to shuttle car A	V17U	→ A
28	Travel from shuttle car A to barge cell V18U	A	→ V18U
29	Move (EC) container from barge cell V18U to shuttle car buffer area TB3L	V18U	→ TB3L
30	Travel from shuttle car buffer area TB3L to barge cell V19U	TB3L	→ V19U
31	Move (EC) container from barge cell V19U to shuttle car buffer area TB3U	V19U	→ TB3U
32	Travel from shuttle car buffer area TB3U to shuttle car B	TB3U	→ B
33	Move (FC) container from shuttle car B to barge cell V23L	B	→ V23L
34	Travel from barge cell V23L to barge cell V20U	V23L	→ V20U
35	Move (EC) container from barge cell V20U to shuttle car B	V20U	→ B
36	Travel from shuttle car B to barge cell V17L	B	→ V17L
37	Move (EC) container from barge cell V17L to buffer area B14U	V17L	→ B14U
38	Travel from buffer area B14U to shuttle car C	B14U	→ C
39	Move (FC) container from shuttle car C to barge cell V24L	C	→ V24L
40	Travel from barge cell V24L to barge cell V18L	V24L	→ V18L
41	Move (EC) container from barge cell V18L to shuttle car C	V18L	→ C
42	Travel from shuttle car C to shuttle car buffer area TB4L	C	→ TB4L
43	Move (FC) container from shuttle car buffer area TB4L to barge cell V21U	TB4L	→ V21U
44	Travel from barge cell V21U to shuttle car A	V21U	→ A
45	Move (FC) container from shuttle car A to barge cell V22U	A	→ V22U
46	Travel from barge cell V22U to barge cell V19L	V22U	→ V19L
47	Move (EC) container from barge cell V19L to shuttle car A	V19L	→ A
48	Travel from shuttle car A to barge cell V20L	A	→ V20L
49	Move (FC) container from barge cell V20L to shuttle car buffer area TB4L	V20L	→ TB4L
50	Travel from shuttle car buffer area TB4L to shuttle car B	TB4L	→ B
51	Move (FC) container from shuttle car B to barge cell V23U	B	→ V23U
52	Travel from barge cell V23U to barge cell V13U	V23U	→ V13U
53	Move (EC) container from barge cell V13U to shuttle car B	V13U	→ B

STEP	OPERATION		
54	Travel from shuttle car B to buffer area B17U	B	→ B17U
55	Move (FC) container from buffer area B17U to barge cell V24U	B17U	→ V24U
56	Travel from barge cell V24U to barge cell V14U	V24U	→ V14U
57	Move (EC) container from barge cell V14U to shuttle car buffer area TB4U	V14U	→ TB4U
58	Travel from shuttle car buffer area TB4U to shuttle car C	TB4U	→ C
59	Move (FC) container from shuttle car C to barge cell V17L	C	→ V17L
60	Travel from barge cell V17L to barge cell V15U	V17L	→ V15U
61	Move (EC) container from barge cell V15U to shuttle car C	V15U	→ C
62	Travel from shuttle car C to buffer area B17L	C	→ B17L
63	Move (FC) container from buffer area B17L to barge cell V18L	B17L	→ V18L
64	Travel from barge cell V18L to shuttle car A	V18L	→ A
65	Move (FC) container from shutter car A to barge cell V19L	A	→ V19L
66	Travel from barge cell V19L to barge cell V16U	V19L	→ V16U
67	Move (EC) container from barge cell V16U to shuttle car A	V16U	→ A
68	Travel from shuttle car A to buffer area B18U	A	→ B18U
69	Move (FC) container from buffer area B18U to barge cell V20L	B18U	→ V20L
70	Travel from barge cell V20L to barge cell V13L	V20L	→ V13L
71	Move (EC) container from barge cell V13L to buffer area B17L	V13L	→ B17L
72	Travel from buffer area B17L to shuttle car B	B17L	→ B
73	Move (FC) container from shuttle car B to barge cell V17U	B	→ V17U
74	Travel from barge cell V17U to barge cell V14L	V17U	→ V14L
75	Move (EC) container from barge cell V14L to shuttle car B	V14L	→ B
76	Travel from shuttle car B to buffer area B18L	B	→ B18L
77	Move (FC) container from buffer area B18L to barge cell V18U	B18L	→ V18U
78	Travel from barge cell V18U to shuttle car C	V18U	→ C
79	Move (FC) container from shuttle car C to barge cell V19U	C	→ V19U
80	Travel empty crane from barge cell V19U to barge cell V15L	V19U	→ V15L
81	Move (EC) container from barge cell V15L shuttle car C	V15L	→ C

STEP	OPERATION		
82	Travel from shuttle car C to barge cell V16L	C	→ V16L
83	Move (EC) container from barge cell V16L to buffer area B17U	V16L	→ B17U
84	Travel from buffer area B17U to shuttle car A	B17U	→ A
85	Move (FC) container from shuttle car A to barge cell V20U	A	→ V20U
86	Travel from barge cell V20U to barge cell V9U	V20U	→ V9U
87	Move (EC) container from barge cell V9U to shuttle car A	V9U	→ A
88	Travel from shuttle car A to buffer area B21U	A	→ B21U
89	Move (FC) container from buffer area B21U to barge cell V13L	B21U	→ V13L
90	Travel from barge cell V13L to barge cell V10U	V13L	→ V10U
91	Move (EC) container from barge cell V10U to buffer area B18L	V10U	→ B18L
92	Travel from buffer area B18L to shuttle car B	B18L	→ B
93	Move (FC) container from shuttle car B to barge cell V14L	B	→ V14L
94	Travel from barge cell V14L to barge cell V11U	V14L	→ V11U
95	Move (EC) container from barge cell V11U to shuttle car B	V11U	→ B
96	Travel from shuttle car B to buffer area B21L	B	→ B21L
97	Move (FC) container from buffer area B21L to barge cell V15L	B21L	→ V15L
98	Travel from barge cell V15L to shuttle car C	V15L	→ C
99	Move (FC) container from shuttle car C to barge cell V16L	C	→ V16L
100	Travel from barge cell V16L to barge cell V12U	V16L	→ V12U
101	Move (EC) container from barge cell V12U to shuttle car C	V12U	→ C
102	Travel from shuttle car C to barge cell V9L	C	→ V9L
103	Move (EC) container from barge cell V9L to buffer area B21L	V9L	→ B21L
104	Travel from buffer area B21L to buffer area B22U	B21L	→ B22U
105	Move (FC) container from buffer area B22U to barge cell V13U	B22U	→ V13U
106	Travel from barge cell V13U to shuttle car A	V13U	→ A
107	Move (FC) container from shuttle car A to barge cell V14U	A	→ V14U
108	Travel from barge cell V14U to barge cell V10L	V14U	→ V10L
109	Move (EC) container from barge cell V10L to shuttle car A	V10L	→ A

STEP	OPERATION		
110	Travel from shuttle car A to barge cell V11L	A	→ V11L
111	Move (EC) container from barge cell V11L to buffer area B21U	V11L	→ B21U
112	Travel from buffer area B21U to shuttle car B	B21U	→ B
113	Move (FC) container from shuttle car B to barge cell V15U	B	→ V15U
114	Travel from barge cell V15U to barge cell V12L	V15U	→ V12L
115	Move (EC) container from barge cell V12L to shuttle car B	V12L	→ B
116	Travel from shuttle car B to buffer area B22L	B	→ B22L
117	Move (FC) container from buffer area B22L to barge cell V16U	B22L	→ V16U
118	Travel from barge cell V16U to shuttle car C	V16U	→ C
119	Move (FC) container from shuttle car C to barge cell V9L	C	→ V9L
120	Travel from barge cell V9L to barge cell V5U	V9L	→ V5U
121	Move (EC) container from barge cell V5U to shuttle car C	V5U	→ C
122	Travel from shuttle car C to barge cell V6U	C	→ V6U
123	Move (EC) container from barge cell V6U to buffer area B22L	V6U	→ B22L
124	Travel from buffer area B22L to shuttle car A	B22L	→ A
125	Move (FC) container from shuttle car A to barge cell V10L	A	→ V10L
126	Travel from barge cell V10L to barge cell V7U	V10L	→ V7U
127	Move (EC) container from barge cell V7U to shuttle car A	V7U	→ A
128	Travel from shuttle car A to buffer area B23U	A	→ B23U
129	Move (FC) container from buffer area B23U to barge cell V11L	B23U	→ V11L
130	Travel from barge cell V11L to shuttle car B	V11L	→ B
131	Move (FC) container from shuttle car B to barge cell V12L	B	→ V12L
132	Travel from barge cell V12L to barge cell V8U	V12L	→ V8U
133	Move (EC) container from barge cell V8U to shuttle car B	V8U	→ B
134	Travel from shuttle car B to barge cell V5L	B	→ V5L
135	Move (EC) container from barge cell V5L to buffer area B22U	V5L	→ B22U
136	Travel from buffer area B22U to shuttle car C	B22U	→ C
137	Move (EC) container from shuttle car C to barge cell V9U	C	→ V9U

<i>STEP</i>	<i>OPERATION</i>		
138	Travel from barge cell V9U to barge cell V6L	V9U	→ V6L
139	Move (EC) container from barge cell V6L to shuttle car C	V6L	→ C
140	Travel from shuttle car C to buffer area B23L	C	→ B23L
141	Move (FC) container from buffer area B23L to barge cell V10U	B23L	→ V10U
142	Travel from barge cell V10U to barge cell V7L	V10U	→ V7L
143	Move (EC) container from barge cell V7L to buffer area B23L	V7L	→ B23L
144	Travel from buffer area B23L to shuttle car A	B23L	→ A
145	Move (FC) container from shuttle car A to barge cell V11U	A	→ V11U
146	Travel from barge cell V11U to barge cell V8L	V11U	→ V8L
147	Move (EC) container from barge cell V8L to shuttle car A	V8L	→ A
148	Travel from shuttle car buffer A to buffer area B24U	A	→ B24U
149	Move (FC) container from buffer area B24U to barge cell V12U	B24U	→ V12U
150	Travel from barge cell V12U to shuttle car B	V12U	→ B
151	Move (FC) container from shuttle car B to barge cell V5L	B	→ V5L
152	Travel from barge cell V5L to barge cell V1U	V5L	→ V1U
153	Move (EC) container from barge cell V1U to shuttle car B	V1U	→ B
154	Travel from shuttle car B to buffer area B24L	B	→ B24L
155	Move (FC) container from buffer area B24L to barge cell V6L	B24L	→ V6L
156	Travel from barge cell V6L to shuttle car C	V6L	→ C
157	Move (FC) container from shuttle car C to barge cell V7L	C	→ V7L
158	Travel from barge cell V7L to shuttle car buffer area TB1U	V7L	→ TB1U
159	Move (EC) container from shuttle car buffer area TB1U to shuttle car C	TB1U	→ C
160	Travel from shuttle car C to buffer area B19U	C	→ B19U
161	Move (FC) container from buffer area B19U to barge cell V8L	B19U	→ V8L
162	Travel from barge cell V8L to shuttle car A	V8L	→ A
163	Move (FC) container from shuttle car A to barge cell V5U	A	→ V5U
164	Travel from barge cell V5U to barge cell V2U	V5U	→ V2U
165	Move (EC) container from barge cell V2U to shuttle car A	V2U	→ A

STEP	OPERATION		
166	Travel from shuttle car A to buffer area B19L	A	→ B19L
167	Move (FC) container from buffer area B19L to barge cell V6U	B19L	→ V6U
168	Travel from barge cell V6U to shuttle car B	V6U	→ B
169	Move (FC) container from shuttle car B to barge cell V7U	B	→ V7U
170	Travel from barge cell V7U to barge cell V3U	V7U	→ V3U
171	Move (EC) container from barge cell V3U to shuttle car B	V3U	→ B
172	Travel from shuttle car B to barge cell V4U	B	→ V4U
173	Move (EC) container from barge cell V4U to buffer area B23U	V4U	→ B23U
174	Travel from buffer area B23U to shuttle car C	B23U	→ C
175	Move (FC) container from shuttle car C to barge cell V8U	C	→ V8U
176	Travel from barge cell V8U to barge cell V1L	V8U	→ V1L
177	Move (EC) container from barge cell V1L to shuttle car C	V1L	→ C
178	Travel from shuttle car C to barge cell V2L	C	→ V2L
179	Move (EC) container from barge cell V2L to buffer area B24L	V2L	→ B24L
180	Travel from buffer area B24L to shuttle car A	B24L	→ A
181	Move (FC) container from shuttle car A to barge cell V1L	A	→ V1L
182	Travel from barge cell V1L to barge cell V3L	V1L	→ V3L
183	Move (EC) container from barge cell V3L to shuttle car A	V3L	→ A
184	Travel from shuttle car A to buffer area B20U	A	→ B20U
185	Move (FC) container from buffer area B20U to barge cell V2L	B20U	→ V2L
186	Travel from to barge cell V2L to shuttle car B	V2L	→ B
187	Move (FC) container from shuttle car B to barge cell V3L	B	→ V3L
188	Travel from barge cell V3L to barge cell V4L	V3L	→ V4L
189	Move (EC) container from barge cell V4L to shuttle car B	V4L	→ B
190	Travel from shuttle car B to buffer area B20L	B	→ B20L
191	Move (FC) container from buffer area B20L to barge cell V4L	B20L	→ V4L
192	Travel from barge cell V4L to shuttle car C	V4L	→ C
193	Move (FC) container from shuttle car C to barge cell V1U	C	→ V1U

STEP	OPERATION		
194	Travel from barge cell V1U to shuttle car buffer area TB1L	V1U	→ TB1L
195	Move (EC) container from shuttle car buffer area TB1L to shuttle car C	TB1L C	→ C
196	Travel from shuttle car C to shuttle car buffer area TB2U	TB2U	→ TB2U
197	Move (EC) container from shuttle car buffer area TB2U to buffer area B24U	B24U	→ B24U
198	Travel from buffer area B24U to shuttle car buffer area TB2L	TB2L	→ TB2L
199	Move (EC) container from shuttle car buffer area TB2L to buffer area B18U	B18U	→ B18U
200	Travel from buffer area B18U to shuttle car A	A	→ A
201	Move (FC) container from shuttle car A to barge cell V2U	V2U	→ V2U
202	Travel from barge cell V2U to shuttle car buffer area TB3U	TB3U	→ TB3U
203	Move (EC) container from shuttle car buffer area TB3U to buffer area B20L	B20L	→ B20L
204	Travel from buffer area B20L to shuttle car buffer area TB3L	TB3L	→ TB3L
205	Move (EC) container from shuttle car buffer area TB3L to buffer area B20U	B20U	→ B20U
206	Travel from buffer area B20U to shuttle car B	B	→ B
207	Move (FC) container from shuttle car B to barge cell V3U	V3U	→ V3U
208	Travel from barge cell V3U to shuttle car buffer area TB4U	TB4U	→ TB4U
209	Move (EC) container from shuttle car buffer area TB4U to buffer area B19L	B19L	→ B19L
210	Travel from buffer area B19L to shuttle car buffer area TB4L	TB4L	→ TB4L
211	Move (EC) container from shuttle car buffer area TB4L to buffer area B19U	B19U	→ B19U
212	Travel from buffer area B19U to shuttle car C	C	→ C
213	Move (FC) container from shuttle car C to barge cell V4U	V4U	→ V4U

## 2.12 GENERAL TESTING REQUIREMENTS

- A. Each crane shall be fully assembled and fully load tested at the manufacturer's plant. Both cranes shall be load tested on site after installation in accordance with Section 01811 - Preliminary and Field Tests and as specified herein.
- B. All major components and sub assemblies shall be shop tested.
- C. Nothing stated herein shall affect the requirements contained in Section 01415 - Miscellaneous Requirements and Section 01451 - Contractor's Quality Control.
- D. During crane testing, hoist drives, trolley drives, gantry drives and the spreader HPU shall be operated under their own power. The test shall use the actual motor controls and operated from the operator's cab. All reeving of drums and sheaves will be required to test the spreader and special features of the cranes.
- E. Programming of the crane positioning system, height detection system and spreader features (height sensing and noise reduction) shall be installed and shop tested to demonstrate that they can satisfactorily perform these functions without major malfunctions. Only minor and final adjustments will be permitted during field and acceptance tests.
- F. The anti-collision system and all safety devices including the gantry slow down and stop limit switches shall be active during the tests to demonstrate their ability to function satisfactorily.
- G. CCTV cameras and floodlights shall be activated.
- H. Each crane shall be videotaped during complete field testing as directed by the Engineer.
- I. Operating current measurements for no load and load tests shall be recorded for electrical equipment (motors and coils) using appropriate instrumentation. Speed measurements shall be recorded.
- J. Recorded values; abnormal differences shall be explained in the remarks and submitted for approval or appropriate adjustments performed. In addition, high temperatures or abnormal operation of any equipment or machinery shall be noted, investigated, and corrected.
- K. With the trolley and gantry drives at slow speed, the main power source shall be disconnected verifying that the trolley will stop and that the brake will set. The test shall be conducted 3 times.
- L. During the shop test and field test, improper operation or poor condition of safety devices, electrical components, mechanical equipment, and structural assemblies shall be monitored. Observed defects critical to continued testing shall be reported immediately to the Engineer, and testing shall be suspended until the deficiency is

corrected. During and immediately following each test, the following inspections shall be made:

1. Inspect for evidence of bending, warping, permanent deformation, cracking, or malfunction of structural components.
2. Check for overheating in brake operations; check for proper stopping. All safety devices, including emergency stop switches and "POWER OFF" pushbuttons, shall be tested and inspected separately to barge cell. Verify proper operation of the brakes.
3. Check for abnormal noise or vibration and overheating in machinery drive components.
4. Check electrical drive components for proper operation, freedom from chatter, noise, or overheating.
5. Check that trolley and gantry drivers are synchronized to prevent skewing or racking while operating.
6. Inspect external gears for abnormal wear patterns, damage, or inadequate lubrication.

## 2.13 SHOP TESTS

- A. All permanent conduit and wires shall be installed for the shop test.
- B. In the event that the facility cannot accommodate the total length of the crane rail to travel the gantry, a minimum of seventy five (75) feet will be acceptable to perform the tests. However this does not relieve the Contractor of responsibility for performing this test at the site.
- C. No Load Operational Test
  1. Each crane shall be fully assembled including the spreader and tested without a load. The no load test shall be conducted with an empty refuse container (12 feet H x 20 feet Lg x 8.5 feet W) used for operation at the transfer station. The test shall be conducted for ten (10) complete cycles of operation as follows:
    - a. Hoist/Lower spreader from full up to down position and simultaneously travel trolley or gantry.
    - b. Lower container to ground level and engage and disengage twist locks and flippers during each cycle to simulate container hook up and release.
    - c. Operate spreader side shift feature to simulate positioning of container in both directions.

- d. Actuate trim/list compensation system five (5) degrees in each direction to simulate barge trim position.
- e. Actuate Anti-Sway system and travel gantry and trolley while hoisting/lowering spreader.
- f. Pre-program crane management system to simulate automatic prepositioning of containers, height detection system and noise reduction of spreader.

#### D. Operational Load Test

- 1. The crane shall be subjected to an operational load test by operating the crane through five (5) full cycles of operation at the rated speeds with a certified load of 30 short tons (60,000 pounds) test load. The cranes shall perform the following tests.
  - a. Hoist the test load to assure that the load is supported by the crane and held load by the hoisting brakes.
  - b. Travel the test load by means of the trolley for the full length of the girder in both directions.
  - c. Travel the test load by means of the gantry the full length of the gantry rail in both directions with the trolley and test load at extreme end of the girder (maximum outreach of the crane).
  - d. Lower the test load and stop and hold the load with the brakes during the test.
  - e. Noise level readings shall be recorded and verified in compliance with the noise requirements specified in Part 2, Products, Article 2.04.

### PART 3 EXECUTION

#### 3.01 CRANE INSTALLATION

##### A. General Requirements

- 1. For all installation purposes, the maximum allowed uniform pier load is 600 psf between crane rails for the entire length of the rails with a maximum concentrated load of 15 tons. The maximum allowed uniform pier load along the perimeter between edge of pier to the waterside rail is 100 psf. It is anticipated that fully or partially assembled cranes be unshipped at the South end of the facility. Site bathymetry data, dredge plans and pier arrangements are depicted on the Drawings.

2. The crane manufacturer shall be responsible for all rigging equipment and materials necessary to unship the cranes to the facility fully or partially assembled.
3. The Contractor shall obtain from the manufacturer a crane installation plan and schedule that entails description of crane installation and all rigging mooring required for installation.
4. All devices, equipment and systems furnished under this Contract shall be fabricated and installed so that adequate clearances are provided for operation, maintenance, repair and replacement. It is the Contractor's responsibility to ensure that the crane manufacturer has reviewed the Contract Drawings, conducted a survey of the crane rail installation and conductor bus bar support and ensured that adequate clearances and tolerances are available, and notify the Engineer in the event that such clearances cannot be obtained and tolerances have not been obtained.
5. When field connections are bolted, they shall be made with bolts in holes aligned, drilled and reamed in the shop.
6. All crane structural, mechanical and electrical devices, including panels, junction boxes, limit switches, and accessories, shall be installed.
7. In addition, and before crane Certification is issued, the Contractor shall obtain from the manufacturer certain records, crane test certifications, and other documents, which are specified elsewhere in the Contract Documents. A partial list of such items appears below, but it shall be the Contractor's responsibility to submit to DSNY all items which are required by the Contract Documents:
  - a. One copy of the crane rail and electrical bus bar support system survey with clearances and tolerances.
  - b. One copy of test procedures and electrical load readings taken during the testing.
8. Crane installation and/or erection shall be photographed in accordance with the General Conditions.

**B. Utilities**

1. The input power supply for the specified cranes is 480 volts and as shown on the Drawings and described elsewhere in the specifications. The Contractor shall provide the primary 480-VAC power required during the installation and testing of the crane.
2. Other temporary electrical power, shall also be supplied by the Contractor.

### 3.02 FIELD TESTING

#### A. General

1. Field testing shall conform to the General Testing Requirements specified in Part 2, Products, Article 2.12.
2. The cranes shall be fully assembled cranes with spreader, electrical conductor bus bar and limit switch assemblies, instrumentation, controls and accessories necessary for the proper functioning of each crane and the operating systems as a whole.
3. The cranes shall operate trouble free for a continuous period of time under load as specified below. If there are any interruptions in operation during the test, the test shall be repeated until the equipment or system operates trouble free for the specified time period.
4. All field tests including equipment and system tests shall be performed in accordance with Sections 13 and 14 of the General Conditions, the requirements of the Specifications and as hereinafter supplemented. The requirements contained herein shall apply, whether or not this Section is specifically referenced elsewhere in the Specifications.
5. All tests required for certification shall be performed to the satisfaction of the certifying agency.

- B. No Load Operation Test: Upon completion and inspection of the crane installation, installation of the electrical conductor bus bar system and the gantry travel limit switches, each crane shall be subjected to a no load, rated load and operational load test as specified below. Upon conducting the test, the crane shall be required to function through full operating ranges in all directions specified. During the test, operation of the travel limit switches, over-travel limit switches, anti-collision system, emergency stop, emergency run switches and limit switch recovery features shall be demonstrated to perform as intended. Operation features for the spreader anti-sway system, automated crane positioning feature, height detection and noise reduction shall also be demonstrated specifically at this time.

#### C. Run-Through Test

1. Run cranes at slow speed and verify clearances and operation of electrical conductor bar rail assembly with collector shoes on cranes. At slow speed verify that all safety devices (limit switches, anti-collision devices, bells, rotating beacons) are active and operational. Travel cranes the full length of the pier through full operating range of varying speeds from 0 to max for 3 complete cycles.
2. Raise and lower the spreaders through full range of hoisting speeds from zero to maximum for 3 complete cycles. Raise spreaders to maximum lift to verify

the two block limit switches and up - stop and down - stop on hoist drum operate satisfactorily. Actuate and operate side shifting feature on spreaders in both directions.

3. The trolley shall travel the full length of the girder at varying speeds from zero to maximum – limit and over travel switches shall be demonstrated.
  4. The spreader flippers, twist lock mechanisms and indicator lights shall be operated through 5 complete cycles to demonstrate that all safety switches and interlocks are operational.
  5. Actuate trim/list/skew feature to demonstrate functionality.
  6. Operate cranes and select random positions to barge cell Verify automatic positioning of crane with barge cell guides, shuttle cars and buffered containers stored on pier.
- D. Rated Load Test: The rated load test shall be performed with a certified test load equal to 75,000 pound (37.5 short tons). The test load shall be used as follows:
1. Hoist the test load to assure that the load is supported by the crane and held load by the hoisting brakes.
  2. Travel the test load by means of the trolley for the full length of the girder in both directions.
  3. Travel the test load by means of the gantry the full length of the gantry rail in both directions with the trolley and test load at extreme end of the girder (maximum outreach of the crane). Verify that no racking of the girders is visible as the gantry is traveling in both directions.
  4. Lower the test load and stop and hold the load with the brakes.
  5. Demonstrate that the features of the crane management system and safety devices are operational and functional during this test.
  6. No excessive overheating, excessive noise or excessive vibration shall occur. After testing, a thorough inspection of the crane shall be conducted to barge cell Verify that there is no permanent set, deformation or other damage to any part of the crane machinery, structure, rigging, or spreader and components.
  7. The crane manufacturer shall supply the test tank/s or certified test weights for testing. This equipment will become the property of City of New York after testing.

**E. Operational Load Test (Acceptance Test)**

1. The cranes shall be subjected to an operational (acceptance) test by operating the cranes through full ranges of operation of motions and speeds with a 30 short ton (60,000 pound) test load container.
2. The test shall include loading/unloading a container from a barge with cell guides to the transfer-car(s) at the land side of the pier. The barge shall be inclined to the maximum adverse inclination to demonstrate the capability of the crane to operate under unfavorable conditions. The crane operator shall perform multiple (simultaneous) operations while the test is being conducted. The test shall be conducted for a period of 16 hours continuous operation while stopping for 30 seconds after each complete cycle.
  - a. The test shall demonstrate the maximum duty cycle for one crane by loading/unloading a loaded container from the furthest most shuttle car and loading it into the lowest/furthest cell on the barge with cell guides.
  - b. The operating time for each cycle shall be recorded and compared to the operating design cycle specified in Part 1, General, Article 1.04. A.
3. The cranes shall operate trouble free for the duration of this test. If there are any interruptions during the test, the test shall be repeated until the equipment on system operates trouble free for the specified time period.
4. During the crane test automatic positioning on the crane management system (CMS) and the height detection and noise reduction systems shall be utilized to demonstrate the automated capability of the crane to lift a selected container from the barge to a selected location on the pier or to a shuttle car. The cranes management system shall also monitor and perform diagnostic checks on systems to detect warnings or malfunctions.
5. The cranes shall be subjected to an emergency stop test by traveling in both directions at full speed with a 30 short tons, (60,000-pound) test load.

**3.03 TRAINING****A. Provide training in accordance with Section 01821 - Training and as follows:**

1. A minimum of 40 hours for crane operations
2. A minimum of 40 hours for crane preventive and scheduled maintenance (electrical)

3. A minimum of 40 hours for crane preventive and scheduled maintenance (mechanical)

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 14695**  
**CONSTANT TENSION MOORING WINCHES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section defines the requirements for design, manufacture, installation and testing of electric constant tension (CT) mooring winches for mooring barges. The CT winches shall be marine quality as shown on the Contract Drawings and within this specification.
- B. The transfer station will require two (2) CT winches. One (1) winch shall be designated left hand and One (1) shall be right hand. Gearbox enclosures and electrical controls shall be watertight Electrical motors and control equipment shall be as specified in Paragraphs 2.03 A and B and electrical controls shall be watertight. Two (2) additional CT winches, one left hand and one right hand, shall be provided as spares. The two (2) CT winches shall be provided and identified in accordance with Table 1.

Table 1: Constant Tension Winch Quantities and Identification

CT Winch Identification No.	Left/Right Hand Designation
F-CTW-01	Right
F-CTW-02	Left

- C. The CT winches shall be manufactured in accordance with NABRICO model number DF-BMW-CD-02 (right hand) DF-BMW-CD-01 (left hand) or approved equal as shown on the Contract Drawings and this specification.
- D. A complete console with controls and enclosure shall be provided as part of the CT winch manufacturer's delivery in accordance with Section 17320 - SCADA System – Control Panels and Enclosures and Section 17330 – SCADA System – Panel-Mounted Instruments and Devices. The console shall be configured as shown on the drawings.

### 1.04 SUBMITTALS

- #### A. Furnish all submittals as specified in Section 01330 - Shop Drawings.

### 1.05 SPARE PARTS

- #### A. Spare parts for CT winches shall be provided in accordance with Division 1 and as follows:

- 1. One (1) complete CT winch, left hand
- 2. One (1) complete CT winch, right hand
- 3. One (1) electric motor in accordance with Paragraph 2.03 A
- 4. One (1) set of electrical controls in accordance with Paragraph 2.03 B
- 5. Two (2) winch drums
- 6. Two (2) complete brake assemblies
- 7. Two (2) sets of brake pads
- 8. Two (2) wire ropes, 300 feet, 1 inch diameter, 6 X 37, EIPS right lay, IWRC, prestressed steel, uncoated
- 9. Two (2) roller chain sprockets (motor)
- 10. Two (2) roller chain sprockets (drum)
- 11. Two (2) roller chains
- 12. Two (2) sets of chain links

### 1.06 WARRANTY

- #### A. The Contractor shall guarantee the material and workmanship of the equipment installed under these specifications and make good any defects not due to ordinary

wear or to improper use which may develop within one year after the completion of the installation or acceptance thereof by beneficial use, whichever is earlier.

## PART 2 PRODUCTS

### 2.01 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, provide equipment of one of the following manufacturers or an approved equivalent in accordance with Section 01631 – Equivalent Materials and Equipment:

1. Nashville Bridge Company. (Nabrico)  
Division of Trinity Industries, Inc.  
P.O. Box 239  
Nashville, TN 37202  
Tel.: +1 (615) 442-1300  
Fax: +1 (615) 442-1313  
<http://www.nabrico-marine.com>
2. Superior Lidgerwood-Mundy, Corp  
302 Grand Avenue  
P.O. Box 39  
Superior, WI 54880  
Tel.: +1 (715) 394-4444; +1 (888) 511-7922  
Fax: +1 (715) 394-6199  
<http://www.lidgerwood.com>  
Contact: Vicki McCusker
3. Appleton Marine, Inc.  
3030 E. Pershing Street  
P.O. Box 9020  
Appleton, WI 54911-9020  
Tel.: +1 (920) 738-5432  
Fax: +1 (920) 738-5435

## 2.02 CT WINCH SYSTEM AND COMPONENTS

### A. Typical CT winch

1. Width 33 inches
2. Length 69 inches
3. Height 70 inches
4. Weight 7000 lbs (Approximately)

### B. Drum Dimension

1. 18 inches – Diameter
2. 10 inches – Width

### C. wire Capacity

1. 1.0-inch diameter wire rope 6 X 37 Extra Improved Plow Steel (E.I.P.S), Independent Wire Rope Core (I.W.R.C) right lay, pre-stressed steel, uncoated
2. Breaking strength 103,400 lbs
3. 300 feet maximum length

### D. Performance

1. 55,000 lbs. starting line pull @ second layer of drum
2. 40,000 lbs. running line pull @ second layer of drum
3. 0 to 30 fpm-Speed

### E. Operation

1. The two (2) CT winches at the transfer station shall be controlled individually or in unison, locally at either winch or from the Operations Room inside the transfer station.
2. When the barge is at the correct mooring position at the pier, the winch control shall be set to "Automatic" and the motor shall be locked into dynamic holding constant tension mode. As the tension on the line increases, the motor, utilizing dynamic braking, shall allow the winch to pay out only the amount of wire rope necessary to maintain the preset tension. As line tension decreases,

the motor shall sense the slack line and recover the wire, continuing to maintain the preset tension.

3. The CT winch shall be equipped with an automatic safety disc brake and a means to measure the length of line released. Upon reaching a prescribed maximum length of line, the winch shall automatically set the brake, preventing further movement of the barge. The disc brake shall be designed to hold the wire to the breaking strength.
4. The CT winches shall be programmed to allow the following three modes of operation:
  - a. Mode 1 CONSTANT TENSION - Both winches shall be designed to maintain a constant mooring line pull preventing the movement of the barge. The winches shall allow the barge to react to the rise and fall of the tide or draft change without shifting position.
  - b. Mode 2 CONSTANT TENSION DURING BARGE POSITIONING - The winches shall be designed to operate simultaneously, maintaining a constant tension on the mooring lines, with one winch "hauling in" while the other winch "pays out" as directed by the operator. This will allow the barge to be repositioned along the face of the pier as loading requirements change. Control levers (joysticks) located on the control console on each winch and in the Operations Room shall be provided to perform this function. The constant tension of the mooring lines shall keep the barge hard against the pier fenders.
  - c. Mode 3 CONSTANT TENSION OFF - The winches shall be designed to permit independent manual operation to allow barges to be shifted.

#### F. Installation

1. The CT winches shall be installed and oriented left and right hand as shown on the Contract Drawings.
2. Provide mounting flanges suitable for installation as shown on the Contract Drawings.

### 2.03 ELECTRICAL EQUIPMENT

#### A. Electric Motor

1. 40 HP, 480 Volts, 3 ph, 60 Hz
2. Ambient: -20 to +120 Degrees F
3. Duty: Continuous

4. Enclosure: Totally enclosed non-ventilated (TENV), with sealed windings and connection. Motor shall be corrosion resistant when exposed to a salt-water environment.
5. Features: Automatic drain valve, 120 VAC space heater

**B. Electrical Equipment**

1. 40 HP, 480 Volts, 3 ph, 60 Hz
2. Ambient: -20 to +120 Degrees F
3. Duty: Continuous
4. Enclosure: NEMA 4X – Equipment shall operate outdoors in all weather conditions. Enclosure shall be corrosion resistant exposed to a salt-water environment.
5. Equipment designed for indoor use shall be NEMA 12 enclosed, minimum.
6. Features: Motor controller shall have 120 VAC space heater

**C. Controls**

1. CT winches shall be operated individually or in unison from either winch at a local control station or in unison from the Operations Room and shall be configured as shown in the Contract Drawings. The local control panel shall be mounted on the winch by the manufacturer. The Contractor shall fabricate the winch control console and mount the master control panel in place for installation in the Operations Room as shown on the Contract Drawings.
2. CT winch shall be fully adjustable and shall be pre-set to 40,000 lbs tension.
3. Each CT winch shall be designed to detect and relay malfunctions to the primary SCADA system located in the Operations Room.

**2.04 PAINTING**

**A. CT winches shall be coated as follows:**

1. Coating/Painting
  - a. The CT winches shall be painted gloss black with a three (3) part Zinc epoxy painting system as specified herein.

- b. Difficult to spray areas, such as sharp plate edges, shall be power tool broken (chamfered or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
- c. The paint system shall not crack or flake off within the guarantee period. The CT winches shall be coated with durable finishes providing the required colors.

## 2. Surface Preparation

- a. Surfaces shall be thoroughly prepared in accordance with SSPC-SP 10. Oil and grease shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.
- b. Three types of coatings shall be used for the entire winch surfaces. Coatings shall consist of a primer, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - (1) Primer: One coat of Epoxy Zinc rich primer applied at the manufacturer's plant with a dry film thickness of at least 65 microns
  - (2) Intermediate: One coat of Epoxy Micaceous iron oxide applied at the manufacturer's plant with a dry film thickness of at least 140 microns.
  - (3) Finish: Two coats of polyurethane recoatable finish applied at the manufacturer's plant with a dry film thickness of at least 40 microns each.

## 3. Miscellaneous

- a. Coatings for the interior surfaces shall be similar to the external surfaces except that a minimum total dry film thickness of 155 microns is required for these parts.
- b. Structures damaged during transportation, storage and erection shall be painted on site in accordance with the requirements described above.
- c. Non-ferrous metals, corrosion resisting steel, machined surfaces, and surfaces in sliding or friction contact shall not be painted.
- d. Machinery units, electrical equipment and panels, and other purchased components shall have the manufacturer's standard paint system and shall not be coated except as required to touch up paint damaged in

handling or assembly. Exterior components shall be given one finish coat to color coordinate with the final CT winch color scheme.

- e. Surfaces which do not require coating shall be protected during the coating of adjacent work. Machine-finished ferrous parts and surfaces, which do not require painting, shall be coated with a suitable rust preventative compound immediately after cleaning.
- f. Machined surfaces shall be coated with rust protection lacquer. For standard components e.g. motors, gear boxes etc. the manufacturer's standard coat shall be used.

### PART 3 EXECUTION

#### 3.01 PRELIMINARY AND FINAL FIELD TESTS

- A. All tests shall be in accordance with Section 01811 – Preliminary and Final Field Tests and as specified herein.
- B. CT winches shall be fully assembled at the manufacturer's facility prior to shipment. The manufacturer shall shop test one winch to demonstrate the capability of the winch, and compliance with this specification as follows:
  - 1. No load run thru at maximum speeds
  - 2. 100% Full load at full speed.
  - 3. 125% of rated load static test at zero speed.
- C. After installation, a site acceptance test shall be performed. Tests shall be performed in accordance with Paragraph 3.01 B above and as follows:
  - 1. CT winches shall be tested as a system with the guide sheaves and four roller fairleads. The test shall demonstrate that the system can safely handle the loads specified herein.
- D. When all defects and faults have been resolved and approved in writing, and it has been proven that the CT winches meet the specified performance requirements, and upon completion of training, the supplied winches shall be deemed to have been accepted.

-END OF SECTION-

**Section 14696**  
**MOORING CAPSTANS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section defines and includes the requirements for design, manufacture, installation and testing of electric mooring capstans for mooring and shifting barges. The mooring capstans shall be marine quality as outlined on the Contract Drawings and in this specification.
- B. The transfer station will require three (3) capstans. All capstans shall be furnished with electric motors and control equipment as specified in Paragraphs 2.03 A and B. All gearboxes and electrical controls shall be watertight. One (1) additional capstan shall be provided as a spare, for a total of four (4).
- C. The capstans shall be NABRICO Drawing DF-C-15-13-45-E or an approved equal as shown on the Contract Drawings and indicated by this specification.

1.04 SUBMITTALS

- A. Furnish all submittals as specified in Section 01330 – Shop Drawings.

1.05 SPARE PARTS

- A. Spare parts for capstans at the transfer station shall be provided in accordance with Division 1 and as follows:
  - 1. One (1) complete capstan with submersible motor in accordance with Paragraph 2.03 A
  - 2. One (1) electric motor in accordance with Paragraph 2.03 A
  - 3. One (1) set of electrical controls in accordance with Paragraph 2.03 B
  - 4. One (1) complete brake assembly
  - 5. One (1) head (barrel) 15-inch diameter
  - 6. Three (3) sets of motor couplings

1.06 WARRANTY

- A. The Contractor shall guarantee the material and workmanship of the equipment installed under these specifications and make good any defects not due to ordinary wear or to improper use which may develop within one year after the completion of the installation or acceptance thereof by beneficial use, whichever is earlier.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Subject to compliance with requirements, provide equipment of one of the following manufacturers or an approved equivalent in accordance with Section 01631 – Equivalent Materials and Equipment:
  - 1. Nashville Bridge Company. (Nabrico)  
Division of Trinity Industries, Inc.  
P.O. Box 239  
Nashville, TN 37202  
Tel.: +1 (615) 442-1300  
Fax: +1 (615) 442-1313  
<http://www.nabrico-marine.com>

2. Jered LLC  
103 Shipyard Drive  
P.O. Box 904  
Brunswick, GA 31521-0904  
Tel.: +1 (912) 262-2000  
Fax: +1 (912) 262-2051  
<http://www.jered.com>
3. Superior Lidgerwood-Mundy, Corp  
302 Grand Avenue  
P.O. Box 39  
Superior, WI 54880  
Tel.: +1 (715) 394-4444; +1 (888) 511-7922  
Fax: +1 (715) 394-6199  
Contact: Vicki Mc Cusker  
<http://www.lidgerwood.com>
4. Coastal Marine Equipment, Inc  
20995 Coastal Parkway Gulfport, MS 39503  
Tel: (228) 832-7655 Fax: (228) 832-7675  
Contact: Anthony Gauthier

## 2.02 CAPSTAN SYSTEM AND COMPONENTS

- A. Brake motor shall be NEMA design "D", 30-minute duty, TENV, designed for wash down duty, with motor brakes. Motor shall have a removable weatherproof cover, and shall be painted the same as the capstan. The cover shall completely enclose the motor and terminal box and be fastened to the foundation by approved means.
- B. Combination starter control shall be included – circuit breaker type, full voltage, combination starter, in NEMA 4 enclosure, external reset, internal circuit breaker, coil and control circuit transformer and start/stop push button station located as required. Mushroom type lock-off panic button shall be installed at the base of the capstan head. All push-button station/lock-off panic buttons shall be weatherproof and dustproof type to meet the NEMA standard. The lock off panic button shall be engraved "Emergency Stop". Push buttons shall be Cutler-Hammer type or an approved equal.
- C. Typical Mooring Capstan Dimensions
  1. Width 31.5 inches
  2. Length 33.5 inches
  3. Height 40 inches
- D. Head Dimensions: 15 inches Diameter

## E. Performance

1. 15 HP motor with brake, 460 Volts, 3 ph, 60 Hz
2. 24,900 lbs. starting line pull
3. 12,450 lbs. running line pull
4. 45 FPM single speed
5. 50,000 lbs. static pull (bollard)

## 2.03 ELECTRICAL EQUIPMENT

## A. Electric Motor

1. 15 HP, 460 Volts, 3 ph, 60 Hz
2. Ambient: -20 to +120 Degrees F
3. Duty: 30-minute
4. Enclosure: Totally enclosed, non-ventilated (TENV), watertight. Motor shall be corrosion resistant when exposed to a salt-water environment.
5. Features: Automatic drain valve, 120 VAC space heater

## B. Electrical Control System

1. 15 HP, 460 Volts, 3 ph, 60 Hz
2. Ambient: -20 to +120 Degrees F
3. Duty: Continuous
4. Enclosure: NEMA 4X – Equipment shall operate outdoors in all weather conditions. Enclosure shall be corrosion resistant when exposed to a salt-water environment.
5. Equipment designed for indoor use shall be NEMA 12 enclosed, minimum.
6. Features: Motor Controller shall have 120 VAC space heater.

## C. Controls

1. Each capstan shall be operated locally.
2. Each capstan shall be designed to detect and relay malfunctions via the primary SCADA system to the Operations Room.

## 2.04 PAINTING

## A. Coating/Painting

1. The main structure of the capstans shall be painted gloss black with a three (3) part Zinc epoxy painting system as specified herein. The capstan heads shall be painted Safety Yellow with a three (3) part Zinc epoxy system as specified herein.
2. Difficult to spray areas, such as sharp plate edges, shall be power tool broken (chamfered or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
3. The paint system shall not crack or flake off within the guarantee period. The capstans shall be coated with durable finishes providing the required colors.

## B. Surface Preparation

1. Surfaces shall be thoroughly prepared in accordance with SSPC SP-10. Oil and grease shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.
2. Three types of coatings shall be used for the entire capstan surfaces. Coatings shall consist of a primer, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - a. Primer: One coat of Epoxy Zinc rich primer applied at the manufacturer's plant with a dry film thickness of at least 65 microns
  - b. Intermediate: One coat of Epoxy Micaceous iron oxide applied at the manufacturer's plant with a dry film thickness of at least 140 microns.
  - c. Finish: Two coats of polyurethane recoatable finish applied at the manufacturer's plant with a dry film thickness of at least 40 microns each

## C. Miscellaneous

1. Coatings for the interior surfaces shall be similar to the external surfaces except that a minimum total dry film thickness of 155 microns is required for these parts.
2. Structures damaged during transportation, storage and erection shall be painted on site in accordance with the requirements described above.
3. Non-ferrous metals, corrosion resisting steel, machined surfaces, and surfaces in sliding or friction contact shall not be painted.

4. Machinery units, electrical equipment and panels, and other purchased components shall have the manufacturer's standard paint system and shall not be coated except as required to touch up paint damaged in handling or assembly. Exterior components shall be given one finish coat to color coordinate with the final capstan color scheme.
5. Surfaces which do not require coating shall be protected during the coating of adjacent work. Machine-finished ferrous parts and surfaces, which do not require painting, shall be coated with a suitable rust preventative compound immediately after cleaning.
6. Machined surfaces shall be coated with rust protection lacquer. For standard components e.g. motors, gear boxes etc. the manufacturer's standard coat shall be used.

### PART 3 EXECUTION

#### 3.01 PRELIMINARY AND FINAL FIELD TESTS

- A. All tests shall be in accordance with Section 01811 - Preliminary and Final Field Tests and as specified herein.
- B. Capstans shall be fully assembled at the manufacturer's facility prior to shipment. One capstan shall be shop tested to demonstrate the capability of the design and compliance with this specification as follows:
  1. No-load run-through at maximum speeds
  2. 100% Full Load run-through at full speed
  3. 125% of the rated load static test at zero speed
- C. After installation, each capstan shall be field tested to demonstrate that it can moor or shift a barge to meet the intended design. Testing shall be in accordance with Section 01811 - Preliminary and Final Field Tests. .

-END OF SECTION-

**Section 14697**  
**MARINE CLEATS AND BOLLARDS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This section defines the requirements for design, manufacture and testing of marine cleats and bollards for mooring and shifting barges. The cleats shall be marine quality as outlined in this specification.
- B. The transfer station will require a total of four (4) cleats and two (2) bollards. One (1) additional cleat and one (1) additional bollard shall be provided as spares, for a combined total of five (5) cleats and three (3) bollards.
- C. Each cleat shall be 42-inch cast steel Model CSC-3 as manufactured by MacElroy or approved equal as shown in the Contract Drawings and this specification.
- D. Each single horn bollard shall be cast steel Model CSB-4 as manufactured by MacElroy or approved equal as shown in the Contract Drawings and this specification.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05561 – Miscellaneous Metal Castings

**1.03 REFERENCES**

Codes and Standards referred to in this section are:

- A. ASTM – American Society for Testing and Materials
- B. SSPC – Society for Protective Coatings

**1.04 SUBMITTALS**

- A. Furnish all submittals as specified in Section 01330 – Shop Drawings.

**1.05 SPARE PARTS**

- A. A. Spare parts shall be in accordance with Division 1 and as follows:
  - 1. One (1) Cleat
  - 2. One (1) Bollard

## 1.06 WARRANTY

- A. The Contractor shall guarantee the material and workmanship of the equipment installed under these specifications and make good any defects not due to ordinary wear or to improper use which may develop within one year after the completion of the installation or acceptance thereof by beneficial use, whichever is earlier.

## PART 2 PRODUCTS

## 2.01 ACCEPTABLE VENDORS

- A. Subject to compliance with requirements, provide equipment of one of the following vendors or an approved equivalent in accordance with Section 01631 - Equivalent Materials and Equipment:

1. J. C. MacElroy Company., Inc.  
91 Ethel Road W.  
P.O. Box 850  
Piscataway, NJ 08855  
Tel.: +1 (732) 572-7100; +1 (800) 622-3576  
<http://www.macelroy.com>
2. Anchor Marine and Industrial Supply, Inc.  
6545 Lindbergh  
Houston, TX 77258  
Tel.: +1 (713) 644-1183; +1 (800) 233-8014  
Fax: +1 (713) 644-1185  
<http://www.anchormarinehouston.com>
3. Nabrico Products, Division of Trinity Industries, Inc.  
P.O. Box 239  
Nashville, TN 37202  
Tel.: +1 (713) 644-1183; +1 (800) 233-801 Tel.: +1 (615) 442-1300  
Fax: +1 (615) 442-1313  
<http://www.nabrico-marine.com>

## 2.02 REQUIREMENTS

- A. Each cleat and bollard shall be designed and manufactured in accordance with the Contract Drawings and as follows.
- B. Cleat
1. Material – cast steel conforming to ASTM-A-27, Gr 65-35.

2. Cleat shall be designed for 25 short ton Safe Working Load at 30-degree angle of pull as shown on the Contract Drawings, with a factor of safety of 3 based on the Safe Working Load.
3. Cleats shall be furnished with mounting holes required to anchor each unit to the pier as shown on the Contract Drawings.

C. Bollard

1. Maximum safe working load of 52 short tons under the horn horizontally, with a factor of safety of 3 based on the Safe Working Load.
2. Material – cast steel – ASTM-A-27 Gr 65-35.
3. Bollards shall be furnished with mounting holes for anchoring to the pier as shown on the Drawings.
4. Core shall be filled with concrete prior to delivery.

2.03 PAINTING

A. Coating/Painting

1. The cleats and bollards shall be painted with a three (3) part Zinc epoxy painting system as specified herein. Cleats and bollards shall be painted Safety Yellow.
2. Difficult to spray areas, such as sharp edges, shall be power tool broken (chamfered or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
3. The paint system shall not crack or flake off within the guarantee period. Cleats and bollards shall be coated with durable finishes providing the required colors.

B. Surface Preparation

1. Surfaces shall be thoroughly prepared in accordance with SSPC-SP 10. Oil and grease shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.

2. Three types of coatings shall be used for the entire surfaces of cleats and bollards. Coatings shall consist of a primer, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - a. Primer: One coat of Epoxy Zinc rich primer applied at the manufacturer's plant with a dry film thickness of at least 65 microns
  - b. Intermediate: One coat of Epoxy Micaceous iron oxide applied at the manufacturer's plant with a dry film thickness of at least 140 microns.
  - c. Finish: Two coats of polyurethane recoatable finish applied at the manufacturer's plant with a dry film thickness of at least 40 microns each.
- C. Fittings damaged during transportation, storage or installation shall be painted on site in accordance with the requirements described above.

### PART 3 EXECUTION

#### 3.01 TESTS

- A. The manufacturer shall shop test one (1) cleat and one (1) bollard at its facility to demonstrate that they meet the requirements of its design. The manufacturer shall provide test a certificate for each test conducted.

-END OF SECTION-

**Section 14698**  
**MARINE FAIRLEAD SHEAVES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section defines the requirements for design, manufacture, and testing of marine fairlead guide sheave assemblies for mooring barges. The sheave assemblies shall be used to fairlead 1-inch diameter wire rope between the constant tension (CT) winch and the marine roller fairlead assembly at each end of the pier. The sheave assemblies shall be marine quality as outlined in this specification.
- B. The transfer station will require two (2) sheave assemblies. One (1) additional sheave assemblies shall be provided as a spare, for a combined total of three (3).
- C. Each sheave assembly shall be in accordance with Smith-Berger, Model No. MC-1214-BD or approved equal as shown on the Contract Drawings, and within this specification.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05500 – Metal Fabrications
- B. Section 05561 – Miscellaneous Metal Castings
- C. Section 05120 – Structural Steel

**1.03 REFERENCES**

- A. Codes and Standards referred to in this section are:
  - 1. AISC – American Institute of Steel Construction
  - 2. ASTM – American Society for Testing and Materials
  - 3. AWS – American Welding Society
  - 4. SAE – Society of Automotive Engineers
  - 5. SSPC – Society for Protective Coatings

**1.04 SUBMITTALS**

- A. Furnish all submittals as specified in Section 01330 – Shop Drawings.

**1.05 SPARE PARTS**

- A. Spare parts shall be in accordance with Division 1 and as follows:
  - 1. One (1) complete sheave assembly
  - 2. One (1) sheave

3. One (1) alloy steel shaft
4. Two (2) grease impregnated bronze bearings

## 1.06 WARRANTY

- A. The Contractor shall guarantee the material and workmanship of the equipment installed under these specifications and make good any defects not due to ordinary wear or to improper use which may develop within one year after the completion of the installation or acceptance thereof by beneficial use, whichever is earlier.

## PART 2 PRODUCTS

### 2.01 ACCEPTABLE MANUFACTURERS

- A. Subject to compliance with requirements, provide equipment of one of the following manufacturers or an approved equivalent in accordance with Section 01631 - Equivalent Materials and Equipment:

1. Smith -Berger Marine, Inc.  
7915 10th Avenue South  
Seattle, WA 98108  
Tel.: (206) 764-4650  
Fax: (206) 764-4653  
<http://www.smithberger.com>
2. The Crosby Group, Inc.  
2801 Dawson Road  
Tulsa, OK 74110  
Tel.: +1 (918) 834-4611  
Fax: +1 (918) 832-8833  
Sales Representative Contact, New York area:  
Brett Woodland +1 (860) 428-2708  
<http://www.thecrosbygroup.com>
3. Skookum, Inc.  
6160 S. Whiskey Hill Road  
Hubbard, OR 97032  
Tel.: +1 (503) 651-3175  
Fax: +1 (503) 651-3409  
Contact: [skookum@ulvencompanies.com](mailto:skookum@ulvencompanies.com)  
<http://www.thomasregister.com/olc/skookum>

### 2.02 REQUIREMENTS

- A. Each guide sheave assembly shall be designed and fabricated as shown on the Drawings and in accordance with this specification.

- B. Minimum design temperature of - 20 degrees Fahrenheit for above water operation.
- C. The sheave mounting base shall be manufactured from steel plate ASTM A572 and provided with bolt holes in the base for mounting to a sub-base as shown on the Drawings.
- D. The guide sheave shall be furnished with a 14 inch outside diameter, 11-7/16 inch tread diameter, cast steel, SAE 1040/1045. Sheaves shall be grooved for one inch (1") diameter wire rope. All sheave surfaces shall be finished such that they are free from burrs, sharp edges and other surface imperfections. The wire rope groove shall be flame hardened to 40 Rockwell C scale.
- E. The sheaves shall have grease impregnated bronze bearings designed to rotate on steel shafts.

## 2.03 PAINTING

- A. Guide sheaves shall be coated as follows:

### 1. Coating/Painting

- a. The guide sheaves shall be painted with a three (3) part Zinc epoxy painting system as specified herein. Sheaves shall be painted Safety Yellow.
- b. Difficult to spray areas, such as sharp plate edges, shall be power tool broken (chamfered or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
- c. The paint system shall not crack or flake off within the guarantee period. Sheaves shall be coated with durable finishes providing the required colors.

### 2. Surface Preparation

- a. Surfaces shall be thoroughly prepared in accordance with SSPC-SP 10. Oil and grease shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.

- b. Three types of coatings shall be used for the entire guide sheave surfaces. Coatings shall consist of a primer, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - (1) Primer: One coat of Epoxy Zinc rich primer applied at the manufacturer's plant with a dry film thickness of at least 65 microns
  - (2) Intermediate: One coat of Epoxy Micaceous iron oxide applied at the manufacturer's plant with a dry film thickness of at least 140 microns.
  - (3) Finish: Two coats of polyurethane recoatable finish applied at the manufacturer's plant with a dry film thickness of at least 40 microns each.
- B. Fittings damaged during transportation, storage or installation shall be painted on site in accordance with the requirements described above.

### PART 3 EXECUTION

#### 3.01 FIELD TESTS

- A. All tests shall be in accordance with Section 01811 - Preliminary and Final Field Tests and as follows:
  - 1. The fairlead sheaves shall be tested in conjunction with testing of the constant tension winches and roller fairleads.

-END OF SECTION-

**Section 14699**  
**MARINE FOUR ROLLER FAIRLEADS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This section defines the requirements for design, manufacture, and testing of marine four roller fairlead for mooring barges. The four roller fairlead shall be marine quality as outlined in this specification. The four roller fairlead will be used to lead 1-inch diameter wire rope from the constant tension winch and sheave assembly to barges.
- B. The transfer station will require two (2) four roller fairleads each. One (1) additional four roller fairlead shall be provided as a spare, for a combined total of three (3) fairleads.
- C. Each four roller fairlead assembly shall be in accordance with Smith-Berger model No. FR4-8-BD or approved equal as shown on the Contract Drawings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 05120 – Structural Steel
- B. Section 05500 – Metal Fabrications

**1.03 REFERENCES**

- A. Codes and Standards referred to in this section are:
  - 1. AISC – American Institute of Steel Construction
  - 2. ASTM – American Society for Testing and Materials
  - 3. AWS – American Welding Society
  - 4. SSPC – Society for Protective Coatings

**1.04 SUBMITTALS**

- A. Furnish all submittals as specified in Section 01330 – Shop Drawings.

**1.05 SPARE PARTS**

- A. Spare parts shall be in accordance with Division 1 and as follows:
  - 1. One (1) complete four roller fairlead assembly
  - 2. Two (2) rollers
  - 3. Two (2) roller shafts
  - 4. Four (4) grease impregnated bronze bearings

1.06 WARRANTY

- A. The Contractor shall guarantee the material and workmanship of the equipment installed under these specifications and make good any defects not due to ordinary wear or to improper use which may develop within one year after the completion of the installation or acceptance thereof by beneficial use, whichever is earlier.

PART 2 PRODUCTS

2.01 ACCEPTABLE VENDORS

- A. Subject to compliance with requirements, provide equipment of one of the following vendors or an approved equivalent in accordance with Section 01631 - Equivalent Materials and Equipment:

1. Smith –Berger Marine, Inc.  
7915 10th Avenue South  
Seattle, WA 98108  
Tel.: (206) 764-4650  
Fax: (206) 764-4653  
<http://www.smithberger.com>
2. Anchor Marine and Industrial Supply  
P.O. Box 58645  
6545 Lindbergh  
Houston, TX 77258  
Tel.: (713) 644-1183; (800) 233-8014  
Fax: (713) 644-1185  
Contact: [Gabriel@anchormarinehouston.com](mailto:Gabriel@anchormarinehouston.com)  
<http://www.anchormarinehouston.com>
3. Nabrico Products, Division of Trinity Industries, Inc.  
P.O. Box 239  
Nashville, TN 37202  
Tel.: (615) 442-1300  
Fax: (615) 442-1313  
<http://www.nabrico-marine.com>

2.02 REQUIREMENTS

- A. Each four-roller fairlead shall be designed in accordance with the drawing and as follows:
  1. Minimum design temperature of -20 degrees Fahrenheit for above water operation.

2. The fairlead shall be furnished with four (4) 8-inch diameter rollers manufactured from hardened alloy steel tubing having a minimum surface hardness of 40 Rockwell C scale. The rollers shall be positioned to provide an 8-inch square opening.
3. The mounting base and frame of the roller fairlead shall be fabricated from steel plate ASTM A572 with holes in the base plate as shown on the Drawing.
4. The rollers shall have grease impregnated bronze bearings designed to rotate on steel shafts.

## 2.03 PAINTING

### A. Coating/Painting

1. The roller fairleads shall be painted with a three (3) part Zinc epoxy painting system as specified herein. Roller fairleads shall be painted Safety Yellow.
2. Difficult to spray areas, such as sharp plate edges, shall be power tool broken (chamfered or rounded) and stripe coated before spray application, in order to obtain an even film thickness on all places.
3. The paint system shall not crack or flake off within the guarantee period. Roller fairleads shall be coated with durable finishes providing the required colors.

### B. Surface Preparation

1. Surfaces shall be thoroughly prepared in accordance with SSPC-SP 10. Oil and grease shall be removed by suitable solvents. No coating shall be applied unless the surface has been cleaned and is dry and free from rust, loose mill scale, dirt, oil, grease and other foreign substances.
2. Three types of coatings shall be used for the entire roller fairlead surfaces. Coatings shall consist of a primer, an intermediate coat and finish coats, with at least 285 microns total dry film thickness as follows:
  - a. Primer: One coat of Epoxy Zinc rich primer applied at the manufacturer's plant with a dry film thickness of at least 65 microns.
  - b. Intermediate: One coat of Epoxy Micaceous iron oxide applied at the manufacturer's plant with a dry film thickness of at least 140 microns.
  - c. Finish: Two coats of polyurethane recoatable finish applied at the manufacturer's plant with a dry film thickness of at least 40 microns each.

- C. Fittings damaged during transportation, storage or installation shall be painted on site in accordance with the requirements described above.

### PART 3 EXECUTION

#### 3.01 PRELIMINARY AND FINAL FIELD TESTS

- A. All tests shall be in accordance with Section 01811 - Preliminary and Final Field Tests and as follows:
  - 1. The marine four roller fairleads shall be tested in conjunction with the testing of the constant tension winches and fairlead sheaves.

-END OF SECTION-

**Section 15050**  
**BASIC MECHANICAL MATERIALS AND METHODS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes the following:
1. Piping materials and installation instructions common to most piping systems
  2. Transition fittings
  3. Dielectric fittings
  4. Mechanical sleeve seals
  5. Sleeves
  6. Escutcheons
  7. Grout
  8. Equipment installation requirements common to equipment sections
  9. Painting and finishing
  10. Concrete bases
  11. Supports and anchorages

**1.02 RELATED SPECIFICATIONS**

- A. Section 15076 - Piping And Equipment Identifications  
B. Section 15771 - Electric Heat Tracing Systems

**1.03 DEFINITIONS**

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, and crawlspaces.
- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

## 1.04 SUBMITTALS

## A. Product Data: For the following:

1. Transition fittings
2. Dielectric fittings
3. Mechanical sleeve seals
4. Escutcheons

## B. Welding certificates

## 1.05 QUALITY ASSURANCE

## A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel"

## B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications"

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping"
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

## 1.06 DELIVERY, STORAGE, AND HANDLING

## A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

## 1.07 COORDINATION

## A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

## B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

## C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces.

## PART 2 PRODUCTS

## 2.01 PIPE, TUBE, AND FITTINGS

## A. Refer to individual Division 15 piping Sections for pipe, tube, and fitting materials and joining methods.

- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

## 2.02 JOINING MATERIALS

- A. Refer to individual Division 15 piping Sections for special joining materials not listed below.
- B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
  - 1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
    - a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
  - 2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.
- C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- E. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.
- F. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- G. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

## 2.03 TRANSITION FITTINGS

- A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
  - 1. Manufacturers
    - a. Cascade Waterworks Mfg. Co.
    - b. Dresser Industries, Inc.; DMD Div.
    - c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
    - d. JCM Industries
    - e. Smith-Blair, Inc.
    - f. Viking Johnson
    - g. Or approved equal

2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling
3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling
4. Aboveground Pressure Piping: Pipe fitting

#### 2.04 DIELECTRIC FITTINGS

- A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
- B. Insulating Material: Suitable for system fluid, pressure, and temperature.
- C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.

1. Manufacturers

- a. Capitol Manufacturing Co.
- b. Central Plastics Company
- c. Eclipse, Inc.
- d. Epco Sales, Inc.
- e. Hart Industries, International, Inc.
- f. Watts Industries, Inc.; Water Products Div.
- g. Zurn Industries, Inc.; Wilkins Div.
- h. Or approved equal

- D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150 psig minimum working pressure as required to suit system pressures.

1. Manufacturers

- a. Capitol Manufacturing Co.
- b. Central Plastics Company
- c. Epco Sales, Inc.
- d. Watts Industries, Inc.; Water Products Div.
- e. Or approved equal

- E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.

1. Manufacturers

- a. Advance Products & Systems, Inc.
- b. Calpico, Inc.
- c. Central Plastics Company
- d. Pipeline Seal and Insulator, Inc.
- e. Or approved equal

2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

- F. Dielectric Couplings: Galvanized-steel coupling with inert and non-corrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers

- a. Calpico, Inc.
- b. Lochinvar Corp.
- c. Or approved equal

- G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers

- a. Perfection Corp.
- b. Precision Plumbing Products, Inc.
- c. Sioux Chief Manufacturing Co., Inc.
- d. Victaulic Co. of America
- e. Or approved equal

## 2.05 MECHANICAL SLEEVE SEALS

- A. Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

1. Manufacturers

- a. Advance Products & Systems, Inc.
- b. Calpico, Inc.
- c. Or approved equal

## 2.06 SLEEVES FOR PIPES

- A. Sleeves and materials for sealing sleeves for gas piping through exterior walls and floor slabs on earth shall be as specified and approved by the Gas Company.
- B. Sheet metal sleeves shall be 20 gauge.
- C. Pipe sleeves shall be service weight cast iron pipe or schedule 40 galvanized steel pipe.
- D. Fire stop penetration materials for sealing sleeves shall be listed by Underwriters Laboratories and shall have Material and Equipment Acceptance (MEA) approval. The materials shall be as specified in Section 07842 - Fire-Resistive Joint Materials.
- E. Material for sealing spaces between pipe and sleeve through all walls below and above grade shall be Roxtec Sealing System as manufactured by; Roxtec International. Seals shall be modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and sleeve. Links shall be loosely assembled with bolts to form a continuous rubber bolt around the pipe with a pressure plate under each bolt head and nut.
- F. Materials for sealing space between each pipe and sleeve through non-fire rated exterior walls above grade shall be Non-shrinking cement
- G. Waterproof sleeves shall be Roxtec Sealing System as manufactured by Roxtec International or approved equal.

## 2.07 ESCUTCHEONS PLATES

- A. Galvanized cast-iron with set screw as manufactured by Grinnell, Fig. No. 395 or Carpenter & Paterson, Inc. Submit manufacturer product technical data.
- B. Galvanized cast iron escutcheons with set screw shall be chrome plated for use in finished rooms or spaces.
- C. Chrome plated cast brass with brass set screws as manufactured by Kohler or McGuire Mfg. Co., Catalog No. 127. Submit manufacturer product technical data.

## 2.08 GROUT

- A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
  - 1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
  - 2. Design Mix: 5000-psi, 28-day compressive strength.

### 3. Packaging: Premixed and factory packaged

## PART 3 EXECUTION

### 3.01 PIPING SYSTEMS - COMMON REQUIREMENTS

- A. Install piping according to the following requirements and Division 15 Sections specifying piping systems.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- F. Install piping to permit valve servicing.
- G. Install piping at indicated slopes.
- H. Install piping free of sags and bends.
- I. Install fittings for changes in direction and branch connections.
- J. Install piping to allow application of insulation.
- K. Select system components with pressure rating equal to or greater than system operating pressure.
- L. Sleeves for Pipes
  - 1. General: All plumbing pipes passing through floors, roofs, walls, partitions, furring, beams, trenches, and wherever else indicated on drawings shall be provided with sleeves installed and maintained by the Contractor. Core drilled holes shall be provided with sleeves. Where plumbing pipes pass through potentially wet floors that do not have membrane waterproofing such as toilet rooms, janitor's sink closet, mechanical equipment rooms, pipe chases and areas that are provided with fire protection sprinkler systems, the

Contractor shall install sleeves of galvanized steel pipe with welded clips or equivalent at bottom ends for securing sleeves to form work and shall project one inch above finished floors, and shall be caulked watertight.

2. Sleeves for gas service piping through exterior walls below grade and floor slabs on earth shall be installed and sealed in accordance with the latest regulations of the Administrative Code of the City of New York. Sleeves for gas piping and gas vents through exterior walls shall be installed and sealed in accordance with the requirements of the serving utility. The space between each pipe and its sleeve through floor slabs on earth and exterior walls above grade for all other piping shall be sealed tightly with picked oakum and molten lead. The lead caulking shall finish flush with the face of the sleeve. The space between each pipe and its sleeve through exterior walls below grade for all other piping shall be sealed tightly with link seals.
3. For interior walls and floors and for pipes through roof, the space between each installed pipe and its sleeve shall be sealed with a three hour rated fire stop penetration material. Fire stop materials shall be installed in accordance with the instructions of the manufacturer.
4. Sheet Metal Sleeves
  - a. Sleeves for pipes passing through floors, partitions, hung or furred ceilings shall be installed with 1/2" maximum clearance all around pipes. Each sleeve for a pipe passing through an interior floor slab shall be fitted with a one-inch flange, or equivalent, at the bottom end for the purpose of securing it to the form work or sheet metal deck. The sleeve shall finish flush with the top of the finished floor. Sleeves for pipes passing through partitions, hung or furred ceilings shall be of one piece construction and shall finish flush with the finished surface.
  - b. Sleeves installed for pipes passing through vent ducts shall be securely fastened, soldered and made airtight.
5. Pipe Sleeve: Install pipe sleeves for pipes passing through roofs, concrete beams, brick walls, foundation walls and floor slabs on earth. Sleeves shall be installed with 1/2" maximum clearance all around pipe and shall finish flush with the surfaces penetrated. Pipe sleeves for pipes through roof shall be made of service weight cast iron only.
6. Sleeves through foundation walls below grade shall be provided under General Construction Work.

## M. Escutcheon Plates

1. Install chrome plated solid cast iron escutcheon plates with set screw on exposed pipes passing through walls, partitions, floors and ceilings, in finished rooms and spaces.
2. Install galvanized solid cast iron escutcheon plates with set screw on concealed pipes passing through walls, partitions, floors and on exposed piping in unfinished rooms and spaces.
3. Install chromium plated cast brass escutcheon plates with brass set screw on waste and water supply piping at all plumbing fixtures including lavatories, drinking fountains, cabinet sinks, wash sinks, etc.
4. Plates shall fit snugly around the pipes and shall be fastened in place before pipes are insulated or concealed.
5. Split type escutcheon plates are not acceptable. Retain paragraph above or below.

## N. Verify final equipment locations for roughing-in.

## 3.02 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.
- F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
  1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

2. **Damaged Threads:** Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- G. **Welded Joints:** Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
- H. **Flanged Joints:** Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

### 3.03 PIPING CONNECTIONS

- A. **Make connections according to the following, unless otherwise indicated:**
  1. **Install unions,** in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
  2. **Install flanges,** in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
  3. **Dry Piping Systems:** Install dielectric unions and flanges to connect piping materials of dissimilar metals.
  4. **Wet Piping Systems:** Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

### 3.04 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

- A. **Install equipment** to allow maximum possible headroom unless specific mounting heights are not indicated.
- B. **Install equipment level and plumb,** parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.
- C. **Install mechanical equipment** to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. **Install equipment** to allow right of way for piping installed at required slope.

### 3.05 PAINTING

- A. **Painting of mechanical systems, equipment, and components** is specified in Section 09912 - Interior Painting and Section 09911 - Exterior Painting.

- B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.06 CONCRETE BASES

- A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions, according to seismic codes at Project, and as described in Section 01732 – Installation of Equipment.

3.07 ERECTION OF METAL SUPPORTS AND ANCHORAGES

- A. Refer to Section 05500 - Metal Fabrications for structural steel.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.
- C. Field Welding: Comply with AWS D1.1.

3.08 GROUTING

- A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 15051**  
**DUCTILE IRON PIPE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing ductile iron pipe, fittings and specials.
- B. Ductile iron pipe and fittings shall be furnished and installed complete with all necessary jointing materials, wall castings, wall sleeves, specials, couplings, hangers, supports, anchors, adapters, identification signs, and other appurtenances as shown on the Contract Drawings and as required for a complete installation.
- C. The Contractor shall provide all labor and materials for making connections to existing lines or lines installed under other contracts, including all specials required to connect pipe of dissimilar materials.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02503 - Installation of Buried Pipelines
- B. Section 02505 - Leakage Tests
- C. Section 03300 - Cast-in-Place Concrete
- D. Section 07845 - Annular Space Seals
- E. Section 09911 - Interior Painting
- F. Section 15056 - Pipe Couplings
- G. Section 15060 - Hangers and Supports
- H. Section 15076 - Piping and Equipment Identification.
- I. Section 15081 - Piping Insulation
- J. Section 15120 - Interior and Exposed Piping Schedule
- K. Section 15141 - Disinfection

**1.03 REFERENCES**

- O. NY Spec 24-C-38 - Caulking
- P. New York City Building Code
- Q. New York Department of Environmental Protection (NYCDEP) Bureau of Water Supply Standard Water Main Specifications

#### 1.04 DESIGN AND MANUFACTURING REQUIREMENTS

- A. Ductile iron pipe shall conform to the American National Standards Institute (ANSI) and American Water Works Association (AWWA) Standards specified herein and recommendations as given in the Ductile Iron Pipe Research Association (DIPRA) "Handbook of Ductile Iron Pipe." Ductile iron pipe for City of New York water shall conform to the rules and regulations of the New York City Building Code and the NYCDEP Bureau of Water Supply; requirements contrary to such rules and regulations specified herein shall be disregarded.

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with Section 01330 - Shop Drawings.
- B. Obtain from the piping manufacturer and submit the following data:
  - 1. Shop Drawings
  - 2. Results of Certified Shop Tests
  - 3. Certified Letters of Compliance

C. Shop Drawings shall include, but not be limited to:

1. Catalog data consisting of specifications, illustrations and a parts schedule that identifies the materials to be used for the various piping components and accessories. The illustrations shall be in sufficient detail to serve as a guide for assembly and disassembly.
2. Complete layout and installation drawings, including plans, sections and cross-sections showing elevations with clearly marked dimensions. Piece numbers, which are coordinated with the tabulated pipe layout schedule, shall be clearly marked. Scale and size of the drawings shall conform to the General Conditions and Division 1. Piping layout drawings shall indicate information on pipe supports, location, support type, hanger rod size, insert type and the load in pounds.
3. Details of pipe lining, coating, wrapping, insulation and painting of all pipe.
4. Weights of all component parts.
5. Tabulated pipe layout schedule shall include the following information for all pipe and fittings: service, pipe size, working pressure, joint type, wall thickness, piece number and laying length.
6. Flexible couplings, with harness details if required.
7. Locations where pipe and valve identification signs will be placed.

1.06 QUALITY ASSURANCE

- A. The pipe and fittings covered by these specifications shall be provided by the Contractor through qualified manufacturers experienced in the fabrication, castings and manufacture of the pipe materials specified herein. The pipe and fittings shall be designed, fabricated and installed in accordance with standards specified herein.

1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Special care in handling shall be exercised during delivery, storage and handling of pipe to avoid damage and setting up stresses. Damaged pipe will be rejected and shall be replaced at the Contractor's expense. Pipe and specials stored prior to use shall be stored in such a manner as to keep the interior free from dirt and foreign matter.
- C. No material furnished under this specification shall be shipped to the job site until all submittals have been approved.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

## A. Acceptable manufacturers are listed below.

1. Ductile-iron pipe and fittings
  - a. American Cast Iron Pipe Company
  - b. McWane Incorporated
  - c. United States Pipe and Foundry Company
  - d. Griffin Pipe Products, Incorporated
  - e. Or approved equal
2. Ductile-iron retainer glands
  - a. 3-inch through 24-inch diameter
    - (1) Nappco, Inc. Series 1246
    - (2) Ebba Iron, Inc., Series 100
    - (3) Or approved equal
  - b. larger than 24-inch diameter
    - (1) Ebba Iron, Inc., Megalug
    - (2) Or approved equal
3. Sleeve-type couplings
  - a. 12-inches in diameter and smaller
    - (1) Dresser Industries, Style 153
    - (2) Smith-Blair, Type 441 Omni Coupling System
    - (3) Or approved equal
  - b. larger than 12-inches in diameter
    - (1) Dresser Industries, Style 38
    - (2) Smith-Blair, Type 411
    - (3) Or approved equal
  - c. Gaskets
    - (1) Dresser Plain Grade 27
    - (2) Smith-Blair 003
    - (3) Or approved equal

## 4. Restrained Push-On Joints

- a. United States Pipe and Foundry, TR Flex
- b. McWane Incorporated, Super-Lock
- c. American Cast Iron Pipe Company, Lok-Ring or Flex-Ring
- d. Griffin Pipe Products, Incorporated, Snap-Lok
- e. Or approved equal

## 5. Gaskets

- a. John Crane, Inc.
- b. Garlock Packing Company
- c. U.S. Rubber Company
- d. American Cast Iron Pipe Company
- e. United States Pipe and Foundry Company
- f. McWane Incorporated
- g. Or approved equal

## 6. Coatings and Linings

- a. Kop-coat
- b. Tnemec
- c. American Cast Iron Pipe Company
- d. United States Pipe and Foundry Company
- e. Or approved equal

## 2.02 MATERIALS

## A. General

- 1. Pipe shall be in accordance with AWWA C151 for push-on, restrained joint, or mechanical joint pipe and AWWA C115 for flanged pipe and shall be of grade 60-42-10 ductile iron. The above standards cover ductile iron pipe with nominal pipe sizes from three (3) inches up to and including sixty-four (64) inches in diameter. Pipe thickness shall be designed in accordance with AWWA C150.
- 2. Provide pipe of the various sizes and classes as specified in the pipe schedules or shown on the Contract Drawings. See Section 02503- Installation of Buried Pipelines and Section 15120 - Interior and Exposed Piping Schedule for pipe schedules. Provide minimum Thickness Class 53 for pipe with threaded flanges.

## B. Buried Water Service Pipe

- 1. In accordance with NYCDEP standards, all pipe for buried water service, including flanged pipe, for sizes up to and including twelve (12) inches shall

have a wall thickness equal to Special Thickness Class 56 as specified in AWWA C151.

2. In accordance with NYCDEP standards, all pipe for buried water service, including flanged pipe, for sizes over twelve (12) inches and up to fifty-four (54) inches shall have a wall thickness equal to Special Thickness Class 54 as specified in AWWA C151. Sizes sixty (60) and sixty-four (64) inches shall have a wall thickness equal to pressure class 350.

#### C. Fittings

1. Fittings shall be ductile iron and shall be in accordance with AWWA C110. Any other fittings, not included in AWWA C110, shall conform in design and performance to the requirements of this Standard.
2. Blind, filler, companion and reducing flanges shall conform to ANSI/ASME B16.1.
3. Where compact fittings are shown or indicated, items shall be in accordance with AWWA C153.

#### D. Flanged Joints

1. Threaded Flanges: Shall be solid, threaded, ductile-iron, flanges meeting the requirements of AWWA C115. Threaded flanges and pipe shall be assembled and faced by the pipe manufacturer; field or shop assembly will not be accepted. Threaded flanges shall be screwed on tight without overstressing the threads and, when properly assembled, shall be concentric with the pipe.
2. The dimensions of all flanges for pipe fittings and specials and the number and sizes of bolts, up to and including 54 inches, shall be in accordance with ANSI B16.1, Class 125 standard flanges.
3. For pipe larger than 54 inches, flanged pipe shall have ANSI Class 125 flanges integrally cast solid and at right angles to the pipe axis, and accurately faced and drilled smooth and true. Flange bolt holes shall be backfaced or spot-faced as required by ANSI specifications.
4. Flanges shall be tapped where tap or stud bolts are required.
5. Bolts: Bolts shall be in accordance with Appendix A of AWWA C115 and as follows: Flanged joints shall be made with bolts or stud-bolts with a nut on each end. Bolts, stud-bolts and nuts shall be ANSI heavy dimension, semi-finish, with square heads and cold-punched hexagonal nuts. For bolts 1-3/4 inches in diameter and larger, stud-bolts shall be used. Bolt size shall be American Standard for ANSI Class 125 flanges. Where flanged joints are in manholes or submerged in tanks, bolts, stud-bolts, and nuts shall be silicon

bronze, ASTM B98, Alloy A, of dimensions and sizes equal to steel bolts, stud-bolts, and nuts specified in Appendix A of AWWA C115.

6. Gaskets: Flange gaskets shall be in accordance with Appendix A of AWWA C115. They shall be full-face gaskets for flanged joints on 12-inch diameter and smaller pipe and shall be of the ring type for flanged joints on larger pipe.
7. After each flanged joint has been made, all bolt heads and nuts, and all surfaces of the flanges not to be painted shall be given two coats of asphaltic coating meeting the requirements of AWWA C151.

E. Grooved-Type Joints

1. Shall be in accordance with AWWA C606 and Section 15056 - Pipe Couplings.

F. Mechanical and Push-On Type Joints

1. Shall be in accordance with AWWA C111.
2. Restrained push-on joints for water lines shall comply with NYCDEP Bureau of Water Supply Standard Water Main Specifications.

G. Flanged Adaptors

1. Bolt hole and bolt patterns shall conform to the mating flange patterns as specified in the piping paragraphs. Bolts, nuts, and flange gaskets shall conform to the specifications for the adjacent piping.
2. Shall have ductile iron bodies.
3. Shall be Models 912 as manufactured by Rockwell Industries or equivalent models by Dresser, Clow, or approved equal.
4. Shall have a rated working pressure of 175 psig.
5. Pipe shall be anchored by using anchor studs drilled into the coupling and connected pipe for nominal pipe size twelve (12) inches and smaller. For nominal pipe sizes over twelve (12) inches, pipe shall be restrained by harnesses or pipe supports as specified for sleeve type couplings.

H. Harnesses

1. Where shown, specified or required, harnesses for pipe with mechanical joints shall be provided.

2. For ductile-iron pipe and fittings with mechanical joints that require harnessing, restrained type mechanical joint pipe will be considered as an alternate upon submission to the Commissioner for approval.
3. Joint Assemblies: Joint assemblies shall be designed to resist pullout of the joints at the test pressures specified for the piping system.

I. Sleeves

1. Sleeves shall be in accordance with AWWA C110. They shall be of ductile iron and shall be provided at all points where pipes will pass through walls and floors and where wall or floor castings are not provided. Unless otherwise shown, sleeves shall have intermediate collars not less than 1/2-inch thick and 1-1/2 to 2 inches high located at the center of the wall.
2. For exterior walls of structures, wall sleeves shall be plain ends and of flush wall design.
3. Where shown on the Contract Drawings or required to maintain 2 hour fire rating, modular wall seals shall be installed in the annular space between the pipe and the sleeve. Wall seals shall be in accordance with Section 07845 - Annular Space Seals. In all other locations, caulk shall be installed in the annular space between the pipe and the sleeve. Caulking materials shall be in accordance with N.Y. Spec 24-C-38. For flanged pipe, sleeves shall be fabricated large enough to accommodate flanges.

J. Sleeve-Type Couplings

1. Sleeve-type couplings shall be in accordance with Section 15056 - Pipe Couplings.
2. Pipe and fittings for use with sleeve-type flexible couplings shall be plain end.

K. Wall Castings, Connecting Pieces, and Special Fittings

1. Wall castings and connecting pieces shall be in accordance with AWWA C110, 250 psi pressure rating, unless specified otherwise. Concrete encased wall castings connected to sluice gates and valves shall be cast from alloy iron, Ni-Resist Type 1, International Nickel Co. or approved equal. Wall castings and connecting pieces shall be furnished with ANSI Class 125 flanged ends, bell ends, flare ends and/or spigot ends where shown, specified or required.
2. Wall castings shall be of standard wall pipe dimensions, unless piping layout precludes their use, in which case special castings shall be furnished.

3. Design of Specials: Special fittings where required shall be of an approved design that meet the same specifications and have the same diameters and thicknesses as standard fittings. Any tees, crosses, elbows, laterals, reducers or other fittings of current ANSI or AWWA standard dimensions are not considered specials.
4. Intermediate Collar: Wall castings shall have an integrally cast intermediate collar not less than 1/2-inch thick and 1-1/2 to 2-inches high located at the center of the wall unless otherwise shown.
5. Where space limitations prevent the use of through bolts for assembling flange connections, stud bolts shall be provided on wall casting flanges.

L. Cleanouts

1. Cleanouts shall be furnished and installed where shown or specified.
2. Size: Cleanout openings shall be not less than 6 inch diameter for pipe 8 inches in diameter or larger. For pipe 6 inches in diameter or smaller, they shall be of the same diameter as the pipe.
3. Cleanout Covers: Cleanout covers which are blind flanges shall be in accordance with AWWA C110, except where conformation is required with the inside curvature of the pipe, in which case the covers shall be flanged plugs of proper shape with American Standard flange drilling.
4. Covers shall be fastened by means of steel studs and bronze nuts and shall be drilled and tapped for a 1-1/2-inch diameter pipe connection.
5. Flange plugs shall be equipped with a dowel or other suitable means to provide proper setting.

M. Coatings and Linings

1. Cement Lining: All ductile-iron pipe and fittings shall be furnished with a cement-mortar lining not less than twice the standard thickness and seal coating meeting the requirements of AWWA C104.
2. Exterior Primer: Pipe and fittings shall be shop coated on the outside in accordance with Section 09912 – Interior Painting or Section 09911 – Exterior Painting for use in exposed locations, such as inside buildings or exterior locations where finish painting or insulating is required.
3. Painting: Pipe and fittings shall be painted in accordance with Section 09912 - Interior Painting or Section 09911 - Exterior Painting.

4. Asphaltic Coating: Pipe and fittings that will not be exposed to view shall be coated with the standard asphaltic outside coating specified in AWWA C151, at twice the specified thickness. Unlined pipe shall be coated with the standard asphaltic inside coating specified in AWWA C151.
5. Epoxy and Urethane Coatings: Epoxy and urethane coatings shall be applied in accordance with Section 09912 - Interior Painting.
6. Polyethylene Encasement: Where ductile iron pipe is in contact with soils, the pipe shall be encased in polyethylene film in accordance with AWWA C105 to isolate the pipe surface from contact with the soils.
7. Concrete Encased Pipe: Pipe and fittings which are to be encased in concrete where watertightness is to be obtained shall not be coated or painted on the outside.
8. Labels: In addition to the information required to be cast onto the pipe by AWWA C151, the letters "N.Y.C." shall be painted on the outside of each pipe, fitting, and special casting.
9. Pipe Couplings: Where flexible or rigid couplings are to be used, the exterior coating on the ends of pipe and fittings shall be left off for approximately eight inches, but the interiors shall be lined throughout.
10. Flange Joints: The back of the flanges and bolt holes shall be coated with asphaltic coating meeting the requirements of AWWA C151/A21.51, Section 51-8.1, immediately after facing and drilling.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. All ductile iron pipe and fittings shall be installed in accordance with the manufacturer's recommendations, approved shop drawings and as specified in Division 1 and Section 02503 - Installation of Buried Pipelines and Section 15120 - Interior and Exposed Piping Schedule.
- B. Where insulation is shown or specified, it shall be installed after the installation and testing of the pipe and accordance with Section 15081 - Piping Insulation of the Plumbing Contract.
- C. Where field cutting of ductile iron pipe is permitted by the Commissioner, ductile iron pipe shall be cut only by means of abrasive saws, hack saws, wheel type cutters or milling type cutters. The use of "squeeze" type pipe cutters and cutting torches will not be permitted. Also, the use of diamond points and dog chisels will not be permitted.

- D. Erecting Exposed Piping: All piping shall be erected to accurate lines and grades, permanently supported as shown, specified or required. Where temporary supports are used during construction, sufficient strength and rigidity shall be provided to prevent shifting or distortion of the pipe.
- E. Supports for Exposed Piping: All exposed pipe, fittings and special castings not in trench or beneath floor structures shall be supported in conformance with Section 15060 - Hangers and Supports and as required by the Contract Drawings.
- F. Supports for Piping Below Floors: Pipe which run beneath ground floors of plant structures shall be encased in concrete to form an integral part of the floor slab or be suspended from the floor slab by approved pipe hangers encased in concrete.
  - 1. Where pipe are contiguous with floor structures, the pipe shall be encased in concrete. The reinforcement in the floor slab shall be placed and bent so that the pipe encasement is an integral part of the concrete structure.
  - 2. Where pipe are below floor structures, the pipe shall be supported by concrete encased adjustable clevis hangers anchored to the floor by means of bearing plates. Supports shall conform to the requirements of Section 15060 - Hangers and Supports. Hangers shall be spaced not more than five feet apart.
  - 3. Concrete for encasement shall be class 40 conforming to the requirements of Section 03300 - Cast-in-Place Concrete. There shall be a 3-inch minimum depth of concrete between reinforcement and pipe or hanger components, and a 3-inch minimum depth covering on reinforcement.
- G. Expansion: Ample provisions for flexibility in all pipelines shall be made to compensate for expansion.
  - 1. Adequate expansion devices shall be provided to allow the lines to expand and contract freely without damage to any part of the piping system.
  - 2. Expansion couplings shall be adjusted after installation so that the pipelines will be fluid-tight through the full range of operating conditions.
- H. Pipe Identifications Signs: Where shown or specified, pipe identification signs shall be furnished and installed in conformity with Section 15076 - Piping and Equipment Identification.
- I. Venting: All pipelines for liquids with air or gas shall be furnished with vent valves at all high points in the lines. Vent valves shall be of an approved design and adequately sized. Where vent valves are located that liquids can discharge and cause damage to a structure or equipment, pipe shall be piped from the vent valve to the nearest gutter or drain in an approved manner.

J. Temporary Bulkheads

1. Temporary bulkheads shall be furnished at the ends of pipe sections where adjoining pipe have not been completed and are not ready to be connected.
2. All temporary bulkheads shall be removed when they are no longer needed.

3.02 LEAKAGE TESTS

- A. All pipes shall be flushed and cleaned after installation.
- B. Pipes shall be tested for leaks in accordance with Section 02505 - Leakage Testing.

3.03 DISINFECTION

- A. All potable water pipes shall be disinfected before they are placed into service, as specified in Section 15141 - Disinfection.

3.04 SCHEDULES

- A. Refer to the Schedules contained in Section 02503 - Installation of Buried Pipelines and Section 15120 - Interior and Exposed Piping Schedule for information on the piping that is to be constructed using the pipe materials and methods specified herein.

-END OF SECTION-

**Section 15052**  
**STEEL AND STAINLESS STEEL PIPE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing steel and stainless steel pipe and cast, forged and fabricated steel fittings, stainless steel fittings, flanges, unions and couplings, complete with coating, wrapping, lining, insulation, and painting.

#### 1.04 DESIGN REQUIREMENTS

- A. In general, pipes shall conform to the applicable provisions of the Code for Pressure Piping, ASME B31.1 and its Supplements and specifically to Chapters 2, 4, and 5 of Section 6 - Fabrication Details except for plumbing and low pressure (15 psig maximum) heating lines.
- B. Pipe and fittings shall conform to the New York City Building Code in respect to plumbing and other applications covered by these codes.
- C. Only NSF61-approved materials shall be used in potable water lines.

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Submit working drawings, shop drawings and material specifications including, but not limited to:
  - 1. Flanged, screwed, welding and mechanical coupling fittings and pipe, couplings, harnessing and special fittings. When special designs or fittings are required, the work shall be shown in large detail and the special or fitting completely described and dimensioned.
  - 2. Fully dimensioned layout of pipe, fittings, couplings, sleeves, expansion joints, supports, anchors, harnessing, valves and equipment. Pipe size, type and materials shall be labeled on the drawing and the schedule included.
  - 3. Cross sections showing elevation of pipe, fittings, sleeves, couplings, supports, anchors, harnessing, valves and equipment.
  - 4. Schedules of pipe, fittings and valves; such schedules shall indicate the material and schedule number of thickness of all pipe, the material and class of all fittings and the rating and description of all valves.
  - 5. Details of pipe coating, wrapping, lining, insulation and painting.
  - 6. Expansion joints, flexible piping and flexible couplings with harness details where such harnesses are specified or where required, for a complete working installation.
  - 7. Locations where pipe and valve identification signs will be placed.

8. Catalog data for pipe, couplings, harnessing and fittings.
  9. Other piping appurtenances.
- C. Quality Control: Submit the following certifications:
1. Certificate of compliance for pipe, fittings, couplings, sleeves, cleanouts and harnessing.
  2. Certificate from an independent testing laboratory, approved by the City of New York, for each welder assigned to the welding of pipe, fittings and pipeline equipment.

#### 1.06 QUALITY ASSURANCE

- A. The pipe and fittings covered by these Specifications shall be provided by the Contractor through qualified manufacturers experienced in the fabrication and manufacture of the pipe materials specified herein. The pipe and fittings shall be designed, fabricated and installed in accordance with the standards specified.
- B. Certified welders, having current certificates conforming to the requirements of the ASME code shall be utilized to perform all welding on steel pipes. Welders shall be qualified under the requirements of Section IX Welding Qualifications of the ASME Boiler and Pressure Vessel Code.
- C. The manufacturer's name or trademark, the year of manufacture and the ASTM or API specification number shall be rolled or permanently inscribe on the pipe surface at the manufacturer's plant. As an alternate, the manufacturer's name or trademark, year of manufacture and ASTM or API specification number may be stenciled on the pipe surface. Pipe 1-1/2 inches and less in nominal diameter shall be bundled and tagged.
- D. Pipe and fittings manufactured outside of the continental United States must meet all the requirements of the latest ASTM standards referred to hereinbefore and, unless waived in writing by the City of New York, shall undergo physical tests and chemical analyses to prove compliance therewith. Such tests and analyses shall be performed by an independent testing laboratory approved by the City of New York. If the testing laboratory is located outside the United States, then the Contractor shall pay all costs for two City of New York personnel to witness such tests. The test samples shall be selected and tested in conformance with ASTM requirements. The City of New York may at its discretion visit the test facility and witness the tests. The cost of all physical tests and chemical analyses shall be borne by the Contractor.

**1.07 DELIVERY, STORAGE AND HANDLING**

- A. Pipe, fittings and couplings shall be delivered, stored and handled in accordance with Division 1, General Requirements and as follows.
- B. When required for maintaining its circular shape and preventing distortion, each length of pipe shall be temporarily braced with an approved type of internal spider in each end of the pipe during erection.
- C. Handling Coated Pipe
  - 1. Coated pipe shall be protected at all times and handled with equipment designed to prevent damage to the coating, such as stout wide canvas slings and wide padded skids. The use of bare chains, cables, hooks, metal bars or narrow skids in contact with the coating will not be permitted. All pipe handling and hauling equipment shall meet the approval of the Commissioner before use. Ample provision shall be made for the prompt and efficient repair of all abrasions and injuries. Care shall be exercised in laying and cradling the pipe to prevent injury to the coating.
  - 2. When shipped by rail, pipes shall be loaded on properly padded saddles not less than six inches in width. Pipes shall be separated so that they do not bear against each other, and the whole load shall be securely fastened together and to the cars to prevent movement in transit.
  - 3. All pipe coating injured in any way during transit or laying shall be satisfactorily repaired prior to placing the backfill.

**PART 2 PRODUCTS****2.01 STEEL PIPE**

- A. Dimensions for steel pipe shall be in accordance with ASME B36.10M and as specified herein.

<b>Pipe Diameter (in.)</b>	<b>Schedule/Thickness</b>	<b>Standard</b>
Up to and Including 12	40	ASTM A53
Gas Piping up to 12	40	ASTM A106
14 to 24 Inclusive	3/8 in.	ASTM A53
30	3/8 in.	ASTM A139

**2.02 STEEL FITTINGS**

- A. Fittings shall be manufactured to standard dimensions, suitable for the pressures specified. Fittings shall be provided of the same or heavier wall thickness as the

pipe of which they are a part. Strength, physical and chemical requirements shall meet or exceed the requirements specified for the pipe.

- B. Fittings used in pipelines 2-inch diameter or smaller shall be of the screwed pattern, except as shown or specified otherwise.
- C. Fittings used in pipelines 2-1/2-inch diameter or larger shall be of the seamless steel welded type or flanged type, except as shown or specified otherwise.
- D. Unions: Screwed unions shall be used on all steel pipelines 2-inch diameter and smaller.

- 1. An adequate number of unions of the screwed or flanged type shall be provided in each main pipe and each branch to facilitate the dismantling or removal of any branch line or any part thereof or the section of the main pipe to which it connects, without disturbing adjacent branch lines or their related main pipeline.
- 2. Where sleeve-type (harnessed) groove-type or shouldered-end flexible pipe couplings, are specified, they may be considered as substitutes for pipe unions.

E. Screwed Fittings

- 1. Screwed fittings 2-inches and smaller shall be malleable iron flat band fittings, ASME B16.3, 125 pounds. For high-pressure service, conform to ASME B16.3, 250 lbs. Malleable iron shall conform to the requirements of ASTM A197.
- 2. Where shown or specified, screwed end fittings of cast iron, conforming to the requirements of ASME B16.4, 125-pound standards for general service and 250-pound for high pressure service shall be provided. Cast iron shall meet the requirements of ASTM A126.
- 3. All threads shall be clean cut and smooth conforming to the American Standard for Pipe Threads, ASME B1.1. Fittings shall be with right and/or left hand threads as required.
- 4. Unions and railroad unions and union elbows and tees shall be malleable iron fitted with brass to iron seats unless otherwise specified.

F. Socket Welding Fittings

- 1. Where shown or specified, steel socket welding fittings shall be provided on 3 inches and smaller services for high pressure gas, oil or where otherwise shown. Steel socket fittings shall conform to the requirements of ASME B16.11 with steel conforming to ASTM A105/A105M, Grade 2. Fittings shall be rated at 2000 pounds (minimum).

2. Socket welding fittings shall be welded in conformity with the applicable provisions of the Code for Pressure Piping, ASME B31.1.

G. Butt Welding Fittings

1. Butt welding fittings shall meet the requirements of ASME B16.9.
2. Outlets for welded connections that are made with welded half coupling shall be of the butt welding type.
3. Outlets for threaded connections shall be made with threaded half couplings.
4. Where welding fittings are approved for assembly in the cement lined pipelines, fittings shall be provided with a plain end, grooved end or shouldered end section welded on each end of the fitting and assembled with sleeve-type, groove-type or shouldered-end couplings as required. Long tangent welding fittings may be submitted for approval as a substitute for welded-on spool piece fittings provided that they can accommodate flexible pipe couplings.

H. Flanged Fittings

1. Where shown on the Contract Drawings or where specified, cast iron or steel flanged fittings shall be provided.
2. Cast iron flanged fittings for general service shall conform to the requirements of ASME B16.1.
3. Steel flanged fittings shall utilize forged steel slip-on flanges. Fittings shall be Class 125 and Class 250 fittings conforming to the requirements of ASME B16.5, 150 pound or 300 pound, respectively, as specified, except flanges that are plain faced shall be provided. Provide Class 125 fittings conforming to AWWA C207, Class B.
4. Cast steel flanged fittings shall be assembled with forged steel flanges of the same pressure rating, conforming to the requirements of ASME B16.5.

2.03 CARBON STEEL PIPE AND FITTINGS FOR NATURAL GAS SERVICE

A. General

1. Steel pipe for natural gas service shall conform to ASTM A106, with a minimum wall thickness of Schedule 40.
2. Natural gas piping shall have a maximum carbon content of 0.32% and shall be in conformity with the requirements of New York State Rules and

Regulations of the Public Service Commission 16 NYCRR Chapter 111 Gas Utilities, Subchapter C Safety, Part 255 Transmission and Distribution of Gas (16 NYCRR 255). Natural gas piping shall also conform to the requirements of the New York City Building Code Section P115.0 – Gas Piping, the National Fuel Gas Code - NFPA 54, and the standards of the natural gas supplier.

3. For buried gas piping, pipe shall be coated steel pipe with a cathodic protection system to prevent corrosion. Piping may either have factory-applied protective coating (mill wrapped) or be field wrapped. All bare sections of pipe and fittings shall be field coated and wrapped in accordance with the standards of the natural gas supplier.

#### B. Joints

1. Joints shall be welded.
2. All field pipe welds shall be ultrasonically inspected in accordance with API Spec 5L. All welds on gas piping shall be radiographically inspected in accordance with 16 NYCRR 255 and inspections shall be scheduled so as not to interfere with the work of other trades, at no additional cost to the City of New York. Repair any defect disclosed by the test and retest the joint at no additional cost.
3. The pipe ends shall be prepared for the jointing system specified for the pipe. Ends for welding shall be beveled in accordance with ASME B31.8 at 30 degrees with a maximum of 37-1/2 degrees.
4. All welds shall be free from burrs, snags or rough projections.

#### C. Fittings

1. Flanged fittings shall conform to the dimensional requirements of ASME B16.5, except that slip-on flanges shall not be used. Flanges shall be weld neck or threaded end. Fittings fabricated in conformance with ASME B16.9 shall be of the same wall thickness as specified for the pipe.
2. Bell type reducers are not acceptable; only cone type reducers shall be used.

#### D. Cathodic Protection

1. Insulating joints: Insulating couplings or fittings shall be used to electrically separate the underground portion of steel piping from the above ground piping or piping in the building. Locate insulators on the above ground portion of a riser and on the pipe immediately after entering the building wall. No other connections shall be made to the underground portion of the piping that could result in an electrical ground to the piping. Use either insulating unions,

threaded or insulating couplings, or insulating flanges. Insulated compression couplings shall be used on outdoor installations only.

2. Magnesium anodes: electrically attach magnesium anodes to underground steel piping. One 3-pound anode shall be installed where the total underground piping length is 10 feet or less. When the total length of underground piping is greater than 10 feet, install one 17-pound magnesium anode for every 100 feet of underground piping.
3. Bury the anode ingot in the soil approximately 2 feet to the side and below the level of the piping at a location near the center of the section of pipe being protected. Follow manufacturer's recommendations for burying the anode.
4. Attach the wire lead to a bare steel area of pipe. After attaching, restore the coating in the area so that no bare metal remains.

## 2.04 FABRICATED STEEL FITTINGS

- A. Fittings shall be shop fabricated from a segmental welded steel section of a plate thickness not less than that specified for pipe connected thereto. The minimum radii of the centerlines of the bends shall be 1.5 times the nominal pipe diameter unless otherwise specifically shown on the Contract Drawings. The included angle between the points of tangency of the bend and connecting straight pipe shall contain not less than the number of bend segments called for in the following table:

Bend	Number of Full Segments	Number of Part Segments
75°-90°	4	2
60°-74°	3	2
45°-59°	2	2
30°-44°	1	2
0°-29°	0	2

1. Full segments shall consist of sections with ends cut to form included angles of 15 degrees; part segments shall consist of sections up to 7-1/2 degrees. In accordance with the above table, a 90 degree bend would require four 15 degree segments, two 7-1/2 degree segments at the ends of the fitting and one additional 15 degree segment; a 45 degree bend would require two 15 degree segments and two 7-1/2 degree segments.
- B. Fittings for cement-lined pipelines shall be lined after fabrication of the fittings.
- C. Cement-lined fabricated fittings shall be installed with flexible pipe couplings. Such fittings shall be provided with extra long end segments extending past the

point of tangency of the radius to the segment centerline to accommodate the couplings.

- D. Fabricated fittings installed with couplings shall be provided with extra long end pieces to suit the coupling. Sleeve-type or shouldered-end couplings provided shall meet the requirements of Section 15056 - Pipe Couplings. Collared end pieces shall be provided for shouldered-end couplings.
- E. Reducers and increasers shall be provided with the same laying length as American Standard Class 125.
- F. Fabricated steel fittings shall be provided with plain ends or welded flanges.
- G. Tees, wyes, laterals and outlets shall be reinforced in accordance with AWWA Manual M11.

## 2.05 FLANGES AND FLANGED JOINTS

- A. Flanges: Unless otherwise shown, all flanges for steel pipe, except blind flanges shall be of the slip-on welding type with hubs meeting the requirements of ASME B16.5. Where specifically captioned on the Contract Drawings or where explicitly required by the Specifications, furnish and install steel pipe flanges complying with AWWA Standard C207 as required. Welding neck steel flanges, ASME B16.5, may be submitted to the Commissioner for approval in place of slip-on flanges.
  - 1. Slip-on flanges shall be welded to the steel pipe at the hub and at the pipe end in conformity with the Code for Pressure Piping, ASME B31.1, Section 6.
  - 2. Plain faced blind flanges in accordance with ASME B16.5 shall be provided.
  - 3. Standard raised faces flanges shall be provided for the sizes specified except for cast iron-to-steel joints which shall be plain faced.
  - 4. Steel 150 pound welding flanges shall be used for assembly with Class 125 cast iron flanged fittings, steel 300-pound flanges with Class 250 cast iron flanged fittings, and AWWA Class B steel hub flanges with 25 pound cast iron flanged fittings.
- B. Flanged Joints: Flanged joints shall be made with bolts or bolt studs with a nut on each end. Stud bolts shall be used for all bolting sizes 1-3/4 inches and larger.
  - 1. Bolts, stud bolts, and nuts shall meet the requirements of ASTM A307 Grade B, except for high temperature service where alloy steel bolts, ASTM A193/A193M, Grade B5, shall be used. Bolts and stud bolts shall conform to the dimensional requirements of ASME B18.2.1 with rolled threads conforming to ASME B1.1, Coarse Series, Class 2 fit. Bolts and stud bolts and nuts shall be of American Standard heavy unfinished hexagonal type.

2. Bolts shall be provided with a 1/4-inch projection beyond the nut when joint with gasket is assembled.
- C. Gaskets: Ring type gaskets shall be provided for pipe larger than 12 inches in diameter, and full face gaskets for pipe sizes 12 inches in diameter and smaller with dimensions in conformity with the requirements of ASME B16.21, unless specified otherwise. Gaskets shall be as thin as the finish and accuracy of the surfaces will permit.
1. For general service, rubber gaskets shall be 1/8-inch thick and meet the requirements of AWWA C207 as modified and supplemented herein.
  2. Gasket material that is provided shall be specifically recommended for the service by the gasket manufacturer and as approved by the Commissioner.
- D. Insulation: Insulated flanged joints shall be provided as required. Flange insulation kits shall include flange insulating gasket, flange bolt insulating sleeves, and flange bolt insulating washers.

## 2.06 COUPLINGS

- A. Where shown on the Contract Drawings, specified or required for the convenience of installation, pipe couplings conforming to the requirements of Section 15056 - Pipe Couplings shall be furnished and installed.
- B. Harnessed sleeve-type couplings shall be used close to the connecting point for pipe connections to pumps and other equipment handling fluids or gases under 200°F susceptible to damage or binding due to pipe strain unless other types of flexible connections are shown or specified.
- C. Cement-lined fabricated fittings shall be assembled with flexible pipe couplings. Where butt welding fittings are approved for assembly in cement lined pipes, fittings shall be provided with spool pieces welded on each end and, assembled with flexible pipe couplings after cement lining. Where harnessed joints are required on lined pipe, the harnessing lugs shall be welded before lining.
- D. Where pipelines pass from a concrete structure into earth, flexible couplings shall be installed at the face of the structure and at a point about four feet from the structure to protect the pipe against damage by displacement or settling.

## 2.07 EXPANSION JOINTS

- A. Where shown on the Contract Drawings, specified or required, the Contractor shall provide internally guided, packed sleeve type expansion joints, in which the traverse slip section functions correctly without leakage at the maximum estimated expanded position at full operating pressure.

- B. Unless specified otherwise, on pipes 3 inches nominal diameter and smaller, expansion joints with screwed ends, of all bronze or brass construction shall be provided.
- C. On pipelines 4 inches and larger, expansion joints with ANSI Class 125 flanged ends, cast semi-steel bodies and brass sleeves shall be provided.
- D. Ample space shall be provided for packing, with packing material suitable for the service and pressure specified. Where specified or shown, integrally cast anchor bases suitable for anchor bolting shall be provided.
- E. Expansion joints shall be installed so that the traverse can move only in a direction parallel to its centerline in conformity with the requirements of the Code for Pressure Piping, ASME B31.1, Paragraph 612.

## 2.08 WALL SLEEVES

- A. Suitable ductile iron or steel pipe sleeves shall be provided at all points where pipes pass through the walls or floors of structures, and where wall castings are not provided.
- B. Ductile iron sleeves shall be provided as specified in Section 15051 - Ductile Iron Pipe.
- C. Steel sleeves 12 inches in diameter and larger shall be provided with a minimum wall thickness of 0.375 inches. Steel sleeves smaller than 12 inches in diameter shall be provided not less than Schedule 40. Steel sleeves shall be provided with an intermediate collar located at the center of the wall. The O.D. of the collar shall be four inches greater than the O.D. of the sleeve, fabricated from steel plate with a minimum thickness equal to the sleeve thickness and double welded to the sleeve.
- D. Modular mechanical-type seals consisting of interlocking synthetic rubber links or blocks shaped to continuously fill the annular space between the pipe and the wall sleeve shall be provided. Where pipes pass from a fire rated area to a non-fire rated area, annular space seals with a 2 hour minimum fire rating shall be provided, meeting the requirements of Section 07845 - Annular Space Seals. The elastomeric element/s shall be of the size, quantity, type and material that the manufacturer recommends for the intended service.

## 2.09 CLEANOUTS

- A. Where shown on the Contract Drawings or specified, flanged cleanouts shall be provided as specified in Section 15051 - Ductile Iron Pipe.

## 2.10 COATINGS AND LININGS

- A. General: Carbon steel pipes shall be lined and coated in accordance with the piping schedule included in Section 02503 – Installation of Buried Pipelines and Section 15120 – Interior and Exposed Piping Schedule.
1. All bolts, nuts, couplings and the like shall be coated after the joint has been made.
  2. Painting shall be in accordance with Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable.
  3. Pipe and fittings that are to be encased in concrete shall not be painted.
- B. Tape Coating: Where shown, specified or required for exterior coating of buried piping multi-layered, cold-applied tape in accordance with AWWA C214 shall be provided.
- C. Liquid Epoxy: Where liquid epoxy lining and coating is shown, specified or required, lining and coating shall be in accordance with AWWA C210, at twice the standard thickness.
- D. Cement-Mortar Lining
1. The pipe and fittings shall be lined before installation in conformity with the requirements of AWWA C205. The lining shall be shop applied. A seal of asphaltic material shall be provided in conformity with AWWA C203.
  2. Fabricated pipe and fittings shall be cement lined after fabrication.
  3. Cement linings for steel pipe and fittings shall conform to the thicknesses as given in AWWA C205 and the following table:

Nominal Pipe Size Inclusive (Inches)	Lining Thickness (Inches)	Tolerance (Inches)
1¼ - 1½	3/32	-1/64 +1/64
2 - 2½	1/8	-1/32 +1/32
3 - 3½	5/32	1/32 +1/32

4. Shop and field cutting of cement-lined pipe will be permitted only by methods specifically approved by the Commissioner, in each case; field cutting will only be permitted if witnessed by the Commissioner.
5. Caps, plugs, sleeves and valve box castings shall not be cement lined but shall receive a liquid epoxy coating as specified under Paragraph C above.

- E. Galvanizing: Galvanizing shall be provided in accordance with ASTM A53 where shown or specified.
- F. Coating Exposed Threads of Buried Galvanized Pipe: Where galvanized pipe is buried underground and joined by means of screwed fittings, a protective zinc dust coating shall be applied to the exposed threads in the field. Do not leave any exposed metal uncoated.
- G. Urethane Coating: Urethane coating shall be provided in accordance with Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable, where shown, specified or required.

## 2.11 HEAVY WALL STAINLESS STEEL PIPE AND FITTINGS

- A. Heavy wall stainless steel pipe and fittings shall be Type 316L stainless steel fabricated in accordance with ASTM A312/312M for nominal pipe sizes up to twelve (12) inches.
- B. Wall thickness shall be Schedules 40S or 80S pipe in accordance with ANSI B36.19 and as indicated on the piping schedule in Section 15120 - Interior and Exposed Piping Schedule.
- C. Where flanges are shown, specified or required for connection of stainless steel pipe and fittings to pipe equipment, forged stainless steel slip-on flanges conforming to ANSI 150 pound or 300 pound standards, shall be provided, welded at the hub and at the face. Flanges, flanged fittings and flanged joints shall conform to the applicable provisions specified herein for steel flanges, flanged fittings and flanged joints, except that steel bolting shall be cadmium plated to produce a uniform appearance.
- D. Fittings
  - 1. For nominal pipe sizes two (2) inches and smaller shall be of the socket-welding type conforming to the dimensional requirements of ASME B16.11.
  - 2. For nominal pipe sizes 2-1/2 inches and larger shall be the butt-welding type conforming to the dimensional requirements of ASME B16.9.
  - 3. Fittings shall conform to the materials and alloy requirements of ASTM A403/A403M.
- E. All stainless steel pipe and fittings shall be precleaned, pickled and passivated after fabrication in accordance with the applicable sections of ASTM A380, except where otherwise specified.

**2.12 STAINLESS STEEL TUBING AND FITTINGS**

- A. Type 316L stainless steel, seamless tubing shall be in accordance with ASTM A269 for pipe sizes less than 1-1/2 inches.
- B. Wall Thickness
  - 1. Tubing shall be as follows:

Nominal Size (Inches)	Rating (psi)	Wall Thickness (Inches)
1/4	3000	0.035
3/8	2500	0.035
1/2	2500	0.049
5/8	2500	0.049
3/4	2500	0.065
1	2000	0.065

- C. Type 316 stainless steel, flareless tube fittings in conformity with ASTM A276 shall be provided.
- D. Dielectric insulating joints or fittings shall be provided at connections between exterior piping and interior piping.
- E. All stainless steel tubing shall be precleaned, pickled and passivated after fabrication in accordance with the applicable sections of ASTM A380, except where otherwise specified.

**PART 3 EXECUTION****3.01 INSTALLATION**

- A. Pipe and fittings in accordance with the manufacturer's recommendations and approved shop drawings.
- B. Welding of Pipe and Fittings
  - 1. No field welding of stainless steel will be permitted.
  - 2. Welding of steel butt-welding fittings, steel fabricated fittings and steel pipe shall be in strict conformity with the Code for Pressure Piping, ASME B31.1, Section 6 and its Supplements. Certificates of qualification of current issue, conforming to the requirements of the Code, shall be submitted to the Commissioner before proceeding with any pipe welding.

3. Backing rings shall be used for all pipe welding butt joints unless otherwise specified. Backing rings shall be of carbon steel with spacer nubs that strike-off or melt with the weld.

C. Welding of Cement Lined Pipe and Fittings

1. Welding of cement lined steel pipe will be permitted only with the approval and under the observation of the Commissioner where such welding is shown on the Contract Drawings or specified.
2. In addition to the welding qualifications specified under Section 3.01B hereinbefore, welding procedures shall conform to the requirements specified herein.
3. The ends of the lined pipe for pipe-to-pipe joints shall be machine cut to provide an approximate bevel of  $27\frac{1}{2}$  degrees. Ends may be chipped provided there is no damage to the cement lining. Ends shall be cleaned of scale, rust, oil and other foreign matter. Where fittings already having a bevel of  $37\frac{1}{2}$  degrees are to be welded to pipe, pipe ends shall be bevelled to a  $17\frac{1}{2}$  degree angle, making a total angle of bevel between joints approximately 55 degrees. A  $\frac{1}{8}$ -inch land shall be provided where possible.
4. Parts to be joined shall be approximately  $\frac{1}{32}$  inch apart before tacking. Backing rings shall not be used at welded joints. Small tack welds shall be made using a  $\frac{1}{8}$ -inch electrode. The first bead or layer of welding shall be laid by bridging across from bevel to bevel at the bottom of the groove just at the top of the land. A suitable crown reinforcement layer shall be made on the top of the joint to finish off.
5. Direct current (dc) shall be used for welding, with the base material on the negative side.
6. The first pass shall be a stringer bead using a  $\frac{1}{8}$ -inch electrode with a current of 80 to 90 amperes at 50 to 55 volts. The second and succeeding passes shall be woven beads using a  $\frac{1}{8}$ -inch electrode and a current of 90 to 100 amperes at 55 to 58 volts. All passes shall be made slowly and with care not to burn through the land or the shoulder into the lining of the pipe. The joint shall not be hotter than 100 F. For large size pipe, a  $\frac{5}{32}$ -inch electrode may be used, provided the temperature of the joint is held within this limit.
7. No stress-relieving of welded joints is necessary unless the pipe wall thickness warrants it. After the weld is completed, the joints in the lining shall be filled with a special compound of a wet slurry mix of the same cement used for the lining. Where accessible from the end of the pipe, the welded joint shall be swabbed with cement using a paint brush thoroughly wetted with the cement slurry.

8. Any defects causing leaks in welded joints shall be repaired by welding without damaging the cement lining using procedures similar to that specified hereinbefore.

D. Expansion

1. Ample provisions for flexibility in all pipelines shall be made to compensate for expansion.
2. Adequate expansion devices shall be provided to allow the lines to expand and contract freely without damage to any part of the piping system.
  - a. Expansion devices in the form of expansion joints, expansion couplings, swivel or swing joints or pipe bends, including such anchors as may be shown, specified or required to make the devices effective shall be provided.
  - b. If expansion devices are not required, all runs of pipe subject to expansion shall be fabricated shorter than their theoretical length to the extent that there is freedom to expand without increasing the stresses imposed when cold.
3. Swing Joints
  - a. On pipelines 2 inches or less, rated at water working pressures up to 150 psi, screwed end swing or swivel joints may be used; otherwise expansion shall be taken up with nipples and fittings as required.
  - b. A sufficient number of fittings and pipe lengths in connection with swing joints shall be provided to assure the absence of distortion of either the pipelines or branches. Branch tees from the risers shall be located so that when the branch lines therefrom expand by heat, the branches will continue to drain properly.
4. Pipe Expansion Bends
  - a. Pipe bends of approved design for compensating thermal expansion when shown, specified or required shall be fabricated and furnished as herein specified.
  - b. In pipelines operating under high pressures or high temperatures in which offsets occur in alignment that may be subject to bending stresses excessive for the fittings, or where otherwise deemed necessary, use appropriate pipe bends to make the offset.

- c. Where possible, all bends shall have radii equal to a least six diameters of the pipe and tangents or straight lengths of the pipe shall be neatly made, true to radius, free from buckles and flat surfaces.

#### E. Erecting Uncoated Pipes

1. Uncoated pipe shall be erected in accordance with the best piping practice with a minimum exposure to the elements and to other corrosive conditions.
2. Before erection, all uncoated pipes shall be placed on end and hammered to remove scale and loose particles.
3. Screwed end pipe: Pipe ends shall be reamed after pipe is cut to final length. Threads shall be cleanly cut to the dimensions of the American Standard for Pipe Threads, ASME B1.1. All burrs, dirt and foreign matter shall be removed and an application of pipe compound given to the threads of both pipe and fittings before assembly. Compound shall be eliminated at the inside of the joint. Once a joint has been tightened, it shall not be backed off unless all threads are re-cleaned and new compound applied.
4. Pipe compounds: For general service, use an approved mastic metallic compound, Teflon tape, or approved equal shall be used. On oil lines, an approved compound resistant to oil shall be used. For potable water lines a NSF61 approved pipe compound shall be used.
5. All piping shall be erected to accurate lines and grades, permanently supported as shown, specified or required. Where temporary supports are used during construction, sufficient strength and rigidity shall be provided to prevent shifting or distortion of the pipe.
6. Expansion couplings shall be adjusted after installation so that the pipelines will be fluid-tight through the full range of operating conditions.

#### F. Venting. All pipelines for liquids shall be provided with adequately sized, approved, air or gas vent valves at all high points in the lines, even though such vent valves may not be shown on the Contract Drawings and/or approved shop drawings.

1. Where vent valves are so located that liquids discharged therefrom would cause damage to structure or equipment, the vent valve shall be piped to the nearest gutter or drain in an approved manner.

#### G. Drainage

1. Pipelines for air, gas or steam shall be provided with approved means for condensate drainage even though such means may not be shown on the Contract Drawings and/or approved shop drawings. Drainage from gas lines

shall be provided through an approved, double valved, manually operated condensate trap or as otherwise shown.

2. An approved means for draining low points in all liquid system pipes shall be provided whether or not such drainage systems are shown on the Contract Drawings and/or approved shop drawings.
- H. Hangers and Supports: All pipelines shall be permanently erected with supporting devices furnished and installed in conformity with requirements of Section 15060G - Hangers and Supports and the applicable provisions of the Code for Pressure Piping, ASME B31.1, Section 6.
- I. Connection of Cast Iron Bell and Spigot Pipe to Steel Pipe: Where connection is required between steel and cast iron pipe, a sleeve-type transition coupling meeting the requirements of Section 15056 - Pipe Couplings shall be provided.
- J. Insulation: Where shown or specified, insulation shall be provided in conformity with Section 15081G - Piping Insulation for pipes and fittings that are exposed to atmosphere after installation.
- K. Reducing Fittings: Ample fittings shall be used for all changes in pipe size. Bushings shall not be used.
- L. Pipe Identifications Signs: Where shown or specified, pipe identification signs shall be furnished and installed in conformity with Section 15076G - Piping and Equipment Identification.

### 3.02 CLEANING

- A. During construction, all piping shall be thoroughly cleaned before placement and the lines kept free from foreign matter of whatever origin. The pipes shall be left thoroughly clean to the satisfaction of the Commissioner.

### 3.03 TESTING

- A. All pipes shall be flushed clean and tested after installation.
- B. Pipes shall be tested for leaks and repaired as required in accordance with Section 02505 - Leakage Tests.
- C. Pressure test shall be as specified in Section 02503 - Installation of Buried Pipelines and Section 15120 - Interior and Exposed Piping Schedule.

3.04 PAINTING

- A. Where shown, specified or required, pipes shall be painted in conformity with the requirements of Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable.

3.05 SCHEDULES

- A. Schedules of the piping that is to be constructed using the pipe materials and methods specified herein are contained in Section 15120 - Piping Schedules and Section 02503 – Installation of Buried Pipelines.

K. National Sanitation Foundation (NSF)

1.04 DESIGN REQUIREMENTS

A. Copper pipe and fittings shall conform to the latest Building Code of the City of New York in respect to plumbing and other applications covered by these laws.

B. Copper pipe shall conform to the latest standards of the American Society for Testing and Materials (ASTM), the American National Standards Institute (ANSI), the American Society of Mechanical Engineers (ASME), the Aluminum Association (AA), the Copper and Brass Research Association (CABRA), the Society of Automotive Engineers (SAE), the Manufacturer's Standardization Society (MSS), the American Welding Society (AWS), and National Pipe Thread (NPT).

C. Use only NSF61-approved materials in potable water lines.

1.05 SUBMITTALS

A. Provide all submittals, including the following, in accordance with Section 01330 - Shop Drawings.

B. Submit the following shop drawings before fabricating or installing pipe.

1. Complete detailed shop drawings in conformance with the specified requirements. Include all data pertinent to the layout of the pipe even though such information is not specifically mentioned in the Specifications.
2. Drawings that show completely dimensioned piping layouts and schedules of all pipe, fittings, valves, expansion joints, flexible couplings, hangers, supports and other appurtenances.
3. Schedules of pipe, fittings and valves. Denote the material and thickness or class of all pipe, the type and material of all fittings and the rating and description of all valves.
4. Details of insulation, painting and similar work for all piping.
5. Details and materials of the support and hanging of pipe.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

A. The following manufacturers are acceptable.

1. Pipe and Fittings

- a. Mueller Industries, Inc., Wichita, KS
- b. IBCO, Elkhart, IN
- c. Or approved equal

2. Flared Tube Fittings

- a. Parker Hannifin Corp., Triple-Lok Fittings
- b. Or approved equal

**2.02 MATERIALS**

A. Copper Pipe and Fittings

1. Small Copper Piping: For copper pipe 3 inches in diameter and smaller, provide Type K seamless, round, hard drawn copper tubing that meets ASTM B88 requirements. Provide tube sizes, dimensions and wall thickness conforming to ASTM B88, Table 1 for Type K tubing, unless otherwise specified. Provide nominal lengths of hard copper tubing in straight lengths of approximately 20 feet, unless otherwise specified.

a. Fittings: For copper tubing, use solder joint or flared end type fittings, as specified. No bending of hard copper tubing will be permitted, unless otherwise specified; make all bends and connections with suitable fittings.

(1) Provide flared tube fittings meeting the requirements of the SAE Hydraulic Tube Fittings standard. After flaring, anneal the joints before assembly. Flared fittings shall be of brass half-hard bar stock, ASTM B 16 (SAE 72) or of brass forgings, ASTM B 124, Alloy Number 2 (SAE 88). Assemble couplings and fittings to prevent overstressing the tubing. Where required, use anti-seize lubricating compound to prevent galling and to facilitate assembly.

(2) Solder Joint Fittings: Provide ASME B16.18, cast copper alloy or ASME B16.22 wrought copper and copper alloy fittings. Braze solder joint fittings and tubing in conformity with the specifications of Section 3 of the CABRA Copper Tube Handbook. Brazing alloy shall be copper-phosphorus alloy, Class BCuP-5, as specified by American Welding Society Spec. AWS A5.8.

- b. Joints: Provide threaded or ASTM B32 lead-free soldered joints.
  - 2. Large Copper Piping: For copper pipe larger than 3 inches in diameter, provide regular seamless copper pipe that meets the ASTM B42 requirements.
    - a. Fittings: Provide solder type fittings of the same material as the pipe.
    - b. Joints: Use threaded or brazed joints.
  - 3. Potable Water Piping: Use ASTM B32 alloy Grade 95TA (95 percent tin and 5 percent antimony) solder for piping carrying potable water.
  - 4. Unacceptable Uses: Do not use copper pipe with soldered joints for transporting fuel oil or other flammable or toxic liquids inside buildings.
- B. Sleeves and Wall Castings: Unless otherwise shown or specified, furnish and install suitable pipe sleeves at all points where pipes pass through walls or floors of structures. Sleeve material shall be ductile iron or steel as shown on the Contract Drawings or specified. Ductile-iron sleeves shall conform to the requirements of Section 15051 - Ductile Iron Pipe, and steel sleeves shall conform to the requirements of Section 15052 - Steel and Stainless Steel Pipe.
- C. Modular, Mechanical Sleeve Seals: Provide modular, mechanical type seals consisting of interlocking, synthetic-rubber links shaped to continuously fill the annular space between the pipe and the sleeve. Provide an elastomeric sealing element that is of the size, quantity, type and material that the manufacturer recommends for the intended service and that will provide an effective hydraulic seal. Provide stainless steel bolts and nuts. Modular, Mechanical Sleeve Seals shall conform to section 07845 - Annular Space Seals.
- D. Drip pans shall be constructed of 16-gauge Type 316 stainless steel. If welding is required to construct the drip pan, Type 316L stainless steel shall be used.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install all pipe and fittings as specified, as shown on the Contract Drawings, and in accordance with the manufacturer's recommendations and approved shop drawings.
- B. Connections Between Dissimilar Metals: Where connections are to be made between pipelines or equipment of dissimilar metals, make the connections using dielectric insulating couplings, unions or other approved dielectric insulating devices.
- C. Reducing Fittings: Use reducing fittings for all changes in pipe size. Do not use bushings.

**D. Pipe Flexibility**

1. Make ample provisions for flexibility in all pipelines.
2. Install branch tees on risers in locations that will allow the branch lines, when expanded by heat, to drain properly.
3. Unless other forms of expansion compensation are specified, such as expansion joints, fabricate all runs of pipe subject to change in length shorter than their theoretical length to the extent of one half of the expansion and erect them such that they may be free to expand without increasing the stresses imposed when cold.
4. When the foregoing method of compensation for expansion is not adequate, furnish and install in the pipelines expansion devices adequate to allow the lines to expand and contract freely without injury to any part of the piping system. The devices may be in the form of expansion joints, swivel joints, swing joints, pipe bends or flexible couplings, and shall include such anchors as may be shown or required to make the devices effective. A sufficient number of fittings and pipe lengths shall be used in connection with swing joints to assure the absence of distortion of either the pipelines or branches. Application guide and anchor requirements for expansion joints shall be in accordance with the recommendations of the manufacturer or the Standards of the EJMA.

E. Hangers and Supports: Furnish and install supporting devices as specified under Section 15060 - Hangers and Supports.

F. Drip Pans: Provide drip pans under all metallic pipelines installed over electrical equipment and motors and conduct drainage to the nearest floor drain, gutter or other drainage system with 3/4-inch red brass pipe. Make the connection between the drip pan and the brass drain pipe leaktight, and pitch the drip pan uniformly toward the drain pipe at a slope not less than 1/8-inch per lineal foot.

G. Pipe identification signs and valve identification numbers shall be furnished and installed in conformity with Section 15076 - Piping and Equipment Identification.

**3.02 CLEANING AND TESTING**

A. Cleaning: During construction, clean all piping before placement and keep the lines free from every kind of foreign matter. All pipelines shall be left thoroughly clean to the satisfaction of the Resident Engineer. Flush all process and potable water pipelines with clean water.

B. Test all pipelines for leakage in conformance with Section 02505 - Leakage Tests.

**3.03 INSULATION**

- A. Piping insulation shall conform to Section 15081 - Insulation.

**3.04 DISINFECTION**

- A. Disinfect all potable water pipelines in accordance with Section 15141 - Disinfection.

**-END OF SECTION-**

**Section 15056**  
**PIPE COUPLINGS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide sleeve-type and groove-and-shoulder-type couplings in pipelines as shown, specified and required.

**1.02 RELATED SPECIFICATIONS**

- A. Section 09911 - Exterior Painting
- B. Section 09912 - Interior Painting
- C. Section 15051 - Ductile Iron Pipe
- D. Section 15052 - Steel and Stainless Steel Pipe

**1.03 REFERENCES**

- A. ASTM A47 - Ferric Malleable Iron Castings

- N. AWWA Manual M11 - Steel Pipe - A Guide for Design and Installation

#### 1.04 DESIGN REQUIREMENTS

- A. Pipe couplings for making field joints between plain end, grooved end, and shouldered end pipe and fittings shall meet the requirements of the Code on Power Piping, ASME B31.1.
- B. Coupling design and construction shall facilitate easy assembly in the field.
- C. Flexible couplings shall be designed and constructed to insure permanently tight joints under all conditions of expansion, contraction, shifting and settlement to which the pipelines may be subjected as a result of the operation and layout of the process system in which they are installed.
- D. Rigid couplings shall be designed and constructed to provide a tight joint and prevent pipe movement at the joint.

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Submit completely detailed shop drawings including the following:
  - 1. Location in pipeline
  - 2. Catalog data showing dimensions and materials of component parts
  - 3. Harnessing, where required
  - 4. Working and test pressures

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. The following manufacturers are acceptable. Equivalent products from other manufacturers may be submitted for approval.
- B. Sleeve-type Couplings
  - 1. Dresser Manufacturing Div. of Dresser Industries, Inc.
    - a. For steel pipelines, Style 38

- b. For ductile iron pipelines
    - (1) 12" and smaller - Style 138
    - (2) larger than 12" - Style 38
  - c. To join different types and sizes of pipe, Style 162
- 2. Smith-Blair, Inc.
  - a. For steel pipelines, Type 411
  - b. For ductile iron pipelines
    - (1) 12" and smaller - Type 441
    - (2) larger than 12" - Type 411
  - c. To join different types and sizes of pipe, Type 441
- C. Groove- and Shoulder-type Couplings (Victaulic)
  - 1. For steel pipelines
    - a. Grooved, flexible, Style 77
    - b. Grooved, rigid, Style 07
    - c. Shouldered, Style 44
  - 2. For ductile iron pipelines
    - a. Grooved, flexible, Style 31 with flexible radius grooves
    - b. Grooved, rigid, Style 31 with rigid radius grooves
    - c. Shouldered, Style 31
  - 3. For stainless steel pipelines
    - a. Grooved, flexible, Style 77S
    - b. Grooved, rigid, Style 008
  - 4. For aluminum pipelines
    - a. Grooved, flexible, Style 77A
  - 5. For copper pipelines
    - a. Grooved, rigid, Style 606

6. For PVC pipelines
  - a. Grooved, flexible, Style 775
7. For High Density Polyethylene (HDPE) pipelines
  - a. Plain end, rigid, Style 995

D. Groove- and Shoulder-type Fittings

1. Victaulic Full-Flow Fittings
2. American Cast Iron Pipe Co.
3. U.S. Pipe and Foundry Co.

2.02 PRODUCTS

A. Couplings shall be either one of the following two types:

1. Sleeve-type couplings shall have a middle ring or sleeve placed around the pipe joint. The middle ring shall be sealed by two wedge-shaped gaskets evenly compressed by follower flanges or rings tightened by bolts and nuts.
2. Groove- and shoulder-type couplings shall have a C-shaped sealing gasket placed around the joint. The gasket shall be enclosed in a split-type housing that shall engage shoulders or grooves in the pipe. The housing shall be assembled by bolts and nuts.

B. Bolts and Nuts

1. Bolts for sleeve-type and groove- and shoulder-type couplings shall be Type 316 stainless steel, ASTM A 193/A 193M, Grade B8, Class 2. Nuts shall be Type 316 stainless steel conforming to ASTM A194/A194M. Bolts shall have American Screw Threads, Coarse Thread Series, ASME B1.1. Nuts shall be American Standard Heavy Dimension Series, ASME B18.2.2.
2. For all sleeve-type couplings, bolts shall be double radius head or button head track type. The collars under the heads shall fit oval or square holes in the follower rings.
3. For all groove-and shoulder-type couplings, bolts shall be track type oval neck bolts. The collars under the heads shall engage the oval slots in the housing.

C. Sleeve-type couplings shall be of steel construction for steel pipe lines. Sleeve-type couplings for ductile iron pipelines shall be constructed of ductile iron or steel for pipe sizes 12 inches and smaller and shall be constructed of steel for pipes larger than 12 inch.

## 1. For Steel Pipe Lines

- a. The middle ring or sleeve and the follower rings or flanges shall be steel, ASTM A 283/A 283M (Grade A). The middle ring or sleeve shall have flared or beveled ends. The follower rings or flanges and the middle ring or sleeve shall be true circular sections free from irregularities, flat spots or surface defects.
- b. The middle ring or sleeve shall not have a center pipe stop, unless otherwise specified, and shall have the following minimum dimensions:

Pipe Diameter (inches)	Middle Ring Thickness (inches)	Middle Ring Length (inches)
8 and Smaller	1/4	5
10-30	3/8	7
Over 30	1/2	10

- c. After welding, welded steel follower rings shall be sized and tested by cold expanding a minimum of one (1) percent beyond the yield point.

## 2. For Ductile Iron Pipe Lines

- a. The middle ring or sleeve shall be ductile iron, ASTM A536. The middle ring or sleeve shall have flared or beveled ends. Follower rings or flanges shall be of ductile iron, ASTM A536, or malleable iron, ASTM A47 (Grade 32510), for pipe sizes 12 inches and smaller, and shall be of steel ASTM A283/A283M (Grade A) for pipe larger than 12 inches.
  - b. The middle ring shall not have a center pipe stop, unless otherwise specified, and shall have the same minimum dimensions as specified above for couplings for steel pipe.
3. Gaskets shall be resilient, wedge-shaped gaskets with a maximum angle of 40 degrees at the wedge end. Gasket material shall be compatible with the type and temperature of the fluid in the pipeline, and shall be the material recommended by the manufacturer for the service if not specified elsewhere.
  4. The maximum working pressure of the sleeve-type couplings shall not be less than 250 psi for pipe sizes smaller than 54 inch, and not be less than 200 psi for pipe larger than 54 inch.

## D. Groove- and Shoulder-type Couplings

1. Couplings may be of the grooved type for steel pipe in sizes up to and including 24 inches. For steel pipe larger than 24 inches, suitable welded steel

collars, Victaulic Vic-Ring Type C or Type E, or approved equal, shall be welded to the pipe ends. Unless otherwise specified, groove-type couplings shall conform to the requirements of AWWA C606.

2. Housing shall be in two or more parts, closely fitting the pipe and gasket. Housing material shall be ductile iron, ASTM A536 (Grade 654512), except for stainless steel and aluminum pipelines, which shall have housings of Type 316 stainless steel, ASTM A744 Grade CF-8M, and aluminum, ASTM B26, Alloy 356-T6, respectively.
3. Gaskets shall be of materials compatible with the type and temperature of the fluid in the pipeline, and shall be of the material as recommended by the coupling manufacturer for the service if not specified elsewhere. Gaskets shall be molded so that internal pressure tightens the seal. All gaskets shall be continuous, uniform in texture, and free from surface blemishes and defects.

**E. Groove- and Shoulder-type Fittings**

1. Grooved end fittings for steel and ductile iron pipe in sizes up to and including 24 inches shall be cast of ductile iron with working pressure ratings not less than the following:

Nominal Pipe Size (Inches)	Working Pressure (psi)
3/4" - 6"	1,000
8" - 12"	800
14" - 22"	300
24"	250

2. For steel and ductile iron pipe larger than 24 inches, fittings shall be provided with shoulders. Working pressure ratings shall not be less than 150 psi. Fabricated steel fittings shall be provided with extra-long end pieces to suit the coupling.
3. Grooved end fittings for stainless steel pipe shall be Type 304 of the thickness schedule specified.
4. Grooved end fittings for aluminum pipe in sizes 1 inch through 8 inches shall be of aluminum alloy 356 T6 conforming to ASTM B26, and shall be equal to Victaulic full-flow aluminum fittings. Working pressure ratings shall be not less than 500 psi for fittings in sizes 1 inch through 6 inches and not less than 400 psi for 8-inch size fittings.
5. Grooved end fittings for copper pipe shall be provided with rolled grooves and shall be designed for a working pressure not less than 300 psi.

## 2.03 PAINTING

- A. All surfaces of the middle and follower rings of all sleeve-type couplings and the housing of all groove- and shoulder-type couplings shall be shop painted in conformance with the requirements of Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Ends of pipe, fittings and couplings shall be cleaned of all scale, dirt and thick outside coatings. Before assembly, the ends of pipe and/or fittings and the outside of the coupling gasket shall be lubricated as recommended by the manufacturer. Fasteners shall be assembled using a thread lubricant equal to G-N paste (Molycote) as manufactured by Dow-Corning.
- B. Couplings shall be assembled by tightening diametrically opposite bolts evenly and progressively. Bolts on sleeve-type couplings shall not be tightened beyond the point of stretching (when the mill scale on the shank begins flaking off). Bolts on groove- and shoulder-type couplings shall be tightened only until there is metal to metal contact between housing segments and the pipe.
- C. Field Assembly of Groove-type Couplings. Field grooving of pipe shall not be done unless approved by the Commissioner, and then shall be limited to steel pipe 24 inches or under nominal diameter and to ductile and cast iron pipe 12 inches or under nominal diameter. Field grooving shall be done only with special tools provided by the coupling manufacturer.
- D. Harness for Sleeve-type Couplings. In all pipelines under pressure, and elsewhere where shown, specified or required, sleeve-type couplings shall be harnessed.
  - 1. On steel pipe, unless otherwise specifically detailed or specified, cast steel "crow-foot" lugs shall be welded on diametrically opposite sides of the pipe, and the joint shall be harnessed with stainless steel tie-bolts and nuts. The dimensions, sizes, spacing and materials for lugs, tie-bolts and nuts shall be based on the use of two bolts and four lugs per joint, in conformity with Section 19.8 (Table 19.7) of AWWA Manual M11 or the standard specifications of the coupling manufacturer for the pipe size, wall thickness and test pressure specified. Welding shall conform to the requirements specified under Section 15052 - Steel and Stainless Steel Pipe.

2. On ductile iron pipe, unless otherwise shown or specified, couplings shall be harnessed with stainless steel tie bolts and nuts connected to flanges or fittings installed on the pipe on each side of the coupling as shown, specified or required for the pipe sizes and specified test pressures. The harnessed length from flange to flange shall not exceed 3 feet.

-END OF SECTION-

**Section 15058**  
**HOSE REEL ASSEMBLIES**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This section includes the requirements for furnishing and installing service water hose reels, non-collapsible rubber hoses, and hose nozzles. Hose reel and accessories shall be provided, assembled as necessary, and installed where shown on the Contract Drawings or as required for a complete installation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 – Shop Drawings
- B. Section 01821 – Training
- C. Section 01831 – Operation and Maintenance Manuals
- D. Section 02505 – Leakage Tests
- E. Section 15076 – Piping and Equipment Identification
- F. Section 16050 – Basic Electrical Materials and Methods
- G. Section 16055 – Electrical Requirement for Shop Assembled Equipment
- H. Section 16220 – Electric Motors

**1.03 REFERENCES**

- A. New York City Building Department requirements
- B. New York City Department of Environmental Protection (NYCDEP), Bureau of Water Supply Standard Water Main Specifications

**1.04 SUBMITTALS**

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Shop Drawings: Submit working drawings, including arrangement and erection drawings, equipment and control equipment; schematic control diagrams; electrical connection diagrams; and complete description of the control system.
- C. Provide manufacturer's data showing capacity of the reel, motor Hp, hose and nozzle performance, system pressures and other operational parameters.
- D. Provide Operation and Maintenance manuals in accordance with Section 01831 – Operation and Maintenance Manuals.

## 1.05 SPARE PARTS

- A. The equipment manufacturer shall submit for approval a spare parts list in accordance with the procedures and requirements set forth in the General Conditions.
- B. The complete list of parts and supplies shall include current unit prices and source of supply.
- C. The complete list of parts and supplies that are either normally furnished at no extra cost with the purchase of the equipment or specified herein to be furnished as part of the Contract.
- D. A list of additional items recommended by the manufacturer to assure efficient operation at the particular installation. Parts shall be completely identified with a numerical system to facilitate parts inventory control and stocking. A separate number shall properly identify each part. Those parts, which are identical for more than one size, shall have the same parts number. Lists specified in paragraphs A and C above shall be submitted with the operation and maintenance manual.
- E. The following spare parts shall be supplied with the equipment:
  - 1. 100 ft length of 1½" rubber hose
  - 2. 1-set hose fittings/adaptors
  - 3. 1-complete nozzle assembly

## 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Use every precaution to prevent damage to the hose reels during transportation and delivery to the site.
- C. If, in the process of transportation or handling, any hose reel or accessory is damaged, replace or repair such reel or reels. Make all required repairs.
- D. Delivery: Ship each hose reel complete, with no field assembly or fabrication required.

## PART 2 PRODUCTS

### 2.01 HOSE REELS

- A. Provide 1½-inch power driven hose reels capable of storing 100-feet of 1½-inch non-collapsible rubber hose. Provide hose reels constructed of Type 304 stainless

steel. Provide hose reels having electric motor rewind with auxiliary hand crank. Provide a minimum ½-horsepower motor rated at 120-volt A.C. Motors shall comply with applicable portions of Section 16050 – Basic Electrical Materials and Methods, Section 16055 - Electrical Requirements for Shop-Assembled Equipment, and Section 16220 – Electric Motors.

- B. Provide adjustable spring tension pinion brake and spring-actuated pin lock. Also supply a manual clutch reeducation unit.
- C. Provide four-way roller assembly with stainless steel housing. Provide swivel joint inlet with 1½-inch female NPT threads. Provide outlet with 1½-inch male NST threads. Hose reels shall be suitable for mounting on floors or walls.
- D. Provide controls for motor rewind to control the speed of the rewind and a momentary contact (dead man) switch to provide power to the reel.
- E. Hose reels shall be manufactured by: Hannay Reels, of Westerlo, NY, Model number: SSEP 7526-33-34-10.5RT, or approved equal

#### 2.02 NON-COLLAPSIBLE RUBBER HOSE FOR HOSE REELS

- A. For each hose reel provide a non-collapsible rubber hose assembly having a single length of 100 feet with no intermediate couplings. Hose assemblies shall include hose, end couplings, washers and appurtenances necessary for a complete assembly. Non-collapsible rubber hose assemblies shall be installed on the hose reels.
- B. Hose: Provide 1½-inch, spiral braid wrapped synthetic rubber hose rated for working pressure of 150 psig and burst pressure of 600 psig. Hose coating shall be oil resistant and kink resistant.
- C. Connections: Provide the hose assembly with any fittings, such as hose shanks and other items, as necessary to connect the hose to the end couplings. All couplings and fittings shall be stainless steel.
- D. Acceptable manufacturers are listed below.
  - 1. Goodyear Rubber Products Corporation, of North Brunswick, NJ
  - 2. Abbott Rubber Company, of Elk Grove Village, IL, Type 1112-1502-50
  - 3. Or Approved Equal

#### 2.03 ADJUSTABLE GALLONGE NOZZLES FOR HOSE REELS

- A. For each hose reel provide a 1½-inch inlet pistol grip nozzle. Nozzles shall be of aluminum or stainless steel construction. Nozzles shall have a protective corrosion resistant coating. Nozzle shall provide varying flow patterns and varying flow rates. Nozzles shall include a ball shut off. Nozzles shall have female connections and rated for working pressure of 150 psig.

B. Acceptable manufacturers are listed below.

1. LDM Products, Saugerties, NY
2. W.S. Darley & Co., Melrose Park, IL
3. Or approved equal

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Hose reel assemblies shall be installed in strict accordance with the most recent installation instructions provided by the hose reel manufacturer, local ordinance, recognized engineering procedure, and other applicable codes.
- B. Equipment identification shall be in accordance with Section 15076 - Piping and Equipment Identification.

#### 3.02 TESTING

- A. After the installation of the hose reel assemblies, subject the equipment to a field running test under actual operating conditions. Perform field test as directed and in the presence of the Commissioner. Perform the field test to demonstrate that under all conditions of operation the unit:
1. Has not been damaged by transportation or installation
  2. Has been properly installed
  3. Has no mechanical defects
  4. Has been properly connected
  5. Is in proper alignment
  6. Is free of overheating of any parts
  7. Is free of all objectionable vibration
  8. Is free of excessive noise
  9. Is free of overloading of any parts
  10. Operates as specified with the control system
- B. Promptly correct any defects in the equipment or failure to meet the requirements of the Specifications.
- A. Leakage tests shall be performed in accordance with Section 02505 – Leakage Tests.

#### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Services: The Contractor shall retain the services of the Supplier to supervise and/or perform checkout and start-up of all system components. As part of these services, the Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to

check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

3.04 TRAINING

- A. Provide training in accordance with Section 01821 – Training.
- B. The manufacturer of the Hose reel shall include one hour of on-site classroom and hands-on.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15060**  
**HANGERS AND SUPPORTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Contractor shall provide all hangers, supporting devices and appurtenances shown, specified or required for pipes, fittings, valves and other in-line equipment.
- B. Included in this classification are rod hangers; clevis hangers, spring hangers; stanchion, roller and pipe pole supports and saddle stands; supports of structural steel; concrete saddles, concrete anchor blocks and bases, and all necessary guides, restraints, fastening devices, anchor bolts, pipe anchors and appurtenances.
- C. Contractor shall provide all temporary pipe supports required during construction.
- D. Contractor shall design all piping support systems in accordance with the requirements of this Specification unless otherwise shown or specified.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 05081 - Galvanizing
- C. Section 05500 - Metal Fabrications
- D. Section 09911 - Exterior Painting
- E. Section 09912 - Interior Painting

**1.03 REFERENCES**

- L. EJMA - Expansion Joint Manufacturers Association.
- M. NFPA 13 - Installation of Sprinkler Systems.

#### 1.04 DESIGN REQUIREMENTS

- A. Contractor shall provide hangers and supports of sufficient strength to maintain the pipelines and appurtenances in proper position and alignment under all operating conditions.
- B. Contractor shall provide the services of a New York State Registered Professional Engineer to design the supports for all pipelines and appurtenances, for all weights, forces and applied pressures. In the design of hangers, supports and anchors, unless otherwise shown or specified, pipe pressures shall be the maximum test pressures specified for pipelines carrying gases and twice the maximum test pressures specified for pipelines carrying liquids. The pipe support designer shall have a minimum of three (3) years experience in the design of pipe supports and have completed successful pipe support projects of equal complexity as the systems specified.
  - 1. Pipe support design shall include load and movement calculations.
  - 2. The following loads shall be included in pipe support design and pipe stress analysis:
    - a. Gravity Force, including weight of pipeline and appurtenances, contents, insulation, etc.
    - b. Thermal Expansion Force developed by the restraint of free end displacement of the piping.

- c. Hydrostatic Forces developed by internal pressure during operation of the piping system.
  - d. Loading due to expansion joint reaction forces.
  - e. Seismic forces, as required by the New York City Building Code.
- 3. Supports, guides and anchors for flexible couplings and expansion joints shall be in accordance with the coupling and joint manufacturer's specification and the standards of the Expansion Joints Manufacturers Association.
- 4. Wherever possible, pipe supports shall be designed using manufacturer's standard catalog products.
- 5. Hangers and Supports for piping systems subject to thermal expansion and contraction, or to similar movements imposed by other sources, shall be designed to provide flexibility, and pipe stress analysis shall be provided.
- 6. Where resonance with imposed vibration and/or shock occurs during operation, suitable dampeners, restraints, anchors, etc., shall be added to remove those effects.
- 7. Occasional load calculations and pipe stress analysis shall be provided where required by Building Codes or Standards. Occasional loads include:
  - a. Seismic forces
  - b. Pressure waves produced by sudden changes in fluid momentum, commonly referred to as water hammer
  - c. Wind, snow or ice loads
  - d. Safety valve thrust loads
- 8. Stressors in hangers, rods and brackets shall be in accordance with Table 2 of MSS-SP-58.
- C. All hangers and supports shall conform to the applicable requirements of ASME B31.1, MSS SP-58, SP-59, SP-69 and SP-90, except as modified herein, and be of standard manufacture wherever possible, and best suited for the service required.
- D. Unless otherwise approved, all hangers, supports and concrete inserts shall be listed with Underwriters' Laboratory, Inc.

## E. General Requirements

1. Pipe and appurtenances connected to equipment shall be supported in a manner to prevent any stress being imposed on the equipment. When manufacturers have indicated requirements that piping loads shall not be transmitted to their equipment, certification shall be submitted stating that requirements have been complied with.
2. Where practicable, piping shall be run in groups and parallel to building walls. A minimum clearance of one inch shall be provided between pipe and other work.
3. Hangers or supports shall be provided at all locations where piping changes direction.
4. Hangers and supports shall be capable of adjustment after placement of piping.
5. Types of hangers and supports shall be kept to a minimum.
6. Suspended or supported ductile iron pipe shall have a hanger or support adjacent to each hub or flanged end.
7. Vertical piping shall be supported at each floor and between floors by stays or braces to prevent rattling and vibration.
8. Hanger rods shall be straight and vertical. Chain, wire, strap or perforated bar hangers shall not be used. Hangers shall not be suspended from piping.
9. Contact between dissimilar metals shall be prevented by use of copper plated, rubber or vinyl coated hangers or supports.
10. Hangers and supports shall provide for expansion and contraction throughout the full operating temperature range.
11. Any required pipe supports, for which the supports called for in this Specification are not applicable, shall be fabricated or constructed from standard stainless steel shapes, concrete and anchor hardware, and shall be subject to the approval of Commissioner.
12. Where hanger or support spacing does not correspond with joist or rib spacing, structural steel channels shall be attached to joists or ribs, and the pipes suspended there from.
13. All hanger rods shall be double nutted at each hanger or support.

14. All threaded assemblies shall be double nutted or provided with pinned nuts. Alternately, tack welding of bolted assemblies may be acceptable unless provisions for vertical adjustment are required.
15. Except where otherwise shown or required, horizontally valves 6-inches and larger shall be supported on each side of the valve, by pipe hangers or supports.
16. At all flexible couplings, supports shall be placed on each side and as close to the coupling as possible. Supports shall be the guide type that prevents axial movement from resulting in pipe deflection and misalignment.
17. Supports, anchorage and guidance for grooved end pipe shall be in accordance with the applicable sections of these specifications and the recommendations of the manufacturer.

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Contractor shall submit the following for approval:
  1. Name and qualifications of the support and hanger engineer.
  2. Detailed Working Drawings showing all hangers and supports for each piping system. Working Drawings shall show location, installation, material, loads, forces, stresses and deflections of all hangers and supports. Reaction forces imparted to structures to which hangers and supports are attached shall be shown.
- C. Contractor shall submit the following product information for approval:
  1. Manufacturer's catalogs and engineering data on all hangers and supports
  2. Load ratings
  3. Materials
  4. Installation details
- D. Contractor shall submit all drawings and design calculations signed and sealed by a New York State registered professional engineer.
- E. Contractor shall provide detailed drawings of each pipe support. Each drawing shall contain enough information to verify the pipe support design and to allow the manufacture of the device. At a minimum, the Contractor shall submit:
  1. Scaled details of the device with dimensions.
  2. A table of applied forces and moments.

3. A complete bill of materials.
4. An isometric showing the applied forces and moments.
5. Detailed connections to existing structure.
6. Shop and field welds.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Equipment and materials shall be delivered to the site to insure uninterrupted progress of the Work. Pipe hanger inserts that are to be embedded in cast-in-place concrete shall be delivered in ample time not to delay the Work.
- C. Equipment and materials shall be stored to permit easy access for inspection and identification, and shall be kept in covered storage off the ground, using pallets, platforms or other supports. They shall be protected from condensation, corrosion and deterioration.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Pipe hangers, supports and appurtenances shall be standard products of the manufacturers.
- B. Each type of hanger and support shall be the product of a single manufacturer.

#### 2.02 MATERIALS

- A. Materials for hangers and supports of metallic construction shall conform to ASME B31.1 and to the following standards:
  1. Structural Steel, ASTM A 36 and A 283
  2. Iron Castings, ASTM A 48 (Class No. 35)
  3. Stainless Steel, ASTM A 276
    - a. Type 316 stainless steel for non-welded items
    - b. Type 316L stainless steel for welded or fabricated items
    - c. Tensile Strength: 70,000 psi minimum
    - d. Yield Strength: 25,000 psi minimum
    - e. Elongation in 2 inches: 35%
    - f. Reduction of area: 45%
  4. Stainless Steel Pipe and Tube, ASTM A 778, Type 316L stainless steel

- B. Pipe supports, hangers, brackets, guides, restraints, rods, bolts, nuts and anchors shall be Type 316 stainless steel. Concrete inserts shall be of malleable iron with galvanized finish.
- C. Pipe rolls, including stands and bases, shall be of cast iron, hot-dipped galvanized conforming to ASTM A123.
- D. Only new materials shall be provided.
- E. Hangers and supports shall conform to MSS-SP-58, Table 2.
- F. Proprietary fiberglass reinforced plastic supports and hangers for use with small diameter chemical and thermoplastic pipe shall be as specified in the piping specification and approved by the Commissioner.
- G. Expansion anchors for use in existing concrete structure shall be made of Type 316 stainless steel.

## 2.03 HANGERS AND SUPPORTS

- A. Hangers and supports where shown shall be in accordance with the Contract Drawings. Hangers and supports not shown shall comply with MSS SP-58.
- B. All hangers and supports shall allow minimum 3-inches of vertical adjustment.
- C. Hangers and Supports shall be of the following types:
  - 1. Hangers for Single Pipes
    - a. Single pipes shall be supported by hangers suspended by rods from structural steel members, inserts in concrete ceilings and beams, bottom of trapeze hangers and wall mounted steel angle brackets. The strength of the rod shall be based on its root diameter.
    - b. Except for piping subject to thermal expansion and contraction or as otherwise specified, pipe hangers shall be adjustable clevis type MSS SP-58 Type-1.
    - c. Piping subject to thermal expansion and contraction shall be supported on rollers.
  - 2. Hangers or Supports for Multiple Pipes
    - a. Multiple pipes, running parallel in the same horizontal plane and adjacent to each other, shall be suspended by trapeze type hangers or supported on wall brackets. Trapeze hangers shall consist of channel

sections supported from threaded rods or attached to concrete walls, columns or structural steel support members.

- b. Except as otherwise specified herein, pipe anchors used for attaching pipe to trapeze or multiple pipe wall brackets, shall be anchor or pipe chairs as required.

### 3. Supports for Single Pipe

- a. Single pipes located in a horizontal plane close to the floor shall be supported by one of the methods specified herein or as shown on the Contract Drawings.
- b. Pipes shall be supported by adjustable stanchions, pipe saddle or roll supports with "U" bolts. Stanchions shall provide at least 4-inches adjustment and be flanged-mounted to floor.
- c. Stanchions and saddle stands shall be of Type 316L stainless steel.
- d. Pipe pole supports for pipe runs above ground, out-of-doors, and where otherwise required, shall consist of a suitable length of stainless steel pipe set upright in at least four feet of concrete; two stainless steel angles secured to the top of the pipe, at right angle and on each side; a stainless steel plate welded to the top of the angles to serve as a horizontal support for the pipes. Supports shall be provided with attachments in the form of stands, clamps, rolls, rods or similar devices of the screw adjustable type in the vertical direction.
- e. Where specified or shown, column supports of built-up welded stainless steel shall be provided, as approved by the Commissioner.
- f. Pipe rollers shall be cast ductile iron unless otherwise shown or specified. Hardware and appurtenances shall be stainless steel.

- 4. Wall Supported Pipes: Single or multiple pipes located adjacent to walls, columns or other structural members, and an excessive distance from ceilings or underside of beams, shall be supported using stainless steel wall brackets, MSS SP-58 Type 32 or 33. Where pipes rest on top of bracket pipe supports, attachments shall meet the requirements specified under Paragraph 2.b above.
- 5. Supports for Base Elbows: Where pipes change direction from horizontal to vertical through a bend, a welded or cast base anchor support shall be installed at the bend to carry the load.
- 6. Supports for Vertical Pipes: Pipe riser clamps shall be used to support all vertical pipes extending through floor slabs. Riser clamps shall be MSS SP-

58 Type 42 or 8. Insulation shall be removed from insulated pipes prior to installing riser clamps.

7. Supports for Pipelines with Thermal Expansion

- a. Pipe rolls for single rod hangers: Stainless steel frame construction, ductile iron roller and stainless steel roller rod provided with threaded nuts; vertical adjustment permitted; for pipe sizes 6 inches or less unless otherwise approved.
- b. Pipe rolls for double rod hangers: Ductile iron roller, stainless steel roller rod, malleable iron threaded sockets which permit vertical adjustment.

8. Supports for Pipelines Subject to Temperatures Greater than 300 F: Spring hangers of heavy stainless steel construction.

9. Supports for Thermoplastic Pipes: All thermoplastic pipe attachments shall have a continuous bearing cradle or saddle on the lower 120 degrees of pipe circumference and a minimum length of one quarter pipe diameter, but not less than 6 inches nor more than 12 inches.

10. Supports for Copper & Brass Pipes: All copper and brass pipe supports shall be specifically manufactured for use with copper & brass pipe. Hangers shall be provided with a copper finish.

11. Hangers for Radiators

- a. Support wall hung radiators on approved wall brackets or overhead hangers.
- b. Support wall hung radiators by all-metal brackets and plates that are screw adjustable after erection. Wall plates shall be made of stainless steel of size and shape to insure rigidity and strength and with a minimum resistance to expansion. Plates shall be fastened directly to walls, columns or pilasters with at least one 1/2-inch bolt, and with spacing of brackets not in excess of 42-inches.
- c. Where rod hangers are specified or shown supporting wall radiators, supporting rods shall be not less than 5/8-inch in diameter.

12. Concrete Supports

- a. Where pipeline or mechanical equipment is shown, specified or required to be supported on concrete supports, supports shall be as specified herein.

- b. Concrete supports for equipment shall be of a size and mass that will resist all forces, both static and dynamic, which may be developed by the equipment.
- c. Concrete supports for pipe, fittings, valves and appurtenances shall be designed to carry the weight of the pipeline and appurtenances. Cradles and anchor blocks shall safely withstand all stresses imposed by the pipelines, under all operating conditions. Concrete cradles shall be shaped to fit the contour of the pipe.
- d. Concrete supports shall be anchored to the floor of main structures by doweling or other approved means. Anchor bolts, extension plates, saddle yokes and other hold-down devices in concrete bases shall be placed before pouring of concrete. Expansion bolts shall not be used on new concrete supports except with the specific approval of the Commissioner.
- e. Concrete supports shall be not less than Class 25 as specified in Section 03300 - Cast-in-Place Concrete.

## 2.04 ACCESSORIES

### A. Hanger Rods

1. Material shall be Type 316 stainless steel. Maximum allowable working stress shall be 5,800 psi, calculated based on the root diameter.
2. Rods shall have a square head nut on top and running thread on bottom end. Hanger rods for single pipe hangers shall be sized in accordance with the following schedule:

<b>Hanger Rod Diameter (Minimum)</b>			
<b>Pipe Size (inches)</b>	<b>Single Rod (inches)</b>	<b>Double Rod (inches)</b>	<b>Maximum Load Per Hanger (lbs)</b>
1/2 to 1-1/2, incl	3/8	3/8	300
2	3/8	3/8	325
2-1/2	1/2	3/8	350
3	1/2	3/8	400
3-1/2	1/2	3/8	450
4	5/8	1/2	850
5	5/8	1/2	950
6	3/4	5/8	1075

<b>Hanger Rod Diameter (Minimum)</b>			
<b>Pipe Size (inches)</b>	<b>Single Rod (inches)</b>	<b>Double Rod (inches)</b>	<b>Maximum Load Per Hanger (lbs)</b>
8	*7/8	5/8	1350
10	*7/8	5/8	1750
12	*7/8	3/4	2200
14	*1	7/8	2500
16	*1	7/8	3075
18	*1	7/8	3700
20	*1-1/4	1	4425
24	*1-1/4	1	6050

\* To be used subject to the Commissioner's specific approval

- a. Hanger loads shall be calculated based on the weight of pipe filled with water plus 50 pounds per foot of dead load.

**B. Concrete Inserts, Attachment Plates and Clamps**

1. Hanger rods up to 7/8-inch diameter shall be attached to new concrete structures using concrete inserts MSS SP-58, Type 18. Inserts shall be malleable iron with galvanized finish. The use of steel inserts is prohibited. Design of the inserts shall permit the rods to be adjusted laterally in one plane and to lock the rod nut or head to the body. The inserts shall be provided with openings or recesses to receive reinforcing rods. To facilitate installation, slots shall be provided in the exposed flanges of the insert. Inserts shall be rated to safely carry the maximum load that can be supported by the hanger rod.
2. Hanger rods larger than 7/8-inch diameter shall be attached to new concrete by means of approved hook anchors as shown on the Contract Drawings.
3. Hanger rods shall be attached to existing concrete structures using stainless steel expansion anchors as specified in Section 05500 – Metal Fabrications.
4. Steel beam clamps shall be malleable iron and conform to MSS SP-58 Type 28 or 29 for wide flange or I-beams, and Type 20 for channel sections or where it is necessary to locate the hanger rod off the beam centerline.
5. Steel U-shape beam attachments welded to the underside of beams, and welded steel brackets fastened to structural steel columns, shall be subject to

specific approval of the Structural Steel and Pipe Supports Working Drawings.

## 2.05 PIPE INSULATION PROTECTION

- A. Contractor shall furnish steel protection saddles on all supports for insulated pipe.
  - 1. For pipe sizes less than 12 inches in diameter, provide saddles of No. 14 U.S. gauge stainless steel curved 180 degrees for use with roller hangers or structural trapeze hangers and of No. 16 U.S. gauge stainless steel curved 120 degrees for use in clevis hangers. Saddles shall be at least 12-inches long. Saddle gripping side edges shall be turned up at least to the thickness of insulation.
  - 2. For pipe 12 inches in diameter and larger, provide saddles of No. 12 U.S. gauge stainless steel with a welded centerplate to provide three-edge support. Saddles shall be at least as long as the pipe diameter, provide 120 degree coverage and have edge and centerplate depths equal to the insulation thickness.
- B. Before placing the saddles, saddles shall be filled with either insulating cement or high-density insulation cut to fit. For vapor barrier insulation, the barrier must be maintained; contact between hanger and support and bare pipe will not be permitted.

## 2.06 PIPE ANCHORS AND BRACES

- A. Anchors and sway braces shall be provided when required to hold the pipelines and equipment in position or alignment. Pipe anchors and braces for rigid fastening to the structures shall be attached to stainless steel anchor plates and anchor bolts set into the forms when placing concrete of new structures. Brackets and braces shall be attached to existing concrete structures with through bolts or expansion anchors.
- B. Anchors, guides and restraints shall be provided for the proper operation of pipeline expansion joints.
- C. Cast iron anchors shall be provided with stainless steel straps on piping, except where anchors form an integral part of pipe fittings and couplings or where an anchor of special design is required or shown on the Contract Drawings.
- D. All pipe anchors, guides and restraints shall be designed to conform to ASME B31.1.

## 2.07 INSPECTION

- A. The City of New York may elect to conduct shop inspections. The inspections may include but not be limited to: mechanical and chemical testing, material sampling,

material certifications, traceability of parts, blasting and painting, visual and dimensional inspection, and free iron contamination check on stainless steel parts.

### PART 3 EXECUTION

#### 3.01 GENERAL

- A. Hangers, supports, and accessories shall be located within maximum span lengths specified to support continuous pipeline runs unaffected by concentrated loadings.
- B. Hangers or supports shall be provided at all locations where piping changes direction.
- C. Hangers and supports shall be located to prevent vibration or swaying and to provide for expansion and contraction.
- D. Hanger rods shall be straight and vertical. Chain, wire, strap or perforated bar hangers shall not be used. Hangers shall not be suspended from piping.
- E. Concrete embedded items shall be installed before concrete placement.
- F. Embedded items shall be fastened securely to prevent movement during concrete placement.
- G. Hanger and support unit installation methods shall be in accordance with manufacturer's recommendations.
- H. Hangers and supports shall be adjusted and grout placed as specified in Section 03300 to bring pipelines to specified elevations.

#### 3.02 SPACING OF HANGERS AND SUPPORTS

- A. Supports and Hangers for Horizontal Pipes
  - 1. Supports and hangers for all piping shall be placed no farther apart than shown below, unless otherwise shown or specified:
    - a. Ductile Iron, Steel and Stainless Steel Pipe
      - (1) Maximum spacing in accordance with Table 3 of MSS-SP-69. The designer should check the capacity of the steel or building structure to which the hanger or support is attached, and adjust the maximum spacing accordingly.
      - (2) In addition, ductile iron pipe shall have a minimum of two supports per length and shall have a hanger or support adjacent to each end.

## b. Thermoplastic Pipe

- (1) Pipes up to 1-inch: 2 feet-6 inches center to center.
- (2) Pipes 1-1/2-inch to 3-inch: 4 feet-0 inches center to center.
- (3) Pipe 4-inch to 8-inch: 6 feet-0 inches center to center.
- (4) Pipes larger than 8-inch: 8 feet-0 inches center to center.

## c. Tubing less than 1-inch diameter: In accordance with best piping practice and ASME B31.1, and as approved by the Commissioner.

2. Additional supports shall be placed immediately adjacent to any change in piping direction, at equipment, and on both sides of valves, expansion joints and couplings.

## B. Supports for Vertical Piping

1. Riser clamp shall be placed under hub, fitting or coupling with approved solid bearing on steel sleeve.
2. Where riser clamps are used with plastic piping they shall be modified so as not to exert any compressive forces on the pipe.
3. Vertical piping shall be supported at each floor and between floors by stays or braces to prevent rattling and vibration. Maximum spacing shall not exceed 25 feet.
4. Base elbows or welded equivalent shall be provided at vertical piping bases.
5. Top support shall have a horizontal connection, and provide for pipe expansion.

## C. Pipelines installed under plumbing work shall be spaced in conformity with the requirements of the New York City Building Code or as specified.

## 3.03 PAINTING AND COATING

- A. Painting shall be in conformity with Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable.
- B. Surfaces of hangers and supports in contact with aluminum, brass, plastic and copper pipelines or pipeline equipment shall be protected with an approved plastic coating to prevent abrasion. Touch-up shall be provided in the field, as required. Coating shall be applied in accordance with the manufacturer's recommendations, and shall be free from spots and brush marks, to the satisfaction of the Commissioner.

3.04 TESTING

- A. All pipe support and restraining systems shall be installed and secured prior to the testing or activation of the pipeline on which they are installed.
- B. After installation, each pipe support system shall be tested in conjunction with the respective piping pressure tests. Tests shall include cycling the piping system to duplicate operating conditions. If any part of the pipe support system proves to be defective or inadequate, as evidenced by vibration or excessive movement, it shall be repaired or augmented at no additional cost to the City of New York.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15071**  
**VIBRATION CONTROL**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for furnishing and installation of vibration isolators for mechanical equipment, piping and ductwork and all other appurtenances for a complete installation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15184 - Refrigeration Piping and Specialties
- B. Section 15540 - Fuel Fired Heaters
- C. Section 15670 - Condensing Units
- D. Section 15720 - Air Handling Units
- E. Section 15730 - Packaged Air Conditioning Units
- F. Section 15765 - Terminal Heat Transfer Units
- G. Section 15810 - Ductwork
- H. Section 15830 - Fans

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. ASTM A 36/A36M - Specification for Structural Steel.
  - 2. NFPA 90A - Installation of Air Conditioning and Ventilating Systems

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Shop Drawings: Submit shop drawings showing structural design and details of vibration isolators, inertia bases, steel beam bases and other custom-fabricated work not covered by the manufacturer's submitted data.
  - 1. Furnish templates to fabricators of equipment bases, foundations and other support systems, as needed for coordination of vibration isolation units with the supported equipment.
  - 2. Submit shop drawings indicating locations of units and flexible connections. Include support isolation points for ductwork including risers and air housings.
  - 3. Include a schedule of the units, showing size or manufacturer's part number, and weight supported and resulting deflection of each unit.

4. Submit catalog data for each type of vibration isolation including materials, dimensions, application and performance characteristics.

## 1.05 QUALITY ASSURANCE

- A. Product Qualification: Provide each type of vibration isolation unit produced by specialized manufacturer and as follows:
  1. Except otherwise indicated, obtain vibration isolation units from a single manufacturer.
  2. Engage the manufacturer to provide technical support in selection and supervision of installation of vibration isolation units.
- B. Performance: Comply with the minimum static deflections recommended by the American Society of Heating, Refrigerating and Air-Conditioning Engineers, including definitions of critical and noncritical locations, for selection and application of vibration isolation materials and units as indicated.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Vibration Isolators
  1. Consolidated Kinetics Corp.
  2. Korfund Dynamics Corp.
  3. Mason Industries, Inc.
  4. Vibration Eliminator Co., Inc.
  5. Vibration Mountings and Controls, Inc.
- C. Flexible Duct Connectors
  1. Vent Products Co. Inc.
  2. Ventfabrics Inc.
  3. Holz Rubber Co.

### 2.02 PAD-TYPE ISOLATORS

- A. General: Except as otherwise indicated, provide a manufacturer's standard pad-type isolation unit, one of the following types, color coded to indicate load capacity:
  1. Fiberglass pads or shapes

2. Neoprene pads
  3. Cork/neoprene pads
- B. Fiberglass Pads and Shapes: Use glass fiber of not more than 0.18 mil diameter, produced by multiple-flame attenuation process, molded with the manufacturer's standard fillers and binders through 10 compression cycles at 3 times the rated load bearing capacity, to achieve natural frequency of not more than 12 hertz, in thicknesses and shapes required for use in vibration isolation units.
- C. Neoprene Pads: Use oil-resistant neoprene sheets, of the manufacturer's standard hardness and cross-ribbed pattern, designed for neoprene-in-shear-type vibration isolation, and of the thicknesses required.
- D. Cork/Neoprene Pads: Use a close grained composition cork sheet, laminated between 2 sheets of ribbed, oil-resistant neoprene, in the thicknesses required.

### 2.03 SPRING ISOLATORS

- A. Spring Isolators, Free-Standing: Except as otherwise indicated, provide vibration isolation springs between top and bottom loading plates, and with pad-type isolators bonded to the bottom of the bottom loading plate. Include studs or cups to provide for centering of the springs on the plates. Include leveling bolts with lock nuts and washers, centered in the top plate, arranged for leveling and anchoring the supported equipment. Include holes in the bottom plate for bolting the unit to the substrate.
- B. Vibration Isolation Springs: Use wound-steel compression springs, of high-strength, heat-treated, spring alloy steel, with an outside diameter of not less than 0.8 times the operating height, with a lateral stiffness not less than vertical stiffness, and designed to reach solid height before exceeding the rated fatigue point of the steel.

### 2.04 RAILS

- A. Equipment Rails: Where rails or beams are indicated for use with isolator units to support equipment, provide steel beams complying with ASTM A 36/A36M, with a minimum depth of 6 inches or 0.08 times the span of beam between isolators (whichever is greater). Provide welded brackets at the ends of each beam, and anchor each end to the spring isolator unit. Provide bolt holes in beams matching anchor bolt holes in equipment. Provide beams of the section modulus indicated, or, if not indicated, selected for normal-weight equipment loading to limit static load stress to 16,000 psi. Except as otherwise indicated, position equipment on equipment rails so that the load will be equally supported by the isolator units.

### 2.05 BASES AND FRAMES

- A. Fabricated Equipment Bases: Where supplementary bases are required for use with isolator units to support equipment (base not integral with equipment),

provide welded units, fabricated of structural steel shapes, plates and bars complying with ASTM A 36/A36M, as shown. Provide welded support brackets at points as required and anchor the base to spring isolator units. Except as otherwise indicated, arrange brackets to result in the lowest possible mounting height for the equipment. Provide bolt holes in bases to match mounting anchor bolt holes in the equipment. Fabricate the bases with the depth of the structure not less than 0.10 times the longest span of the base, rigidly braced to support the equipment without deflections or distortions which would be detrimental to the equipment or equipment performance.

## 2.06 HANGERS AND RISERS

- A. Isolation Hangers: Provide hanger units formed with brackets and including the manufacturer's standard compression isolators of the type indicated. Design brackets for 5 times the rated loading of units. Fabricate units to accept misalignment of suspension members, and for use with either rod or strap type members, including acoustical washers to prevent metal-to-metal contacts.
1. Provide a vibration isolation spring with a cap and pad-type isolators, securely retained in the unit.
  2. Provide a neoprene pad, securely retained in the unit.
  3. Provide a fiberglass pad or shape, securely retained in the unit, with a threaded metal top plate.
  4. Install a removable spacer in each unit, to limit the deflection during installation to the rated-load deflection.
- B. Riser Isolators: Provide the manufacturer's standard pad-type isolator bonded to steel plates, formed for welding to the pipe sleeve extension.
- C. Riser Support Isolators: Provide the manufacturer's standard pad-type isolator laminated between 2 formed steel plate members, one for welding to the pipe sleeve extension and other for welding to the pipe riser.

## 2.07 DUCT AND PIPE CONNECTORS

- A. Flexible Duct Connectors: Provide flexible connections made from prefabricated galvanized metal for galvanized ductwork and Type 316 L stainless steel for stainless steel ductwork, and laminated flexible sheets of cotton duct and sheet elastomer, neoprene, reinforced with steel wire mesh where required for strength to withstand the duct pressure indicated. Form connectors with full-faced flanges and accordion bellows to perform as a flexible isolation unit, and of the manufacturer's standard length for each size unless otherwise indicated. Provide adequate joint flexibility to allow for thermal, axial, transverse, and torsional movement, and capable of absorbing vibration of connected equipment. Equip each unit with galvanized steel retaining rings for airtight connections with ductwork. Provide

products approved by NFPA for vibration isolation connectors in duct systems as covered by NFPA Bulletin 90A.

1. Provide U-type configurations, asbestos free of 2 ply, vulcanized EPDM elastomer fabric flexible connectors, with a 6-inch minimum width, and molded flanges and corners. Design the flexible connectors for no less than 2 psi, temperature no greater than 180 degrees F, and to accept the system movements without imposing any significant forces on the ductwork. Provide flexible connectors resistant to acids, alkalis, chlorides and all chemicals and reaction byproducts they are exposed to. Use shop painted retaining bars to back up flanges.
- B. Flexible Pipe Connectors: For ferrous piping, provide stainless steel hose covered with stainless steel wired braid with NPT steel nipples or 150 psi ANSI flanges, welded to the hose.
- C. Rubber Flexible Pipe Connectors: Provide connectors of rubber and butyl construction with integral full-faced duck and butyl flanges, internally steel wire reinforced, and furnished complete with steel retaining rings. Provide connectors with the temperature and pressure ratings to suit the intended service.

### PART 3 EXECUTION

#### 3.01 APPLICATIONS

- A. General: Apply types of vibration isolation materials and units indicated at locations shown or otherwise required. Selection is at the Contractor's option where more than one type is indicated.
- B. Pad-Type Isolators: Install pad type isolators at the following equipment:
  1. Fuel Fired Heaters
  2. Condensing Units
  3. Air Handling Units
  4. Packaged Air Conditioning Units
- C. Equipment Rails or Fabricated Equipment Bases and Spring Isolators: Install equipment rails or fabricated equipment bases and spring isolators where the following floor-mounted equipment is indicated:
  1. Air handling units
  2. Supply and exhaust fans
  3. Condensing Units
  4. Fuel Fired Heaters
  5. Packaged Air Conditioning Units
  6. Air handling units

- D. Isolation Hangers: Install isolation hangers where the following suspended equipment is indicated:
1. Package air conditioner units
  2. Fans
  3. Unit Heaters
  4. Pipe over 1-inch pipe size, located in mechanical equipment rooms, and each run connected to vibration-isolation-mounted equipment for a distance of 100 diameters but not less than 50 feet
  5. Ductwork except flexible ductwork, located in mechanical equipment rooms, and each run connected to vibration-isolation-mounted equipment for a distance of 50 feet
- E. Riser Isolators: Install riser isolators where the following risers pass through floors and roofs; provide support-type where riser support is required:
1. Pipe risers
  2. Pipe risers, within 50 feet 0 inches of a connection with vibration-isolation-mounted equipment for a distance of 50 feet
  3. Pipe risers in critical locations
- F. Flexible Duct Connectors: Install flexible duct connectors at the following ductwork connections:
1. Connections with air handling equipment
  2. Connections with all fans
  3. Building expansion joints
- G. Flexible Pipe Connectors: Install flexible pipe connectors in piping systems at the following locations:
1. Air handling units
  2. Condensing units - refrigerant pipes
  3. Environmental control system indoor units - refrigerant pipes

### 3.02 INSTALLATION

- A. General: Except as otherwise indicated, comply with the manufacturer's instructions for installation and load application to vibration isolation materials and units. Make adjustment so that the units do not exceed the rated operating deflections or bottom out under loading, and are not short-circuited by other

contacts or bearing points. Remove space blocks and similar devices intended for temporary protection against overloading during installation.

- B. Anchor and attach units to substrate and equipment as required for a secure operation and to prevent displacement by normal forces, and as indicated.
- C. Adjust leveling devices as required to distribute loads uniformly onto isolators. Shim units as required where leveling devices cannot be used to distribute loading properly.
- D. Locate isolation hangers as near overhead support structure as possible.
- E. Weld riser isolator units in place as required to prevent displacement from loading and operations.
- F. Bond flanges of flexible duct connectors to ducts and housings to provide airtight connections. Seal seams and penetrations to prevent air leakage.
- G. Install flexible pipe connectors on the equipment side of shutoff valves, horizontally and parallel to equipment shafts wherever possible.

### 3.03 EXAMINATION OF RELATED WORK

- A. Coordination: Examine the installation of equipment, piping, ducts and conduits related to vibration isolation, including items connected to vibration isolators and after completion of other related work before equipment startup, furnish a written report of the inspection and correct any observed inadequacies for proper operation and performance of the vibration isolators. Have the report cover, but not necessarily be limited to the following:
  - 1. Equipment installations on vibration isolators
  - 2. Piping connections including flexible connections
  - 3. Ductwork connections including provisions for flexible connections
  - 4. Passage of piping and ductwork which is to be isolated through walls and floors
- B. Equipment Start-Up: Do not start-up equipment until inadequacies have been corrected in an acceptable manner.

3.04 DEFLECTION MEASUREMENTS

- A. Measurement Report: Upon completion of the vibration isolation Work, prepare a report showing measured equipment deflections for each major item of equipment as indicated.

1. Air handlings
2. Fans
3. Air cooled condensers

-END OF SECTION-

**Section 15076**  
**PIPING AND EQUIPMENT IDENTIFICATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish and install all components of the system for identification of piping and equipment. The system includes the placing of identification signs and direction-of-flow arrows on all visible plant piping, the placing of nameplates on plant equipment and structures, and painting in color of all equipment and pipe, except stainless steel or aluminum surfaces, as shown on the Contractor's working drawings submitted under the related Specifications sections for equipment, piping and valves, and shown on the Contract Drawings, and as required for a complete job.

**1.02 RELATED SPECIFICATION**

- A. Section 09911 - Exterior Painting
- B. Section 09912 - Interior Painting

**1.03 SUBMITTALS**

- A. Product Data: For identification materials and devices.
- B. Samples: Of color, lettering style, and graphic representation required for each identification material and device.
- C. Valve Schedules: For each piping system. Reproduce on standard-size bond paper. Tabulate valve number, piping system, system abbreviation as shown on tag, room or space location of valve, and variations for identification. Mark valves intended for emergency shutoff and similar special uses. Besides mounted copies, furnish copies for maintenance manuals specified in Division 1.

**1.04 REFERENCES**

- A. ASTM D523 - Standard Test Method for Specular Gloss
- B. ASTM D543 - Standard Practices for Evaluating the Resistance of Plastics to Chemical Reagents
- C. ASTM D638 - Standard Test Method for Tensile Properties of Plastics
- D. ASTM D646 - Standard Test Method for Grammage of Paper and Paperboard (Mass per Unit Area)

- E. ASTM D709 - Standard Specification for Laminated Thermosetting Materials
- F. ASTM D790 - Standard Test Methods for Flexural Properties of Un-reinforced and Reinforced Plastics and Electrical Insulating Materials
- G. ASTM D792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement
- H. ASTM D5420 - Standard Test Method for Impact Resistance of Flat, Rigid Plastic Specimen by Means of a Striker Impacted by a Falling Weight (Gardner Impact)

#### 1.05 QUALITY ASSURANCE

- A. Comply with ASME A13.1, "Scheme for the Identification of Piping Systems" for lettering size, length of color field, colors, and viewing angles of identification devices. Follow color facility standard, if exist.

#### 1.06 SEQUENCING AND SCHEDULING

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Install identifying devices before installing acoustical ceilings and similar concealment.

#### 1.07 MANUFACTURER'S GUARANTEE

- A. Provide the specified items from firms regularly engaged in the manufacture of identification devices of types and sizes required, with at least three (3) years of experience in manufacturing signs. In addition, the manufacturer shall guarantee the sign, in writing, against color fading, chipping, corroding or any other manufacturing defects for a period of ten (10) years.

#### 1.08 SPARE PARTS AND ACCESSORIES

- A. Furnish the following spare parts and accessories:
  - 1. For every 20 pipe identification signs installed:
    - a. One pair stainless steel mounting screws
    - b. One pair stainless steel threaded brackets

- c. One pair fiber or plastic washers
  - d. One pair stainless steel banding seals
- 2. One set banding tools and banding accessories
- 3. One stainless steel banding strap, approximately 1000 ft.
- 4. One complete nameplate mounting assembly for every 20 nameplates installed
- 5. One stainless steel cable and splice for every 20 valve identification tags
- B. Provide all spare parts and accessories suitably boxed and marked for storage and reordering.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Construct fiberglass reinforced plastic identification signs and nameplates of 70 mils thick fiberglass reinforced plastic conforming to ASTM D709.
- B. Provide fiberglass reinforced plastic process with a blemish free, low gloss surface of superior permanence and durability in the colors selected. Provide each identification sign and nameplate in two colors and with the legend specified. Provide the backside of the sign in black or some other uniform color.
- C. Provide lettering made by silk screening or other permanent embedment of subsurface printed graphics in the material so as to produce a clear, legible sign. Do not place lettering, symbols or markings containing the name of the manufacturer on the signs. The contract number and the year of the contract as given on the Contract Drawings may be placed in small lettering on the front of the sign, if approved by the Commissioner.
- D. Provide signs for piping and valve identification with two 3/8-inch diameter grommet-protected holes located on the long side centerline, the center of the hole to be 1/2 inch from the edge. Provide nameplates for equipment and structures with four 3/8-inch diameter grommet-protected holes, the center of the hole located 1/2 inch away from the edges. Provide all holes with suitable brass or stainless steel grommets.
- E. Construct all signs and nameplates in conformity with ASTM D523, D638, D646, D790, D792 and D5420.

**2.02 DIMENSIONS OF SIGNS AND TAGS**

- A. Provide identification signs and nameplates rectangular in shape and of the dimensions specified below. A dimensioned tolerance of plus or minus 1/16 inch is permissible.

<b>TYPE OF SIGN</b>	<b>Sign Dimensions (Width x Length)</b>
<b>PIPE IDENTIFICATION -</b> 1. Outside diameter of pipe (including pipe insulation): a. 4 inches and larger b. less than 4 inches	  3-1/2 x 12 inches 1-1/2 x 7 inches
<b>VALVE IDENTIFICATION -</b> 1. Valve tags	2 inches diameter
<b>NAMEPLATES -</b> 1. Equipment and structures	3-1/2 x 12 inches

**2.03 LETTERING OF SIGNS**

- A. Perform all lettering and numbering on identification signs and nameplates in block style in size and spacing to suit the size of sign, as approved.
- B. Unless otherwise approved, limit the legend on pipe identification signs to one line and to a total of 12 letters and spaces, and the legend on equipment nameplates to two lines and a maximum of 35 letters and spaces.
- C. Submit samples of the lettering to be used for fiberglass reinforced plastic signs to the Commissioner for approval before manufacturing begins. Such samples must show the height, width and spacing of letters and numbers for any three (3) legends of ten or more letters and spaces.

**2.04 CHEMICAL RESISTANCE**

- A. Provide fiberglass reinforced plastic signs resistant to abrasion, impact, corrosion, and the following acids, alkalis, salts and solvents in accordance with ASTM D543:
1. 10% citric acid
  2. 5% acetic acid
  3. 3-30% sulfuric acid
  4. 10% ammonium hydroxide
  5. 10% sodium chloride
  6. turpentine

7. mineral spirits
8. heptane
9. kerosene
10. ethyl alcohol
11. ethyl acetate
12. transformer oil
13. heavy duty detergents
14. water

- B. Submit certification on acid resistance prior to installation.

## 2.05 COLORS

- A. Code pipeline signs and equipment nameplates and finish coats of paint for pipelines and equipment in basic colors.
- B. Provide brilliant colors, distinctive shades matching as closely as possible (without custom color blending) the following basic colors as specified by the Munsell Color System (MN):

Table Of Standard Colors	
Color	Munsell Number
White	MN - N8.8/
Yellow	MN - 4Y7.5/12.8
Orange	MN - 0.5 YR 4.6/12.2
Red	MN - 7R 3.6/12.7
Brown	MN - 2.5 YR 4.2/4.3
Gray	MN - 2.5PB 5.8/1.7
*Charcoal	MN - 6B 5/0.4
Black	MN - N1/
Blue	MN - 3PB 3.3/7.4
Green	MN - 8G 4.4/6.2
* Provide color "Charcoal" for paints equivalent to MN - N 3.75.	

- C. Provide identification signs for pipelines of all sizes, mechanical equipment and valves in the color combinations specified below under "General Color Code".

General Color Code		
Service Line	Colors	
	Letters	Background
1. MOTOR OIL	Orange	White
2. HYDRAULIC OIL	Red	White
3. LIQUIDS WEAK IN SOLIDS a. Sewage/Bilge Water	Black	Gray
4. NON-POTABLE WATER a. Service Water	Yellow	Blue
5. CITY WATER	White	Blue
6. COMPRESSED AIR	White	Green

- D. Provide vents and drains of the same color combination as the contents of tanks and equipment vented and drained.

## 2.06 LEGEND FOR PIPE IDENTIFICATION SIGNS

- A. Provide identification signs with the following words or abbreviations in color combinations shown to identify the pipe line service:

Pipe Identification Signs			
LEGEND	Service	Color Code	
		Lettering	Background
COMP. AIR	Compressed air	White	Green
DIESEL FUEL	Diesel fuel oil	Orange	White
DRAIN - *	Drain - *	*	*
MOTOR OIL	Motor oil	Orange	White
M.O. FILL	Motor oil fill	Orange	White
HYDRAULIC OIL	Hydraulic fluid	Red	White
H.O. FILL	Hydraulic oil Fill	Black	White
W.O. EXTRACTION	Waste Oil Extraction	Black	White
SERVICE WATER	Service water	Yellow	Gray
SEWAGE	Sewage	Black	Gray
SPRAY WATER (Dust Suppression)	Spray water	Yellow	Gray
SPRAY WATER (Odor Control)			
VENT - *	Vent - *	*	*

Pipe Identification Signs			
LEGEND	Service	Color Code	
		Lettering	Background
W.O. DRAIN	Waste Oil Drain	Black	White
WATER	City water	White	Blue
* Where shown, specified or required, the legend for drain, vent and similar lines shall also include the equipment, structure or identification number to which the service applies.			

- B. Number valves in conformity with the Basic Code as specified by the Operation and Maintenance Manual for the plant. Perform color combinations for such lines and valves in the same color combinations as the medium serviced and as given in the "General Color Code".
- C. In addition to the identification requirements listed above, for all gas piping at pressures above ½ psig, show the maximum pressure level within the piping as required by Local Law 30.

## 2.07 VALVE IDENTIFICATION TAGS

- A. Furnish and attach valve identification tags on all valves and controls.
- B. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch sequenced numbers. Include 5/32-inch hole for fastener.
1. Material: 0.032-inch- thick, polished brass.
  2. Size: 1-1/2-inches diameter, unless otherwise indicated.
  3. Shape: As indicated for each piping system.
- C. Valve Tag Fasteners: Brass, wire-link or beaded chain; or brass S-hooks.
- D. Valve Schedule Frames: Glazed display frame for removable mounting on masonry walls for each page of valve schedule. Include screws.
1. Frame: Extruded aluminum.
  2. Glazing: ASTM C 1036, Type I, Class 1, Glazing quality B, 2.5-mm, single-thickness glass.
- E. Valve Tag Application Schedule: Tag valves according to size, shape, color scheme, and with captions similar to those indicated in the following:
- F. Tag Material: Brass.
- G. Tag Size and Shape: According to the following:

1. Water: 2 inches, round.

H. Tag Color: Natural

I. Letter Color: Black

## 2.08 ARROWS

A. Lettering: Manufacturer's standard preprinted captions as selected by Commissioner.

1. Arrows: Either integrally with piping system service lettering, to accommodate both directions, or as separate unit, on each pipe marker to indicate direction of flow.

## 2.09 NAMEPLATES

A. Provide nameplates for equipment and structures in the same color combination as the medium they service. Legends for nameplates must follow the terminology shown. Provide numbering system as described in the Operation and Maintenance Manual.

B. Equipment Nameplates: Metal permanently fastened to equipment with data engraved or stamped.

1. Data: Manufacturer, product name, model number, serial number, capacity, operating and power characteristics, labels of tested compliances, and essential data.

2. Location: Accessible and visible.

C. Snap-On Plastic Pipe Markers: Manufacturer's standard preprinted, semirigid, snap-on type. Include color-coding according to ASME A13.1, unless otherwise indicated.

D. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers, extending 360 degrees around pipe at each location.

E. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers, at least 3 times letter height and of length required for label.

F. Engraved Plastic-Laminate Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.

1. Engraving: Engraver's standard letter style, of sizes and with terms to match equipment identification.
  2. Thickness: 1/16 inch, for units up to 20 sq. in. or 8 inches in length, and 1/8 inch for larger units.
  3. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.
- G. Plastic Equipment Markers: Follow facility standards, if not existing follow as below - Manufacturer's standard laminated plastic, in the following color codes:
1. Yellow: Heating equipment and components.
  2. Blue: Equipment and components that do not meet criteria above.
  3. Hazardous Equipment, if any: Use colors and designs recommended by ASME A13.1.
  4. Terminology: Match schedules as closely as possible. Include the following:
    - a. Name and plan number.
    - b. Equipment service.
    - c. Design capacity.
    - d. Other design parameters such as pressure drop, entering and leaving conditions, and speed.
  5. Size: 2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.
- H. Plasticized Tags: Preprinted or partially preprinted, accident-prevention tags, of plasticized card stock with mat finish suitable for writing.
1. Size: 3-1/4 by 5-5/8 inches.
  2. Fasteners: Brass grommets and wire.
  3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
- I. Lettering and Graphics: Coordinate names, abbreviations, and other designations used in mechanical identification with corresponding designations indicated. Use numbers, letters, and terms indicated for proper identification, operation, and maintenance of mechanical systems and equipment.

1. Multiple Systems: Identify individual system number and service if multiple systems of same name are indicated.
- J. The following is a representative list, not necessarily complete, of nameplate legends with appropriate color combinations to which the equipment identification number must be added:

NAMEPLATES			
Legend		Color Code	
First Line <sup>(1)</sup>	Second Line <sup>(2)</sup>	Lettering	Background
AIR COMPRESSOR	**	White	Green
AUXILIARY ELECTRIC	GENERATOR **	Red	Green
W.O. EXTRACTION	OIL PUMP **	Black	White
MOTOR OIL	DISPENSER	Black	White
HYDRAULIC OIL	DISPENSER	Black	White
WASTE OIL	SUMP	Black	White
HYDRO-PNEUMATIC	TANK **	White	Blue
HYDRAULIC OIL STORAGE	TANK	Black	White
HYDRAULIC OIL TRANSFER	PUMP **	Black	White
MOTOR OIL STORAGE	TANK **	Black	White
MOTOR OIL TRANSFER	PUMP **	Black	White
COMPRESSED AIR	COMPRESSOR **	White	Green
COMPRESSED AIR	RECEIVER **	White	Green
SPRAY WATER (Dust Suppression)	PUMP **	Yellow	Gray
SPRAY WATER (Odor Control)			
EMERGENCY GENERATOR	**	Red	Green
WASTE OIL	EXTRACTION PUMP	Black	White
WASTE OIL STORAGE	TANK **	Black	White
<sup>(1)</sup> Nominal limit of 18 letters, numerals and spaces. <sup>(2)</sup> Nominal limit of 17 letters, numerals and spaces. *Where equipment is mounted on roofs or where exposed to the public view, such as in office areas, the color will be selected by the Commissioner.  **The legend on these nameplates also includes the appropriate numeral and letter designation for such equipment and structures as specified by the Operation and Maintenance Manual.			

## 2.10 ADDITIONAL SIGNS AND NAMEPLATES

- A. In addition to the legends specified above, the Commissioner may order the Contractor to furnish and install additional identification signs, arrows and nameplates at no additional cost to the City of New York. Such additional signs may be requested near completion of the work and will be limited to no more than five (5) signs for each of the five types specified in Article 2.02. Conform legends and color combinations for additional signs to the requirements specified.

## 2.11 COLOR OF PIPELINES

- A. Paint all pipelines and equipment in conformity with the requirements of Sections 09911- Exterior Painting and 09912 - Interior Painting, as applicable. Color code the color of the final coats of paint. Paint each piping system a different color as selected and approved.
- B. Do not paint aluminum or stainless steel ductwork or jackets on insulated pipelines. Should the specifications state that flanges, flexible couplings, valves and fittings for such jacketed lines not be covered, paint only the flanges, flexible couplings, valves and fittings.

## PART 3 EXECUTION

### 3.01 LABELING AND IDENTIFYING PIPING SYSTEMS

- A. Install pipe markers on each system. Include arrows showing normal direction of flow.
- B. Marker Type: Plastic markers, with application systems. Install on pipe insulation segment where required for hot, noninsulated pipes. Stenciled markers are not acceptable.
- C. Fasten markers on pipes and insulated pipes smaller than 6 inches OD by one of following methods:
  - 1. Snap-on application of pretensioned, semirigid plastic pipe marker.
  - 2. Adhesive lap joint in pipe marker overlap.
  - 3. Laminated or bonded application of pipe marker to pipe or insulation.
- D. Fasten markers on pipes and insulated pipes 6 inches in diameter and larger by one of following methods:
  - 1. Laminated or bonded application of pipe marker to pipe or insulation.
  - 2. Strapped to pipe or insulation with manufacturer's standard stainless-steel bands.

- E. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations according to the following:
1. Near each valve and control device.
  2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Mark each pipe at branch, where flow pattern is not obvious.
  3. Near penetrations through walls, floors, ceilings, or non-accessible enclosures.
  4. At access doors, manholes, and similar access points that permit view of concealed piping.
  5. Near major equipment items and other points of origination and termination.
  6. Spaced at a maximum of 50-foot intervals along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
  7. On piping above removable acoustical ceilings, except omit intermediately spaced markers.

### 3.02 LOCATION

- A. Locate identification signs for piping along straight line runs at intervals of not more than 30 feet, near valves, branches and junction points and where pipes pass through walls or ceilings. Place direction-of-flow arrows as shown or required. Locate signs on large valves on or adjacent to the valve itself. Place all piping identification signs so as to be easily visible from operating locations. Locate nameplates on equipment bases and on structures at readily visible levels in such positions relative to the equipment and structures so as to prevent damage to the nameplate.

### 3.03 VALVE TAGS

- A. Install on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, plumbing fixture supply stops, shutoff valves, faucets, convenience and lawn-watering hose connections, and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in valve schedule.
- B. Install mounted valve schedule in each major equipment room.

### 3.04 MOUNTING

- A. Mount identification signs and arrows on piping parallel and tangent to the pipe and valves by fastening with screws, plastic or fiber washers, threaded brackets and banding straps and seals. Provide screws and brackets of stainless steel with 5/16 -

18 American Standard Coarse Threads; provide No. 25 U.S. gauge stainless steel, 3/4 inch wide bands.

- B. Where pipe is insulated, use care in mounting the signs so to prevent the banding straps from crushing the insulation.
- C. Provide mounting assembly "Steelbinder" strapping unit as manufactured by A.J. Gerrard & Co., Des Plaines, Illinois, Independent Metal Strap Co., Inc., Roslyn, N.Y. or approved equal.
- D. Mount nameplates in a manner specifically approved by the Commissioner after the installation of equipment or construction of structures. Submit details of the method of fastening to the Commissioner for approval. Provide fastening devices for nameplates and valves of stainless steel construction.
- E. Mount valve identification signs with approved stainless steel brackets or approved stainless steel strapping in such a fashion that sharp corners or edges on signs, brackets, bolts, chain or strapping will not constitute a hazard to personnel operating the valves. Since it is impractical to detail each means of attachment in the Detailed Specifications or on the Contract Drawings, each means of attachment will receive approval only on its own merits. Submit for approval sketches of each type proposed.
- F. Do not attach identification tags or signs to handwheels. Use of flange bolts or bonnet bolts as a means of attachment of brackets will receive consideration. Provide all attachment devices and bolting of Type 304 stainless steel.

### 3.05 EQUIPMENT SIGNS AND MARKERS

- A. Install engraved plastic-laminate signs or equipment markers on or near each major item of mechanical equipment. Include signs for the following general categories of equipment:
  - 1. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
  - 2. Meters, gages, thermometers, and similar units.
  - 3. Pumps and similar motor-driven units.
  - 4. Water Heater and similar equipment.
  - 5. Tanks and pressure vessels.
  - 6. Strainers, filters, and similar equipment.

3.06 ADJUSTING AND CLEANING

- A. Relocate mechanical identification materials and devices that have become visually blocked by work of this or other Divisions.
- B. Clean faces of identification devices and glass frames of valve charts.

-END OF SECTION-

**Section 15081**  
**PIPING INSULATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes preformed, rigid and flexible pipe insulation; insulating cements; field-applied jackets; accessories and attachments; and sealing compounds.

**1.02 RELATED SPECIFICATIONS**

- A. Section 07842 - Fire-Resistive Joint System, for firestopping materials and requirements for penetrations through fire and smoke barriers.
- B. Section 15820 - Duct Insulation, for insulation materials and application for pumps, tanks, hydronic specialties, and other equipment.
- C. Section 15060 - Hangers and Supports, for pipe insulation shields and protection saddles.
- D. Section 15076 - Piping And Equipment Identifications
- E. Section 15771 - Electric Heat Tracing Systems

**1.03 SUBMITTALS**

- A. Product Data: Identify thermal conductivity, thickness, and jackets (both factory and field applied, if any), for each type of product indicated.
- B. Shop Drawings: Show fabrication and installation details for the following:
  - 1. Application of protective shields, saddles, and inserts at pipe hangers for each type of insulation and hanger.
  - 2. Attachment and covering of heat trace inside insulation.
  - 3. Insulation application at pipe expansion joints for each type of insulation.
  - 4. Insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
  - 5. Application of field-applied jackets.
- C. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compli-

ance of insulation materials, sealers, attachments, cements, and jackets with requirements indicated. Include dates of tests.

- D. Installer Certificates: Signed by the Contractor certifying that installers comply with requirements.

#### 1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the U.S. Department of Labor, Bureau of Apprenticeship and Training.
- B. Fire-Test-Response Characteristics: As determined by testing materials identical to those specified in this Section according to ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and sealer and cement material containers with appropriate markings of applicable testing and inspecting agency.
  - 1. Insulation Installed Indoors: Flame-spread rating of 25 or less, and smoke-developed rating of 50 or less.
  - 2. Insulation Installed Outdoors: Flame-spread rating of 75 or less, and smoke-developed rating of 150 or less.

#### 1.05 DELIVERY, STORAGE, AND HANDLING

- A. Ship insulation materials in containers marked by manufacturer with appropriate ASTM specification designation, type and grade, and maximum use temperature.

#### 1.06 COORDINATION

- A. Coordinate size and location of supports, hangers, and insulation shields specified in Section 15060 - Hangers and Supports.
- B. Coordinate clearance requirements with piping Installer for insulation application.
- C. Coordinate installation and testing of steam or electric heat tracing.

#### 1.07 SCHEDULING

- A. Schedule insulation application after testing piping systems and, where required, after installing and testing heat-trace tape. Insulation application may begin on segments of piping that have satisfactory test results.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Cellular-Glass Insulation
    - a. Pittsburgh-Corning Corp.
    - b. Or approved equal

**2.02 INSULATION MATERIALS**

- A. Cellular-Glass Insulation: Inorganic, foamed or cellulated glass, annealed, rigid, hermetically sealed cells, incombustible.
  - 1. Preformed Pipe Insulation, without Jacket: Comply with ASTM C 552, Type II, Class 1.
  - 2. Preformed Pipe Insulation, with Jacket: Comply with ASTM C 552, Type II, Class 2.
- B. Prefabricated Thermal Insulating Fitting Covers: Comply with ASTM C 450 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

**2.03 METAL JACKETS**

- A. Stainless Steel Jackets: ASTM A 167 or ASTM A 240/A 240M; Type 304, minimum thickness of 33 gage (0.010 inch), smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface. Provide stainless steel bands, minimum width of 0.5 inch.
- B. Factory-Fabricated Fitting Covers
  - 1. Same material, finish, and thickness as jacket.
  - 2. Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
  - 3. Tee covers
  - 4. Flange and union covers
  - 5. End caps
  - 6. Beveled collars

- 7. Valve covers
- 8. Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

#### 2.04 ACCESSORIES AND ATTACHMENTS

- A. Stainless Steel Bands: 3/4 inch wide x 0.007 inch thick, materials compatible with jacket.
- B. Coating and vapor barrier treatment shall be less than 0.02 perms, and shall be Benjamin Foster 30-35, MEI 55-10, Childers CP-30 (indoors), Childers Encacel 5 (outdoor)
- C. Vapor barrier sealant and flashing compound shall be equal to Benjamin Foster No. 30-45, MEI 44-05, Childers CP-70 or CP-76.

#### 2.05 VAPOR RETARDERS

- A. Mastics: Materials recommended by insulation material manufacturer that are compatible with insulation materials, jackets, and substrates.

#### 2.06 BELOW PIER PIPING

- A. Asphalt Bonded: All of the under pier pipe insulation shall be installed with single or multiple layers of Cellular-Glass insulation fabricated with hot asphalt and covered with stainless steel jackets per manufactures recommendations.
- B. All of the under pier pipe insulation shall be a water tight installation.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 SURFACE PREPARATION

- A. Clean and dry pipe and fitting surfaces. Remove materials that will adversely affect insulation application.

### 3.03 GENERAL APPLICATION REQUIREMENTS

- A. Apply insulation materials, accessories, and finishes according to the manufacturer's written instructions; with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.
- B. Refer to schedules at the end of this Section for materials, forms, jackets, and thicknesses required for each piping system.
- C. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Apply insulation with longitudinal seams at top and bottom of horizontal pipe runs.
- E. Apply multiple layers of insulation with longitudinal and end seams staggered.
- F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- G. Seal joints and seams with vapor-retarder mastic on insulation indicated to receive a vapor retarder.
- H. Keep insulation materials dry during application and finishing.
- I. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.
- J. Apply insulation with the least number of joints practical.
- K. Apply insulation over fittings, valves, and specialties, with continuous thermal and vapor-retarder integrity, unless otherwise indicated. Refer to special instructions for applying insulation over fittings, valves, and specialties.
- L. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic.
  - 1. Apply insulation continuously through hangers and around anchor attachments.
  - 2. For insulation application where vapor retarders are indicated, extend insulation on anchor legs at least 12 inches from point of attachment to pipe and taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.

3. Install insert materials and apply insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by the insulation material manufacturer.
  4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect the jacket from tear or puncture by the hanger, support, and shield.
- M. Insulation Terminations: For insulation application where vapor retarders are indicated, taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.
- N. Apply adhesives and mastics at the manufacturer's recommended coverage rate.
- O. Apply insulation with integral jackets as follows:
1. Pull jacket tight and smooth
  2. Circumferential Joints: Cover with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip and spaced 4 inches o.c.
  3. Longitudinal Seams: Overlap jacket seams at least 1-1/2 inches. Apply insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches o.c.
    - a. Exception: Do not staple longitudinal laps on insulation having a vapor retarder.
  4. Vapor-Retarder Mastics: Where vapor retarders are indicated, apply mastic on seams and joints and at ends adjacent to flanges, unions, valves, and fittings.
  5. At penetrations in jackets for thermometers and pressure gages, fill and seal voids with vapor-retarder mastic.
- P. Exterior Wall Penetrations: For penetrations of exterior walls, terminate insulation flush with mechanical sleeve seal. Seal terminations with vapor-retarder mastic.
- Q. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and floors.

R. Fire-Rated Wall and Partition Penetrations: Apply insulation continuously through penetrations of fire-rated walls and partitions.

1. Firestopping and fire-resistive joint sealers are specified in Section 07842 - Fire-Resistive Joint Materials of the Structures and Equipment Contract.

S. Floor Penetrations: Apply insulation continuously through floor assembly.

1. For insulation with vapor retarders, seal insulation with vapor-retarder mastic where floor supports penetrate vapor retarder.

### 3.04 CELLULAR-GLASS INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:

1. Secure each layer of insulation to pipe with wire, tape, or bands without deforming insulation materials.
2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vapor-retarder mastic.
3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.

B. Apply insulation to flanges as follows:

1. Apply preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of the same thickness as pipe insulation.
4. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic.

C. Apply insulation to fittings and elbows as follows:

1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.

2. When premolded sections of insulation are not available, apply mitered sections of cellular-glass insulation. Secure insulation materials with wire, tape, or bands.
3. Cover fittings with metal jacking.
4. Cover fittings metal jacking. Overlap metal jacking on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

D. Apply insulation to valves and specialties as follows:

1. Apply premolded segments of cellular-glass insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to stainer basket without disturbing insulation.
2. Apply insulation to flanges as specified for flange insulation application.
3. Use preformed standard metal jacking fittings covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
4. Use preformed metal jacking fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

### 3.05 PIPING SYSTEM APPLICATIONS

- A. Insulation materials and thicknesses are specified in schedules at the end of this Section.
- B. Items Not Insulated: Unless otherwise indicated, do not apply insulation to the following systems, materials, and equipment:
  1. Flexible connectors
  2. Vibration-control devices
  3. Fire-suppression piping
  4. Drainage piping located in crawl spaces, unless otherwise indicated
  5. Below-grade piping, unless otherwise indicated
  6. Chrome-plated pipes and fittings, unless potential for personnel injury

## 3.06 FIELD QUALITY CONTROL

- A. Inspection: Perform the following field quality-control inspections, after installing insulation materials, jackets, and finishes, to determine compliance with requirements:
  - 1. Inspect fittings and valves randomly selected by Engineer.
  - 2. Remove fitting covers from 20 elbows or 1 percent of elbows, whichever is less, for various pipe sizes.
  - 3. Remove fitting covers from 20 valves or 1 percent of valves, whichever is less, for various pipe sizes.
- B. Insulation applications will be considered defective if sample inspection reveals noncompliance with requirements. Remove defective Work and replace with new materials according to these Specifications.
- C. Reinstall insulation and covers on fittings and valves uncovered for inspection according to these Specifications.

## 3.07 INSULATION APPLICATION SCHEDULE, GENERAL

- A. Refer to insulation application schedules for required insulation materials, vapor retarders, and field-applied jackets.
- B. Application schedules identify piping system and indicate pipe size ranges and material, thickness, and jacket requirements.

## 3.08 INSULATION APPLICATION SCHEDULE

- A. Indoor Services: Domestic Hot and recirculated Hot Water, Domestic Cold Water, & Service water
  - 1. Operating Temperature: 60 to 140 deg F
  - 2. Insulation Material: Cellular Glass
  - 3. Vapor Retarder: Yes
  - 4. Jacket: Aluminum/Stainless Steel
  - 5. Insulation shall be Mineral-Fiber, Preformed Pipe Insulation, Type I
    - a. Pipe size -  $\frac{3}{4}$  inch to 1  $\frac{1}{2}$  inch, insulation - 1 inch thick
    - b. Pipe size - 2 inch to 2  $\frac{1}{2}$  inch, insulation - 1  $\frac{1}{2}$  inch thick
    - c. Pipe size - 3 inch to 4 inch, insulation - 2 inch thick
- B. Indoor Service: Storm Drainage Piping
  - 1. Operating Temperature: 60 to 140 deg F
  - 2. Insulation Material: Cellular glass

3. Vapor Retarder: yes
4. Jacket: Aluminum/Stainless Steel
5. Insulation shall be Mineral-Fiber, Preformed Pipe Insulation, Type I
  - a. Pipe size - 2 inch to 2 ½ inch, insulation -1 1/2 inch thick
  - b. Pipe size - 3 inch to 15 inch, insulation - 2 inch thick

C. Outdoor Service: Sanitary Waste

1. Operating Temperature: 45 to 60 deg. F
2. Insulation Material: Cellular glass
3. Vapor Retarder: Yes
4. Jacket: Stainless Steel
5. Insulation shall be Mineral-Fiber, Preformed Pipe Insulation, Type I
  - a. Pipe size - 1 ½ inch, insulation -1 inch thick
  - b. Pipe size - 2 inch to 2 ½ inch, insulation - 1 ½ inch thick
  - c. Pipe size - 3 inch to 8 inch, insulation - 2 inch thick

D. Outdoor Service: Under Pier Storm Drainage Piping

1. Operating Temperature: 45 to 60 deg F
2. Insulation Material: Cellular glass
3. Vapor Retarder: yes
4. Water Tight installation: yes
5. Jacket: Stainless Steel
6. Insulation shall be Mineral-Fiber, Preformed Pipe Insulation, Type I
  - a. Pipe size - 2 inch to 2 ½ inch, insulation -1 1/2 inch thick
  - b. Pipe size - 3 inch to 15 inch, insulation - 2 inch thick

-END OF SECTION-

**Section 15110**  
**PLUMBING VALVES**

**PART 1 GENERAL****1.01 SUMMARY**

A. This Section includes the following general-duty valves:

1. Bronze angle valves
2. Copper-alloy ball valves
3. Bronze check valves
4. Gray-iron swing check valves
5. Bronze gate valves
6. Cast-iron gate valves
7. Bronze globe valves
8. Cast-iron globe valves

**1.02 RELATED SPECIFICATIONS**

- A. Section 13915 - Fire-Suppression Piping and Section 13921 - Electric Drive, Centrifugal Fire Pumps, for fire-protection valves.
- B. Section 15076 - Piping and Equipment Identification
- C. Section 15430 - Plumbing Specialties

**1.03 DEFINITIONS**

A. The following are standard abbreviations for valves:

1. CWP: Cold working pressure
2. EPDM: Ethylene-propylene-diene terpolymer rubber
3. NBR: Acrylonitrile-butadiene rubber
4. PTFE: Polytetrafluoroethylene plastic
5. SWP: Steam working pressure
6. TFE: Tetrafluoroethylene plastic

**1.04 SUBMITTALS**

- A. Product Data: For each type of valve indicated. Include body, seating, and trim materials; valve design; pressure and temperature classifications; end connections; arrangement; dimensions; and required clearances. Include list indicating valve and its application. Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.

## 1.05 QUALITY ASSURANCE

- A. ASME Compliance: ASME B31.9 for building services piping valves.
  - 1. Exceptions: Domestic hot- and cold-water, sanitary waste, storm drainage piping valves & industrial waste unless referenced.
- B. ASME Compliance for Ferrous Valves: ASME B16.10 and ASME B16.34 for dimension and design criteria.
- C. NSF Compliance: NSF 61 for valve materials for potable-water service.

## 1.06 DELIVERY, STORAGE, AND HANDLING

- A. Prepare valves for shipping as follows:
  - 1. Protect internal parts against rust and corrosion.
  - 2. Protect threads, flange faces, grooves, and weld ends.
  - 3. Set angle, gate, and globe valves closed to prevent rattling.
  - 4. Set ball and plug valves open to minimize exposure of functional surfaces.
  - 5. Block check valves in either closed or open position.
- B. Use the following precautions during storage:
  - 1. Maintain valve end protection.
  - 2. Store valves indoors and maintain at higher than ambient dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

## PART 2 PRODUCTS

### 2.01 VALVES, GENERAL

- A. Refer to Part 3 "Valve Applications" Article for applications of valves.
- B. Bronze Valves: NPS 2 and smaller with threaded ends, unless otherwise indicated.
- C. Ferrous Valves: NPS 2-1/2 and larger with flanged ends, unless otherwise indicated.
- D. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- E. Valve Sizes: Same as upstream pipe, unless otherwise indicated.

## F. Valve Actuators

1. Handwheel: For valves other than quarter-turn types
2. Lever Handle: For quarter-turn valves NPS 6 and smaller, except plug valves.
3. Wrench: For plug valves with square heads. Furnish Owner with 1 wrench or every 10 plug valves, for each size square plug head.

## G. Extended Valve Stems: On insulated valves.

## H. Valve Flanges: ASME B16.1 for cast-iron valves, ASME B16.5 for steel valves, and ASME B16.24 for bronze valves.

## I. Valve Grooved Ends: AWWA C606.

1. Solder Joint: With sockets according to ASME B16.18.
  - a. Caution: Use solder with melting point below 840 deg F for angle, check, gate, and globe valves; below 421 deg F for ball valves.
2. Threaded: With threads according to ASME B1.20.1.

## J. Valve Bypass and Drain Connections: MSS SP-45.

## 2.02 BRONZE ANGLE VALVES

## A. Manufacturers

1. Type 1, Bronze Angle Valves with Metal Disc:
  - a. Cincinnati Valve Co.
  - b. Crane Co.; Crane Valve Group; Stockham Div.
  - c. Hammond Valve
  - d. Milwaukee Valve Company
  - e. NIBCO INC.
  - f. Red-White Valve Corp.
  - g. Or approved equal

## B. Bronze Angle Valves, General: MSS SP-80, with ferrous-alloy handwheel.

## C. Type 1, Class 150, Bronze Angle Valves: Bronze body with bronze disc and union-ring bonnet.

**2.03 COPPER-ALLOY BALL VALVES****A. Manufacturers****1. Two-Piece, Copper-Alloy Ball Valves:**

- a. Conbraco Industries, Inc.; Apollo Div.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Jamesbury, Inc.
- h. Milwaukee Valve Company
- i. NIBCO INC.
- j. R & M Energy Systems (Borger, TX)
- k. Red-White Valve Corp.
- l. Watts Industries, Inc.; Water Products Div.
- m. Or approved equal

**2. Three-Piece, Copper-Alloy Ball Valves**

- a. Conbraco Industries, Inc.; Apollo Div.
- b. Grinnell Corporation
- c. Hammond Valve
- d. Jamesbury, Inc.
- e. NIBCO INC.
- f. Red-White Valve Corp.
- g. Worcester Controls
- h. Or approved equal

**B. Copper-Alloy Ball Valves, General: MSS SP-110.****C. Two-Piece, Copper-Alloy Ball Valves: bronze, Bronze body with full port, chrome-plated ball; TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.****D. Three-Piece, Copper-Alloy Ball Valves: or bronze, Bronze body with full port, chrome-plated bronze ball; TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.****2.04 BRONZE CHECK VALVES****A. Manufacturers****1. Type 3, Bronze, Swing Check Valves with Metal Disc:**

- a. American Valve, Inc.
- b. Crane Co.; Crane Valve Group; Crane Valves

- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. NIBCO INC.
- i. Powell, Wm. Co.
- j. Red-White Valve Corp.
- k. Walworth Co.
- l. Watts Industries, Inc.; Water Products Div.
- m. Or approved equal

2. Type 4, Bronze, Swing Check Valves with Nonmetallic Disc

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. McWane, Inc.; Kennedy Valve Div.
- h. Milwaukee Valve Company
- i. NIBCO INC.
- j. Red-White Valve Corp.
- k. Walworth Co.
- l. Watts Industries, Inc.; Water Products Div.
- m. Or approved equal

B. Bronze Check Valves, General: MSS SP-80.

C. Type 2, Class 150, Bronze, Vertical Lift Check Valves: Bronze body with nonmetallic disc and bronze seat.

D. Type 3, Class 150, Bronze, Swing Check Valves: Bronze body with bronze disc and seat.

E. Type 4, Class 150, Bronze, Swing Check Valves: Bronze body with nonmetallic disc and bronze seat.

2.05 GRAY-IRON SWING CHECK VALVES

A. Manufacturers

1. Type I, Gray-Iron Swing Check Valves with Metal Seats

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.

- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. Mueller Co.
- i. NIBCO INC.
- j. Powell, Wm. Co.
- k. Red-White Valve Corp.
- l. Walworth Co.
- m. Or approved equal

B. Gray-Iron Swing Check Valves, General: MSS SP-71.

C. Type I, Class 125, gray-iron, swing check valves with metal seats.

D. Type II, Class 125, gray-iron, swing check valves with composition to metal seats.

## 2.06 BRONZE GATE VALVES

### A. Manufacturers

#### 1. Type 2, Bronze, Rising-Stem, Solid-Wedge Gate Valves

- a. American Valve, Inc.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. NIBCO INC.
- i. Powell, Wm. Co.
- j. Red-White Valve Corp.
- k. Walworth Co.
- l. Or approved equal

#### 2. Type 3, Bronze, Rising-Stem, Split-Wedge Gate Valves:

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Jenkins Valves
- c. Grinnell Corporation
- d. NIBCO Inc.
- e. Or approved equal

B. Bronze Gate Valves, General: MSS SP-80, with ferrous-alloy handwheel.

C. Type 2, Class 150, Bronze Gate Valves: Bronze body with rising stem and bronze solid wedge and union-ring bonnet.

## 2.07 CAST-IRON GATE VALVES

## A. Manufacturers

## 1. Type I, Cast-Iron, Rising-Stem Gate Valves

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. NIBCO INC.
- i. Powell, Wm. Co.
- j. Red-White Valve Corp.
- k. Walworth Co.
- l. Watts Industries, Inc.; Water Products Div.
- m. Or approved equal

## B. Cast-Iron Gate Valves, General: MSS SP-70, Type I.

## C. Class 125, OS&amp;Y, Bronze-Mounted, Cast-Iron Gate Valves: Cast-iron body with bronze trim, rising stem, and solid-wedge disc.

## 2.08 BRONZE GLOBE VALVES

## A. Manufacturers

## 1. Type 1, Bronze Globe Valves with Metal Disc

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves
- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. NIBCO INC.
- i. Powell, Wm. Co.
- j. Red-White Valve Corp.
- k. Walworth Co.
- l. Or approved equal

## 2. Type 3, Bronze Globe Valves with Renewable Seat and Metal Disc

- a. Cincinnati Valve Co.
- b. Crane Co.; Crane Valve Group; Crane Valves
- c. Crane Co.; Crane Valve Group; Jenkins Valves

- d. Crane Co.; Crane Valve Group; Stockham Div.
- e. Grinnell Corporation
- f. Hammond Valve
- g. Milwaukee Valve Company
- h. NIBCO INC.
- i. Walworth Co.
- j. Or approved equal

- B. Bronze Globe Valves, General: MSS SP-80, with ferrous-alloy handwheel.
- C. Type 1, Class 150, Bronze Globe Valves: Bronze body with bronze disc and union-ring bonnet.
- D. Type 3, Class 125, Bronze Globe Valves: Bronze body with bronze disc and renewable seat. Include union-ring bonnet.

## 2.09 CHAINWHEEL ACTUATORS

### A. Manufacturers

- 1. Babbitt Steam Specialty Co.
- 2. Roto Hammer Industries, Inc.
- 3. Or approved equal

### B. Description: Valve actuation assembly with sprocket rim, brackets, and chain.

- 1. Sprocket Rim with Chain Guides: Ductile iron of type and size required for valve.
- 2. Brackets: Type, number, size, and fasteners required to mount actuator on valve.
- 3. Chain: Hot-dip, galvanized steel of size required to fit sprocket rim.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine piping system for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- C. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

- D. Examine threads on valve and mating pipe for form and cleanliness.
- E. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- F. Do not attempt to repair defective valves; replace with new valves.

### 3.02 VALVE APPLICATIONS

- A. Refer to piping Sections for specific valve applications. If valve applications are not indicated, use the following:
  - 1. Shutoff Service: Ball or gate valve
  - 2. Throttling Service: Ball or globe valves
  - 3. Pump Discharge: Spring-loaded, lift-disc check valves
- B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP class or CWP ratings may be substituted.
- C. Domestic Water Piping: Use the following types of valves:
  - 1. Ball Valves, NPS 2 and Smaller: Three-piece, 400-psig-psig CWP rating, copper alloy
  - 2. Ball Valves, NPS 2-1/2 and Larger: Class 150, ferrous alloy
  - 3. Lift Check Valves, NPS 2 and Smaller: Type 2, Class 125, horizontal or vertical, bronze
  - 4. Swing Check Valves, NPS 2 and Smaller: Type 1, Class 150, bronze
  - 5. Swing Check Valves, NPS 2-1/2 and Larger: Type II, Class 125, gray iron
  - 6. Spring-Loaded, Lift-Disc Check Valves, NPS 2 and Smaller: Type I, Class 150
  - 7. Spring-Loaded, Lift-Disc Check Valves, NPS 2-1/2 and Larger: Type I, Class 125, cast iron
  - 8. Gate Valves, NPS 2 and Smaller: Type 2, Class 150, bronze
  - 9. Gate Valves, NPS 2-1/2 and Larger: Type I, Class 125, rising stem, OS&Y, bronze-mounted cast iron
  - 10. Globe Valves, NPS 2 and Smaller: Type 2, Class 125, bronze
  - 11. Globe Valves, NPS 2-1/2 and Larger: Type I, Class 125, bronze-mounted cast iron

- D. Sanitary Waste, Storm Drainage and industrial waste Piping: Use the following types of valves:
1. Swing Check Valves, NPS 2 and Smaller: Type 3, Class 150, bronze
  2. Swing Check Valves, NPS 2-1/2 and Larger: Type I or II, Class 125, gray iron
  3. Gate Valves, NPS 2 and Smaller: Type, Class 125, bronze
  4. Gate Valves, NPS 2-1/2 and Larger: Type I, Class 125, cast iron OS&Y, bronze-mounted cast iron
  5. Globe Valves, NPS 2 and Smaller: Type 1, Class 150, bronze
  6. Globe Valves, NPS 2-1/2 and Larger: Type I, Class 125, cast iron
- E. Select valves, except wafer and flangeless types, with the following end connections:
1. For Copper Tubing, NPS 2 and Smaller: Solder-joint or threaded ends
  2. For Copper Tubing, NPS 2-1/2 to NPS 6: Flanged ends
  3. For Steel Piping, NPS 2 and Smaller: Threaded ends
  4. For Steel Piping, NPS 2-1/2 to NPS 6: Flanged ends

### 3.03 VALVE INSTALLATION

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- C. Locate valves for easy access and provide separate support where necessary.
- D. Install valves in horizontal piping with stem at or above center of pipe.
- E. Install valves in position to allow full stem movement.
- F. Install chainwheel operators on valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor elevation.
- G. Install check valves for proper direction of flow and as follows:
1. Swing Check Valves: In horizontal position with hinge pin level.
  2. Lift Check Valves: With stem upright and plumb.

3.04 JOINT CONSTRUCTION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping joint construction.
- B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

3.05 ADJUSTING

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15111**  
**VALVES 4-INCH AND LARGER**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install 4 inch and larger valves and appurtenances complete and operational.
- B. Valves for gas and air have been specifically identified. All other valves are for liquid service.

**1.02 RELATED SPECIFICATIONS**

## 1.04 GENERAL REQUIREMENTS

- A. Manually operated valves, with or without extension stems, shall require not more than a 40-pound pull on the manual operator to open or close a valve against the specified criteria. The gear actuator and the valve components shall be able to withstand a minimum pull of 200 pounds on the manual operator and an input torque of 300 foot pounds to an actuator nut. Manual operators include handwheel, chain, crank, lever and a T-handle wrench.
- B. All valves shall turn clockwise to close, unless otherwise specified.
- C. All valves shall have permanent markings for direction to open.
- D. Exposed valves shall have flanged ends conforming to ANSI B16.1, Class 125, for Class 150 valves; and Class 250 and Class 300 flanges for Class 250 valves, unless otherwise shown or specified.
- E. Buried valves shall be provided with mechanical or push-on joints, restrained or unrestrained, similar to the piping.
- F. All materials of construction of the valves shall be confirmed suitable for the application by the valve manufacturer.
- G. Wetted parts shall be protected from galvanic corrosion due to contact of two different metals.
- H. All valves shall have manufacturer's name and rated pressure cast in raised letters on the valve body.
- I. All 4-inch and larger valves shall be provided with brass or Type 316 stainless steel nameplates attached with Type 316 stainless steel screws. The nameplates shall have engraved letters and shall include the following information as a minimum:
  - 1. Valve size
  - 2. Pressure and temperature ratings
  - 3. Date of manufacture
  - 4. Manufacturer's name and address
- J. The valves shall be provided with identification conforming to the requirements of Section 15076 - Piping and Equipment Identification.
- K. Fabricated stainless steel items shall be cleaned and descaled in accordance with ASTM A 380, and shall be as follows:
  - 1. All stainless steel welded fabricated items shall be passivated after manufacture by immersion in a pickling solution of 6 percent nitric acid and 3 percent hydrofluoric acid. Temperature and detention time shall be sufficient

for removal of oxidation and ferrous contamination without etching of surface. Perform a complete neutralizing operation by immersion in a trisodium phosphate rinse followed by clean water wash.

2. The welds shall be scrubbed with the same pickling solution or pickling paste and stainless steel wire brushes after fabrication to remove weld discoloration, and then shall be neutralized and washed clean.
- L. For all stainless steel bolting, anti-seize compound, graphite free, shall be used to prevent galling. Strength of bolting shall not be affected by anti-seize compound.
- M. All valves shall be suitable for operation at the higher operating pressures without leakage.
- N. Electric actuators for electrically actuated valves shall be furnished by the valve manufacturers.
- O. Where shown on the Contract Drawings and/or specified, the manually operated valves shall be provided with limit switches as specified under Article 2.12.

#### 1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 - Shop Drawings.
- B. Working Drawings
  1. Product data sheets for make and model
  2. Complete catalog information, descriptive literature, specifications, and identification of materials of construction
  3. Certificates of compliance with AWWA Standards where applicable
  4. Manufacturer's qualifications
  5. Confirmation of suitability of the valve materials for the application
  6. Power and control wiring diagrams, including terminals and numbers
  7. Complete nameplate data of electric actuators
  8. Spare parts list
  9. Special tools list

## C. Calculations

1. Sizing of electric actuators
2. Sizing of operating mechanisms with extension stems
3. Sizing of gear actuators
4. Sizing of anchor bolts

## D. Certified copies of shop test results and inspection data.

## E. Operation and Maintenance Data: Submit complete manuals including:

1. Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

## F. Samples: One foot of chain for chainwheel operated valves.

## G. Material test reports representing all major components of valves and operators shall be submitted. All such components shall be traceable to the original heat and/or lot numbers unless otherwise approved.

## 1.06 SPARE PARTS

## A. The following spare parts shall comprise a "spare parts set" for the valve type listed:

## 1. Gate Valves

- a. One set of gaskets
- b. One set of glands
- c. One set of bushings

## 2. Butterfly Valves

- a. One set of bearings
- b. One set of bearing seals or O-rings
- c. One set of packing
- d. One disc seat (if replaceable)

## 3. Check Valves

- a. One set of seat rings
- b. One set of hinge bushings
- c. One set of pins

## 4. Ball Valves

- a. One set of bearings
- b. One set of bearing seals or O-rings
- c. One set of packing

- B. The following quantities of spare parts sets shall be furnished for each type and each size of valve installed.

Number of Valves Installed	Sets of Spare Parts Required
1 – 5	1
6 – 10	2
11 – 15	3
16 – 30	5
Greater than 30	15%

## 1.07 TOOLS

- A. The following tools shall be furnished for the valves:

1. Tee-Wrenches: One per every 5 valves installed

## 1.08 QUALITY ASSURANCE

- A. Manufacturer's Qualifications

1. Manufacturer shall have a minimum of three (3) years of experience in the production of substantially similar valve equipment, and shall show evidence of satisfactory service in the installations.
2. Each type of valve shall be the product of one manufacturer.

## 1.09 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Valves and appurtenances shall be handled carefully. Valves that are dropped, dented, cracked or otherwise damaged will not be acceptable.
- C. Provide full-face protectors of waterproof material fastened to each side of the valve body to protect joints and the valve interior.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. The following manufacturers are acceptable. Equivalent products of other manufacturers may be submitted for approval.
- B. Gate Valves
  - 1. U.S. Pipe and Foundry
  - 2. M & H Valve Co.
- C. Eccentric Plug Valves
  - 1. DeZurik
- D. Rubber Seated Ball Valves
  - 1. Henry Pratt Co.
- E. Butterfly Valves
  - 1. Henry Pratt Co.
  - 2. DeZurik
- F. Swing-check Valves for Liquid Service
  - 1. GA Industries, Inc.
- G. Check Valves for Air or Gas Service
  - 1. Crane Valve Co.
- H. Automatic Pressure Reducing, Pressure Sustaining and Electric Check Valves
  - 1. GA Industries, Inc.
- I. Motor-Operators (Open/Close and Modulating)
  - 1. Limitorque
  - 2. Rotork

## 2.02 MATERIALS - GENERAL

## A. Non-Ferrous Materials

1. Non-ferrous materials are all materials consisting of mixtures of copper, tin, zinc, lead, or other metals in which iron does not predominate.
2. Non-ferrous materials shall be provided with standard composition and physical properties conforming to ASTM standards except as otherwise indicated.
3. All non-ferrous materials shall be made from new metals of purest commercial quality. Scrap can be used only when it is the result of the processes of manufacture of articles of similar composition.
4. Bronze items shall have the following composition:
  - a. Composition A conforming to ASTM B 61 (Alloy UNS No. C92200) or B 62 (Alloy UNS No. C83600).
  - b. Composition B conforming to ASTM B 61 (Alloy UNS No. C92200) or an approved standard composition having good wear and corrosion resisting qualities and sufficiently ductile for peening into dove-tail grooves.
  - c. Composition C conforming to ASTM B 584, Copper Alloy UNS No. C86500 or C86400; or ASTM B 21, Copper Alloy UNS No. C46400; or ASTM B 124, Copper Alloy UNS No. 37700.
  - d. Composition D conforming to ASTM B 584, Copper Alloy UNS No. C86200 or C86700; or B 21, Copper Alloy UNS No. C46400.

B. Ferrous Materials: Cast iron of the valves, unless specified otherwise, shall conform to ASTM A 126, Class B.

C. Substitute Materials: Materials that are standard with the valve manufacturer but differ from the foregoing requirements and have similar or superior characteristics and are equally suitable for the purpose intended can be considered. Substitutions may be made only upon the written approval of the Commissioner.

## D. Castings

1. Castings shall be true to pattern, sound, smooth, and without injurious cold shuts, swells, lump scabs, scoria, sand holes or other defects and imperfections.

2. Weld repair will not be allowed without the written permission of the Commissioner. Map all defects over 1/4-inch wide or 1/4-inch deep. If such defects add up to ten percent or more of the total open surface area, then the casting will be rejected unless waived by the Commissioner. Map defects smaller than 1/4-inch if they are densely concentrated, and report to the Commissioner for approval or repair. Conduct repairs permitted by the Commissioner per approved procedures. Any acceptable casting defect that affects the paint integrity shall be plugged or filled using approved methods and only with the consent of the Commissioner.
3. All castings shall be thoroughly, inside and outside, free from sand and dust. Use wire brushes, scrapers or other approved mechanical appliances for this purpose. Do not use acid or other corrosive liquids in cleaning castings.
4. The thickness of metal in the body of an iron casting having a standard thickness of less than 0.8 inch can not be more than 0.08 inch less than the standard thickness; and the deficiency in thickness of castings having a standard thickness of 0.8 inch or more can not exceed the standard thickness by more than 10 percent. The above allowable deficiencies in thickness, however, cannot extend over more than one half the area of any casting.

## 2.03 METAL SEATED GATE VALVES - SOLID WEDGE AND DOUBLE DISC TYPE

### A. General

1. The valves shall conform to AWWA C500 and as specified herein.
2. Sizes
  - a. Non Rising-Stem (NRS): 4 in. through 48 in.
  - b. Outside Screw and Yoke (OS&Y) Rising-Stem: 4 in. through 12 in.
3. Type
  - a. Valves for buried service shall be NRS.
  - b. Valves for interior and exposed service shall be OS & Y unless specified otherwise.
  - c. NRS valves for interior and exposed service shall be provided with position indicators.
4. Design Working Pressures
  - a. Valves 12 Inches and Smaller: 200 psig
  - b. Valves 16 Inches and Larger: 150 psig

5. Maximum Fluid Temperature: 150 degrees F, unless otherwise specified.
  6. Tongue-and-groove guides shall be provided for solid-wedge valves.
  7. Rollers and tracks shall be provided for horizontal 16 in. and larger double disc valves.
  8. Double disc valves shall be provided with minimum four point wedging mechanism.
  9. Where shown on the Contract Drawings, bypasses shall be provided for valves 16 in. and larger. Bypasses shall be of bolted construction and the bypass valves shall be similar to the main valves. Minimum size of the bypass valves shall be as specified in AWWA C500.
  10. Unless otherwise specified, the gate valves shall be solid wedge gate type.
- B. Materials of Construction: All materials of construction shall conform to the requirements of AWWA C500 and shall be as follows for various valve components:
1. Body, Bonnet, Stuffing Box and Discs: Gray iron or ductile iron
  2. Seat and Disc Rings: Bronze, Composition A
  3. Stem and Stem Nut: Bronze, Composition C for valves up to 24 inches and Composition D for valves larger than 24 inches
  4. Disc Pin and Side Spreader: Bronze
  5. Top and Bottom Wedge Nuts: Cast iron with integrally cast bronze bushing
  6. Guide Contacts for 16 in. and Larger Valves: Bronze
  7. Rollers and Tracks: Bronze
  8. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel
  9. All Rubber Items: Buna-N
- C. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.
- D. Testing: All valves shall be shop tested in conformance with the requirement of AWWA C500.

## E. Gear Actuators for Manual Valves

1. The valves shall be provided with gear actuators conforming to the requirements of AWWA C500.
2. The gear actuators shall be sized for maximum differential pressures.

## 2.04 RESILIENT-SEATED GATE VALVES

## A. General

1. The valves shall conform to AWWA C509 and as specified herein.
2. Sizes: 4 in. through 12 in., 16 in. and 20 in.
3. Type: Rising or non-rising stem valves shall be furnished as specified.
4. Design Working Pressures:
  - a. Valves 12 in. and Smaller: 200 psig
  - b. Valves 16 in. and 20 in.: 150 psig
5. Maximum Fluid Temperature: 150°F
6. The valves shall be provided with fully encapsulated resilient wedges.

## B. Materials of Construction: All materials of construction shall conform to the requirements of AWWA C509 and shall be as follows for various valve components:

1. Body, Bonnet and Stuffing Box: Cast iron, ASTM A 126, Class B.
2. Wedge: Cast iron, symmetrically and fully encapsulated with molded rubber having minimum 1/8 in. thickness.
3. Stem: Manganese Bronze, ASTM B 584, Alloy UNS C86500.
4. All Rubber Items: Buna-N
5. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.

## C. Interior Coating: All valves shall be coated inside. The steel cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.

## D. Testing: All valves shall be tested in conformance with the requirements of AWWA C509.

## E. Gear Actuators for Manual Valves

1. The valves shall be provided with gear actuators conforming to the requirements of AWWA C500.
2. The gear actuators shall be sized for maximum differential pressures as specified.

## 2.05 ECCENTRIC PLUG VALVES

## A. General

1. The valves shall be quarter turn valves having an eccentric action that causes the plug to rise off the seat contact during the opening movement rather than sliding from its seat.
2. Sizes: 4-inch through 12-inch
3. Design Working Pressure: 175 psig
4. Maximum Fluid Temperature: 180°F
5. The valves shall have a minimum port area of 80 percent of the full area of the pipe in which the valves are installed.
6. The water-tightness or gas-tightness of the valve seating shall be adjustable. The valves shall have a seating adjustment device that is external to the valve and that can be used without the need to remove the valve from the piping and with the valve under pressure.
7. The valves shall have oil impregnated, permanently lubricated bearings in the upper and lower journals.
8. The valves shall have a stem seal consisting of multiple, self-adjusting and replaceable chevron type packing rings and a packing gland or shall have two replaceable, self-adjusting, U-cup seals. The stem seal shall be adjustable and replaceable without removing the valve from the piping and without the need to disassemble the valve and operator. For buried or submerged service, the stem seal shall have a sealed enclosure.
9. The valves shall have 3 and 4-way configuration when shown or specified.
10. Except for buried or submerged service, the valves shall have an external visible indication of plug position.

B. Materials of Construction: All materials of construction shall be as follows for various valve components:

1. Body: Cast iron, or semi-steel at least equal to ASTM A126, Class B
2. Plug: Neoprene or Buna-N facings
3. Seat Overlay: 90 percent pure nickel on all surfaces contacting the plug face with a minimum thickness of 1/16-inch for valve sizes 20-inch and smaller and a minimum of 1/8-inch for valve sizes 24-inch and greater
4. Bearings: Type 316 stainless steel
5. Bonnet bolts, studs, and nuts: Zinc plated carbon steel

C. Testing

1. Leakage Test: A plug leakage shop test shall be performed on each eccentric plug valve in the closed position. Unless otherwise specified, the leakage test shall be performed with a minimum pressure of 150 psig applied sequentially to both the upstream and downstream faces of the plug. The test shall be performed for a minimum duration of 15 seconds. The test must demonstrate that no leakage past the plug.
2. Hydrostatic Test: Hydrostatic shop tests shall be given to each eccentric plug valve with the plug open and with the plug closed. The hydrostatic tests shall be performed with a minimum pressure that is at least equal to the test pressure specified for the pipeline in which the valve is installed. The test shall be performed for a minimum duration of 30 seconds. The hydrostatic tests shall demonstrate that the valve is structurally sound and that there are no leaks through the external surfaces of the valve.

D. Operators

1. Valve sizes 6-inch or smaller shall be equipped with wrench or lever operators.
2. Valve sizes 8-inch or larger shall be equipped with gear operators.
3. For submerged or buried service, gear operators shall be housed in a watertight enclosure and valve operators shall be equipped with stainless steel external bolting.

## 2.06 RUBBER SEATED BALL VALVES

### A. General

1. The valves shall conform to AWWA C507 and as specified herein.
2. Sizes: 6 in. through 48 in.
3. Design Working Pressures: 150 psig, unless otherwise specified
4. Maximum Fluid Temperature: 180°F
5. The body shall have full, unobstructed, circular inlet and outlet port diameters equal to the size of the valve.
6. The valves shall provide drip-tight bi-directional shut-off at the design working pressure as well as operating pressure.
7. The valve bodies shall have support legs or pads to support the valve and actuator weight when installed in a horizontal pipeline.
8. The ball assembly shall be supported by a two-way thrust bearing assembly consisting of a stud and thrust collar in a grease packed cavity suitable for lifetime lubrication.
9. Valve seats shall seal a full 360 degrees circumference without interruption.
10. Valve seats shall be field adjustable around the 360 degrees circumference and replaceable without dismantling the operator, shaft or ball.
11. Packing shall be self-adjusting, chevron type and shall be accessible without having to dismantle the valve.

### B. Materials of Construction: All materials of construction shall conform to the requirements of AWWA C507 and shall be as follows for various valve components:

1. Body: Gray iron, ductile iron, or cast steel
2. Ball: Gray iron, ductile iron, or cast steel
3. Rubber Seats in Body, Bearing Seal O-Rings and Packing: Buna-N or other synthetic rubber suitable for the application.
4. Seating Surface on Ball: Type 316 stainless steel or nickel-chrome
5. Shaft: Type 316 stainless steel

6. Tapered Pins for Attachment of Shaft to Ball: Type 316 stainless steel
  7. Bearings: Teflon-lined with fiberglass backing, self-lubricating
  8. Thrust Collar and Stud Bolt of Thrust Bearing Assembly: Type 316 stainless steel
  9. Shaft Seals: Self-adjusting V-type chevron packing, material same as of rubber seats
  10. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.
- C. Testing: All valves shall be shop tested in conformance with the requirement of AWWA C507.
- D. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.
- E. Gear Actuator for Manual Valves
1. The valves shall be provided with gear actuators conforming to the requirements C507.
  2. Gear actuators for valves 10 in. and smaller shall be sized for the differential pressure equal to the design working pressure of the valve and port velocity of 35 feet per second.
  3. Gear actuators for valves larger than 10 in. shall be sized for maximum differential pressures and flow velocities as specified.

## 2.07 BUTTERFLY VALVES

### A. General

1. The valves shall conform to AWWA C504 and as specified herein.
2. Sizes
  - a. Flanged: 4 in. through 72 in.
  - b. Mechanical Joint: 4 in. through 48 in.
3. Design Working Pressure: 150 psig, Class 150B
4. Maximum Fluid Temperature: 180°F

5. The valves shall provide drip-tight bidirectional shut-off at the design working pressure as well as operating pressures as specified.
  6. Valve seats shall be mounted in the body. Rubber seats of 24 in. and larger valves shall be field replaceable.
  7. The valves shall be capable of being held in open, or partially open position for manual operation or for automatic operation. When the disc is so held, there shall be no chatter or vibration of the disc or operating mechanism.
  8. Valve packing shall be replaceable without dismantling the valve.
- B. Materials of Construction: All materials of construction shall conform to the requirements of AWWA C504 and shall be as follows for various valve components:
1. Body: Cast iron, ductile iron, or alloy cast iron
  2. Shaft: Type 316 stainless steel
  3. Discs
    - a. Valves Smaller than 30 in.: Cast iron
    - b. Valves 30 in. and Larger: Ductile iron
  4. Seats: Buna-N or other synthetic rubber suitable for the application
  5. Seating Surfaces: Type 316 stainless steel
  6. Bearings
    - a. Valves Smaller than 24 in.: Nylon
    - b. Valves 24 in. and Larger: Fiberglass with Teflon lining
  7. Shaft Seals: Self-adjusting V-type chevron, material same as of seats
  8. Tapered Pins for Attachment of Shaft to Disc: Type 316 stainless steel
  9. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.
- C. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.
- D. Testing: All valves shall be shop tested in conformance with the requirements of AWWA C504.

E. Gear Actuators for Manual Valves

1. The valves shall be provided with gear actuators conforming to the requirements of C504.
2. Gear actuators for valves 20 in. and smaller shall be sized for 150 psi differential pressure and 16 feet per second velocity.
3. Gear actuators for valves 24 in. and larger shall be sized based on maximum differential pressures and velocities as specified.

2.08 SWING CHECK VALVES

A. General

1. The valves shall conform to AWWA C508 and as specified herein.
2. Sizes: 4 in. through 24 in.
3. Type: Resilient-seated
4. Design Working Pressure:
  - a. Smaller than 12 in. Diameter: 175 psig
  - b. 12 in. Diameter and Larger: 150 psig
5. The valves shall be suitable for horizontal or vertical mounting.
6. The check valves shall have a clear waterway with full open area equal to the pipe size.
7. The check valves shall be provided with outside adjustable weight and lever.
8. Valves larger than 6 in. shall be provided with adjustable air cushion chambers.
9. Valve seats shall be mechanically attached and shall be field replaceable.

B. Materials of Construction: All materials of construction shall conform to the requirements of AWWA C508 and shall be as follows for various valve components:

1. Body, Disc, Cover and Gland: Cast-iron
2. Disc Arm: Ductile iron
3. Hinge Shaft: Type 316 stainless steel

4. Hinge Shaft Bushings: Bronze, ASTM B 62, Alloy UNS C83600
  5. Shaft End Plate: Type 316 stainless steel
  6. Body Seat and follower ring on rubber seat on disc: Type 316 stainless steel
  7. Disc Center Pin Assembly: Type 316 stainless steel
  8. Air Cushion Chamber:
    - a. Chamber and Plunger: Bronze, ASM B 62, Alloy UNS C83600
    - b. Linkages and Pins: Type 316 stainless steel
    - c. Air Check Valve and Tubing: Brass
  9. All Rubber Items:
    - a. Up to 180°F Fluid Temperature: Buna-N
    - b. Greater than 180°F Fluid Temperature: Viton
  10. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.
  11. Gland Packing: Graphite and Kevlar
- C. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.
- D. Testing
1. All valves shall be shop tested in conformance with the requirement of AWWA C508.
  2. Permitted Leakage at Design Working and Operating Pressures: Zero.

## 2.09 CHECK VALVES (AIR SERVICE)

### A. General

1. Design Working Pressure: 125 psig
2. Internal Temperature Rating: 250 °F
3. Maximum Head loss at Design Operating Condition:
4. The valves shall be tight seating against operating back pressure with zero leakage and shall operate without hammer or shock.

5. The valves shall be of double door type and spring loaded.

B. Materials of Construction:

1. Body: Cast iron, ASTM A 126
2. Double Doors: Aluminum alloy
3. Hinge and Stop Shafts: Type 316 stainless steel
4. Springs: Type 316 stainless steel
5. Seal Material: Viton, rated for minimum 250 °F
6. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.

C. Testing:

1. All valves shall be shop tested with water against leakage at the design rated and operating pressures.
2. Permitted Leakage: Zero
3. All valves shall be hydrostatically tested at twice the rated pressure.

2.10 AUTOMATIC PRESSURE REDUCING VALVES

A. General

1. Application: Reduce a higher fluctuating upstream pressure to a lower steady downstream pressure within a specified range of flow variations.
2. Rated Working Pressure
  - a. Smaller than 12-inch: 250 or 500 psig
  - b. 14-inch thru 36-inch: 250 psig
3. The set point downstream pressure shall be field adjustable within near zero to 110 percent range.
4. The valves shall not suffer cavitation damage within a 5-year period from the date of installation when exposed to the specified operating conditions.

**B. Valve Construction**

1. Type: Pilot operated globe or angle style valves as shown on the Contract Drawings.
2. The valves shall include a one-piece piston and a full stroke length liner. The seating shall include a replaceable resilient seat ring mounted on underside of the piston and a metal seat integral with the liner or attached to the valve body.
3. Provide V-ports for pressure control at low flows.
4. The flow area shall be equal to nominal pipe area when valve is fully open.
5. The valves shall provide a drip-tight shut-off at the rated pressure when closed.
6. Provide a removable flanged cover to access the valve internals.
7. Provide an indicator rod attached to the piston for visual position indication of the piston.
8. The pilot control piping shall include the following minimum items:
  - a. A needle valve for field adjustment of closing speed
  - b. A pilot valve to adjust the required set point downstream pressure
  - c. A Y-strainer with a valved blow-off connection
  - d. Isolation valves

**C. Materials of Construction**

1. Body: Cast iron, ASTM A126, Class B, or Ductile Iron, ASTM A536
2. Piston, liner, seat crown, indicator rod and hardware, vent tube and glands: Bronze, ASTM B62.
3. All Flexible Items: Buna-N, leather or other synthetic rubber suitable for the application
4. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel
5. Packing: Teflon
6. All control piping components including piping, tubing, fittings, valves and Y-strainer: Brass or bronze with stainless steel wetted trim. All small valves shall conform to Section 15112 – Valves Smaller than 4 Inches.

D. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, shall be epoxy coated in accordance with AWWA C550.

E. Testing

1. Test each assembled valve, except control piping, hydrostatically at 1-1/2 times the rated working pressure for a minimum of five minutes.
2. Test each valve for leakage at the rated working pressure against closed valve. The test duration shall be minimum 15 minutes and permitted leakage shall be zero.
3. Perform functional test on each valve to verify specified performance.

2.11 AUTOMATIC PRESSURE SUSTAINING VALVES

A. General

1. Application: Maintain a minimum set point upstream pressure regardless of variations in flow demand and/or variations in downstream pressure. The valve will open on an increase in upstream pressure and close on a decrease in upstream pressure to maintain the required set point upstream pressure.
2. Rated Working Pressure
  - a. 12-inch and Smaller: 250 or 500 psig
  - b. 14-inch thru 36-inch: 250 psig
3. The set point upstream pressure shall be field adjustable within near zero to 110 percent range.
4. The valves shall not suffer cavitation damage within a 5-year period from the date of installation when exposed to the specified operating conditions.

B. Valve Construction

1. Type: Pilot operated globe or angle style valves as shown on the Contract Drawings.
2. The valves shall include a one-piece piston and a full stroke length liner. The seating shall include a replaceable resilient seat ring mounted on underside of the piston and a metal seat integral with the liner or attached to the valve body.
3. Provide V-ports for pressure control at low flows.
4. The flow area shall be equal to nominal pipe area when valve is fully open.

5. The valves shall provide a drip-tight shut-off at the rated pressure when closed.
6. Provide a removable flanged cover to access the valve internals.
7. Provide an indicator rod attached to the piston for visual position indication of the piston.
8. The pilot control piping shall include the following minimum items:
  - a. A needle valve for field adjustment of closing speed
  - b. A pilot valve to adjust the required set point upstream pressure
  - c. A Y-strainer with a valved blow-off connection
  - d. Isolation valves

C. Materials of Construction

1. Body: Cast iron, ASTM A126, Class B, or Ductile Iron, ASTM A536.
2. Piston, liner, seat crown, indicator rod and hardware, vent tube and glands: Bronze, ASTM B62.
3. All Flexible Items: Buna-N, leather or other synthetic rubber suitable for the application.
4. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.
5. Packing: Teflon.
6. All control piping components including piping, tubing, fittings, valves and Y-strainer: Brass or bronze with stainless steel wetted trim. All small valves shall conform to Section 15112 - Valves Smaller than 4 Inches.

D. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, shall be epoxy coated in accordance with AWWA C550.

E. Testing

1. Test each assembled valve, except control piping, hydrostatically at 1-1/2 times the rated working pressure for a minimum of five minutes.
2. Test each valve for leakage at the rated working pressure against closed valve. The test duration shall be minimum 15 minutes and permitted leakage shall be zero.
3. Perform functional test on each valve to verify specified performance.

## 2.12 AUTOMATIC ELECTRIC CHECK VALVES

## A. General

1. Application: Valve shall open and close at a controlled rate during a pump start-up and shutdown. During emergency pump shutdown, due to power failure or other malfunctions, valve shall close quickly to minimize reverse flow through the pump.
2. Rated Working Pressure:
  - a. 12 inch and smaller: 250 or 500 psig
  - b. 14 inch thru 36 inch: 250 psig
3. Opening or Closing Time of Valve: One to five minutes, adjustable
4. Emergency Closing Time of Valve: 15 to 30 seconds, adjustable

## B. Valve Construction:

1. Type: Pilot operated globe or angle style valves as shown on the Contract Drawings
2. The valves shall include a one-piece piston and a full stroke length liner. The seating shall include a replaceable resilient seat ring mounted on underside of the piston and a metal seat integral with the liner or attached to the valve body.
3. Provide V-ports for optimum surge control during normal pump start-up and shutdown.
4. The flow area shall be equal to nominal pipe area when valve is fully open.
5. The valves shall provide a drip-tight shut-off at the rated pressure when closed.
6. Provide a removable flanged cover to access the valve internals.
7. Provide an indicator rod attached to the piston for visual position indication of the piston.
8. The pilot control piping shall include the following minimum items:
  - a. A solenoid operated pilot valve for normal controlled opening and closing of the check valve.
  - b. An emergency solenoid pilot valve for quick closing of the check valve.

- c. Manual separate needle valves for controlled normal opening and closing and for emergency closing of the check valve.
    - d. A Y-strainer with a valved blow-off connection
    - e. Isolation valves
  - 9. Provide SPDT limit switches with NEMA 4 enclosure as shown on the Contract Drawings.
- C. Materials of Construction
- 1. Body: Cast iron, ASTM A126, Class B, or Ductile Iron, ASTM A536
  - 2. Piston, liner, seat crown, indicator rod and hardware, vent tube and glands: Bronze, ASTM B62
  - 3. All Flexible Items: Buna-N, leather or other synthetic rubber suitable for the application
  - 4. All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel
  - 5. Packing: Teflon
  - 6. All control piping components including piping, tubing, fittings, valves and Y-strainer: Brass or bronze with stainless steel wetted trim. All small valves shall conform to Section 15112 - Valves Smaller than 4 Inches.
- D. Interior Coating: All valves shall be coated inside. The steel, cast-iron and ductile iron surfaces, shall be epoxy coated in accordance with AWWA C550.
- E. Testing
- 1. Test each assembled valve, except control piping, hydrostatically at 1-1/2 times the rated working pressure for a minimum of five minutes.
  - 2. Test each valve for leakage at the rated working pressure against closed valve. The test duration shall be minimum 15 minutes and permitted leakage shall be zero.
  - 3. Perform functional test on each valve to verify specified performance.

## 2.13 ELECTRIC ACTUATORS (OPEN/CLOSE)

### A. Application Criteria

1. Ambient Temperature Rating: -20 to +150 °F
2. Ambient Humidity: 100 percent
3. Maximum design differential pressures and forward/reverse flows applicable to the valves:
4. Opening and Closing Speeds: 60 seconds
5. Power Supply: 480 volts, 3 phase, 60 Hz
6. Control Voltage: 120 volts, single phase, 60 Hz
7. Torques: Per valve manufacturer
8. Duty Cycle: 6 starts per hour, minimum

### B. General

1. Conform to the requirements of AWWA C540.
2. The actuator shall be operable with handwheel or chainwheel even after the electric motor has been disengaged and removed for repairs.
3. All valves with electric actuators located more than six feet above the operating floor shall be provided with separate control panels installed approximately five feet above the operating floor at an approved location. Electrical wiring shall be modified as required for the remote location of the control panels.
4. Sizing of each electric actuator shall be coordinated with the valve manufacturer who shall furnish the valve and the electric actuator as a unit.
5. The electric actuators shall be suitable for the valve orientation as shown on the Contract Drawings.
6. All electrical components shall conform to the area classification shown on the Contract Drawings.

### C. Electric Motor

1. Motor shall be in accordance with the requirements of Section 16220 - Electric Motors of the Contract. Motor shall be specifically designed for

valve actuator service. It shall have high torque characteristics and shall have a maximum continuous total temperature rating of 70 °C.

2. The motor shall be sized for at least 1.5 times the actuator torque requirement.

D. Actuator Gearing

1. Housing: Die-cast aluminum
2. Close coupled to electric motor
3. Input Shaft Gearing: Spur or bevel gear assembly
4. Output Shaft Gearing: Self-locking worm gears with minimum gear backlash to prevent valve disc chatter or vibration. The gearing shall be rated for twice the required actuator torque.
5. All gearing shall be of hardened alloy steel or a combination of hardened alloy steel and alloy bronze, accurately cut by hobbing machine.
6. Lubrication: Oil bath
7. Bearings: Ball or roller with a minimum B-10 life of 100,000 hours
8. Input Shaft: Hardened alloy steel
9. Provide mechanical stops adjustable to 5 degrees at each end of travel.

E. Limit Switches

1. Each actuator shall be provided with end of travel limit switches to allow control of desired end position for each direction of travel.
2. Open and close limit switches shall be geared to the drive mechanism and in step at all times, whether the unit is operated electrically or manually and whether or not the actuator is powered by the 3-phase power supply. Friction devices or setscrew arrangements shall not be used to maintain the setting.
3. Limit switch gearing shall be appropriately lubricated.
4. The driven mechanism shall be totally enclosed to prevent entrance of foreign matter or loss of lubricant.
5. Each actuator shall be provided with four auxiliary contacts. Two contacts shall close and two contacts shall open at a desired end position for each direction of travel.

6. Switches shall be rated 10 amperes at 120 volts.

F. Torque Switches

1. Adjustable torque switches shall be provided with each valve actuator. The torque switches shall operate during the complete valve cycle without the use of auxiliary relays, linkages, latches or other devices.
2. Torque switches shall be wired to de-energize the valve actuator motor in the event excessive torque is developed during either direction of travel.
3. It shall be possible to select the torque switches to control the open and close limit positions in either direction of valve travel.
4. Dry contacts (10A, 120 Vac) shall be provided for remote high torque alarm for automatically controlled valves.

G. Handwheel and Chainwheel Operation

1. The actuator shall be equipped with a handwheel for manual operation, so connected that operation by the motor will not cause the handwheel to rotate.
2. Should power be returned to the motor while the handwheel is in use, design of the unit shall prevent transmission of the motor torque to the handwheel.
3. The handwheel shall require an effort of no more than 80 pounds on the rim for seating or unseating load, or 60 pounds on running load.
4. The handwheel shall have an arrow and the word "Open" or "Close" indicating required rotation. The handwheel shall operate in the clockwise direction to close.
5. Chain Operators: All valves more than 6 feet-0 inches above the operating floor level shall be equipped with chain operators.
6. Handwheels and chain operators shall conform to Article 2.15.

H. Controls

1. Provide controls in a separate compartment integral with the actuator.
2. Enclosure: NEMA 6
3. Starter: Combination reversing magnetic starter with circuit breaker and disconnect switch

4. Control Power Transformer: Provide a transformer to transform the rated three phase, 60 Hz power to 120 volts, single phase. The transformer shall be complete with a grounded and fused secondary and dual primary fuses.
5. Provide Local/Off/Remote Selector Switch. "Local" position provides operation from open/close/stop push buttons. "Off" position disables local and remote operation. "Remote" position enables open/close/stop control from a remote source.
6. Open/close/stop push buttons with hold-to-run or momentary contact selection.
7. Open/close/stop indicating lights and 0-100 percent position indication on a liquid crystal display window.
8. Provide thermal overload and single phasing protection of the motor.
9. Provide a set of dry contacts to remotely indicate that the actuator is available for remote operation.
10. Actuator circuit boards shall be rated for high temperature service, minimum 55 degrees C.
11. Provide electrical interlocks as shown on the Contract Drawings.

I. Remote Mounted Control Panels

1. Where required by the valve location or as indicated on the Contract Drawings, remote control panels shall be provided.
2. Enclosure: NEMA 4X, Type 316 stainless steel.
3. Provide Local/Off/Remote Selector Switch. "Local" position provides operation from open/stop/close push buttons. "Remote" position enables open/close/stop control from remote source. "Off" position disables local and remote operation. Provide contact when switch is in remote position for remote indication.
4. Open/close/stop push buttons with hold-to-run or momentary contact selection.
5. Open/close/stop indicating lights and 0-100 percent position indication on liquid crystal display window.

J. Testing: Each actuator shall be shop tested in conformance with the requirements of AWWA C540.

## 2.14 ELECTRIC ACTUATORS (MODULATING)

## A. Application Criteria

1. Ambient Temperature Rating: -20 to +150 °F
2. Ambient Humidity: 100 percent
3. Maximum design differential pressures and forward/reverse flows applicable to the valves:
4. Duty Cycle: Continuous (minimum 1200 starts/stops per hour), unless otherwise specified
5. Power Supply: 480V, 3 ph, 60 Hz
6. Control Voltage: 120V, single phase, 60 Hz
7. Torque: Per valve manufacturer
8. Accepts 4 to 20 mAdc input to positioner.

## B. General

1. Actuator shall conform to the requirements of AWWA C540.
2. The actuator shall be operable with handwheel even after the electric motor has been disengaged and removed for repairs.
3. All valves with electric actuators located more than six feet above the operating floor shall be provided with separate push-button stations installed approximately five feet above the operating floor at an approved location. Electrical wiring shall be modified as required for the remote location of the control panels.
4. Sizing of each electric actuator shall be coordinated with the valve manufacturer who shall furnish the valve and the electric actuator as a unit.
5. The electric actuators shall be suitable for the valve orientation as shown on the Contract Drawings.
6. All electrical components shall conform to the area classification shown on the Contract Drawings.

**C. Electric Motor**

1. Motor shall be in accordance with the requirements of Section 16220 - Electric Motors of the Contract. Motors shall be specifically designed for valve actuator service, of high torque characteristics and minimum 70°C temperature rating.
2. The motor shall be sized for at least 1.5 times the actuator torque requirement.

**D. Actuator Gearing**

1. Housing: Die-cast aluminum
2. Close coupled to electric motor.
3. Input Shaft Gearing: Spur or bevel gear assembly.
4. Output Shaft Gearing: Self-locking worm gears with minimum gear backlash to prevent valve disc chatter or vibration. The gearing shall be rated for at least twice the required actuator torque.
5. All gearing shall be of hardened alloy steel or a combination of hardened alloy steel and alloy bronze, accurately cut by hobbing machine.
6. Lubrication: Oil bath
7. Bearings: Ball or roller with a minimum B-10 life of 100,000 hours
8. Input Shaft: Hardened alloy steel
9. Provide mechanical stops adjustable to  $\pm 5$  degrees at each end of travel.
10. Provide mechanical position indication.

**E. Limit Switches**

1. Each actuator shall be provided with 'end of travel' limit switches to allow control of desired end position for each direction of travel.
2. Open and close limit switches shall be geared to the drive mechanism and in step at all times, whether the unit is operated electrically or manually and whether or not the actuator is powered by the 3-phase power supply. Friction devices or setscrew arrangements shall not be used to maintain the setting.
3. Limit switch gearing shall be appropriately lubricated.

4. The driven mechanism shall be totally enclosed to prevent entrance of foreign matter or loss of lubricant.
5. Each actuator shall be provided with four auxiliary contacts. Two contacts shall close and two contacts shall open at a desired end position for each direction of travel.
6. Switches shall be rated 10 amperes at 120 volts.

F. Torque Switches

1. Adjustable double-torque switches shall be provided with valve actuator.
2. The torque switches shall operate during the complete valve cycle without the use of auxiliary relays, linkages, latches or other devices.
3. Torque switches shall be wired to de-energize the valve actuator motor in the event excessive torque is developed during either direction of travel.
4. It shall be possible to select the torque switches to control the open and close limit positions in either direction of valve travel.
5. Dry contacts (10A, 120 Vac) shall be provided for remote high torque alarm for automatically controlled valves.

G. Handwheel and Chainwheel Operation

1. The actuator shall be equipped with a handwheel for manual operation, so connected that operation by the motor will not cause the handwheel to rotate.
2. Should power be returned to the motor while the handwheel is in use, design of the unit shall prevent transmission of the motor torque to the handwheel.
3. The handwheel shall require an effort of no more than 80 pounds on the rim for seating or unseating load, or 60 pounds on running load.
4. The handwheel shall have an arrow and the word "Open" or "Close" indicating required rotation. The handwheel shall operate in the clockwise direction to close.
5. Chain Operators: All valves more than 6 feet-0 inches above the operating floor level shall be equipped with chain operators.
6. Handwheels and chain operators shall conform to Article 2.24.

## H. Controls

1. Provide controls in a separate compartment integral with the actuator.
2. Enclosure: NEMA 6
3. Starter: Combination reversing magnetic starter with circuit breaker and disconnect switch.
4. Control Power Transformer: Provide a transformer to transform the rated three phase, 60 Hz power to 120 volts, single phase. The transformer shall be complete with a grounded and fused secondary and dual primary fuses.
5. Provide Local/Off/Remote selector switch. "Local" position provides operation from open/close/stop push buttons. "Off" position disables local and remote operation. "Remote" position enables open/close/stop control from a remote source.
6. Open/close/stop push buttons with hold-to-run or momentary contact selection.
7. Open/close/stop indicating lights and 0-100 percent position indication on a liquid crystal display window.
8. The motor shall be de-energized in the event of a jammed valve.
9. Provide thermal overload and single phasing protection of the motor.
10. For monitoring of the actuator, provide a set of SPDT dry contacts. The monitor relay shall indicate that the actuator is available for remote operation.
11. Supply each actuator with a position controller. The controller shall have the following features:
  - a. Receive a 4-20 mA<sub>dc</sub> analog control signal and position the valve in proportion to this signal.
  - b. Adjustments for duty cycle, band width, span, and zero.
  - c. On loss of control signal the valve shall stay in its last position.
  - d. Provision for adequate cooling of the unit.
12. Provide actuator with a position transmitter capable of producing a 4-20 mA<sub>dc</sub> output signal. Unit shall be a standard slidewire (potentiometer) position transducer which shall provide an output corresponding to 0-100 percent of travel. Accuracy shall be 1 percent of scale. It shall include an

integral temperature-compensated, constant-current source for slidewire excitation. Transmitter shall be integral to the actuator.

13. Supply actuator with circuit boards for high temperature service, minimum 55 degrees C.

I. Remote Mounted Control Panels

1. Where required by the valve location or as indicated on the Contract Drawings, remote control panels shall be provided.
2. Enclosure: NEMA 4X, Type 316 stainless steel.
3. Provide Local/Off/Remote Selector Switch. "Local" position provides operation from open/close/stop push buttons. "Remote" position enables 4-20 mA dc control from remote source. "Off" position disables local and remote operation. Provide contact when switch is in remote position for remote indication.
4. Open/Stop/Close push buttons with hold-to-run or momentary contact selection.
5. Open/close/stop indicating lights and continuous valve position indication with LCD display.

- J. Testing: Each actuator shall be shop tested in conformance with the requirements of AWWA C540.

2.15 APPURTENANCES FOR EXPOSED METALLIC VALVES

A. General

1. All valves located less than 6 feet high above the operating floor shall be provided with handwheels or levers. All 6 inch and larger valves shall be provided with handwheels and 4-inch quarter turn valves shall be provided with levers, unless otherwise shown or specified.
2. All valves located at 6 feet or more above the operating floor shall be provided with chain operators.
3. Where indicated, the valves shall be provided with extension stems and floorstands.

B. Handwheels

1. All handwheels shall conform to the applicable AWWA Standards.

2. Material of Construction: Ductile iron or cast aluminum.
3. Arrow indicating direction of opening and word "OPEN" shall be cast on the trim of the handwheel.
4. Maximum Handwheel Diameter: 30 inches.

C. Chain Operators

1. All valves more than 6 feet above the operating floor shall be provided with chain operators.
2. Chains shall extend to three feet above the operating floor.
3. A 1/2-inch stainless steel hook bolt shall be provided to keep the chain out of the walking area.
4. Materials of Construction:
  - a. Chain: Type 316L stainless steel
  - b. Chain wheel: Recessed groove type made out of Type 316 stainless steel
  - c. Guards and Guides: Type 316L stainless steel
5. Chain Construction: Chain shall be of welded link type with smooth finish. Chain that is crimped and has links type with exposed ends that may cause injury shall not be acceptable.
6. Provide geared operators where required to position chain wheels in vertical position.

D. Crank Operator

1. Crank operator shall be removable and fitted with a rotating handle.
2. Maximum Radius of Crank: 15 inches
3. Materials:
  - a. Crank: Cast iron or ductile iron
  - b. Handle: Type 304 stainless steel
  - c. Hardware: Type 304 stainless steel
4. Extension Stems and Floorstands for Gate Valves:
5. Sizing of the complete lifting mechanism shall conform to the applicable requirements of AWWA C501.

6. Bench and Pedestal Floorstands
  - a. The valves requiring extension stems shall be provided with bench or pedestal floorstands as indicated.
  - b. Type: Heavy-duty with tapered roller bearings enclosed in a weatherproof housing, provided with positive mechanical seals around lift nut and pinion shaft to prevent loss of lubrication and to prevent moisture from entering the housing. A lubrication fitting shall be provided for grease. The base shall be machined.
7. Extension Stems
  - a. Maximum Slenderness Ratio (L/R): 100
  - b. Minimum Diameter: 1.5 in.
  - c. Threads: ACME
  - d. A top nut and a bottom coupling shall be provided on the stem with required pins and set screws.
8. Stem Guides
  - a. Maximum Stem Length between Guides: 7 feet
  - b. Stem guides shall be adjustable in two directions
9. Materials of Construction
  - a. Floorstand Housing: Cast-iron, ASTM A126, Class B
  - b. Lift Nut: Cast bronze, ASTM B 98
  - c. Wall Brackets for Floorstands: Type 316L stainless steel
  - d. Stem and Stem Couplings: Type 316 stainless steel
  - e. Top Nut, Bottom Coupling and Hardware: Type 316 stainless steel
  - f. Stem Guides: Type 316 cast stainless steel
  - g. Grease Fitting: Stainless steel
  - h. All Bolting: Type 316 stainless steel
10. Stem Covers shall be furnished with clear butyrate plastic or grade 153 Lexan pipe stem covers. The cover shall be furnished with a cast adaptor for mounting cover to bench and floor stands. Stem cover shall be designed and furnished with gasketing and breathers to eliminate water intrusion into operator and condensation within the cover. The cover shall be provided with mylar tape with legible markings showing the gate position at one inch intervals and open/close limits of the gates.

## 2.16 APPURTENANCES FOR BURIED METALLIC VALVES

## A. Wrench Nuts

1. Wrench nuts shall be provided on all buried valves and shall be of nominal 2-inch size conforming to AWWA C500.
2. Arrow indicating direction of opening the valve shall be cast on the nut along with the word OPEN.
3. Material: Ductile iron
4. The nut shall be secured to the stem by mechanical means.

## B. T-Handle Operating Wrenches

1. Contractor to provide from valve manufacturer.
2. Provide T-Handle operating wrenches in lengths to permit operation of all valves by operators.
3. Number of wrenches required: 2

## C. Extension Stems for Non-Rising Stem Gate Valves and Quarter Turn Buried Valves:

1. Extension stems shall be provided to bring the operating nut to 6 inches below the box cover.
2. Minimum Size and Material: Same as valve stem
3. Maximum Unsupported Length: 3 feet

## D. Valve Boxes

1. Valve boxes shall be as indicated and as required.
2. Type: Heavy duty, suitable for highway loading, telescopic, and adjustable
3. Material: Cast or ductile iron
4. Coating: Two coats of asphalt varnish conforming to Federal Specification TT-C494.
5. Marking: As required for service

## 2.17 ANCHOR AND MISCELLANEOUS MOUNTING BOLTS

- A. All bolts, nuts and washers furnished for connection of the valve appurtenances to the concrete structure or other structural members shall be furnished by the valve equipment manufacturer, and shall be of ample size and strength for the purpose intended. Anchor bolts shall be hooked or adhesive type. Bolts and washers shall be of Type 316 stainless steel, and nuts shall be Nitronic 60.

## 2.18 PAINTING OF EXPOSED VALVES AND APPURTENANCES

- A. Exterior steel, cast-iron, and ductile iron surfaces except machined or bearing surfaces of all exposed valves and appurtenances shall be finish painted in the shop. The surface preparation, priming, finish painting, and field touch-up painting shall conform to Sections 09911 - Exterior Painting and 09912 - Interior Painting, as applicable.

## 2.19 PAINTING OF BURIED VALVES

- A. Exterior steel, cast-iron, and ductile iron surfaces except machined or bearing surfaces of all buried valves shall be shop-painted with two coats of asphalt varnish conforming to Federal Specification TT-C 494.

## 2.20 INSPECTION AND SHOP TESTS

- A. Allow for inspection and testing of valves 20 inches or larger by the Commissioner at the place of manufacture.
- B. The City of New York may elect to conduct shop inspection on any size valves. The inspection may include but not be limited to: quality of the castings and other major components, mechanical and chemical testing, material sampling, material certifications, traceability of parts, blasting and painting and hydrostatic testing of the valves.
- C. Where required, shop testing of the valves shall be witnessed. Test valves hydrostatically at twice the rated working pressure and then test them for leakage at the rated working pressure. Apply the rated working pressure alternately to each side of the close valve, or in the case of parallel seated gate valves, between the discs. For check valves, apply the rated working pressure against the direction of flow.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. All valves and appurtenances shall be installed in accordance with manufacturer's instructions.

- B. All valves shall be installed so that operating handwheels or levers may be conveniently turned from operating floor without interfering with access, and shall be as approved by the Commissioner. Chain operators shall be oriented out of the way from the walking areas.
- C. For motor-operated valves located lower than six feet above the operating floor, the orientation of the motor actuator shall permit easy access to the push buttons and the handwheel.
- D. All valves shall be installed plumb and level. The valves shall be free from distortion and strain caused by misaligned piping, equipment or other causes.
- E. For buried valve installations, the valve boxes shall be set plumb and centered, with carefully tamped to a lateral distance of 4 feet on all sides of the box, or to the undisturbed trench face if less than 4 feet.
- F. Plug valves in horizontal sludge lines shall be installed with the stem horizontal. The plugs shall be on top when open and on pressure side when closed. Valves in vertical sludge lines shall be installed with the plug at the top when closed.

### 3.02 FIELD TESTS AND ADJUSTMENTS

- A. All parts and components shall be adjusted as required to provide correct operation.
- B. A functional field test of each valve shall be conducted in the presence of the Commissioner to demonstrate that each part and all components function together correctly.

### 3.03 MANUFACTURER'S SERVICE

- A. Where required, the Contractor shall provide the services of qualified factory-trained service technicians to check and approve the installation.

-END OF SECTION-

**Section 15112**  
**VALVES SMALLER THAN 4 INCHES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Contractor shall provide all labor materials, equipment and incidentals as shown, specified and required to furnish and install valves smaller than 4 inches complete with appurtenances. All valves smaller than 4 inches shall be furnished under this specification unless specifically indicated on the schedule and shown on the Contract Drawings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 09912 - Interior Painting
- B. Section 11570 - Dust Suppression System
- C. Section 13861 - Odor Control System
- D. Section 15076 - Piping and Equipment Identification
- E. Section 15111 - Valves 4-Inch and Larger

**1.03 REFERENCES**

- A. American National Standards Institute (ANSI)

D. Military Specification

1. MIL-C-27487, Coupling Halves, Quick-Disconnect, Cam-Locking Type.

1.04 GENERAL REQUIREMENTS

- A. All valves shall turn clockwise to close, unless otherwise specified.
- B. All valves shall have permanent markings for direction to open.
- C. All materials of construction of the valves shall be confirmed suitable for the application by the valve manufacturer.
- D. All valves shall have manufacturer's name and rated pressure cast in raised letters on the valve body.
- E. The valves shall be provided with identification conforming to the requirements of Section 15076 - Piping and Equipment Identification.

1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Working Drawings:
  1. Product data sheets for make and model
  2. Complete catalog information, descriptive literature, specifications, and identification of materials of construction
  3. Power and control wiring diagrams, including terminals and numbers
  4. Manufacturer's qualifications
  5. Confirmation of suitability of the valve materials for the application
  6. Complete motor nameplate data
  7. Certificates of compliance with AWWA Standards where applicable
  8. Spare Parts List
  9. Special Tools List
  10. Valve manufacturer(s) certified test results of shop testing

- C. Operation and Maintenance Data: Submit complete manuals including:
1. Copies of all Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information
- D. Samples
1. One foot of chain for chain wheel operated valves

#### 1.06 SPARE PARTS

- A. The following quantities of spare valves shall be furnished for each type and size of valve installed.

Number of Valves Installed	Sets of Spare Valves Required
1-5	1
6-10	2
11-15	3
16-30	5
Greater than 30	15%

#### 1.07 QUALITY ASSURANCE

- A. Manufacturer's Qualifications
1. Manufacturer shall have a minimum of three (3) years of experience in the production of substantially similar valve equipment, and shall show evidence of satisfactory service in at least 5 installations.
  2. Each type of valve shall be the product of one manufacturer.

#### 1.08 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Valves and appurtenances shall be handled carefully. Valves which are dropped, dented, cracked or otherwise damaged will not be acceptable.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. The following manufacturers are acceptable. Equivalent products of other manufacturers may be submitted for approval.
- B. Solenoid Valves
1. Automatic Switch Company
  2. Automatic Valve Company
- C. Ball Valves
1. Stockham Valves and Fitting Company
  2. Lunkenheimer Company
  3. Swagelok
- D. Globe Valves
1. Stockham Valves and Fitting Company
  2. Lunkenheimer Company
- E. Check Valves
1. Stockham Valves and Fitting Company
  2. Lunkenheimer Company
- F. Gate Valve
1. Stockham Valves and Fitting Company
  2. Lunkenheimer Company
- G. Needle Valves
1. Stockham Valves and Fitting Company
  2. Lunkenheimer Company
- H. Pressure Reducing Valves
1. Cla-Val Company
  2. Watts Regulator Company
- I. Hose Valves
1. Crane Valves
  2. W.M. Powell Company, Powell Valves

## J. Corporation Stops

1. Mueller Company
2. A.Y. McDonald Manufacturing Company

## K. Strainers

1. Mueller Steam Specialty Company
2. Armstrong Steam Specialty Company

## L. Quick Connect Couplings

1. Civacon, Kamlok, Dover Resources Company
2. PT Coupling Company

## M. Dielectric Pipe Couplings

1. Watts Regulator Company
2. EPCO Sales, Inc.

## N. Electric Motor Actuators

1. Limitorque
2. Rotork

## O. Valve Chain Operators

1. Babbitt Steam Speciality Co.

## 2.02 MATERIALS - GENERAL

## A. Non-ferrous Materials

1. Non-ferrous materials are materials consisting of mixtures of copper, tin, zinc, lead, or other metals in which iron does not predominate.
2. Non-ferrous materials shall have standard composition and physical properties conforming to ASTM standards except as otherwise indicated.

## B. Valves

1. Cast iron valves shall conform to ASTM A126, Class A.
2. Type 316 stainless steel bolts and studs shall conform to ASTM A193, Grade B.
3. Carbon steel bolts shall conform to ASTM A307, Grade A.

## 2.03 VALVES FOR METALLIC PIPE LINES

## A. Solenoid Valves

1. Type: Packless construction with screwed end connections and threaded conduit connection.
2. Materials: Bronze body and wetted parts with type 304 stainless steel hardware.
3. Coil: Continuous duty, epoxy encapsulated.
4. Failure Mode: Fail open, energize to close, unless otherwise specified.
5. Electrical Power: 120 volt, 60 Hz, single phase.
6. Each solenoid valve shall be protected with a strainer upstream.

## B. Ball Valves

1. Body: Bronze, semi-steel or Stainless Steel as specified.
2. Ball, Stem Handle and Hardware: Type 316 stainless steel.
3. Seat, Packing and Gasket: Teflon.
4. End Connections: Screwed.
5. Rating: 150 psig Water, Oil or Gas (W.O.G.).
6. Ball Valves for Dust Suppression and Odor Control systems shall meet the requirements of Section 11570 – Dust Suppression System, and Section 13861 – Odor Control System.

## C. Globe Valves

1. Type: Composition or plug-type disc, union bonnet.
2. Materials: Bronze and brass.
3. End Connections: Screwed.
4. Rating: 150 psig Steam Working Pressure (SWP).
5. Compressed Air Piping: Composition disc.
6. Copper and Brass Piping: Plug-type disc.

## D. Check Valves

1. Type: Swing, regrindable bronze disc, screw-in cap.
2. Materials: Brass and bronze, or stainless steel as specified.
3. End Connections: Screwed.
4. Rating: 200 psig Steam Working Pressure (SWP).
5. 2 and 2 1/2-inch swing check valves shall conform to AWWA C508.
6. 3-inch and Larger Valves: Conform to the requirements of Section 15111 – Valves 4-Inch and Larger.

## E. Gate Valves

1. Type: Solid wedge, rising stem.
2. Body and Wetted Parts: Bronze.
3. Handle and Hardware: Type 316 stainless steel.
4. End Connections: Screwed.
5. Rating: 150 psig Water, Oil or Gas (W.O.G.).
6. 3-inch Valves: Resilient seated conforming to the requirements of Section 15111 - Valves 4-Inch and Larger.

## F. Needle Valves

1. Type: Long tapered plug for fine flow regulation.
2. Body and Wetted Parts: Bronze.
3. Handwheel: Malleable iron.
4. Hardware: Type 316 stainless steel.
5. End Connections: Screwed.
6. Rating: 150 psig.

## G. Pressure Reducing Valves

1. Type: Balanced, soft closing, single seat. Constant downstream pressure regardless of upstream pressure or flowrate. Drop tight shutoff when downstream pressure greater than spring setting.
2. Strainer: Integral with the valve, Type 316 stainless steel.

3. Body and Cover: Bronze with pressure gauge taps.
4. Trim: Type 316 stainless steel.
5. End Connections: Screwed.
6. Diaphragm: Ethylene Propylene Diene Terpolymer (EPDM), fully guided at top and bottom
7. Pressures and Flows

#### H. Hose Valves

1. Type: Chicago pattern
2. Materials: Bronze body with brass trim
3. Operator: Tee handle
4. Pipe End Connection: Threaded
5. Hose Connection: 1-1/2-inch NPT for 1-1/2 inch hose, quick connect couplings for larger hoses

### 2.04 APPURTENANCES AND MISCELLANEOUS ITEMS

#### A. Corporation Stops

1. Type: AWWA standard tapered thread, ball valve
2. Material: Bronze
3. End Connection
  - a. Copper Pipe: Threaded flare
  - b. Thermoplastic Pipe: Compression with Type 304 stainless steel stiffener rings
4. Type: Y-pattern
5. Body
  - a. Metallic Piping: Bronze, screwed ends
  - b. Thermoplastic Piping: Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds, true union ends

6. Screens: Monel, No. 20 mesh, 2.5 times the inlet area
  7. Rating: 125 psig
- B. Quick Connect Couplings
1. Type: Dual cam and groove, male end dimensionally similar to MIL-C-27487, with dust cap, Type 304 stainless steel chain and lock
  2. Body: Cast iron
  3. Cam Arms: Type 304 stainless steel
  4. Gaskets: Buna-N
- C. Dielectric Pipe Couplings:
1. Provide at every location where copper pipe connects to steel, stainless steel or ductile iron pipe or equipment.
  2. Body: Steel with non-conducting bushings on each end
  3. End Connections: Screwed
  4. Rating: 200 psig at 225°F
- D. Valve Boxes, Floor Boxes and Operating Wrenches
1. Provide in accordance with Section 15111 - Valves 4-Inch and Larger.
- E. Electric Motor Actuators: Electric motor actuators shall conform to the requirements of AWWA C540 and shall have the following characteristics.
1. Type: Open-Close, reversing
  2. Open-Close Time for Ball Valves: 10 seconds
  3. Open-Close Time for Diaphragm Valves: 60 seconds maximum
  4. Housing: NEMA 4X with corrosion resistant epoxy coating
  5. Power: 120 volt, 60 hz, single phase
  6. SPDT switches shall be provided for remote valve position indication.
  7. Space heater and thermostat shall be provided in the housing.

8. Integral thermal overload protection shall be provided with automatic reset.
9. Limit switches shall be in accordance with Section 15111- Valves 4-Inch and Larger.

F. Valve Chain Operators

1. All ball, butterfly and diaphragm valves 1-1/2-inch and larger located more than 6 feet-0 inches above the operating floor level shall be equipped with a manual gear operator mounting assembly and a chain operator adapted to fit the gear operator, chain guide and sprocket wheel bolted directly to the valve operating wheel.
2. Aluminum or type 316 stainless steel chain shall be provided to hang three feet above the operating floor. All operators shall be equipped with a 1/2-inch hook bolt located to keep chain out of walking areas or to permit access to equipment.
3. Chain shall be of welded link type with smooth finish. Chain that is crimped and has links type with exposed ends that may scratch or cut the operator shall not be acceptable.
4. A one-foot sample of chain shall be provided for approval as specified herein before.

2.05 TESTING

- A. The following valves shall be tested in conformance with the requirement of AWWA Standards:
1. 3-inch metal-seated gate valve - C500
  2. 3-inch resilient-seated gate valve - C509
  3. 2, 2 ½ and 3-inch swing check valves - C508
- B. All other valves and valve sizes shall be tested in accordance with the manufacturer's standard test procedures.

2.06 PAINTING

- A. All valves and appurtenances shall be painted in accordance with Section 09912 - Interior Painting.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. All valves and appurtenances shall be installed in accordance with manufacturer's instructions.
- B. All valves shall be installed so that operating handwheels or wrenches may be conveniently turned from operating floor without interfering with access, and shall be as approved by the Commissioner.
- C. All valves shall be installed plumb and level. The valves shall be free from distortion and strain caused by misaligned piping, equipment or other causes.
- D. For buried valve installations, the valve boxes shall be set plumb and centered, with carefully tamped to a lateral distance of 4 feet on all sides of the box, or to the undisturbed trench face if less than 4 feet.

### 3.02 FIELD TESTS AND ADJUSTMENTS

- A. All parts and components shall be adjusted as required to provide correct operation.
- B. A functional field test of each valve shall be conducted in the presence of the Commissioner to demonstrate that each part and all components function together correctly.

### 3.03 MANUFACTURER'S SERVICE

- A. Where required, the Contractor shall provide the services of qualified factory-trained service technicians to check and approve the installation.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 15120**  
**INTERIOR AND EXPOSED PIPING SCHEDULES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall furnish and install all interior and exposed piping as indicated in the interior and exposed piping schedules, and as specified in the Division 15.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02505 - Leakage Tests
- B. Section 15051 - Ductile Iron Pipe
- C. Section 15052 - Steel and Stainless Steel Pipe
- D. Section 15081 - Piping Insulation
- E. Section 15141 - Disinfection
- F. Section 15191 - Diesel Fuel Piping
- G. Section 15771 - Electric Heat Tracing Systems

**1.03 SCHEDULES**

- A. All piping shall be provided as listed in the following schedules:
- 1. Schedule 15120 Interior and Exposed Piping.
- B. Nomenclature for nominal pipe size ranges shall be as follows: "to" means all pipe sizes within the listed range including the upper listed size, and "up to" means all pipe sizes within the listed range not including upper listed size.
- C. Exposed or interior piping includes all piping that is not buried below ground, encased in concrete, or below the lowest finished floor elevation in structures.
- D. All rubber gaskets used in piping joints shall be suitable for the application.
- E. Abbreviations used in the pipe schedules are (Not All Used On This Project):
- 1. Material
    - GALV - Galvanized
    - 304LSS - 304L Stainless Steel
    - 316LSS - 316L Stainless Steel (Low carbon)
    - BR - Brass
    - DI - Ductile Iron
    - CI - Grey Cast Iron
    - CS - Carbon Steel
    - CU - Copper

FRP	-	Fiberglass Reinforced Plastic
HDPE	-	High Density Polyethylene
PE	-	Polyethylene
CPVC	-	Chlorinated Polyvinyl Chloride
PVC	-	Polyvinyl Chloride

## 2. Wall Thickness

CL	-	Class
PCL	-	Pressure Class
SCH	-	Schedule
SDR	-	Standard Diameter Ratio
STCL	-	Special Thickness Class
STD	-	Standard

## 3. Type of Joint

BS	-	Bell and Spigot
COMP	-	Compression
FLG	-	Flanged
GR	-	Grooved
LW	-	Lap Welded
MJ	-	Mechanical Joint
POJ	-	Push On Joint
RPOJ	-	Restrained Push on Joints
SD	-	Soldered
SSC	-	Split Sleeve Coupling
SW	-	Solvent Welded
THD	-	Threaded
WLD	-	Welded

## 4. Type of Fittings

304LSS	-	304L Stainless Steel
316LSS	-	316L Stainless Steel (Low Carbon)
CI	-	Grey Cast Iron
CU	-	Copper
DI	-	Ductile Iron
CS	-	Carbon Steel
BR	-	Brass
FRP	-	Fiberglass Reinforced Plastic

## General Notes:

1. Wall thickness shall be as specified.
2. All connections to valves and equipment shall be made with flanged joints.
3. Pressure and leakage testing requirements and procedures are specified in Section 02505 - Leakage Tests.
4. Heat trace and insulate exterior piping as shown on the Contract Drawings and in accordance with Sections 15081 - Piping Insulation and 15771 - Electric Heat Tracing Systems.
5. No field welding of stainless steel pipe will be permitted. Provide flanged joints for field connection of stainless steel pipe in accordance with Section 15052 - Steel and Stainless Steel Pipe.
6. Use temporary tie rods at all expansion joints during pressure testing of piping.
7. Heat trace and insulate interior piping as shown on the Contract Drawings and in accordance with Sections 15081 - Piping Insulation and 15771 - Electric Heat Tracing Systems.
8. Diesel fuel piping shall be double wall containment piping with 2 inch type 304 L stainless steel carrier and 4 inch FRP containment pipe as specified in Section 15191 - Diesel Fuel Piping. Diesel fuel piping shall also be incased in concrete when passing through the building. No other pipe lines shall be incased in the same concrete encasement.

**NO TEXT ON THIS PAGE**

**Section 15121**  
**PIPE EXPANSION AND SEISMIC FITTINGS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes the following pipe expansion joints and expansion compensation devices for mechanical piping systems:

1. Metal-bellows expansion joints
2. Flexible Loops for Seismic
3. Flexible Expansion Joints for Piping
4. Alignment guides and anchors

**1.02 PERFORMANCE REQUIREMENTS**

- A. Compatibility: Products shall be suitable for piping system fluids, materials, working pressures, and temperatures.
- B. Capability: Products shall absorb 200 percent of maximum axial movement between anchors.

**1.03 SUBMITTALS**

- A. Product Data: For each type of pipe expansion joint and alignment guide indicated.
- B. Shop Drawings: Signed and sealed by a qualified professional engineer.
1. Design Calculations: Calculate requirements for thermal expansion of piping systems and for selecting and designing expansion joints.
  2. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
  3. Alignment Guide Details: Detail field assembly and attachment to building structure.
  4. Schedule: Indicate type, manufacturer's number, size, material, pressure rating, end connections, and location for each expansion joint.
- C. Product Certificates: For each type of pipe expansion joint, signed by product manufacturer.
- D. Welding certificates.
- E. Operation and Maintenance Data: For pipe expansion joints to include in emergency, operation, and maintenance manuals.

## 1.04 QUALITY ASSURANCE

### A. Welding: Qualify procedures and personnel according to the following:

1. Steel Shapes and Plates: AWS D1.1, "Structural Welding Code - Steel."
2. Welding to Piping: ASME Boiler and Pressure Vessel Code: Section IX.

## PART 2 PRODUCTS

### 2.01 EXPANSION JOINTS

#### A. Metal-Bellows Expansion Joints: ASTM F 1120, circular-corrugated-bellows type with external tie rods.

##### 1. Manufacturers

- a. Adsko Manufacturing, LLC
- b. Badger Industries
- c. Expansion Joint Systems, Inc.
- d. Flex-Hose Co., Inc.
- e. Flexicraft Industries
- f. Flex-Pression, Ltd.
- g. Flex-Weld, Inc.
- h. Metraflex, Inc.
- i. Piping Technology & Products, Inc.
- j. Senior Flexonics, Inc.; Pathway Division
- k. Unaflex Inc.
- l. WahlcoMetroflex
- m. Or approved equal

##### 2. Metal-Bellows Expansion Joints for Steel Piping: Multiple-ply stainless-steel bellows, steel pipe end connections, and carbon-steel shroud.

##### 3. Minimum Pressure Rating: 150 psig , unless otherwise indicated.

##### 4. Configuration: Single bellows type with base, unless otherwise indicated.

##### 5. End Connections: Flanged.

#### B. Flexible Loops for Seismic

##### 1. Manufacturers

- a. Flex-Hose Co., Inc.
- b. Flexicraft Industries
- c. Flex-Pression, Ltd.
- d. Metraflex, Inc.
- e. Or approved equal

2. Flexible Hose Loops for Seismic: Manufactured assembly with two flexible-metal-hose legs joined by long-radius, 180-degree return bend or center section of flexible hose; with inlet and outlet elbow fittings, corrugated-metal inner hoses, and braided outer sheaths.
3. Stainless-steel hoses and double-braid, stainless-steel sheaths with 300 psig at 70 deg F and 225 psig at 450 deg F ratings.
4. Flexible-Hose Expansion Joints for Steel Piping: Steel fittings with 150 lb. flanged end connections.

C. Flexible Expansion Joints for Piping

1. Flexible expansion joints shall be installed in the locations indicated on the drawings and shall be manufactured of 65-45-12 ductile iron conforming to the material requirements of ASTM A536 and ANSI/AWWA C153/A21.53. Foundry certification of material shall be readily available upon request.
2. Flexible expansion joints fittings shall allow for seismic event of the building moving 6 inches and the ramp moving as much as 6" in the opposite direction. Total of 12 inches differential. Fittings will be utilized on fire water lines, sanitary line and a domestic water line.
3. Each flexible expansion joint shall be pressure tested prior to shipment against its own restraint to a minimum of 350 psi. A minimum 2:1 safety factor, determined from the published pressure rating, shall apply. Factory Mutual approved is required.
4. Each flexible expansion joint shall consist of an expansion joint designed and cast as an integral part of a ball and socket type flexible joint, having a minimum per ball deflection of: 20° and 4-inches minimum expansion. Additional expansion sleeves shall be available and easily added or removed at the factory or in the field. Both ends of the flexible joint shall be provided with 125lb flanges.
5. All internal surfaces (wetted parts) shall be lined with minimum of 15 mils of fusion bonded epoxy conforming to the applicable requirements of ANSI/AWWA C213 and shall be holiday tested with a 1500 volt spark test conforming to said specification. Sealing gaskets shall be constructed of EPDM. The coating and gaskets shall meet ANSI/NSF-61.
6. All external surfaces shall be coated with a catalyzed coat tar epoxy conforming to the material requirements of AWWA C120.
7. Manufacturer's certification of compliance to the above standards and requirements shall be readily available upon request. The owner shall reserve the right to inspect the manufacturer's facility expansion joints shall be FLEX-TEND as manufactured by EBAA Iron, Inc. or approved equal.

## 2.02 ALIGNMENT GUIDES

- A. Steel, factory fabricated, with bolted two-section outer cylinder and base for alignment of piping and two-section guiding spider for bolting to pipe.

### 1. Manufacturers

- a. Adsko Manufacturing, LLC.
- b. Advanced Thermal Systems, Inc.
- c. Flex-Hose Co., Inc.
- d. Flexicraft Industries
- e. Flex-Weld, Inc.
- f. Hyspan Precision Products, Inc.
- g. Metraflex, Inc.
- h. Piping Technology & Products, Inc.
- i. Senior Flexonics, Inc.; Pathway Division
- j. Or approved equal

## 2.03 MATERIALS FOR ANCHORS

- A. Steel Shapes and Plates: ASTM A 36/A 36M.
- B. Bolts and Nuts: ASME B18.10 or ASTM A 183, steel, hex head.
- C. Washers: ASTM F 844, steel, plain, flat washers.
- D. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened portland cement concrete, and tension and shear capacities appropriate for application.
1. Stud: Threaded, zinc-coated carbon steel
  2. Expansion Plug: Zinc-coated steel
  3. Washer and Nut: Zinc-coated steel

## PART 3 EXECUTION

### 3.01 EXPANSION-JOINT INSTALLATION

- A. Install manufactured, nonmetallic expansion joints according to FSA's "Technical Handbook: Non-Metallic Expansion Joints and Flexible Pipe Connectors."
- B. Install expansion joints of sizes matching size of piping in which they are installed.
- C. Install alignment guides to allow expansion and to avoid end-loading and torsional stress.

3.02 SWING CONNECTIONS

- A. Connect risers and branch connections to mains with at least five pipe fittings, including tee in main.
- B. Connect risers and branch connections to terminal units with at least four pipe fittings, including tee in riser.
- C. Connect mains and branch connections to terminal units with at least four pipe fittings, including tee in main.

3.03 FLEXIBLE EXPANSION JOINTS FOR PIPING

- A. Install flexible expansion joints in accordance with manufactures recommendations.

3.04 ALIGNMENT-GUIDE INSTALLATION

- A. Install guides on piping adjoining pipe expansion joints and bends and loops.
- B. Attach guides to pipe and secure to building structure.

3.05 ANCHOR INSTALLATION

- A. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.
- B. Fabricate and install steel anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and AWS D1.1.
- C. Install pipe anchors according to expansion-joint manufacturer's written instructions if expansion joints or compensators are indicated.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

## Section 15122 METERS AND GAGES

### PART 1 GENERAL

#### 1.01 SUMMARY

- A. This Section includes the following meters and gages for mechanical systems:

1. Thermometers
2. Gages
3. Test plugs

#### 1.02 RELATED SPECIFICATIONS

- A. Section 13921 - Electric-Drive, Centrifugal Fire Pumps, for fire-pump flowmeter systems.
- B. Section 15140 - Domestic Water Piping, for domestic and fire-protection water service meters inside the building.
- C. Section 15190 - Fuel Gas Piping, for gas meters inside the building.

#### 1.03 DEFINITIONS

- A. CR: Chlorosulfonated polyethylene synthetic rubber
- B. EPDM: Ethylene-propylene-diene terpolymer rubber

#### 1.04 SUBMITTALS

- A. Product Data: For each type of product indicated; include performance curves.
- B. Shop Drawings: Schedule for thermometers, gages flowmeters and thermal-energy meters indicating manufacturer's number, scale range, and location for each.
- C. Product Certificates: For each type of thermometer gage flowmeter and thermal-energy meter, signed by product manufacturer.
- D. Operation and Maintenance Data: For flowmeters and thermal-energy meters to include in emergency, operation, and maintenance manuals.

### PART 2 PRODUCTS

#### 2.01 METAL-CASE, LIQUID-IN-GLASS THERMOMETERS

- A. Manufacturers
1. Palmer - Wahl Instruments Inc.
  2. Terice, H. O. Co.

3. Weiss Instruments, Inc.
  4. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
  5. Or approved equal
- B. Case: Die-cast aluminum or brass, 9 inches long.
- C. Tube: Red or blue reading, mercury or organic-liquid filled, with magnifying lens.
- D. Tube Background: Satin-faced, nonreflective aluminum with permanently etched scale markings.
- E. Window: Glass
- F. Connector: Adjustable type, 360 degrees in horizontal plane, with locking device.
- G. Stem: Copper-plated steel, aluminum, or brass for thermowell installation and of length to suit installation.
- H. Accuracy: Plus or minus 1 percent of range or plus or minus 1 scale division to maximum of 1.5 percent of range.

## 2.02 BIMETALLIC-ACTUATED DIAL THERMOMETERS

### A. Manufacturers

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Ernst Gage Co.
3. Eugene Ernst Products Co.
4. Marsh Bellofram
5. Palmer - Wahl Instruments Inc.
6. REO TEMP Instrument Corporation
7. Tel-Tru Manufacturing Company
8. Weiss Instruments, Inc.
9. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
10. WIKA Instrument Corporation
11. Winters Instruments
12. Or approved equal

- B. Description: Direct-mounting, bimetallic-actuated dial thermometers complying with ASME B40.3.
- C. Case: Liquid-filled type, stainless steel with 5-inch diameter
- D. Element: Bimetal coil
- E. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings
- F. Pointer: Red metal
- G. Window: Glass
- H. Ring: Stainless steel
- I. Connector: Adjustable angle type
- J. Stem: Metal, for thermowell installation and of length to suit installation
- K. Accuracy: Plus or minus 1 percent of range or plus or minus 1 scale division to maximum of 1.5 percent of range

## 2.03 THERMOWELLS

### A. Manufacturers

1. AMETEK, Inc.; U.S. Gauge Div.
2. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
3. Ernst Gage Co.
4. Marsh Bellofram
5. Miljoco Corp.
6. Trerice, H. O. Co.
7. Weiss Instruments, Inc.
8. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
9. WIKA Instrument Corporation
10. Winters Instruments
11. Or approved equal

- B. Description: Pressure-tight, socket-type metal fitting made for insertion into piping and of type, diameter, and length required to hold thermometer. Provide thermowell from same manufacturer of thermometer being used.

## 2.04 PRESSURE GAGES

### A. Manufacturers

1. AMETEK, Inc.; U.S. Gauge Div.
2. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
3. Ernst Gage Co.
4. Eugene Ernst Products Co.
5. Palmer - Wahl Instruments Inc.
6. Trerice, H. O. Co.
7. Weiss Instruments, Inc.
8. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
9. WIKA Instrument Corporation
10. Winters Instruments
11. Or approved equal

### B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type complying with ASME B40.100.

1. Case: Liquid-filled type, drawn steel or cast aluminum, 6-inch diameter
2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated
3. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated
4. Movement: Mechanical, with link to pressure element and connection to pointer
5. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings
6. Pointer: Red metal

7. Window: Glass
  8. Ring: Stainless steel
  9. Accuracy: Grade A, plus or minus 1 percent of middle half scale
  10. Vacuum-Pressure Range: 30-in. Hg of vacuum to 15 psig of pressure
  11. Range for Fluids under Pressure: Two times operating pressure
- C. Remote-Mounting, Dial-Type Pressure Gages: ASME B40.100, indicating-dial type
1. Case: Dry type, drawn steel or cast aluminum, 4-1/2-inch diameter with holes for panel mounting
  2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated
  3. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated
  4. Movement: Mechanical, with link to pressure element and connection to pointer
  5. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings
  6. Pointer: Red metal
  7. Window: Glass
  8. Ring: Stainless steel
  9. Accuracy: Grade A, plus or minus 1 percent of middle half scale
  10. Vacuum-Pressure Range: 30-in. Hg of vacuum to 15 psig of pressure
  11. Range for Fluids under Pressure: Two times operating pressure
- D. Pressure-Gage Fittings
1. Valves: NPS 1/4 brass or stainless-steel needle type
  2. Syphons: NPS 1/4 coil of brass tubing with threaded ends
  3. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure

## 2.05 TEST PLUGS

## A. Manufacturers

1. Flow Design, Inc.
2. MG Piping Products Co.
3. National Meter, Inc.
4. Peterson Equipment Co., Inc.
5. Sisco Manufacturing Co.
6. Trerice, H. O. Co.
7. Watts Industries, Inc.; Water Products Div.
8. Or approved equal

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg.

D. Core Inserts: One or two self-sealing rubber valves.

1. Insert material for air, water, oil, or gas service at 20 to 200 deg F shall be CR.
2. Insert material for air or water service at minus 30 to plus 275 deg F shall be EPDM.

E. Test Kit: Furnish two test kits containing one pressure gage and adaptor, two thermometers, and carrying case. Pressure gage, adapter probes, and thermometer sensing elements shall be of diameter to fit test plugs and of length to project into piping.

1. Pressure Gage: Small bourdon-tube insertion type with 2- to 3-inch diameter dial and probe. Dial range shall be 0 to 200 psig.
2. Low-Range Thermometer: Small bimetallic insertion type with 1- to 2-inch-diameter dial and tapered-end sensing element. Dial ranges shall be 25 to 125 deg F.
3. High-Range Thermometer: Small bimetallic insertion type with 1- to 2-inch-diameter dial and tapered-end sensing element. Dial ranges shall be 0 to 220 deg F.
4. Carrying case shall have formed instrument padding.

## 2.06 FLOW INDICATORS

### A. Manufacturers

1. Brooks Instrument Div.; Emerson Electric Co.
2. Dwyer Instruments, Inc.
3. Ernst Gage Co.
4. Eugene Ernst Products Co.
5. McCrometer, Inc.
6. OPW Engineered Systems; Dover Corp.
7. Penberthy, Inc.
8. Or approved equal

B. Description: Instrument for installation in piping systems for visual verification of flow

C. Construction: Bronze or stainless-steel body; with sight glass and indicator, and threaded or flanged ends

D. Pressure Rating: 125 psig

E. Temperature Rating: 200 deg.

F. End Connections for NPS 2 and Smaller: Threaded

G. End Connections for NPS 2-1/2 and Larger: Flanged

## PART 3 EXECUTION

### 3.01 THERMOMETER APPLICATIONS

A. Install liquid-in-glass thermometers in the following locations:

1. Inlet and outlet of each thermal storage tank

B. Install liquid-filled-case-type, bimetallic-actuated dial thermometers at suction and discharge of each pump.

C. Provide the following temperature ranges for thermometers:

1. Domestic Hot Water: with 2-degree scale divisions 30 to 240 deg F, with 2-degree scale divisions.
2. Domestic Hot Water Circulating: 30 to 180 deg F, with 2-degree scale divisions with 2-degree scale divisions.
3. Domestic Cold Water: 0 to 100 deg F, with 2-degree scale divisions with 2-degree scale divisions.

4. Install thermometers as indicated on all Plumbing Drawings.

### 3.02 GAGE APPLICATIONS

- A. Install dry-case-type pressure gages for discharge of each pressure-reducing valve.
- B. Install liquid-filled-case-type pressure gages at suction and discharge of each pump.

### 3.03 INSTALLATIONS

- A. Install direct-mounting thermometers and adjust vertical and tilted positions.
- B. Install remote-mounting dial thermometers on panel, with tubing connecting panel and thermometer bulb supported to prevent kinks. Use minimum tubing length.
- C. Install thermowells with socket extending a minimum of 2 inches into fluid one-third of diameter of pipe and in vertical position in piping tees where thermometers are indicated.
- D. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.
- E. Install remote-mounting pressure gages on panel.
- F. Install needle-valve and snubber fitting in piping for each pressure gage for fluids
- G. Install test plugs in tees in piping.
- H. Install flow indicators, in accessible positions for easy viewing, in piping systems.
- I. Install permanent indicators on walls or brackets in accessible and readable positions.
- J. Install connection fittings for attachment to portable indicators in accessible locations.

### 3.04 ADJUSTING

- A. Adjust faces of meters and gages to proper angle for best visibility

-END OF SECTION-

**Section 15140**  
**DOMESTIC WATER PIPING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes domestic water piping and water meters inside the building.
- B. Water meters will be furnished by utility company for installation by Contractor.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15122 - Meters and Gages, for thermometers, pressure gages, and fittings.
- B. Section 15430 - Plumbing Specialties, for water distribution piping specialties.

**1.03 GENERAL REQUIREMENTS**

- A. Provide components and installation capable of producing domestic water piping systems with 125 psig, unless otherwise indicated.

**1.04 SUBMITTALS**

- A. Product Data: For pipe, tube, fittings, and couplings and water meters.
- B. Water Samples: Specified in Part 3 "Cleaning" Article.
- C. Field quality-control test reports.

**1.05 QUALITY ASSURANCE**

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- B. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9," for potable domestic water piping and components.

**PART 2 PRODUCTS**

**2.01 PIPING MATERIALS**

- A. Refer to Part 3 "Pipe and Fitting Applications" Article for applications of pipe, tube, fitting, and joining materials.
- B. Transition Couplings for Aboveground Pressure Piping: Coupling or other manufactured fitting the same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

## 2.02 COPPER TUBE AND FITTINGS

- A. Hard Copper Tube: ASTM B 88, Types L, water tube, drawn temper.
  - 1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
  - 2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends. Furnish Class 300 flanges if required to match piping.
  - 3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

## 2.03 VALVES

- A. Bronze and cast-iron, general-duty valves are specified in Section 15410 - Plumbing Valves.
- B. Balancing and drain valves are specified in Section 15430 - Plumbing Specialties.

## 2.04 WATER METERS

- A. Water meters shall be in accordance with City of New York Department of Environmental Protection.

## PART 3 EXECUTION

## 3.01 EXCAVATION

- A. Excavating, trenching, and backfilling are specified in Section 02316 - Excavation and Section 02317 - Backfilling.

## 3.02 PIPE AND FITTING APPLICATIONS

- A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.
- B. Flanges may be used on aboveground piping, unless otherwise indicated.
- C. Domestic Water Piping on Service Side of Water Meter inside the Building: Use the following piping materials for each size range:
  - 1. NPS 3/4" to NPS 4": Hard copper tube, Type L; copper pressure fittings; and soldered joints.

### 3.03 VALVE APPLICATIONS

- A. Drawings in general indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
  - 1. Shutoff Duty: Use bronze ball or gate valves for piping NPS 2 and smaller. Use cast-iron gate valves with flanged ends for piping NPS 2-1/2 and larger.
  - 2. Throttling Duty: Use bronze ball or globe valves for piping NPS 2 and smaller. Use cast-iron globe valves with flanged ends for piping NPS 2-1/2 and larger.
  - 3. Hot-Water-Piping, Balancing Duty: Memory-stop balancing valves.
  - 4. Drain Duty: Hose-end drain valves.
- B. Install shutoff valve close to water main on each branch and riser serving plumbing fixtures or equipment, on each water supply to equipment, and on each water supply to plumbing fixtures that do not have supply stops. Use ball or gate valves for piping NPS 2 and smaller. Use gate valves for piping NPS 2-1/2 and larger.
- C. Install drain valves for equipment at base of each water riser, at low points in horizontal piping, and where required to drain water piping.
  - 1. Install hose-end drain valves at low points in water mains, risers, and branches.
  - 2. Install stop-and-waste drain valves where indicated.
- D. Install balancing valve in each hot-water circulation return branch and discharge side of each pump and circulator. Set balancing valves partly open to restrict but not stop flow. Use ball valves for piping NPS 2 and smaller and butterfly valves for piping NPS 2-1/2 and larger. Balancing valves are specified in Section 15430 - Plumbing Specialties.
- E. Install calibrated balancing valves in each hot-water circulation return branch and discharge side of each pump and circulator. Set calibrated balancing valves partly open to restrict but not stop flow. Calibrated balancing valves are specified in Section 15430 - Plumbing Specialties.

### 3.04 PIPING INSTALLATION

- A. Basic piping installation requirements are specified in Section 15050 - Basic Mechanical Materials and Methods.
- B. Install under-building-slab copper tubing according to CDA's "Copper Tube Handbook."

- C. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in Section 15050 - Basic Mechanical Materials and Methods.
- D. Install wall penetration system at each service pipe penetration through foundation wall. Make installation watertight. Wall penetration systems are specified in Section 15050 - Basic Mechanical Materials and Methods.
- E. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve, inside the building at each domestic water service entrance. Pressure gages are specified in Section 15122 - Meters and Gages, and drain valves and strainers are specified in Section 15430 - Plumbing Specialties.
- F. Install domestic water piping level with 0.25 percent slope downward toward drain and plumb.
- G. Rough-in domestic water piping for water-meter installation according to utility company's requirements.

### 3.05 JOINT CONSTRUCTION

- A. Basic piping joint construction requirements are specified in Section 15050 - Basic Mechanical Materials and Methods.
- B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

### 3.06 WATER METER INSTALLATION

- A. Rough-in domestic water piping for water meter installation and install water meters according to utility company's requirements.
- B. Install water meters according to AWWA M6 and in accordance with New York City Department of Environmental Protection requirements.
  - 1. Install turbine-type water meters with shutoff valve on water-meter inlet and outlet and in accordance with New York City Department of Environmental Protection requirements.
  - 2. Install compound-type water meters with shutoff valves on water-meter inlet and outlet. Support meters, valves, and piping in accordance with New York City Department of Environmental Protection requirements.
  - 3. Install remote registration system according to standards of utility and in accordance with New York City Department of Environmental Protection requirements.

## 3.07 HANGER AND SUPPORT INSTALLATION

- A. Seismic-restraint devices are specified in Section 15071 - Vibration Control.
- B. Pipe hanger and support devices are specified in Section 15060 - Hangers and Supports. Install the following:
  - 1. Vertical Piping: MSS Type 8 or Type 42 clamps.
  - 2. Individual, Straight, Horizontal Piping Runs: According to the following:
    - a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers
    - b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers
    - c. Longer Than 100 Feet: MSS Type 49, spring cushion rolls, if indicated
  - 3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze
  - 4. Base of Vertical Piping: MSS Type 52, spring hangers
- C. Install supports according to Section 15060 - Hangers and Supports.
- D. Support vertical piping and tubing at base and at each floor.
- E. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/4 and Smaller: 84 inches with 3/8-inch rod
  - 2. NPS 1-1/2: 108 inches with 3/8-inch rod
  - 3. NPS 2: 10 feet with 3/8-inch rod
  - 4. NPS 2-1/2: 11 feet with 1/2-inch rod
  - 5. NPS 3 and NPS 3-1/2: 12 feet with 1/2-inch rod
  - 6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod
  - 7. NPS 6: 12 feet with 3/4-inch rod
- F. Install supports for vertical steel piping every 15 feet.
- G. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 3/4 and Smaller: 60 inches with 3/8-inch rod
  - 2. NPS 1 and NPS 1-1/4: 72 inches with 3/8-inch rod
  - 3. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod
  - 4. NPS 2-1/2: 108 inches with 1/2-inch rod
  - 5. NPS 3 to NPS 5: 10 feet with 1/2-inch rod
  - 6. NPS 6: 10 feet with 5/8-inch rod
- H. Install supports for vertical copper tubing every 10 feet.

- I. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

### 3.08 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment and machines to allow service and maintenance.
- C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.
- D. Connect domestic water piping to water-service piping with shutoff valve, and extend and connect to the following:
  1. Booster Pumps: Cold-water suction and discharge piping
  2. Water Heaters: Cold-water supply and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections
  3. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code. Refer to Section 15410 - Plumbing Fixtures and Trim.
  4. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

### 3.09 FIELD QUALITY CONTROL

- A. Inspect domestic water piping as follows:
  1. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
  2. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
    - a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
    - b. Final Inspection: Arrange final inspection for authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
  3. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

B. Test domestic water piping as follows:

1. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
3. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
4. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
6. Prepare reports for tests and required corrective action.

3.10 ADJUSTING

A. Perform the following adjustments before operation:

1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
  - a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide flow of hot water in each branch.
  - b. Adjust calibrated balancing valves to flows indicated.
5. Remove plugs used during testing of piping and plugs used for temporary sealing of piping during installation.

6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
8. Check plumbing specialties and verify proper settings, adjustments, and operation.

### 3.11 CLEANING

#### A. Clean and disinfect potable domestic water piping as follows:

1. Purge new piping and parts of existing domestic water piping that have been altered, extended, or repaired before using.
  2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction or, if methods are not prescribed, procedures described in either AWWA C651 or AWWA C652 or as described below:
    - a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    - b. Fill and isolate system according to either of the following:
      - (1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
      - (2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.
    - c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
    - d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.
- B. Prepare and submit reports of purging and disinfecting activities.
- C. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

-END OF SECTION-

**Section 15141  
DISINFECTION**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Disinfection of all pipelines, and equipment which are to store, handle or carry potable water. Furnish all labor, water, chemicals and equipment, including taps, corporation stops, temporary pumps and other items necessary to perform the Work, except as otherwise specified. Water for the initial disinfection procedure will be furnished by City of New York.

**1.02 REFERENCES**

- A. AWWA C651 - Disinfecting Water Main
- B. New York Department of Environmental Protection (NYCDEP) Bureau of Water Supply Standard Water Main Specifications
- C. New York City Building Code

**1.03 QUALITY ASSURANCE**

- A. Disinfection Standards: Disinfect in accordance with AWWA C651 for water mains, except as modified herein.
- B. Local Requirements: Disinfection procedures for new water mains shall also conform to the requirements of the New York City Building Code, Section P107.27, "Disinfection of Potable Water Systems," and Section P107.8, "Water Supply Tanks," respectively, as well as the requirements in the NYCDEP Bureau of Water Supply Standard Water Main Specifications, except as modified herein

**PART 2 PRODUCTS (Not Used)**

**PART 3 EXECUTION**

**3.01 APPLICATION**

- A. Disinfect pumps, hydrants, and other water handling equipment items that are part of the potable water distribution system in the same manner as described herein for the pipelines.
- B. Disinfection Procedures for Piping: Flush pipelines with clean water before disinfecting. Disinfect by the continuous feed method, as specified in AWWA C651, using sodium hypochlorite solution. Then add chlorinated water containing not less than 50 mg/l free available chlorine followed by clean water at one end of the section being disinfected and discharged at the far end.

1. Add the chlorinated water until the water coming from each downstream blowoff has a residual of not less than 25 mg/l of chlorine.
  2. Close the pipelines and allow the solution to remain in the lines for at least 24 hours. Recheck the chlorine residual in the pipeline. If the free chlorine residual is less than 10 mg/l after 24 hours, disinfect the pipelines again with more concentrated chlorinated water.
  3. After meeting the previous requirements in this subsection and after a 24-hour holding period, thoroughly flush out the pipelines and equipment and fill with clean water. Do not permit flushing water to discharge into existing water mains.
  4. Do not discharge flushing water to sanitary or storm sewers without permission of the NYCDEP. Where necessary, contact Federal, State and local regulatory agencies to determine special provisions for the disposal of heavily chlorinated water.
  5. When new potable water pipelines are to be connected to an existing water distribution system, the connecting piping shall be disinfected and tested in accordance with the procedure set forth in Section 9.1 or Section 9.2, as applicable, of AWWA C651 and in accordance with NYCDEP Bureau of Water Supply requirements.
- C. Disinfection Procedures for Tanks: Disinfect potable water storage tanks and equipment in accordance with AWWA C652, Method 2 or 3, using sodium hypochlorite.
1. In Method 2, spray method, spray the entire interior surface of the tank with chlorinated water containing 200 mg/l of available chlorine. After spraying, allow the tank to stand at least two hours before filling with fresh water. After disinfection, allow the tanks and equipment to overflow until the chlorine residual is approximately 2 mg/l.
  2. In Method 3, add sodium hypochlorite and water to the tank in amounts such that the solution contains 50 mg/l of available chlorine when the tank is filled to approximately 5 percent of the total storage volume. Hold the solution in the tank for not less than 6 hours, then fill the tank to the overflow level and let stand for not less than 24 hours. At completion, purge the highly chlorinated water from the drain piping. After the 24-hour period has elapsed, the free-chlorine residual shall be not less than 2 mg/l.
- D. Water Supply: Water for the first filling, disinfection and flushing procedure of each pipeline, tank and piece of equipment will be furnished by the City of New York, at no cost to the Contractor, from the nearest hydrant or other source. The Contractor shall provide all necessary apparatus to convey the water to the point of use and perform the disinfection procedure. If the water in the pipelines or storage facility fails the bacteriological tests, water for subsequent disinfection procedures

shall be provided by the Contractor. If agreeable to the City or New York, water for the subsequent disinfection procedures may be furnished by the City of New York but shall be metered, and the Contractor shall credit the City of New York for the cost of water used for the subsequent procedures.

3.02 VERIFICATION OF DISINFECTION

- A. Final Samples: Bacteriological samples will be taken and tested by the Contractor as required by the New York City Department of Health. If the samples are not satisfactory, repeat the entire disinfection procedure.
  - 1. Submit test reports to the Commissioner for review and approval.
  - 2. Assume the expense of taking and testing additional samples until satisfactory samples are obtained.
  - 3. Assume the expense of all water for subsequent fillings of the pipelines, tanks and equipment.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15150**  
**SANITARY WASTE, INDUSTRIAL WASTE AND VENT PIPING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes furnishing and installing sanitary waste and vent pipe, fittings, accessories, specialties as shown, specified or required for a complete installation and satisfactory operation. Provide pipe and fittings of new materials, protected from dirt, moisture and mechanical damage.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15430 - Plumbing Specialties, for storm drainage piping system specialties.

**1.03 SUBMITTALS**

- A. Product Data: For pipe, tube, fittings, and couplings.
- B. Shop Drawings: For solvent drainage system, include plans, elevations, sections, and details.
- C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

**1.04 PERFORMANCE REQUIREMENTS**

- A. Provide components and installation capable of producing piping systems with the following minimum working-pressure ratings, unless otherwise indicated:
  - 1. Soil, Waste, and Vent Piping: 10-foot head of water
  - 2. Sanitary Sewer, Force-Main Piping: 50 psig

**1.05 QUALITY ASSURANCE**

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

**PART 2 PRODUCTS**

**2.01 PIPING MATERIALS**

- A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

- B. Flexible Transition Couplings for Underground Nonpressure Piping: ASTM C 1173 with elastomeric sleeve. Include ends of same sizes as piping to be joined and include corrosion-resistant metal band on each end.
- C. Transition Couplings for Underground Pressure Piping: AWWA C219 metal, sleeve-type coupling or other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

## 2.02 CAST-IRON SOIL PIPING

- A. Hub-and-Spigot Pipe and Fittings: ASTM A 74, Service and Extra-Heavy class.
  - 1. Gaskets: ASTM C 564, rubber
- B. Hubless Pipe and Fittings: ASTM A 888 or CISPI 301
  - 1. Couplings: ASTM C 1277 assembly of metal housing, corrosion-resistant fasteners, and ASTM C 564 rubber sleeve with integral, center pipe stop.
    - a. Heavy-Duty, Type 304, Stainless-Steel Couplings: ASTM A 666, Type 304, stainless-steel shield; stainless-steel bands; and sleeve
      - (1) NPS 1-1/2 to NPS 4: 3-inch- wide shield with 4 bands
      - (2) NPS 5 to NPS 10: 4-inch- wide shield with 6 bands

## 2.03 STEEL PIPING

- A. Steel Pipe: ASTM A 53, Type Grade A or B, Schedule 40, galvanized. Include ends matching joining method.
  - 1. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53 or ASTM A 106, Schedule 40, galvanized, seamless steel pipe. Include ends matching joining method.
  - 2. Malleable-Iron Unions: ASME B16.39; Class 150; hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface; and female threaded ends
  - 3. Cast-Iron, Threaded, Drainage Fittings: ASME B16.12, galvanized
  - 4. Gray-Iron, Threaded Fittings: ASME B16.4, Class 125, galvanized, standard pattern
  - 5. Cast-Iron Flanges: ASME B16.1, Class 125
  - 6. Cast-Iron, Flanged Fittings: ASME B16.1, Class 125, galvanized

7. Steel-Piping, Expansion Joints: Compound, galvanized steel fitting with telescoping body and slip-pipe section. Include packing rings, packing, limit rods, chrome-plated finish on slip-pipe section, and flanged ends.

#### 2.04 COPPER TUBE AND FITTINGS

- A. Hard Copper Tube: ASTM B 88, Types L, water tube, drawn temper.
  1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
  2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends. Furnish Class 300 flanges if required to match piping.
  3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

#### 2.05 DUCTILE IRON PIPING AND FITTINGS

- A. Grooved-End, Ductile-Iron Pipe: AWWA C151, with factory- or field-formed, radius-cut-grooved ends according to AWWA C606.
  1. Grooved-Joint Piping Systems:
    - a. Manufacturer: Victaulic Co. of America or approved equal.
    - b. Grooved-End-Pipe Couplings: AWWA C606, gasketed fitting matching ductile-iron-pipe OD. Include ductile-iron housing with keys matching ductile-iron-pipe and fitting grooves, pressure responsive synthetic rubber gasket of a FlushSeal design with center leg, and steel bolts and nuts. Victaulic Style 31 or approved equal.

### PART 3 EXECUTION

#### 3.01 EXCAVATION

- A. Refer to Section 02316 - Excavation and 02317 - Backfilling for excavating, trenching, and backfilling.

#### 3.02 PIPING APPLICATIONS

- A. Transition and special fittings with pressure ratings at least equal to piping pressure ratings may be used in applications below, unless otherwise indicated.
- B. Flanges may be used on aboveground pressure piping, unless otherwise indicated.

- C. Aboveground, Soil, Industrial Waste, Waste, and Vent Piping: Use the following piping materials for each size range:
  - 1. NPS 1-1/4 and NPS 2: Galvanized Steel pipe; cast-iron, galvanized threaded drainage fittings; and threaded joints
  - 2. NPS 3 to NPS 10: Hubless, cast-iron soil piping and the following:
    - a. Couplings: Heavy-duty, Type 304, stainless steel
- D. Underground and Under pier, Soil, Waste, Industrial Waste, and Vent Piping: Use the following piping materials for each size range:
  - 1. NPS 2 to NPS 10: Extra-Heavy class, cast-iron soil piping; gaskets; and gasketed joints.

### 3.03 PIPING INSTALLATION

- A. Refer to Section 02503 – Installation of Buried Pipelines for Project-site sanitary sewer piping.
- B. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping installation.
- C. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.
- D. Install cleanout fitting with closure plug inside the building in sanitary force-main piping.
- E. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Refer to Section 15050 - Basic Mechanical Materials and Methods for sleeves and mechanical sleeve seals.
- F. Install wall penetration system at each service pipe penetration through foundation wall. Make installation watertight. Refer to Section 15050 - Basic Mechanical Materials and Methods for wall penetration systems.
- G. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
- H. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if

pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

- I. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.
- J. Install soil and waste drainage and vent piping at the following minimum slopes, unless otherwise indicated:
  - 1. Building Sanitary Drain: 1 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger
  - 2. Horizontal Sanitary Drainage Piping: 1 percent downward in direction of flow
  - 3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack
- K. Install force mains at elevations indicated.
- L. Install engineered soil and waste drainage and vent piping systems in locations indicated and as follows:
  - 1. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.
  - 2. Cast-Iron, Sovent, Single Stack: Comply with ASSE 1043 and sovent fitting manufacturer's written installation instructions.
  - 3. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.
- M. Sleeves are not required for cast-iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.
- N. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

### 3.04 JOINT CONSTRUCTION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping joint construction.

- B. Cast-Iron, Soil-Piping Joints: Make joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Gasketed Joints: Make with rubber gasket matching class of pipe and fittings.
2. Hubless Joints: Make with rubber gasket and sleeve or clamp.

- C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

### 3.05 VALVE INSTALLATION

- A. Refer to Sections 15110 - Plumbing Valves and 15112 - Valves Smaller than 4 Inches for valves for general-duty valves.

- B. Shutoff Valves: Install shutoff valve on each sewage pump discharge.

1. Use gate or full-port ball valve for piping NPS 2 and smaller.
2. Use gate valve for piping NPS 2-1/2 and larger.

- C. Check Valves: Install swing check valve, downstream from shutoff valve, on each sewage pump discharge.

### 3.06 HANGER AND SUPPORT INSTALLATION

- A. Refer to Section 15071 - Vibration Control.

- B. Refer to Section 15060 - Hangers and Supports for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or Type 42, clamps.
2. Individual, Straight, Horizontal Piping Runs: According to the following:
  - a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
  - b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
  - c. Longer Than 100 Feet, if Indicated: MSS Type 49, spring cushion rolls.
3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

- C. Install supports according to Section 15060 - Hangers and Supports.

- D. Support vertical piping and tubing at base and at each floor.

- E. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod
  - 2. NPS 3: 60 inches with 1/2-inch rod
  - 3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod
  - 4. NPS 6: 60 inches with 3/4-inch rod
  - 5. NPS 8 to NPS 12: 60 inches with 7/8-inch rod
  - 6. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches
- F. Install supports for vertical cast-iron soil piping every 15 feet.
- G. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/4: 84 inches with 3/8-inch rod
  - 2. NPS 1-1/2: 108 inches with 3/8-inch rod
  - 3. NPS 2: 10 feet with 3/8-inch rod
  - 4. NPS 2-1/2: 11 feet with 1/2-inch rod
  - 5. NPS 3: 12 feet with 1/2-inch rod
  - 6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod
  - 7. NPS 6: 12 feet with 3/4-inch rod
  - 8. NPS 8 to NPS 12: 12 feet with 7/8-inch rod
- H. Install supports for vertical steel piping every 15 feet.
- I. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/4: 72 inches with 3/8-inch rod
  - 2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod
  - 3. NPS 2-1/2: 108 inches with 1/2-inch rod
  - 4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod
  - 5. NPS 6: 10 feet with 5/8-inch rod
  - 6. NPS 8: 10 feet with 3/4-inch rod
- J. Install supports for vertical copper tubing every 10 feet.
- K. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

### 3.07 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

## C. Connect drainage and vent piping to the following:

1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code. Refer to Section 15410 - Plumbing Fixtures and Trim.
2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code. Refer to Section 15430 - Plumbing Specialties.
4. Equipment: Connect drainage piping as indicated. Provide shutoff valve, if indicated, and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

## D. Connect force-main piping to the following:

1. Sanitary Sewer: To exterior force main or sanitary manhole
2. Sewage Pumps: To sewage pump discharge

## 3.08 FIELD QUALITY CONTROL

## A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

## B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

## C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

## D. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
  3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
  4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg. Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
  5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
  6. Prepare reports for tests and required corrective action.
- E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
  2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
  3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
  4. Prepare reports for tests and required corrective action.

### 3.09 CLEANING

- A. Clean interior of piping. Remove dirt and debris as work progresses.

- B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
- C. Place plugs in ends of uncompleted piping at end of day and when work stops.

**-END OF SECTION-**

**Section 15160**  
**STORM DRAINAGE PIPING**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section includes furnishing and installing storm drain pipe, fittings, accessories, specialties as shown, specified or required for a complete installation and satisfactory operation. Provide pipe and fittings of new materials, protected from dirt, moisture and mechanical damage.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15430 - Plumbing Specialties, for storm drainage piping system specialties.

**1.03 SUBMITTALS**

- A. Product Data: For pipe, tube, fittings, and couplings.
- B. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

**1.04 QUALITY ASSURANCE**

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

**PART 2 PRODUCTS**

**2.01 PIPING MATERIALS**

- A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.
- B. Flexible Transition Couplings for Underground Nonpressure Piping: ASTM C 1173 with elastomeric sleeve. Include ends of same sizes as piping to be joined and include corrosion-resistant metal band on each end.
- C. Transition Couplings for Underground Pressure Piping: AWWA C219 metal, sleeve-type coupling or other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

## 2.02 CAST-IRON SOIL PIPING

- A. Hub-and-Spigot Pipe and Fittings: ASTM A 74, Service and Extra-Heavy classes.
  - 1. Gaskets: ASTM C 564, rubber
- B. Hubless Pipe and Fittings: ASTM A 888 or CISPI 301
  - 1. Couplings: ASTM C 1277 assembly of metal housing, corrosion-resistant fasteners, and ASTM C 564 rubber sleeve with integral center pipe stop.
    - a. Heavy-Duty, Type 304, Stainless-Steel Couplings: ASTM A 666, Type 304, stainless-steel shield; stainless-steel bands; and sleeve.
      - (1) NPS 1-1/2 to NPS 4: 3-inch- wide shield with 4 bands
      - (2) NPS 5 to NPS 10: 4-inch- wide shield with 6 bands

## 2.03 STEEL PIPING

- A. Steel Pipe: ASTM A 53, Type Grade A or B, Schedule 40, galvanized. Include ends matching joining method.
  - 1. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53 or ASTM A 106, Schedule 40, galvanized, seamless steel pipe. Include ends matching joining method
  - 2. Malleable-Iron Unions: ASME B16.39; Class 150; hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface; and female threaded ends
  - 3. Cast-Iron, Threaded, Drainage Fittings: ASME B16.12, galvanized
  - 4. Gray-Iron, Threaded Fittings: ASME B16.4, Class 125, galvanized, standard pattern
  - 5. Cast-Iron Flanges: ASME B16.1, Class 125
  - 6. Cast-Iron, Flanged Fittings: ASME B16.1, Class 125, galvanized
  - 7. Steel-Piping, Expansion Joints: Compound, galvanized steel fitting with telescoping body and slip-pipe section. Include packing rings, packing, limit rods, chrome-plated finish on slip-pipe section, and flanged ends.

## 2.04 COPPER TUBE AND FITTINGS

- A. Hard Copper Tube: ASTM B 88, Types L, water tube, drawn temper.
  - 1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
  - 2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends. Furnish Class 300 flanges if required to match piping.
  - 3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

## PART 3 EXECUTION

### 3.01 EXCAVATION

- A. Refer to Section 02316 - Excavation and Section 02317 - Backfilling for excavating, trenching, and backfilling.

### 3.02 PIPING APPLICATIONS

- A. Transition and special fittings with pressure ratings at least equal to piping pressure ratings may be used in applications below, unless otherwise indicated.
- B. Flanges may be used on aboveground pressure piping, unless otherwise indicated.
- C. Aboveground Storm Drainage Piping: Use the following piping materials for each size range:
  - 1. NPS 2 to NPS 15: Hubless, cast-iron soil piping and one of the following:
    - a. Couplings: Heavy-duty, Type 304, stainless steel
- D. Underground and Under Pier Storm Drainage Piping: Use the following piping materials for each size range:
  - 1. NPS 3 and NPS 15: Extra-Heavy class, cast-iron soil piping; gaskets; and gasketed joints

### 3.03 PIPING INSTALLATION

- A. Refer to Section 02503 - Installation of Buried Pipelines for Project site storm sewer and drainage piping.
- B. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping installation.

- C. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers.
- D. Install cleanout fitting with closure plug inside the building in storm drainage force-main piping.
- E. Underground, Ductile-Iron, Force-Main Piping: Comply with AWWA C600. Install buried piping inside building between wall and floor penetrations and connection to storm sewer piping outside building with restrained joints. Anchor pipe to wall or floor. Install thrust-block supports at vertical and horizontal offsets.
  - 1. Encase piping with PE film according to ASTM A 674 or AWWA C105.
- F. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Refer to Section 15050 - Basic Mechanical Materials and Methods for sleeves and mechanical sleeve seals.
- G. Install wall penetration system at each service pipe penetration through foundation wall. Make installation watertight. Refer to Section 15050 - Basic Mechanical Materials and Methods for wall penetration systems.
- H. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
- I. Make changes in direction for storm piping using appropriate branches, bends, and long-sweep bends. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.
- J. Lay buried building drain piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.
- K. Install storm drainage piping at the following minimum slopes, unless otherwise indicated:
  - 1. Building Storm Drain: 1 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.
  - 2. Horizontal Storm-Drainage Piping: 1 percent downward in direction of flow.
- L. Install force mains at elevations indicated.
- M. Install engineered controlled-flow storm drainage piping in locations indicated.

- N. Sleeves are not required for cast-iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.
- O. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

### 3.04 JOINT CONSTRUCTION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for basic piping joint construction.
- B. Cast-Iron, Soil-Piping Joints: Make joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
  - 1. Gasketed Joints: Make with rubber gasket matching class of pipe and fittings.
  - 2. Hubless Joints: Make with rubber gasket and sleeve or clamp.
- C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

### 3.05 VALVE INSTALLATION

- A. Refer to Section 15110 - Plumbing Valves for general-duty valves.
- B. Shutoff Valves: Install shutoff valve on each sump pump discharge.
  - 1. Use gate or full-port ball valve for piping NPS 2 and smaller.
  - 2. Use gate valve for piping NPS 2-1/2 and larger.
- C. Check Valves: Install swing check valve, downstream from shutoff valve, on each sump pump discharge.
- D. Backwater Valves: Install backwater valves in piping subject to backlog.
  - 1. Horizontal Piping: Horizontal backwater valves. Use normally closed type, unless otherwise indicated.
  - 2. Install backwater valves in accessible locations.
  - 3. Refer to Section 15430 - Plumbing Specialties for backwater valves.

### 3.06 HANGER AND SUPPORT INSTALLATION

- A. Refer to Section 15060 - Hangers and Supports for pipe hanger and support devices. Install the following:
  - 1. Vertical Piping: MSS Type 8 or Type 42, clamps.

2. Individual, Straight, Horizontal Piping Runs: According to the following:
    - a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
    - b. Longer than 100 Feet: MSS Type 43, adjustable roller hangers.
    - c. Longer than 100 Feet, if indicated: MSS Type 49, spring cushion rolls.
  3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
  4. Base of Vertical Piping: MSS Type 52, spring hangers.
- B. Install supports according to Section 15060 - Hangers and Supports.
- C. Support vertical piping and tubing at base and at each floor.
- D. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.
- E. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod
  2. NPS 3: 60 inches with 1/2-inch rod
  3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod
  4. NPS 6: 60 inches with 3/4-inch rod
  5. NPS 8 to NPS 12: 60 inches with 7/8-inch rod
  6. NPS 15: 60 inches with 1-inch rod
  7. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches
- F. Install supports for vertical cast-iron soil piping every 15 feet.
- G. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 1-1/4: 84 inches with 3/8-inch rod
  2. NPS 1-1/2: 108 inches with 3/8-inch rod
  3. NPS 2: 10 feet with 3/8-inch rod
  4. NPS 2-1/2: 11 feet with 1/2-inch rod
  5. NPS 3: 12 feet with 1/2-inch rod
  6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod
  7. NPS 6: 12 feet with 3/4-inch rod
  8. NPS 8 to NPS 12: 12 feet with 7/8-inch rod
- H. Install supports for vertical steel piping every 15 feet.

- I. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/4: 72 inches with 3/8-inch rod
  - 2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod
  - 3. NPS 2-1/2: 108 inches with 1/2-inch rod
  - 4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod
  - 5. NPS 6: 10 feet with 5/8-inch rod
  - 6. NPS 8: 10 feet with 3/4-inch rod
- J. Install supports for vertical copper tubing every 10 feet.
- K. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

### 3.07 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.
- C. Connect storm drainage piping to roof drains and storm drainage specialties.
  - 1. Storm Sewer: To storm manhole
  - 2. Sump Pumps: To sump pump discharge

### 3.08 FIELD QUALITY CONTROL

- A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
  - 1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
  - 2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
- B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
- C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test storm drainage piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Test Procedure: Test storm drainage piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
5. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

3.09 CLEANING

- A. Clean interior of piping. Remove dirt and debris as work progresses.

- B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
- C. Place plugs in ends of uncompleted piping at end of day and when work stops.

**-END OF SECTION-**

**NO TEXT ON THIS PAGE**

**Section 15184**  
**REFRIGERATION PIPING AND SPECIALTIES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Refrigeration piping and piping specialties used for air conditioning applications.

**1.02 RELATED SPECIFICATIONS**

- A. Section 07920 - Exterior Joints Sealants
- B. Section 07921 - Interior Sealants
- C. Section 15060 - Hangers and Supports
- D. Section 15076 - Piping and Equipment Identification
- E. Section 15081 - Piping Insulation
- F. Section 15670 - Condensing Units
- G. Section 15730 - Packaged Air Conditioning Units
- H. Section 15761 - Air Coils
- I. Section 16121 - Wire and Cable - 600 Volts and Below

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
- 1. ASHRAE 15 - Safety Code for Mechanical Refrigeration
  - 2. ASME - Boiler and Pressure Vessel Code SEC IX - Welding and Brazing Qualifications
  - 3. ASME B31.5 - Refrigeration Piping
  - 4. ASME B31.9 - Building Services Piping
  - 5. AWS A5.8 - Brazing Filler Metal
  - 6. AWS BRH - Brazing Handbook
  - 7. ARI 760 - Solenoid Valves for Use with Volatile Refrigerants

**1.04 ELECTRICAL REQUIREMENTS**

- A. Design the solenoid and regulating valves for use on a nominal 120 volts, single phase, 60 hertz electrical service.

**1.05 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.

- B. Product Data: Provide the manufacturer product data for each type of valve and for each type refrigerant piping specialty specified.
- C. Shop Drawings: Submit shop drawings showing the layout of refrigerant piping, specialties, and fittings including, but not necessarily limited to, pipe and tube sizes, valve arrangements and locations, slopes of horizontal runs, wall and floor penetrations, and equipment connection details. Show the interface and spatial relationships between piping and proximity to equipment.
- D. Brazer's Certification: Submit signed qualification certificates certifying that brazers comply with the requirements specified under "Quality Assurance".
- E. Maintenance Data: - Submit maintenance data for refrigerant valves and piping specialties, for inclusion in the Operating and Maintenance Manual specified in Section 01831.

#### 1.06 QUALITY ASSURANCE

- A. Welding Materials and Procedures: Qualify brazing processes and brazing operators in accordance with ASME "Boiler and Pressure Vessel Code," Section IX, "Welding and Brazing Qualifications".
- B. Regulatory Requirements: Conform work to ANSI/ASME B31.9 as applicable.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, and store piping and specialties in shipping containers with labeling in place.
- B. Protection: Protect piping and specialties from entry of contaminating material by leaving end caps and plugs in place until installation.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Refrigerant Valves and Specialties
  - 1. Alco Controls Div, Emerson Electric
  - 2. Danfoss Electronics, Inc.
  - 3. Eaton Corporation, Control Div.
  - 4. Henry Valve Company
  - 5. Parker-Hannifin Corporation, Refrigeration and Air Conditioning Division
  - 6. Sporlan Valve Company
  - 7. Or approved equal

## 2.02 MATERIALS

### A. Copper Pipe and Fittings

1. Small Copper Piping: For copper pipe 3 inches in diameter and smaller provide Type K seamless, round, hard drawn copper tubing that meets ASTM B88 requirements. Provide tube sizes, dimensions and wall thickness conforming to ASTM B88, Table 1 for Type K tubing, unless otherwise specified. Provide nominal lengths of hard copper tubing in straight lengths of approximately 20 feet, unless otherwise specified.
  - a. Fittings: For copper tubing, use solder joint or flared end type fittings, as specified. No bending of hard copper tubing will be permitted, unless otherwise specified; make all bends and connections with suitable fittings.
    - (1) Provide flared tube fittings meeting the requirements of the SAE Hydraulic Tube Fittings standard. After flaring anneal the joints before assembly. Flared fittings shall be of brass half-hard bar stock, ASTM B 16 (SAE 72) or of brass forging, ASTM B 124, Alloy Number 2 (SAE 88). Assembly couplings and fittings to prevent oversteering the tubing. Where required, use anti-seize lubricating compound to prevent galling and to facilitate assembly.
    - (2) Solder Joint Fittings: Provide ASME B16.18, cast copper alloy or ASME B16.22 wrought copper and copper alloy fittings. Braze solder joint fittings and tubing in conformity with the specifications of Section 3 of the CABRA Copper Tube Handbook. Brazing alloy shall be copper-phosphorus alloy, Class BCuP-5, as specified by American Welding Society Spec. AWS A5.8.
  - b. Joints: Provide threaded or ASTM B32 lead-free soldered joints.
2. Large Copper Piping: For copper pipe larger than 3 inches in diameter, provide regular seamless copper pipe that meets the ASTM B42 requirements.
  - a. Fittings: Provide solder type fittings of the same materials as the pipe.
  - b. Joints: Use threaded or brazed joints.
3. Potable Water Piping: Use ASTM B32 alloy Grade 95TA (95 percent tin and 5 percent antimony) solder for piping carrying potable water.
4. Unacceptable Uses: Do not use copper pipe with soldered joints for transporting fuel oil or other flammable or toxic liquid inside building.

**B. Threadless Copper Pipe and Fittings**

1. Provide hard drawn threadless copper pipe, standard pipe size pipe conforming to ASTM B302 furnished in 20 foot lengths. Limit maximum internal working pressure to 200 psi as computed using the Code for Pressure Piping, ASME B31.1.
2. Provide threadless bronze fittings with physical requirements meeting ASTM B62 for lines 2 inches and smaller, and ASTM B61 for lines over 2 inches.
3. Assemble threadless copper pipe ("TP") with threadless bronze fittings braze together with the copper-silver-phosphorus type of brazing alloy to form a uniform, tight joint. The alloy shall be Class BCuP-5, in accordance with American Welding Society Spec. AWS A5.8.
4. Follow the brazing procedure specifications of the Copper and Brass Research Association (CABRA).

**C. Valves: Provide complete valve assemblies, UL-listed, and designed to conform to ARI 760.**

1. Globe: 450 psig maximum operating pressure, 275 degrees F maximum operating temperature; cast bronze body, with cast bronze or forged brass wing cap and bolted bonnet; replaceable resilient seat disc; plated steel stem. Provide valves capable of being repacked under pressure. Provide straight through or angle pattern valves, with solder-end connections.
2. Check Valves - Smaller Than 7/8 inch: 500 psig maximum operating pressure, 300 degrees F maximum operating temperature; cast brass body, with removable piston, Teflon seat, and stainless steel spring; straight through globe design. Provide straight through pattern valves, with solder-end connections.
3. Check Valves - 7/8 inch and Larger: 450 psig maximum operating pressure, 300 degrees F maximum operating temperature; cast bronze body, with cast bronze or forged brass bolted bonnet; floating piston with mechanically retained Teflon seat disc. Provide straight through or angle pattern valves, with solder-end connections.
4. Solenoid Valves: 240 degrees F temperature rating, 500 psig working pressure; packless construction, forged brass, with Teflon valve seat and stainless steel core, two-way straight through pattern, and solder end connections. Provide manual operator to open valve. Furnish complete with NEMA 1 solenoid enclosure with 1/2-inch conduit adapter, and normally closed moisture resisting holding coil.

5. Evaporator Pressure Regulating Valves: Pilot-operated, forged brass or cast bronze; complete with pilot operator, stainless steel bottom spring, pressure gauge tappings, standard coil; and wrought copper fittings for solder end connections.
  6. Thermal Expansion Valves: Straight through or angle design, with solder-end connections, thermostatic adjustable, modulating type; size as required for specific evaporator requirements, and factory set for proper evaporator superheat requirements. Provide packless type valves with a forged brass body and corrosion resistant brass and stainless steel trim, complete with sensing bulb, a distributor having a side connection for hot gas bypass line, external superheat adjustments, and an external equalizer line.
  7. Hot Gas Bypass Valve: Adjustable type, sized to provide capacity reduction beyond the last step of compressor unloading; and wrought copper fittings for solder end connections.
- D. Refrigeration Piping Specialties: Provide complete refrigeration piping specialty assemblies designed to conform to ARI 760, and UL-listed.
1. Strainers: 500 psig maximum working pressure; forged brass body with monel 80-mesh screen, and screwed cleanout plug; Y-pattern, with solder end connections.
  2. Moisture/Liquid Indicators: 500 psig maximum operation pressure, 200 degrees F maximum operating temperature; forged brass body, with replaceable polished optical viewing window, moisture sensing element which changes color when an unsafe moisture level exists in the system, and solder-end connections.
  3. Filter-driers: 500 psig maximum operation pressure; steel shell, flange ring, and spring, gasketed ductile iron cover plate with steel capscrews, and wrought copper fittings for solder end connections. Furnish complete with replaceable filter-drier core kit, including gaskets, as follows:
    - a. High capacity desiccant sieves to provide micronic filtration and extra drying capacity.
  4. Suction Line Filter-Drier: 350 psig maximum operation pressure, 225 degrees F maximum operating temperature; steel shell, and wrought copper fittings for solder end connections. Permanent filter element with a molded felt core surrounded by a desiccant, for removal of acids and moisture from refrigerant vapor.
  5. Suction Line Filters: 500 psig maximum operation pressure; "T" type corrosion resistant plated steel shell, flange ring, and spring, gasketed ductile iron cover plate with steel capscrews, and wrought copper fittings for solder

end connections. Furnish complete with replaceable filter core kit, including gaskets, as follows:

- a. High capacity filter kit to provide micronic filtration.
6. Flanged Unions: 400 psig maximum working pressure, 330 degrees F maximum operating temperature; two brass tailpiece adapters for solder end connections to copper tubing; flanges for 7/8 inch through 1-5/8 inch unions of forged steel, and for 2-1/8 inch through 3-1/8 inch of ductile iron; four plated steel bolts, with silicon bronze nuts and fiber gasket. Provide a factory-applied rust-resistant coating for flanges and bolts.
7. Flexible Connectors: 500 psig maximum operating pressure; seamless tin bronze or stainless steel core, high tensile bronze braid covering, solder connections, and synthetic covering; dehydrated, pressure tested, minimum 7 inch in length.

## 2.03 IDENTIFICATION

- A. Provide piping, equipment and valve identification in accordance with the requirements of Section 15076 – Piping and Equipment Identification.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine rough-in for refrigeration piping systems to verify actual locations of piping connections prior to installation.

### 3.02 INSTALLATION

- A. Piping: Install refrigeration piping in accordance with ASHRAE Standard 15.
  1. Install piping in as short and direct arrangement as possible to minimize pressure drop.
  2. Install piping for minimum number of joints using as few elbows and other fitting as possible.
  3. Arrange piping to allow normal inspection and servicing of compressor and other equipment.
  4. Provide adequate clearance between pipe and adjacent walls and hanger, or between pipes for insulation installation. Use sleeves through floors, walls, or ceilings, sized to permit the installation of full thickness insulation.
  5. Insulate the refrigerant piping in accordance with the requirements of Section 15081 – Piping Insulation.

6. Install branch tie-in lines to parallel compressors with an equal length, and pipe identically and symmetrically.
  7. Install copper tubing in rigid or flexible conduit in locations where copper tubing will be exposed to mechanical injury.
  8. Slope refrigeration piping as follows:
    - a. Install horizontal hot gas discharge piping with 1/2-inch per 10 feet downward slope away from the compressor.
    - b. Install horizontal suction lines with 1/2 inch per 10 feet downward slope to the compressor, with no long traps or dead ends which may cause oil to separate from the suction gas and return to the compressor in damaging slugs.
    - c. Install traps and double risers where indicated, and where required to entrain oil in vertical runs.
    - d. Liquid lines may be installed level.
  9. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.
  10. Install piping tight to slabs, beams, joists, columns, walls, and other permanent elements of the building. Provide space to permit insulation applications, with 1 inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
  11. Make reductions in pipe sizes using eccentric reducer fittings installed with the level side down.
- B. Valves and Specialties: Install valves and specialties in accessible locations to allow for servicing and inspection, and in accordance with the manufacturer's instructions.
1. Install globe valves on each side of strainers and driers, in liquid and suction lines at evaporators, and elsewhere as indicated.
  2. Install a full sized, 3-valve bypass around each drier.
  3. Install solenoid valves ahead of each expansion valve and hot-gas bypass valve. Install solenoid valves in horizontal lines with coil at the top.
    - a. Electrical wiring for solenoid valves to be furnished in accordance with the requirements of Section 16121 - Wires and Cables - 600 Volts and Below.

4. Thermostatic expansion valves may be mounted in any position, as close as possible to the evaporator.
    - a. Where refrigerant distributors are used, mount the distributor directly on the expansion valve outlet.
    - b. Install the valve in such a location so that the diaphragm case is warmer than the bulb.
    - c. Secure the bulb to a clean, straight, horizontal section of the suction line using two bulb straps. Do not mount the bulb in a trap or at the bottom of the line.
    - d. Where external equalizer lines are required make the connection where it will clearly reflect the pressure existing in the suction line at the bulb location.
  5. Install pressure regulating and relieving valves as required by ASHRAE Standard 15.
  6. Install strainers immediately ahead of each expansion valve, solenoid valve, hot gas bypass valve, compressor suction valve, and as required to protect refrigerant piping system components.
  7. Install moisture/liquid indicators in liquid lines between filter/driers and upstream of thermostatic expansion valves and in liquid line to receiver.
    - a. Install moisture/liquid indicators in lines larger than 2-1/8 inch OD, using a bypass line.
  8. Install filter/driers upstream of solenoid and expansion valves.
  9. Install unions to allow for removal of solenoid valves, pressure regulating valves, expansion valves, and at connections to compressors and evaporators.
  10. Install flexible connectors at the inlet and discharge connection of compressors and condensers.
- C. Hangers and Supports: Hangers, supports, and anchors are to be furnished in accordance with the requirements of Section 15060 – Hangers and Supports.
- D. Pipe Joint Construction: Provide brazed joints complying with the procedures contained in the AWS "Brazing Manual."
1. **WARNING:** Some filler metals contain compounds which produce highly toxic fumes when heated. Avoid breathing fumes and provide adequate ventilation.

2. CAUTION: When solenoid valves are being installed, remove the coil to prevent damage. When sight glasses are being installed, remove the glass. Remove stems, seats, and packing of valves, and accessible internal parts of refrigerant specialties before brazing. Do not apply heat near the bulb of the expansion valve.
  3. Fill the pipe and fittings during brazing, with an inert gas i.e., nitrogen or carbon dioxide to prevent formation of scale.
  4. Heat joints using oxy-acetylene torch. Heat to the proper and uniform brazing temperature.
- E. Equipment Connections: The Contract Drawings indicate the general arrangement of piping, fittings, and specialties. Install piping adjacent to machines to allow servicing and maintenance.
- F. System Charging: Charge the system using the following procedure:
1. Install core in filter dryer after leak test but before evacuation.
  2. Evacuate refrigerant system with vacuum pump, until a temperature of 35 degrees F is indicated on the vacuum dehydration indicator.
  3. During evacuation, apply heat to pockets, elbows, and low spots in the piping.
  4. Maintain a vacuum on the system for minimum of 5 hours after closing the valve between the vacuum pump and the system.
  5. Break the vacuum with refrigerant gas, and allow the pressure to build up to 2 psi.
  6. Complete charging of system, using a new filter dryer core in the charging line. Provide full operating charge.

### 3.03 FIELD QUALITY CONTROL

- A. Inspection: Inspect, test, and perform corrective action of refrigerant piping in accordance with ASME Code B31.5, Chapter VI.
- B. Repairs: Repair leaking joints using new materials, and retest for leaks.
- C. Manufacturer's Field Service: Train City of New York maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance of refrigeration piping valves and refrigeration piping specialties, as specified in Section 01821 - Training.

3.04 ADJUSTING AND CLEANING

- A. General: Verify actual evaporator applications and operating conditions, and adjust the thermostatic expansion valve to obtain proper evaporator superheat requirements.
- B. Adjust Controls and Safeties: Replace damaged or malfunctioning controls and equipment with new materials and products.
- C. Procedures: Before installation of copper tubing, clean the tubing and fittings using the following cleaning procedure:
  - 1. Remove coarse particles of dirt and dust by drawing a clean, lintless cloth through the tubing by means of a wire or an electrician's tape.
  - 2. Draw a clean, lintless cloth saturated with trichloroethylene through the tube or pipe. Continue this procedure until the cloth is not discolored by dirt.
  - 3. Draw a clean, lintless cloth, first saturated with compressor oil and then squeezed dry, through the tube or pipe to remove any remaining lint. Inspect the tube or pipe visually for remaining dirt and lint.
  - 4. Finally, draw a clean, dry, lintless cloth through the tube or pipe.

-END OF SECTION-

**Section 15190**  
**FUEL GAS PIPING**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes piping, specialties, and accessories for natural gas systems within building and to gas meters.
- B. This Section includes piping, specialties, and accessories for natural gas systems within building and to point indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15122 – Meters and Gages for pressure gages
- B. Section 15060 – Hangers and Supports

**1.03 SYSTEM PERFORMANCE REQUIREMENTS**

- A. Minimum Working-Pressure Ratings: Except where otherwise indicated, minimum pressure requirements are as follows:
  - 1. Low-Pressure Natural Gas Piping: 2 psig
  - 2. Medium-Pressure Natural Gas Piping: 10 psig
- B. Approximate values of natural gas supplied for these systems are as follows:
  - 1. Heating Value: 1000 Btu/cu.ft.
  - 2. Specific Gravity: 0.6
  - 3. Service Line Pressure: 3 psig

**1.04 SUBMITTALS**

- A. Product Data for each type of natural gas specialty and special-duty valve. Include pressure rating, rated capacity, and settings of selected models.
- B. Coordination Drawings for natural gas piping, including required clearances and relationship to other services for same work areas.
- C. Test reports specified in "Field Quality Control" Article in Part 3.
- D. Maintenance data for natural gas specialties and special-duty valves to include in the operation and maintenance manual specified in Section 01831 – Operation and Maintenance Manuals.

## 1.05 QUALITY ASSURANCE

- A. Comply with NFPA 54, "National Fuel Gas Code," for gas piping materials and components; installations; and inspecting, testing, and purging.
- B. New York City Plumbing Code, Subchapter 16, Plumbing and Gas Piping and Reference Standards RS-16 Plumbing and Gas Piping.
- C. Comply with the rules and regulations of the Gas Company, New York City Building Department and with the latest regulations of the Administrative Code of the City of New York.
- D. When welding is to be performed as part of the work covered in this specification, the Contractor, before assigning any welder for this work, shall provide the Commissioner with the names of welders to be employed for this work. Welders installing gas piping at any pressure shall be qualified for all pipe sizes, wall thicknesses, and all positions in accordance with the latest editions of either API 1104 or ASME Section IX Boiler and Pressure Vessel Code and be re-qualified on an annual basis. The qualification testing shall be performed by an agency listed with the Department of Buildings, and the inspector, that verifies the welder's qualifications, shall have a minimum radiography qualification of Level II in accordance with the American Society of Non-Destructive Testing Recommended Practice Document No. SNT-TC-IA, Supplement A. Copies of the certified welder qualification reports shall be maintained by the responsible welding contractor and shall be submitted to the Commissioner.
- E. All welding of gas piping shall be in full compliance with the latest editions of API 1104 and ASME Section IX Boiler and Pressure Vessel Code. Whenever welding operations are performed, the services of a full time certified inspector or certified technician shall be retained by the Commissioner to ensure said compliance. Certified inspectors and certified technicians shall be qualified to perform visual inspections and shall have a minimum radiography qualification of Level II in accordance with the American Society of Non-Destructive Testing Recommended Practice Document No. SNT-TC-IA, Supplement A. The certified inspector or certified technician shall also be responsible for Controlled Inspection sign off upon completion of the work.
- F. The Project Officer shall coordinate with Commissioner to assure compliance during all phases of the work.
- G. Comply with NFPA 70, "National Electrical Code," for electrical connections between wiring and electrically operated control devices.
- H. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

- I. Listing and Labeling: Provide equipment and accessories specified in this Section that are listed and labeled:
  - 1. Terms "Listed" and "Labeled": As defined in National Electrical Code, Article 100.
  - 2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- J. Product Options: Drawings indicate size, profiles, connections, dimensional requirements, and characteristics of natural gas piping equipment, specialties, and accessories and are based on specific types and models indicated. Other manufacturers' equipment and components with equal performance characteristics may be considered. Refer to Section 01631 - Equivalent Materials and Equipment.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Handling Flammable Liquids: Remove and legally dispose of liquids from drips in existing gas piping. Handle cautiously to avoid spillage and ignition. Notify gas supplier. Handle flammable liquids used by Installer with proper precautions and do not leave on premises from end of one day to beginning of next day.

#### 1.07 SEQUENCING AND SCHEDULING

- A. Notification of Interruption of Service: Notify each affected user when gas supply will be turned off.
- B. Work Interruptions: Leave gas piping systems in safe condition when interruptions in work occur during repairs or alterations to existing gas piping systems.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. Gas piping inside the building shall be standard weight (Schedule 40) black steel pipe, outside the building shall be extra heavy, Schedule 80 black steel pipe. Gas control, vent and relief piping shall be extra heavy, schedule 80 black steel pipe. Steel pipe shall be seamless or welded made in accordance with the Current Edition of the ASTM A53 Specification.
  - 1. In no case shall any gas pipe be less than 3/4". The sizes of pipe indicate nominal pipe size.
  - 2. Gas distribution piping for systems operating at 1/2 PSIG or less shall be in accordance with New York City Department of Buildings requirements and ANSI Z223.1-1974 (NFPA-54), National Fuel Code (as modified by the New York City Building Code).

3. Materials used in gas service and meter piping systems shall be in accordance with the requirements as specified by the gas utility company providing the services, and of the New York City Department of Buildings.
4. Gas service piping run underground outside the building shall be mill wrapped in accordance with the serving utility company requirements for service piping. Gas distribution piping located on the roof or exposed to the elements shall receive one coat of rust inhibitor paint, and one coat of yellow finish paint
5. Gas distribution piping run exposed outside the building shall be mill wrapped in accordance with requirement of the serving utility for their service piping.
6. Piping Joints for Gas Distribution Piping:
  - a. Piping at 1/2 psig (14" W.C.) and less:
    - (1) 4" and Smaller.....Screwed
    - (2) Over 4".....Welded
  - b. over 1/2 psig (14" W.C.) to and including 3 psig:
    - (1) Under 4" .....Screwed
    - (2) 4" and Larger.....Welded
  - c. Piping over 3 psig:
    - (1) All piping .....Welded
7. All welded gas distribution piping shall be subject to controlled inspection. Controlled inspectors shall be retained by the Commissioner. In addition to independent pressure testing of the entire system, 100% percent of all welds shall be subject to non-destructive testing (radiographed and/or subjected to ultrasonic testing). All welds shall be radiographed at the Contractor's expense if any of the samples failed. Contractor shall make all necessary repairs at no cost to the City of New York.
8. Before any work is commenced on an item of construction requiring controlled inspection, all persons responsible for such controlled inspection shall be notified in writing at least seventy two (72) hours prior to such commencement.
9. All required inspections designated for controlled inspection, shall be made and witnessed by or under the direct supervision of Commissioner, including preparation of materials, welding procedures, and finished welds.

**B. Fittings**

1. Fittings for screwed gas piping shall be 150 lbs. black malleable iron fittings, conforming to ASTM specifications A-197, latest edition.
2. Compression type fittings and steel welding fittings shall be as specified and approved by the Gas Company.
3. Steel butt welding fittings shall conform to ANSI B16.9 requirements.
4. Fitting for control, vent and relief piping shall be 300 lb. black malleable iron screwed fittings conforming to ASTM Specification A-197, latest edition.

**C. Flanges**

1. All flanges shall be steel and compatible in type and pressure ratings with mating flange and shall comply with ANSI B16.5.
2. Flanges shall be welding neck or threaded end. Slip on flanges are not permitted.
3. Where 150 pound steel flanges are bolted to Class 125 cast iron flanges, the raised face on the steel flange shall be removed.

**D. Gaskets**

1. Gaskets shall be compatible with the gas service on which they are used, without change to their chemical or physical properties.
2. Gasket shall be BLUE-GARD compressed asbestos free gaskets, style 3000 or GYLON gasketing style 3500, color: Fawn with Blue brand both as manufactured by Garlock Inc.
3. Gaskets of metal or metal-jackets, aluminum o-rings and spiral wound metal gaskets, or other materials, if approved by the Utility Company may be used.
4. Full face gaskets shall be used with all bronze and cast iron flanges.

**E. Bolts and Nuts:** Bolts and nuts shall be of best quality bolt steel with square head bolts and hexagon nuts with machine cut V-threads.**F. Thread sealant** to be used on natural gas piping shall be RectorSeal Corp No. 5, Oatey Great Blue pipe joint compound or approved equal. Thread sealant shall be a non-toxic, soft setting, slow drying sealant made from inert fillers. The joint compound shall not contain any Teflon. Teflon tapes shall not be used in natural gas lines. Teflon tapes are prone to tearing when pipes are being assembled and tightened and bits of torn tape can migrate into the fluid system, clogging valves, screens, and filters.

## 2.02 VALVES

- A. Manual Valves: Conform to standards listed or, where appropriate, to ANSI Z21.15.
- B. Gas Stops, 2-Inch NPS and Smaller: AGA-certified, bronze-body, plug type with bronze plug, ball type with chrome-plated brass ball, or butterfly valve with stainless-steel disc and fluorocarbon elastomer seal, for 2 psig or less natural gas. Include AGA stamp, flat or square head or lever handle, and threaded ends conforming to ASME B1.20.1.
- C. Gas Valves, 2-Inch NPS and Smaller: ASME B16.33, 150 psig WOG, bronze body, bronze plug, straightaway pattern, square head, tapered-plug type, with threaded ends conforming to ASME B1.20.1.
- D. Gas Valves, 2-1/2-Inch NPS and Larger: MSS SP-78, Class 125 or Class 175 WOG, non-lubricated-plug type, semisteel body, wrench operated, with flanged ends.

## 2.03 GAS SAFETY SHUT-OFF VALVES

- A. Gas safety shut-off valves shall be FM & UL listed, electric motor operated, normally closed, manual reset type. Valves shall be rising stem design with a straight through flow path with metal-to-metal seat and disc arrangement. The valve seat shall be stainless steel and the disc ductile iron. Valves shall be provided with a NEMA 4 enclosure modified for Class 1, Division II hazardous locations, be provided with an electrical terminal block and shall operate on 120 Volt, A.C., 60 Cycles, single phase. Valves shall meet ANSI Class VI leakage standard and shall be provided with a visual indicator to note the position of the valve whether "OPEN" or "SHUT".
- B. Gas safety shut-off valves 2" and smaller shall be threaded, 2 1/2" and larger shall be flanged. Flanged valves shall be provided with companion flange set by valve manufacturer.
- C. Gas safety shut-off valves shall be Maxon Corporation Series 808 for sizes 2" and smaller and Series 808-CP for valves 2-1/2" and larger. All valves shall be provided with trim package 1-1.
- D. Gas Safety Shut-Off Valves; Operating Sign
  - 1. Provide a sign made of two colors laminated engravers stock phenolic, 1/16" minimum thickness, machine engraved to expose inner core color (white). Signs to be provided with uniform margins and character size minimum 1/4" high.

## 2. Sign to read:

**"IMPORTANT"**

GAS SAFETY SHUT-OFF VALVES LOCATED IN THE NEAR-GAS-METER PIPING MUST BE MANUALLY RESET UPON ACTION OF THE GAS LEAK DETECTION SYSTEM OR LOSS OF NORMAL ELECTRICAL POWER.

## 2.04 SPECIALTY VALVES

- A. Solenoid Valves: Bronze, aluminum, or cast-iron body; 120 VAC, 60 Hz, Class B continuous-duty molded coil; UL labeled and FM approved. Include NEMA ISC 6, Type 4, coil enclosure and electrically opened and closed dual coils. Valve position is normally closed. Include threaded ends conforming to ASME B1.20.1 for 2-inch NPS and smaller and flanged ends for 2-1/2-inch NPS and larger.
- B. Earthquake Valves: FM approved or listed in IAS Directory as complying with ANSI Z21.70 and UL listed FM approved Listed in IAS Directory as complying with ANSI Z21.70 and UL listed. Include mechanical operator.

## 2.05 PIPING SPECIALTIES

- A. Gas Pressure Regulators: ANSI Z21.18, single-stage, steel-jacketed, corrosion-resistant pressure regulators. Include atmospheric vent, elevation compensator, with threaded ends conforming to ASME B1.20.1 for 2-inch NPS and smaller and flanged ends for 2-1/2-inch NPS and larger. Regulator pressure ratings, inlet and outlet pressures, and flow volume in cubic feet per hour of natural gas at specific gravity are as indicated.
  - 1. Service Pressure Regulators: Inlet pressure rating not less than natural gas distribution system service pressure.
  - 2. Line Gas Pressure Regulators: Inlet pressure rating not less than system pressure.
  - 3. Gas Pressure Regulator Vents: Factory- or field-installed corrosion-resistant screen in opening when not connected to vent piping.
- B. Strainers: Y pattern, full size of connecting piping. Include stainless-steel screens with 3/64-inch perforations, except where other screens are indicated.
  - 1. Pressure Rating: 125-psig minimum steam or 175-psig WOG working pressure, except where otherwise indicated
  - 2. 2-Inch NPS and Smaller: Bronze body, with threaded ends conforming to ASME B1.20.1

3. 2-1/2-Inch NPS and Larger: Cast-iron body, with flanged ends
4. Screwed screen retainer with centered blow-down and pipe plug

## 2.06 GAS METER

- A. Secure from the utility company gas meter and other ancillaries such as gas regulator that may be necessary for the complete installation of the gas system.
- B. Pulsating gas meter shall come equipped with dry contacts (2 wire Form A, single channel; 3 wire Form C, dual channel) that will enable among other things conversion of the pulse signal outputs into therms of natural gas consumed. Coordinate request for the gas meter with the TCC.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. Close equipment shutoff valves before turning off gas to premises or section of piping. Perform leakage test as specified in "Field Quality Control" Article to determine that all equipment is turned off in affected piping section.
- B. Comply with NFPA 54 Paragraphs "Prevention of Accidental Ignition."
- C. Include gas distribution system piping to point indicated, service pressure regulator.

### 3.02 VALVE APPLICATIONS

- A. Use gas valves for shutoff to equipment.

### 3.03 GAS METERS AND REGULATORS

- A. Con Edison will furnish the gas meters, regulators and relief valves, but they shall be installed by the Contractor.

### 3.04 GAS SAFETY SHUT-OFF VALVES

- A. Gas safety shut-off valves shall be installed within the near-gas-meter piping.
- B. Gas safety shut-off valves shall be wired to the fire alarm detection system and shall function to shut off all gas supply to the building upon.
  1. Action of the fire alarm detection system (alarm condition), and
  2. Loss of normal electrical power
- C. Valves must be manually reset upon correction of the alarm condition or restoration of electrical power.

## 3.05 PIPING INSTALLATIONS

- A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation requirements.
- B. Drips and Sediment Traps: Install drips at points where condensate may collect. Locate where readily accessible to permit cleaning and emptying. Do not install where condensate would be subject to freezing.
  - 1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.
- C. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels, except where indicated to be exposed to view.
- D. Install gas piping at uniform grade of 0.1 percent slope upward toward risers.
- E. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.
- F. Connect branch piping from top or side of horizontal piping.
- G. Install unions in pipes 2-inch NPS and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.
- H. Install strainers on supply side of each control valve, gas pressure regulator, solenoid valve, and elsewhere as indicated.
- I. Install dielectric fittings (unions and flanges) with ferrous and brass or bronze end connections, separated by insulating material, where piping of dissimilar metals is joined.
- J. Install dielectric fittings (unions and flanges) with 2 ferrous end connections, separated by insulating material, at outlet from gas meter and, where indicated, for ferrous piping.
- K. Install flanges on valves, specialties, and equipment having 2-1/2-inch NPS and larger connections.
- L. Anchor piping to ensure proper direction of piping expansion and contraction. Install expansion joints, expansion loops, and pipe guides as indicated.

- M. Install vent piping for gas pressure regulators and gas trains, extend outside building, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion-resistant insect screens in large end.

### 3.06 JOINT CONSTRUCTION

- A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

### 3.07 VALVE INSTALLATION

- A. Install valves in accessible locations, protected from damage. Tag valves with metal tag indicating piping supplied. Attach tag to valve with metal chain.
  - 1. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for valve tags.
  - 2. Refer to Section 15076 – Piping and Equipment Identification for valve tags.
- B. Install gas valve upstream from each gas pressure regulator. Where 2 gas pressure regulators are installed in series, valve is not required at second regulator.
- C. Install pressure relief or pressure-limiting devices so they can be readily operated to determine if valve is free; test to determine pressure at which they will operate; and examine for leakage when in closed position.

### 3.08 HANGER AND SUPPORT INSTALLATION

- A. Refer to Division 15 Section "Hangers and Supports" for pipe hanger and support devices.
- B. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
  - 1. 1/2-Inch NPS : Maximum span, 72 inches ; minimum rod size, 3/8 inch
  - 2. 3/4- and 1-Inch NPS : Maximum span, 96 inches ; minimum rod size, 3/8 inch
  - 3. 1-1/4-Inch NPS : Maximum span, 108 inches; minimum rod size, 3/8 inch
  - 4. 1-1/2- and 2-Inch NPS: Maximum span, 108 inches; minimum rod size, 3/8 inch
  - 5. 2-1/2- to 3-1/2-Inch NPS : Maximum span, 10 feet ; minimum rod size, 1/2 inch

- 6. 4-Inch NPS and Larger: Maximum span, 10 feet ; minimum rod size, 5/8 inch
- C. Support horizontal, corrugated stainless-steel tubing according to manufacturer's written instructions.
- D. Support vertical pipe and tube at each floor.

### 3.09 CONNECTIONS

- A. Install gas piping next to equipment and appliances using gas to allow service and maintenance.
- B. Connect gas piping to equipment with shutoff valves and unions Install union or flanged connection downstream from valve. Include flexible connectors when indicated.
- C. Sediment Traps: Install tee fitting with capped nipple in bottom forming drip, as close as practical to inlet for appliance using gas.
- D. Electrical Connections: Wiring is specified in Division 16 Sections.

### 3.10 ELECTRICAL BONDING AND GROUNDING

- A. Install aboveground portions of natural gas piping systems that are upstream from equipment shutoff valves, electrically continuous, and bonded to grounding electrode according to NFPA 70.
- B. Do not use gas piping as grounding electrode.

### 3.11 FIELD QUALITY CONTROL

- A. Inspect, test, and purge piping according to NFPA 54, Part 4 "Gas Piping Inspection, Testing, and Purging" and requirements of authorities having jurisdiction.
- B. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.
- C. Report test results promptly and in writing to Commissioner and authorities having jurisdiction.
- D. Verify capacities and pressure ratings of gas meters, regulators, valves, and specialties.
- E. Verify correct pressure settings for pressure regulators.

- F. Verify that specified piping tests are complete.

### 3.12 PAINTING

- A. All exposed gas pipe in the unfinished area shall receive one(1) coat of Tnemec 10-99 or Benjamin Moore Iron Clad Retardo or approved equal rust inhibitive primer paint and one(1) finished coat of safety yellow.
- B. All exposed gas pipe in finished spaces or run exposed outside of the building shall receive one (1) coat of Tnemec 10-99 or Benjamin Moore Iron Clad Retardo or approved equal rust inhibitive primer paint and one (1) finished coat of flat or enamel to match adjoining surfaces.
- C. Mill-wrapped piping shall not be painted.
- D. Piping at different pressure levels in the same space shall be color coded and labeled.
- E. For additional materials and method of painting, refer to Section 09900 – Painting.

### 3.13 ADJUSTING

- A. Adjust controls and safety devices. Replace damaged and malfunctioning controls and safety devices.

-END OF SECTION

**Section 15191**  
**DIESEL FUEL PIPING**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish all labor, materials, equipment and incidentals as shown, specified and required to furnish, install and test diesel fuel containment piping. Diesel fuel containment piping shall include the entire system consisting of carrier pipe, secondary containment pipe, special fittings, and all appurtenances required for a complete system as shown on contract drawings and specified herein.
- B. Limitations: Secondary containment piping shall be provided for all diesel fuel piping outside of containment structures. Secondary containment piping shall be provided for buried, encased and exposed piping located outside of containment structures.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01330 - Shop Drawings
- B. Section 01431 - Quality Assurance Inspection
- C. Section 01831 - Operation and Maintenance Manuals
- D. Section 01651 - Transportation and Handling of Materials and Equipment
- E. Section 01661 - Protecting of Materials and Equipment
- F. Section 15060 - Hangers and Supports
- G. Section 15076 - Piping and Equipment Identification
- H. Section 15120 - Interior and Exposed Piping Schedule
- I. Section 16230 - Packaged Engine Generator System

**1.03 REFERENCES**

- A. ANSI – American Standards Institute
- B. ASME B31.1 – Power Piping
- C. ASME B31.3 – Process Piping
- D. ASME - Boiler and Pressure Vessel Code
- E. ASTM D-2996 – Standard Specification to Filament-Wound “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe
- F. ASTM D-2992 – Standard Practice for Obtaining Hydrostatic or Pressure Design Basis for “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe and Fittings

- G. ASTM D-2310 - Standard Classification for Machine-Made "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe.

#### 1.04 SUBMITTALS

- A. Provide all shop drawings as specified in the General Conditions and Section 01330, Shop Drawings. Drawings shall include details of pipe fabrications, including supporting devices, method of attachment, spacing, pre-fabricated double containment fitting dimensions, starting and termination connections, high point vent and low point drain details for the secondary containment, valves, and accessories.
- B. Joint details, methods, and locations of supports, and all other pertinent technical data for all piping to be furnished shall be submitted.
- C. Provide Field Assembly Instructions

#### 1.05 QUALITY ASSURANCE AND QUALIFICATIONS

- A. Quality Assurance shall be in accordance with Section 01431, Quality Assurance Inspection and as stated below.
- B. Manufacturer shall have a minimum of three (3) years experience in production of similar piping system.
- C. Contractor must have taken, if applicable, manufacture's training courses on the installation of piping and meet the licensing requirements in the State of New York.
- D. The double containment piping system shall be a pre-fabricated system as manufactured by IPEX or approved equal.
- E. The system shall be fabricated, installed and tested in accordance with the manufacturer's recommendations and as specified herein and shall be suitable for use with Diesel, Bio Diesel and 100% Ethanol.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Section 01651 - Transportation and Handling of Materials and Equipment and Section 01661 - Protection of Materials and Equipment.
- B. Care: Use every precaution to prevent damage to the double containment piping during transportation and delivery to the site. Take extreme care in loading and unloading equipment and accessories.
  - 1. Do not allow the piping to be dropped, bumped, dragged, pushed, rolled or moved in any way which will cause damage.

2. If, in the process of transportation or handling, any piping is damaged, replace such piping or accessories.

## PART 2 PRODUCTS

### 2.01 GENERAL

- A. The containment piping system shall consist of Schedule 40 T304L Stainless Steel carrier piping system supported within a UL FRP secondary containment housing. The system shall be provided with suitable drains and vents and be designed to provide complete drainage of the secondary containment piping. Interstitial supporting devices shall be made from Polypropylene or UL FRP clips and shall be provided within the secondary containment pipe, and shall be designed to allow continuous drainage in the annular space to the containment sumps. Drain fittings shall be designed to allow a valve attachment to be made so that the secondary containment compartment may be readily drained and manually checked for leaks.
- B. Piping shall be installed in accordance with the manufacturer's instructions especially regarding linear expansion due to temperature differentials. Contractor shall consider the linear expansion of the pipelines when installing them and provisions shall be made to compensate for such changes in length. Lowest expected temperatures that the piping will be subjected to shall be assumed to be - 5°F; highest expected temperatures shall be either 105°F or the actual air temperature when the piping is installed, whichever is greater.

### 2.02 MATERIALS

- A. Primary carrier pipe and fittings shall be manufactured from Schedule 40 T304L Stainless Steel materials as listed by ASTM and ANSI.
- B. Secondary containment pipe and fittings shall be UNSPLIT, UL FRP or approved equal.
- C. All listed primary pipe and containments shall be schedule 40 materials. Pipe shall have Schedule 40 steel pipe thickness according to ANSI. All listed pressure fittings shall be Schedule 40 T304L stainless steel according to ANSI. All other unlisted components that are intended for use as pressure retaining components shall have sufficient thickness and reinforcement so as to be able to maintain the same pressure ratings as the equivalent Schedule 40 steel pipe.
- D. All Secondary containment pipe and fittings shall meet ASTM specifications D-2310, D-2992, and D-2996. Containment fittings shall have carrier components pre-assembled, supported and tested. Mitered pipe shall not be permitted. Carrier fittings shall be pre-beveled ready for welding. Containment fittings shall have spigot ends to allow for an unsplit closure coupling or approved equal to be installed after primary system pressure tested. All other unlisted components that are intended for use as pressure retaining components shall have sufficient thickness

and reinforcement so as to be able to maintain the same pressure rating as the equivalent unsplit UL FRP pipe and fittings or their approved equal vent.

- E. All fittings will be pre-assembled and pre-tested by the manufacturer.
- F. Both the pipe and fittings shall be from the same manufacturer, to ensure both material and dimension compatibility.
- G. Containment pipe manufacturer shall provide, where necessary, all special fittings to contain where applicable line shutoff valves, checks, and flanges.

## 2.03 SYSTEM JOINTING AND ASSEMBLY

- A. Primary carrier pipe shall be fully welded.
  - 1. All welds shall be made using gas arc welding techniques according to ASME B31.1
    - a. GAW
    - b. TIG
    - c. MIG
- B. Secondary containment joints shall use multiple piece split closure couplings.
  - 1. Only manufacturer's recommended and approved adhesives shall be used in the assembly of the containment pipe.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. All installation procedures shall be according to the manufacturer's specific recommendations.
- B. Manufacturer shall furnish the services of a qualified representative to supervise the contractor's personnel during the start of installation.
- C. All contractor personnel that will perform gas welded stainless steel field welds shall be qualified to do so according to the requirements of ASME Boiler and Pressure Vessel Code.
- D. All contractor personnel that will perform epoxy cemented joints shall be qualified for such bonding practices according to the bonding qualification procedures described in ASME B31.3, Chapter VII for bonding of plastic piping.

- E. Secondary containment piping shall be supported from hangers and supports and shall be installed per pipe manufacturer's instructions. Pipe hangers and supports shall be provided per the requirements of Section 15060, Hangers and Supports.
- F. Piping shall be installed in accordance with manufacturer's instructions regarding linear expansion due to temperature differentials.

### 3.02 FIELD TESTS

- A. The manufacturer shall submit test procedures for approval prior to installation.
- B. After installation, and prior to concrete encasement (where indicated) test both primary carrier piping and secondary containment piping for leaks.
  - 1. Primary carrier piping system shall be pressure tested at 150% of the system design pressure for a period of one hour.
  - 2. Testing of primary carrier pipe shall be conducted during the installation at intervals to be determined by the manufacturer.
  - 3. Secondary containment piping system shall be pneumatically tested at a minimum duration of two and a half (2.5) hours. The external joints shall be soaped and visually inspected for leaks. A working pressure regulator shall be used during the pneumatic test to insure that over-pressurization of the UL FRP, beyond 5psi, cannot occur. All precautions should be taken to protect against the hazard of a possible brittle fracture of UL FRP under compressed gas.
  - 4. All tests shall be done in accordance with manufacturer's recommendations, and witnessed by a representative of the pipe manufacturer.
- C. After installation, primary carrier piping system shall be flushed clean per manufacturer's recommendations. The contractor shall check the operation of all valves and appurtenances.
- D. The annular space shall be purged of moisture contained air by replacing the volume of air with clean, dry nitrogen.

### 3.03 MANUFACTURER'S FIELD SERVICES

- A. The services of a qualified manufacturer's service representative shall be provided for the following:
  - 1. Supervise the initial installation of the double containment pipe system.

2. Train the contractor's personnel in the proper methods of field testing the integrity of the double containment pipe system and assist in the performance of field tests.
- B. Services of the representative shall be provided for the following minimum durations:
1. Installation Supervision: one (1) visit of one (1) day
  2. Field Tests: One (1) visit of one (1) day, or as recommended by the manufacturer
- C. Reports from the manufacturer shall be submitted for each visit to the site. Provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction and all other pertinent information.

-END OF SECTION-

**Section 15271**  
**STORMWATER TREATMENT SYSTEM**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. The Contractor, and/or a manufacturer selected by the Contractor and approved by the Commissioner, shall furnish all labor, materials, equipment and incidentals required and install all precast concrete stormwater treatment systems and appurtenances in accordance with the Drawings and these specifications.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02504 - Sanitary and Storm Sewer Structures
- B. Section 02316 - Excavation
- C. Section 02317 - Backfilling
- D. Section 05561 - Miscellaneous Metal Castings

**1.03 REFERENCES**

- A. ASTM B209: Standard Specification for Aluminum and Aluminum Alloy Sheet and Plate
- B. ASTM C32: Standard Specification for Manhole Brick
- C. ASTM C139: Standard Specification for Concrete Masonry Units for Construction of Catch Basin and Manholes
- D. ASTM C150: Standard Specification for Portland Cement
- E. ASTM C595M: Standard Specification for Blended Hydraulic Cements
- F. ASTM C857: Standard Practice for Minimum Structural Loading for Underground Precast Concrete Utility Structures
- G. ASTM C858: Standard Specification for Underground Precast Concrete Utility Structures
- H. ASTM C891: Standard Practice for Installation of Underground Precast Utility Structures
- I. ASTM C990: Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the General Conditions and Section 01330 "Shop Drawings."
  - 1. Dimensional drawings showing details for construction, reinforcing, joints and any cast in place appurtenances. Indicate all material to be used and all applicable standards for materials, required test of materials and design assumptions for structural analysis. Scale of the shop drawing shall be not less than 1/4 in per foot.
  - 2. Design calculations and shop drawings shall be certified by a Professional Engineer retained by the system manufacturer or contractor and licensed in the State of New York

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Stormwater treatment system shall be a Vortechs System as manufactured by CONTECH Stormwater Solution, Inc. or approved equal.
- B. Stormwater treatment system shall be of a type that has been installed and used successfully for a minimum of 3 years. The manufacturer of said system shall have been regularly engaged in the engineering design and production of systems for the physical treatment of stormwater runoff during the aforementioned period.

#### 2.02 MATERIALS

- A. Concrete for precast stormwater treatment systems shall conform to ASTM C857 and C 858 and meet the following additional requirements:
  - 1. The wall thickness shall not be less than 6 inches or as shown on the dimensional drawings. In all cases the wall thickness shall be no less than the minimum thickness necessary to sustain HS20-44 (MS18) loading requirements as determined by a Licensed Professional Engineer.
  - 2. Sections shall have tongue and groove or ship-lap joints with a butyl mastic sealant conforming to ASTM C 990.
  - 3. Cement shall be Type II Portland cement conforming to ASTM C 150.
  - 4. All sections shall be cured by an approved method. Sections shall not be shipped until the concrete has attained a compressive strength of 4,000 psi (28 MPa) or until 5 days after fabrication and/or repair, whichever is the longer.
  - 5. Pipe openings shall be sized to accept pipes of the specified size(s) and material(s), and shall be sealed by the Contractor with a hydraulic cement conforming to ASTM C 595M

- B. Internal aluminum plate components shall be aluminum alloy 5052-H32 in accordance with ASTM B 209.
- C. Sealant to be utilized at the base of the swirl chamber shall be 60 durometer extruded nitrile butadiene rubber (Buna N) and shall be provided to the concrete precaster for installation.
- D. Brick or masonry used to build the manhole frame to grade shall conform to ASTM C 32 or ASTM C 139 and shall be installed in conformance with all local requirements.
- E. Casting for manhole frames and covers shall be in accordance with Section 05561-Miscellaneous Metal Castings.

## 2.03 PERFORMANCE

- A. Stormwater treatment system shall adhere to the following performance specifications at the design treatment capacities, as listed below:

Design Treatment Capacity (cfs)/(l/s)	Sediment Storage (yd <sup>3</sup> )/(m <sup>3</sup> )
6.0 - 8.5 (175-240)	3.2 (2.45)
14 - 17.5 (400-500)	5.6 (4.28)

- B. A verified proprietary stormwater management practice shall be used and sized per Chapter 9 (Application, sizing and performance criteria, as well as alternative practices for redevelopment projects) of the New York State Stormwater Management Design Manual (New York State Department of Environmental Conservation, January 2, 2007).
- C. Stormwater treatment system shall include a circular aluminum "swirl chamber" (or "grit chamber") with a tangential inlet to induce a swirling flow pattern that will accumulate and store settleable solids in a manner and a location that will prevent re-suspension of previously captured particulates.
- D. Stormwater treatment system shall be of a hydraulic design that includes flow controls designed and certified by a professional engineer using accepted principles of fluid mechanics that raise the water surface inside the tank to a pre-determined level in order to prevent the re-entrainment of trapped floating contaminants.
- E. Individual stormwater treatment systems shall have the Design Treatment Capacity listed in a table in Part 2.03, Section A., and shall not re-suspend trapped sediments or re-entrain floating contaminants at flow rates up to and including the specified Design Treatment Capacity.
- F. Individual stormwater treatment systems shall have usable sediment storage capacity of not less than the corresponding volume listed in the table in Part 2.03, Section A. The systems shall be designed such that the pump-out volume is less

than ½ of the total system volume. The systems shall be designed to not allow surcharge of the upstream piping network during dry weather conditions.

- G. A water-lock feature shall be incorporated into the design of the stormwater treatment system to prevent the introduction of trapped oil and floatable contaminants to the downstream piping during routine maintenance and to ensure that no oil escapes the system during the ensuing rain event. Direct access shall be provided to the sediment and floatable contaminant storage chambers to facilitate maintenance. There shall be no appurtenances or restrictions within these chambers.
- H. Stormwater treatment systems shall be completely housed within one rectangular structure.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Stormwater Treatment System shall be constructed according to the sizes shown on the Drawings and as specified herein. Install at elevations and locations shown on the Drawings or as otherwise directed by the Commissioner.
- B. Place the precast base unit on a granular subbase of minimum thickness of six inches after compaction or of greater thickness and compaction if specified elsewhere. The granular subbase shall be checked for level prior to setting and the precast base section of the trap shall be checked for level at all four corners after it is set. If the slope from any corner to any other corner exceeds 0.5% the base section shall be removed and the granular subbase material re-leveled.
- C. Prior to setting subsequent sections place bitumen sealant in conformance with ASTM C 990 along the construction joint in the section that is already in place.
- D. After setting the base and wall or riser sections, prepare to install the swirl chamber. Place the 3/4-inch thick by 3/4-inch wide butyl mastic seal vertically on the outside of the swirl chamber starting one inch above the bottom of the swirl chamber and continuing to a height equal to the elevation of the bottom of the upper aperture of the swirl chamber. The butyl mastic seal should abut the downstream side of the pre-drilled mounting holes that attach the swirl chamber to the long walls of the concrete vault. Next, install the extruded Buna N seal on the bottom edge of the 180 degree downstream section of the swirl chamber by first applying a bead of Sikaflex-1a polyurethane elastomeric sealant into the extruded slot then slide the seal onto the swirl chamber. The extruded seal should extend 3-inches upstream of the mounting holes, toward the inlet end of the vault. Set the swirl chamber into position and keep the seal approximately ½-inch above the floor of the concrete vault. Apply a continuous bead of Sikaflex-1a sealant under the cupped bottom of the seal. Set the circular swirl chamber on the floor of the vault and anchor it by bolting the swirl chamber to the side walls of the concrete vault at the three (3) tangent points and at the inlet tab using HILTI brand stainless steel drop-in wedge

anchors or equivalent 3/8-inch (10 mm) diameter by 2-3/4 inch minimum length at heights of approximately three inches (3") off the floor and at fifteen inch (15") intervals to approximately the same height of the butyl mastic sealant (at locations of pre-drilled holes in aluminum components). Apply a continuous bead of Sikaflex-1a sealant to the intersection of the inside bottom edge of the extruded seal and the vault floor.

- E. If the oil baffle wall (Baffle A) and flow control wall (Baffle B) are not integrally cast-in to riser/wall sections then the Baffle wall panels shall be placed in the formed keyways or between bolted-in-place angle flanges as provided by the manufacturer. Apply non-shrink grout or Sikaflex-1a sealant to each end of Baffle A and Baffle B at the upstream intersection with the side walls of the concrete vault.
- F. Prior to setting the precast roof section, bitumen sealant equal to ASTM C 990 shall be placed along the top of the oil baffle wall (Baffle A), using more than one layer of mastic if necessary, to a thickness at least 1-inch (25 mm) greater than the nominal gap between the top of the baffle and the roof section. The nominal gap shall be determined either by field measurement or the shop drawings. Do not seal the top of Baffle B unless specified on the shop drawings to do so. After placement of the roof section has compressed the butyl mastic sealant in the gap over Baffle A, finish sealing the gap with an approved non-shrink grout on both sides of the gap using the butyl mastic as a backing material to which to apply the grout. If roof section is "clamshell" or "bathtub" halves, then finish sealing the ends of the Baffle walls by applying non-shrink grout or Sikaflex-1a sealant to each end of Baffle A at the upstream intersection with the side walls of the concrete vault and to each end of Baffle B at the downstream intersection with the side walls of the concrete vault.
- G. After setting the precast roof section of the stormwater treatment system, set precast concrete manhole riser sections, to the height required to bring the cast iron manhole covers to grade, so that the sections are vertical and in true alignment with a 1/4-inch (6 mm) maximum tolerance allowed. Backfill in a careful manner, bringing the fill up in 6-inch (152 mm) lifts on all sides. If leaks appear, clean the inside joints and caulk with lead wool to the satisfaction of the Commissioner. Precast sections shall be set in a manner that will result in a watertight joint. In all instances, installation of Stormwater Treatment Systems shall conform to ASTM specification C 891 "Standard Practice for Installation of Underground Precast Utility Structures".
- H. Holes made in the concrete sections for handling or other purposes shall be plugged with a nonshrink grout or by using grout in combination with concrete plugs.
- I. Where holes must be cut in the precast sections to accommodate pipes, do all cutting before setting the sections in place to prevent any subsequent jarring which may loosen the mortar joints. The Contractor shall make all pipe connections

3.02 FIELD QUALITY CONTROL

A. Removal of Rejected Work

1. Mark sections rejected after delivery to the site for identification and remove from the site at once
2. All sections which have been damaged beyond repair during delivery will be rejected and, if already installed, repaired to the Commissioner's acceptance level or removed and replaced, entirely at Contractor's expense.

B. Cleaning

1. Clean the system in accordance with manufacturer's specification.

-END OF SECTION-

**Section 15410**  
**PLUMBING FIXTURES AND TRIM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section includes plumbing fixtures and related components.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15412 - Emergency Plumbing Fixtures.
- B. Section 15415 - Water Coolers.
- C. Section 15430 - Plumbing Specialties, for backflow preventers and specialty fixtures not in this Section.

**1.03 SUBMITTALS**

- A. Product Data: Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports and indicate materials and finishes, dimensions, construction details, and flow-control rates for each type of fixture indicated.
- B. Shop Drawings: Diagram power, signal, and control wiring and differentiate between manufacturer-installed and field-installed wiring.
- C. Maintenance Data: For plumbing fixtures to include in maintenance manuals specified in Division 1.

**1.04 QUALITY ASSURANCE**

- A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.
  - 1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.
- D. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

- E. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.
- F. Comply with the following applicable standards and other requirements specified for plumbing fixtures:
  - 1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M
  - 2. Hand Sinks: NSF 2 construction
  - 3. Porcelain-Enameled, Formed-Steel Fixtures: ASME A112.19.4M
  - 4. Stainless-Steel Fixtures Other Than Service Sinks: ASME A112.19.3M
  - 5. Vitreous-China Fixtures: ASME A112.19.2M
  - 6. Water-Closet, Flushometer Tank Trim: ASSE 1037
- G. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:
  - 1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3M
  - 2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M
  - 3. Faucet Hose: ASTM D 3901
  - 4. Faucets: ASME A112.18.1M
  - 5. Hose-Connection Vacuum Breakers: ASSE 1011
  - 6. Hose-Coupling Threads: ASME B1.20.7
  - 7. Integral, Atmospheric Vacuum Breakers: ASSE 1001
  - 8. NSF Materials: NSF 61
  - 9. Pipe Threads: ASME B1.20.1
  - 10. Supply and Drain Fittings: ASME A112.18.1M
- H. Comply with the following applicable standards and other requirements specified for shower faucets:
  - 1. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M
  - 2. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016
  - 3. Faucets: ASME A112.18.1M

4. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445
  5. Manual-Control Antiscald Faucets: ASTM F 444
  6. Pipe Threads: ASME B1.20.1
  7. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016
  8. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016
- I. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
1. Atmospheric Vacuum Breakers: ASSE 1001
  2. Brass and Copper Supplies: ASME A112.18.1M
  3. Manual-Operation Flushometers: ASSE 1037
  4. Tubular Brass Drainage Fittings and Piping: ASME A112.18.1M
- J. Comply with the following applicable standards and other requirements specified for miscellaneous components:
1. Floor Drains: ASME A112.21.1M
  2. Hose-Coupling Threads: ASME B1.20.7
  3. Off-Floor Fixture Supports: ASME A112.6.1M
  4. Pipe Threads: ASME B1.20.1
- 1.05 COORDINATION
- A. Coordinate roughing-in and final plumbing fixture locations, and verify that fixtures can be installed to comply with original design and referenced standards.
- 1.06 EXTRA MATERIALS
- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Faucet Washers and O-Rings: Equal to 10 percent of amount of each type and size installed.
  2. Faucet Cartridges and O-Rings: Equal to 5 percent of amount of each type and size installed.
  3. Faucet, Laminar-Flow Fittings: Equal to 10 percent of amount of each type and size installed, but not less than 2 of each type and size.

4. Faucet, Flow-Control Fittings: Equal to 10 percent of amount of each type and size installed.
5. Supply, Flow-Control Fittings: Equal to 5 percent of amount of each type and size installed.
6. Shower, Flow-Control Fittings: Equal to 5 percent of amount of each type and size installed.
7. Flushometer Valve, Repair Kits: Equal to 10 percent of amount of each type installed, but not less than 12 of each type.
8. Provide hinged-top wood or metal box, or individual metal boxes, with separate compartments for each type and size of extra materials listed above.
9. Flushometer Tank, Repair Kits: Equal to 5 percent of amount of each type installed, but not less than 2 of each type.
10. Toilet Seats: Equal to 5 percent of amount of each type installed.

## PART 2 PRODUCTS

### 2.01 LAVATORY FAUCETS

- A. Lavatory Faucet, P-4: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.
  1. Product: Chicago Faucets, Model No. 802-VCP or approved equal
  2. Body Material: Cast brass, quarter-turn washerless ceramic disc valve
  3. Finish: Polished chrome plate
  4. Type: Two-handle mixing
  5. Centers: 4 inches
  6. Mounting: Deck, exposed
  7. Handles: Curved level handles
  8. Inlets: NPS 3/8 tubing, with NPS 1/2 male adaptor
  9. Spout: Rigid
  10. Spout Outlet: Standard Aerator, vandal-resistant

11. Drain: Grid
12. Maximum flow rate: 2.2 GPM

## 2.02 SHOWER FAUCETS

- A. Shower Faucet, P-6: Provide and install Acorn Apex flush-mounted showers 411-W-P-BS-G housing shall be 16 gage, type 304 stainless steel with satin finish. All internal piping shall be copper tubing and bronze or wrought copper fittings. Shower head shall be Acorn Logan with adjustable spray from coarse stream to fine mist. Shower shall be pre-piped and hydrostatically factory test at 150 PSI. Shower shall be provided with the following optional equipment.
1. Model: Acorn, Model 4-APEX or approved equal
  2. Maximum Flow Rate: 2.5 gpm, unless otherwise indicated
  3. Valve: Safti-Therm, hot & cold temperature balancing
  4. Supply: Wall
  5. Shower Head:, Extended head – 17½"
  6. Hand volume control
  7. Soap Dish
  8. Privacy Compartment: Stainless Steel

## 2.03 SINK FAUCETS

- A. Sink Faucet, P-5: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.
1. Manufacturer: Elkay, LK4103F
  2. Maximum Flow Rate: 2.2 gpm, unless otherwise indicated
  3. Body Material: Cast brass
  4. Finish: Polished chrome plate
  5. Type: Kitchen faucet with spray, three-hole fixture
  6. Mixing Valve: Single control
  7. Backflow Protection Device for Side Spray: Required
  8. Centers: 4 inches
  9. Mounting: Deck, exposed
  10. Handle: Lever
  11. Inlets: NPS 3/8 plain-end tubing
  12. Spout: Swing, round tubular
  13. Spout Outlet: Aerator, Spray
  14. Drain: Grid
  15. Tempering Device: High-temperature limit stop

## 2.04 TOILET SEATS

## A. Toilet Seat: Solid plastic

1. Manufacturer: Olsonite: Model WC-1/WC-1A
2. Configuration: Open front
3. Size: Elongated
4. Class: Standard commercial
5. Hinge Type: check
6. Color: White

## 2.05 PROTECTIVE SHIELDING GUARDS

- A. Protective Shielding Guard: Manufactured, plastic covering for hot- and cold-water supplies and trap and drain piping and complying with ADA requirements.

## 2.06 FIXTURE SUPPORTS

- A. Water-Closet Support, P-1: Water-closet combination carrier designed for standard mounting height, adjustable closet carrier. Include single or double, vertical or horizontal, hub-and-spigot or hubless waste fitting as required for piping arrangement; faceplates; epoxy coated cast iron, couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

1. Manufacturer: Watts Drainage, Model No. ISCA-101-L/R or approved equal

- B. Urinal Support, P-2: Type I, urinal carrier with fixture support plates and coupling with seal and fixture bolts and hardware matching fixture. Include steel uprights with feet.

1. Accessible Fixture Support: Include rectangular steel uprights

- C. Lavatory Support, P-4: Lavatory carrier with concealed arms and tie rod Include steel uprights with feet, adjustable epoxy coated iron arms with leveling screws and basin locking device.

1. Manufacturer: Watts Drainage: Model No. CA-411/CA-411-WC, or approved equal

## 2.07 SHOWER RECEPTORS

- A. Shower Receptor: Base for built-up shower.

1. Manufacturer: Stern Williams, Model 14 or approved equal
2. Type: Standard

3. Material: Precast terrazzo with slip-resistant bathing surface complying with ASTM F 462
4. Size: 36 by 36 inches
5. Color: White
6. Outlet: Cast-in-floor drain with NPS 2 outlet

## 2.08 WATER CLOSETS

### A. Water Closets, P-1: Wall-hanging, back-outlet, vitreous-china fixture designed for flushometer valve operation

1. Product: American Standard, AFWall 2257.103 or approved equal
2. Style: One piece
  - a. Bowl Type: Elongated with siphon-jet design
  - b. Design Consumption: 1.6 gal./flush
  - c. 1-1/2" Top Spud
3. Style: Flushometer valve
  - a. Bowl Type: Elongated siphon-jet design
    - (1) Design Consumption: 1.6 gal./flush
4. Flushometer: Sloan, Royal 111 or approved equal

## 2.09 URINALS

### A. Urinals, P-2: Wall-hanging, back-outlet, vitreous-china fixture designed for flushometer valve operation.

1. Product: American Standard, Model Trimbrook 6561.017 or approved equal
2. Type: Washout with extended shields
3. Strainer: Separate removable strainer with integral trap
4. Design Consumption: 1.0 gal./flush
5. Color: White
6. Supply Spud Size: NPS 3/4

7. Outlet Size: NPS 2
8. Flushometer: Sloan, 186-1.0 or approved equal

## 2.10 LAVATORIES

### A. Lavatories, P-4: Wall-hanging, vitreous-china fixture.

1. Product: American Standard, Model Lucerne Wall-Mount Sink, Model No. 0356.421 or approved equal
2. Type: With back
3. Size: 20 by 18 inches, rectangular
4. Faucet Hole Punching: Two, 4-inch centers, holes
5. Faucet Hole Location: Top
6. Color: White
7. Faucet: Lavatory
8. Supplies: NPS 3/8 chrome-plated copper with stops
9. Drain: Grid
10. Drain Piping: NPS 1-1/4 by NPS 1-1/2 chrome-plated cast-brass trap; thick tubular brass waste to wall; and wall escutcheon
11. Protective Shielding Guards

## 2.11 COUNTER TOP SINK

### A. Counter top sinks, P-3

1. Product: Crane Plumbing, Model No. Stevens 1299V or approved equal
2. Size: 18" Round, acid resisting, porcelain enameled steel, self-rimming
3. Faucet Hole Punching: Three, 4-inch centers, holes
4. Faucet Hole Location: Top
5. Color: White Porcelain Enameled Steel
6. Supplies: NPS 3/8 chrome-plated copper with stops

7. Drain: Grid
8. Drain Piping: NPS 1-1/4 by NPS 1-1/2 chrome-plated cast-brass trap; thick tubular brass waste to wall; and wall escutcheon

## 2.12 KITCHEN SINKS

- A. Kitchen Sinks, P-5: Seamlessly drawn of 18 gauge, type 304, nickel bearing stainless steel, self-rimming fixture
  1. Product: Elkay Model LRQ2522 or approved equal
  2. Overall Size: 25 by 22 inches
  3. Number of Compartments: One
  4. Supplies: NPS 1/2 chrome-plated copper with stops
  5. Strainer: NPS 1-1/2"
  6. Drain Piping: NPS 1-1/2 chrome-plated cast-brass trap, 0.045-inch- thick tubular brass waste to wall and wall escutcheon

## 2.13 SERVICE BASINS

- A. Service Basins, P-7: Flush-to-wall, floor-mounting receptor composed of pearl gray marble ships and white Portland cement ground smooth, grouted and sealed to resist stains terrazzo basin with rim guard.
  1. Product: Stern-Williams Co., Inc.; Model SB-702 approved equal
  2. Shape: Square
  3. Size: 24 by 24 inches
  4. Height: 12 inches
  5. Tiling Flange: On two sides
  6. Rim Guard: Stainless steel, on all top surfaces
  7. Color: White
  8. Faucet: Sink Model T-10-VB, Mop sink service sink fitting with vacuum breaker, adjustable top brace, 3/4" hose thread on spout with bucket hook inlets 8" on center, chrome finish
  9. Splash catcher panels of 20 gauge, type 304 stainless steel

10. Drain: Cast brass with stainless steel strainer, with NPS 3 outlet

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine roughing-in for water soil and for waste piping systems and supports to verify actual locations and sizes of piping connections and that locations and types of supports match those indicated, before plumbing fixture installation. Use manufacturer's roughing-in data if roughing-in data are not indicated.
- B. Examine walls, floors, and cabinets for suitable conditions where fixtures are to be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 FIXTURE INSTALLATION

- A. Assemble fixtures, trim, fittings, and other components according to manufacturers' written instructions.
- B. For wall-hanging fixtures, install off-floor supports affixed to building substrate.
  1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
  2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
  3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.
- C. Install back-outlet, wall-hanging fixtures onto waste fitting seals and attach to supports.
- D. Install wall-hanging fixtures with tubular waste piping attached to supports.
- E. Install counter-mounting fixtures in and attached to casework.
- F. Install fixtures level and plumb according to manufacturers' written instructions and roughing-in drawings.
- G. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.
  1. Exception: Use ball, gate, or globe valve if stops are not specified with fixture. Refer to Section 15112 - Valves Smaller than 4 Inches of the Structures and Equipment Contract for general-duty valves.

- H. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.
  - I. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.
  - J. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.
  - K. Install toilet seats on water closets.
  - L. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.
  - M. Install faucet, flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.
  - N. Install shower, flow-control fittings with specified maximum flow rates in shower arms.
  - O. Install traps on fixture outlets.
    - 1. Exception: Omit trap on fixtures with integral traps.
    - 2. Exception: Omit trap on indirect wastes, unless otherwise indicated.
  - P. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for escutcheons.
  - Q. Set shower receptors, and service basins in leveling bed of cement grout. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for grout.
  - R. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Section 07921 - Interior Sealants of the Structures and Equipment Contract for sealant and installation requirements.
- 3.03 CONNECTIONS
- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
  - B. Connect water supplies from water distribution piping to fixtures.
  - C. Connect drain piping from fixtures to drainage piping.

- D. Supply and Waste Connections to Plumbing Fixtures: Connect fixtures with water supplies, stops, risers, traps, and waste piping. Use size fittings required to match fixtures. Connect to plumbing piping.
- E. Supply and Waste Connections to Fixtures and Equipment Specified in Other Sections: Connect fixtures and equipment with water supplies, stops, risers, traps, and waste piping specified. Use size fittings required to match fixtures and equipment. Connect to plumbing piping.

### 3.04 FIELD QUALITY CONTROL

- A. Verify that installed fixtures are categories and types specified for locations where installed.
- B. Check that fixtures are complete with trim, faucets, fittings, and other specified components.
- C. Inspect installed fixtures for damage. Replace damaged fixtures and components.
- D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

### 3.05 ADJUSTING

- A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.
- B. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.
- C. Replace washers and seals of leaking and dripping faucets and stops.

### 3.06 CLEANING

- A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
  - 1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
  - 2. Remove sediment and debris from drains.

3.07 PROTECTION

- A. Provide protective covering for installed fixtures and fittings.
- B. Do not allow use of fixtures for temporary facilities unless approved in writing by the City.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 15412**  
**EMERGENCY PLUMBING FIXTURES**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. This Section includes the following emergency plumbing fixtures:

1. Combination units
2. Water-tempering equipment

**1.02 DEFINITIONS**

- A. Accessible Fixture: Emergency plumbing fixture that can be approached, entered, and used by people with disabilities.
- B. Plumbed Emergency Plumbing Fixture: Fixture with fixed, potable-water supply.
- C. Tempered: Approximately 85 deg F temperature
1. Allowable Variation: Plus or minus 5 deg F

**1.03 SUBMITTALS**

- A. Product Data: Include flow rates and capacities; shipping, installed, and operating weights; furnished specialties; and accessories for each product indicated.
- B. Shop Drawings: Diagram power, signal, and control wiring and differentiate between manufacturer-installed and field-installed wiring.
- C. Product Certificates: Submit certificates of performance testing specified in "Source Quality Control" Article.
- D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- E. Maintenance Data: For emergency plumbing fixtures to include in maintenance manuals specified in Division 1.

**1.04 QUALITY ASSURANCE**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. ANSI Standard: Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."

- C. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

## 1.05 COORDINATION

- A. Coordinate roughing-in and final plumbing fixture locations, and verify that fixtures can be installed to comply with original design and referenced standards.

## PART 2 PRODUCTS

### 2.01 COMBINATION UNITS

- A. Combination Units: Plumbed, freestanding type with emergency shower and eye/face wash equipment. A-SEW-01, A-SEW-02, A-SEW-03, A-SEW-04.

#### 1. Products

- a. Bradley Corporation
- b. Chicago Faucet Co.
- c. Encon Safety Products
- d. Haws Corporation
- e. Murdock, Inc.
- f. Speakman Co.
- g. Guardian Equipment Co.
- h. Or approved equal

#### 2. Piping: Galvanized steel

- a. Unit Supply: NPS 1-1/2 from top
- b. Unit Drain: Outlet at side near bottom
- c. Shower Supply: with flow regulator and stay-open control valve
- d. Eye/Face Wash Supply: NPS 1/2 with flow regulator and stay-open control valve

#### 3. Shower Capacity: Deliver potable water at rate not less than 20 gpm for at least 15 minutes.

- a. Control-Valve Actuator: Pull chain
- b. Shower Head: 10-inch minimum diameter, stainless steel

#### 4. Eye/Face Wash Equipment: With capacity to deliver potable water at rate not less than 3.0 gpm for at least 15 minutes.

- a. Control-Valve Actuator: Push bar and foot treadle
- b. Receptor: stainless-steel bowl
- c. Dust cover: Stainless-steel

#### 5. Alarm: Emergency alarm and light complete with an amber flashing light and 90 db at 10 feet, buzzer that is operated by flow switch. Unit is activated when

the emergency shower or eye shower or eye is in operation. 120 volts, 60 cycles, provide a relay contact DPDT for SCADA system, Haws Model No. 9001 with 9001 DPDT.

6. Combination unit shall be Model No. 8347 as Manufactures by Haws or approved equal.
- B. Combination Units: freeze-protected, freestanding type with emergency shower and eye/face wash equipment. A-SEW-01, A-SEW-02. A-SEW-04
1. Products
    - a. Encon Safety Products
    - b. Guardian Equipment Co.
    - c. Haws Corporation
    - d. Speakman Co.
    - e. Or approved equal
  2. Piping: Stainless steel
    - a. Unit Supply: NPS 1-1/4 minimum, side
    - b. Shower Supply: NPS 1 with flow regulator and stay-open control valve
    - c. Eye/Face Wash Supply: NPS 1/2 with flow regulator and stay-open control valve
  3. Heating System: Electric, 120V ac; and insulation with protective jacket
  4. Shower Capacity: Deliver potable water at rate not less than 20 gpm for at least 15 minutes
    - a. Control-Valve Actuator: Pull rod
    - b. Shower Head: 10-inch minimum diameter, plastic
  5. Eye/Face Wash Equipment: With capacity to deliver potable water at rate not less than 3.0 gpm for at least 15 minutes
    - a. Control-Valve Actuator: Push bar
  6. Freeze protection bleed valve, automatically opens to flush water during freezing conditions and power failures.
  7. Alarm: Emergency alarm and light complete with an amber flashing light and 90 db at 10 feet, buzzer that is operated by flow switches Unit is activated when the emergency shower or eye shower or eye is in operation. 120 volts, 60 cycles, provide a relay contact for SCADA system, Haws Model No. 9001 with 9001 DPDT or approved equal.

8. Freeze resistant combination unit shall be Model No. 8317CTFP, 120V or approved equal.
- C. Wall Mounted Emergency Eye Wash: A-SEW-03
1. Products
    - a. Encon Safety Products
    - b. Guardian Equipment Co.
    - c. Haws Corporation
    - d. Speakman Co.
    - e. Or approved equal
  2. Piping: Stainless steel
    - a. Unit Supply: NPS 1/2" minimum, side
    - b. 11" Round stainless steel receptor, aluminum wall bracket, and twin soft-flo ABS plastic anti-surge eyewash heads
    - c. With waste tailpiece and trap
    - d. Stainless steel dust cover.
    - e. Manufactured by Haws Model No. 7460BT or approved equal
  3. Alarm: Emergency alarm and light complete with an amber flashing light and 90 db at 10 feet, buzzer that is operated by flow switches. Unit is activated when the emergency shower or eye shower or eye is in operation. 120 volts, 60 cycles, provide a relay contact for SCADA system, Haws Model No. 9001 with 9001 DPDT or approved equal.
- D. Tempered Water Blending System for emergency/ shower/eye wash: Guardian Equipment Co. or approved equal. System consists of mixing hot and cold water to provide tempered water up to 44 gpm for emergency shower and eyewashes. Consists of a thermostatic mixing valve, a high temperature limit valve, a bypass valve and outlet temperature gauge. Unit is constructed of bronze, brass copper and stainless steel. Complete with tempered water blending system cabinet.
- E. Tempered Water Blending System for emergency eye wash: Guardian Equipment Co. or approved equal. System consists of mixing hot and cold water to provide tempered water up to 5 gpm for emergency eyewash. Consists of a thermostatic mixing valve, a high temperature limit valve, a bypass valve and outlet temperature gauge. Unit is constructed of bronze, brass copper and stainless steel. Complete with tempered water blending system cabinet.

## PART 3 EXECUTION

## 3.01 EXAMINATION

- A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before plumbed emergency plumbing fixture installation. Proceed with installation only after unsatisfactory conditions have been corrected.

## 3.02 EMERGENCY PLUMBING FIXTURE INSTALLATION

- A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components according to manufacturer's written instructions.
  - B. Install fixtures level and plumb.
  - C. Fasten fixtures to substrate.
  - D. Install shutoff valves in water-supply piping to fixtures. Use ball, gate, or globe valve if specific type valve is not indicated. Install valves chained or locked in open position. Install valves in locations where they can easily be reached for operation. Refer to Section 15110 - Plumbing Valves for general-duty shutoff valves.
    - 1. Exception: Omit shutoff valves on valved supplies to group of plumbing fixtures that includes emergency plumbing fixture.
    - 2. Exception: Omit shutoff valves on supplies to emergency equipment if prohibited by authorities having jurisdiction.
  - E. Install shutoff valve and strainer in steam piping and shutoff valve in condensate return piping.
  - F. Install dielectric fitting in supply piping to fixture if piping and fixture connections are made of different metals. Refer to Section 15050 - Basic Mechanical Materials and Methods for dielectric fittings.
  - G. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Refer to Section 15050 - Basic Mechanical Materials and Methods for escutcheons.
- 3.03 CONNECTIONS
- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
  - B. Connect cold-water-supply piping to plumbed emergency plumbing fixtures not having water-tempering equipment.

- C. Connect hot- and cold-water-supply piping to hot- and cold-water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures.
- D. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary or storm drainage piping.
- E. Ground Equipment
  - 1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

#### 3.04 FIELD QUALITY CONTROL

- A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities and temperatures.
- B. Electrical-Component Testing: After electrical circuitry has been energized, test for compliance with requirements.
  - 1. Test and adjust controls and safeties.
- C. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.
- D. Report test results in writing.

#### 3.05 ADJUSTING

- A. Adjust or replace fixture flow regulators for proper flow.
- B. Adjust equipment temperature settings.

-END OF SECTION-

**Section 15415**  
**WATER COOLERS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Water-station water coolers
- B. Fixture supports

**1.02 GENERAL REQUIREMENTS**

- A. Accessible Water Cooler: Fixture that can be approached and used by people with disabilities.
- B. Fitting: Device that controls flow of water into or out of fixture.
- C. Water Cooler: Electrically powered fixture for generating and delivering cooled drinking water.

**1.03 SUBMITTALS**

- A. Product Data: Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories for each type of fixture indicated.
- B. Shop Drawings: Diagram power, signal, and control wiring and differentiate between manufacturer-installed and field-installed wiring.
- C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- D. Maintenance Data: For fixtures to include in maintenance manuals specified in Division 1.

**1.04 QUALITY ASSURANCE**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Regulatory Requirements: Comply with requirements in the U.S. Architectural & Transportation Barriers Compliance Board's "Uniform Federal Accessibility Standards (UFAS), 1985-494-187" about fixtures for people with disabilities.
- C. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

- D. ARI Standard: Comply with ARI 1010, "Self-Contained, Mechanically Refrigerated Drinking-Water Coolers," for water coolers and with ARI's "Directory of Certified Drinking Water Coolers" for type and style classifications.

#### 1.05 COORDINATION

- A. Coordinate roughing-in and final fixture locations, and verify that fixtures can be installed to comply with original design and referenced standards.

#### 1.06 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- 1. Filter Cartridges: Equal to 10 percent of amount installed for each type and size indicated, but not less than 10 of each.

### PART 2 PRODUCTS

#### 2.01 WATER COOLERS

- A. Water Coolers, P-8

- 1. Available Products: Haws electric water cooler, Model H1119.8 or approved equal
  - 2. Products: Haws or approved equal
    - a. Model: Barrier Fee, dual height, Electric Drinking Fountain
  - 3. Cabinet: All 304 stainless steel, satin finish with refrigerated compartment in front panel
  - 4. Bubbler: One, with automatic stream regulator, located on deck
  - 5. Control: Push button
  - 6. Supply: NPS 3/8 with ball, gate, or globe valve
  - 7. Drain: Grid with NPS 1-1/4 minimum horizontal waste and trap complying with ASME A112.18.1 for each fountain

8. Cooling System: Electric, with hermetically sealed compressor, cooling coil, air-cooled condensing unit, corrosion-resistant tubing, refrigerant, corrosion-resistant-metal storage tank, and adjustable thermostat
  - a. Capacity: 8 gph of 50 deg F cooled water from 80 deg F inlet water and 90 deg F ambient air temperature
  - b. Electrical Characteristics: 1/8 hp; 110V ac; single phase; 60 Hz

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before fixture installation. Verify that sizes and locations of piping and types of supports match those indicated.
- B. Examine walls and floors for suitable conditions where fixtures are to be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.02 APPLICATIONS

- A. Use mounting frames for recessed water coolers, unless otherwise indicated.
- B. Use chrome-plated brass or copper tube, fittings, and valves in locations exposed to view. Plain copper tube, fittings, and valves may be used in concealed locations.

#### 3.03 INSTALLATION

- A. Install mounting frames affixed to building construction and attach recessed water coolers to mounting frames, unless otherwise indicated.
- B. Install fixtures level and plumb.
- C. Install water-supply piping with shutoff valve on supply to each fixture to be connected to water distribution piping. Use ball, gate, or globe valve. Install valves in locations where they can be easily reached for operation. Refer to Division 15 Section "Valves" for general-duty valves.
- D. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.
- E. Seal joints between fixtures and walls and floors using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Section 07921 - Interior Sealants for sealant and installation requirements.

## 3.04 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect water supplies from water distribution piping to fixtures.
- C. Connect drain piping from fixtures to drainage piping.
- D. Ground Equipment
  - 1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

## 3.05 FIELD QUALITY CONTROL

- A. Water-Cooler Testing: After electrical circuitry has been energized, test for compliance with requirements. Test and adjust controls and safeties.
- B. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.
- C. Report test results in writing.

## 3.06 ADJUSTING

- A. Adjust fixture flow regulators for proper flow and stream height.
- B. Adjust water-cooler temperature settings.

## 3.07 CLEANING

- A. After completing fixture installation, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish. Clean fixtures, on completion of installation, according to manufacturer's written instructions.

-END OF SECTION-

**Section 15430**  
**PLUMBING SPECIALTIES**

**PART 1 GENERAL****1.01 SECTION INCLUDES****A. This Section includes the following plumbing specialties:**

1. Backflow preventers
2. Strainers
3. Key-operation hydrants
4. Drain valves
5. Miscellaneous piping specialties
6. Sleeve penetration systems
7. Flashing materials
8. Cleanouts
9. Floor drains
10. Trench drains
11. Roof drains

**1.02 RELATED SPECIFICATIONS**

- A. Section 09967 - Coating for Steel Waterfront Structures
- B. Section 15122 - Meters and Gages, for water meters, thermometers, and pressure gages.

**1.03 SUBMITTALS****A. Product Data:** Include rated capacities and shipping, installed, and operating weights. Indicate materials, finishes, dimensions, required clearances, and methods of assembly of components; and piping and wiring connections for the following:

1. Backflow preventers and water regulators
2. Strainers
3. Thermostatic water mixing valves and water tempering valves
4. Water hammer arresters and air vents
5. Drain valves, hose bibs and hydrants
6. Cleanouts, floor drains, open receptors, trench drains, and roof drains.
7. Vent caps, vent terminals, and roof flashing assemblies
8. Sleeve penetration systems

**B. Field test reports****C. Maintenance Data:** For plumbing specialties to include in maintenance manuals. Include the following:

1. Backflow preventers and water regulators

2. Water filters
3. Thermostatic water mixing valves and water tempering valves

#### 1.04 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of plumbing specialties and are based on the specific system indicated.
- B. Plumbing specialties shall bear label, stamp, or other markings of specified testing agency.
- C. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for piping materials and installation.
- D. City of New York Department of Environmental Protection
  1. Typical Water Meter Setting Details and Regulations
  2. Chapter 20 Rules Governing and Restricting the Use and Water
- E. NSF Compliance
  1. Comply with NSF 61, "Drinking Water System Components--Health Effects", Sections 1 through 9, for potable domestic water plumbing specialties.

#### 1.05 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  1. Water Filter Cartridges: Equal to 200 percent of amount installed for each type and size indicated.
  2. Operating Key Handles: Equal to 100 percent of amount installed for each key-operated hose bibb and hydrant installed.

### PART 2 PRODUCTS

#### 2.01 BACKFLOW PREVENTERS

- A. Manufacturers
  1. Ames Co., Inc.
  2. Cla-Val Co.
  3. CMB Industries, Inc.; Febco Backflow Preventers
  4. Conbraco Industries, Inc.
  5. Mueller Co.; Hersey Meters Div.
  6. Watts Industries, Inc.; Water Products Div.

7. Zurn Industries, Inc.; Wilkins Div.
  8. Or approved equal
- B. General: ASSE standard, backflow preventers
1. NPS 2 and Smaller: Bronze body with threaded ends
  2. NPS 2-1/2 and Larger: Bronze, cast-iron, steel, or stainless-steel body with flanged ends
    - a. Interior Lining: AWWA C550 or FDA-approved, epoxy coating for backflow preventers having cast-iron or steel body
  3. Interior Components: Corrosion-resistant materials
  4. Exterior Finish: Polished chrome plate if used in chrome-plated piping system
  5. Strainer: On inlet, if indicated
- C. Pipe-Applied, Atmospheric-Type Vacuum Breakers: ASSE 1001, with floating disc and atmospheric vent
- D. Hose-Connection Vacuum Breakers: ASSE 1011, nickel-plated, with nonremovable and manual drain features, and ASME B1.20.7, garden-hose threads on outlet. Units attached to rough-bronze-finish hose connections may be rough bronze
- E. Intermediate Atmospheric-Vent Backflow Preventers: ASSE 1012, suitable for continuous pressure application. Include inlet screen and two independent check valves with intermediate atmospheric vent.
- F. Reduced-Pressure-Principle Backflow Preventers: ASSE 1013, suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet; test cocks; and pressure-differential relief valve with ASME A112.1.2 air-gap fitting located between two positive-seating check valves. Reduced-Pressure Backflow Preventers shall be the type approved by NYC Department of Environment Protection.
1. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range
- G. Antisiphon-Pressure-Type Vacuum Breakers: ASSE 1020, suitable for continuous pressure application. Include shutoff valves, spring-loaded check valve, spring-loaded floating disc, test cocks, and atmospheric vent.
1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range
  2. Units in paragraph below are for low hazard and are available in NPS 1/2 to NPS 1-1/4 (DN 15 to DN 32).

3. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range

- H. Double-Check Detector Assembly Backflow Preventers: ASSE 1048, FM approved or UL listed, and suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; two positive-seating check valves; and bypass with displacement-type water meter, valves, and double-check backflow preventer. Double-Check Detector Assembly Backflow Preventers shall be the type approved by NYC Department of Environment Protection.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range

- I. Hose-Connection Backflow Preventers: ASSE 1052, suitable for at least 3-gpm flow and applications with up to 10-foot head of water back pressure. Include two check valves; intermediate atmospheric vent; and nonremovable, ASME B1.20.7, garden-hose threads on outlet.
- J. Back-Siphonage Backflow Vacuum Breakers: ASSE 1056, suitable for continuous pressure and backflow applications. Include shutoff valves, check valve, test cocks, and vacuum vent.

## 2.02 STRAINERS

- A. Strainers: Y-pattern, unless otherwise indicated, and full size of connecting piping. Include ASTM A 666, Type 304, stainless-steel screens with 3/64-inch round perforations, unless otherwise indicated. Strainers shall be the type approved by NYC Department of Environment Protection.

1. Pressure Rating: 125-psig minimum steam working pressure, unless otherwise indicated
2. NPS 2 and Smaller: Bronze body, with female threaded ends
3. NPS 2-1/2 and Larger: Cast-iron body, with interior AWWA C550 or FDA-approved, epoxy coating and flanged ends
4. Y-Pattern Strainers: Screwed screen retainer with centered blowdown
  - a. Drain: Factory- or field-installed, hose-end drain valve
5. T-Pattern Strainers: Malleable-iron or ductile-iron body with grooved ends; access end cap with drain plug and access coupling with rubber gasket

- B. Drainage Basket Strainers: Non-pressure-rated, cast-iron or coated-steel body; with bolted flange or clamp cover and drain with plug

1. Basket: Bronze or stainless steel with 1/8- or 3/16-inch- diameter holes and lift-out handle

2. Female threaded ends for NPS 2 and smaller, and flanged ends for NPS 2-1/2 and larger

## 2.03 KEY-OPERATION HYDRANTS

### A. Manufacturers

1. Josam Co.
2. Murdock, Inc.
3. Smith, Jay R. Mfg. Co.
4. Watts Industries, Inc.; Drainage Products Div.
5. Woodford Manufacturing Co.
6. Zurn Industries, Inc.; Jonespec Div.
7. Or approved equal

### B. General: ASME A112.21.3, key-operation hydrant with pressure rating of 125 psig.

1. Inlet: NPS 3/4 or NPS 1 threaded or solder joint
2. Outlet: ASME B1.20.7, garden-hose threads
3. Operating Keys: Two with each key-operation hydrant

### C. Non-freeze Exposed Hose Connection with Vacuum Breaker

1. Classification: Bronze nickel plated quarter turn non-freeze hydrant with 3/4" hose connection, integral vacuum breaker with vandal resistant cap and "T" handle key
2. Non-Freeze wall hydrant shall be Model No. 5609QT as manufactured by J.R. Smith or approved

## 2.04 DRAIN VALVES

### A. Hose-End Drain Valves: MSS SP-110, NPS 3/4 ball valve, rated for 400-psig minimum CWP. Include two-piece, copper-alloy body with standard port, chrome-plated brass ball, replaceable seats and seals, blowout-proof stem, and vinyl-covered steel handle.

1. Inlet: Threaded or solder joint
2. Outlet: Short-threaded nipple with ASME B1.20.7, garden-hose threads and cap

### B. Hose-End Drain Valve: MSS SP-80, gate valve, Class 125, ASTM B 62 bronze body, with NPS 3/4 threaded or solder-joint inlet and ASME B1.20.7, garden-hose threads on outlet and cap. Hose bibbs are prohibited for this application.

## 2.05 MISCELLANEOUS PIPING SPECIALTIES

- A. Water Hammer Arresters: ASSE 1010 or PDI-WH 201, metal-bellows type with pressurized metal cushioning chamber. Sizes indicated are based on ASSE 1010 or PDI-WH 201, Sizes A through F.
1. Manufacturers
    - a. Josam Co.
    - b. Smith, Jay R. Mfg. Co.
    - c. Tyler Pipe; Wade Div.
    - d. Zurn Industries, Inc.; Specification Drainage Operation
    - e. Or approved equal
- B. Hose Bibbs: Bronze body with replaceable seat disc complying with ASME A112.18.1M for compression-type faucets. Include NPS 1/2 or NPS 3/4 threaded or solder-joint inlet, of design suitable for pressure of at least 125 psig; integral [or field-installed,] nonremovable, drainable hose-connection vacuum breaker; and garden-hose threads complying with ASME B1.20.7 on outlet.
1. Finish for Equipment Rooms: Rough bronze
  2. Finish for Service Areas: Chrome or nickel plated
  3. Finish for Finished Rooms: Chrome or nickel plated
  4. Operation for Equipment Rooms: Wheel handle or operating key
  5. Operation for Service Areas: Wheel handle
  6. Operation for Finished Rooms: Wheel handle
  7. Include operating key with each operating-key hose bibb
  8. Include integral wall flange with each chrome- or nickel-plated hose bibb
- C. Air Vents: Float type for automatic air venting.
1. Bolted Construction: Bronze body with replaceable, corrosion-resistant metal float and stainless-steel mechanism and seat; threaded NPS 1/2 minimum inlet; 125-psig minimum pressure rating at 140 deg F; and threaded vent outlet.
- D. Roof Flashing Assemblies: Manufactured assembly made of 6-lb/sq. ft., 0.0938-inch- thick, lead flashing collar and skirt extending at least 8 inches from pipe with galvanized steel boot reinforcement, and counterflashing fitting.
1. Manufacturer: Acorn Engineering Company; Elmdor/Stoneman Div. or approved equal
  2. Open-Top Vent Cap: Without cap
  3. Low-Silhouette Vent Cap: With vandal-proof vent cap
  4. Extended Vent Cap: With field-installed, vandal-proof vent cap

- E. Open Drains: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron, soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting, joined with ASTM C 564, rubber gaskets.
- F. Floor-Drain Inlet Fittings: Cast iron, with threaded inlet and threaded or spigot outlet, and trap seal primer valve connection.
- G. Stack Flashing Fittings: Counterflashing-type, cast-iron fitting, with bottom recess for terminating roof membrane, and with threaded or hub top for extending vent pipe.
- H. Vent Caps: Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and set-screws to secure to vent pipe.
- I. Vent Terminals: Commercially manufactured, shop- or field-fabricated, frost-proof assembly constructed of galvanized steel, copper, or lead-coated copper. Size to provide 1-inch enclosed air space between outside of pipe and inside of flashing collar extension, with counterflashing.

## 2.06 SLEEVE PENETRATION SYSTEMS

- A. Manufacturer: ProSet Systems, Inc. or approved equal.
- B. Description: UL 1479, through-penetration firestop assembly consisting of sleeve and stack fitting with firestopping plug.
  - 1. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
  - 2. Stack Fitting: ASTM A 48, gray-iron, hubless-pattern, wye-branch stack fitting with neoprene O-ring at base and gray-iron plug in thermal-release harness in branch. Include PVC protective cap for plug.
    - a. Special Coating: Include corrosion-resistant interior coating on fittings for plastic chemical waste and vent stacks.

## 2.07 FLASHING MATERIALS

- A. Lead Sheet: ASTM B 749, Type L51121, copper bearing, with the following minimum weights and thicknesses, unless otherwise indicated:
  - 1. General Use: 4-lb/sq. ft., 0.0625-inch thickness
  - 2. Vent Pipe Flashing: 3-lb/sq. ft., 0.0469-inch thickness
  - 3. Burning: 6-lb/sq. ft., 0.0938-inch thickness

- B. Copper Sheet: ASTM B 152, of the following minimum weights and thicknesses, unless otherwise indicated:
  - 1. General Applications: 12 oz./sq. ft..
  - 2. Vent Pipe Flashing: 8 oz./sq. ft..
- C. Zinc-Coated Steel Sheet: ASTM A 653/A 653M, with 0.20 percent copper content and 0.04-inch minimum thickness, unless otherwise indicated. Include G90 hot-dip galvanized, mill-phosphatized finish for painting if indicated.
- D. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil minimum thickness
- E. Fasteners: Metal compatible with material and substrate being fastened
- F. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.
- G. Solder: ASTM B 32, lead-free alloy
- H. Bituminous Coating: SSPC-Paint 12, solvent-type, bituminous mastic

## 2.08 CLEANOUTS

- A. Comply with ASME A112.36.2M ASME A112.3.1.
- B. Cleanouts shall conform to the features of the cleanouts contained in the schedule below. The manufacturer's numbers are for the purpose of type only. The Contractor shall submit manufacturer product technical data for each type required before installation for approval.
  - 1. Gasket seal plugs will not be accepted in place of taper thread plugs.
- C. Cleanout plugs shall be bronze and countersunk type with taper screw threads.
- D. Cleanouts for cast iron pipe and galvanized steel pipe in exposed horizontal runs and accessible hung ceilings shall be as follows:
- E. Cleanouts for membrane waterproof floors shall be furnished with an integrally cast flashing flange with flashing clamp. Cleanouts in unfinished areas shall have cast iron tops and covers and in finished areas shall have nickel bronze tops and covers.

## Cleanout Schedule:

<u>Location</u>	<u>Piping</u>	<u>Figure Number</u> Or Approved Equal
Wall	Exposed Cast Iron	Smith 4420 Wade W-8550-D MIFAB C1450
Wall	Exposed Steel	Smith 4470 Wade W-8590-D MIFAB C1430
Wall	Concealed Cast Iron	Smith 4532-U Wade W-8460-R MIFAB C1460RD-6
Wall	Concealed Steel	Smith 4472-U Wade W-8590-E MIFAB C1430-RD-6
Floor-Concrete	Steel or Cast Iron	Smith 4248-U Wade W-6010-Z MIFAB C1100-XR
Floor-Asphalt Tile	Cast Iron	Smith 4168-U Wade W-6010-TS MIFAB C1100-TS
Floor-Terrazzo	Cast Iron	Smith 4188-U Wade W-7040-U MIFAB C1100
Floor-General Finished Area	Cast Iron	Smith 4028-U Wade W-6010-TS MIFAB C1100
Outside Grade Cast		Smith 4258 Wade W-8300-MF FAB C1300 w/C1230

## F. Cleanouts and Cleaning Screw Plugs for Acid Drainage Piping

1. Cleanouts flush with floor shall be silicon iron. All other cleanouts shall be of the same materials and by the same manufacturer as the piping to which they are connected.

2. Wall access covers shall be Jay R. Smith Fig. 4735-NB-U, Wade W-8480-S-5 or MIFAB C1400-S-1. Floor access cleanout covers shall Jay R. Smith Fig. 4930-U, Wade W-8300-S-1-5 or MIFAB C1300-S-1. Provide spanner type vandal proof screws for access covers.

## 2.09 FLOOR DRAINS

- A. Type A: (Toilet Room/Shower stall drains) shall be cast iron with double drainage flange and seepage openings, bottom outlet connection, flashing clamp device, and 6" round adjustable strainer of high polished brass or bronze. Individual shower compartments use a 6" round adjustable strainer of high polished nickel bronze. Drains shall be Smith 2010-A, Zurn Z-415-103-VP, Josam 30000-6A-X (shower), Josam 30000-6A-2-X (toilet), Wade W-1100 or MIFAB F1000C.
- B. Type B: (Boiler Room, Mechanical Spaces, Meter Rooms) shall be cast iron, triple drainage, bottom outlet caulk connection, medium duty round grate and slotted sediment bucket with 3/8" or 1/4" bottom drainage openings, so designed that grate cannot be set unless bucket is in position. Drains shall be Smith 2230, Zurn Z-540-Z-VP, Wade W-1210-TD, Josam 32220-17-X or MIFAB F1340-Y-14-5.
- C. Type C: (Tipping Floor, Pier Level) shall be cast iron, flashing collar, adjustable top, seepage opening, removable cast iron deep sediment bucket, seepage opening, caulk opening, slotted heavy duty cast iron grate, H2O loading, Smith Fig. No. 2488 or approved equal.
- D. Type D: Same (Loading Floor Level) same as Type C except with diamond plate non-skid hinged cover plate with lifting handle. Smith Fig. No SQ-2-2289 or approved equal.
- E. Type E: (Ejector Room) shall be cast iron drain with stainless steel 4" funnel, triple drainage, bottom outlet caulk connection, medium duty round grate and slotted sediment bucket with 3/8" or 1/4" bottom drainage openings, so designed that grate cannot be set unless bucket is in position. Drains shall be Smith 2230 & 9703 or approved equal.

## 2.10 TRENCH DRAINS

- A. Trench shall be aqueduct type, built in continuous 0.25% channel slope as indicated on drawings.
- B. Trench drain channels shall be manufactured from fiberglass reinforced plastic.
- C. Fiberglass channel shall have an interior surface coefficient or roughness of 0.010.
- D. Grating shall be manufactured of ASTM A536 ductile iron and certified to a proof loading of 200,000 lbs. Grating shall have a minimum open area of 40 square inches per linear foot.

- E. Grates shall be locked down on each side with stainless steel bolts at least  $\frac{1}{2}$ " diameter spaced a maximum of 18" on center.
- F. Grate frames shall be fabricated from Z-profile shapes made from  $\frac{1}{4}$ "-thick ASTM A36 steel with compatible headed stud concrete anchors on both sides spaced a maximum of 18" on center. Grate frames shall be of all welded construction, coated in conformance with the provisions of Section 09967. Exposed edges of frame facing trench shall be ground to a radius of  $\frac{1}{8}$ ". Rear edges of frame facing concrete shall be beveled to a bevel face of 0.05 inches with no fins either side of edge.
- G. Joints between channels shall be sealed during installation with polyurethane joint sealant as furnished by the trench drain system manufacture.
- H. Trench drain shall be Aquaduct Custom 8" as Manufactured by Aquaduct, Inc. meeting the above requirements, or approved equal.
- I. Submit detail shop drawing for approval prior to fabrication.

## 2.11 GUTTER DRAINS

- A. Terrace Drains: Comply with ASME A112.21.2M.
  - 1. Application: Gutter drains
  - 2. Product: Smith, Jay R. Mfg. Co.; DX-1010 or approved equal
  - 3. Delete features below if not required
  - 4. Body Material: Duct Cast iron
  - 5. Dome Material: Polyethylene
  - 6. Size: 20" diameter wide flange
  - 7. Combination Flashing Ring and Gravel Stop: Not Required
  - 8. Outlet: Bottom
  - 9. Sump Receiver: Required
  - 10. Dome: Required
  - 11. Extension Collars: Required
  - 12. Underdeck Clamp: Required

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Refer to Section 15050 - Basic Mechanical Materials and Methods for piping joining materials, joint construction, and basic installation requirements.
- B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
  - 1. Locate backflow preventers in same room as connected equipment or system.

2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
  3. Do not install bypass piping around backflow preventers.
  4. Install all backflow preventers in accordance with New York City Department of Environmental Protection.
- C. Install pressure regulators with inlet and outlet shutoff valves and balance valve bypass. Install pressure gages on inlet and outlet.
- D. Install strainers on supply side of each control valve, pressure regulator, and solenoid valve.
- E. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:
1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
  2. Locate at each change in direction of piping greater than 45 degrees.
  3. Locate at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
  4. Locate at base of each vertical soil and waste stack.
- F. Install cleanout deck plates with top flush with finished floor, for floor cleanouts for piping below floors.
- G. Install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall, for cleanouts located in concealed piping.
- H. Install flashing flange and clamping device with each stack and cleanout passing through floors with waterproof membrane.
- I. Install vent flashing sleeves on stacks passing through roof. Secure over stack flashing according to manufacturer's written instructions.
- J. Install frost-proof vent caps on each vent pipe passing through roof. Maintain 1-inch clearance between vent pipe and roof substrate.
- K. Install trench drains system in strict accordance with manufacture's recommendations. Submit detail shop drawing for approval prior to beginning the installation.

- L. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
  - 1. Position floor drains for easy access and maintenance.
  - 2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:
    - a. Radius 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
    - b. Radius 30 to 60 Inches: Equivalent to 1 percent slope.
    - c. Radius 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1-inch total depression.
  - 3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
  - 4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.
- M. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions.
  - 1. Install roof-drain flashing collar or flange so no leakage occurs between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
  - 2. Position roof drains for easy access and maintenance.
- N. Fasten wall-hanging plumbing specialties securely to supports attached to building substrate if supports are specified and to building wall construction if no support is indicated.
- O. Fasten recessed-type plumbing specialties to reinforcement built into walls.
- P. Install wood-blocking reinforcement for wall mounting and recessed-type plumbing specialties.
- Q. Install individual shutoff valve in each water supply to plumbing specialties. Use ball, gate, or globe valve if specific valve is not indicated. Install shutoff valves in accessible locations. Refer to Section 15112 - Valves Smaller than 4 Inches for general-duty ball, butterfly, check, gate, and globe valves.
- R. Install air vents at piping high points. Include ball, gate, or globe valve in inlet and drain piping from outlet to floor drain.

- S. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.
- T. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

### 3.02 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Connect plumbing specialties to piping specified in other Division 15 Sections.
- D. Ground equipment.
- E. Connect plumbing specialties and devices that require power according to Division 16 Sections.

### 3.03 FLASHING INSTALLATION

- A. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:
  - 1. Lead Sheets: Burn joints of lead sheets 6-lb/sq. ft., 0.0938-inch thickness or thicker. Solder joints of lead sheets 4-lb/sq. ft., 0.0625-inch thickness or thinner.
  - 2. Copper Sheets: Solder joints of copper sheets.
- B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
  - 1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of 10 inches, and skirt or flange extending at least 8 inches around pipe.
  - 2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches around sleeve.
  - 3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches around specialty.
- C. Set flashing on floors and roofs in solid coating of bituminous cement.
- D. Secure flashing into sleeve and specialty clamping ring or device.

- E. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Section 07620 - Sheet Metal Flashing and Trim.
- F. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.
- G. Fabricate and install flashing and pans, sumps, and other drainage shapes.

3.04 LABELING AND IDENTIFYING

- A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each backflow preventer.
  - 1. Text: Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.
  - 2. Refer to Section 15076 – Piping and Equipment Identification for nameplates and signs.

3.05 PROTECTION

- A. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15444**  
**PACKAGE BOOSTER PUMPS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. This Section includes constant-speed, triplex, packaged booster pumps for domestic water piping systems.

**1.02 SUBMITTALS**

- A. **Product Data:** For each packaged booster pump specified. Include certified performance curves with operating points plotted on curves; and rated capacities of selected models, furnished specialties, and accessories.
- B. **Shop Drawings:** For packaged booster pumps and accessories. Include plans, elevations, sections, details, and attachments to other work.
1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
  2. **Design Calculations:** Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
  3. **Vibration Isolation Base Details:** Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails and equipment mounting frames.
  4. **Wiring Diagrams:** Detail power, signal, and control wiring.
- C. **Manufacturer Seismic Qualification Certification:** Submit certification that packaged booster pumps, accessories, and components will withstand seismic forces. Include the following:
1. **Basis for Certification:** Indicate whether withstand certification is based on actual test of assembled components or on calculation.
    - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
  2. **Dimensioned Outline Drawings of Equipment Unit:** Identify center of gravity and locate and describe mounting and anchorage provisions.
  3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- D. Operation and Maintenance Data: For each packaged booster pump to include in emergency, operation, and maintenance manuals.

#### 1.03 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of packaged booster pumps and are based on the specific system indicated.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. ASME Compliance: Comply with ASME B31.9 for piping.
- D. Packaged booster pumps shall be listed and labeled as pumping systems by testing agency acceptable to authorities having jurisdiction.

#### 1.04 DELIVERY, STORAGE, AND HANDLING

- A. Retain shipping flange protective covers and protective coatings during storage.
- B. Protect bearings and couplings against damage.
- C. Comply with pump manufacturer's written rigging instructions for handling.

#### 1.05 COORDINATION

- A. Coordinate size and location of concrete bases with the Structures and Equipment Contractor.

### PART 2 PRODUCTS

#### 2.01 CONSTANT-SPEED, MULTIPLEX PACKAGE BOOSTER SYSTEM, (A-DWP-01) A-DWP-1A, A-DWP-1B, A-DWP-1C

- A. Manufacturers
  - 1. Alyan Pump Company
  - 2. Federal Pump Corp.
  - 3. Amtrol Inc.
  - 4. Hydronic Modules Corporation
  - 5. Paco Pumps, Inc.
  - 6. Thrush Company, Inc.
  - 7. Tigerflow, Inc.
  - 8. Or approved equal
- B. Description: Factory-assembled and -tested, packaged booster pump with multiple pumps, piping, valves, sensors, and controls on skids or base.

- C. Furnish and install where shown on the plans and pump schedule. Factory assembled water booster system on a common steel base with vibration isolators or approved equal. It shall include 3 close-coupled bronze fitted end suction centrifugal pumps.
- D. The 2 main pumps shall have a 1-1/2" combination pressure and check valve and the size of the jockey pump shall be 1-1/2" combination pressure and check valve. Each pump shall have shut-off isolation valves and on the discharge size of each pump there shall be a pressure gauge. The pressure and check valves and shut-off valves shall face the front of the unit, which is the motor end of the pumps. The suction and discharge headers shall be 2-1/2" copper with flanged connections. Shipped loose shall be two 2-1/2" Model SF stainless steel flexible connectors, 18" long each. Each header shall be provided with a pressure gauge and the discharge header shall include a mercoird pressure switch to operate the pumps. Each pump shall be provided with a temperature and purge valve, which will be piped to the nearest floor drain.
- E. The Unit shall include a Federal Pump Corp. Model FXA-500, 132 Gal. Cushion Stop Tank with rating of 125 psi and carry an ASME Label. The size of the tank shall be 30" Dia. x 57" High. This tank will operate off the jockey pump with a separate pressure switch and gauge. The Unit shall be factory assembled on a common steel base with vibration isolators.
- F. The unit shall include a mounted and wired NEMA-1 Triplex Control Panel. The bottom of the panel shall be mounted at the same level as the discharge header. In no way shall the panel obstruct the pump piping and instrumentation. The panel will include 3 circuit breakers, 3 magnetic starters, 3 HOA selector switches, 3 pilot lights, 1 alarm section with red light, bell and silencer, 1 lead-lag manual transfer switch, required transformers, holding circuits, time delays, terminal switch and main pump control pressure switch, low-suction pressure cut-out switch with front panel, indicator light and required circuitry to stop the pumps, if the suction pressure drops below a predetermined minimum level. The panel shall include a lead pump failure circuit, which will automatically make the next pump the lead pump. The panel shall include automatic alternation every 24 hours for the 2 main pumps.
- G. The jockey pump shall operate continuously and its control valve shall maintain the systems pressure. As water demand in the building increases beyond the ability of the jockey pump to satisfy it, the system pressure will drop, causing the lead main pump to start and operate in parallel with the jockey pump. After a set time delay period, the second main pump will start and operate in parallel with the other 2 pumps. After a set minimum time, or when the demand in the building drops sufficiently to allow the jockey pump to satisfy it alone, the main pumps will shutdown. The operating sequence of the main pumps shall alternate every 24 hours.
- H. The manufacturer shall include start-up and instructions and warrantee the entire unit, both labor and material, for one year against factory defects.
- I. See drawings for Package Booster Pump schedule.

- J. The unit shall have the New York Approval MEA NO.7 41-50SA.

## 2.02 FLEXIBLE CONNECTORS

### A. Manufacturers

1. Anamet, Inc.
2. Flex-Hose Co., Inc.
3. Flexicraft Industries.
4. Flex-Pression, Ltd.
5. Flex-Weld, Inc.
6. Hyspan Precision Products, Inc.
7. Mercer Rubber.
8. Metraflex, Inc.
9. Proco Products, Inc.
10. Tozen America Corporation.
11. Unaflex Inc.
12. Or approved equal

- B. Description: Corrugated, bronze inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze-welded to tubing. Include 150-psig minimum working-pressure rating and ends according to the following:

1. NPS 2 and Smaller: Threaded. Provide flanged ends if pump has flanged connections.
2. NPS 2-1/2 and Larger: Flanged.

## 2.03 BUILDING-AUTOMATION-SYSTEM INTERFACE

- A. Provide auxiliary contacts in pump controllers for interface to building SCADA system. Contacts shall be SPDT, rated 5A at 120 Volts, contacts to relay all alarms conditions as a single group "Trouble" alarm signal Include the following:

1. Low pressure of each pump.
2. Failure of any pump

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine roughing-in for packaged booster pumps to verify actual locations of connections before booster pump installation.

### 3.02 BOOSTER PUMP INSTALLATION

- A. Install packaged booster pumps level on concrete bases with access for periodic maintenance including removal of pumps, motors, impellers, couplings, and accessories.
  - 1. Do not dismantle packaged booster pumps or remove individual components.
- B. Vibration Isolation: Install on spring isolators with minimum deflection of Vibration isolation devices.
- C. Support connected domestic water piping so weight of piping is not supported by packaged booster pumps.

### 3.03 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect domestic water piping to packaged booster pumps. Install suction and discharge pipe equal to or greater than size of unit suction and discharge headers piping.
  - 1. Install flexible connectors on piping connections to unit suction and discharge piping. Install flexible connectors same size as piping.
  - 2. Install shutoff valves on piping connections to each booster pump suction and discharge headers piping. Install ball, or gate valves same size as suction and discharge headers piping. General-duty valves are specified in Section 15110 - Plumbing Valves.
  - 3. Install union or flanged connections on pump suction and discharge headers piping at connection to domestic water piping.
  - 4. Install piping adjacent to packaged booster pumps to allow service and maintenance.
- C. Ground equipment according to Section 16060 - Grounding.
- D. Connect wiring according to Section 16121 - Wires and Cables - 600 Volt and Below.

### 3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform the following startup service:
  - 1. Complete installation and startup checks according to manufacturer's written instructions.

2. Check piping connections for tightness.
  3. Clean strainers if any.
  4. Verify that pump controls are correct for required application.
- B. Perform the following startup checks for each pump of packaged booster pump unit before starting:
1. Verify bearing lubrication.
  2. Prime pumps by opening suction valves and closing discharge valves, and prepare pumps for operation.
  3. Start motors.
  4. Open discharge valves slowly.
  5. Adjust settings.
- C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting packaged booster pumps to suit actual occupied conditions. Provide up to two visits to Project outside normal occupancy hours for this purpose.

### 3.05 LABELING AND IDENTIFICATION

- A. Install identifying equipment markers and equipment signs on booster pumps. Labeling and identification materials are specified in Section 15076 – Piping and Equipment Identification.

### 3.06 DEMONSTRATION

- A. Engage a factory-authorized service representative to train the City of New York's maintenance personnel to adjust, operate, and maintain packaged booster pumps. Refer to Sections 01781 – Project Closeout and 01821 - Training.

-END OF SECTION-

**Section 15486**  
**DOMESTIC WATER HEATERS**

**PART 1 GENERAL****1.01 SUMMARY**

A. This Section includes the following for domestic water systems:

1. Commercial, copper fin tube gas water heaters with storage tank
2. Commercial, instantaneous water heater
3. Commercial, electric water heaters
4. Accessories

**1.02 SUBMITTALS**

- A. Product Data: For each type and size of water heater. Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.
- B. Shop Drawings: Detail water heater assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
1. Wiring Diagrams: Power, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring.
- C. Product Certificates: Signed by manufacturers of water heaters certifying that products furnished comply with requirements.
- D. Maintenance Data: For water heaters to include in maintenance manuals specified in Division 1.
- E. Warranties: Special warranties specified in this Section.

**1.03 QUALITY ASSURANCE**

- A. Source Limitations: Obtain same type of water heaters through one source from a single manufacturer.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of water heaters and are based on specific units indicated. Other manufacturers' products complying with requirements may be considered. Refer to Section 01631 – Equivalent Materials and Equipment.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- D. ANSI Compliance: Provide gas water heaters that comply with ANSI standards for gas water heaters and related products and that bear AGA certification label.
- E. ASME Compliance: Fabricate and label water heater, hot-water storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.
- F. ASHRAE Standards: Comply with performance efficiencies prescribed for the following:
  - 1. ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings," for commercial water heaters.
  - 2. ASHRAE 90.2, "Energy Efficient Design of New Low-Rise Residential Buildings," for household water heaters.

#### 1.04 WARRANTY

- A. General Warranty: Special warranty specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace components of water heaters that fail in materials or workmanship within specified warranty period.
  - 1. Failures include storage tanks, circulators, burner assemblies.
  - 2. Warranty Period: From date of Substantial Completion:
    - a. Storage Tanks: 10 years
    - b. Circulators: Eight years
    - c. Burner Assemblies: Five years

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Commercial, Storage, Atmospheric-Vent, Gas Water Heaters:
    - a. American Water Heater Co.
    - b. Bock Water Heaters, Inc.
    - c. Bradford White Corp.
    - d. Lochinvar Corp.

- e. Rheem Manufacturing Co.; Rheem Water Heater Div.
- f. Smith: A. O. Smith Water Products Co.
- g. Or approved equal

2.02 DOMESTIC HOT WATER HEATER PACKAGE SYSTEM. A-HWH-01.

- A. The domestic hot water heater shall be a package system, as shown on the Drawings. Package system shall consist of a water heater, a jacketed and insulated lock temp Storage Tank, an all bronze circulating pump, inlet and outlet ball valves and an ASME temperature and pressure relief valve. Entire assembly shall be pre piped, assembled and skid-mounted, pressure tested and ready for installation. Components shall be as follows:

1. The water containing section shall be of a "Fin Tube" design, with straight pure copper tubes having extruded integral fins spaced seven (7) fins per inch. The tubes shall be securely rolled into a one piece, glass-lined, cast iron header. There shall be no bolts, gaskets or "O" rings in the header configuration. There shall be free access to either end of the heat exchanger for purposes of inspection, cleaning, or repair. The heat exchanger shall be mounted on a stress free jacket assembly in order to provide a "free floating" design, able to withstand the effects of thermal shock. The water heater shall bear the ASME "HLW" stamp for 160 psi working pressure and shall be National Board listed. The complete heat exchanger assembly shall carry a three (3) year limited warranty against failure caused by defective workmanship or material. The water heater shall be equipped with a factory installed circulating pump of sufficient capacity to ensure scale free performance. The pump shall be all bronze and provided for operation on 120 volt, 60 cycle, 1 phase power supply.
2. The combustion chamber shall be enclosed with a high temperature resistant, 1" thick, "Loch Heat™" ceramic fiberboard insulation which shall be modular for ease of replacement in sections. The burners shall be constructed of stainless steel and fire on a horizontal plane.
3. The water heater shall be constructed with a heavy gauge galvanized steel jacket assembly, primed and pre-painted on both sides with a minimum dry film thickness of 0.70 mills. The unit shall have a built in draft diverter contained entirely within the jacket, and requiring no additional external draft hood devices.
4. The water heater shall be certified and listed by CSA International under the latest edition of the harmonized ANSI Z21.10.3 test standard for the US and Canada. The water heater shall comply with the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. The water heater shall operate at a minimum of 82% thermal efficiency.
5. Standard operating controls and equipment shall include 100% safety pilot shutdown, dual adjustable high limit controls, and combination gas valve

with redundant seats, main and pilot gas regulators, 24-volt control circuit, ASME temperature and pressure relief valve. The manufacturer shall verify proper operation of the burners, all controls and the heat exchanger by connection to water and venting for a factory fire test prior to shipping. A quality test report shall be shipped with each unit.

6. The Firing Control System shall be with intermittent spark ignition with Electronic Flame Supervision.
  7. The circulating pump shall be all bronze and operate on a 120 volt, 60 cycle, 1 phase power supply. The pump shall be wired to run with intermittent pump operation.
  8. Storage tank shall be a vertical Lochinvar tank having a storage capacity as indicated on drawings. The tank shall be constructed with an inner chamber designed to receive all circulation to and from the water heater. The baffled tank shall supply 80% of tank capacity without a drop in outlet temperature. A-HWS-01.
  9. The storage tank shall be constructed in accordance with ASME requirements, if ASME, stamped and registered with the National Board of Boiler and Pressure Vessel Inspectors. The storage tank shall have a working pressure of 125 psi standard for ASME tanks. The storage tank shall be glass lined and fired to 1600°F to ensure a molecular fusing of glass and steel, and carry a five (5) year warranty. The tank shall be constructed with a heavy gauge galvanized steel jacket assembly, primed and pre-painted on both sides with a minimum dry film thickness of 0.70 mils. The jacket and tank base shall be a watertight construction with a built-in drain pan, complete with a 3/4" drain connection to assist in protecting against damage in the event of a tank or component leakage. The Storage Tank shall be completely encased in high-density insulation of sufficient thickness to meet the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. The entire assembly shall be mounted on "T" beam skids to facilitate handling and installation.
- 2.03 INSTANTANEOUS SINGLE POINT ELECTRIC WATER HEATER, A-HWH-02, A-HWH-03.
- A. Instantaneous water heaters shall be as shown on the drawings.
- 2.04 COMMERCIAL, POINT-OF-USE, STORAGE, ELECTRIC WATER HEATERS A-HWH-04, A-HWH-05, A-HWH-06.
- A. Description: Comply with UL 174 or UL 1453, and listed by manufacturer for commercial applications.

- B. Storage Tank Construction: ASME-code steel with 150-psig working-pressure rating.
  - 1. Tappings: Factory fabricated of materials compatible with tank for piping connections, relief valve, drain, anode rod, and controls as required. Attach tappings to tank before testing and labeling. Include ASME B1.20.1, pipe thread.
  - 2. Interior Finish: Materials and thicknesses complying with NSF 61, barrier materials for potable-water tank linings. Extend finish into and through tank fittings and outlets.
  - 3. Insulation: Comply with ASHRAE 90.1. Surround entire storage tank except connections and controls.
  - 4. Jacket: Steel, with enameled finish.
- C. Heating Elements: Two, unless otherwise indicated; electric, screw-in, immersion type.
  - 1. Temperature Control: Adjustable thermostat.
- D. Anode Rod: Factory installed, magnesium.
- E. Drain Valve: ASSE 1005, corrosion-resistant metal, factory installed.
- F. Energy cut-off: shuts off electrical power should the water temperature in tank reach 205°F.
- G. Temperature, pressure relief valve and gauge.
- H. High and low water pressure limit switches
- I. Handhole cleanout.
- J. Hinged access door
- K. See schedule on drawing for size.
- L. Provide electric contact for SCADA system.

## 2.05 WATER HEATER ACCESSORIES

- A. Combination Temperature and Pressure Relief Valves: According to the following:
  - 1. Gas Water Heaters: ANSI Z21.22, combination temperature and pressure relief valve.

2. Option: Separate temperature and pressure relief valves are acceptable instead of combination relief valve.
  3. Exception: Omit combination temperature and pressure relief valve for tankless water heater, and furnish pressure relief valve for installation in piping.
- B. Pressure Relief Valves
1. Gas Water Heaters: ANSI Z21.22 pressure relief valve for storage tanks of 200,000 Btuh.
- C. Vacuum Relief Valves
1. Gas Water Heaters: ANSI Z21.22.
  2. Exception: Omit if water heater has integral vacuum-relieving device.
- D. Gas Shutoff Valves: ANSI Z21.15, manually operated. Furnish for installation in piping.
- E. Gas Pressure Regulators: ANSI Z21.18, appliance type, factory or field installed. Include pressure rating, capacity, and pressure differential required for water heater and gas supply.
- F. Automatic Valves: ANSI Z21.21, appliance, electrically operated, on-off automatic valve.
- G. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE 90.1 or ASHRAE 90.2.

### PART 3 EXECUTION

#### 3.01 WATER HEATER INSTALLATION

- A. Install commercial water heaters on concrete bases.
1. Exception: Omit concrete bases for commercial water heaters if installation on stand, bracket, suspended platform, or direct on floor is indicated.
- B. Install water heaters, level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.
- C. Anchor water heaters to substrate.
- D. Install seismic restraints for water heaters. Anchor to substrate.

- E. Install and connect gas water heaters according to NFPA 54.
  - 1. Install appliance, gas pressure regulators on gas-burner inlets of water heaters without pressure regulators.
- F. Install temperature and pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend relief valve outlet with water piping in continuous downward pitch and discharge onto closest floor drain.
- G. Install pressure relief valves in water piping for water heaters without storage. Extend relief valve outlet with water piping in continuous downward pitch and discharge onto closest floor drain.
- H. Install vacuum relief valves in cold-water-inlet piping.
- I. Install vacuum relief valves in water heater storage tanks that have copper lining.
- J. Install water heater drain piping as indirect waste to spill into open drains or over floor drains. Install hose-end drain valves at low points in water piping for water heaters that do not have tank drains. Refer to Section 15430 "Plumbing Specialties" for drain valves.
- K. Install thermometers on water heater inlet and outlet piping. Refer to Section 15122 - Meters and Gages for thermometers.
  - 1. Exception: Omit thermometers for the following:
    - a. Commercial, point-of-use, water heater inlet piping.
- L. Install pressure gages on water heater piping. Refer to Section 15122 - Meters and Gages for pressure gages.
- M. Arrange for insulation on equipment and piping not furnished with factory-applied insulation.
- N. Install piping-type heat traps on inlet and outlet piping of water heater storage tanks without integral or fitting-type heat traps.
- O. Fill water heaters with water.

### 3.02 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.

- C. Connect hot- and cold-water piping with shutoff valves and unions. Connect hot-water-circulating piping with shutoff valve, check valve, and union.
- D. Connect gas piping to gas burner with drip leg, tee, shutoff valve, and union; minimum size same as inlet connection.
- E. Make connections with dielectric fittings where piping is made of dissimilar metal.
- F. Gas, Water Heater Vent Connections: Connect to vent system. Include draft hoods and diverters where required. Use vents same size as or larger than water heater outlets, but not smaller than indicated unless smaller vent size has been calculated according to NFPA 54. Comply with gas utility requirements for sizing. Gas vents are specified in Section 15550 - Breechings, Chimneys, and Stacks.
- G. Electrical Connections: Power wiring and disconnect switches are specified in Division 16 Sections. Arrange wiring to allow unit service.
- H. Ground equipment.
  - 1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### 3.03 FIELD QUALITY CONTROL

- A. Engage a factory-authorized service representative to perform startup service.
- B. In addition to manufacturer's written installation and startup checks, perform the following:
  - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment and retest until satisfactory results are achieved.
  - 2. Verify that piping system tests are complete.
  - 3. Check for piping connection leaks.
  - 4. Check for clear relief valve inlets, outlets, and drain piping.
  - 5. Check operation of circulators.
  - 6. Test operation of safety controls, relief valves, and devices.
  - 7. Energize electric circuits.
  - 8. Adjust operating controls.

9. Adjust hot-water-outlet temperature settings. Do not set above 140 deg F unless piping system application requires higher temperature.

3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train the City of New York's maintenance personnel to adjust, operate, and maintain water heaters.
  1. Train the City of New York's maintenance personnel on procedures for starting and stopping trouble-shooting, servicing, and maintaining equipment. Refer to Section 01821 - Training
  2. Review data in maintenance manuals. Refer to Section 01781 - Project Closeout.
  3. Review data in maintenance manuals. Refer to Section 01831 - Operation and Maintenance Manuals.
  4. Schedule training with the City of New York with at least seven days' advance notice.

-END OF SECTION-

**Section 15540**  
**FUEL FIRED HEATERS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Indirect gas fired heat modules, and high intensity infrared heaters, their accessories and controls as required for a complete installation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15071 - Vibration Control
- B. Section 15190 - Fuel Gas Piping
- C. Section 15550 - Breechings, Chimneys and Stacks
- D. Section 15551 - Chimney Automation System
- E. Section 15810 - Ductwork
- F. Section 15900 - HVAC Controls
- G. Section 15950 - Testing, Adjusting and Balancing
- H. Section 16220 - Electric Motors

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. NFPA 90B - Installation of Warm Air Heating and Air Conditioning Systems
  - 2. NFPA 211 - Chimneys, Fireplaces, Vents and Solid Fuel Burning Appliances
  - 3. ANSI Z223.1 - National Fuel Gas Code
  - 4. MIL WW-F-2743 - Furnaces, Warm Air Heaters, Unit Forced Air Circulation, Oil- and Gas-Fired
  - 5. NFPA 90A - Installation of Air Conditioning and Ventilating Systems

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Section 01330 - Shop Drawings.
- B. Product Data: Submit catalog product data indicating rated capacities, dimensions, weights, accessories, materials and finishes, electrical requirements, and wiring diagrams.

- C. Shop Drawings: Submit shop drawings indicating assembly, equipment locations, required clearances, and location and size of field connections.
- D. Operation and Maintenance Data: Submit manufacturer's descriptive literature including installation and operation instructions, controls, accessories, maintenance and repair data and parts listing.

#### 1.05 QUALITY ASSURANCE

- A. Provide equipment from company specializing in design and manufacture of fuel-fired heaters which has a minimum of three (3) years documented experience and issues complete catalog data on these products.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Storage and Protection: Store products in their original shipping containers, with labeling in place until time of installation. Store products in clean, dry place and protect from physical damage.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Indirect Gas Fired Heat Modules
  - 1. The Trane Co.
- C. High Intensity Infrared Heaters
  - 1. Reznor
  - 2. Roberts Gordon, Inc.

#### 2.02 MATERIALS

- A. General: Provide factory assembled fuel fired heaters tested and finished, with all accessories necessary for a complete installation.

- B. Indirect Gas Fired Heat Modules: Provide indirect gas fired heating sections of size, capacity and arrangement shown and schedule meeting the following requirements:
1. The gas heat section shall be natural gas, indirect fired and shall be completely factory assembled, wired and tested at the factory before shipment. The indirect gas heater consists of the heat exchanger, power burner, gas train, flame management controls and control panel. The section shall bear UL label for Industrial Gas Heating Equipment ANSI/UL Standard 749 and Industrial Gas fired Package Units (CGA Standard 3.2-1976). It shall have double wall construction with fiberglass insulation and a burner access door on the same side as the fan motor access. All burner and control components shall be housed in the burner vestibule complete with a combustion air intake louver. It is an integral part of the entire air-handling system.
  2. The drum-and-tube heat exchanger shall be constructed of 14-gauge 409 stainless steel on both the primary and the secondary surfaces. The heat exchanger shall be a two-pass design for 200 - 1150 MBh and a four-pass design for 1250 - 2500 MBh. Both primary and secondary surfaces shall be constructed of a minimum of 14-gauge welded 409 stainless steel. Lighter metal gauges and non-stainless steel components will not be acceptable. Tubes shall be fitted with multi-plane metal turbulators. The heat exchangers shall be fitted with a flame viewing port and cleanout plate to facilitate cleaning and inspection of tubes and tubulators. A condensate drain connection shall be piped to the nearest floor drain.
  3. The burner shall be an industrial forced draft, full modulating type capable of efficient firing over its operating range without producing excessive CO, CO<sub>2</sub> or NO<sub>x</sub>. It shall be fitted with a combustion air damper assembly for control of fuel-air ration through its modulating range. The burner shall use a modulating gas valve design to provide precise capacity control. The combustion air damper and modulating gas valve shall be linked either internally or through a control linkage that is factory preset. Step-controlled gas valves and/or two-speed fan motors will not be acceptable. The burner shall have a low fire start interlock. A stainless steel multi-port diffuser and flame retention firing head combine to produce full-range, stable performance. The burner is equipped with a integrally mounted direct drive combustion blower, internal thermal overload protection and combustion air damper, which controls the fuel-air ration throughout the modulating range for efficient turndown. The burner shall be manufactured by Eclipse, Maxon, Power Flame, or approved equal, and be designed to fire natural gas with turndown ration of 10:1.
  4. The combustion blower shall be centrifugal type direct drive, capable of delivering the proper amount of combustion air to the burner nozzle. The blower motor shall have an internal thermal overload protection and an air

proving switch shall be mounted on the scroll, interlocking burner operation with the gas train controls to prevent burner operation when the combustion air fan is shut down. Where shown provide an induced draft exhaust fan for positive venting of combustion products. The induced draft fan shall be centrifugal type, capable of withstanding high temperatures associated with flue gas.

5. The heating section shall use a Honeywell 7800 series or approved equal flame relay to provide the flame safeguard programming. The flame relay shall have annunciation lights indicating pilot on, safeties satisfied, combustion airflow and flame failure. The flame relay shall have a pre-purge cycle, providing for a minimum of four air changes in the heat exchanger before ignition. An ultraviolet (UV) flame detector senses the presence of a flame. The flame relay shall have a spark-ignited gas pilot system to establish an intermittent pilot. The ignition transformer shall provide a 6000-volt spark.
6. The standard gas train shall meet UL and FM requirements and shall be Industrial Risk Insurers (IRI) approved designed for 7-14 in. WC incoming gas pressure. It components include the following:
  - a. Primary automatic gas safety shutoff valve with pressure taps
  - b. Gas pressure regulator
  - c. Secondary redundant automatic gas safety shutoff valve (above 400 MBH)
  - d. Modulating gas valve
  - e. Main gas shutoff valve with pressure tap and second ball shutoff cock
  - f. Gas pressure taps for servicing and adjusting burner
  - g. Pilot solenoid
  - h. Pilot gas pressure regulator
  - i. Pilot solenoid valve
  - j. Orifice plate
  - k. High gas pressure safety switch
  - l. Low gas pressure safety switch
  - m. Pilot gas pressure regulator

- n. Pilot gas solenoid
  - o. Pilot gas manual shutoff valve
7. The gas operating and safety controls shall include the following:
- a. Modulating actuator to drive the gas control valve and the combustion air damper
  - b. Electronic flame relay with UV flame sensor
  - c. High conditioned air temperature limit
  - d. Conditioned air flow interlock
  - e. Combustion air flow interlock
  - f. Low fire start relay
  - g. Control power transformer that allows the gas heat section to be powered by the same 3-phase voltage as the supply fan.
  - h. Digital readout annunciation module for flame relay. This consists of a plug-in module for the flame relay featuring two-line digital English language readout of over 50 parameters.
8. The flame relay shall be Honeywell Model 7895A or approved equal and shall be equipped with annunciation lights indicating pilot on, safeties satisfied, combustion airflow and flame failure. The unit shall have a purge cycle that provides a minimum of four air changes of the heat exchanger interior. The purge time shall not exceed four minutes. The heating system shall have an intermittent spark ignition to establish the pilot flame. The unit shall be programmed to start in low-fire mode.
9. The burner control panel is mounted in the burner vestibule. It houses the incoming power terminal block, circuit breaker, low start relay and numbered terminal strips. All wiring shall be factory pre-wired in flex conduit and numbered for ease of service. A circuit breaker serves as a disconnecting device and overcurrent protection.
10. Field connections shall required only main power (120 VAC or 3-phase with inducted draft fans), a heat start contact closure and a modulating 0-10 VDC (or optional 4-20 mA) signal.
- C. High Intensity Infrared Heaters: Provide infrared gas fired, high-intensity heaters to operate with natural gas with a 115 volt supply voltage approved by the

American Gas Association of the minimum size, heating and arrangement, meeting the following requirements:

1. Provide burner control system to have a direct spark ignition with a 100 percent safety shut-off and a solenoid gas valve with 1/2 inch N.P.T inlet.
2. Control unit operation as specified in Section 15900 - HVAC Controls.
3. Heater shall be of compact modular design and rugged construction consisting of the controls; a seamless aluminized steel plenum chamber with stainless steel ceramic tile retainer clips; surface combustion ceramic burner capable of full intensity temperature in less than 30 seconds; venturi mixer of spun metal construction for precision metering of air/gas mixture; highly polished parabolic reflector; balanced suspension holes; wire grid; and heat deflector shield.
4. The burner assembly shall be removable for cleaning or replacement. The ceramic combustion surface shall reach temperatures up to 185 degrees F and shall be design with alternating rows of precision perforations producing a shorter stable flame.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. General: Examine gas-fired heaters at time of delivery for damaged or missing components. Do not proceed with installation of units until all items found defective have been corrected.
- B. Power Supply: Verify that proper power supply is available.
- C. Gas Supply: Verify that proper gas supply is available for connection.

#### 3.02 INSTALLATION

- A. General: Install all units in accordance with manufacturer's instructions. Make all necessary adjustments to provide complete and satisfactory operation upon completion of installation.
- B. Vent Connections: Provide vent connections in accordance with requirements specified in Section 15550 - Breechings, Chimneys and Stacks.
- C. Vibration Controls: Install units with vibration isolation in accordance to Section 15071 - Vibration Control.
- D. Thermostats: Install thermostats in accordance with Section 15900 - HVAC Controls.

3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Services: Provide services of qualified representative of manufacturer as specified in Division 1 to inspect installation of equipment, certify that it met manufacturer's recommendations, and instruct operating personnel in its operation and maintenance.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15550**  
**BREECHINGS, CHIMNEYS, AND STACKS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Metal breechings, chimneys, stacks and vents and accessories for gas fired appliances.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15081 - Piping Insulation  
B. Section 15060 - Hangers and Supports  
C. Section 15540 - Fuel Fired Heaters

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
1. ASTM A 167 - Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
  2. ANSI Z223.1 - The National Fuel Gas Code
  3. ASHRAE - Handbook, Equipment Volume, Chapter "Chimney, Gas Vent, and Fireplace Systems"
  4. NFPA 82 - Incinerators, Waste and Linen Handling Systems and Equipment
  5. NFPA 211 - Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances
  6. SMACNA - HVAC Duct Construction Standards - Metal and Flexible
  7. UL 103 - Standard for Factory Built Low Heat Chimneys
  8. AWS D9.1 - Specifications for Welding Sheet Metal

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit product data including materials, dimensions, weights, and accessories.

- C. Shop Drawings: Submit shop drawings drawn to scale of not less than 1/4 inch representing one foot showing plans and sections, including required clearances, expansion flashing and counter-flashing, rustproof materials and finishes, assembly and installation instructions, and support details of all components as complete system.
- D. Quality Control
  - 1. Certificates: Submit certificates of materials compliance with specified ASTM, UL, and ASHRAE requirements.
  - 2. Certificates: Submit Welders' Qualification Certificates.
  - 3. Certificates: Submit a complete engineering report certifying that stacks meet design wind and seismic loads.

#### 1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide equipment from a company specializing in the manufacture of products specified in this Section with minimum three (3) years documented experience.
- B. Welder's Qualifications: Certify all welders in accordance with AWS Standard D9.1.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Single Wall Breeching Expansion Joints
  - 1. Metraflex Co.
- C. Breeching, Gas Vents, Chimneys and Stacks
  - 1. Selkirk Metalbestos
  - 2. Van Packer

#### 2.02 MATERIALS

- A. General: Except as otherwise indicated, provide manufacturer's standard breechings, gas vents, chimneys and stacks where shown, of size and type indicated, constructed of materials and components as indicated, and as required for complete installation.

- B. Single Wall Breeching: Fabricate breechings of black hot rolled steel with welded seams in accordance with SMACNA standards for breechings.
1. Fabricate breechings from following minimum gauges:
    - a. Sizes up to 14 inches - 16 gauge
    - b. Sizes over 14 to 16 inches - 14 gauge
    - c. Sizes over 16 to 18 inches - 12 gauge
    - d. Sizes over 18 inches - 10 gauge
  2. Provide adjustable self-actuating barometric dampers, full size of breeching.
  3. Provide bolted type cleanout doors, same gauge as the breeching.
  4. Weld longitudinal seams. Provide end joints with gasketed and bolted companion angle flanges. Construct flanges of a minimum 1-1/2 by 3/16 inch steel angles.
  5. Provide bellows type breeching expansion joints and breeching anchors. Provide packless Type 316L stainless steel expansion joints with steel flanged ends. Fabricate bellows as a hydraulically formed tube with longitudinal seams only. Provide rectangular joints with camera or bevel type corners. Design expansion joints to flex not less than 5000 cycles as installed without failure. Do not use bellows with circumferential seams. Provide expansion joints suitable for temperature of 650 degrees F and maximum pressure of 5 psig, designed to absorb thermal expansion of breeching between anchor points.
  6. Reinforce rectangular breeching with angle frames and round breechings with flanged joints or angle frames. Refer to SMACNA HVAC Duct Construction Standards.
  7. Fabricate breeching fittings to match adjoining breechings. Fabricate elbows with centerline radius equal to breeching diameter. Limit angular tapers to 20 degrees maximum.
  8. Insulate breechings in accordance with the requirements of the specifications Section 15081 - Piping Insulation.
- C. Double Wall Prefabricated Gas Vents, Chimneys and Stacks: Provide double wall prefabricated metal gas vents, chimneys and stacks, tested to UL 103 and UL listed, for use with building heating equipment burning gas and fuels, in compliance with NFPA 211.
1. Fabricate the gas vents, chimneys and stacks with 1 inch minimum air space between the walls. Construct the inner jacket of 20 gauge ASTM A 167

Type 316 stainless steel. Construct the outer jacket of 316 stainless steel 24 gauge for sizes 10 to 24 inches and 20 gauge for sizes 28 to 48 inches.

2. Provide accessories each bearing factory applied UL label including insulated fittings, roof support assembly, ventilated roof thimble, storm collar with tall flashing to fit the concrete curb, full angle ring with required supporting steel, drained tee cap, a half angle ring with threaded support rods, insulated exit cone, and an adapter to match the outlet flange of the heating equipment.
3. Seal the joints with silicone sealant rated for 600 degrees F temperature. Assemble gas vent, chimney and stack sections with V-type draw bands and formed channel bands, bolted together with Type 316 stainless steel bolts.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install breechings, gas vents, chimneys and stacks in accordance with manufacturer's installation instructions and UL listing. Maintain minimum clearances from combustibles as specified in UL listing.
  1. Install products in accordance with the recommendations of ASHRAE - Handbook, Equipment Volume, Chapter "Chimney, Gas Vent, and Fireplace Systems", and ANSI Z223.1 (NFPA 54).
- B. Joints: Install breechings and gas vents with minimum number of joints. Align them accurately at connections, with internal surfaces smooth.
  1. Seal joints between sections of positive pressure gas vents in accordance with the manufacturer's installation instructions, and using only sealants recommended by manufacturer.
- C. Supports: Support breechings and gas vents from building structures, rigidly, with suitable ties, braces, hangers and anchors to hold to shape and prevent buckling. Support gas vents, chimneys and stacks to adjacent structural surfaces, or at floor penetrations at 12 foot spacing. Refer to SMACNA HVAC Duct Construction Standards - Metal and Flexible for equivalent duct support configuration and size.
  1. Install concrete inserts for support of breechings, gas vents, chimneys, and stacks in coordination with formwork.
  2. Support gas vents at the intervals recommended by the manufacturer to support the weight of the vent and all accessories, without exceeding loading of appliances.
- D. Equipment Connection: Pitch breechings with positive slope up from the fuel-fired equipment to chimney or stack.

- E. Install gas fired equipment with separated combustion system, flue gas and combustion air terminal assembly, meeting requirements specified in Section 15540 - Fuel Fired Heaters.
- F. Stacks: Assemble and install stack sections in accordance with NFPA 82, industry practices, and in compliance with UL listing. Connect base section to foundation using anchor lugs.
  - 1. Install chimney level and plumb.
- G. Thermal Expansion: Install expansion joints on breechings, gas vents, chimneys and stacks, to allow for thermal expansion.
- H. Slip Joints: At appliances, provide slip joints permitting the removal of appliances without the removal or dismantling of breechings, gas vents, chimneys, or stacks.
  - 1. Provide a minimum of 2 feet of breeching or gas vent to connect appliances to chimneys.

### 3.02 ADJUSTING AND CLEANING

- A. General: Clean breechings and gas vents internally during installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth.

### 3.03 PROTECTION

- A. Temporary Closure: At ends of breechings, where gas vents and chimneys which are not completed or connected to equipment, provide a temporary closure to prevent the entrance of dust and debris until installations are completed.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 15551**  
**CHIMNEY AUTOMATION SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Section includes Chimney Automation System and related equipment including the following:
  - 1. Packaged chimney fan/control combination, listed to UL378, Standard for Draft Equipment as a complete system
  - 2. Electrical connection
  - 3. Stack connection

**1.02 RELATED SPECIFICATIONS**

- A. Section 16055 - Electrical Requirements for Shop-Assembled Equipment

**1.03 REFERENCES**

- A. The following published specifications standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this section:
  - 1. UL – Underwriters Laboratories
  - 2. National Electrical Code

**1.04 SUBMITTALS**

- A. Contractor shall coordinate equipment product data submittal sheets and shall provide a comprehensive set of interfaced drawings and stack design calculations, which shall serve as the basis for system evaluation by the Commissioner.
- B. Submit the following:
  - 1. Comprehensive set of mechanical venting calculations based on the Chimney Design Equation published in the ASHRAE Handbook. Calculations must show flue gas volumes, pressure losses and estimated temperatures in each section to assure compliance with fan temperature rating and prevent condensation, if appropriate.
  - 2. Chimney fan descriptive literature, dimensional diagram and electrical diagram
  - 3. Control descriptive literature, dimensional diagrams and electrical diagrams

4. Specification review with respect to submitted equipment identifying all areas of compliance and exceptions
5. Certification of listing by recognized testing laboratory

#### 1.05 QUALITY ASSURANCE

- A. All equipment and accessories shall be the product of a manufacturer regularly engaged in its manufacture and shall be a standard catalog product. The manufacturer must have a minimum of three (3) years documented experience.
- B. Draft system shall be guaranteed to operate satisfactorily and efficiently without objectionable smoke or odor.
- C. Scheduled equipment performance is minimum capacity required.
- D. Scheduled electrical capacity shall be considered as maximum available.
- E. Equipment shall be manufactured at ISO 9001 certified plant.

#### 1.06 MANUFACTURER'S WARRANTY

- A. All equipment shall be guaranteed against defects in materials and/or workmanship for a period of 24 months from the date of Substantial Completion. The warranty shall be provided by the equipment manufacturer and shall include the parts necessary to repair or replace all defective parts and materials.
- B. The chimney fan(s) shall be covered by a 10-year warranty against corrosion perforation.

#### 1.07 OPERATING AND MAINTENANCE MANUALS

- A. Provide complete Operation and Maintenance manuals with product literature on the chimney fan and controls, dimensional and wiring diagrams, in accordance with Section 01831 – Operation and Maintenance Manuals.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  1. Exhausto Inc.
  2. Tjernlund Products Inc.

## 2.02 CHIMNEY AUTOMATION SYSTEM DESIGN

- A. Furnish a fully redundant Appliance Draft Control System to ensure a flue pressure over the entire operating range of the all the appliances. All components shall be furnished as a complete system from a single manufacturer. System shall be fully redundant so that any failure of any control component shall automatically cause the standby unit to begin operation; this will ensure the heating plant stays operational at all times. The system, its application and functionality must be listed to UL378, Standard for Draft Equipment.
- B. The draft fan design must be a Type B, Spark Resistant Construction in compliance with AMCA Standard 99-0401. The draft fan shall have a removable motor assembly for easy motor, impeller and duct accessibility and be manufactured in a heat and corrosion resistant material, such as Type 316L stainless steel, rated for an operating temperature of 575°F (300°C) measured at the draft fan inlet point. The impeller must be 316L stainless steel or cast aluminum rated for condensing applications. Fan motor is to be three phase 208-230 or 460 VAC TEFC, permanently lubricated with sealed ball bearings and EPACT rated for energy efficiency. Fan is to be UL378 listed for use with condensing flue gases which shall be acknowledged in the installation manual. Fan temperature rating shall be at least 500°F at all operating speeds.
- C. Variable Frequency Drive (VFD) shall control the speed of the Draft Fan. The VFD must be factory programmed to the individual Draft Fan that it will control but shall not be part of the PID-loop. The VFD must be UL Listed and NEMA 12 rated. The VFD shall convert incoming fixed frequency three-phase AC power into a variable frequency and voltage for controlling the speed of three-phase AC motors. Motor voltage shall be varied with frequency to maintain desired motor magnetization current suitable for fan control and to eliminate the need for motor de-rating. With the motor's rated voltage applied to the VFD input, the VFD shall allow the motor to produce full rated power at rated amps, RMS fundamental volts, and speed without using the motor's service factor. VFD shall include a "signal loss detection" circuit to sense the loss of an analog input signal such as 4 to 20 mA or 2 to 10 V DC, and shall be programmable to react as desired in such an instance.
- D. The modulating fan control must be a true PID-based control with infinitely variable speed settings and in a NEMA 12 rated enclosure. It must NOT be able to control or interfere with the operation of the heating appliances by delaying burner operation due to unstable draft conditions. Interference is only allowed during emergencies where a mechanical or electrical problem occurs. The control shall include a chimney probe along with tubing and a pressure transducer, for installation in the chimney or stack as shown on the manufacturer's submittal. The features must be part of the compliance with UL378, Standard for Draft Equipment and UL508, Standard for Industrial Controls:

1. Able to maintain a constant draft between 0.01 inch W.C. and 0.6 inch W.C. with a tolerance of no more than  $\pm 2\%$  when measured with an external manometer under stable load conditions.
2. Ramp-up and ramp-down time of no more than 20 seconds
3. "Plug-and-Play" self-check that detects connections, setting requirements and accessories during each start-up.
4. Programmable microprocessor for selective programming of, but not limited to, draft, intermittent vs. continuous fan operation, purge times, sensor sensitivity, alarm limits and delays, manual overrides, low/high limit fan speeds via the operating panel or the RS-232 port.
5. A standard board that interlocks with up to 6 gas fired units so a call for heat activates the draft fan and releases the burner once the pre-set draft has been established.
6. An integrated and programmable proven draft function that can be set for automatic and manual reset.
7. An integrated operating priority option, which allows one or more appliances to operate during electrical or mechanical failure of the fan, provided the draft requirement can be met and safe operation assured. Set up of a default operating priority must be possible, so the most important appliance(s) have highest priority during calls for heat. It must automatically check for fan operation every two hours and go back to normal operation if appropriate.
8. Bearing cycle activation every 7 days if the draft fan has not been operating during the past 7 day period.

E. Sequence of Operation

1. Upon a call for heat the appliance will satisfy all internal safeties, and before the gas valve is opened the call for heat will land at the controller so the draft fan can start. Once the proof of flow for the draft fan has occurred and the adjustable pre purge time delay has elapsed the controller will send the start command back to the appliance so the gas valve can open and the appliance can start. All appliances are to be interlocked with either (lead or lag) controller.
2. Upon normal appliance shut down the call for heat contact at the appliance will open. The controller will sense this and return the call for shut down back to the appliance. The controller will keep the draft fan operating for an adjustable post purge time delay to ensure all flue gases are evacuated.

3. Redundant control sequence of operation: For each control component listed above provide a duplicate unit, to be installed as a complete redundant system. The redundant system shall be fully commissioned at the time of the primary system. Program the two systems such that the main controllers monitor each other in so that if one should fail the other will automatically take over. Any failures (alarms) will close a contact that can be annunciated on the building automation system. Provide a means to isolate one draft fan from the other so only one fan is operating. This is to be accomplished with isolation dampers as shown on the drawings. A draft fan failure will cause the isolation damper for that unit to close and the standby unit to open. That draft fan will then start with a dedicated proof of flow switch, proving flow, allowing the appliances to fire. Failure of any one component, VFD, controller, press transducer or draft fan will cause the back up unit to begin operation and the alarm contact to close.

## 2.03 STACK CONNECTION

- A. Furnish slip connection type as required.

## 2.04 BALANCING BAFFLES

- A. Furnish balancing baffles, for each gas fired unit where specified by manufacturer.

## 2.05 ELECTRICAL REQUIREMENTS

- A. All wiring shall be furnished in accordance with the National Electrical Code and Section 16055 - Electrical Requirements for Shop-Assembled Equipment.

# PART 3 EXECUTION

## 3.01 INSTALLATION

- A. Complete structural, mechanical, and electrical connections in accordance with manufacturers' printed instructions.
- B. Install all Chimney Automation System components as required, including low voltage wiring from pressure transducer to modulating fan control controller and line voltage wiring from modulating fan control to the chimney fan. Allow satisfactory arrangement in the space available.
- C. Connecting to Stack: Install as required and in accordance with manufacturer's printed instruction.

3.02 FIELD QUALITY CONTROL

- A. Provide services of the chimney automation system manufacturer to:
  - 1. Confirm proper installation of chimney fan and controls.
  - 2. Start-up and adjust control and balancing baffles.
  - 3. Test individual controls for proper operation.
  - 4. Set draft for specified operation.
  - 5. Test safety system
- B. Submit a written report signed by the manufacturer, confirming that safety and operating controls have been properly installed.

3.03 SYSTEM START-UP AND TRAINING

- A. System shall be started up and programmed and by a factory certified technician. Provide a report to the City of New York showing the system was properly commissioned and what the user adjustable parameters have been set at. Provide 2 hours of training for City of New York personnel in accordance with the requirements of Section 01821 - Training.

-END OF SECTION-

**Section 15670**  
**CONDENSING UNITS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Air-cooled condensing units complete with refrigerant compressors, condensing coils, condenser fans, controls, and accessories.

**1.02 RELATED SPECIFICATIONS**

- A. Section 03300 - Cast-in-Place Concrete
- B. Section 15071 - Vibration Control
- C. Section 15184 - Refrigeration Piping and Specialties
- D. Section 15720 - Air Handling Units
- E. Section 15900 - HVAC Controls

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. ASHRAE 15 - Safety Code for Mechanical Refrigeration
  - 2. NEMA MG 1 - Motors and Generators
  - 3. UL 207 - Refrigerant-Containing Components and Accessories, Non-Electrical
  - 4. UL 303 - Refrigeration and Air-Conditioning Condensing, and Compressor Units
  - 5. UL 465 - Air Conditioners, Central Cooling
  - 6. ARI 210/240 - Unitary Air-Conditioning and Air-Source Heat Pump Equipment
  - 7. ARI 520 - Positive Displacement Refrigerant Compressors, and Condensing Units
  - 8. ASHRAE 23 - Methods of Testing for Rating Positive Displacement Condensing Units
  - 9. ARI 270 - Sound Rating of Outdoor Unitary Equipment
  - 10. ASHRAE 90.1- Energy Conservation in New Building Design

11. ANSI Z21.47/UL1995 – Unitary Air Conditioning Standard for safety requirements

1.04 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Submit catalog product data indicating dimensions, general assembly, specialties and accessories, weights, rated capacities, performance ratings, materials and finishes, controls, electrical requirements, and wiring diagrams.
- C. Shop Drawings: Submit shop drawings indicating components, assembly, equipment locations, dimensions, weights and loadings, required clearances, and location and size of field connections. Include schematic layouts showing condensing units, cooling coils, refrigerant compressors, refrigeration piping, and accessories required for complete system.
- D. Operations and Maintenance Manuals: Submit Operations and Maintenance Manuals as specified in Section 01831 including manufacturer's descriptive literature including installation and operation instructions, start-up instructions, controls, accessories, maintenance and repair data, and parts lists.

1.05 QUALITY ASSURANCE

- A. Provide equipment from a company specializing in the design and manufacture of condensing units which has a minimum of three (3) years documented experience, and issues complete catalog data on these products.

1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.
- B. Shipping and Handling: Comply with the manufacturers' instructions for rigging, unloading and transportation of units.
- C. Storage and Protection: Store equipment in its original shipping crates or containers, with labeling in place until time of installation. Store equipment in clean, dry place and protect coils from physical damage.

1.07 SPARE PARTS

- A. Furnish one complete change of lubricating oil.

1.08 WARRANTY

- A. Provide one year parts warranty from the start-up date.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Air Cooled Condensing Units
  - 1. The Trane Company
  - 2. Carrier Corporation
  - 3. York International Corp.

## 2.02 MATERIALS

- A. General: Factory fabricate, assemble, test and finish condensing units with indicated capacities and characteristics, and including all necessary accessories for complete installation.
- B. Air Cooled Condensing Units: Provide air-cooled condensing units of minimum size, capacity and arrangement shown and scheduled, meeting the following requirements.
  - 1. Provide factory assembled, air cooled condensing unit prepiped and prewired, comprising refrigeration compressor equipment, condenser coil, condenser fans and motors, magnetic starters, controls, and fan guards mounted in heavy gauge steel casing. Construct casing of one piece welded assembly with removable panels for access to all components.
  - 2. Protect the entire air-cooled condenser unit including condenser coil with a protective coating.
  - 3. Provide Corrosion Protective Coating for Coils: Provide protective corrosion-resistant coating meeting the following requirements:
    - a. Air-Dried Polyelastomer Coating: Provide a single component, complex chain linked polyelastomer coating (Husky coil coat-dip protective coating as manufactured by Bronz-Glow Industries or approved equal). Thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer (if required) and coating of an air-dried poly elastomeric corrosion-resistant coating to obtain a minimum total dry film thickness of 0.8 – 1.5 mils.
    - b. Manufacturer recommendations: Perform cleaning, surface preparation, and coating procedures as specified and in accordance with the coating manufacturer's published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.

- c. Surface Preparation: Remove all traces of oil, grease, rust, dirt and dust. Pressure rinse with a high pH cleaning solution. Rinse with fresh water. Pressure rinse with a low pH cleaning solution to reduce surface pH to 5.0 to 7.0. Allow to air-dry thoroughly.
4. Provide hermetic type compressor with forced feed lubrication provided by positive displacement reversible oil pump, a crankcase sight glass, and electric crankcase heater. Provide compressor equipped with suction and discharge shutoff valves, and mounted on spring vibration isolators.
5. Provide operating and safety controls for condensing unit including refrigerant high and low pressure safety cutouts, low oil pressure cutout, and compressor winding thermostat cutout. Provide condensing unit complete with circuit breaker and magnetic starter, control circuit fusing and control power transformer. Provide necessary relays, timers and manual reset overloads.
6. Provide condenser coil constructed of seamless copper tubing mechanically bonded to heavy-duty aluminum plate fins with protective coating of Heresite or approved equal. Test condenser coils at factory at 450 psig air pressure under water, and vacuum dehydrate. Seal with holding charge of nitrogen.
7. Fabricate each condensing unit at factory as one unit including all internal piping and with internal wiring to identified terminal strips in unit control panel.
8. Provide statically and dynamically balanced direct-driven condenser fans of propeller type, with all exposed fan and shaft surfaces weatherproofed and arranged to give vertical air discharge with fan guard, and with permanently sealed ball bearings.
9. Provide factory wired controls mounted in a weatherproof accessible location, including fan contactor, low voltage terminal strip and single point power entry. Provide thermal and current sensitive overload devices for compressor motor protection. Provide solid state compressor protection control system to prevent short cycling due to safety devices or power interruptions, controlled by positive acting timer.
10. Provide accessory equipment including filter-drier, liquid line moisture indicating sight glass, refrigeration tubing, and insulation package. Charge system with recommended oil.

## 2.03 SOURCE QUALITY CONTROL

- A. Provide units constructed and rated in accordance with ARI 210/240. Test in accordance with ASHRAE 23.

- B. Provide units with Energy Efficiency Rating (EER) and Coefficient of Performance (COP) not less than prescribed by ASHRAE 90.1.
- C. In the event the unit is not UL approved, the manufacturer shall provide a field inspection by a UL representative to verify conformance to UL standards, at manufacturer's expense. If necessary, contractor shall perform modifications to the unit to comply with UL, as directed by the UL representative, at no additional expense to the Owner.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. General: Examine condensing units at the time of delivery for damaged or missing components. Do not proceed with installation of units until all items found defective have been corrected.

### 3.02 INSTALLATION

- A. Install all units in accordance with manufacturer's instructions. Make all necessary adjustments to equipment to provide complete and satisfactory operation upon completion of installation.
- B. Connect to electrical service.
- C. Install units on vibration isolators. Refer to Section 15071 - Vibration Control.
- D. Install units on concrete base as indicated in accordance with the requirements of Section 03300 - Cast-In-Place Concrete.
- E. Provide connections to refrigeration piping system and evaporators. Refer to Section 15184 - Refrigeration Piping and Specialties and comply with ANSI/ASHRAE 15.
- F. Supply the initial charge of refrigerant and oil for each refrigerant circuit. Replace losses of refrigerant and oil.

### 3.03 FIELD QUALITY CONTROL

- A. Operation and Checkout: Provide initial and cooling season start-up, and winter season shut down during first year of operation, including routine servicing and check out.
- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and

place the equipment in trouble-free operation, and instruct operating personnel in its operation and maintenance as specified in Division 1.

- C. Tests: After installation of the units, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions.

-END OF SECTION-

**Section 15720**  
**AIR HANDLING UNITS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Air handling units are manufactured in a modular form.
- B. In hazardous locations, provide equipment and wiring meeting the requirements for National Electric Code Class I, Group D, Division (1) (2).

**1.02 RELATED SPECIFICATIONS**

- A. Section 15071 - Vibration Control
- B. Section 15540 - Fuel Fired Heaters
- C. Section 15670 - Condensing Units
- D. Section 15761 - Air Coils
- E. Section 15820 - Ductwork Accessories
- F. Section 15900 - HVAC Controls
- G. Section 16055 - Electrical Requirements for Shop Assembled Equipment
- H. Section 16220 - Electric Motors

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. AMCA 99 - Air Movement and Control Association Standards Handbook
  - 2. AMCA 210 - Laboratory Methods of Testing Fans for Rating Purposes
  - 3. AMCA 300 - Reverberant Room Method for Sound Testing of Fans
  - 4. AMCA 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
  - 5. AMCA 500 - Test Methods for Louver, Dampers, and Shutters
  - 6. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings
  - 7. AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings
  - 8. UL 900 - Test Performance of Air Filter Units
  - 9. ARI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils
  - 10. ARI 430 - Standard for Central-Station Air Handling Units

11. NFPA 90A - Installation of Air Conditioning and Ventilation Systems
12. SMACNA - HVAC Duct Construction Standards
13. ANSI Z21.47/UL 1995 - Unitary Air Conditioning Standard for safety requirements

#### 1.04 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit complete catalog product data, including the following:
  1. Dimensions
  2. Assembly
  3. Weights
  4. Specialties and accessories
  5. Rated capacities
  6. Performance ratings
  7. Controls
  8. Certified fan performance curves with system operating conditions indicated, including brake horsepower, static pressure, and static efficiency plotted against air volume for the duty scheduled
  9. Certified fan sound power ratings for both fan outlet and casing radiation at rated capacity
  10. Certified coil performance ratings with system operating conditions indicated
  11. Motor ratings and electrical characteristics plus motor and fan accessories
  12. Electrical requirements for power supply wiring, including wiring diagrams for interlock and control wiring, clearly indicating factory-installed and field-installed wiring
  13. Materials gauges and finishes
  14. Filters with performance characteristics assembly and frames
  15. Dampers, including housings, linkages, and operators

- C. Shop Drawings: Submit shop drawings indicating assembly, locations, dimensions, weight loading, required clearances, construction details, and location and size of each field connection.
- D. Field Reports: Submit field quality control test reports.
- E. Operation and Maintenance Manuals: Submit manufacturer's descriptive literature, including operation instructions, lubrication instructions, filter replacement data, motor and drive replacement instructions, wiring diagrams, controls, accessories, maintenance and repair data, and parts listing. Include this data and product data in an operation and maintenance manual as specified in Section 01831.

#### 1.05 QUALITY ASSURANCE

- A. Fan Performance Ratings: Conform to AMCA 210 and provide the AMCA Certified Rating Seal.
- B. Sound Ratings: Conform to AMCA 301, test to AMCA 300.
- C. Fabrication: Conform to AMCA 99 and ARI 430.
- D. Filter Media: Provide UL 900 listed filter, Class I or Class II.
- E. Air Coils: Certify capacities, pressure drops, and selection procedures in accordance with ARI 410.
- F. Manufacturers: Provide equipment from a company regularly engaged in the manufacture of air handling units, of the types and capacities required, whose products have been in satisfactory use in similar service for not less than three (3) years, and which issues complete catalog data on these products.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store, and handle all products and materials as specified in Division 1 and as follows:
- B. Delivery and Handling: Deliver products to the site in factory-fabricated protective containers, with factory-installed shipping skids and lifting lugs. Handle products properly to prevent damage, breaking, denting and scoring. Do not install damaged equipment, replace damaged units with new ones. Comply with the manufacturer's rigging instructions for unloading and transporting equipment to its final location.
- C. Storage and Protection: Store equipment in its original containers with labeling in place until the time of installation.
  - 1. Store in clean dry place, protect from weather, dirt, fumes, construction traffic, debris, and physical damage.

## 1.07 SEQUENCE AND SCHEDULING

- A. Equipment Pads: Coordinate the size and location of concrete equipment pads. Cast anchor bolt inserts into pad.
- B. Structural Supports: Coordinate the size and location of structural steel support members.

## 1.08 SPARE PARTS

- A. General: Deliver spare parts securely wrapped or boxed, indexed and tagged with complete information for use and reordering.
- B. Furnish the following spare parts.
  - 1. One complete set of filters for each air handling unit
  - 2. One complete set of belts for each air handling unit
  - 3. One gasket for each sectional joint of each air handling unit

## 1.09 WARRANTY

- A. Provide parts warranty one year from start-up.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Air Handling Units
  - 1. The Trane Company
  - 2. Carrier Corporation
  - 3. York International Corp.
- C. Polyelastomer Corrosion Resistant Coating:
  - 1. Bronz-Glow Industries
- D. Panel-Type Air Filters
  - 1. Servodyne Corp. - Series Hi-E-40A
  - 2. Camfil Farr Company - Model 30/30

## E. Filter Gauges

1. Dwyer - Durablock 200
2. Cambridge Filter Corp.

## 2.02 AIR HANDLING UNITS - TYPE 1

- A. General: Factory fabricate, assemble, test and finish air-handling units of the arrangement, minimum size, capacities and characteristics scheduled. Provide units having refrigeration coils and suitable for externally mounted air-cooled condensing units and indirect gas fired heat modules.
- B. Corrosion Protective Coating for Units: Provide protective corrosion resistant coating meeting the following requirements:
1. Air-Dried Polyelastomer Coating: Provide a single component, complex chain linked polyelastomer coating (SPC- clear or tinted as manufactured by Bronz-Glow Industries or approved equal). Thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer (if required) and coating of an air-dried poly elastomeric corrosion-resistant coating to obtain a minimum total dry film thickness of 6 mils.
  2. Manufacturer recommendations: Perform cleaning, surface preparation, and coating procedures as specified and in accordance with the coating manufacturer's published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.
  3. Surface Preparation: Remove all traces of oil, grease, rust, dirt and dust. Pressure rinse with a high pH cleaning solution. Rinse with fresh water. Pressure rinse with a low pH cleaning solution to reduce surface pH to 5.0 to 7.0. Allow to air-dry thoroughly.
- B. Casing: Fabricate the unit casing of insulated double wall heavy-gauge steel, reinforced and braced with steel angle framework, rigidly constructed and braced to prevent vibration, complete with removable panels for access to all internal parts. Make the casing section joints airtight by using a gasketed or caulked assembly.
- C. Blower: Provide the blower of a double width, double inlet, multiblade, centrifugal type, statically and dynamically balanced at the factory, with a rigid steel shaft with grease lubricated fan bearings and lubrication fittings extended to the service side. Provide the belt drive, including a fan sheave, an adjustable motor sheave permitting adjustment of at least 5 percent above rated cfm, V-belts, and a removable belt guard. Provide adjustable motor supports.
- D. Motors: Provide TEFC high energy efficient type motors furnished in accordance with the requirements of Section 16220 - Electric Motors except that in designated hazardous areas provide explosion-proof type.

- E. Electrical Equipment: All electrical equipment and materials furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop Assembled Equipment.
- F. Drives and Guards: Provide belt drives, including machine matched belts of the size and type recommended for the piece of equipment, with a capacity rating not less than 150 percent of motor rating. Provide each belt drive and each direct coupled drive with a substantial removable guard giving adequate clearance and safety protection at all positions of drive adjustment. Provide openings in the guard to permit measurement of driver and driven pulley speeds.
- G. Drain Pans: Provide double sloped condensate drain pan constructed of PVC with external connections on either side of unit. The drain pan shall be removable for cleaning.
- H. Insulation: Comply with NFPA Standard 90A for insulation. Insulate the coil section, fan section and accessory sections of the unit with 1-inch thick, 3-pound density, mat-faced fiberglass. Secure insulation to the casing with waterproof adhesive and permanent mechanical fasteners.
- I. Coils: Provide coils meeting the requirements of Section 15761 - Air Coils and the minimum capacity and maximum air and water resistance values scheduled.
- J. Gas Fired Heat Modules: Provide gas fired units meeting the requirements of Section 15540 - Fuel Fired Heaters
- K. Dampers: Provide low leak type dampers meeting the requirements of Section 15900 - HVAC Controls.
- L. Mixing Box: Provide parallel-blade dampers in a reinforced, galvanized steel cabinet. Provide galvanized steel damper blades mechanically fastened to steel operating rods. Connect operating rods for each set of dampers together with a common linkage and interconnect linkages so that dampers operate simultaneously and in the opposite direction (one opens when the other closes).
- M. Air Filters: Comply with NFPA Standard 90A for air filters. Provide air filters as required and as follows.
  - 1. Provide panel filters of the sizes scheduled, 2-inch thick, pleated media replaceable type, with not less than 30 percent atmospheric dust spot efficiency on the ASHRAE Standard 52 Test.
  - 2. Equip panel filter units with side removal filter racks and sealing devices to accommodate the filters, complete with hinged access doors with cam fasteners to facilitate filter replacement.

- N. Filter Gauges: Provide filter gauges for measuring the pressure drop across each bank of air filters. Provide gauges complete with all necessary tubing, static tips, and accessories, including 3-way cocks arranged for ease in checking liquid level.
- O. Vibration Control: Provide air handling units with the fan and motor assembly internally isolated from unit casing with spring vibration isolators meeting the requirements of Section 15071 - Vibration Control.
- P. Controls: Provide controls in accordance with Section 15900 - HVAC Controls and as follows:
1. Select, provide, and mount damper actuators on each damper. Actuators shall be of sufficient size and quantity to ensure complete damper operation. Actuators shall be direct coupled to minimize linkage.
  2. Provide differential pressure switches. Pressure switches shall be factory installed across each filter bank for individual filters to monitor clean/dirty filter status.
  3. Provide differential pressure gauges. Pressure gauges shall be factory installed across each filter bank for individual filters. The gauge shall be diaphragm- actuated dial type.
  4. Provide a momentary push-button reset circuit using a double-pole low limit switch. Low limits shall be factory engineered to maximize coil coverage. Capillary radius clips shall be used at low limit bends to ensure no crimping or wear of low limits. Low limits shall be wired to shut down the fan to protect the unit.
  5. Provide and mount fan status switches.
  6. Provide and mount discharge temperature sensors on the fans. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
  7. Provide outside air temperature sensors.
  8. Provide averaging temperature sensors. Sensors shall be factory engineered to accurately measure mixed air temperatures. Capillary radius clips shall be used at capillary bends to ensure no crimping or wear of the tube. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
- Q. All heating and ventilating units shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A. Equipment shall be provided with seismic restraints in accordance with City of New York Building Code and referenced Uniform Building Code requirements.

## 2.03 AIR HANDLING UNITS - TYPE 2

- A. General: Factory fabricate, assemble, test and finish air-handling units of the arrangement, minimum size, capacities and characteristics scheduled. Provide units having refrigeration coils and suitable for externally mounted air cooled condensing units and electric heating module.
- B. Corrosion Protective Coating for Units: Provide protective corrosion resistant coating meeting the following requirements:
1. Air-Dried Phenolic Coating: Where an air-dried phenolic corrosion-resistant coating is required, thoroughly clean, prepare and protect against corrosion all metal parts of unit with one coat of primer and at least two coats of an air-dry phenolic corrosion-resistant coating to obtain a minimum total dry film thickness of 4 to 6 mils.
- C. Manufacturer Recommendation: Perform cleaning and coating procedures as specified and in accordance with the coating manufacturers published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.
1. Air-Dried Polyelastomer Coating: Provide a single component, complex chain linked polyelastomer coating (SPC- clear or tinted as manufactured by Bronz-Glow Industries or approved equal). Thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer (if required) and coating of an air-dried poly elastomeric corrosion-resistant coating to obtain a minimum total dry film thickness of 6 mils.
  2. Manufacturer recommendations: Perform cleaning, surface preparation, and coating procedures a specified and in accordance with the coating manufacturer's published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.
  3. Surface Preparation: Remove all traces of oil, grease, rust, dirt and dust. Pressure rinse with a high pH cleaning solution. Rinse with fresh water. Pressure rinse with a low pH cleaning solution to reduce surface pH to 5.0 to 7.0. Allow to air-dry thoroughly.
- D. Casing
1. Fabricate the unit casing of zinc coated heavy-gauge steel, reinforced and braced with steel angle framework, rigidly constructed and braced to prevent vibration, complete with removable panels for access to all internal parts. Make the casing section joints airtight by using a gasketed or caulked assembly.
  2. Casting shall be completely insulated with cleanable, foil faced, fire-retardant, permanent, odorless glass fiber material. All insulation edges shall be either captured or sealed. Knockouts shall be provided for unit electrical

power and refrigerant piping connections. Captive screws shall be standard on all access panels.

- E. Blower: Provide the blower of a double width, double inlet, forward centrifugal type, statically and dynamically balanced at the factory. Provide the belt drive, including a fan sheave, an adjustable motor sheave permitting adjustment of at least 5 percent above rated cfm, V-belts and a removable belt guard. Provide adjustable motor supports. Fan bearings shall be permanently lubricated.
- F. Motors: TEFC high energy efficient type motors furnished in accordance with the requirements of Section 16220 - Electric Motors, except that in designated hazardous areas provide explosion-proof type.
- G. Electrical Equipment: All electrical equipment and materials furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop-Assembled Equipment.
- H. Drives and Guards: Provide belt drives, including machine matched belts of the size and type recommended for the piece of equipment, with a capacity rating not less than 150 percent of motor rating. Provide each belt drive and each direct-coupled drive with a substantial removable guard giving adequate clearance and safety protection at all positions of drive adjustment. Provide openings in the guard to permit measurement of driver and driven pulley speeds.
- I. Drain Pan: Provide drain pan mounted under the coil section with cooling coils and where shown. Provide double-sloped condensate drain pan constructed of PVC with external connections on either side of unit. The drain pan shall be removable for cleaning.
- J. Insulation: Comply with NFPA Standard 90A for insulation. Insulate the coil section, fan section and accessory sections of the unit with 1-inch thick, 3-pound density, mat-faced fiberglass. Secure insulation to the casing with waterproof adhesive and permanent mechanical fasteners.
- K. Coils: Provide coils meeting the requirements of Section 15761 - Air Coils, and the minimum capacity and maximum air resistance values scheduled, except as noted in this section.
- L. Refrigeration System: The units shall have a single refrigeration circuit refrigeration circuit controlled by a factory-installed thermal expansion valve.
- M. Evaporator Coil: Configured aluminum fin surface shall be mechanically bonded to 3/8-inch internally enhanced copper tubing and factory pressure and leak tested at 375 psig. Coil is arranged for draw-through airflow and shall provide a double sloped condensate drain pan constructed of PVC plastic. The drain pan shall be removable for cleaning. Coil shall be completely factory assembled including the expansion valves and drain pans. Unit casing shall be constructed of zinc coated,

heavy gauge, galvanized steel. Exterior surfaces shall be cleaned, phosphatized and finished with an enamel finish. Casing shall be completely insulated with foil faced, fire-retardant, permanent, odorless glass fiber material.

- N. Electric Heaters: UL and CSA approved electric heat modules shall be available for installation directly on fan discharge. Electric heater shall be two stage control, single-point electric power connection and terminal strip connections. Electric heater element shall be constructed of heavy-duty nickel chromium elements internally wye connected on 480/600 volt, three phase. Each 480/600 volt heater shall have automatic line break high limit controls.
- O. Dampers: Provide low leak type dampers meeting the requirements of Section 15900 - HVAC Controls.
- P. Air Filters: Comply with NFPA Standard 90A for air filters. Provide air filters as required and as follows.
  - 1. Provide panel filters of the sizes scheduled, 2-inch thick, pleated media replaceable type, with not less than 30 percent atmospheric dust spot efficiency on the ASHRAE Standard 52 Test.
  - 2. Equip panel filter units with side removal filter racks and sealing devices to accommodate the filters, complete with hinged access doors with cam fasteners to facilitate filter replacement.
- Q. Filter Gauges: Provide filter gauges for measuring the pressure drop across each bank of air filters. Provide gauges complete with all necessary tubing, static tips, and accessories, including 3-way cocks arranged for ease in checking liquid level.
- R. Vibration Control: Provide air handling units with the fan and motor assembly internally isolated from unit casing with spring vibration isolators meeting the requirements of Section 15071 - Vibration Control.
- S. Mounting Subbase: Subbase shall be constructed of heavy gauge, zinc coated galvanized steel with baked enamel finish to match air handler unit. Provide corrosion-resistant coating to match air handling unit.
- T. Controls: Provide controls in accordance with Section 15900 - HVAC Controls and as follows:
  - 1. Select, provide, and mount damper actuators on each damper. Actuators shall be of sufficient size and quantity to ensure complete damper operation. Actuators shall be direct coupled to minimize linkage.
  - 2. Provide differential pressure switches. Pressure switches shall be factory installed across each filter bank for individual filters to monitor clean/dirty filter status.

3. Provide differential pressure gauges. Pressure gauges shall be factory installed across each filter bank for individual filters. The gauge shall be diaphragm- actuated dial type.
  4. Provide a momentary push-button reset circuit using a double-pole low limit switch. Low limits shall be factory engineered to maximize coil coverage. Capillary radius clips shall be used at low limit bends to ensure no crimping or wear of low limits. Low limits shall be wired to shut down the fan to protect the unit.
  5. Provide and mount fan status switches.
  6. Provide and mount discharge temperature sensors on the fans. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
  7. Provide outside air temperature sensors.
  8. Provide averaging temperature sensors. Sensors shall be factory engineered to accurately measure mixed air temperatures. Capillary radius clips shall be used at capillary bends to ensure no crimping or wear of the tube. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
- U. All heating and ventilating units shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A. Equipment shall be provided with seismic restraints in accordance with City of New York Building Code and referenced Uniform Building Code requirements.

## 2.04 SOURCE QUALITY CONTROL

- A. Test: Perform the following factory tests.
1. Sound Power Level Rating: Comply with AMCA Standard 301 "Method for Calculating Fan Sound Ratings for Laboratory Test Data." Test fans in accordance with AMCA Standard 300 "Test Code for Sound Rating."
  2. Units Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210/ASHRAE 51 - Laboratory Methods of Testing Fans for Rating.

**PART 3 EXECUTION****3.01 EXAMINATION**

- A. General: Perform examination of equipment and field condition as follows.
  - 1. Examine units at the time of delivery for damaged or missing components.
  - 2. Examine areas and conditions for compliance with requirements for installation tolerances, housekeeping pads, and other conditions affecting performance of central-station air handling units.
  - 3. Examine rough-in for refrigerant, condensate drainage piping and electrical to verify actual locations of connections prior to installation.
  - 4. Do not proceed until unsatisfactory conditions have been corrected.
- B. Power Supply: Verify that proper power supply is available.

**3.02 INSTALLATION**

- A. General: Install equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Support: Support air handling units as follows.
  - 1. Support floor-mounted units on concrete equipment pads using housed spring isolators. Secure units to anchor bolts installed in concrete equipment pads.
  - 2. Support suspended units from structural steel support frame using threaded steel rods and vibration isolation springs in accordance with Section 15071 - Vibration Control.
- C. Access Space: Provide access space around air handling units, coils and motors for service. Provide no less than the minimum as recommended by the manufacturer. Allow space for motor, coil, and filter removal.
- D. Ductwork and Piping Connections: Make final connections of ductwork and piping as detailed on approved shop drawings. Install air handling units in conformance with ARI 435. Provide flexible connections at inlet and discharge of air handling equipment and where shown.
- E. Electrical Leads: Install air handling units as shown and specified, with flexible electrical leads.
- F. Air Filters: Install a new set of filters in each system at the time of substantial completion.

- G. Operating Requirements: Do not operate air handling units for any purpose until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.
- H. Filter Gauges: Install air filter gauges for measuring the air flow resistance through filters at all filter sections and filter banks for all air handling units. Install filter gauge static pressure tips upstream and downstream of filters. Mount filter gauges on outside of filter housing or filter plenum, in accessible position. Adjust and level. Permanently mark each gauge to show the normal resistance rating and the recommended resistance at which the air filters should be placed.
- I. Lubrication: Properly lubricate all pieces of equipment, furnished with lubrication fittings, prior to start-up and at recommended intervals up to substantial completion. Attach a linen tag or heavy-duty shipping tag to each piece of equipment showing the date of lubrication and the name and number of lubricant used. Furnish typewritten list, in triplicate, of each item lubricated and the type of lubricant used.

### 3.03 FIELD QUALITY CONTROL

- A. Adjustment and Cleaning: Perform adjusting and cleaning as follows.
  - 1. Align, adjust and balance each belt drive to prevent noise and vibration.
  - 2. Adjust damper linkages for proper damper operation.
  - 3. Start air handling units and check for excessive vibration and correct.
  - 4. Remove all loose materials and obstructions from interior of equipment.
  - 5. Remove debris and waste materials resulting from installation.
  - 6. Clean tar, adhesive, dirt or marks from exterior of units.
- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, and instruct the operating personnel in its operation and maintenance as specified in Division 1.
- C. Tests: After installation of the units, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15730**  
**PACKAGED AIR CONDITIONING UNITS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Packaged rooftop air conditioning units and packaged indoor air conditioning units.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15071 - Vibration Control
- B. Section 15720 - Air Handling Units
- C. Section 15761 - Air Coils
- D. Section 15900 - HVAC Controls
- E. Section 16055 - Electrical Requirements for Shop-Assembled Equipment

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
- 1. ASME Boiler and Pressure Vessel Code Section VIII, Division 1 - Pressure Vessels
  - 2. ANSI/NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
  - 3. ANSI/NFPA 90A -Installation of Air Conditioning and Ventilation Systems
  - 4. ASHRAE 52.1 -Gravimetric and Dust Spot Procedures for Testing Air Cleaning Devices Used in General Ventilation for Removing Particulate Matter
  - 5. FS TT-C-490 -Cleaning Method and Pretreatment of Ferrous Surfaces for Organic Coatings
  - 6. ARI 210/240 -Standard for Unitary Air-Conditioning Equipment
  - 7. ASHRAE 15 -Safety Code for Mechanical Refrigeration
  - 8. ISA-S71.04 -Environmental Conditions for Process Measurement and Control System: Airborne Contaminants
  - 9. ANSI Z21.47/ -Unitary Air Conditioning Standard for safety UL1995 requirements

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit the manufacturer's technical product data, including rated capacities of the selected model clearly indicated, weights of units, furnished specialties and accessories, and installation and start-up instructions.
- C. Shop Drawings: Submit the manufacturer's assembly-type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of components.
- D. Service Connections: Indicate drain, electrical, and refrigeration rough-in connections on shop drawings and product data.
- E. Wiring Diagrams: Submit the manufacturer's electrical requirements for power supply wiring to packaged air conditioning units, and air purifier units. Submit the manufacturer's ladder-type wiring diagrams for interlock and control wiring required for final installation of packaged air conditioning units and controls. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
- F. Operation and Maintenance Data: Submit operation and maintenance data and a parts list for each packaged air conditioning unit, control, and accessory; including "trouble-shooting" maintenance guide. Include this data and product data in an operation and maintenance manual as specified in Section 01831.

**1.05 QUALITY ASSURANCE**

- A. Regulatory Requirements: Conform to ANSI/NFPA 90A, Underwriters Laboratories, National Electrical Codes, Local and State Building Codes for the installation of packaged air conditioning units.
- B. Manufacturer: Provide equipment from a company specializing in the manufacture of the products specified in this section with a minimum of three (3) years documented experience.

**1.06 DELIVERY, STORAGE, AND HANDLING**

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Handling: Handle packaged air conditioning units and components carefully to prevent damage, breaking, denting and scoring. Do not install damaged packaged air conditioning units, air purifier units or components. Replace damaged units with new units.

- C. Storage and Protection: Store packaged air conditioning units, and components in a clean dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.
- D. Unloading: Comply with the manufacturer's rigging and installation instructions for unloading packaged air conditioning units and moving units to final location for installation.

#### 1.07 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. One complete set of filters for each packaged air conditioning unit  
One complete set of belts for each belt driven piece of equipment

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Products may be submitted for approval.
- B. Packaged Rooftop Air Conditioning Units
  - 1. The Trane Company
  - 2. Reznor
  - 3. Carrier Corporation
- C. Packaged Indoor Air Conditioning Units
  - 1. The Trane Company

#### 2.02 PACKAGED ROOFTOP AIR CONDITIONING UNITS

- A. General: Provide roof-mounted air conditioning units that are factory fabricated and assembled, factory tested and factory finished, and of the arrangement, minimum size, capacities and characteristics as specified and scheduled. Provide units having electric heating and electric refrigeration. Provide each unit comprised of casing and frame, supply fan, controls, filters, electric heating coil, cooling coil, compressor, condenser coil and condenser fan.
- B. Casing: Provide galvanized steel casing with corrosion protective coating, access hinged doors or removable access panels with quick fasteners, locking door handle type with piano hinges. Fabricate the structural members of heavy gauge galvanized steel.

Provide casings with panels for access to controls, compressors, evaporator fan, motor and drives, dampers and air filters. Provide unit frames to include structural channel bases, reinforced as required to be rigid.

- C. Insulation: Provide 1/2 inch thick neoprene coated glass fiber on surfaces where conditioned air is handled. Protect edges from erosion.
- D. Supply Fan: Provide forward curved centrifugal type, double width, double inlet, resiliently mounted with V-belt drive, adjustable variable pitch motor pulley, and rubber isolated hinge mounted motor. Isolate complete fan assembly.
- E. Evaporator Coil: Provide an evaporator coil of nonferrous construction with seamless copper tubes mechanically bonded to aluminum fins with corrosion protective coating. Factory test the coil for leakproofness at 375 psig air pressure. Clean and dehydrate the refrigerant system and completely charge the system with refrigerant and recommended oil before shipment. Provide the coil with a remote bulb thermal expansion valve for each refrigerant circuit.
- F. Drain Pan: Provide double sloped condensate drain pan constructed of PVC with external connections on either side of unit. The drain pan shall be removable for cleaning.
- G. Electric Heating Coil
  - 1. Provide the electric heating coil with corrosion protective coating of the size and capacity shown, comprising heating elements fabricated of 80 percent nickel and 20 percent chromium wire, insulated by floating ceramic bushings, supported in an aluminized steel frame with stainless steel terminals insulated with phenolic bushings. Provide the units listed by UL, Inc. built to meet the requirements of the NEC and tested dielectrically at 2,000 volts before shipment.
  - 2. Provide the electric heating coil complete with disc type manual and automatic reset thermal cutouts, built-in magnetic contactors, control transformer, built-in circuit breaker and disconnect switch, fan interlock relay, and pilot lights to indicate when the heater is on and when overheating. Factory wired heater elements and controls to terminal strips with internal wiring suitable for 105 degrees C, all contained in a NEMA Type 3R enclosure and furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop-Assembled Equipment.
- H. Air Flow Switch: Provide an airflow switch factory installed on the unit wired into the electric heating coil control circuit so that the heater cannot operate unless there is adequate airflow through the heater. In lieu of the air flow switch, microprocessor control can be provided to prevent operation of compressor(s) or heater(s) when loss of air flow is detected.

- I. Air Filters: Provide the air filter section equipped with one inch panel-type throw away air filters and a filter gauge meeting the requirements specified in Section 15720 - Air Handling Units.
- J. Compressor: Provide refrigeration compressors of the hermetic scroll or reciprocating type, resiliently mounted with positive lubrication, designed for air-cooled condensing, with service shut-off valves and crankcase heater. Provide the refrigeration section operating and safety controls to include low and high pressure cutout, compressor motor overload and winding thermostat cutout, and controls to prevent frequent unit cycling. Provide three overload relays for three-phase motor starts. Provide control panels with NEMA 4X enclosures, combination magnetic starters with control transformer in conformance with Section 16055 - Electrical Requirements for Shop-Assembled Equipment numbered terminal strip and accessories.
  - 1. Provide refrigeration controls that include reset relay circuits to provide manual resetting of the high pressure control and the compressor winding thermostats. Provide each unit with provision at the control panel terminal block for remote start-stop.
  - 2. Provide five-minute timed off circuit to delay compressor start.
  - 3. Provide step capacity control by hot gas bypass or cycling and unloading.
- K. Condenser: Provide condenser coil of nonferrous construction with Heresite corrosion protective coating and seamless copper tubes mechanically bonded to heavy-duty aluminum fins, with liquid refrigerant subcooling capacity. Factory test condenser coils at 200 psig air pressure under water, and vacuum dehydrated at 175 degrees F. Provide weatherproof corrosion coated condenser fans, of the propeller type, directly driven by a weatherproof motor with permanently lubricated bearings. Provide the condensing units suitable for operation at temperatures down to 0 degrees F ambient air. Provide fan guard at each condenser fan discharge.
- L. Dampers: Provide outside and return dampers with damper operator and control package to automatically vary outside air quantity. Provide the outside air damper that fails to closed position.
- M. Gaskets: Provide tight fitting dampers with edge gaskets, maximum leakage 5 percent at 2 inches pressure differential.
- N. Damper Operator: Provide a 24-volt damper operator with gear train sealed in oil with spring return.

- O. Controls: Provide controls as specified in Section 15900 - HVAC Controls and as follows:
1. Select, provide, and mount damper actuators on each damper. Actuators shall be of sufficient size and quantity to ensure complete damper operation. Actuators shall be direct coupled to minimize linkage.
  2. Provide differential pressure switches. Pressure switches shall be factory installed across each filter bank for individual filters to monitor clean/dirty filter status.
  3. Provide differential pressure gauges. Pressure gauges shall be factory installed across each filter bank for individual filters. The gauge shall be diaphragm- actuated dial type.
  4. Provide a momentary push-button reset circuit using a double-pole low limit switch. Low limits shall be factory engineered to maximize coil coverage. Capillary radius clips shall be used at low limit bends to ensure no crimping or wear of low limits. Low limits shall be wired to shut down the fan to protect the unit.
  5. Provide and mount fan status switches.
  6. Provide and mount discharge temperature sensors on the fans. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
  7. Provide outside air temperature sensors.
  8. Provide averaging temperature sensors. Sensors shall be factory engineered to accurately measure mixed air temperatures. Capillary radius clips shall be used at capillary bends to ensure no crimping or wear of the tube. Temperature sensors mounted within the AHU shall have sensor material selected to integrate with the BAS controller.
- P. Economizer: Where noted provide dry bulb economizer complete with indoor and outdoor air sensors and controls. Provide factory-mounted economizer complete with fully modulating 0 to 100 percent motor and dampers, barometric relief, minimum position settings, and preset linkage.
- Q. Roof Curb: Provide roof curb designed to mate with the units downflow supply and return and provide support and a watertight installation when installed properly. The roof curb design shall allow field-fabricated rectangular supply/return ductwork to be connected directly to the curb. Curb shall be shipped knocked down for field assembly and shall include wood nailer strips

- R. All packaged rooftop air conditioning units shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A, in accordance with the City of New York Building Code and Uniform Building Code.

## 2.03 PACKAGED INDOOR AIR CONDITIONING UNITS

- A. General: Provide factory assembled horizontal, single piece, air cooled, indoor, ceiling plenum mounted electric heating and cooling unit factory tested and of a size, capacity, as specified and scheduled. Provide units with ARI - rated cooling capacity. Contained within the unit enclosure shall be all factory wiring, piping, controls, and refrigerant charge (R-410A).
- B. Casing shall be constructed of galvanized steel with corrosion protective coating . Interior shall be insulated with 1/2-inch thick neoprene coated fiberglass. Insulation shall be bonded to interior surfaces. Provide with side access panels and bottom hanging removable doors to facilitate ease of maintenance. Side panels allow access to the control box, refrigeration components, and condenser coil. Control box shall be hinged allowing access to the compressor and pressure switches. Bottom doors shall allow access to and easy removal of the condenser and evaporator motors and blower assemblies. Provide insulated drain pan equipped with two 3/4-inch threaded condensate drain connections below the evaporator coil and one 3/4-inch threaded connection for condenser coil wash down. Drain line shall be insulated. Unit shall have an integral hanging bracket requiring only 4 threaded rods run to the top flange of the unit for hanging, eliminating need for external hanger brackets. Contains junction box for power connection and opening for routing of control wiring.
- C. Fans
1. Evaporator: Blower shall be of the forward-curved, centrifugal, direct-drive type or belt drive as shown on equipment schedule. Motor shall have permanently lubricated bearings.
  2. Condenser: Blower shall be of the forward-curved, centrifugal, direct-driven type or belt drive as shown on equipment schedule. Motor shall have permanently lubricated bearings.
- D. Compressor: Provide hermetic scroll or reciprocating type compressor complete with accessory equipment and refrigerant piping factory prepiped suitable for operation down to 0°F outdoor ambient.
- E. Coils: Evaporator and condenser coils shall be of non-ferrous construction with aluminum fins mechanically bonded to seamless copper tubes with all joints brazed with corrosion protective coating (Heresite, or approved equal).
- F. Filter Section: Provide filter section that consist of factory-installed throw-away filters, removable from the same side as the access panels without the use of tools.

- G. Controls and Safeties: Control system shall include a high-pressure switch, a low-pressure switch and a compressor lockout feature which upon tripping of any safety device shall prevent compressor from restarting unit reset at the thermostat. Controls shall be as specified in Section 15900 - HVAC Controls.
- H. Operating Characteristics: Unit shall operate using refrigerant R-410A and shall be designed for indoor suspended horizontal mounting and operation.
- I. Electrical Requirements: Unit shall have single point power connection to leads in terminal box with disconnect switch.
- J. Electric Heat Module: Provide encased U.L. listed electric heating coil, with corrosion protective coating, that shall attach directly to the base unit discharge with bottom access. Factory wired heater elements and controls to terminal strips with internal wiring suitable for 105 degrees C, all contained in a NEMA Type 3R enclosure and furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop-Assembled Equipment. Provide an airflow switch factory installed on the unit wired into the electric heating coil control circuit so that the heater cannot operate unless there is adequate airflow through the heater. In lieu of the air flow switch, microprocessor control can be provided to prevent operation of compressor(s) or heater(s) when loss of air flow is detected.
- K. Vibration Isolation Package: Shall provide 4 spring hangers for ceiling mounted unit to damper vibration that may be transmitted to building structure.
- L. All packaged indoor air conditioning units shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A, in accordance with the City of New York Building Code and Uniform Building Code.

#### 2.04 CORROSION PROTECTIVE COATING FOR COILS

- A. Provide protective corrosion resistant coating meeting the following requirements.
- B. Air-Dried Polyelastomer Coating: Provide a single component, complex chain linked polyelastomer coating (Husky coil coat-dip protective coating as manufactured by Bronz-Glow Industries or approved equal). Thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer (if required) and coating of an air-dried poly elastomeric corrosion-resistant coating to obtain a minimum total dry film thickness of 0.8 – 1.5 mils.
- C. Manufacturer recommendations: Perform cleaning, surface preparation, and coating procedures as specified and in accordance with the coating manufacturer's published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.
- D. Surface Preparation: Remove all traces of oil, grease, rust, dirt and dust. Pressure rinse with a high pH cleaning solution. Rinse with fresh water. Pressure rinse with

a low pH cleaning solution to reduce surface pH to 5.0 to 7.0. Allow to air-dry thoroughly.

### PART 3 EXECUTION

#### 3.01 INSPECTION

- A. General: Examine areas and conditions under which packaged air conditioning units are to be installed. Do not proceed with installation work until unsatisfactory conditions have been corrected in an acceptable manner.
- B. Field Verification: Verify that the ceiling system is ready to receive Work and opening dimensions are as indicated on shop drawings.
- C. Service Connections: Examine rough-in for refrigeration, and condensate drainage piping, and electrical conduits, to verify the proper locations of connections prior to installation.

#### 3.02 INSTALLATION

- A. General: Install units in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Electrical Wiring: Install electrical devices furnished by the manufacturer but not specified to be factory-mounted. Furnish a copy of the manufacturer's field wiring diagram with equipment. Verify that the electrical wiring installation is in accordance with the manufacturer's submittal and installation requirements furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop Assembled Equipment. Do not proceed with equipment start-up until the wiring installation is acceptable.
- C. Drain Piping: Connect each unit drain to the nearest indirect waste connection. At drain pans provide a trap constructed at least 1-inch deeper than the fan pressure.

#### 3.03 FIELD QUALITY CONTROL

- A. Start-Up: Start up packaged units, in accordance with the manufacturer's start-up instructions. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, and instruct the operating personnel in its operation and maintenance as specified in Section 01831.

- C. Tests: After installation of the packaged air conditioning units, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions.

3.04 OPERATION DEMONSTRATION

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to demonstrate the proper operation and instruct station personnel in the equipment's operation and maintenance, as specified in Division 1.

-END OF SECTION-

**Section 15761  
AIR COILS****PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Direct expansion cooling coils and electric heating coils for installation in air systems.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15081 - Piping Insulation
- B. Section 15184 - Refrigeration Piping and Specialties
- C. Section 15900 - HVAC Controls
- D. Section 16055 - Electrical Requirements for Shop-Assembled Equipment

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. ARI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils.
  - 2. NEC - National Electrical Code.
  - 3. UL 1096 - Electric Central Air Heating Equipment.
  - 4. SMACNA - HVAC Duct Construction Standards, Metal and Flexible.

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Product Data and Information: Submit product data indicating coil and frame configurations, dimensions, materials, rows, connections, and rough-in dimensions.
- C. Shop Drawings: Submit shop drawings indicating coil and frame configurations, dimensions, materials, rows, connections and rough-in dimensions.
- D. Diagrams: Submit complete wiring and control diagrams.
- E. Quality Control: Submit manufacturer's certificate that coil capacities, pressure drops and selection procedures meet or exceed specified requirements.

**1.05 QUALITY ASSURANCE**

- A. General: Provide equipment from a company specializing in manufacturing the products specified in this Section with minimum three (3) years documented experience.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Storage and Protection: Protect coil fins from crushing and bending by leaving them in the shipping cases until installation, and by storing indoors, in a clean, dry place.
- C. Protect coils from entry of dirt and debris with pipe caps or plugs.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Direct Expansion Cooling Coils
  - 1. The Trane Company
  - 2. Carrier Corporation
  - 3. York International Corp.
- C. Electric Heating Coils
  - 1. INDEECO
  - 2. Brasch Mfg. Co. Inc.

### 2.02 COILS - GENERAL

- A. General Design: Factory fabricate and assemble, factory test, and factory finish air coils, with indicated capacities and characteristics, and including all necessary accessories for complete installation.
- B. Corrosion Protective Coating for Coils: Provide protective corrosion resistant coating meeting the following requirements:
  - 1. Air-Dried Polyelastomer Coating: Provide a single component, complex chain linked polyelastomer coating (Husky coil coat-dip protective coating as manufactured by Bronz-Glow Industries or approved equal). Thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer (if required) and coating of an air-dried poly elastomeric corrosion-resistant coating to obtain a minimum total dry film thickness of 0.8 – 1.5 mils.
  - 2. Manufacturer recommendations: Perform cleaning, surface preparation, and coating procedures as specified and in accordance with the coating

manufacturer's published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.

3. Surface Preparation: Remove all traces of oil, grease, rust, dirt and dust. Pressure rinse with a high pH cleaning solution. Rinse with fresh water. Pressure rinse with a low pH cleaning solution to reduce surface pH to 5.0 to 7.0. Allow to air-dry thoroughly.

## 2.03 DIRECT EXPANSION COOLING COILS

- A. General: Provide units meeting the minimum face area and maximum air friction drop as scheduled coated with protective coating, and as follows.
- B. Headers: Construct headers of seamless copper tubes with silver brazed joints.
- C. Liquid Distributors: Provide copper venturi type distributor with seamless copper distributor tubes.
- D. Tubes: Provide tubes of 5/8 inch OD seamless copper arranged in parallel or staggered pattern, expanded into fins, with silver brazed joints.
- E. Fins: Provide aluminum continuous plate type fins with full fin collars or individual helical finned tube type wound under tension. (Solder coat copper fin coils.)
- F. Testing: Provide coils air tested under water at 300 psig for working pressure of 250 psig; clean, dehydrate and seal with dry nitrogen charge.
- G. Accessory: Provide refrigeration accessory equipment as specified in Section 15184 - Refrigeration Piping and Specialties.

## 2.04 ELECTRIC HEATING COILS

- A. General: Provide units listed by UL Inc., meeting the requirements of the National Electrical Code and furnished in accordance with the requirements of Section 16055 - Electrical Requirements for Shop-Assembled Equipment. Provide units meeting the size, capacities and electric characteristics shown, and as follows:
- B. Construction: Provide frame member, control box and cover and other sheet metal parts constructed of heavy gauge, die formed aluminized steel finished with baked enamel. Construct the electric heating elements of 80/20 percent nickel chromium resistance wire.
- C. Design
  1. Provide finned type, heating elements insulated in tubular type aluminum finned tube, flanged frames designed for installation in air handling equipment.

2. Provide exposed heating elements insulated by floating ceramic bushings, slip-in type designed for installation through a rectangular opening in the duct. Provide heating elements wired to stainless steel terminals insulated with phenolic bushings. Balance electrical circuits for the number of stages shown.
- D. Controls: Provide staging contactor for each heating stage activated by a silicone controlled rectifier (SCR) and step controller. Provide built-in controls prewired to identify terminal strips on the control box by a vernier control system. Provide controls meeting the requirement specified in Section 15900 - HVAC Controls.
- E. Thermal Protection: Provide coils complete with automatic reset thermal cutout wired in series with staging contactors, safety contactor wired to disconnect all underground line voltage conductors of each internal circuit, contactor holding coils connected in series with built-in manual reset thermal cutouts for back-up protection, overcurrent protective fuses or circuit breaker to open all underground line voltage conductors of each internal circuit and control voltage transformer in the event of an overcurrent condition, main safety disconnect switch to disconnect power automatically when the control box door is opened, and an airflow switch to prevent heater operation upon airflow failure.

### PART 3 EXECUTION

#### 3.01 EXAMINATION

- A. Examine units at the time of delivery for damaged or missing components. Do not proceed with the installation of units until all items found defective upon examination have been corrected.

#### 3.02 INSTALLATION

- A. General: Install coils in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1. Make all necessary adjustments to the equipment to provide a complete and satisfactory operation upon completion of the installation.
- B. Removal Space: Install to permit removal of coils. Provide no less space for removal than minimum as recommended by the manufacturer.
- C. Regulatory Requirements: Install electric heating coils in ducts and casings in accordance with SMACNA HVAC Duct Construction Standards, Metal and Flexible.
- D. Supports: Support coil sections independent of piping on steel channel or double angle frames and secure to casings. Arrange supports to avoid piercing drain pans. Provide an airtight seal between coil and duct or casing.

- E. Protection: Protect coils to prevent damage to fins and flanges. Comb out bent fins.
- F. Alignment: Install coils level.
- G. Connection: Make connections to coils with unions and flanges.
- H. Moisture Eliminators: Provide moisture eliminator for cooling coils where the air velocity exceeds 500 ft/min.
- I. Drain Pans: Provide drain pan and drain connections for cooling coils. Fabricate drain pans from 20-gauge galvanized steel. Extend the drain pan 3 inches from face of coil entering air side, (6) inches from face of coil leaving air side and 4 inches from face of eliminators. Pipe drain pans individually to floor drain with water seal trap.
- J. Sight Glass: On refrigerant coils, provide a sight glass in the liquid line within 12 inches of the coil.
- K. Insulation: Insulate headers located outside air flow as specified for piping. Refer to Section 15081 - Piping Insulation.

### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Provide the services of a qualified representative of the manufacturer to inspect the installation of air coils, certify that it meets the manufacturer's recommendations, and instruct the operating personnel in their operation and maintenance.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15765**  
**TERMINAL HEAT TRANSFER UNITS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Baseboard heaters and electric unit heaters.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15071 - Vibration Control
- B. Section 16055 - Electrical Requirements for Shop Assembled Equipment

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. NFPA 70 - National Electrical Code

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Product Data: Submit manufacturer's specifications for terminal heat transfer units showing dimensions, capacities, ratings, performance characteristics, gages and finishes of materials, and installation instructions.
- C. Shop Drawings: Submit assembly-type shop drawings showing unit dimensions, construction details, and field connection details.
- D. Wiring Diagrams: Submit the manufacturer's electrical requirements for power supply wiring to terminal units. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between those portions of wiring that are factory-installed and portions to be field-installed.
- E. Samples: Submit 3 samples of each type of cabinet finish furnished.
- F. Operation and Maintenance Data: Submit maintenance instructions, including lubrication instructions, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, and shop drawings in operation and maintenance manuals as specified in Section 01831 – Operation and Maintenance Manuals.

## 1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide equipment from firms regularly engaged in the manufacture of terminal units, of the types and sizes required, whose products have been in satisfactory use in similar service for not less than three (3) years.
- B. UL Compliance: Provide electrical components for terminal units which are listed and labeled by UL.

## 1.06 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.
- B. Protection Handle terminal units and components carefully to prevent damage, breaking, denting and scoring. Do not install damaged terminal units or components, replace them with new units.
- C. Storage: Store terminal units and components in a clean dry place, protected from weather, dirt, fumes, water, construction debris, and physical damage.
- D. Handling: Comply with the Manufacturer's rigging and installation instructions for unloading terminal units, and moving them to final location.

## 1.07 SEQUENCE AND SCHEDULING

- A. Install terminal heat transfer units after walls and ceilings are finished and painted to avoid damage to the units.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Baseboard Heaters
  - 1. Q-Mark, Marley Electric Heating
  - 2. Trane Company
- C. Electric Unit Heaters
  - 1. Trane Co.
  - 2. Reznor
  - 3. Industrial Engineering and Equipment Co. (INDEECO)

## 2.02 MATERIALS

## A. Baseboard Heaters

1. Type: Wall mounted electric, baseboard heaters, completely factory wired with integral thermostat, end caps and filler or blank sections shall be included.
2. Capacity: As specified on the Contract Drawings.
3. Cabinet
  - a. 16 gage steel enclosure with reinforced all welded construction
  - b. Enclosure chemically treated to resist corrosion.
  - c. Top discharge to be an extruded aluminum bar grille with protective 1/4-inch mesh screen below grille.
  - d. Bottom air inlet perforated openings
  - e. Back surface of heater, filler and blank section enclosure to be completely smooth, except for electrical knockouts and mounting holes.
  - f. Bottom of front cover fastened to back panel with concealed screws and top of front cover to engage with grille supports.
  - g. Sleeve, end cap and corner accessories to be internal telescoping type, mounted to concealed top and bottom sliding set screw fasteners in end of sill line heaters, filler or blank sections and finished in dark baked enamel.
  - h. Back panel slotted along top and bottom for attachment to wall without removal of heating assembly.
  - i. Fill and blank section accessories to be of same cross-section as heater enclosure, with butt-joint end. 8-inch filler section to have hinged access door.
  - j. All heaters and electrical accessories to be labeled by Underwriters Laboratories, Inc.
  - k. Provide baseboard unit heater with corrosion protective coating (Heresite or approved equal).

## 4. Elements

- a. Heating elements shall be aluminum.
- b. Elements shall be center anchored and shall float freely on each end through nylon bushings.

## 5. Controls

- a. Factory installed built-in controls shall include thermostat, power disconnect switch, transformer relay, etc. Wall mounted thermostats for field wiring where shown on the Contract Drawings.
- b. Thermostats shall be adjustable.
- c. An automatic reset thermal overload protector with automatic reset shall run the full-length of the heater and shall turn off heating elements should overheating occur at any point along heating length.

B. Electric Unit Heaters: Provide electric unit heaters of the minimum size, heating and air capacities, electric characteristics and arrangement shown, meeting the following requirements.

1. Provide each unit comprised of a dynamically balanced aluminum blade propeller fan direct-driven by a totally enclosed continuous duty motor, metal sheathed electric heating elements, power magnetic contactors, and automatic reset thermal overload cutout, all mounted in a heavy gauge metal cabinet. Construct the cabinet of phosphate treated steel finished in baked enamel.
2. Provide electrical components factory prewired to a terminal strip. Provide the units noted for three phase electric supply wired to give balanced electrical circuits. Provide an integral transformer to give a low voltage control circuit if the power supply is other than 115 volt single phase.
3. Provide electric unit heaters listed by the Underwriters Laboratories Inc. and meeting the requirements of the National Electric Code.
4. Provide ceiling or wall mounting brackets where required, and a fan guard.
5. Suspend unit heaters by hanger rods and neoprene vibration isolators meeting the requirements specified in Section 15071 - Vibration Control.
6. Provide electric unit heater with corrosion protective coating (Heresite or approved equal).

**PART 3 EXECUTION****3.01 INSPECTION**

- A. General: Examine areas and conditions under which terminal units are to be installed. Verify that the required utilities are available, in the proper location, and ready for use. Do not proceed with Work until unsatisfactory conditions have been corrected.

**3.02 INSTALLATION**

- A. General: Install terminal heat transfer units, in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Baseboard Heaters: Locate baseboard heaters where shown on drawings.
- C. Unit Heaters: Hang unit heaters from the building structure, with pipe hangers anchored to the building, not from piping. Mount the units as high as possible to maintain the greatest headroom unless otherwise indicated.
- D. Equipment Protection: Protect units with protective covers during the balance of construction.
- E. Electrical Requirements: Install electric heating equipment including devices furnished by the manufacturer but not factory-mounted. Furnish a copy of the manufacturer's wiring diagram submittal. Verify that the electrical wiring is furnished in accordance with the requirements of Section 16055 – Electrical Requirements for Shop Assembled Equipment.

**3.03 FIELD QUALITY CONTROL**

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1.
- B. Tests: After installation of the terminal heat transfer units, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions.

**3.04 CLEANING AND PAINTING**

- A. General: After construction is completed, including painting, clean exposed surfaces of units, vacuum clean terminal coils and the inside of cabinets.

- B. Touch-Up: Retouch any marred or scratched surfaces of factory-finished cabinets, using finish materials furnished by the manufacturer.

-END OF SECTION-

**Section 15771**  
**ELECTRIC HEAT TRACING SYSTEMS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install electric heat tracing system(s) as indicated on Contract Drawings or specified herein.
  - 1. All piping, valves and accessories related to fluid transfer systems located outdoor and indoor and subject to freezing conditions.
  - 2. HVAC exhaust fan ducts below open exhaust stacks.
  - 3. Other piping where indicated on Contract Drawings or specified.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15081 - Piping Insulation
- B. Section 15076 - Piping and Equipment Identification
- C. Section 15120 - Interior and Exposed Piping Schedules
- D. Section 15815 - Duct Insulation
- E. Division 16 - Electrical

**1.03 REFERENCES**

- A. Reference Standards: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified. Requirements of this Contract shall supersede the Standards in case of conflict:
  - 1. Factory Mutual (FM)
  - 2. National Electrical Manufacturers' Association (NEMA)
  - 3. Underwriters' Laboratories (UL).
  - 4. The Institute of Electrical and Electronics Engineers (IEEE)
  - 5. NFPA 70 - National Electrical Code.
  - 6. New York City Electrical Code

**1.04 HEAT TRACING SYSTEM DESIGN**

- A. Contract Drawings show approximate number and location of heat trace circuits required.
- B. Design complete heat trace systems based on design criteria contained herein,

## 1.05 SUBMITTALS

- A. Provide all submittals in accordance with the General Conditions and Section 01330 – Shop Drawings.
- B. Samples: Submit for approval the following:
  - 1. One linear foot of each heat trace cable, per type of cable
  - 2. Fastening devices
- C. Shop Drawings: Submit for approval the following:
  - 1. Manufacturers' catalog literature, specifications, and illustrations with the following information:
    - a. Thermal properties
    - b. Physical properties
    - c. Bill of Materials
    - d. Installation instructions
    - e. Jointing recommendations for butt joints and longitudinal seam
    - f. Wiring Schematic
  - 2. Qualifications of the system design engineer
  - 3. System design calculations and equipment layout drawings
  - 4. Details for heating cable installation
  - 5. Data sheet for each electric heating cable with the following information:
    - a. Heater catalog number
    - b. Heater length
    - c. Voltage required
    - d. Ampere load
    - e. Total output in watts
    - f. Output in watts per linear foot
    - g. Thermostats, junction boxes
    - h. Control Panel layout and wiring diagram
- D. Submit record drawings and documents upon completion of the work. Accurately record actual locations of heating cables, resistance temperature detectors and circuit connections.
- E. Submit operation and maintenance manuals in accordance with the procedures and requirements set forth in Section 01831- Operation and Maintenance Manuals.

## 1.06 QUALITY ASSURANCE

- A. The Heat Trace System shall be designed, installed and tested in compliance with IEEE-515.
- B. Manufacturer Qualifications
  - 1. The Contractor shall engage a single firm for performance and other requirements and components of the specified equipment.
  - 2. The equipment covered by these specifications is intended to be standard equipment of proven performance as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed.
  - 3. Manufacturer shall have at least three (3) years experience in production of heat tracing systems.
  - 4. ISO 9001 certified
- C. Installer's Qualifications
  - 1. Installer of heat-tracing equipment shall have at least three (3) years experience in the installation of specified Work, and shall employ only tradesmen with specific skills and experience in this type of Work and show evidence of satisfactory operation in the installations.
- D. Requirements of Regulatory Agencies: Comply with applicable provisions of regulatory agencies below and others having jurisdiction.
  - 1. Underwriters Laboratories, Incorporated
  - 2. National Fire Protection Association (NFPA)
  - 3. Local and National Electrical Code
  - 4. Local and State Building Codes and Ordinances
    - a. New York City Construction Codes
    - b. New York State Uniform Fire Prevention and Building Code
    - c. New York State Energy Conservation Construction Code
  - 5. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

## 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Protection: Material shall be warehoused on or near the job site and drawn from this protected area as used.

## PART 2 PRODUCTS

## 2.01 ELECTRIC HEAT TRACING SYSTEM

- A. General: For each heat tracing system, 480Y/277-volt service power shall be supplied under Division 16 of the Specifications.
  - 1. Each system shall be controlled from a Control/Monitoring panel as defined on the Contract Drawings or in the Specifications.
  - 2. Heat tracing cables shall be installed before insulation is installed.
  - 3. Control Panel/Multiple Heat Trace Circuiting: For each system, power shall be supplied from the Electrical distribution system to the Control/Monitoring panel. Provide overcurrent and GFCI protection for each individual circuit. Locate O/C and GFCI within the Control/Monitoring panel. For each system, provide all conduit and wiring from the Control/Monitoring panel to heat trace cables and field devices.
  - 4. Refer to the Contract Drawings and Specifications for the type of heat tracing application required. Furnish and install a complete heat tracing system with all components including temperature sensor, cable, junction box, etc., being the product of one manufacturer or supplier.
  - 5. All outdoor remote connections and equipment shall be corrosion resistant weatherproof, NEMA 4X.
- B. The heater cable shall be suitable for cutting to desired length to suit conditions at installation. The cable shall form a continuous heating circuit. Heat trace cable shall not be used as jumper conduit from one piping system to another. Contractor shall use heat trace cable, wire, conduit and junction boxes to achieve the complete circuit.
- C. The design and materials selected for the electrical heat tracing system shall be in accordance with applicable provisions of the NYCBC, shall meet requirements of Underwriters' Laboratories, IEEE-515 and all other applicable standards.

## 2.02 SELF-REGULATING CABLE

- A. The heater cable shall be capable of maintaining maximum recommended pipe temperatures, and withstand continuous exposure temperatures as outlined below, without permanent damage to the matrix core.
1. The maximum maintenance temperature rating of the cable shall be 150°F.
  2. The maximum continuous exposure rating of the cable shall be 185°F.
  3. The minimum installation temperature rating of the cable shall be -30°F.
  4. At a minimum the heat trace cable shall be designed to maintain the solution in the pipe at a temperature at 40°F, unless otherwise specified, when the ambient temperature is 0°F with a 20 mph wind with a 10 percent safety factor but shall not have a rating of less than 3 watts per foot length of cable.
- B. The heater cable assembly shall consist of two parallel copper bus wires, minimum size 16 AWG, connected through a semi-conductive heating matrix. This heating element shall be covered with a cross-linked polyolefin insulation jacket. This insulation shall be covered by a tinned copper braid and then covered again with a fluoropolymer insulating jacket. The cable heat output capacity and voltage shall be as listed in Article 3.03.
- C. Before shipment, cable shall indicate an insulation resistance of 20 megohms minimum bus to braid using a 2500 volt DC megger and withstand for one minute a voltage equal to twice rated plus 1,000 volts applied bus to braid.
- D. Electric heat trace cable shall be as manufactured by one of the following:
1. Delta-Therm Corporation, Series IN-CBF
  2. Thermon Manufacturing Company, Series BSX-FOJ
  3. Raychem Corporation (Tyco Thermal Controls), Series BTV-CT
  4. Chromalox Inc. Series SRL3
  5. Or approved equal

## 2.03 SELF-REGULATING CABLE – HIGH TEMPERATURE

- A. The heater cable shall be capable of maintaining maximum recommended pipe temperatures, and withstand continuous exposure temperatures as outlined below, without permanent damage to the matrix core.
1. The maximum continuous temperature rating of the cable with the power on shall be 250°F.
  2. The maximum continuous temperature rating of the cable with the power off shall be 375°F.

3. The minimum installation temperature rating of the cable shall be -30°F.
  4. The heat trace cable shall be designed to maintain the solution in the pipe at a temperature at 40°F when the ambient temperature is 0°F with a 20 mph wind with a 10 percent safety factor but shall not have a rating of less than 5 watts per foot length of cable.
- B. The heater cable assembly shall consist of two parallel copper bus wires, minimum size 16 AWG, connected through a semi-conductive heating matrix. This heating element shall be covered with a fluoropolymer insulation jacket. This insulation shall be covered by a tinned copper braid and then covered again with a fluoropolymer insulating jacket. The cable heat output capacity and voltage shall be as listed in Article 3.03.
- C. Before shipment, cable shall indicate an insulation resistance of 20 megohms minimum bus to braid using a 2500 volt DC megger and withstand for one minute a voltage equal to twice rated plus 1,000 volts applied bus to braid.
- D. Electric heat trace cable shall be as manufactured by one of the following:
1. Thermon Manufacturing Company, Series VSX-FOJ
  2. Raychem Corporation (Tyco Thermal Controls), Series XTV-CT
  3. Delta-Therm Corporation, Series HT CB/F
  4. Chromalox, Inc. Series SRM/E20
  5. Or approved equal

## 2.04 HEAT TRACE CONTROLS

### A. Heat Trace Control/Monitoring Panel

1. The temperature controller shall be a microprocessor based temperature control and monitoring system specifically for heat tracing. The single or multiple circuit module, as required, shall provide on-off control, digital information display and alarms. Diagnostic self-test capabilities. Minimum and maximum values monitored during a given period shall be retained for display on demand, independent of temperature alarm set points.
  - a. Real time data for:
    - (1) Temperature
    - (2) Heater current
    - (3) Ground leakage current
  - b. Stored data for:
    - (1) Highest temperature encountered
    - (2) Lowest temperature encountered

## c. Alarm information for:

- (1) Low and high temperature
- (2) Low and high heater current
- (3) Ground leakage current
- (4) Damaged RTD sensor

## 2. Specifications

- a. Single heat trace circuit up to 30 amps
  - b. 120 or 208/240 Vac module supply voltage
  - c. 120-480 Vac controlled output voltage
  - d. -40° to 140°F ambient operating limits
  - e. Nonvolatile EEPROM data retention
  - f. 30 to 150 mA ground leakage alarm/trip
  - g. Modbus ASCII via RS 485 communications port
  - h. On-Off control with soft start to limit in-rush current
  - i. Branch circuit protected by GFCI circuit breakers
3. The heat tracing systems installer shall review and coordinate power (voltage and phase) provided to determine input module supply voltage.
  4. The panel shall utilize a backlit display for reporting temperatures and operating parameters. Separate LED's indication of status of power to the control panel, power to the heat tracing circuit and any alarms affecting the system. All alarms shall activate a solid state alarm relay rated at 1 ampere at 240 Vac and shall be wired to an audio device.
  5. Control module and all wiring and control accessories shall be enclosed in a NEMA 4X fiberglass reinforced plastic enclosure with clear vision panel to view control module data display. Enclosure panel shall accommodate multiple heat trace modules as required. Panel shall provide for rack mounting of multi-circuit control modules.
    - a. Enclosure shall include a suitably sized panelboard for power distribution to the multiple heat trace circuits, including spare circuits as required by the Specifications. Enclosure shall include a main power fused disconnect, sized to accommodate future circuits.
    - b. Control module(s) and power distribution equipment may be housed in separate enclosure panels. Wiring and conduit between panels shall be provided by the Contractor.
  6. Provide all power wiring, control wiring, conduit, and electrical accessories between the Heat Trace Control/Monitoring Panels, thermostats, sensors, heat trace cable and all other remote field installed devices as required and in accordance with Division 16.

7. Provide dry contact closure for remote monitoring of the following:
  - a. System Fault (comprised of the following):
    - (1) Low and high temperature
    - (2) Low and high heater current
    - (3) Ground leakage current
    - (4) Damaged RTD sensor
  - b. Provide Wire and conduit from the Control/Monitoring Panels to the PLC.
8. Acceptable Control/Monitoring Panel manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - a. Delta-Therm Corporation
  - b. Thermon Manufacturing Company
  - c. Raychem Corporation (Tyco Thermal Controls)
  - d. Chromalox, Inc.
  - e. Or approved equal

B. Resistance Temperature Detector (RTD)

1. RTD shall be three-wire platinum, right-angle construction, with an integral junction box.
  - a. RTD housing shall be 316 stainless steel
  - b. Junction box shall be NEMA 4 cast aluminum
  - c. RTD shall be Thermon Manufacturing Company, Series RTD-100, or approved equal
2. Install RTD's at locations and in quantities as shown in detailed design provided by heat trace system supplier.

C. Moisture Sensor

1. Moisture sensor with integral ambient thermostat to detect snow.
  - a. Moisture sensor enclosure shall be NEMA 4, suitable for direct conduit mounting.
  - b. Moisture sensor shall be Environmental Technology, Inc., Series CIT-1, or approved equal.

2. Install moisture sensor(s) at locations and in quantities as shown in detailed design provided by heat trace system supplier.

## 2.05 ACCESSORIES

- A. Insulation and Metal Jacket: Refer to Section 15081 - Piping Insulation and Section 15815 - Duct Insulation.
- B. Aluminum Tape
  1. Aluminum tape shall be 2-mil thick, high tensile aluminum foil coated with fire retardant, acrylic pressure-sensitive adhesive.
  2. Two-inch wide aluminum foil-coated tape, provided by the heat trace manufacturer, shall be installed on top of, and parallel to, the heat trace cable to increase the area of heat transfer.
  3. Provide one of the following:
    - a. Delta-Therm Corporation, Catalog No. T-AL200
    - b. Thermon Manufacturing Company, Catalog No. AL-20P
    - c. Raychem Corporation, Catalog No. AT-180
    - d. or approved equal
- C. Splicing connectors, end termination, caution labels, tee connectors and power termination kits shall be provided as required to achieve a complete heat trace system in accordance with Division 16. Control wiring and conduit shall all be in accordance with Division 16.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. Ensure that surfaces of all equipment including pipes, valves, fittings and ducts are clean and dry before installing heat tracing.
- B. Ensure that piping and equipment has been inspected and released for application of insulation.
- C. Beginning of installation indicates that installer accepts conditions.

### 3.02 ELECTRIC HEAT TRACE CABLE INSTALLATION

- A. Cable shall be carefully located so as to preclude subsequent damage coincident with normal operations and maintenance.

- B. Cable installation should begin at the cold junction and work toward the hot junction allowing extra cable as required.
- C. Allow additional cable for valves, flanges and supports per manufacturer's instructions.
- D. Initial cable lay should be done with temporary taping or banding to permit final placement so as to uniformly position the cable on the pipeline.
- E. Band cable to pipe with fiberglass tape wraps approximately every 12 inches. Locate cable on pipe per manufacturer's instructions.
- F. Accordion cable around valves, etc. to avoid overlaying cable over cable.
- G. Special care is required to permit turning, or inserting, spec blinds, repacking or replacing valves, and adjusting and calibrating process control instruments.
- H. Provide insulation and metal jacket for heat-traced systems as specified in Section 15081 - Piping Insulation and Section 15815 - Duct Insulation. Do not install insulation and jacketing until the testing requirements of Article 3.05 are satisfied. The installed heating cable should be covered with thermal insulation and waterproof jacketing as rapidly as possible. Install thermal insulation in accordance with insulation requirements specified herein.
- I. The following decal type sign shall be prominently fixed to the exterior of the thermal insulation every 10 feet and readily visible from ground level: ELECTRIC HEAT TRACING: CAUTION. The sign shall indicate the panel number and circuit number of the particular heat trace circuit at the location of the sign.

### 3.03 SCHEDULE

- A. Circuit voltage and heat output (watts per foot) for heat trace cable shall be as specified below.

	Circuit Voltage	Watts/Foot*
Interior and exterior pipes up to and including 4" diameter	277	3
Interior and exterior pipes larger than 4" diameter	277	5
HVAC Exhaust Ducts	277	20

\* Nominal Watts/Foot at 50°F and 240V.

3.04 CLEANING

- A. Clean tar, cement or other dirt from the heat trace cable.
- B. Remove debris and other waste material resulting from installation.
- C. Do not disturb pipe coating.

3.05 TESTING

- A. Perform insulation resistance test of each bus wire to the copper braid at the following stages. The minimum acceptable reading will be 20 megohms.
  - 1. After receipt of heat trace cable and prior to installation.
  - 2. After installation and splicing (if required) of the heat trace cable, but prior to installation of insulation and jacket.
  - 3. After installation of insulation and jacket.
- B. If at any time the insulation resistance test shows an unacceptable reading, correct any deficiencies according to manufacturer's guidelines and repeat testing.
- C. After making power connections, test the continuity of each heat trace circuit (both legs) from end to end.
- D. Thoroughly test the Heat Trace Control/Monitoring panel and monitoring system to establish proper operation and benchmarks from which to evaluate system degradation.
- E. Record all test results and include test report in the Operation and Maintenance Manuals.

- 17. SMACNA - HVAC Duct Construction Standards
- 18. SMACNA - Round Industrial Duct Construction Standards
- 19. SMACNA - Fire Damper Guide
- 20. UL 181 - Factory Made Air Ducts and Air Connectors

#### 1.04 DEFINITIONS

- A. Sealing Requirements Definitions: The following definitions apply for duct system sealing requirements:

- 1. Seams: Joining of two longitudinally (in the direction of airflow) oriented edges of duct surface material occurring between two joints. All other duct surface connections made on the duct perimeter are deemed to be joints.
- 2. Joints: Joints include girth joints; branch and subbranch intersections; so-called duct collar tap-ins; fitting subsections; louver and air terminal connections to ducts; access door and access panel frames and jambs; duct, plenum, and casing abutments to building structures.

#### 1.05 SYSTEM DESCRIPTION

- A. Design Requirements: The duct system design, as indicated, has been used to select and size air moving and distribution equipment and other components of the air system. Changes or alterations to the layout or configuration of the duct system must be specifically approved in writing. Accompany requests for layout modifications with calculations showing that the proposed layout will provide the original design results without increasing the system total pressure.

## 1.06 SUBMITTALS

- A. General: Provide all submittals, including the following as specified in Division 1.
- B. Shop Drawings: Submit shop drawings indicating duct systems routing, sizes, fitting details, reinforcing, support, required clearances, and installed accessories and devices.

## 1.07 QUALITY ASSURANCE

- A. General: Provide materials from a company specializing in the design and manufacture of ductwork and duct fittings having a minimum of three (3) years documented experience, which issues complete catalog data on these products.
- B. All supply, return and exhaust ductwork and fittings shall be manufactured by the same company.
- C. Codes: Qualify welding processes and welding operators in accordance with AWS D1.1 for hangers and supports and AWS D9.1. Certify that each welder qualification is current.

## 1.08 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Delivery: Deliver sealant and fire-stopping materials to site in original unopened containers or bundles with labels informing about manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials.
- C. Storage and Protection: Store and handle sealant fire-stopping materials in compliance with manufacturers' recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes. Store ductwork and duct fittings in a clean dry place and protect from physical damage.

## PART 2 PRODUCTS

## 2.01 DUCTWORK

- A. General: Provide ductwork and plenums conforming to the more stringent recommendations of the current editions of the ASHRAE Handbook and of the SMACNA "HVAC Duct Construction Standards", "Round Industrial Duct Construction Standards" and "Accepted Industry Practice for Industrial Duct Construction".
- B. All ductwork shall be constructed of Type 316L stainless steel

- C. Construction Material: Provide duct reinforcing and duct specialties constructed of the same materials as the duct. Provide 316 stainless steel grilles, registers, and diffusers on duct systems as specified with Type 316L stainless steel fasteners.
- D. Reinforcing: Reinforce ductwork to prevent sagging, flexing and drumming, and build ductwork to be airtight at the fan static pressures scheduled.
- E. Dimensions: The dimensions of the ducts shown are not to be considered absolute; however, any changes from dimensions indicated are subject to approval. Where it is necessary to change dimensions of ducts, do not exceed equivalent friction loss.
  - 1. Duct sizes noted are the clear dimensions inside the duct liner for lined ducts, or the actual inside dimensions for unlined ducts.
- F. Fire Stopping: Furnish in accordance with the requirements of the Specification Section 07921 - Interior Sealants.
- G. Hangers and Supports: Provide duct hangers and supports meeting the following requirements:
  - 1. Building Attachments: Fasten duct hangers and supports to concrete surfaces with Type 316 stainless steel threaded expansion type concrete anchors when cast-in-place concrete inserts are not installed. Do not cut reinforcing steel. Do not use powder actuated concrete fasteners.
  - 2. Hangers: Securely support horizontal ducts from the building structure by means of hanger rods or angle supports as recommended in the current editions of the ASHRAE Handbook and of the SMACNA "HVAC Duct Construction Standards", "Round Industrial Duct Construction Standards" and "Accepted Industry Practice for Industrial Duct Construction. Provide the hanger rods sized for the weight carried, threaded at both ends, and equipped with nuts and washers. Fabricate entire assembly from Type 316 stainless steel. Provide angles as duct bottom supports. When angle hangers are used, extend the hangers from flanged duct connections, extended stiffeners, or fabricated trapezes.
  - 3. Duct Attachments: Provide sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
  - 4. Trapeze and Riser Supports: Provide steel shape conforming to ASTM A 36/A36M as follows:
    - a. Where spiral Type 316L stainless steel ducts are installed, provide Type 316L shapes and plates.

- H. Pressure Loss: Provide duct curves, bends, offsets, transitions and transformation pieces to be gradual, to minimize air turbulence. In general, design duct transformations changing air velocity for minimum loss in total pressure.
  - 1. Refer to equipment schedules for duct system pressure and seal classifications.
- I. Seismic Requirements: All piping and ductwork shall be provided with seismic restraints in accordance with the seismic Restraint Manual, guidelines for Mechanical Systems, latest edition, as published by the Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA) and designed in accordance with the seismic provisions of the international Building Code (IBC) 2003, Section 1621 and ASCE7-02, Section 9.6, in conjunction with the current New York City Building Code to the extent that the most stringent provisions are utilized in developing the design seismic forces. Refer to the General Structural Notes on the Structural Contract Drawings for site and structure specific seismic design criteria.

## 2.02 ROUND SPIRAL DUCTWORK

- A. General: All round spiral supply, return and exhaust ductwork shall be Type 316L stainless steel. The duct system shall consist of fittings that are factory fitted with a sealing gasket and spiral duct which, when installed according to the manufacturer's instructions, will seal the duct joints without the use of duct sealer.
- B. Materials: When specified on contract documents, stainless steel Type 316L in accordance with ASTM A-240 shall be provided.
- C. Construction: Unless otherwise noted, all duct and fittings shall be constructed per SMACNA's Duct Construction Standards (-6 inch W.G.) as shown in the latest edition of the Round Industrial Duct Standards, Chapter 11, Tables 11-5.1 minimum required gage based on bending loads and Table 11-5.1 minimum required gage for Class 5 Stainless Steel Spiral Pipe.
- D. Fittings
  - 1. All fittings ends shall come factory equipped with a double lipped, U-profile, EPDM rubber gasket. Gasket shall be manufactured to gauge and flexibility so as to insure that system will meet all the performance criteria set forth in the manufacturer's literature. Gasket shall be classified by an internationally recognized laboratory authority to conform to ASTM E84-91a and NFPA 90A flame spread and smoke developed ratings of 25/50
  - 2. All fitting ends shall be calibrated to manufacturer's published dimensional tolerance standard and associated spiral duct.

3. All elbows from 3" to 12" diameter shall be 2 piece die stamped and continuously stitch welded. All elbows 14" diameter and larger shall be standing seam gorelock construction and internally sealed.
4. The radius of all 90° and 45° elbows shall be 1.5 times the elbow diameter, unless otherwise noted on the Contract Documents to be 1.0 times the elbow diameter. The radius of all 15°, 30° and 60° elbows shall be 1.0 times the elbow diameter.
5. All fittings that are of either spot-welded or button punched construction shall be internally sealed. When contract documents require divided flow fittings, only full body fittings will be accepted. The use of duct taps is unacceptable except for retrofit installations.
6. All volume dampers shall be fitting sized to slip into spiral duct. Damper shall have the following features:
  - a. Locking quadrant with blade position indicator
  - b. 2" sheet metal insulation stand-off
  - c. Integral shaft/blade assembly
  - d. Shaft mounted, load bearing bushings
  - e. Gasketed shaft penetrations to minimize leakage

E. Spiral Duct

1. Spiral duct shall be calibrated to manufacturer's published dimensional tolerance standard.
2. All spiral duct 14" Dia. and larger shall be corrugated for added strength and rigidity.
3. Spiral seam slippage shall be prevented by means of a flat seam and a mechanically formed indentation evenly spaced along the spiral seam.

- F. Performance: Duct system performance shall meet requirements at the system design static pressure as indicated on the Contract Drawings.

2.03 STAINLESS STEEL DUCTWORK

- A. All ductwork shall be constructed of Type 316 stainless steel except where specified or indicated on the Contract Drawings.
- B. All stainless steel ductwork shall be shop fabricated in sections with welded flanged ends. No field welding of ductwork will be permitted. Welding equipment and electrodes shall be of a type specifically suited for welding light gauge Type 316 stainless steel.

- C. Flanged duct joints shall be 0.25-inch Butyl gasketed and bolted together with type 316 stainless steel bolts, nuts, washers and lock washers. All duct joints shall be airtight.
- D. All accessories including but not limited to registers, grilles, diffusers, turning vanes, air turning devices, manual volume dampers, motor operated control dampers, fire dampers, and access doors installed in stainless steel ductwork shall be fabricated of the same stainless steel material as the associated ductwork. Supports, angles, clamps and hardware shall be Type 316 stainless steel.
- E. Curbs to prevent water leakage shall be provided around all floor openings. Where concrete curbs are not indicated on the Contract Drawings, provide curbs fabricated of 4-inch by 4-inch by 1/4-inch thick angles with welded corners. The curb shall be set in a mastic compound and securely fastened to the floor to provide a watertight installation. Curbs associated with stainless steel ductwork shall be fabricated by Type 316 stainless steel.

## 2.04 IDENTIFICATION

- A. General: Identification for ductwork systems to be furnished in accordance with the requirements of Section 15076 - Piping and Equipment Identification.

## PART 3 EXECUTION

### 3.01 APPLICATION

- A. General: Except as otherwise indicated construct all ductwork as specified of Type 316L stainless steel in accordance with SMACNA standards.
  - 1. Provide spiral Type 316L stainless steel for all the systems serving all process Areas such as Tipping, Loading, Lidding, Gallery and Maintenance Equipment Storage Area.
- B. Duct Lining: Provide duct lining at the following locations:
  - 1. Ductwork and plenums conveying outside air, extending from intake louvers through to the inlet side of all air-handling units.
  - 2. Air Conditioning Systems
    - a. Supply air ducts from the discharge side of the air handling unit for 20 feet 0 inches downstream, including at least one bend.
    - b. Return air ducts from the inlet side of the air handling unit for 20 feet 0 inches upstream, including at least one bend.

- c. Return air ducts and exhaust air ducts from the inlet side of the return air fan or exhaust air fan 20 feet 0 inches upstream, including at least one bend.
  - d. Supply ducts from air terminal units shall be lined for a distance of 5 feet.
- 3. In toilet exhaust duct branches from each register to a point at least 10 feet downstream and including at least one bend.
  - 4. At other locations shown or noted.

### 3.02 DUCT INSTALLATION, GENERAL

- A. Duct System Pressure Class: Construct and install each duct system for the specific duct pressure classification as required.
- B. Joints: Install ducts with the fewest possible joints.
- C. Fittings: Use fabricated fittings for all changes in directions, changes in size and shape, and connections.
- D. Duct Openings: Provide openings in ductwork where required to accommodate thermometers and controllers. Provide pitot tube openings where required for testing of systems, complete with metal cap with spring device or screw to ensure against air leakage. Where openings are provided in insulated ductwork, install insulation material inside a metal ring.
- E. Duct Location: Locate ducts, except as otherwise indicated, vertically and horizontally, parallel and perpendicular to building lines; avoid diagonal runs. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building. Install duct systems in shortest route that does not obstruct useable space or block access for servicing building and its equipment.
- F. Construction Penetrations: Determine the exact location and size of floor opening required for ductwork. Core drill all penetrations through existing floors, walls or ceilings. Chipping is not allowed in lieu of core drilling. Obtain written approval prior to making any new penetrations through existing floors, walls or ceilings. Drill pilot holes before core drilling to locate any interference with existing conduits, equipment, etc. Neatly patch and seal opening after installation of new equipment to match existing walls, floors, ceilings, etc.
- G. Clearances: Where insulated or uninsulated ducts pass through walls, floors, or partitions, provide the opening in the construction not exceeding 1-inch clearance on all sides. Where ducts pass through walls, floors, or partitions required to have a fire-resistance rating and fire dampers are not required, provide the opening in the construction not exceeding 1-inch clearance on all sides, filled solidly with an

approved material capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste when subject to the same NFPA 251 time-temperature fire conditions required for fire barrier penetration. Where fire dampers are installed, maintain proper clearance for expansions.

- H. Flexible Connections: Support at free end within 12 inches of flexible connection all ducts at flexible connections with air-handling equipment and fans.
- I. Shafts and Enclosures: Conceal ducts from view in finished and occupied spaces by locating in mechanical shafts, hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as specifically shown.
- J. Layout: Coordinate layout with suspended ceiling and lighting layouts and similar finished Work.
- K. Electrical Equipment Spaces: Route ductwork to avoid passing through electrical equipment spaces and enclosures.
- L. Nonfire-Rated Partition Penetrations: Where ducts pass interior partitions and exterior walls, and are exposed to view, conceal the space between construction opening and duct or duct insulation with sheet metal flanges of same gauge as duct. Overlap openings on four sides by at least 1-1/2 inches.
- M. Seal: Seal externally insulated ducts prior to insulation installation.
- N. Concrete Insert: Install concrete inserts prior to pouring concrete.
- O. Plenum Access Doors: Set plenum access doors 6 to 12 inches above floor. Arrange door swings so that fan static pressure holds door in closed position.
- P. Blank Off Panels: Blank off unused portions of louvers with insulated panels provided in accordance with the requirements of Section 10200 - Louvers and Screens.
- Q. Flexible Duct: Provide flexible duct connectors where shown.
- R. Temporary Closures: During construction, provide temporary closures of metal or taped polyethylene on open ductwork to prevent construction dust from entering ductwork system.
- S. Hanging and Supporting: Support ductwork as follows:
  - 1. Make provisions for supporting all ductwork, dampers and other ductwork accessories, where necessary.

2. Construct, reinforce, support and brace ductwork to prevent buckling, warping, sagging, flexing and vibrating and be quiet in operation under all operating conditions and airtight at the fan static pressures scheduled.
3. Securely support horizontal ducts from the building structure by means of hanger rods or angle supports as recommended in the current editions of the ASHRAE Handbook and of the SMACNA "HVAC Duct Construction Standards", "Round Industrial Duct Construction Standards" and "Accepted Industry Practice for Industrial Duct Construction". Size hanger rods for the weight carried, thread at both ends, and equip with nuts and washers.
4. Support horizontal ducts within 2 feet of each elbow and within 4 feet of each branch intersection.
5. Support vertical ducts as recommended in the current editions of the ASHRAE Handbook and of the SMACNA "HVAC Duct Construction Standards", "Round Industrial Duct Construction Standards" and "Accepted Industry Practice for Industrial Duct Construction".

### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide inspect the completed installation, make any necessary adjustments, as specified in Division 1.

### 3.04 CLEANING

- A. General: Perform cleaning Work in accordance with the following:
  1. Keep each duct system internally clean by installing only clean materials and by providing temporary closures during the installation.
  2. Remove all loose materials and obstructions from interior of ducts.
  3. Clean duct system and force air at high velocity through duct to remove accumulated dust. To obtain sufficient air, clean half the system at a time. Protect equipment which may be harmed by excessive dirt with temporary filters, or bypass during cleaning.
  4. Clean large duct systems with high power vacuum machines. Protect equipment which may be harmed by excessive dirt with filters, or bypass during cleaning. Provide adequate access into ductwork for cleaning purposes.

-END OF SECTION-

**Section 15815**  
**DUCT INSULATION**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all duct insulation complete with auxiliary equipment and accessories as shown, specified and/or required for proper operation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 15810 - Ductwork

**1.03 REFERENCES**

- A. Reference Standards: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified. The provisions of this Contract shall superseded the Standards in case of conflict:

1. ASTM C 195- Mineral Fiber Thermal Insulation Cement
2. ASTM C 449- Mineral Fiber Hydraulic-Setting Thermal Insulating and Finish Cement
3. ASTM C 553 - Mineral Fiber Blanket and Felt Insulation
4. ASTM C 612 - Mineral Fiber Block and Board Thermal Insulation
5. ASTM C 916 - Adhesives for Duct Thermal Insulation
6. ASTM C 920 - Elastomeric Joint Sealants
7. ASTM C 92 - Practice for Determining the Properties of Jacketing Materials for Thermal Insulation
8. ASTM E 84 - Surface Burning Characteristics of Building Materials
9. ASTM E 119 - Standard Method of Fire Test of Building Construction and Materials: 2 Hour External Total Engulfment Test
10. ASTM E 814 - Standard Method of Fire Tests of Through-Penetration Fire Stops
11. American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE)

12. NFPA 90A - Installation of Air Conditioning and Ventilating Systems
  13. NFPA 255 - Surface Burning Characteristics of Building Materials
  14. UL 723 - Surface Burning Characteristics of Building Materials
  15. UL 1479 - Through-Penetration Firestop Test
- B. Field Measurements: Take field measurements where required prior to installation to ensure proper fitting of Work.

#### 1.04 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit the manufacturer's technical product data, insulation materials, fire ratings, material safety data sheets and installation instructions for each type of mechanical insulation. Submit a schedule showing the manufacturer's product number, k-value, thickness, density and furnished accessories for each mechanical system requiring insulation.

#### 1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide insulation from firms regularly engaged in manufacture of ductwork insulation products, of the types and sizes required, whose products have been in satisfactory use in similar services for not less than three (3) years.
- B. Installer's Qualifications: Use firm with at least three (3) years successful installation experience on projects with mechanical insulations similar to that required for this project.
- C. Flame/Smoke Ratings: Provide composite mechanical insulation, jackets, coverings, sealers, mastics and adhesives with flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E 84 method.
1. Exception - Outdoor Insulation: Flame spread index of 75 and a smoke developed index of 150.
- D. Requirements of Regulatory Agencies: Comply with applicable provisions of regulatory agencies below and others having jurisdiction.
1. Underwriters Laboratories, Incorporated.
  2. National Fire Protection Association.
  3. Local and State Building Codes and Ordinances.

**1.06 DELIVERY, STORAGE, AND HANDLING**

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.
- B. Labeling: Deliver the insulation, coverings, cements, adhesives, and coatings to the site in containers with the manufacturer's stamp or label, affixed showing the fire hazard indexes of products.
- C. Protection: Protect the insulation against dirt, water, and chemical and mechanical damage. Do not install damaged or wet insulation and remove damaged materials from the project site.

**1.07 JOB CONDITIONS**

- A. Sequencing: Obtain the Engineer's approval of insulation, adhesives, coatings and method of installation before installing any insulation
- B. All duct leaks shall be sealed prior to installation of external insulation to prevent billowing and damage to insulation.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Certainteed Corp.
  - 2. Knauf Fiber Glass GmbH
  - 3. Manville Products Corp.
  - 4. Owens-Corning Fiberglas Corp.

**2.02 MATERIALS**

- A. Exposed Ductwork Insulation (Rigid): All exposed ductwork as listed under Article 3.02 - Ductwork System Insulation, shall be insulated with minimum 1-1/2" thick glass fiber board having a density of not less than 3.0 lbs./cu.ft., and a thermal conductivity of not more than 0.23 BTU-inch/hour square feet °F at 75°F mean temperature. The insulation shall be Johns-Manville No. 814 Spin - Glas, Certain Teed Corporation Industrial Board, or approved equal. The insulation shall be impaled over pins welded to the duct surface on 12" centers. The pins shall be coated with vapor barrier adhesive, and the insulation shall then be secured with caps over the pins. All joints and breaks in the vapor barrier shall be sealed with 3" wide strips of the vapor barrier facing. All insulation shall be reinforced with corner bead. The facing shall be finished with a 3-ply application of lagging adhesive, glass fabric reinforcing and a finish coat of mastic.

- B. **Concealed Ductwork Insulation (Flexible):** All concealed ductwork as listed under Article 3.02 - Ductwork System Insulation, shall be insulated with 1-1/2" thick flexible fiberglass duct insulation, having a thermal conductivity of not more than 0.28 BTU-inch/hour -square feet °F at 75°F mean temperature. The insulation shall have a reinforced foil vapor barrier facing. Insulation shall be secured with 4" wide bands of adhesive on 12" centers. All joints shall be sealed by adhering a 2" sealing lap or 3" strips of vapor barrier facing applied with vapor barrier adhesive. On horizontal ducts over 14" wide, welded pins and clips shall be used on the underside on 18" centers.
- C. **Non-Combustible Duct Warp:** All exposed ductwork as listed under Paragraph 3.02E shall be a 2-inch insulated high temperature inorganic foil encapsulated insulation fiber blanket for duct application requiring two-hour rating. Flamechek Plus 2 duct insulation as manufactured by Certainteed or approved equal.
- D. **Internal Duct Liner Insulation - Acoustical Insulation**
1. **Type:** Fiberglass duct liner board with black surface
  2. **Density:** Minimum 1-1/2 lbs. per cubic foot
  3. **Thickness:** 1-1/2 inch minimum
  4. **Thermal Conductivity:** 0.23 Btu-Inch/HR.FT<sup>2</sup>. °F @ 75°F mean temperature.
- E. **Adhesives and Accessories**
1. **Acoustical Lining Insulation Adhesive:** Insulation shall be applied in cut-to-size pieces attached to the interior of the duct with a nonflammable, fire-resistant adhesive conforming to ASTM C 916, Type I. Exposed edges of the liner at the duct ends and at other joints where the lining will be subject to erosion shall be coated with a heavy brush coat of the nonflammable, fire-resistant adhesive to prevent delamination of glass fibers.
  2. **Mineral Fiber Insulation Cement:** Cement shall be in accordance with ASTM C 195.
  3. **Lagging Adhesive:** Lagging adhesive shall be nonflammable and fire-resistant and shall have flame spread and smoke developed rating of 25/50 when measured in accordance with ASTM E 84.
  4. **Contact Adhesive:** Adhesive may be dispersed in non-halogenated organic solvent with a low flash point (flash pint less then minus 25 degrees F when tested in accordance with ASTM D 3278) or, dispersed in a nonflammable organic solvent which shall not have a fire point below 200 degrees F. The adhesive shall be nonflammable and fire-resistant.
  5. **Caulking:** Caulking shall be in accordance wit ASTM C 920.

6. Corner Angles: Nominal 0.016 inch type 316 stainless steel 1 x 1 inch with factory applied kraft backing and adhesive.
7. Finishing Cement: Mineral fiber hydraulic-setting thermal insulating cement ASTM C 449.
8. Fibrous Glass Cloth and Glass Tape: Fibrous glass cloth and glass tape shall have flame spread and smoke developed ratings of no greater than 25/50 when measured in accordance with ASTM E 84.
9. Staples shall be outward clinching Type 316 stainless steel.
10. White Vapor Retarder ASJ (All Service Jacket): For use on ducts. Vapor retarder jackets used on insulation exposed in finished areas shall have white finish suitable for painting.
11. Weatherproof Jackets: Type 316 stainless steel jackets shall be smooth sheet, 0.016 inch nominal thickness. Corrugated metal jacket shall not be used outdoors for insulated ducts.

### PART 3 EXECUTION

#### 3.01 INSPECTION

- A. Examine areas and conditions under which mechanical insulation is to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable for insulation installation.

#### 3.02 DUCTWORK SYSTEM INSULATION

- A. Insulation Omitted: Do not insulate lined ductwork.
- B. Thermal Insulation - Rigid: The following exposed ductwork exposed in room shall be insulated:
  1. All outside air intake ducts and plenums from the outside air intake louver, outside air intake shaft, or roof mounted intake up to the point where the duct or plenum is connected to the heating and ventilating units, air conditioning units, or supply fans in heated and air conditioned spaces.
  2. All exhaust and return air ductwork from air conditioned spaces.
  3. All supply and return air ductwork associated with Air Conditioning Units.
  4. All heated and air conditioned ductwork located in unheated spaces.

5. All heated and air conditioned ductwork located outdoor shall be insulated and covered with weatherproof stainless steel jacket.
  6. Where indicated on the Contract Drawings.
- C. Thermal Insulation - Flexible: The following ductwork located above hung ceiling shall be insulated:
1. All supply, exhaust and return ductwork associated with air conditioning units.
  2. All outside air intake ducts and plenums from the outside air intake louver, outside air intake shaft or roof mounted intake up to the point where the duct or plenum is connected to the heating and ventilating units and supply fans.
  3. Where indicated on the Contract Drawings.
- D. Insulation Thickness: All ductwork insulation shall be 1-1/2 inch thick except for outside air intake plenum and outside air ductwork insulation which shall be 2 inches thick.
- E. Non-Combustible Duct Wrap: HVAC ductwork in smoke shaft.
- F. Heat Trace Insulation: Flexible ductwork insulation shall be 1-1/2 inch thick with stainless steel jacketing.
- G. Jackets for Ductwork Insulation: All service jacket ductwork insulation.
- H. Weatherproof Jackets: Use stainless steel jackets where noted on drawings.

### 3.03 INSTALLATION

- A. General: Install ductwork and equipment thermal insulation products in accordance with the manufacturer's recommendations and approved shop drawings, and as specified in Division 1. Install all products in accordance with the recognized industry practices so that insulation serves its intended purpose.
- B. Ductwork Insulation
1. Insulation Surfaces: Install the insulation materials with smooth and even surfaces.
  2. Cleaning and Drying: Clean and dry ductwork prior to insulating. Butt insulation joints firmly together to form a complete and tight fit over the surfaces to be covered.
  3. Integrity: Maintain the integrity of the vapor-barrier on ductwork insulation, and protect it to prevent puncture and other damage.

4. Penetrations: Extend ductwork insulation without interruption through walls, floors and similar ductwork penetrations, except where otherwise indicated.
5. Lined Ductwork: Except as otherwise indicated, omit insulation on ductwork where the internal insulation or sound absorbing linings have been installed.
6. Corner Angles: Except for oven and hood exhaust duct insulation, install corner angles on external corners of insulation on ductwork in exposed finished spaces before covering with the jacketing.
7. Follow all manufacturers' installation requirements for non-combustible duct insulation.

#### 3.04 PROTECTION AND REPLACEMENT

- A. Replacement: Replace damaged insulation which cannot be satisfactorily repaired, including units with vapor barrier damage and moisture saturated units.
- B. Protection: Follow methods which are required for protection of the insulation Work during the remainder of construction period, to avoid damage and deterioration.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 15820**  
**DUCTWORK ACCESSORIES**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Ductwork accessories such as turning vanes, volume dampers, splitter dampers, air extractors, duct hardware, access doors, instrument test holes, gravity backdraft dampers, fire dampers and airflow measuring stations.

**1.02 RELATED SPECIFICATIONS**

- A. Section 13581 - Fire Alarm and Detection System
- B. Section 15076 - Piping and Equipment Identification
- C. Section 15810 - Ductwork
- D. Section 15900 - HVAC Controls
- E. Section 15950 - Testing, Adjusting and Balancing

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. SMACNA - HVAC Duct Construction Standards, Metal and Flexible
  - 2. ASHRAE - Handbook - Systems and Equipment; Recommendations pertaining to construction of ductwork accessories
  - 3. UL 555 - Fire Dampers and Ceiling Dampers
  - 4. UL 33 - Heat Responsive Links for Fire Protection Services
  - 5. NFPA 90A - Installation of Air Conditioning and Ventilating Systems

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit catalog product data indicating dimensions, assembly, materials and finishes, and operation and performance data.
- C. Shop Drawings: Submit shop drawings for shop fabricated assemblies. Provide product data for the hardware used.
- D. Operation and Maintenance Data: Submit the manufacturer's installation, maintenance, and repair data as specified in Section 01831 including a parts lists for each type of duct accessory. Include this data, product data, and shop drawings in the operation and maintenance manual.

## 1.05 QUALITY ASSURANCE

- A. Provide equipment from manufacturers regularly engaged in the design and manufacture of ductwork accessories, of the types and sizes required, which have a minimum of three (3) years documented experience and which issue complete catalog data on these products.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Storage and Protection: Store products in a clean, dry place and protect from physical damage in their original shipping packings, with labeling in place until the time of installation.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Turning Vanes
  - 1. Aero Dyne Co.
  - 2. Tuttle and Bailey
- C. Volume Dampers
  - 1. Ruskin Mfg. Co.
  - 2. Vent Product Co.
- D. Air Extractors
  - 1. Barber-Colman Co.
  - 2. Titus
- E. Duct Hardware
  - 1. Ventfabrics Inc.
  - 2. Young Regulator Co.
- F. Access Doors
  - 1. Air Balance Inc.
  - 2. Ruskin Mfg. Co.
  - 3. Ventfabrics Inc.

## G. Instrument Test Holes

1. Ventfabrics Inc.

## H. Gravity Backdraft Dampers

1. Air Balance Inc.
2. American Warming and Ventilating Inc.
3. Ruskin Mfg. Co.

## I. Fire Dampers

1. Air Balance Inc.
2. American Warming and Ventilating Inc.
3. Ruskin Mfg. Co.

## J. Combination Fire/Smoke Dampers

1. Ruskin Mfg. Co.
2. Nailor-Hart

## 2.02 MATERIALS

A. General: Provide ductwork accessories of the same materials as the duct, if commercially available. Otherwise fabricate such ductwork accessories of Type 316L stainless steel, protected inside and outside with a factory applied 4-6 mil heresite, or equal, air dried phenolic coating. Construct duct accessories in accordance with SMACNA "HVAC Duct Construction Standards."

B. Turning Vanes: Provide turning vanes as follows:

1. Fabricated Turning Vanes: Provide fabricated turning vanes and vane runners, constructed of the same material as the associated ductwork in accordance with SMACNA "HVAC Duct Construction Standards".
2. Manufactured Turning Vanes: Factory fabricate turning vanes of a streamlined design, with single thickness vanes not more than 1-1/2 inch apart for ducts 24 inches and smaller and with double thickness vanes spaced 3-1/4 inches apart for ducts larger than 24 inches.
3. Acoustic Turning Vanes: Provide acoustic turning vanes constructed of airfoil shaped aluminum extrusion with perforated faces and fiberglass fill.

C. Volume Dampers

1. Reference: SMACNA Standards.
2. Material: As specified for ductwork.
3. Blades: Opposed blades, vinyl edge seals.
4. Provide outside handle, quadrant and approved position indicator and locking device.
5. Performance
  - a. Damper Leakage: Not more than 16 cfm per square foot at 4-inch W.G.
  - b. Certification: Manufacturer shall provide certified test data.

D. Air Extractors: Provide air extractors capable of providing uniform air distribution and designed to minimize pressure drop and turbulence.

E. Duct Hardware: Provide duct hardware, manufactured by one manufacturer for all items on project, for the following:

1. Quadrant Locks: Provide for each damper, a quadrant lock device on one end of the shaft; and an end bearing plate on the other end for damper lengths over 12 inches. Provide extended quadrant locks and end extended bearing plates for externally insulated ductwork.
2. Damper Remote Drives: Provide remote flexible drive where specified, complete with flexible couplings, linkages and concealed type regulators for flush ceiling mounting.

F. Access Doors: Provide duct and plenum access doors where necessary to service or replace equipment. Construct doors of the same or greater gauge as the ductwork or plenums served. Provide insulated doors for insulated ductwork and plenums. Provide insulated doors as double wall type insulated with 1-inch 6-pound density glass fiber, with suitable reinforced edges, closing into structurally framed openings with 1/2-inch neoprene-lined channels. Provide door panels with double diagonally cross breaks, hinged with two or more butt hinges and secured with two or more compression latches. Provide plenum doors with latch handles on both the inside and outside. Provide flush frames for uninsulated ductwork, and extended frames for externally insulated duct. Provide one side hinged and the other side with one handle-type latch for doors 12 inches high and smaller or 2 handle-type latches for larger doors.

- G. Test Holes: Provide instrument test holes in the ducts and plenums at appropriate locations for insertion of 3/4-inch pitot tubes and similar air measuring instruments. Equip the openings with removable, tight fitting caps or covers.
- H. Gravity Backdraft Dampers
1. Provide counterbalanced interlinked backdraft dampers at gravity relief locations shown and as specified. Construct the dampers complete with jamb and blade seals, nonmetallic bearings, and adjustable counterbalance on extended shaft. Provide dampers suitable for operation at a maximum of 4 inches w.g. and a pressure drop not exceeding 0.2 inches w.g.
- I. Fire Dampers: Provide, where shown Type B fire dampers, of the sizes indicated, complete with necessary sleeves, chains and fusible links, and in compliance with NFPA and UL listed. Construct casings and sleeves of Type 316 stainless steel. Provide fusible links rated at 160 to 165 degrees F unless otherwise indicated. Provide dampers with a positive lock in the closed position, and with the following additional features:
1. Damper Blade Assembly: Curtain type
  2. Blade Material: Steel, match casing
- Provide an access door constructed of the same gauge metal as the duct, complete with suitable hinges, latches and gaskets, to permit link replacement at each fire damper.
- J. Combination Fire/Smoke Dampers: Provide combination fire dampers and 115 volt motor operated smoke dampers with end switches, complete with necessary chains and factory sleeve, conforming to NFPA requirements, and listed and classified by UL Inc. as Class 1 low leakage rated combination fire/smoke damper. Fire/smoke damper shall be equipped with a heat-actuated release device to provide controlled closure and prevent duct and HVAC component damage. Instantaneous damper closure due to use of fusible links is unacceptable. Provide fire/smoke damper with the ability to be remotely reset. Provide an access door constructed of the same gauge metal as the duct, complete with suitable hinges, latches and gaskets, to permit manual damper reset.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. General: Examine areas and conditions under which ductwork accessories will be installed. Do not proceed with the Work until unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General: Install ductwork accessories in accordance with the manufacturer's installation instructions, with applicable portions of details of construction as shown in SMACNA standards, and in accordance with recognized industry practices to ensure that products serve intended function. Make all necessary adjustments to provide a complete and satisfactory operation upon completion of the installation.
- B. Turning Vanes: Install turning vanes in square or rectangular 90 degree elbows in supply, return and exhaust air systems, and elsewhere as indicated.
- C. Volume Dampers: Install volume dampers in main ducts and branch ducts and at all return and exhaust air branch duct take off connections and all other locations where shown.
- D. Extractors: Install air extractors behind all supply registers and all other locations where shown.
- E. Duct Hardware: Install locking quadrant controls for each volume damper.
- F. Access Doors: Install access doors to open against system air pressure, with latches operable from either side, except outside only where the duct is too small for a person to enter. Provide access doors, amply sized to suit their function, in ducts and plenums for inspection and cleaning, at maximum 50 foot spacing, coils, fans, volume dampers, automatic dampers, fire and smoke dampers, turning vanes as necessary to service or required to replace equipment.
- G. Instrument Test Holes: Provide instrument test holes in ducts and plenums where required for testing and balancing purposes.
- H. Gravity Backdraft Dampers: Install backdraft dampers at gravity relief locations and where shown.
- I. Fire Dampers: Install fusible link fire dampers in all ducts passing through fire rated building walls, floors and partitions indicated on the architectural drawings and where shown.
- J. Coordination: Coordinate as necessary to interface installation of ductwork accessories properly.

### 3.03 FIELD QUALITY CONTROL

- A. Tests: Operate installed ductwork accessories to demonstrate their compliance with the specified requirements. Test for air leakage while the system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leakproof performance.

- B. Manufacturer's Field Services: Provide the services of a qualified representative of the manufacturer as specified in Division 1 to inspect the installation of equipment, certify that it meets the manufacturer's recommendations, and instruct the operating personnel in its operation and maintenance.

3.04 ADJUSTING AND CLEANING

- A. Adjusting: Adjust ductwork accessories for proper settings, install fusible links in fire dampers and adjust for proper action.
  - 1. Label access doors in accordance with the requirements of Section 15076 - Piping and Equipment Identification.
  - 2. Final positioning of manual dampers is specified in accordance with the requirements of Section 15950 - Testing, Adjusting and Balancing.
- B. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with the manufacturer's touch-up paint.

#### 1.04 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Submit complete catalog product data, including the following:
  - 1. Dimensions
  - 2. Assembly
  - 3. Weights
  - 4. Specialties and accessories
  - 5. Rated capacities
  - 6. Performance ratings
  - 7. Controls
  - 8. Certified fan performance curves with system operating conditions indicated, including brake horsepower, static pressure, and static efficiency plotted against air volume for the duty scheduled
  - 9. Certified fan sound power ratings, for both fan outlet and casing radiation at rated capacity
  - 10. Motor ratings and electrical characteristics plus motor and fan accessories
  - 11. Wiring diagrams that detail power, signal, and control wiring. Differentiate between manufacturer-installed wiring and field-installed wiring.

- 12. Materials gauges and finishes, including color charts
- 13. Dampers, including housings, linkages, and operators
- C. Shop Drawings: Submit shop drawings detailing equipment assemblies and indicating locations, dimensions, weights, required clearances, construction details, and location and size of field connections.
- D. Operation and Maintenance Manuals: Submit manufacturer's descriptive literature, as specified in Section 01831, including operation instructions, lubrication instructions, motor and drive replacement instructions, wiring diagrams, controls, accessories maintenance and repair data, and parts listing. Include this data and product data in the operation and maintenance manual.

#### 1.05 QUALITY ASSURANCE

- A. Performance Ratings: Conform to AMCA 210 and place the AMCA Certified Rating Seal on the equipment.
- B. Sound Ratings: Conform to AMCA 301, test to AMCA 300 and place the AMCA Certified Sound Rating Seal on the equipment.
- C. Fabrication: Conform to AMCA 99.
- D. Fans and Components: Provide UL listed and labeled fans and components.
- E. Motors and Electrical Accessories: Comply with NEMA standards and NEC.
- F. Manufacturer: Provide equipment from a company regularly engaged in design and manufacture of fans, of types and capacities required, whose products have been in satisfactory use in similar service for not less than three (3) years documented experience, and which issues complete catalog data on these products.

#### 1.06 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store, and handle all products and materials as specified in Division 1 and as follows:
- B. Delivery and Handling: Deliver products to site in factory fabricated protective containers. Handle products properly to prevent damage, breaking, denting and scoring. Do not install damaged equipment. Replace damaged units with new. Comply with manufacturer's instructions for unloading and transporting equipment to final location.
- C. Storage and Protection: Store equipment in its original containers with labeling in place until the time of installation and as specified in Division 1.

1.07 SEQUENCE AND SCHEDULING

- A. Equipment Roof Supports: Coordinate the installation of roof curbs, equipment supports, and roof penetrations.
- B. Structural Supports: Coordinate the size and location of structural steel support members.

1.08 SPARE PARTS

- A. Furnish spare parts wrapped or boxed, indexed and tagged with complete information for use and reordering. Provide the following spare parts.
  - 1. One complete set of belts for each belt-driven fan.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Air-Dried Phenolic Coating
  - 1. Heresite - VR500 Series
- C. Roof-Mounted Fans
  - 1. Greenheck Fan Corp.
- D. Roof Curbs
  - 1. Penn Ventilation Co.
  - 2. Thybar Corp.
  - 3. Pate
- E. Propeller Fans
  - 1. Greenheck Fan Corp.
  - 2. Penn Ventilator Co.
- F. Vane Axial Fans
  - 1. Greenheck Fan Corp.
  - 2. Hartzell Fan Inc.

## G. Tubeaxial Fans

1. Greenheck Fan Corp.
2. Hartzell Fan Inc.

## H. In-Line Square Centrifugal Fans (Belt Drive)

1. Greenheck Fan Corp.

## 2.02 FANS GENERAL

- A. General Design: Assemble and test fans of the arrangement, minimum size, capacities and characteristics scheduled.
- B. Fan Performance: Provide fans tested and rated in accordance with Air Movement and Control Association, Inc. (AMCA) test procedures, bearing the AMCA rating seal. Provide certified performance curve for each fan.
- C. Fans and Shafts: Provide fans statically and dynamically balanced at the factory. Design fans for continuous operation at the maximum rated fan speed and motor horsepower. Provide turned, ground, and polished steel fan shafts designed to operate at no more than 70 percent of the first critical speed at the top of the speed range of the fan's class.
- D. Belt Drives: Provide drives of a V-belt type, factory mounted, with final alignment and belt adjustment made after installation. Provide V-belt drives which have a minimum service factor of 1.5 based on motor horsepower.
- E. Belts: Provide V-belt type belts in matched sets. Provide oil-resistant, nonsparking, and nonstatic belts.
- F. Motor and Fan Wheel Pulleys: Use adjustable pitch motor sheaves with motors through 15 hp; use fixed pitch motor sheaves on larger than 15 hp motors with adjustable pitch fan sheaves. Select pulley so that pitch adjustment is at the middle of the adjustment range at fan design conditions. Include an allowance to replace motor and fan wheel pulleys as required to obtain required airflow during final air balance of system.
- G. Belt Guards: Provide steel belt guards for motors mounted on the outside of the fan housing.
- H. Shaft Bearings: Provide self-aligning grease lubricated bearings of the type indicated having a median life "Rating Life" AFBMA L50 of 200,000 hrs., calculated in accordance with ANSI/AFBMA Standard 9 for ball bearings and ANSI/AFBMA Standard 11 for roller bearings.
- I. Lubrication: Provide fan lubrication fittings extended to the service side with aluminum tubes and secured accessibly outside the fan housing.

- J. Protective Coating: Provide protective coating meeting the following requirements:
1. Air-Dried Phenolic Coating: Where an air-dried phenolic corrosion-resistant coating is required, thoroughly clean, prepare and protect against corrosion all metal parts of the unit with one coat of primer and at least two coats of an air-dry phenolic corrosion-resistant coating to obtain a minimum total dry film thickness of 4 to 6 mils.
  2. Manufacturer Recommendation: Perform cleaning and coating procedures as specified and in accordance with the coating manufacturers published recommendations. As a minimum provide SSPC-SP3 Power Tool Cleaning.
- K. Controls: Provide controls furnished with equipment meeting the requirements of Sections 15900 - HVAC Controls and in accordance with the requirements of Section 16055 - Electric Requirements for Shop Assembled Equipment.
- L. Motors: Provide TEFC high energy efficient type motors in accordance with the requirements of Section 16220 - Electric Motors of the Electrical Contract, except that in designated hazardous areas provide explosion-proof type motors. Provide motors, electrical equipment and wiring located in hazardous areas or in airstreams exhausted from these areas meeting NEC electrical hazard classification requirements shown and as specified. Provide mill and chemical duty motors where shown.
- M. Electrical Equipment: Provide all electrical equipment and materials, including combination motor starters, circuit breakers and disconnect circuit breakers in accordance with the requirements of Section 16491 - Control Components and Devices.
- N. All fans shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A, in accordance with the City of New York Building Code and the referenced Uniform Building Code.
- 2.03 ROOF-MOUNTED FANS
- A. General: Provide roof-mounted fans of the centrifugal type as noted, of the minimum size and capacity scheduled and belt driven unless noted otherwise. Provide roof-mounted fans complete with curb cap, 1/2-inch mesh aluminum bird screen, integral disconnect switch, extended lubrication lines, and either a gravity, pneumatic or electrically operated interlinked back draft damper as noted on the fan schedule or as specified in Section 15900 - HVAC Controls.
- B. Housing: Provide fan housing constructed of aluminum. Provide removable dome top and outlet baffle type housing, designed to provide easy access to the fan, bearings, shaft and motor.
- C. Wheel: Provide fan impellers constructed of aluminum with backward inclined blades.

- D. Motors: Provide motors for belt-driven fans with an adjustable mounting for adjusting belt tension, and the motor and drive housed in a weatherproof ventilated compartment outside of the airstream.

#### 2.04 ROOF CURBS

- A. Provide prefabricated roof curbs of types as required and shown. Provide curbs of monolithic construction, 14 gauge galvanized steel, with continuous arc-welded corner seams, galvanized steel inner liner, factory-installed wood nailer and insulated with 1-1/2-inch thick, 3-pound density rigid fiberglass board insulation. Provide curbs with a minimum height of 12 inches above the finished roof deck and of the style and design to mate the deck. Provide all curbs with tops leveled, with pitch built into curb where roof slopes 1/4 inch per foot or more.

#### 2.05 STEEL PROPELLER FANS

- A. General: Provide propeller fans which meet the minimum size, capacity and arrangement as scheduled, and are belt driven unless shown otherwise.
- B. Construction: Provide each propeller fan comprised of a heavy-gauge steel panel with folded edges and integral venturi, rigid steel motor and drive assembly frame, motor, adjustable pitch motor sheave, V-belts, fan sheave and a dynamically and statically balanced propeller blade assembly. Bolt fan guards fabricated of heavy-gauge galvanized wire to the steel panel at the motor and discharge sides unless noted otherwise.
- C. Damper: Provide a gravity, pneumatic or electrically operated back draft damper as noted, comprised of a heavy-gauge welded steel frame with aluminum interlinked blades with neoprene edge seals, and linkage. (Provide gravity dampers mounted at aluminum propeller fans of all aluminum construction.)

#### 2.06 VANE AXIAL FANS

- A. General: Provide vane axial fans meeting the minimum size, capacity, performance ratings and arrangement as scheduled.
- B. Construction: Provide vane axial fans complete with mounting feet or brackets as required, heavy-duty self-aligning bearings, matched V-belts, fan sheave, adjustable motor sheave permitting adjustment of at least 5 percent adjustment above the below rated cfm, belt guard, adjustable motor support, shaft seal and extended lubrication fittings.
- C. Housing and Wheel: Construct the fan housing and fan wheel of heavy-gauge steel. Provide the fan wheel with steel airfoil section blades driven by a V-belt drive and totally enclosed motor. Properly key and secure fan wheels on the fan shaft.

- D. Vanes: Weld heavy-gauge aerodynamically designed straightening vanes in the fan casing.
- E. Sound Level: Design fans such that the sound level at the outlet of the fan does not exceed 82 and 81 dB in the second and third octave band when operating at 700 rpm.
- F. Vibration Isolation: Mount vaneaxial fans on neoprene vibration isolators. Provide neoprene vibration isolators meeting the requirements specified in Section 15071 - Vibration Control.
- G. Motors: Provide mill and chemical duty type motors for tubeaxial fans in accordance with the requirements of Section 16220 - Electric Motors.

## 2.07 TUBEAXIAL FANS

- A. General: Provide tubeaxial fans which meet the minimum size, capacity and performance as scheduled.
- B. Assembly: Provide V-belt driven duct axial fans constructed of continuously welded steel with inlet and outlet flanges, impeller blades shall be airfoil type steel propeller statically and dynamically balanced on the fan shaft, fan shaft with belt tube with cover plate, heavy-duty self-aligning ball type relubricable bearings with sealed bearing covers and extended lube lines to the outside of the housing, steel mounting brackets, motor mounted on adjustable base plate, variable pitch drive, drive guard, and matched V-belts.
- C. Construction: Provide all structural parts in the airstream made of steel.
- D. Motors: Provide motors for tubeaxial fans as specified in Section 16220 - Electric Motors.

## 2.08 IN-LINE SQUARE CENTRIFUGAL FANS

- A. In-line square fans shall be of centrifugal belt driven in-line type. The fan housing shall be of the square design constructed of heavy gauge all steel and shall include square duct mounting collars.
- B. Fan construction shall include two removable access panels located perpendicular to the motor mounting panel. The access panels must be of sufficient size to permit easy access to all interior components.
- C. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced.
- D. Motors and drives shall be mounted out of the airstream with combination motor cover and belt guards. Motors shall be readily accessible for maintenance.

- E. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings
- F. Drives shall be sized for a minimum of 150 percent of driven horsepower. Pulleys shall be of the fully machined cast iron type, keyed and securely attached to the wheel and motor shafts. Motor pulleys shall be adjustable for system balancing.

## 2.09 SOURCE QUALITY CONTROL

- A. Tests: Perform the following factory tests:
  - 1. Sound Power Level Ratings: Comply with AMCA Standard 301 "Method for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans in accordance with AMCA Standard 300 "Test Code for Sound Rating." Provide fans which are licensed to bear the AMCA Certified Sound Ratings Seal.
  - 2. Units Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210/ ASHRAE Standard 51 - Laboratory Methods of Testing Fans for Rating.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. General: Examine equipment and field conditions as follows.
  - 1. Examine fans at the time of delivery for damaged or missing components.
  - 2. Examine areas and conditions for compliance with requirements for installation tolerances, housekeeping pads, and other conditions affecting performance of fans.
  - 3. Do not proceed until unsatisfactory conditions have been corrected.
- B. Power Supply: Verify that the proper power supply is available.

### 3.02 INSTALLATION

- A. General: Install equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1. Make all necessary adjustments to equipment to provide complete and satisfactory operation upon completion of the installation.

- B. Support fans as described below.
1. Support floor-mounted units on concrete equipment bases using housed spring isolators. Secure units to anchor bolts installed in concrete equipment base.
  2. Install prefabricated roof mounting curbs for roof-mounted fans, watertight in accordance with the prefabricated curb manufacturer's recommendations. Secure roof-mounted fans to roof curbs. Set each fan on a continuous 2- by 1/2-inch sponge neoprene gasket. Flange connecting ducts over the wood mounting frame attached to the fan curb. Provide roof openings in accordance with approved manufacturers shop drawing submittals.
  3. Suspend overhead mounted units from structural steel support frame using threaded steel rods and vibration isolation springs.
- C. Vibration Correction: If undesirable vibration occurs in the fan after installation, rebalance the fan in the field or replace to achieve operation within acceptable limits.
- D. Access Space: Provide access space around fans and motors for service. Provide no less than minimum as recommended by the manufacturer. Allow space for motor removal.
- E. Electrical Leads: Install fans, as shown and specified, with flexible electrical leads.
- F. Flexible Connections: Provide flexible connections at inlet and discharge of fans where shown. Ensure metal bands of flexible connectors are parallel with minimum 1-inch flex between ductwork and fan while running. Flexible connections are not to be in tension while fan is running.
- G. Safety Screen: Provide safety screen where fan inlet or outlet is exposed.
- H. Drain Piping: Pipe fan scroll drains to nearest floor drain.
- I. Backdraft Dampers: Provide backdraft dampers on discharge of exhaust fans and as indicated.
- J. Operating Requirements: Do not operate fans for any purpose until ductwork is clean, bearings are lubricated, and fans have been test run under observation.
- K. Access Doors: Provide access doors for all fans, for inspection and maintenance.
- L. Lubrication: Properly lubricate all pieces of equipment, furnished with lubrication fittings, prior to start-up and at recommended intervals before turning equipment over to the City of New York. Attach a linen tag or heavy-duty shipping tag to each piece of equipment showing the date of lubrication and the name and number

of lubricant used. Furnish typewritten list, in triplicate, of each item lubricated and the type of lubricant used.

3.03 FIELD QUALITY CONTROL

A. Adjustment and Cleaning: Perform adjusting and cleaning as follows:

1. Align, adjust and balance each belt drive to prevent noise and vibration.
2. Adjust damper linkages for proper damper operation.
3. Start fan system and check for excessive leaks and vibration and correct.
4. Remove all loose materials and obstructions from interior of equipment.
5. Remove debris and waste materials resulting from installation.
6. Clean tar, adhesive, dirt or marks from exterior of unit.

B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to inspect the installation of equipment, and certify that it meets the manufacturer's recommendations as specified in Division 1. Make any necessary adjustments, test and place the equipment in satisfactory operating condition and instruct the operating personnel in its operation and maintenance.

3.04 PAINTING

A. Paint fans in accordance with the requirements of Sections 09911 and 09912 - Exterior and Interior Painting.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 15850**  
**AIR OUTLETS AND INLETS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for furnishing and installing ceiling air diffusers, registers, grilles, gravity ventilators, and all accessories and appurtenances necessary for complete installation.

**1.02 RELATED SPECIFICATIONS**

- A. Section 09911 - Exterior Painting
- B. Section 09912 - Interior Painting

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. SSPC-SP3 - Power Tool Cleaning

**1.04 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Submit manufacturer's technical product data for air outlets and inlets including the following:
  - 1. Data sheet for each type of air outlet and inlet, and accessory furnished, indicating construction, finish and mounting details.
  - 2. Performance data for each type of air outlet and inlet furnished, including aspiration ability, temperature and velocity traverses, throw and drop; and noise criteria ratings. Indicate selections on data.
- C. Shop Drawings: Submit shop drawings for air outlets and inlets including the following:
  - 1. Manufacturer's assembly-type shop drawing for each type of air outlet and inlet, indicating materials and methods of assembly of components.
  - 2. Schedule of outlets and inlets indicating type, size, location, application, and noise level.
- D. Quality Control: Review requirements of outlets and inlets as to size, finish, and type of mounting prior to submitting product data and schedules.

- E. Operations and Maintenance Manuals: Submit maintenance data, including cleaning instructions for finishes, and spare parts lists. Include this data, product data, and shop drawings in maintenance manuals, in accordance with requirements of Section 01831.

#### 1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of air outlets and inlets of types and capacities required, whose products have been in satisfactory use in similar service for not less than three (3) years.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Shipping and Packing: Deliver air outlets and inlets wrapped in factory-fabricated fiberboard type containers. Identify on outside of container, the type of outlet or inlet, and location to be installed. Provide complete information for use and reordering, including supplier's name, address and phone number.
- C. Storage and Protection: Store air outlets and inlets in original cartons and protect them from weather and construction Work traffic. Where possible, store indoors. When necessary to store outdoors, store above grade and enclose with waterproof wrapping. Avoid crushing or bending, and prevent dirt and debris from entering and settling in devices.
- D. Inspection: Inspect all air outlets and inlets against approved shop drawings at the time of delivery.

Return for replacement all air outlets and inlets damaged or not meeting the requirements of the approved drawings.

#### 1.07 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. Three sets of operating keys for each type of air outlet and inlet that require them.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

**B. Ceiling Air Diffusers**

1. Titus Products; Division of Philips Industries, Inc.
2. A. J. Manufacturing Co.

**C. Registers and Grilles**

1. Titus Products; Division of Philips Industries, Inc.
2. A. J. Manufacturing Co.

**D. Air Boot****2.02 MATERIALS, GENERAL**

- A. Except as otherwise indicated, provide manufacturer's standard ceiling air diffusers, registers and grilles, and gravity ventilators where shown, of size, shape, capacity, and type indicated, constructed of materials and components as indicated, and as required for complete installation.
- B. Ceiling/Surface Compatibility: Provide diffusers, registers and grilles with border styles that are compatible with adjacent construction systems, and that are specifically manufactured to fit into ceiling module or wall construction with accurate fit and adequate support. Refer to Contract Drawings and Specifications for types of ceiling systems and surfaces which will contain each type of air diffuser, register and grille.

**2.03 CEILING AIR DIFFUSERS**

- A. Provide ceiling air diffusers materials and coatings as follows:
  1. Type 316 stainless steel in stainless steel ducts
- B. Square and Rectangular Ceiling Diffusers: Provide square and rectangular ceiling diffusers where shown and specified meeting the following requirements.
  1. Provide square or rectangular, adjustable pattern, stamped, perforated face type ceiling diffusers to discharge air in 4 direction pattern with sectorizing baffles where indicated. Type 316 stainless steel, Model SSPERF-S manufactured by A.J. Manufacturing Co. or approved equal.
  2. Provide 24 inch x 24 inch ceiling module panel to fit in lay-in ceiling space.
  3. Provide opposed blade dampers with equalizing grid, with damper adjustable from diffuser face.
  4. Provide square to round transitions for Model SSPERF-S.

## 2.04 REGISTER AND GRILLES

- A. Provide registers and grilles materials as follows:
  - 1. Type 316 stainless steel in stainless steel ducts
- B. Supply Registers and Grilles: Provide supply registers and grilles where shown and specified meeting the following requirements.
  - 1. Provide supply air registers and grilles as double deflection type, with individually adjustable vertical front blades, flanged and gasketed. Type 316 stainless steel - Model SS250V, manufactured by A.J. Manufacturing Co. or approved equal.
  - 2. Fabricate 1-1/4 inch margin frames with concealed mounting.
  - 3. Provide air extractors and integral, gang-operated opposed blade dampers with a removable key operator, operable from the face.
- C. Exhaust and Return Registers and Grilles: Provide exhaust and return registers and grilles where shown and specified meeting the following requirements.
  - 1. Provide exhaust and return air registers and grilles as single deflection type, with fixed horizontal blades set at 45 degrees deflection, flanged and gasketed; Type 316 stainless steel - Model SS550H, manufactured by A.J. Manufacturing Co., or approved equal, flanged and gasketed or approved equal.
  - 2. Fabricate 1-1/4 inch margin frames with concealed mounting.
  - 3. Provide integral, gang-operated opposed blade dampers with a removable key operator, operable from the face.
- D. Provide ceiling mounted perforated return air registers where shown and specified meeting the following requirements.
  - 1. Provide square or rectangular, stamped, perforated face type ceiling registers where indicated. Type 316 stainless steel or approved equal - Model SSPERF-R, manufactured by A.J. Manufacturing Co. or approved equal.
  - 2. All registers to be mounted in 24 inch x 24 inch ceiling module panel, to fit in lay-in ceiling space.
- E. Provide surface mounted eggcrate grilles with 1/2 x 1/2 x 1/2 inch, aluminum core where indicated on plans, manufactured by Titus, Model No. 50F or approved equal.

- F. Transfer Grille Assembly: Wall mounted grilles shall consist of two (2) grilles, installed flushed to each side of wall. A Type B fire damper shall be installed between the grilles when located in fire rated walls. The fire damper shall consist of a fully adjustable, key operated opposed blade damper with a spring loaded fusible link assembly Type 316 stainless steel construction. The fusible link shall be UL rated at 160F. The entire assembly shall conform to the latest edition of the National Fire Code No. 90A. All transfer grilles assembly shall be Type 316 stainless steel. Transfer grilles shall be as manufactured by A.J. Manufacturing Co., or approved equal.

## 2.05 AIR BOOT

- A. Provide air boot constructed of Type 316 stainless steel as indicated on "Air Boot Detail" in Contract Drawings.

## 2.06 SOURCE QUALITY CONTROL

- A. Performance: Provide air inlets and outlets meeting the following performance requirements.
  - 1. Provide ceiling air diffusers, registers and grilles that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device as listed in manufacturer's current data.
  - 2. Provide gravity ventilators that have, as maximum, face velocity and pressure drop across the unit, and as minimum, noise criteria ratings for each size product as listed in manufacturer's current data.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. General: Examine areas and conditions under which air outlets and inlets are to be installed. Do not proceed with installation Work until unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General: Install air outlets and inlets, in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Coordination: Coordinate with other work, including ductwork and duct accessories, as necessary to interface installation of air outlets and inlets with other work.
- C. Location: Locate ceiling air diffusers, registers and grilles, as indicated on the "Reflected Ceiling Plans" included in the Contract Drawings. Unless otherwise indicated, locate units in center of acoustical ceiling module.

- D. Connecting Ductwork: Flange connecting ductwork over the mounting frame attached to the roof curb.
- E. Curb Gasket: Set each louver penthouse on a continuous 2- by 1/2-inch thick sponge neoprene gasket.
- F. Construction Openings: Provide roof openings in accordance with approved manufacturers shop drawing submittals.
- G. Painting: Paint visible interior duct surfaces behind grilles and registers flat black in accordance with the requirements of Sections 09911 - Exterior Painting and 09912 - Interior Painting.

-END OF SECTION-

**Section 15900**  
**HVAC CONTROLS**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for providing electronic/electric, and direct digital control (DDC) temperature control systems for heating, ventilating, and air conditioning systems as indicated. Provide systems complete in all respects, including thermostats, smoke detectors, thermometers, timers, relays and switches, automatic dampers, damper operators, signal selectors, transmitters, DDC systems with all peripheral devices, DDC software, miscellaneous accessories, temperature control panels (TCP), and alarm systems. Provide all control panels rated NEMA 12.

**1.02 RELATED SPECIFICATIONS**

- |    |               |   |  |
|----|---------------|---|--|
| A. | Section 01821 | - | Training   |
| B. | Section 09911 | - | Exterior Painting                                    |
| C. | Section 09912 | - | Interior Painting                                    |
| D. | Section 15551 | - | Chimney Automation System                            |
| E. | Section 15670 | - | Condensing Units                                     |
| F. | Section 15720 | - | Air Handling Units                                   |
| G. | Section 15730 | - | Packaged Air Conditioning Units                      |
| H. | Section 15765 | - | Terminal Heat Transfer                               |

| J. | Section 15950 | - | Testing, Adjusting and Balancing                     |
| K. | Section 16055 | - | Electrical Requirements for Shop Assembled Equipment |
| L. | Section 16491 | - | Control Components and Devices                       |

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
1. AMCA 500 - Test Methods for Louvers, Dampers and Shutters
  2. ASME B16.22 - Wrought Copper and Copper Alloy Solder Joint Pressure Fittings
  3. ASTM B 32 - Solder Metal
  4. NEMA 250 - Enclosures for Electrical Equipment (1,000 Volts Maximum)
  5. NFPA 90A - Installation of Air Conditioning and Ventilation Systems

6. ASTM B 280 - Seamless Copper Tube for Air Conditioning and Refrigeration Field Service
7. NEMA DC 3 - Residential Controls - Electric Wall-Mounted Room Thermostats

#### 1.04 SUBMITTALS

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Product Data: Provide complete catalog data for all proposed control components including manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts and installation instructions.
- C. Shop Drawings: Provide shop drawings for the following:
  1. Complete data on all proposed control components
  2. Dimensioned external and internal control panel layouts, with components identified
  3. Bills of material for all control components
  4. Control sequence description for each system
  5. Catalog cuts for all devices and equipment
  6. Control diagrams specific to this project. General control diagrams are not acceptable.
  7. Furnish a connection diagram and schematic for each piece of equipment that is specific to this project. A manufacturer's standard connection diagram or schematic showing more than one method of wiring is not acceptable unless the intended method is clearly marked.
  8. DDC data points, system panels to which they are connected, input/output devices, associated alarm limits and alarm messages, point identification numbers and necessary appurtenances
  9. System graphics for all DDC monitored points
  10. DDC system configuration with all peripheral devices, battery backup power conditioning, interconnection diagrams, etc
  11. Software listings for all control loops and each point in the system
  12. Computer system drawings

13. Point-to-point electrical interconnection and loop diagrams (These are needed in the early phase of the project.) Clearly differentiate between manufacturers' wiring and field wiring
  14. Factory and field test Procedures
  15. Damper schedule including sizes, trim, operator sizes and pressure drop calculations
  16. Air temperature sensor schedule including range, element type, element length accuracy, hysteresis, linearity, power requirements and mounting details
  17. Detailed operating instructions
  18. Complete plan wiring, riser and schematic diagrams, and terminal connection diagrams
  19. Calculations and all other details required to demonstrate the system design has been coordinated and will properly function as a system. Submit all sensor range calculations.
- D. Field and Panel Instruments: Provide instruments which contain the following information, as a minimum.
1. Tag number per the Specifications and Contract Drawings
  2. Product (item) name used herein and on the Contract Drawings
  3. Name of manufacturer or supplier
  4. Manufacturer's complete model number
  5. Location of the device
  6. Input-output characteristics
  7. Range, size, graduations and the operating power requirement
  8. Physical size with dimensions, NEMA enclosure classification and mounting details
  9. Materials of construction of all components
  10. Instrument or control device sizing calculations, where applicable
  11. Certified calibration data on all flow metering devices, where applicable

12. Environmental requirements during storage and operation
  13. Verify the process data with the equipment manufacturers and submit completed data sheets. The Contractor is responsible for developing process data on remaining instruments.
- E. DDC Shop Drawings: Submit shop drawings (ladder diagrams, etc.) or Direct Digital Controller shop drawings (DDC configuration printouts, etc.) for review several weeks before the factory acceptance tests. Provide descriptions and reference to rung numbers in the program drawings. Clearly define all assumptions made relative to the derivation of each equation and program module. Include extensive comments in ladder diagrams to describe program steps. Provide a complete detailed listing of all DDC configuration sheets, side loops, global and local points. Submit following documents as a minimum:
1. A complete input-output list for all DDCs
  2. DDC card I/O layout
  3. Cross-reference table. This table will list all registers and coils description with reference to the rung numbers.
  4. DDC configuration data including input/output assignment; memory organization and communication baud rate
  5. Logic diagram or complete ladder diagrams and complete annotation and rung description indicating rung and I/O usage
  6. Manufacturer's application programming manual and software
- F. Catalog Cuts: Submit for review, the name of the manufacturer, identifying trade name and/or model designation, and catalog cuts for all equipment and material proposed under this Section. Provide catalog cuts certified for the tag numbers and ratings of the equipment being supplied. Clearly indicate on the catalog data the equipment and devices specifically being proposed.
- G. Electrical Interconnection and Loop Diagrams: Provide point-to-point electrical interconnection diagrams and loop diagrams during early phase of the project. Prepare instrument loop diagrams per ISA Standard S5.4 and show one loop per sheet. Show all equipment designations, terminal numbers, wire numbers, conduit numbers, cable designations and junction box numbers, etc on the final interconnection wiring diagrams.

- H. Configuration Data Sheet: Submit completed Configuration Data Sheets For all DDC cards and programmable instruments.

Include the following data:

1. Equipment ID (Tag No.)
  2. Manufacturer
  3. Model No.
  4. Zero settings
  5. Span settings
  6. Service
  7. Tuning constants
- I. Application Software for DDC: Provide five copies of a software documentation book which contains programs developed for this project.
- J. Operation and Maintenance Manuals: Submit operation and maintenance manuals covering the function, operation and maintenance of all control components and systems including the DDC control system as specified in Section 01831.

#### 1.05 QUALITY ASSURANCE

- A. Manufacturer: Provide materials and equipment which are standard products of manufacturers regularly engaged in the production of such materials and equipment. Provide the manufacturers latest design that conforms to these specifications. Provide the products of the same manufacturers when two or more units of the same class of material and equipment are required.
- B. Installer: Must specialize in installing the Work of this Section and have substantial years documented experience.
- C. DDC System Supplier: Provide DDC supplier staffed with factory-trained engineers fully capable of providing instruction, routine maintenance and emergency maintenance service on all system components.
- D. Manufacturer's Representative: During the DDC startup furnish the services of a qualified, factory-trained service engineer to assist in installation, start-up, field testing, calibration, placing into operation and provide training for the DDC system.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store, and handle all products and materials as specified in Division 1 and as follows.
- B. Acceptance: Accept products on-site in factory-fabricated protective containers, with factory-installed shipping skids and lifting lugs. Inspect products for damage.

- C. Storage and Protection: Store products in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

#### 1.07 SPARE PARTS

- A. Provide all of the individual manufacturer's recommended spare parts and tools for all equipment specified herein. In addition to the recommended spares, furnish all of the following minimum spare parts, tools and devices. Provide spare parts and special tools in accordance with the requirements of the General Conditions.

1. General: Provide 10% (minimum of ten (10)) spare fuses, indicating lights, etc., for each size and type provided.
2. Electronic Field Instruments: Provide one (1) complete spare instrument for every ten (10), or part thereof, installed instruments (minimum of one (1)). Include any integral indicators, adapters, converters and modules needed to provide a complete functional replacement. Where similar units have been provided having different characteristics or ranges, the aforementioned quantities pertain to each type.
3. Primary Sensing Elements: One (1) spare of each size and type, complete with housing and appurtenances for each ten (10) or part thereof installed.
4. Pressure and Temperature Switches: One (1) spare of each size, type and range, complete with housing and appurtenances for each ten (10) or part thereof installed.
5. Panel Mounted Instruments: (Includes Loop Controllers, Digital Indicators, Run Time Meters, Isolators, Power Supplies etc.) Provide one (1) spare of each size, type and range, complete with housing and appurtenances for each ten (10) or part thereof installed.
6. In addition to the spares required above provide:
  - a. One (1) spare power supply for every five (5) or part thereof installed.
  - b. One (1) spare electronic module, indicator and/or circuit board for every five (5) or part thereof installed.
  - c. One (1) complete set of memory modules for each controller installed with the current program preloaded.
7. Relays, Circuit Breakers, etc.: Provide 10% (minimum of two (2)) spares of each size, type and configuration for each ten (10) or part thereof installed.

8. Panel Mounted Switches and Indicating Lights: Provide 10% (minimum of two (2)) spares of each size, type and configuration for each ten (10) or part thereof installed.
  9. Gauges, Indicators and Thermometers: One (1) spare gauge and thermometer of each size, type and range, complete with appurtenances for each ten (10) or part thereof installed.
- B. Packaging: Package spare parts in containers bearing labels clearly designating the contents. Identify all spare parts with information needed for reordering. Deliver spare parts in original factory containers.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Temperature Control Equipment
  1. Johnson Controls, Inc.
  2. Siemens
- C. DDC Control Equipment
  1. Johnson Controls, Inc. - Metasys
  2. Siemens - System 600
- D. Operator Interface Terminal (OIT)
  1. Proface – Series APL3700K
- E. Control Dampers
  1. Aluminum Dampers
    - a. Ruskin - Model CD50
    - b. Air Balance - Series 500
  2. Stainless Steel Dampers
    - a. Ruskin - Model CD30VG2
    - b. American Warming - Model VC20 and 21 (Stainless Steel)

## F. Damper Operators

1. Electronic Damper Operators
  - a. Johnson Controls - Series M-100
  - b. Belimo Aircontrols

## G. Time Delay Relays

1. Agastat - Cat. No. SSC12ABA
2. ISSC - Cat. No. 1017-B-1

## H. Repeat Cycle Timers

1. Eagle Signal Controls - CA Series
2. Automatic Timing and Controls Co. - Series 342

## I. Differential Pressure Switches

1. Dwyer Instruments Inc. - Series 1900

## J. Current Switches

1. Veris Industries Inc. Hawkeye Series 708/908

## K. Thermostats

1. General Use Thermostats
  - a. Johnson Controls
  - b. Honeywell
2. Corrosion Resistant Thermostats
  - a. Indeco Catalog number C211-040

## 2.02 HVAC CONTROLS, GENERAL

- A. General: Provide temperature control systems as specified and complete in all respects. Provide control components subject to mechanical strain of metallic construction. Provide all electric and electronic control components to be UL listed.

1. Provide all wiring and conduit that conform to the requirements of Division 16 and to applicable codes.
2. Coordinate power and wiring requirements for all equipment.

- B. Provide all power wiring, control wiring and communication wiring, associated conduit, transformers and appurtenances interconnecting all equipment provided, except as specifically specified to be provided otherwise, including but not limited to the following:
1. Temperature Transmitters
  2. Damper Actuators
  3. Limit Switches
  4. HVAC Protection Devices
  5. HVAC Control Devices
  6. Temperature Control Panel mounted electrical equipment and devices
  7. Current Switches for single phase motors
  8. Operator Interface Terminals
- C. Provide all equipment, control wiring, communication wiring and associated conduit, transformers and appurtenances interconnecting the following equipment.
1. Temperature Control Panels
  2. Air Cooled Condensing Units
  3. Packaged Air Conditioning Units
  4. Heating and Ventilating Units
  5. Air Conditioning Units
  6. Fuel Fired Heaters
  7. Chimney Automation System
  8. Supply, Exhaust and Return Air Fans
  9. Provide wiring and conduit between the HVAC equipment and the TCP for alarm connections to the SCADA system.
- D. Wiring and associated conduit for the following equipment.
1. Motor control centers to HVAC equipment, but not be limited to the following:
    - a. Motors 0.5 hp and larger
    - b. Air Cooled Condensing Units
    - c. Packaged Air Conditioning Units
    - d. Heating and Ventilating Units
    - e. Air Conditioning Units
    - f. Supply, Exhaust and Return Air Fans
  2. Lighting and power panels to temperature control panels
  3. Lighting and power panels to temperature control panels for motors less than 1/2 hp with motor starters in the TCP and from the TCP to the motors.
  4. Lighting and power panels to 120 volt powered motors with local manual motor starters.

- E. Provide power equipment and control wiring terminations in the TCP and control wiring and conduit between the MCC and TCP.
- F. Power, control and communications wiring and associated conduit interconnecting certain pieces of equipment provided under Division 16.
  - 1. All wiring and conduit from the smoke detectors to the Fire Alarm Control Panel.
  - 2. All wiring and conduit from the Fire Alarm Control Panel to the Temperature Control Panel (TCP).
  - 3. All wiring and conduit from the Purge Panel to the TCP.
  - 4. All conduit and wiring from 3-phase motors current sensors to the TCP.
- G. DDC System Communication Wiring
  - 1. The communication wiring and conduit between TCP(s), and SCADA System.

#### 2.03 OPERATOR INTERFACE TERMINALS (OITs) HARDWARE

- A. General: Install the Operator Interface Terminals (OITs) as shown and as specified in NEMA 12 rated 19-inch rack mount industrial workstations. Provide each station of identical parts and components and provided with the following features and functions:
  - 1. 15" XGA TFT color flat panel
  - 2. NEMA 4x sealed front panel
  - 3. Intel Core Due 2.0 GHz processor
  - 4. 4GB RAM
  - 5. Four PCI expansion slots
  - 6. 10/100 Base T Ethernet port
  - 7. RS232 port
  - 8. RS232 or RS485 port
  - 9. Parallel port
  - 10. PS/2 keyboard and mouse port
  - 11. USB port
  - 12. DVD-RW drive
  - 13. CD-R/W drive
  - 14. Floppy drive
  - 15. 250 GB hard drive
  - 16. Microsoft Windows XP Professional

## 2.04 CONTROL DAMPERS

- A. General: Provide multiple blade control dampers of the sizes shown at locations shown and specified. Furnish control dampers of the low leakage type designed to give not more than 15 cfm leakage per square foot of a 48-inch square damper at 4-inch w.g. pressure differential when tested in accordance with AMCA 500.
- B. Construction: Provide dampers for proportional mixing of converging airstreams of the multiple parallel blade type with blades positioned to direct air into the converging branch, and dampers for throttling of the multiple opposed blade type, unless otherwise shown. Provide control damper meeting the following requirements:
1. Construct dampers (blades and frames) of the same type of material as the ductwork in which they are installed.
  2. Except where specified otherwise, provide damper blades which do not exceed 6 inches in width and 48 inches in length and are rigidly constructed. Supply blades suitable for high velocity performance. Connect multiple section dampers with epoxy coated steel jackshaft.
  3. Provide damper bearings made of non copper-bearing corrosion-resistant materials, molded synthetic or Type 316 stainless steel. Provide EPDM rubber blade seals along with the damper. Provide jamb seals of the spring type of materials specified resulting in a tight closing, low leakage damper.
- C. Stainless Steel Dampers: Construct stainless steel dampers of Type 316 stainless steel. Supply frames 5-inch wide, 14-gauge stainless steel with mounting flanges, reinforced corners and flexible stainless steel jamb seals. Supply blades of 16 gauge stainless steel with elastomer edge seals mechanically fastened. Furnish axles and linkage in the air stream of 316 stainless steel.

## 2.05 DAMPER OPERATORS

- A. Electronic Actuators: Furnish electronic damper actuators of two position or modulating type as required. Provide actuators which have electronic overload or digital rotation sensing circuitry to prevent damage throughout rotation. Provide actuators with the torque required for proper close-off and capable of being mechanically or electrically paralleled to increase torque where required. Provide a mechanical spring return mechanism for "Fail safe" operation. Non-mechanical forms of fail safe are not acceptable. Provide all spring actuators capable of both clockwise and counterclockwise operation by changing the mounting orientation. Provide proportional actuators designed to accept a 2 to 10 VDC or 4-20 mA input signal and provide an independent 2 to 10 VDC position feedback signal. Provide proportional actuators powered by 24 VAC or VDC and 2 position spring return actuators powered by 24 or 120 VAC. Power consumption not to exceed 15 VA per actuator. Provide actuators with an external manual gear release or crank to allow manual positioning when the actuator is not powered. Provide all

modulating actuators with an external direction of rotation switch and a 3-foot electrical cable.

## 2.06 SWITCHES AND RELAYS

- A. General: Provide electric switches and relays necessary to accomplish specified control functions installed in the appropriate temperature control panels. Provide switches and relays with 10 amp at 120 Vac rated contacts. Provide electric switches and relays complying with applicable requirements and ratings specified in Division 16 unless otherwise specified.
- B. Construction: Provide electric relays of the plug-in mechanical type with indicating light.
- C. Time Delay Relays: Provide adjustable time delay relays with automatic reset, with ranges as specified.
- D. Latching Relays: Provide magnetic latching dual coil relays with contact position indicator that maintains the condition during a power failure.

## 2.07 DIFFERENTIAL PRESSURE SWITCHES

- A. Differential Pressure Switches: Supply differential pressure switches for air systems. Select each differential pressure switch with a suitable operating range for the specific application. Provide differential pressure switches diaphragm operated, suitable for temperatures -30 degrees F to 180 degrees F, with 45-inch w.g. rated pressure, 10 psig maximum surge pressure and complete with adjustable differential pressure setpoint screw.
- B. Functions: Unless otherwise noted, provide each differential pressure switch to accomplish the following functions as described in Article 3.04.
  - 1. Provide an identified DDC point alarm (visual and audible) through the DDC system.

## 2.08 CURRENT SWITCHES

- A. General: Provide all single phase motor operated systems with electric current switches. Provide electric current switches to accomplish specified control functions and comply with applicable requirements specified in Division 16.
- B. Construction: Provide current switches of a solid state type with compatible current and voltage ratings. Provide switches complete with in-rush time delay, single setpoint adjustment, power and status LED's, and adjustable trip setpoint with accuracy of  $\pm 2$  percent of range. Provide switches with UL listing and NEMA 4X rating.

- C. Design: Provide switches designed for 5 to 185 degrees F and 0 to 95 percent humidity, and of a power induced type. Switches with external power supply are not acceptable.
- D. Functions: Unless otherwise noted, provide each switch to accomplish the following functions:
  - 1. De-energize the respective motor starter.
  - 2. Energize an audible alarm and an identified pilot light at the related temperature control panel, and identified DDC point alarm (visual and audible) throughout the DDC system.
- E. Provide current switches by Veris Industries, Hawkeye Series 708/908 or approved equal.

## 2.09 TEMPERATURE MEASUREMENT

### A. Temperature Transmitters

- 1. General: Mount temperature transmitters for RTD inputs in an enclosure that is wall or stand mounted adjacent to the temperature element assembly or as indicated on the contract drawings. Provide with weatherproof enclosure or intrinsically safe as appropriate for the environment. Provide transmitters to be loop powered from Temperature Control Panel or I/O panel with 24 VDC and which have an isolated current output range of 4 to 20 mA 24V DC.
- 2. RTD Input
  - a. Provide transmitters which have an accuracy of 0.2 percent of full scale, an ambient temperature coefficient better than plus or minus 0.01 percent/degree F total for factors of zero shift, span shift and suppression shift for calibration spans as low as 3.0 millivolts.
  - b. Equip room temperature transmitters with epoxy coated steel covers.
  - c. Provide duct-type transmitters with insertion probe or using capillary averaging elements in systems or ductwork with greater than 8 feet perimeter (or circumference) length.

## 2.10 THERMOSTATS

- A. Electric Thermostats: Provide electric thermostats as two-position type or fully modulating type as required. Furnish electric thermostats with bimetallic sensing elements and concealed adjustable setpoint. Supply electric thermostats with field adjustable sensitivity and with thermometers in covers of approved standard finish. Furnish electric modulating type thermostats that operate on the balanced bridge principle. Provide thermostats sensing the temperature of rooms, when located

outside of the room, of the remote bulb type with stainless steel bulb and capillary not exceeding 20 feet in length.

- B. Corrosion-Resistant Thermostats: Provide all thermostats to be electric, corrosion-resistant type in a NEMA 4X enclosure with a nickel-plated or stainless steel bulb.

## 2.11 TEMPERATURE CONTROL PANELS

- A. General: Furnish temperature control panels with suitable brackets for wall mounting or floor mounting as required by the panel size, each prewired to integral identified terminal strips. Provide interior panel wiring color coded and with numbered conductors, neatly bundled and secured. Furnish panels of the NEMA 12 enclosed type, equipped with hinged doors and locks, and constructed of heavy-gauge sheet steel or aluminum with baked enamel finish. Provide a disconnect switch mounted inside the panel for each 120-volt circuit powering the temperature control panel. Provide a power "ON" pilot light mounted on the face of the panel for each circuit feeding the panel to be energized when the electric circuit feeding the panel is energized. Number each panel and provide a nameplate identifying the system or systems controlled. Conform panels to Section 16055 - Electrical Requirements for Shop-Assembled Equipment.
- B. Provide each temperature control panel powered through its own UPS. Provide UPS under this Division of the Specifications. Provide a UPS meeting the requirements of the applicable Division 16 Specification.
- C. Panel Components: Furnish the temperature control panels with thermometers, switches, alarm annunciators and pilot lights and similar items mounted on the front of the panel. Mount DDC controllers, control relays, timing relays, reset timers, remote control stations, terminal strips and other components inside the panel. Equip the panels with starters with thermal overload for associated HVAC and plumbing equipment motors 1/3 hp and smaller. Provide identified pilot lights for each motor. Provide red RUN indication pilot light and green OFF indication pilot light. Provide motor starter meeting the requirements of Division 16. Provide an Operator Interface Terminal (OIT) for DDC monitoring and control specified in paragraph 2.03.A.
- D. Alarm Annunciator: Provide the alarm annunciator as solid-state suitable for flush panel mounting or mounting adjacent to the temperature control panel. Provide the annunciator window engraved with black lettering and illuminated blue for ALARM. Provide a panel-mounted lamp test push button such that when pressed all alarm lights are illuminated.
  - 1. Alarm Module Function: Provide the alarm module such that when an alarm occurs, the alarm module causes a horn to sound and the corresponding alarm light to flash. Provide a panel-mounted SILENCE push button to silence the horn and change the flashing light to a steady light when pressed. Provide the alarm module such that another alarm occurring in the system repeats the above sequence. When the alarm condition returns to normal, the

alarm module automatically causes the corresponding steady alarm light to turn off. Provide each annunciator module with a lock/nonlock feature.

2. Auxiliary Contacts: Include in each alarm module auxiliary isolated dry contacts which repeat the field contact function. Provide alarm circuits as double pole, prewired to a terminal strip for remote signaling. Provide, in addition, the annunciator with an auxiliary contact which closes upon loss of power to the annunciator.
  3. Alarm Horn: Furnish the annunciator with a variable volume alarm horn powered by 115-volt ac, 60 hertz, and suitable for panel mounting.
- E. Identification: Identify devices mounted on the front of the panel by engraved bakelite or formica tags. Identify all equipment as scheduled and as shown on the control diagram. Mount the tags using stainless steel screws. Mounting tape and glue are not acceptable. Permanently mount the control diagrams provided under suitable protective cover adjacent to the local control panel.
- F. Electrical Diagrams: Consult the schematic diagrams shown for control relays, timing relays and other accessory equipment to be provided, and mounted and prewired to terminal strips in the temperature control panels. Provide control relays, timing relays, reset timers, manual motor starters and remote control stations meeting applicable requirements of Division 16.

## 2.12 DDC SENSORS AND TRANSMITTERS

- A. Temperature Sensors: Provide platinum resistance temperature detector (RTD) elements to measure all temperatures. Thermocouples are not acceptable.
- B. Outdoor Air Sensors: Provide outdoor air sensors protected from direct sunlight, building thermal effects and aspirated properly.

## 2.13 DDC SYSTEM - GENERAL REQUIREMENTS

- A. General: Furnish the DDC System Operator's Console as a computer-based system of modular design consisting of a central operator console, including central processing unit, display unit, keyboard, and hard copy printer interconnected with DDC temperature control panels by a multiplexed communications network. Provide the basic elements of the DDC structure built up of only standard components kept in inventory by the DDC supplier. Provide DDC controls meeting the following requirements:
1. Provide Direct Digital Controls as shown on the Contract Drawings and as specified herein. Provide DDCs with all necessary components to accomplish these requirements. Provide an Operator Interface Terminal (OIT) with keypad to facilitate monitoring of points, changes of setpoints, etc. mounted on the face of each Temperature Control Panel with DDC.

2. Configure the DDCs to perform functions shown and specified. Coordinate and obtain from all equipment suppliers DDC systems of the same manufacturer and series.
3. Functions to be performed by the DDCs include but are not necessarily limited to the following:
  - a. Alarm and status indication
  - b. PID control and arithmetic functions
  - c. Interlock and sequential logic control of processes and equipment operations
  - d. Collection and transmission of data and control parameters to and from other DDCs
  - e. Provide a dry contact rated 2 amperes at 120 volts ac for remote indication of DDC failure. Wire all such alarm contacts from each DDC in parallel and indicate status locally with an indicator light.
4. Provide the DDCs of the electronic type furnished with all necessary relays (binary outputs), timers, counters, and latches as data manipulative functions and arranged into the format required to accomplish the functions shown and specified.
5. Design and construct the DDCs for the demanding requirements of real-time process management and control.
6. Provide each panel with at least 25-percent spare of each type of supplied I/O point such that expansion need only consist of connections, field wiring and controller programming.
7. The DDC configuration to be capable of being remotely (off-line) and locally (on-line) monitored, programmed, modified and displayed by use of a personal computer and documentation software which must be provided as part of this contract.
8. Provide the capability to enter and display DDC logic on the OIT.
9. Provide any process control description which cannot be addressed by a standard DDC firmware module with a custom program written by the manufacturer.
10. Arrange each Temperature Control Panel, in modular type design. Provide all DDC units to be easily removed for ease in replacement or restructuring the hardware arrangement.

11. In the event of a power failure or malfunction of the logic hardware, the controller shall provide dry, Form C contact closures for remote and local indication and alarming.
  12. Include a self-diagnostics package to determine proper processor operation. Provide an LED in clear view on the front of the panel connected to indicate improper processor operation..
  13. Provide the system such that changing an on-line control logic process operation does not necessitate the halting of other DDC processors.
  14. Provide optical isolation for all inputs and outputs for controller logic protection.
- B. Provide any card, any slot, plug-in packaging, with locking bars/ or screws to hold I/O modules in place
- C. Provide 300 Volt, screw type, field wiring terminal strips sized to accommodate a minimum of two #14 AWG wires per terminal. Terminate all field wiring on the field wiring terminal strips. Do not run field wiring directly to any panel internal devices.
- D. Provide individually fused output circuits for all discrete output modules. Provide fuses capable of being inspected without removal of and replaced without disassembly of the DDC module.
- E. Provide all outputs for contactors and relays rated for a minimum of 2.0 amps continuous at 120 Vac. Provide higher rated outputs and/or interposing relays inside the temperature control panel in order to assure that ratings of the output contacts are not exceeded. Coordinate with equipment being controlled by the respective outputs.
- F. For outputs to motor contactors and other equipment type load relays, provide transient and inrush surge suppressor connected across the output contact terminal and the neutral-common terminal inside the control center to suppress the switching surge transient to lower than the continuous rating of the output contacts.
- G. Provide the following types of I/O circuits for use with the supplied DDC System:
1. Analog Inputs (12 bits minimum)
    - a. 0-10 VDC
    - b. 1-5 VDC
    - c. 4-20 mAdc (250 ohms maximum impedance)
    - d. Millivolt signals
    - e. RTD signals

2. Analog Outputs (12 bits minimum)
  - a. 4-20 mA<sub>dc</sub> (load of 750 ohms minimum)
  - b. 0-10 VDC
  - c. 1-5 VDC
3. Register Inputs and Outputs (16 bit)
  - a. Single BCD
  - b. Multiplexed BCD
4. Discrete Inputs
  - a. 5 V, 12 V, 24 V, 48 V and 120 VAC/dc in both isolated and common circuit types
  - b. TTL Logic
5. Discrete Outputs
  - a. 120 VAC in both isolated and common circuit types
  - b. 12-120 VDC
  - c. Form C Relay Contacts
  - d. TTL Logic
6. High Speed Encoder/Counter
  - a. Accept and count pulse inputs independently and unaffected by I/O scan or program scan
  - b. Minimum pulse rate of 50 KHZ
7. DDC communication system
  - a. Network DDC cards with each other via a proprietary peer to peer dedicated serial communication system. The serial communication system to operate at a minimum of 1Megabaud.
8. Arrange signal and control circuitry to individual DDC boards such that board failure must not disable more than one half of the control loops within any group of controlled equipment (e.g., one pump out of a group of three pumps, two pumps out of four, etc.). Where possible, assign individual control loops and equipment to individual boards such that failure of the board will disable only one loop or piece of equipment.

**H. Required Features**

1. Construction: Modular printed circuit boards
  2. Type: Electronic components with integral processing unit and firmware reprogramming capabilities
  3. Memory: Provide DDC memory which has sufficient capacity for default firmware and additional RAM as required for any custom firmware utilized on the particular board. DDC board configuration to be stored in Non-volatile type (EEPROM) or Lithium battery-backed RAM with minimum retention time of 2 years under worst case conditions. Provide DDC UPS as previously specified.
  4. Language Format: Standard and custom firmware blocks
  5. Provide type and quantity of I/O as required to perform the operational and functional requirements plus 20 percent spare (minimum of one module) for each type of I/O module used. Mount and wire spare points ready for use and to require only field wiring connections and software configuration to place the point in service.
  6. Internal Functions: Provide relays, timers, counters, latches, internal storage registers, and other functions as required to perform specified functional requirements plus 20 percent spare capacity.
  7. Security Features: Provide security password protection through system programmer terminal to prevent tampering of logic sequences and unauthorized programming.
  8. Processor Scan Time: 2 ms per 1 K bytes of memory typical.
  9. Operating Temperature: 32°F to 140°F.
  10. Storage Temperature: Minus 40° F to 160°F.
  11. Power Supply: 120 VAC, 10 percent with fuse or circuit breaker protection. Size supplies for a minimum of 130 percent of maximum simultaneous current draw.
  12. Clock: Battery-backed clock with typical variation of 20 sec. per month.
  13. Programming/Documentation Software:
- I. Provide DDC programming/documentation software package compatible with the latest version of Microsoft Windows Operating System which is fully menu-driven

and self-prompting. Package to provide fully integrated programming and documentation.

- J. Package System: Provide the DDC system herein specified fully integrated and installed as a complete operating package conforming to applicable requirements of Division 16. Provide the DDC system with all computer software and hardware, operator input/output devices, remote processing units, sensors and controls, relays, switches, wiring and piping. Provide DDC manufacturer responsibility for preparing wiring diagrams, final installation and final connections. Provide a DDC panel, output display, and operator entry device (OIT) at each TCP location.
- K. DDC Supplier: DDC supplier to provide the engineering, installation supervision and labor, calibration, software programming, and checkout necessary for a complete and fully operational DDC system as specified. Provide all adjustments and calibrations.

## 2.14 DDC SYSTEM - OPERATION

- A. Input/Output Capabilities: Supply the control operator console with capabilities through the keyboard and CRT to:
  - 1. Request displays for any point or group of points, such as, but not limited to, all fan statuses, all mixed air temperatures, all discharge temperatures for any individual system.
  - 2. Issue start, stop and similar commands to equipment.
  - 3. Initiate and cancel all point logs, trend logs, alarm summaries and reports.
  - 4. Add, delete, or change points within a system, building, or in and out of all application programs.
  - 5. Communicate in full English language. Provide identifiers having 80 characters of description which are operator entered.
  - 6. Display time and date.
- B. Programming Capabilities: Provide operator programming capabilities to do additions to the system without going back to the manufacturer's software programmers. Provide the capability of doing all changes, while the system is on-line and operational. Provide operator programming capabilities which include, but are not limited to, the following:
  - 1. Add and delete all types of points.
  - 2. Modify any point parameter or engineering units.
  - 3. Change, add, or delete English language descriptors.
  - 4. Change, add, or delete points in start/stop programs, trend logs.

5. Select analog alarm limits.
  6. Add, modify or delete any display.
- C. Fail Safe Operation: Design the system to automatically restart after a power failure or upon initialization of the system controlled loads which have a user programmable delay between successive starts to limit demand peaks.
1. Provide a dedicated fail-safe relay in the DDC panels controller to change state on a hardware and/or software fault. Use the relay contacts to set a fixed fail-safe position for designated output controlled devices.
  2. Store the TCP/DDC panels' software and system data on disk memory. Supply the OIT to up-line load any entered attribute changes made at the panel by a manual command. Provide for all system functions to stay on-line during such loading.
  3. Provide each DDC panel comprised of self-diagnostics that continuously monitor the proper operation of the unit, such that malfunction of the controller, any distributed control module, or associated communication link are reported automatically to display the condition of failure along with time and date. Provide service message buffer in each DDC panel to store at least the last 20 service alarms with their time/date of occurrence and the time/date of their acknowledgment. Arrange the system to permit on-line interrogation via a telephone modem from a remote location for service inquiries.
- D. Control Programs: Provide each DDC panel with control functions integrated and executed within the panel.
1. Provide Control functions for two and three-position start/stop, event scheduling, direct digital control of analog control loops and safety interlocks which utilize preprogrammed software.
  2. Utilize a self-prompting, fill-in-the-blanks programming methodology for user reconfiguration of the system.
  3. Provide program elements accessible for review or modification through direct keyboard inquiry, and also accessible for review or modification by use of single keystroke to sequentially select each application program and subsequently step forward or backward through each application program element by single keystroke.
  4. Apply direct digital control to all analog control loops for proportional, integral and derivative control strategies. Design the system to implement, modify or remove these algorithm strategies while the system is on-line and operating. Provide each control loop to be user definable for sensor and

actuator field devices, software reset schedules, setpoint, PID constants, dead band region, and output high-low limits.

5. Provide time of day scheduling for 32-event schedules for equipment start/stop and setpoint operation. Provide each schedule containing 6 events per day for each of 7-calendar week days plus two unique holidays and one temporary schedule day. Provide schedules to be on-line modifiable. Each controlled point may have its own unique schedule or be assigned to a common schedule for use in making general schedule changes.
  6. Provide the time scheduling program to operate in accordance with a yearly calendar that automatically adjusts for daylight savings time and leap year.
  7. Provide holiday schedule for 32-user programmed holiday periods which may be defined one year in advance, with each period design to provide for up to 99 consecutive days and be assignable in the event schedules as either one of two holiday types or as a temporary day schedule.
  8. Supply maintenance scheduling that monitors equipment run time and generates a maintenance message after a pre-established time has elapsed, where 32-character user definable message is displayed or printed automatically at any one of three preset run time values. Provide each run time limit to be programmable from 0 to 65,000 hours. Provide separate and distinct messages associated with each run time interval capable of being displayed selectively on any DDC panel in the system.
  9. Design the system such that control priorities manage the programmed control strategies for any start/stop function so that at any point in time, the highest priority control function is implemented. Allow safety event sequences and manual commands to override lower level functions, such as duty cycling or time scheduling. Provide minimum of 16 priority levels for each start/stop point. Provide the system such that the system operator be able to query the current priority level function that has control of the start/stop point at either a local DDC panel, remote terminal, or operator's console.
- E. Alarm Processing: Supply the OIT with the following alarm processing features:
1. Program the OIT such that each change of state causes an alarm message, including the time of receipt of the alarm report, system and point descriptor and alarm condition.
  2. Display, at a minimum, the previous 24 hours of alarms.
  3. Sound an audible alarm which can be silenced by manual alarm acknowledgment on receipt of New contact or analog alarm printouts.

4. Provide an automatic time delay of alarms during equipment start-up or shutdown to prevent nuisance and false alarms.
  5. Annunciate failure of field cabinets or communication lines to it.
  6. Display of maintenance messages upon alarms.
- F. Software Capabilities: Include in the resident software tabular and graphical data screens for each system and groups of systems served. Provide graphics displays with the capability of displaying setpoints, analog values, statuses and alarms directly upon the appropriate equipment graphic. Provide maximum graphic analog data update time of 4 seconds. Provide software that, upon restoration of power after a power failure, automatically reloads all required software.
- G. Control Loops: Provide all control loops with PID capability. Provide on-line automatic tuning PID control loops using actual input and output data history. Provide graphic depiction of input and output during tuning operation.

## 2.15 OPERATOR'S CONSOLES

### A. Furnish and install an engineering workstation as follows:

1. CPU >2600 MHZ Intel Pentium (latest generation) (Gateway, Dell, Compaq, or approved equal) with additional internal cooling fans
2. Ram Memory 1024 Megabytes (Minimum)
3. Cache Memory 512 K (Minimum)
4. Floppy Drives 1 - 1.44 MEG 3.5 Inch
5. Hard Drive 1 - 120 GB
6. CD Rom Read and Write CD-RW drive
7. Video 128 MEG RAM Memory
8. Color Monitor 20 Inch Flat Panel, 19.3 inch viewable LCD
9. Modem 56K Baud with fax send/receive software
10. Network Card 10/100 MBps Ethernet, 3-COM 3C905 or approved equal (for access to network printer)
11. Input Devices 124 Key Keyboard  
Track Ball or Mouse  
Membrane Keyboard (for Operating)

12. Operating System      Latest Version of Microsoft Windows Operating System
  13. Log and Report Printers      Provide a latest version of the laser printer, 8-1/2" x 11" format. Hewlett Packard Lasterjet 4100 Series or approved equal. Include JetDirect print server ethernet card.
- B. Power the workstation console from its own UPS.
- C. Provide one (1) notebook portable computer with modem for off site system monitoring by facilities engineers with the following features:
1. Intel Pentium (latest generation) Micro Processor - fastest speed available at time of bid
  2. 512 Megabytes RAM Minimum
  3. 1.44 MB 3.5" Drive
  4. 60 MB Minimum Hard Drive
  5. Active Color Matrix SVGA LCD display with external monitor connector 1280 x 1024
  6. 1 Parallel Port
  7. 1 Serial Port
  8. USB Ports
  9. Mouse
  10. Data Acquisition Remote Access Software Package
  11. 56K Modem with fax send and receive software
  12. Latest Version of Microsoft Windows Operating System
  13. With spare battery and battery charge kit
- D. DDC Software
1. Furnish, install, program, test and place in satisfactory operation on the workstation above, a supervisory control and data acquisition (DDC) software system as follows.

2. Provide software packages to permit workstation to operate in real time and continue monitoring while simultaneously permitting unlimited off line development of control strategies, graphic displays, alarms and reports on a remote workstation.
3. The failure or shutdown of the workstation shall not inhibit the operation of any control system or function. While the purpose of this system is monitoring and data acquisition, provide software that has the ability to perform basic control functions.
4. Generate reports by both operator action and automatically by date and time. Provide the report for viewing on the display and printing. Display or print alarms continuously with operator keyboard enabling of alarm points and selection of destination.
5. Provide DDC Software based on the latest version of Microsoft Windows Operating System and provided with all necessary drivers, modules, protection devices, licenses and unlimited telephone support from the manufacturer. Operating system must be real time pre-emptive multitasking.
6. Provide software packages from a single supplier as provided by Iconics "Genesis", FIXX DMACS Wonderware software development "Wonderware" or approved equal.

E. DDC System Programming

1. Provide programming, testing and startup services by the supplier to customize the DDC software packages to the specific requirements of this project and as required for proper operation and as detailed below.
2. The system monitoring workstation to present all information in graphic and tabular form. Provide graphic displays showing a general plant overview, with one screen showing status of the heating systems. In addition, provide detailed graphic screens for each heating loop, and air handling and other fan systems system, showing all temperatures, pressures, flows, levels, speeds, and equipment status on a background of general equipment and piping layout based on the Contract Documents. Selection of any screen including graphics, alarms, reports and status to be by two keystrokes and/or point and click with the trackball (or mouse). All equipment pertaining to the HVAC, plumbing and fire protection systems shall be monitored by this system.
3. Include a "Main Menu" screen on which appear the keystrokes necessary to access any and all system screens and functions.

**F. Alarms**

1. Provide the system with current and historical alarm screens with date and time stamping. Alarms to be acknowledged from the TCPs or from the workstation. Provide system such that operator acknowledgment of alarms and return to normal status can also be printed and indicated on the alarm pages with time and date stamp. Provide system such that it is possible to acknowledge and clear alarms from the current alarm table. Ensure the system is able to store historical alarm data for a minimum of 30 days before being saved to disk.
2. Provide system such that current alarms are entered in an alarm log file with a description, their priority and a time and date stamp. While an alarm condition exists, the graphic symbol for the device shall indicate the condition on the screen with a flashing red or yellow symbol. In addition, operator response to alarms and return to normal status of all alarm points shall be recorded in the log file. Provide for printing the log file.
3. Submit the proposed messages and/or names generated by the alarms to the Engineer for review.
4. Combination of several pieces of information may be necessary to generate some alarms. Perform this logic in the TCPs using ladder logic. Alarm points to include but not be limited to: failure of any piece of equipment to start on command (after a delay), motor trip, and temperature deviation beyond preset limits and analog loop failure, as well as malfunction alarms generated in control logic and hardware.

G. Event Log: In addition to the alarm tables, provide an event log capable of recording and storing on hard drive, sequences of events over a one week period for later printout and/or storage to floppy disk. These events to include starting and stopping of fans and auxiliary equipment. The log to record failures and startup of backup and standby equipment. All events to be date and time stamped for future reference. Provide the system such that the operator does not have the option of disabling the event log feature from the keyboard.

H. Analog Trending: Provide trend graphs for all analog data for the previous one hour, 24 hour and 30 day period. Selection of from one to eight analog points to be selectable by the operator for display and/or printing on a trend graph. Analog data to be permanently stored in spread sheet format (Lotus or Excel) for later retrieval on disk and/or printer. Data also to be printable in graph format.

I. Help Screen: In addition to the above mentioned screens provide help screens available from any point in the system showing the operator how to move from area to area and describing what symbols and icons indicate.

## J. Graphic Displays

1. Display equipment status graphically with the use of colors, blinking and inverse video. The equipment symbol to be green when off and ready, red when running, flashing red or yellow on malfunction or alarm and grey when not ready. Valve symbols to be green when not fully open and red when open. Flow switches to be green to indicate no flow and red to indicate flow.
2. Display all analog values numerically on the graphic screen in one decimal point engineering units in their relative position in the system. Analog data displays to agree with data on transmitters and/or controllers within one digit. When analog values go above or below operator selectable setpoints the value to appear in a red background. When values go out of range or signal is lost, the data field to change to a flashing red background. Default alarm values to be 10% and 90% of range.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. General: Verify that systems are ready to receive control component Work.

### 3.02 INSTALLATION

- A. General: Install required control components in accordance with the manufacturer's recommendations and approved shop drawings. Adjust and test to meet the required control performance. Prior to control installation, coordinate the proposed controls with electrical plans and interfacing equipment for compatibility. Install the systems by experienced competent mechanics employed by a firm with an established controls service organization.
- B. Configure DDC components to prevent erroneous and nuisance alarms by using techniques including time delays and logic.
- C. Configure operator interface unit using function keys and instructional prompts so that operators can modify setpoints and presets without any special training or knowledge of the programming.
- D. For open/close dampers, after a time delay sufficient to permit the damper to operate fully, compare the DDC output with the associated limit switch. If the output calls for an open damper, the open limit switch should be made and the closed switch should not and vice versa. Any combination other than these two to cause an alarm.
- E. Program the DDC system to monitor limit switch positions for dampers in transition.

- F. Display dampers in transition (between open and close position) on the OIT with message "In Transition". Submit limit switch development for all dampers on 100 percent outdoor air units and exhaust fans with motorized dampers.
- G. Electrical Requirements: Provide electrical material and installation in accordance with applicable requirements of Division 16.
- H. Setpoints: Provide adjustable setpoints for all setpoints listed in the specified or scheduled control sequences.
  - 1. Temperatures shall be shown in degrees F.
- I. Fan Failure: Prove operation of all 120-volt supply, exhaust and return air fans by current switches. Prove operation of all 3-phase supply, exhaust and return air fans utilizing the current switches provided by electrical in the motor starters and wired to the TCP by electrical. If a fan has been commanded on and the current switch indicates a no-flow status, initiate an individual identified audible and visual alarm and DDC alarm and close remote alarm contacts at the temperature control panel annunciator for the fan in alarm. Provide an adjustable time delay function for each current switch to lock out the alarm during fan start-up.
- J. Control Devices: Provide a HAND/OFF/AUTO (HOA) selector switch for each supply, exhaust and return air fan at the temperature control panel and Hand Control (HC) for each mixed air damper control.
- K. Test Button: Provide an OFF/LOCK-ENABLE switch with a momentary contact TEST push button at each fan. Provide and wire the TEST push button to bypass the fan's safety devices regardless of the HOA switch position.
- L. Signals: Provide signals as follows:
  - 1. All electronic instruments transmitters to provide a linear 4 to 20 milliamp signal at a nominal 24VDC. Provide the signal proportional to the process variable indicated. Signal conditioning such as square root extraction or frequency conversion, if needed, is to be done by the transmitter electronics.
- M. Painting: Provide painting in accordance with Section 09911 - Exterior Painting and Section 09912 - Interior Painting.
- N. Control Sensors: Check and verify locations of thermostats, and other exposed control sensors with plans and room details before installation. Locate room thermostats 48 inches above floor. Align with lighting switches.
  - 1. Mount outdoor thermostats and outdoor sensors indoors, with sensing elements outdoors protected by a sun shield.

2. Provide thermostats in aspirating boxes in front entrances, and where indicated.
  3. Provide guards on thermostats in entrance hallways and other public areas and where indicated.
- O. Smoke Detectors and Dampers: Provide smoke detectors and smoke dampers installed in accordance with NFPA 90A.
- P. Thermometers: Locate a thermometer adjacent to each thermostat or DDC sensor. Mount a dial thermometer, minimum 2-1/2-inch diameter, with a liquid-filled remote system adjacent to each remote bulb thermostat, remote sensor and DDC sensor. Supply averaging bulb thermometers where averaging bulb thermostats and sensors are required. Provide duct-type thermometers in all fresh air intakes, mixed air and return air main ducts, and all supply fan discharges. Furnish thermometers with proper range scales for the locations where they are installed.
- Q. Control Dampers: Provide mixing dampers of opposed or parallel blade construction arranged to mix streams.
- R. Damper Operators: Provide pilot positioners on damper operators sequenced with other controls. Locate damper operators outside of the airstream wherever possible.
- S. Temperature Control Panels: Mount control panels adjacent to associated equipment on vibration-free walls or freestanding angle iron supports.
- T. Conduit and Wiring: Provide conduit and electrical wiring where required meeting requirements of Division 16.
- U. Lights, Switches, and Push Buttons: Provide pilot lights, selector switches, and push buttons located on face of control panels to be heavy duty oil tight in accordance with Section 16491 - Control Components and Devices.
- V. Panel Wiring: Provide panel wiring powered from sources outside the panel a different color from panel wiring powered from sources inside the panel. Provide a sign on the front of the panel indicating multiple sources of power and color of the wire for sources outside the panel.
- W. Current Switch
1. Where equipment is powered from a combination starter, mount the sensor in the starter. Where equipment is powered from the TCP, mount the sensor in the TCP. For two speed, two winding motor powered equipment, provide a current switch for each speed. Provide relay or software logic, as appropriate, to determine whether or not the equipment is operating at the proper speed.

If the equipment is not operating at the proper speed, generate an alarm in the DDC system and displayed on the OIT.

2. Adjust the current switch to provide a closed contact only when the motorized equipment is operating properly. Adjust the switch to provide an open contact when proper air flow is not achieved due to a broken belt, closed damper, or any other reason.
3. Provide software programming to provide an alarm at the OIT and operator console when the equipment is called to operate and after an adjustable time delay, the current switch does not provide a closed contact.

X. Coordinate for the location of duct type smoke detectors.

### 3.03 GENERAL SEQUENCES OF OPERATION AND CONTROL REQUIREMENTS

#### A. DDC Point Numbering System

1. DDC points have the following general form: A-BBB-XX-CCCC-DDD, where
  - a. A is the Building Letter designation in which, or nearest which the point is contained
  - b. BBB is the identification (typically from equipment schedules) of the equipment or system monitored or controlled
  - c. XX is the numerical sequence number of the equipment/system (e.g., EAF4)
  - d. CCCC is the abbreviation of the type of monitoring and control. The abbreviations are listed at the end of the DDC Points lists contained at the end of this Specification Section
  - e. DDD is used when multiple points need to be uniquely identified.
2. Use the DDC Point Numbering System in DDC point lists contained in Control Submittals. Include in the Control Submittals the points contained in this Specification and modified general points contained in some sequences of operation.

#### B. Electrical and Equipment Ratings

1. Review ALL documents for required electrical ratings
2. The more stringent ratings apply (e.g., minimum rating for all panels and equipment is NEMA 12.)

- C. Include in Control Submittals containing Sequences of Operation, all DDC points listed and all DDC points implied by Specification Sequences of Operation.
- D. Provide temperature, static pressure, etc., setpoints and alarm points that are easily and clearly adjustable from OIT.
- E. Provide all Analog points with high and low alarm limits and include these limits in Control Submittals.
- F. All temperatures listed are in degrees F.
- G. Mount control devices on the panel front as follows:
  - 1. Group together the control devices for each area served.
  - 2. Provide greater spacing between the groups of control devices than the spacing between control devices in a group so that the grouping by area served is obvious.
- H. Hand/Off/Auto (HOA) Switches
  - 1. Provide panel face HOA switches or switch designations to match the control requirements at the appropriate TCP for all HVAC motors. Clearly and permanently identify the system served by the switch.
  - 2. HOA switch for each fan with an associated two position damper for 100 percent outside air units with motor operated dampers:
    - a. In the HAND position open the damper associated with the fan and when proved open by the damper end switch run the fan. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.
    - b. In the OFF position the fan will not operate. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.
    - c. In the AUTO position the fan will operate based on the control strategies that follow unless shutdown by the FACP or overridden by the PSP.
  - 3. HOA switch for each fan with an associated motor operated modulating damper:
    - a. In the HAND position the fan runs. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.

- b. In the OFF position the fan will not operate. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.
    - c. In the AUTO position the fan will operate based on the individual equipment control strategies that follow unless shutdown by the FACP or over ridden by the PSP.
  - 4. HOA switch for all equipment except for the fans indicated above:
    - a. In the HAND position the unit runs. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.
    - b. In the OFF position the unit will not operate. Provide an alarm to the DDC system and displayed on the OIT indicating the HOA switch is not in the AUTO position.
    - c. In the AUTO position the unit will operate based on the control strategies that follow.
- I. Hand Control (HC)
  - 1. Provide panel face HC to match the control requirements at the appropriate TCP for all mixed air damper controls.
  - 2. Clearly and permanently identify the system served by the control.
  - 3. Provide the control with the capability to set the outside air damper, return air damper and exhaust air damper for minimum outside air damper positions from 0 –100% outside air.
- J. Manual Control of Dampers
  - 1. Provide a manual means of damper operation for use during commissioning of HVAC systems and in the event of DDC failure.
  - 2. Provide override of dampers, either at the actuator or in the associated TCP
- K. DDC Alarms
  - 1. Provide all DDC points with programmable alarms and alarm messages.
  - 2. Provide any alarm capable of being easily assigned visual or visual and audible annunciation. Initially, provide all alarms with visual and audible alarm annunciation.

3. Provide a minimum message for each DDC point alarm that includes
  - a. The point ID number
  - b. The English point name
  - c. The type of alarm (refer to Points List for alarm types)

L. Air Flow Status

1. Airflow status is provided by current switches located in the TCP for 120-volt motors and in the MCC for 3-phase motor.
  - a. Coordinate with the test and balance work performed in Section 15950 – Testing, Adjusting and Balancing to properly set the upper and lower operating current ranges of normal operation.
  - b. Use the work performed in Item “a” to determine improper airflow settings.

M. The HVAC equipment and Chimney Automation System local control panels shall communicate to the HVAC DDC system via one of the following:

1. Mutually compatible digital communication links.
2. Fully configured gateway.
3. Dedicated interface panel.

N. Division 15 is responsible for the coordination of all control connections.

O. Sequence of Operation Controls Submittal Requirements

1. Organize the submitted in the following order:
  - a. By Building ID letter and Name
  - b. By TCP ID number
  - c. By system
2. Indicate whether the system is DDC or conventional controls
3. Submit specific sequences for all equipment.
4. Include DDC point identification numbers applicable to sequence features as described in A. above.
5. Include summary of system type at start of each individual sequence, e.g., 2 speed- 100% Outdoor Air, etc.

P. Fan Interlocks

1. Include interlock schedules with control submittals organized separately for the Building, TCP and System Sequences of Operation with which they are associated.
2. Where a unit is shown interlocked to a space temperature sensor, indicate the sensor ID Number in Control Submittals. Units controlled by space sensors typically require a make up (outdoor) air damper or dampers to open. Also indicate in the damper ID Numbers in Control Submittals
3. Interlock starting of 100 percent outdoor air HVUs, RTUs and ACUs to their outdoor air damper position limit switch.
4. Interlock starting of exhaust air fans with two position motorized exhaust air dampers to the damper end position limit switches.

Q. Fan Hard Wired Control Logic

1. The local stop/Lock shall stop fan at all times.
2. Normal fan operation may be inhibited by the Fire Alarm Control Panel and overridden by the Purge Station Panel as described in succeeding sections.
3. Provide an isolated relay to signal the MCC to "Run" the fan. Provide isolated contacts in the MCC connected to the TCP for motor "RUN" and "OFF" status.
4. Provide each fan with a Hand Off Auto (HOA) selector switch mounted on the TCP. In the Hand position, the fan shall operate as described herein. In the Off position the fan shall stop. In the Auto position, the fan shall operate as described herein when directed by the DDC system's isolated dry "run" contact.
5. To operate three phase fans, the following logic shall be executed:
  - a. Open outside air damper fully for 100 percent outside air units.
  - b. Open exhaust air damper fully for exhaust fans with motor operated dampers.
  - c. When all associated dampers are proved in the proper position, send the run signal to the MCC.

6. Provide the following signals to the DDC system for three phase fans:
  - a. "O/L" failure signal from MCC
  - b. "Auto" from HOA
  - c. "Running" signal from motor starter
  - d. "Off" signal from motor starter
7. Provide the following signals to the DDC system for single phase fans:
  - a. "Running" signal from motor starter
8. Accept the "RUN" signal from the DDC system.

R. Fire Alarm Control Panel (FACP) Hard Wired Control

1. FSD-INTAKE-ACU-01-ACU-030ACU-02-HVU-01: The Fire Alarm Control Panel (FACP) shall provide a contact closure signal at the TCP. Interlock such that all of the associated fans (ACU-01, ACU-02, ACU-03, and HVU-01) will stop regardless of whether the fans are running in HAND or AUTO mode
  - a. Upon receipt of contact closure from the FACP, the following hard-wired logic shall be executed:
    - (1) Provide a latching relay with reset push button (PB) and FACP indicator light on the front of the TCP indicating FACP FAN SHUTDOWN. Wire a dry contact from the latching relay as a Digital Input (DI) signal to the DDC system.
    - (2) Unless overridden by the Purge Station Panel (PSP), upon receipt of the contact closure signal, remove fan "Run" contact and perform the following:
      - (a) Close outside air damper through relay logic if applicable.
      - (b) Close all combination fire and smoke dampers (FSDs) associated with fans. Associated FSD identification tags on drawings include the fan system identification of the fans with which the FSDs are associated.
      - (c) When the FACP contact closure is removed at the FACP and manually reset at the TCP, the TCP will resume control of fans unless other interlocks prevent operation and open FSDs.
2. FSD-INTAKE-01-A: FACP shall provide a contact closure signal at the TCP upon FSD-INTAKE-01-A's associated duct smoke detector activation.

The TCP shall be hard-wired to close the FSD upon receipt of the contact closure from FACP at the TCP.

3. FSD Control - General: FACP shall provide a contact closure signal at the TCP for fan shut down when smoke is sensed at associated duct smoke detector. Interlock such that the fan will stop regardless of whether the fan is running in HAND or AUTO mode.
  - a. Upon receipt of contact closure from the FACP, the following hard-wired logic shall be executed:
    - (1) Provide a latching relay with reset push button (PB) and FACP indicator light on the front of the TCP indicating FACP FAN SHUTDOWN. Wire a dry contact from the latching relay as a Digital Input (DI) signal to the DDC system.
    - (2) Unless overridden by the Purge Station Panel (PSP), upon receipt of the "Stop" signal remove "Run" contact and perform the following:
      - (a) Close outside air damper through relay logic if applicable.
      - (b) Close all FSDs associated with fan. Associated FSD identification tags on drawings include the fan system identification of the fan with which the FSDs are associated.
      - (c) When the FACP contact closure is removed at the FACP and manually reset at the TCP, the TCP will resume fan control unless other interlocks prevent operation and open FSDs.

S. Purge Station Panel (PSP) Hard Wired Control

1. The Purge Station Panel (PSP) shall provide an individual "Run" dry contact closure for each fan at the TCP and accept a 120 volt signal from each fan to illuminate a pilot light on its panel face to indicate that the fan is running. Provide under the Electrical Contract the PSP and wiring between it and the TCP.
2. Upon receipt of a "Run" dry contact closure from the PSP, the following hard wired logic shall be executed:
  - a. Provide an auxiliary relay and use a dry contact as a Digital Input (DI) signal to the DDC system.

- b. Operate the fan as described under section "Fan Hard Wired Control Logic".
- c. When any mixed air HVU, RTU or ACU is commanded on by the PSP, relay logic shall cause the normal damper control strategies to be overridden. Upon receiving this signal, mixed air HVUs, RTUs and ACUs shall operate with outdoor and exhaust air dampers open: return air dampers closed. After the PSP signal is removed, dampers shall revert to automatic control by the TCP.
- d. Open combination fire and smoke dampers fully at the 2-Hr and above fire rated walls.
- e. When operating from PSP override, send 120-volt signal to Purge Station Panel to energize the fan's associated "Running" light at the Purge Station Panel. The 120-volt signal to be generated only when the fan is running in "Purge" mode.
- f. When the PSP "Run" signal is cleared, the fan will resume TCP control unless other interlocks prevent operation.

T. Single Phase Motor Control

- 1. All single phase fan motor controls and motor starters are located in the TCP associated with the motors and are provided and installed under this contract.
- 2. To operate single phase fans, the following logic shall be executed:
  - a. Send 120-volt power from contactor in TCP.

3.04 SEQUENCES OF OPERATION

- A. Damper Control Positions: (1) Normal positions of control dampers must be the position the dampers return to on power failure or when its associated fan is not operating. (2) Operating positions of control dampers are the minimum outside air positions for ventilation requirements when its associated fan is operating. Refer to equipment schedules for minimum outside air requirements. Dampers can also modulate if required by the temperature control strategy. Include all interlocks and safeties.
  - 1. Provide Normal positions as follows:
    - a. Outside air damper (F-BBB-XX-D1): Closed
    - b. Return air damper (F-BBB-XX-D2): Open
    - c. Exhaust fan damper (F-BBB-XX-D3): Closed

2. Provide Mixed Air Operating positions as follows:
  - a. Outside air damper (F-BBB-XX-D1): Modulate to minimum position setpoint at TCP (HC)
  - b. Return air damper (F-BBB-XX-D2): Modulate to maximum position
  - c. Exhaust air damper (F-BBB-XX-D3): Modulate to match outside air damper position
3. Provide Two Position Operating positions as follows:
  - a. Outside air damper (F-BBB-XX-D1): Move to minimum position setpoint at TCP (HC)
  - b. Return air damper (F-BBB-XX-D2): Move to maximum position
  - c. Exhaust air damper (F-BBB-XX-D3): Move to match outside air damper position
- B. Air Filter Alarm: Provide a dirty air filter alarm through a differential pressure switch when its setpoint exceeds .3" W.C. to the TCP for the HVUs, RTUs and ACUs.
- C. Air Cooled Condenser (ACC): Provide on the front of the TCP a red run IL for each ACC.
- D. Hard Wired Control Logic applies to all equipment. Provide the following:
  1. Local Stop/Lock control at each piece of equipment.
  2. Hard wired controls to operate all equipment in the event of a DDC failure.
  3. Inhibit normal equipment operation by the Fire Alarm Control Panel (FACP) as described in the succeeding sections.
  4. Override the FACP equipment shutdown and other controls by the PSP as described in succeeding sections.
  5. Interlocks, safeties, permissives, switches and indicator lights as shown and as specified.
  6. Hard wired control logic that is contained within the TCP and controls related equipment.

7. Mount the following on the TCP face: Hand Switches (HS), Hand Control (HC), Hand/Off/Auto Switches (HOA), Push Buttons (PB), and Indicating Lights (IL).
  8. Includes, but is not limited to, except as modified by the individual sequences of operation:
    - a. Fire Alarm Control Panel (FACP)
    - b. Purge Station Panel (PSP)
    - c. Damper end switch control for each fan specified or shown with an associated two position damper such that if the damper fails to open the fan will not start except as otherwise specified. Provide an alarm in the DDC system and displayed on the OIT when the fan is called upon to run and the damper fails to open.
    - d. HOA switch for each fan with an associated two-position damper for 100 percent outside air units with motor operated dampers.
    - e. HOA switch for each fan with an associated motor operated modulating damper.
    - f. HOA switch for all equipment except for the fans indicated above.
- E. Control Strategy 001 Area Served: Locker Rooms and Toilets (F-ACU-01, F-ACC-01 AND F-EAF-13) (TCP) (100% O.A.)
1. Description: F-ACU-01 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.
    - a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.
    - b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.
    - c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.

## 2. Hard-wired Interlocks

### a. F-ACU-01 operates as follows:

- (1) Starting the fan: When the associated dampers are proved open by the damper end switch, start fan.
- (2) Stopping the fan: Stop the fan and close the associated dampers.

### b. Interlock Exhaust fan F-EAF-13 to operate when F-ACU-01 is operating and each HOA switch is in the AUTO position.

- (1) Starting the fan: When the associated dampers are proved open by the damper end switch, start fan.
- (2) Stopping the fan: Stop the fan and close the associated dampers.

## 3. Temperature Control

### a. F-ACU-01 operates as follows:

- (1) The supply fan operates continuously in occupied mode.
- (2) The supply fan operates on and off based on room temperature in the unoccupied mode.

### b. Cooling: When F-ACU-01 is operating, stage F-ACC-01 to maintain setpoint.

### c. Heating: When F-ACU-01 is operating, modulate the gas burner to maintain setpoint.

## F. Control Strategy 002 Area Served: Lunch Room and Offices (F-ACU-02, F-ACC-02, F-RHC-02, F-RHC-06 AND F-RAF-04) (TCP) (Mixed Air Economizer).

### 1. Description: F-ACU-02 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.

- a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.
- b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.

- c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.
- 2. Hard Wired Control
  - a. Interlock Return Air fan F-RAF-04 to operate when F-ACU-02 is operating and each HOA switch is in the AUTO position.
- 3. Temperature Control
  - a. F-ACU-02 operates as follows:
    - (1) The supply fan operates continuously in occupied mode.
    - (2) The supply fan operates on and off based on room temperature in unoccupied mode.
  - b. Cooling: As room temperature rises above the cooling setpoint, modulate the dampers to maintain the cooling setpoint. When the outside air temperature rises above 70°F close the dampers to the minimum outside air position. On a continued rise of room air temperature above the cooling setpoint return the dampers to their minimum outside air position and cycle F-ACC-02 on and off to maintain the setpoint.
  - c. Heating: On a fall in room temperature, modulate the dampers until the room temperature is below the cooling setpoint. Return the dampers to their minimum outside air position and as the room temperature falls below the heating setpoint, modulate the gas burner to maintain setpoint.
- 4. Reheat Coil F-RHC-02, -06 - Offices - [Conventional Controls]
  - a. Room temperature thermostats controls the electric reheat coils to maintain space temperature due to varying room load.
- G. Control Strategy 003 Area Served: Corridors (F-ACU-03, F-ACC-03 AND F-RAF-05) (TCP) (Mixed Air Economizer).
  - 1. Description: F-ACU-03 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.
    - a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.

- b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.
  - c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.
- 2. Hard Wired Control
  - a. Interlock Return Air fan F-RAF-05 to operate when F-ACU-03 is operating and each HOA switch is in the AUTO position.
- 3. Temperature Control
  - a. F-ACU-03 operates as follows:
    - (1) The supply fan operates continuously in occupied mode.
    - (2) The supply fan operates on and off based on room temperature in unoccupied mode.
  - b. Cooling: As room temperature rises above the cooling setpoint, modulate the dampers to maintain the cooling setpoint. When the outside air temperature rises above 70°F close the dampers to the minimum outside air position. On a continued rise of room air temperature above the cooling setpoint return the dampers to their minimum outside air position and cycle F-ACC-03 on and off to maintain the setpoint.
  - c. Heating: On a fall in room temperature, modulate the dampers until the room temperature is below the cooling setpoint. Return the dampers to their minimum outside air position and as the room temperature falls below the heating setpoint, modulate the gas burner to maintain setpoint.
- H. Control Strategy 004 Area Served: Security Room (F-ACU-04 and F-RHC-01) (TCP) (Mixed Air)
  - 1. General: Provide factory or field installed wired unit communications controls that interface with the DDC system. Provide any miscellaneous interlock or field device mounting, power and wiring to unit provided DDC control panel.
  - 2. Description: F-ACU-04 and its Conventional Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows:

- a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.
  - b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.
  - c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.
3. Provide a Heat-Cool-Fan-Auto-On (HCFAO) switch on the thermostat.
  - a. Heat: Thermostat controls heating to maintain heat setpoint.
  - b. Cool: Thermostat controls F-ACU-04 to maintain cooling setpoint.
  - c. Fan
    - (1) Auto: Thermostat automatically switches between heat and cool modes as required to maintain room temperature.
    - (2) On: Fan runs continuously.
4. Fan Start/Stop
  - a. Provide an Off-Auto (OA) Switch in the TCP. Off-Auto switch selects local control of the supply fan.
  - b. Off: The fan will not operate. Neither heat nor cool cycles operate.
  - c. Auto: The fan starts and stops under DDC command by the operator or when heating/cooling cycles are activated.
5. Temperature Control
  - a. F-ACU-04 operates as follows:
    - (1) The supply fan operates continuously in occupied mode.
    - (2) The supply fan operates on and off based on room temperature in unoccupied mode.
  - b. Cooling: When F-ACU-04 is operating, cycle cooling to maintain setpoint.
  - c. Heating: When F-ACU-04 is operating, stage the electric heater to maintain setpoint.

- d. Provide means controlling the electric heater and F-ACU-04 manually in the event of failure.
- I. Control Strategy 005: Area Served: Operation Room, Maintenance Office and Secured Storage (F-ACU-05, F-ACC-05, F-RAF-01, F-RHC-03 and F-EAF-12) (TCP) (Mixed Air Economizer)
1. General: Provide factory or field installed wired unit communications controls that interface with the DDC system. Provide any miscellaneous interlock or field device mounting, power and wiring to unit provided DDC control panel.
  2. Description: F-ACU-05 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.
    - a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.
    - b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.
    - c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.
  3. Hard Wired Control: Interlock Return Air fan F-RAF-01 and F-EAF-12 to operate when F-ACU-05 is operating and each HOA switch is in the AUTO position.
  4. Fan Start/Stop
    - a. Provide an Off-Auto (OA) Switch in the TCP. Off-Auto switch selects local or DDC control of the supply fan.
    - b. Off: The fan will not operate.
    - c. Auto: The fan starts and stops under DDC command by the operator or when heating/cooling cycles are activated.
  5. Heating/Cooling/Fan Mode
    - a. Heat-Cool-Off-Auto (HCOA) Switch: Provide HCOA switch on the thermostat. HCOA switch selects unit mode operation.

- b. Fan On-Auto Switch: Thermostat selects FAN always On or Auto mode operation.
6. Temperature Control
- a. F-ACU-05 operates as follows:
    - (1) The supply fan operates continuously in occupied mode.
    - (2) The supply fan operates on and off based on room temperature in unoccupied mode.
  - b. Cooling: As room temperature rises above the cooling setpoint, modulate the dampers to maintain the cooling setpoint. When the outside air temperature rises above 70°F close the dampers to the minimum outside air position. On a continued rise of room air temperature above the cooling setpoint return the dampers to their minimum outside air position and cycle ACC on and off to maintain the setpoint.
  - c. Heating: On a fall in room temperature, modulate the dampers until the room temperature is below the cooling setpoint. Return the dampers to their minimum outside air position and as the room temperature falls below the heating setpoint, stage the electric heater to maintain setpoint.
  - d. Provide means controlling the electric heater and F-ACU-05 manually in the event of DDC failure.
  - e. Reheat Coil – Maintenance Office: A room thermostat controls the electric reheat coil to maintain space temperature due to varying room load.
- J. Control Strategy 006: Area Served: - Foreman's Office (F-RTU-01 and F-RAF-02 and F-EAF-11) (TCP) (Mixed Air)
- 1. General: Provide factory or field installed wired unit communications controls that interface with the DDC system. Provide any miscellaneous interlock or field device mounting, power and wiring to unit provided DDC control panel.
  - 2. Description: F-RTU-01 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows:

- a. Occupied mode normal air space setpoints are 70°F heating and 75°F cooling.
  - b. Unoccupied mode normal air space setpoints are 68°F heating and 82°F cooling.
  - c. Provide occupied and unoccupied control by the operator through the DDC or under the DDC time scheduling program.
3. Hard Wired Control: Interlock Return Air fan F-RAF-02 and F-EAF-11 to operate when F-RTU-02 is operating and each HOA switch is in the AUTO position.
4. Fan Start/Stop
  - a. Provide an Off-Auto (OA) Switch in the TCP. Off-Auto switch selects local or DDC control of the supply fan.
  - b. Off: The fan will not operate.
  - c. Auto: The fan starts and stops under DDC command by the operator or when heating/cooling cycles are activated.
5. Heating/Cooling/Fan Mode
  - a. Heat-Cool-Off-Auto (HCOA) Switch: Provide HCOA switch on the thermostat. HCOA switch selects unit mode operation.
  - b. Fan On-Auto Switch: Thermostat selects FAN always On or Auto mode operation.
6. Temperature Control
  - a. F-RTU-02 operates as follows:
    - (1) The F-RTU-02 supply fan operates continuously in occupied mode.
    - (2) The F-RTU-02 supply fan operates on and off based on room temperature in the unoccupied mode.
  - b. Cooling: When F-RTU-02 is operating, cycle cooling to maintain setpoint.
  - c. Heating: When F-RTU-02 is operating, operate the electric heater to maintain setpoint.

- d. Provide means controlling the electric heater and F-RTU-02 manually in the event of DDC failure.
- K. Control Strategy 007: Area Served: Service Rooms (F-HVU-01, F-RCH-04 and F-RAF-06) (TCP) (Mixed Air)
- 1. Description: F-HVU-01 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.
    - a. Normal operation air space setpoints are 65°F Winter and 76°F Summer.
    - 2. Hard Wired Control: Interlock Return Air fan F-RAF-06 to operate when F-HVU-01 is operating and each HOA switch is in the AUTO position.
    - 3. Temperature Control
      - a. F-HVU-01 supply fan operates as follows:
        - (1) The supply fan operates continuously.
        - (2) When the supply fan is not operating the dampers are at their normal positions.
      - b. Ambient Cooling: As room temperature rises above the cooling setpoint, modulate the dampers to maintain the cooling setpoint.
      - c. Heating: On a fall in room temperature, modulate the dampers until the room temperature is below the cooling setpoint. Return the dampers to their minimum outside air position and as the room temperature falls below the heating setpoint, modulate the gas burner to maintain setpoint.
      - d. Reheat Coil - Machine Shop: A room thermostat controls the electric reheat coil to maintain space temperature due to varying room load.
- L. Control Strategy 008: Area Served: Vehicle Maintenance (F-HVU-02 and F-EAF-16) (TCP) (100% O.A.)
- 1. Description: F-HVU-02 and its DDC Control Systems maintain space temperature. Display equipment alarms and system status through the Operator's Interface Terminal (OIT) in the Temperature Control Panel (TCP) and as scheduled to the SCADA system. The system's operation, equipment and control are as follows.

- a. Normal operating air space setpoints are 50°F Winter and 104°F Summer.
- 2. Hard Wired Interlocks
  - a. F-HVU-02 operates as follows:
    - (1) Starting the fan: When associated dampers are proved open by the damper end switch, start fan.
    - (2) Stopping the fan: Stop the fan and close the associated dampers.
  - b. Interlock exhaust fan F-EAF-16 to operate when F-HVU-02 is operating and each HOA switch is in the AUTO position.
    - (1) Starting the fan: When associated dampers are proved open by the damper end switch, start fan.
    - (2) Stopping the fan: Stop the fan and close the associated dampers.
- 3. Temperature Control
  - a. F-HVU-02 supply fan operates as follows:
    - (1) The supply fan operates continuously.
    - (2) When the supply fan is not operating the dampers are at their normal positions.
  - b. Heating: When F-HVU-02 is operating, modulate the gas burner to maintain setpoint.
- M. Control Strategy 009: Area Served: Electrical Room 2 F-SAF-09 and F-EAF-09)
  - 1. Hard Wired Interlocks
    - a. Supply fan F-SAF-09
      - (1) Starting the fan: When the associated dampers are proved open by the damper end switch, start fan.
      - (2) Stopping the fan: Stop the fan and close the associated dampers.
    - b. Interlock Exhaust fan F-EAF-09 to operate when F-SAF-09 is operating and each HOA switch is in the AUTO position.

2. Fan Start/Stop
    - a. HOA Switch: Provide an HOA switch for each fan on the face of TCP. The HOA switch selects local or DDC control of each fan.
    - b. Hand: The fan runs continuously.
    - c. Off: The fan does not run.
    - d. Auto: The fan starts and stops under DDC command by the operator or DDC programmed temperature control.
  3. Temperature Control- [Conventional Controls]: When the space temperature reaches 90°F, both supply and exhaust fans run.
- N. Control Strategy 010: Area Served: Electrical Room 1 (F-SAF-10 and F-EAF-10) (2-Speed Fans)
1. Hard Wired Interlocks
    - a. F-SAF-10 supply fan operates as follows:
      - (1) Starting the fan: When the associated dampers are proved open by the damper end switch, start fan.
      - (2) Stopping the fan: Stop the fan and close the associated dampers.
    - b. Interlock Exhaust fan F-EAF-10 to operate when F-SAF-10 is operating and each HOA switch is in the AUTO position.
      - (1) Starting the fan: When the associated dampers are proved open by the damper end switch, start fan.
      - (2) Stopping the fan: Stop the fan and close the associated dampers.
  2. Fan Start/Stop
    - a. HOA Switch: Provide an HOA switch for each fan on the face of TCP. The HOA switch selects local or DDC control of each fan.
    - b. Hand: The fan runs continuously.
    - c. Off: The fan does not run.
    - d. Auto: The fan starts and stops under DDC command by the operator or DDC programmed temperature control.

3. Temperature Control - [Conventional Controls]
  - a. When the space temperature is between 90°F and 100°F, both supply and exhaust fans run in low speed. When the space temperature is above 100°F, both supply and exhaust fans run in high speed.
- O. Control Strategy 011: Area Served: Unassigned Storage (F-SAF-15, F-RHC-05 and F-EAF-15) (TCP) (Mixed Air)
  1. Fan start/stop
    - a. HOA Switch: Provide HOA switches on the front of the TCP for each supply and exhaust fan. Select local or DDC control of each exhaust and supply fan with the HOA switch.
    - b. Hand: The fan runs continuously.
    - c. Off: The fan does not run.
    - d. Auto: The fan starts and stops under DDC command by the operator or DDC programmed temperature control.
  2. Hard Wired Control: Hard wire the exhaust fan F-EAF-15 to operate when F-SAF-15 is operating and each HOA switch is in the AUTO position.
  3. Temperature Control - [Conventional Controls]: Both supply and exhaust fans run continuously.
  4. Reheat Coil – Unassigned Storage [Conventional Controls]:
    - a. A room temperature thermostat controls the electric reheat coil to maintain space temperature due to varying room load.
- P. Radiant Heaters - [Conventional Controls]: Space mounted electric thermostat cycles for heat. On a call for heat the heater ignition sequence begins. Heater operates to maintain setpoint of 50°F adjustable.
- Q. F-ECV-01 through 07 - Convectors - [Conventional Controls]: Unit mounted thermostat controls are integral with convector. Thermostats control setpoint temperatures of 70°F.
- R. A-EUH-01 through 06 - Unit Heaters - [Conventional Controls]: Unit mounted electric thermostat cycles unit fan to maintain space temperature setpoint of 50°F.

- S. Chimney Automation System: Refer to Section 15551 – Chimney Automation system.

1. Provide alarm from the Chimney Automation Systems control panel to the DDC system. Display alarm on the OIT.

### 3.05 SCADA INTERFACE

- A. Parallel all alarm conditions (TCP) identified as (1) on the DDC points list and provide single contact closure to extend indication (HVAC ALARM/ A Station) to SCADA. Contacts shall be SPDT rated at 5A at 120 volts.

### 3.06 DDC POINTS LIST

- A. List begins at the end of Section

### 3.07 FIELD QUALITY CONTROL

- A. Field Instrument Calibration Requirements: Provide DDC system instrument calibration as follows:

1. Provide the services of experienced instrumentation technicians to field calibrate each instrument to its specified accuracy in accordance with the manufacturer's specification and instructions for calibration.
2. Each instrument to be calibrated at 10, 50 and 90% of span using test instruments to simulate inputs and read outputs. Test instruments to be rated to an accuracy of at least five (5) times greater than the specified accuracy of the instrument being calibrated. Where applicable, such test instruments to have accuracies as set forth by the National Bureau of Standards.
3. Provide a written calibration sheet to the City of New York for each field instrument, certifying that it has been calibrated to its specified accuracy. Submit proposal calibration sheets for various types of instruments for City of New York approval prior to the start of calibration. This sheet to include but not be limited to date, instrument tag numbers, calibration data and name of person performing the calibration, calibration, calibration reading as finally adjusted. Maintain a log for all calibrated instruments.
4. Maintain a log for all calibration data for all field and panel instruments. Provide instrument calibration data sheets with the following information:
  - a. Tag Number
  - b. Range
  - c. Span
  - d. Setpoint Range & Setpoint
  - e. Proportional Band Setting
  - f. Integral Setting

- g. Derivative Setting
- h. Remarks (Special Comments)

- B. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1.
- C. Training: Provide training to the operating personnel in the operation and maintenance of the temperature control system as required by Section 01821 - Training and as follows:
  - 1. Provide basic operator training for data display, alarm and status descriptors, requesting data, execution of commands and request of logs.
  - 2. Provide on-site hands-on operator instruction to the operating personnel, during system commissioning and at such time that acceptable performance of the DDC hardware and software has been established.
  - 3. Provide operator instruction at an agreed upon time, during normal working hours by competent representatives familiar with the computer's software, hardware and accessories.
  - 4. Provide operator orientation of the DDC system which includes, but is not limited to, the overall operational program, equipment functions both individually and as part of the total integrated system, commands, advisories, and appropriate operator intervention required in responding to the system's operation.
- D. Tests: After installation of the equipment, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions.
  - 1. Perform prefinal inspection/test as follows:
    - a. Carry out test with controls operating as near as possible to service conditions.
    - b. Correct all defects in the controls.
  - 2. Final Inspection/Test
    - a. Prior to the acceptance test, completely adjust and operate properly all controls.

- b. Notify the Commissioner when the installation is ready for acceptance tests. At least two weeks prior to scheduled acceptance tests, deliver copies of record internal panel layouts and detailed schematic and wiring diagrams to the Commissioner. At the acceptance test, demonstrate the complete functions and proper operation of each control system to the Commissioner. Simulate conditions of off-season temperature and alarms as required for a complete demonstration.

-END OF SECTION-

**Section 15946**  
**AIR MONITORING**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for providing equipment, materials, labor and services for a complete air monitoring system including gas monitors, gas detectors, gas calibration equipment, audible and visual alarms, spare parts, interconnecting wiring and accessories as required for a complete air monitoring system as indicated.

**1.02 RELATED SPECIFICATIONS**

- A. Section 09911 - Exterior Painting
- B. Section 09912 - Interior Painting
- C. Section 15900 - HVAC Controls
- D. Section 17600 - SCADA System - Control Strategies
- E. Division 16 - Electrical

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. ANSI MC 85.1M - Terminology for Automatic Control
  - 2. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
  - 3. NEC - National Electrical Code

**1.04 SYSTEM DESCRIPTION**

- A. Design Requirements: Provide a central air monitoring system capable of continuously detecting and monitoring ambient air for carbon monoxide, and nitrogen dioxide at multiple remote locations, as shown, using a programmable micro-processor based unit with multi channels of communications to remote gas sensor/transmitters designed to measure gas concentrations.
- B. Provide a multi-channel monitoring system with multiple transmitters each, capable of displaying gas concentration values and providing remote warning, alarm and control signals for each gas monitored.

**1.05 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.

- B. Product Data and Information: Submit catalog data for the gas monitors, gas sensor units, alarms and gas calibration equipment.
- C. Shop Drawings: Submit Shop Drawings for the air monitoring system including arrangement of all equipment and controls, panel dimensions, mounting, schematic control diagrams, wiring diagrams, identified terminals for external wiring, complete description of the monitoring system, and a materials list.
- D. Revisions: Revise shop drawings to reflect actual installation and operating sequence and submit these as Project Record Documents.
- E. Operation and Maintenance Manuals: Submit Operation and Maintenance Data in an Operation and Maintenance Manual as specified in Section 01831 including interconnection wiring diagrams complete for field installed system with identified and numbered system components and devices. Also, include inspection period, cleaning methods, cleaning materials recommended, and calibration tolerances.

#### 1.06 QUALITY ASSURANCE

- A. Manufacturer: Provide products from a company specializing in manufacturing the products specified in this Section with minimum 3 years documented experience.
- B. Installer: Use a company specializing in installing equipment specified in this Section approved by the manufacturer.
- C. Start Up: Start up to include testing and calibration of each sensing unit installed according to manufacture's recommendations.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.
- B. Handling: Handle air monitoring equipment and accessories carefully to prevent damage. Do not install damaged equipment or accessories. Replace damaged equipment with new.
- C. Storage and Protection: Store air monitoring equipment and accessories in a clean dry place. Protect from weather dirt, construction debris, and physical damage.

#### 1.08 COORDINATION

- A. General: Coordinate Work in accordance with the requirements contained in Division 1.
- B. Other Components: Furnish installation of components complementary to the installation of similar components in other systems. Coordinate installation of system components with installation of mechanical systems and controls.

## 1.09 SPARE PARTS

- A. General: Provide spare parts according to the following table:

<u>Gas Monitors Installed</u>	<u>Spare Parts</u>
1-2	One control module
<u>Sensing Heads - Each Type Installed</u>	<u>Required - Each Gas Monitored</u>
1-10 Class 1 Div 1 Group B,C,D	One sensor head assembly
1-10 All Types	One calibration gas cylinder

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
- B. Air Monitoring Equipment
1. Mine Safety Appliances Company
  2. Vulcain Inc.
- C. Gas Monitor
1. Mine Safety Appliances Co. - (5000 Series)
  2. Vulcain Inc.
- D. Gas Sensor Units
1. Mine Safety Appliances Company
  2. Vulcain Inc.
- E. Gas Calibration Equipment
1. Mine Safety Appliances Co.
  2. Vulcain Inc.
- F. Alarm Horn, Nonexplosion-proof
1. Edwards - Model 5531

## G. Alarm Light, Nonexplosion-proof

1. Federal Signal Corp. - Model 225XL-120-240F light with a Model LWM B2 aluminum mounting bracket

## 2.02 MATERIALS

- A. General: Have a single supplier provide air monitoring components in one or more prefabricated gas monitor cabinets, gas sensors, audible and visual alarms, gas calibration equipment and spare parts for the air monitoring system; provide complete wiring diagrams; make equipment calibration and adjustment; supervise the system installation and guarantee all components. Furnish and install detector assemblies and analyzers with required accessories and appurtenances.
- B. Design: Provide the monitoring system to operate on the catalytic oxidation principle or the electro-chemical principle.
- C. Provide the air monitoring system to measure and display the gas concentration and provide audible and visual alarms when preset limits are exceeded. Provide relay outputs for alarms and analog signals representing gas concentrations.
- D. Provide the system consisting of a pre-configured multi channel gas monitor with separate gas sensor/transmitter units, audible/visual alarms for each point, gas calibration equipment and interconnecting wiring. Provide gas sensor units capable of being located remote from the control module by up to 2000 feet. Provide gas sensor units which receive power from and send signals corresponding to gas values to the gas monitor.
- E. Provide the gas monitor to be microprocessor based and compatible with all of the gas sensors of the same manufacturer to detect toxic gases. Provide the gas monitor with a digital display and two adjustable alarm levels: warning and alarm. Provide each point having alarm relays for each alarm level as specified.
- F. When an alarm is energized, the air monitoring system shall operate the alarm system. Furnish the necessary relays and auxiliary contacts to provide remote alarms and the operation of the ventilation equipment. Gas transmitters or sensors must contain 4-20mA output.
- G. Design gas monitoring equipment for the atmospheres and conditions in which it will be installed. Provide Class 1 Div 1 Group B, C, D Enclosures for transmitter/sensors with the ability to remote sensing technology from transmitter portion and capable of remote calibration of remote sensor.
- H. Provide gas monitors and gas detector assemblies that are approved by Factory Mutual Engineering Corporation or the Canadian Standards Association and NYC Buildings Department MEA

- I. Provide electrical conduit and wiring between the air monitoring system components, including alarms.
- J. Wiring and conduit between the gas monitoring system panel for alarm connection to the SCADA system and operation of the ventilation system.
- K. Power wiring to the gas monitor panel.
- L. Provide electrical wiring, and conduit required in accordance with Division 16 and the approved wiring diagrams.
- M. Provide the number and type of monitoring points as follows:

<u>Gas</u>	<u>Range/Full Scale</u>	<u>No. of Points</u>
Carbon Monoxide (CO)	0-500 ppm	8/station
Nitrogen Dioxide (NO <sub>2</sub> )	0-5 ppm	8/station

## 2.03 GAS MONITOR

- A. General: Provide a gas monitor of the enclosed wall mount type in general purpose NEMA 12 enclosure.
- B. Access: Provide access to the inside of the enclosure, monitor front panel, and wiring connections through a hinged, front facing, full length door.
- C. Access Door: Provide the door with a shatterproof window of sufficient size to allow the viewing of all meters and alarm indicating lights.
- D. Wiring Connections: Mark all wiring connections with functional designations such that connections can be made without the use of diagrams or tables. Provide all connections easily accessible from the front.
- E. External Controls: Provide an external sealed switch to allow for alarm reset and audible alarm silencing without opening the enclosure.
- F. Readout Display: Provide an alphanumeric display to display the value of each sensor and keypad for navigation.
- G. Visual Alarm Indicators: Furnish separate indicating lights for Caution Warning and Alarm for each gas sensor. Use color coded lights.
- H. Alarm Set Point Levels: Provide three separate alarm set point levels for each sensor which are independently adjustable for any value within the readout range. Arrange the set points to provide drive signals to the user interface relays. Supply at least two of the three alarm set points per sensor with the capability of providing the user a selection of latching or nonlatching mode.

- I. Relay Outputs: Have the alarm set point drive signals activate user relays as follows:
  - 1. Number of Relays - Furnish the necessary relays and auxiliary contacts to provide remote alarms and operate the ventilation system. As a minimum, provide relays for each WARNING level and ALARM level for each monitored gas in each monitored space. As a minimum, provide two relays for each set point level for every multiple of six sensors.
  - 2. Time Delay - To prevent chatter or control oscillation provide at least half the relays capable of being programmed to provide reset time delay when the relay is used in the nonlatching mode. Provide a time delay of up to 15 minutes.
  - 3. Set point Drive Deselect - Provide switches or keypad with security code to allow the user to deselect a set point drive signal from activating a relay.
  - 4. Contact Rating - Provide all relays as Form C dry contact, double pole, double-throw. Rate contacts for 5 amps resistive at 120-volt ac.
  - 5. Contact Selection - Provide contacts capable of being selected normally open or normally closed.
- J. Malfunction Indication: Provide system trouble indication as follows:
  - 1. Trouble Relay - Provide a relay to indicate trouble when any of the following conditions exist.
    - a. System power loss
    - b. Signal loss from any sensor
    - c. 15 percent or greater under range
  - 2. Display Indication - Display a separate unique character on the readout display when an over range or greater than 10 percent under range condition exists.
- K. Audible Alarm: Provide an audible horn or buzzer when an alarm condition occurs.
- L. Output signals: Provide a 4-20 ma signal representing the gas concentration for each gas sensor in the system. Make the signal capable of driving a 250 ohm load.

M. Controls: Provide controls as follows:

1. Operating Modes and Parameters Selection - Accomplish the following selections by the use of a keypad or other means that do not involve the use of tools:
  - a. Display range value
  - b. Latching or nonlatching mode for at least two alarm set point drivers
  - c. Relay reset time delay
  - d. Deselect of alarm set point driving a relay
  - e. Removing any point from service
  - f. Increasing or decreasing alarm action
2. Front Panel Controls - Accomplish the following functions by using push button type controls readily accessible on the front panel:
  - a. Display of alarm set point level on the read out display described in subparagraph H.
  - b. Resetting any alarm set point
  - c. Temporary disabling any specific sensor from affecting the system
  - d. Silencing of audible alarm
  - e. Resetting any latching relay if alarm condition is cleared

N. System Power Requirements: Provide for system operation on 115-volt ac, 60 hertz. Do not exceed 200 VA per 10 system points.

O. Maximum System Maintenance Requirements: Design the system such that periodic sensor checking or actual adjustment of the sensor units can be accomplished by one person at the sensor unit location. Sensors calibration must not require opening the sensor enclosure or declassification of space. Sensors should require quarterly inspection and calibration..

P. UL Listing: Provide, as a minimum, the following parts of the system with UL approval.

1. All primary ac components including connectors
2. All user relays
3. All remote sensor unit enclosures

## 2.04 GAS SENSOR UNITS

- A. Sensor Configuration: Provide sensor/transmitters of the indicating (remote if required) type.
  - 1. Provide sensors of the non-intrusive type that do not require declassification of environment for the purpose of calibration. Provide sensors that do not require the opening of enclosure for purpose of calibration.
  - 2. Provide sensors/transmitters mounted in an epoxy coated conduit enclosure at elevation shown and specified.
- B. Gas Monitor to Sensor Unit Interconnection: Provide interconnect wiring, the sensor operating voltage and sensor signal in accordance with the following:
  - 1. Provide interconnect wiring as 2-wire shielded cable in conduit.
  - 2. To eliminate radio frequency interference and electromagnetic interference, provide the signal from the sensor to the monitor to be in digital format or frequency format.
  - 3. Do not exceed 24-volt dc for the voltage supplied to the sensor.
- C. Toxic Gas Sensors: Provide toxic gas sensors of the electrochemical type. Provide sensors which do not require the periodic addition of reagents.
- D. Sensing Element Useful Life: Provide sensing elements which have a minimum useful life of one year. Provide a replacement sensor at no charge for sensors that do not meet this minimum requirement within one year from the date of substantial completion.
- E. Sensing Element Remote Location: Sensing elements must be capable of remove location of up to 100 feet from transmitter body.
- F. Products
  - 1. MSA Series Ultima XIR sensor
  - 2. or approved equal

## 2.05 GAS CALIBRATION EQUIPMENT

- A. Calibration Kit: Provide a calibration kit for field checking the calibration of the gas detection systems. Provide kits which include a light weight carrying case, dispensing valve, regulator assembly and hose, test coils and necessary calibration gas cylinders for each type of gas monitored.

## 2.06 ALARM HORN - NONEXPLOSION-PROOF TYPE

- A. General: Provide the alarm horn as a solid state signaling device consisting of a multiple tone generator, audio amplifier and speaker. Provide an alarm capable of producing four different user selected audible output signals from a programmable tone generator with a priority tone selection capability. Use UL listed units.
- B. Electrical Requirements: Operate the signal from a 120-volt, 60 hertz, power supply and mount in accordance with the National Electric Code requirements.
- C. Signal Features: Provide the unit with the capability of accepting four different inputs without the addition of other housings or modules. Provide the four tones as field selectable by the City by using the miniature programming switches inside the unit. Provide the unit meeting the following requirements.
  - 1. A unit which requires changing tone modules to accomplish tone selection will not be acceptable.
  - 2. Provide one of the programmed tones as a priority, overriding tone.
  - 3. Provide a minimum of 13 tones to select from including: horn, warble, siren, vibrato, slow whoop, fast whoop, beep, stutter, chime, hi-lo, rapid siren, yeow and ding-dong.
  - 4. Provide audio amplifier portion of the signal unit with short circuit and overload protection as an integral part of the circuit design.
  - 5. Design the unit for heavy-duty use.
- D. Sound Level: Provide the signal unit from the factory with the sound level set at maximum output, but easily field adjustable for the required decibel level. Provide the speaker portion of the signal unit with a lateral position adjustment. Provide the unit meeting the following requirements.
  - 1. Supply the initial tone selection for any ALARM signal with a repeating rapid siren tone signal that varies from 600 to 1,250 hertz high to low tone at four cycles per second. This signal has priority over a WARNING alarm signal.
  - 2. Provide initial tone selection for any WARNING alarm as a repeating alternating high-low tone signal that varies from 780 to 600 hertz tones at 0.52 second intervals for each tone.

## 2.07 ALARM LIGHT

- A. Nonexplosion-Proof: Provide a nonexplosion-proof NEMA 4X rated, LED-type alarm light having 65 flashes per minute in a red double fresnel lens made of

shatter resistant polycarbonate dome with an anodized aluminum base for operation at 120-volt ac. Mount the light on a cast aluminum mounting bracket.

## 2.08 CARBON MONOXIDE AND NITROGEN DIOXIDE

A. General: Provide a carbon monoxide gas detection system to continuously monitor ambient air for carbon monoxide and nitrogen dioxide at locations as shown and as follows.

1. Provide a complete integrated system including a multi-channel gas monitor, gas sensors, audible and visual alarms, interconnecting wiring and calibration kit. Provide an independent monitoring channel for each gas sensor having a full scale range as specified.
2. Provide the carbon monoxide and nitrogen dioxide gas detection system to operate on the principle of electro conductivity. Provide detectors which are unaffected by ambient temperature in the range of -40 to 100 degrees F and relative humidity between 0 and 95 percent non condensing. Do not allow response time to exceed 90 seconds to 90 percent of step change.

### B. Alarms

1. Provide gas alarms for the following gas concentration alarm levels:
  - a. Carbon Monoxide WARNING level - 35 ppm
  - b. Carbon Monoxide ALARM level - 200 ppm
  - c. Nitrogen Dioxide WARNING level - 1 ppm
  - d. Nitrogen Dioxide ALARM level - 2 ppm
2. Provide the following circuits and alarms in response to a WARNING signal from the gas detectors:
  - a. Provide and activate a strobe light and horn (1st tone) alarm in the room.
  - b. Close a relay to operate the emergency ventilation system as shown in electrical drawings and report to SCADA system.
3. Provide the following circuits and alarms in response to an ALARM signal from the gas detectors:
  - a. Provide and activate a strobe light and horn (2nd tone) alarm in the room.
  - b. Provide and activate a strobe light alarm outside each entrance to the room.

- c. Close a relay to advise SCADA of the alarm and maintain the operation of the emergency ventilation system.

## PART 3 EXECUTION

### 3.01 INSPECTION

- A. General: Examine air monitoring systems components for damaged or missing parts. Examine areas and conditions for compliance with requirements for installation tolerances. Do not proceed until unsatisfactory conditions have been corrected.

### 3.02 INSTALLATION

- A. General: Install air monitoring equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1. Install equipment with required accessories and appurtenances. Locate gas monitors and gas sensors where shown.
- B. Electrical Wiring: Install electrical wiring including required conduit in accordance with Division 16 and the approved wiring diagrams.
- C. Conduit Openings: Caulk gas tight all conduit openings through walls separating the Monitored Area from adjacent areas of the facility in accordance with Division 16 Sections.
- D. Sensor Location: CO 5 feet off the floor and NO<sub>2</sub> 1-3 feet from top of ceiling.
- E. Alarms: Set alarms for the following levels of gas concentration:

Alarm Level	Alarm Set Point
Carbon Monoxide WARNING	35 ppm
Carbon Monoxide ALARM	200 ppm
Nitrogen Dioxide WARNING	1 ppm
Nitrogen Dioxide ALARM	2 ppm

### 3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Services: Furnish the services of a qualified representative of the manufacturer to provide instruction on proper installation of the equipment, inspect the completed installation, make any necessary adjustments, participate in the startup of the equipment, participate in the field testing of the equipment and place the equipment in trouble-free operation, as specified in Division 1. Provide a minimum of 8 hours of training.

- B. Tests: After installation of the air monitoring system, control equipment and all appurtenances, subject each unit to a field running test as specified in Division 1, under actual operating conditions and as follows:
1. Perform Prefinal Test as follows:
    - a. Calibrate equipment and set alarms.
    - b. Carry out test with the equipment operating as near as possible to service conditions.
    - c. Correct all defects in the equipment at no cost to the City of New York.
  2. Perform Final Test as follows:
    - a. Prior to the acceptance test, determine that all controls are completely adjusted and operating properly.
  3. Notify the Commissioner when the installation is ready for acceptance tests. At least 2 weeks prior to scheduled acceptance tests, deliver copies of records detailed schematic and wiring diagrams. Demonstrate at the acceptance test the complete functions and proper operation of the air monitoring system. Simulate conditions of gas concentration alarms as required for a complete demonstration.

-END OF SECTION-

**Section 15950**  
**TESTING, ADJUSTING AND BALANCING**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section Includes: Requirements for providing and installing the following:
  - 1. Testing, adjustment and balancing of air systems.
  - 2. Measurement of final operating conditions of HVAC systems.

**1.02 REFERENCES**

- A. Codes and standards referred to in this Section include:
  - 1. AABC - National Standards for Field Measurement and Instrumentation, Total System Balance.
  - 2. ASHRAE- Most Recent Systems Handbook: Chapter 57, Testing, Adjusting and Balancing.
  - 3. NEBB - Procedural Standards for Testing, Balancing and Adjusting of Environmental Systems.

**1.03 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Division 1.
- B. Testing and Balancing Agency: Submit the name and qualifications of the testing, adjusting and balancing agency and their personnel for approval within 30 days after Notice to Proceed is issued.
- C. Test Reports: Submit a complete set of all approved tests prior to final acceptance.
- D. System Testing and Balancing: Submit a detailed account of the proposed methods and sequence to carry out system testing and balancing.
- E. Draft Reports: Prior to commencing the Work, submit draft reports indicating adjusting, balancing and equipment data required. Submit three draft copies of the report for review prior to final acceptance. Provide three final copies for the City of New York and for inclusion in the operation and maintenance manuals.
- F. Reports Quality: Provide reports in soft cover, letter size, 3-ring binder manuals, complete with index page and indexing tabs, with cover identification at front and side. Include a set of reduced drawings with air outlets and inlets, and equipment identified to correspond with the data sheets, and indicating thermostat locations.

- G. Testing and Balancing Equipment: Submit data sheets of specific instruments to be used, listing their most recent calibration dates prior to commencing system balance.
- H. Other Requirements: Include detailed procedures, agenda, sample report forms and copy of AABC National Project Performance Guarantee, prior to commencing the system balance.

#### 1.04 REPORT FORMS

- A. General: Submit reports on AABC National Standards for Total System Balance or NEBB forms.
- B. Format: Include the following information on the report forms:
  - 1. Title Page
    - a. Company name
    - b. Company address
    - c. Company telephone number
    - d. Project name
    - e. Project location
    - f. Project ENGINEER
    - g. Project CONTRACTOR
    - h. Project altitude
  - 2. Instrument List
    - a. Instrument
    - b. Manufacturer
    - c. Model
    - d. Serial number
    - e. Range
    - f. Calibration date
  - 3. Air Handling Equipment
    - a. Identification/Location
    - b. Manufacturer
    - c. Model/Size
    - d. Air flow, design and actual
    - e. Return air flow, design and actual
    - f. Outside air flow, design and actual
    - g. Total static pressure (total external), design and actual
    - h. Inlet pressure
    - i. Discharge pressure
    - j. Fan RPM

4. Exhaust Fan Data
  - a. Identification/Location
  - b. Manufacturer
  - c. Model/Size
  - d. Air flow, design and actual
  - e. Total static pressure (total external), design and actual
  - f. Inlet pressure
  - g. Discharge pressure
  - h. Fan RPM
5. Supply Fan Data
  - a. Identification/Location
  - b. Manufacturer
  - c. Model/Size
  - d. Air flow, design and actual
  - e. Total static pressure (total external), design and actual
  - f. Inlet pressure
  - g. Discharge pressure
  - h. Fan RPM
6. Return Air/Outside Air Data
  - a. Identification/Location
  - b. Design air flow
  - c. Actual air flow
  - d. Design return air flow
  - e. Actual return air flow
  - f. Design outside air flow
  - g. Actual outside air flow
  - h. Return air temperature
  - i. Outside air temperature
  - j. Required mixed air temperature
  - k. Actual mixed air temperature
  - l. Design outside/return air ratio
  - m. Actual outside/return air ratio
7. Electric Motors
  - a. Manufacturer
  - b. HP/BHP
  - c. Phase, voltage, amperage; nameplate, actual, no load
  - d. RPM
  - e. Enclosure
  - f. Service factor
  - g. Starter size, rating, heater elements

## 8. V-Belt Drive

- a. Identification/Location
- b. Required driven RPM
- c. Driven sheave, diameter and RPM
- d. Belt, size and quantity
- e. Motor sheave, diameter and RPM
- f. Center to center distance, maximum, minimum and actual

## 9. Duct Traverse

- a. System zone/branch
- b. Duct size
- c. Area
- d. Design velocity
- e. Design air flow
- f. Actual velocity
- g. Actual air flow
- h. Duct static pressure
- i. Air temperature
- j. Air correction factor

## 10. Air Distribution Test Sheet

- a. Air terminal number
- b. Room number/location
- c. Terminal type
- d. Terminal size
- e. Area factor
- f. Design velocity
- g. Design air flow
- h. Actual velocity
- i. Actual air flow
- j. Percent of design air flow

## 11. Terminal Unit Data

- a. Identification/Location
- b. Manufacturer
- c. Model/Size
- d. Type, constant, variable, single, dual duct
- e. Minimum static pressure
- f. Minimum design air flow
- g. Maximum design air flow
- h. Maximum actual air flow
- i. Inlet static pressure

## 12. Electric Duct Heater

- a. Identification/Location
- b. Manufacturer
- c. Model/Size
- d. Design kW
- e. Number of stages
- f. Phase, voltage, amperage
- g. Actual voltage (each phase)
- h. Actual amperage (each phase)
- i. Air flow, design and actual
- j. Temperature rise, design and actual

## 13. Air Cooled Condenser

- a. Identification/Location
- b. Manufacturer
- c. Model/Size
- d. Entering DB air temperature, design and actual
- e. Leaving DB air temperature, design and actual
- f. Number of compressors

## 14. Cooling Coil Data

- a. Identification/Location
- b. Manufacturer
- c. Service
- d. Air flow, design and actual
- e. Entering air DB temperature, design and actual
- f. Entering air WB temperature, design and actual
- g. Leaving air DB temperature, design and actual
- h. Leaving air WB temperature, design and actual
- i. Air pressure drop, design and actual

## 15. Heating Coil Data

- a. Identification/Location
- b. Manufacturer
- c. Service
- d. Air flow, design and actual
- e. Entering air temperature, design and actual
- f. Leaving air temperature, design and actual
- g. Air pressure drop, design and actual

## 16. Sound Level Report

- a. Location
- b. Octave bands - equipment off
- c. Octave bands - equipment on

## 17. Vibration Test

- a. Location of points
  - (1) Fan bearing, drive end
  - (2) Fan bearing, opposite end
  - (3) Motor bearing, center (if applicable)
  - (4) Motor bearing, drive end
  - (5) Motor bearing, opposite end
  - (6) Casing (bottom or top)
  - (7) Casing (side)
  - (8) Duct after flexible connection (discharge)
  - (9) Duct after flexible connection (suction)
- b. Test readings
  - (1) Horizontal, velocity and displacement
  - (2) Vertical, velocity and displacement
  - (3) Axial, velocity and displacement
- c. Normally acceptable readings, velocity and acceleration
- d. Unusual conditions at time of test
- e. Vibration source (if noncomplying)

## 18. Duct Leak Test

- a. Description of ductwork under test
- b. Duct design operating pressure
- c. Duct design test static pressure
- d. Duct capacity, air flow
- e. Maximum allowable leakage duct capacity times leak factor
- f. Test apparatus
  - (1) Blower
  - (2) Orifice, tube size
  - (3) Orifice size
  - (4) Calibrated
- g. Actual static pressure
- h. Actual orifice differential pressure
- i. Leakage

1.05 PROJECT RECORD DRAWINGS

- A. General: Submit Record Drawings as specified in Section 01332 – Record Drawings.
- B. Location Record: Accurately record actual locations of flow measuring stations balancing valves and rough setting.

1.06 QUALITY ASSURANCE

- A. Provide services from a company specializing in the testing, adjusting and balancing of systems specified in this Section with minimum 3 years documented experience certified by AABC or NEBB.
  - 1. Perform Work under supervision of AABC Certified Test and Balance Engineer or NEBB Certified Testing, Balancing and Adjusting Supervisor.
  - 2. Perform the total system balance in accordance with AABC National Standards for Field Measurement and Instrumentation, Total System Balance or NEBB Procedural Standards for Testing, Balancing and Adjusting of Environmental System.

1.07 SEQUENCING AND SCHEDULING

- A. Sequence the Work to commence after completion of systems and schedule completion of Work before Substantial Completion. Schedule and provide assistance in final adjustment and test of life safety, smoke evacuation and smoke control system with the City of New York Fire Department.

1.08 PRE-INSTALLATION

- A. Conference: Convene a conference 1 week prior to commencing testing as specified in Section 01310 – Project Coordination.

PART 2 PRODUCTS (Not Used)

PART 3 EXECUTION

3.01 EXAMINATION

- A. General: Before commencing Work, verify that the systems are complete and operable. Verify the following:
  - 1. Equipment is operable and in a safe and normal condition
  - 2. Temperature control systems are installed complete and operable
  - 3. Proper thermal overload protection is in place for electrical equipment

4. Final filters are clean and in place. If required, install temporary media in addition to final filters.
  5. Duct systems are clean of debris
  6. Fan rotations are correct
  7. Fire and volume dampers are in place and open
  8. Coil fins have been cleaned and combed
  9. Access doors are closed and duct end caps are in place
  10. Air outlets are installed and connected
  11. Duct system leakage has been minimized
- B. Defects and Deficiencies: Report any defects or deficiencies noted.
- C. System Imbalance: Promptly report abnormal conditions in mechanical systems or conditions which prevent system balancing.
- D. Acceptance of Existing Conditions: Beginning of testing means acceptance of existing conditions.

### 3.02 PREPARATION

- A. Additional Balancing: Provide additional balancing devices as required.
- B. Instruments: Provide instruments required for testing adjusting and balancing operations. Make these instruments available to facilitate spot checks during testing.

### 3.03 INSTALLATION TOLERANCES

- A. Air Systems: Adjust the air handling systems to plus or minus 5 percent for supply systems and plus or minus 10 percent for return and exhaust systems from the design figures indicated.

### 3.04 ADJUSTING

- A. Completion: Properly install, inspect and confirm proper operation of each individual component of the system before giving notice to proceed with testing, adjusting and balancing. Do not perform testing, adjusting and balancing until all mechanical equipment is properly installed and is 100 percent operational, all temperature controls are installed and calibrated and all systems are cleaned and clean filters installed.

- B. **Deficiency and Correction:** Assist in the system testing, adjusting and balancing. Adjust the system and make corrections of any deficiencies found such as: motor starters and horsepower; improper sheave and belt sizes; missing, improperly installed or malfunctioning volume control dampers, air extractors, power wiring, controls and any other items that prevent the completion of the system testing, adjusting and balancing.
- C. **Recorded Data:** Record data representing actually measured, or observed conditions.
- D. **Settings:** Permanently mark settings of dampers and other adjustment devices then allow the balanced settings to be restored.
- E. **Balance Verification:** After adjustment, take measurements to verify that the balance has not been disrupted or that such disruption has been rectified.
- F. **Operating Systems:** Leave systems in proper working order, replacing belt guards, closing access doors, closing doors to electrical switch boxes, and restoring thermostats to the specified settings.

### 3.05 AIR SYSTEM TESTING AND BALANCING

- A. **Perform air system balancing as follows:**
  - 1. Check filters for cleanliness and minimum bypass leakage, dampers both volume and fire for correct position, and temperature controls for completeness of installation.
  - 2. Prepare test report sheets for fans, and air inlets and outlets. Obtain the manufacturer's flow factors and follow the recommended procedure of testing.
  - 3. Open all supply dampers, and place all fans in specified operation.
  - 4. Check motor amperage and voltage for each motor, fan rotation, and automatic dampers for proper position.
  - 5. Check air temperature controls and verify that they are operating to deliver design temperatures. Adjust the system with mixing dampers positioned under the minimum outdoor air condition.
  - 6. Using pitot tube and calibrated manometer, traverse the main duct and all main branches and ascertain the total air being delivered. Adjust or replace pulleys and belts and install additional dampers if required to obtain the design airflow. Make adjustments so that all finally adjusted air quantities are at least equal to, but more than 10 percent above, the air quantities noted on the Contract Drawings.

7. Adjust branch dampers until the proper air volume is obtained in each branch duct.
8. Commence terminal outlet balancing beginning with the outlets nearest the fan. Use branch dampers for major adjusting and terminal dampers for minor adjustments only.
9. Make additional test and adjustment passes through entire systems as necessary to obtain the noted outlet values.
10. Read and record amperage readings for each motor lead, fan static and velocity pressures and the static pressure drop across each major component (i.e., intake, filters, coils).
11. Reposition system dampers to supply maximum outdoor air and record the amperage and pressure readings in this position.
12. Adjust air terminal outlets for proper distribution pattern.
13. Inspect and test all electrical protective devices and circuits for proper motor protection, including properly sized starter overload heater elements, for all equipment furnished.
14. Provide a system schematic with the required and actual air quantities recorded at each outlet or inlet.
15. When modulating dampers are provided, take measurements and balance the system at extreme conditions.
16. Measure building static pressure and adjust the supply, return and exhaust air systems to provide the required relationship to maintain approximately 0.05 inches positive static pressure for each zone near building entries.
17. Adjust air quantities with mixing dampers first set for summer ventilation, then for heating, then modulating.
18. Permanently mark the balance position of all manual volume dampers, and replace all access covers.

### 3.06 OPERATION DEMONSTRATION

- A. When each system has been completed and proved functional, demonstrate its intended operation in each of its operating modes. Simulate in an acceptable manner functions dependent upon parameters such as weather, process or emergency conditions which are unavailable at the time of test, or separately demonstrate when those parameters exist, to assure proper functioning under all operating conditions. Immediately after testing, properly reset control settings temporarily modified for such simulations.

- B. Final acceptance of the Work will be contingent upon the operation of all equipment and systems meeting the specified requirements.

**-END OF SECTION-**

**NO TEXT ON THIS PAGE**

**Section 16020**  
**TEMPORARY ELECTRICAL SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing a complete temporary electrical system to supply power and light as required for the construction related activities and temporary power to the existing transfer station as specified and shown. Provide a temporary electrical system that is complete and includes but is not limited to: service entrance and distribution center, conduit, wire, temporary overhead or underground extensions, grounding, lighting fixtures, panelboards and all auxiliary equipment necessary to support the construction.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods
- B. Section 16060 - Grounding
- C. Section 16121 - Wires and Cables - 600 Volts and Below
- D. Section 16130 - Electric Raceway Systems
- E. Section 01513 - Temporary Power Facilities

**1.03 REFERENCES**

- A. Codes and Standards: The following codes and standards are referred to in this Section:
  - 1. NEC - National Electrical Code
  - 2. NYCBC - New York City Building Code
  - 3. NESC - National Electrical Safety Code
  - 4. Local Utility Requirements
  - 5. OSHA - Occupational Safety and Health Administration Regulations

**1.04 SYSTEM DESCRIPTION**

- A. The Contractor shall make all necessary arrangements with Con Edison and shall provide a temporary electrical service point connection. Connecting lines and service supply shall be of sufficient capacity to supply all temporary light and power required on the site of the new MTS and support the continued use of the nearby existing transfer station.
- B. Arrangements shall be made with Con Edison immediately after notice to commence work.
- C. The service shall have provisions for meter connections for the Contractor and the Resident Engineer and the existing transfer station. The service shall be branched and metered using circuit breakers or fused switches and meters.

1. The distribution from the meter to the Contractor's field office and shops at the site shall be the responsibility of the Contractor.
  2. The distribution from one (1) meter to Resident Engineer's field office shall be the responsibility of the Contractor.
  3. The distribution from one (1) meter to the construction temporary light, power, and security system shall be the responsibility of the Contractor.
  4. The distribution from the meter to the existing nearby transfer station shall be the responsibility of the Contractor.
- D. The Contractor shall be responsible for making arrangements with Con Edison to have any additional meters they may require installed and for payment there for.
- E. The energy charges for the Contractor's field office and shop usage shall be the responsibility of the Contractor.
- F. Energy charges associated with the work areas general power and lighting and the security site lighting shall be the responsibility of the Contractor.
- G. Energy charges associated with the Resident Engineer's field office shall be the responsibility of the Contractor.
- H. Energy charges associated with the existing transfer station shall be billed directly to the City of New York by Con Edison. The City of New York shall pay these charges.
- I. Any additional power the Contractor requires beyond that specified herein, it shall arrange with Con Edison for such additional temporary power and light and shall bear the costs of all material and ancillary equipment necessary.
- J. Provide a portable generator for use in accordance with the requirements of Section 01513 – Temporary Power Facilities.

#### 1.05 DESIGN REQUIREMENTS

- A. The Contractor shall provide all systems and circuits in accordance with the Electrical Code of the City of New York, NFPA 70, the National Electrical Safety Code, Utility requirements, and OSHA requirements.
- B. The temporary electrical system shall be provided in accordance with the following design requirements:
1. The Contractor and the Resident Engineer trailer complex shall each have a separate branch.

2. The Contractor's branch shall supply the work area general lighting, power, and security. Receptacles (GFI type) shall be located throughout the work area. Receptacle connected equipment shall be suitable for 120-volt operation. Operating input shall not exceed 1500 volt-amperes. Illumination levels shall be as required by OSHA.
3. Security site lighting circuits shall supply a system of security lighting for the work area, field office complex(s), Contractor's staging areas, and all parking areas. Unless specifically shown otherwise on the Contract Drawings or stated in the Specifications, the system shall be arranged to provide a minimum lighting intensity of 5-foot candles in these areas.
4. A minimum of three 200 ampere meter pans and one 500 amp meter assembly and fused disconnect switches rated for 120/208 volt, 3 phase, 4 wire may be furnished, installed and wired for the above. All meters shall be paid by the Contractor. The ampacity listed is the minimum to be installed and may not meet the requirements of these specifications. The installed capacity shall meet all specified requirements.

#### 1.06 SUBMITTALS

- A. Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Product Data and Information: Furnish manufacturer's catalog data for the equipment provided for use in the Temporary Electrical System
- C. Shop Drawings: Furnish shop drawings showing the following:
  1. One-line diagram representing the power distribution for the temporary system
  2. Location plan indicating the major distribution equipment
  3. Panel loading, voltage drop, short circuit and other calculations, as required
  4. Security lighting layout

#### 1.07 QUALITY ASSURANCE

- A. The temporary general lighting system shall provide lighting for access to and egress from the work and for safe and expeditious construction within designated enclosed areas of the structure or structures.
- B. The temporary service for the existing transfer station shall provide adequate power at acceptable voltage to run that facility as the operation requires, during the construction of the new MTS. This service is not required until the work on the

water interface in the area of the new construction requires interruption of the present service.

- C. All temporary electrical system equipment and components shall be of recent manufacture and of proper working order for the intended purpose.
- D. The Contractor shall maintain in proper working order and repair the temporary electrical system.
- E. The Contractor shall modify, extend, and relocate the temporary electrical system components, as needed, to support construction activities.
- F. The Contractor shall remove the temporary electrical system when directed by the Resident Engineer.

## PART 2 PRODUCTS

### 2.01 ELECTRICAL SERVICE CONNECTION

- A. The Contractor shall provide a service entrance and distribution center at the service point. Service entrance and distribution equipment shall be in accordance with the following:
  - 1. Enclosures shall be rated NEMA 3R.
  - 2. Meter pans and assemblies shall be suitable for revenue meters of various capacities required. Meters will be furnished by the Utility.
  - 3. Circuit breakers shall be thermal magnetic type. Circuit breakers shall be equipped with lockable handles.
  - 4. Disconnect switches shall be fused type with current limiting fuses. Disconnect switches shall be equipped with padlocking features.
  - 5. All equipment shall be approved by Con Edison.
- B. The Contractor shall also provide the following other equipment at the service point:
  - 1. Eight-foot high, steel chain link fence with gate shall enclose the service entrance and distribution center. The fence shall be arranged so to permit a minimum clearance distance of 6 feet between the fence and the equipment.
  - 2. The fence shall include baked enamel, 14 by 10 inch caution signs. The signs shall read, "DANGER - HIGH VOLTAGE - KEEP - OUT". The signs shall be bolted to the fence on each side of the fence and on the main gate.

3. A 4/0 AWG ground grid consisting of four ground rods, one at each corner, shall be provided. Maximum ground resistance shall be 2 ohms. Grounding system shall be in accordance Section 16060 – Grounding.

## 2.02 RACEWAYS AND WIRING

- A. All conductors shall be 600 volt, enclosed in properly sized raceways or be routed aerially using Type AC, MC or TC cable.
- B. Conductors shall be provided for all devices, suitably sized for the intended purpose. Conductors installed in raceways shall be single conductor type THHN/THWN or equal to be approved by the Engineer and Con Edison. Armored cable, Type AC, metal-clad cable, Type MC or power and control tray cable, Type TC shall also be permitted.
- C. Raceways where used shall be suitably sized for the conductors. Raceways shall be rigid metallic type.
- D. Aerially routed cables shall be messenger supported from solid wood poles or other recognized means. Messenger shall be high strength galvanized steel.
- E. Poles shall have a class suitable for the installation in accordance with the National Electrical Safety Code and the Utility's requirements and shall be thirty feet length minimum. Poles shall be guyed at angle or corner runs and when eccentrically loaded.
- F. Underground cables shall be USE rated and suitably protected from damage during construction. This method may only be used where permitted by applicable codes and with permission of the engineer.

## 2.03 LIGHTING FIXTURES AND DEVICES

- A. Receptacles (GFI type) shall be grounded type, 120 volt, 20 ampere suitable for hand tools such as drills, hammers and grinders.
- B. General lighting lamps shall be 100 watt installed in suitable lamp holders. Security lighting lamps (outdoor) shall be 400-watt high pressure sodium installed within a floodlight type fixture suitable to illuminate the intended area.
- C. Switches, breakers and miscellaneous equipment shall be suitable for the intended purpose, with voltage, current and short circuit interrupting ratings as required for the circuits.

**PART 3 EXECUTION****3.01 INSTALLATION**

- A. The ground grid cable shall be installed in loop fashion completely around and outside the service point fence. The fence and distribution equipment shall be connected to the grid at a minimum of two locations.
- B. The temporary general lighting system shall be installed progressively in structures as the designated areas are enclosed or as lighting becomes necessary because of partial enclosure. Lamps shall be installed to provide an even distribution of illumination over the work areas.
- C. Receptacles shall be installed in such a manner so as to reach any point in the work areas with an extension cord not to exceed 40 feet in length.
- D. Security lighting shall be installed on poles to illuminate the staging, outdoor and parking areas.
- E. Aerial conductors shall be installed at a minimum height of 14 feet above finished grade. When conductors cannot be routed at the proper height or where it will interfere with plant operations or construction activities, conductors shall be provided in rigid steel conduit and installed underground.

**3.02 OPERATION**

- A. The Contractor shall keep the temporary power and lighting system alive in accordance with Section 01513 - Temporary Power Facilities.

**3.03 MAINTENANCE**

- A. The temporary electrical system shall be maintained and repaired until it is no longer required.
- B. Lamps, fuses and other equipment shall be repaired and/or replaced, as required.

**3.04 REMOVAL**

- A. At the conclusion of the work, when directed by the Resident Engineer, the temporary system shall be removed in its entirety. The ground surfaces and structures disturbed by the work shall be restored to their original condition.

-END OF SECTION-

**Section 16050**  
**BASIC ELECTRICAL MATERIALS AND METHODS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. General requirements for providing basic electrical materials and methods.
- B. Related Work Specified in Other Sections Includes:
  - 1. Certain equipment, control devices, conduit and wiring shown on electrical drawings, but are specified in other sections pertaining to plumbing, heating, ventilating, air conditioning, temperature control systems, process equipment, process control systems, instrumentation, fire suppression, fire alarm, heat trace, impressed current Cathodic protection and other non-Division 16 portions of the specifications. Install and connect these items to the electrical system as indicated or required in accordance with the Contract Documents.
- C. Overall Application of Specifications: This Section applies to all Division 16 sections and to other sections that include requirements for electrical equipment. Irrespective of where the electrical requirements are specified, provide and install all materials necessary for a complete operational system.
- D. Temporary Requirements: This Section applies to any temporary circuits, overcurrent devices, conduit, wiring, and other equipment required during changeover from the existing electrical system to a new electrical system. This Section also applies to temporary rewiring of lighting circuits, power circuits, instruments and devices.

**1.02 DEFINITIONS**

- A. Corrosive Areas: The following areas are designated corrosive areas:
  - 1. Tipping Floor
  - 2. Loading Floor
  - 3. Lidding Area
  - 4. Container Loading Area
  - 5. Vehicle Maintenance Room
  - 6. Outdoors at Pier Level
  - 7. Ramps
  - 8. Odor Control Room
  - 9. Mechanical Mezzanine
  - 10. Outdoor area around fuel and oil storage tanks, fill ports and the Engine-Generator enclosure.
  - 11. Outdoor under the Pier Level Floor Slab.

- B. Architectural Finished Areas: The following areas are designated as architectural finished areas:
  - 1. Offices
  - 2. Personnel Areas
  - 3. Control Rooms
- C. Hazardous Area Classification.
  - 1. Fueling Station
  - 2. Fuel Port

### 1.03 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Product Data and Information: Furnish a complete list of electrical equipment and materials to be furnished that shows the manufacturer, catalog number, size, type, capacity, voltage rating and other pertinent information related to each item on the list.
  - 1. Furnish catalog data on the manufacturer's standard equipment and materials. Clearly indicate on the catalog data the equipment and devices specifically being proposed.
  - 2. Identification: Furnish a complete schedule or listing of system and equipment identification labels with legends.
- C. Contractor's Shop Drawings: Furnish shop drawings on items manufactured for the Contract or systems – Security (CCTV, Access Control), Telephone/Data, Paging, Fire Detection and Alarm, etc. – supplied for this contract..
  - 1. Furnish a connection diagram and schematic for each piece of electrical equipment. A manufacturer's standard connection diagram or schematic showing more than one method of wiring is not acceptable unless, the intended method is clearly marked.
  - 2. Furnish diagram that show connections to field equipment. Clearly differentiate between manufacturer's wiring and field wiring.
  - 3. Furnish raceway layout drawings that show conduits, boxes, and panels which contain the conductors to be provided. Include schedules listing conduit sizes and conductor content and identification.

4. Where additions and modifications are made to existing equipment, furnish drawings which clearly identify the existing equipment that remains and the new Work.
- D. Coordination Drawings: Furnish coordination drawings that have a scale of 1/4"=1'-0" or larger; that show major elements, components, and systems of electrical equipment as they relate to other systems, installations, and building components. Indicate locations where access space is limited and where sequencing and coordination of installations are required for the efficient flow of the Work, including (but not limited to) the following:
1. Indicate the proposed locations of major raceway systems, equipment, and materials. Include the following:
    - a. Clearances for servicing equipment, including space for equipment disassembly as required for periodic maintenance
    - b. Exterior wall and foundation penetrations
    - c. Fire-rated wall and floor penetrations
    - d. Equipment connections and support details
    - e. Sizes and location of required concrete pads and bases
  2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
  3. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.
  4. Prepare reflected ceiling plans to coordinate the installation of air outlets and inlets, light fixtures, communications systems components, sprinklers, and other ceiling-mounted devices.
- E. Record Documents: Furnish record documents, and in addition to the requirements specified in Division 1, indicate installed conditions for:
1. Interior and exterior major raceway systems' sizes and locations; locations of control devices; distribution and branch electrical circuitry; and fuse and circuit breaker sizes and arrangements
  2. Exposed and concealed equipment locations dimensioned from prominent building lines
  3. Approved substitutions, and actual equipment and materials installed

F. Maintenance Manuals: Furnish maintenance manuals, and in addition to the requirements specified in Section 01831, include the following information for equipment items:

1. Functional description, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and catalog numbers of replacement parts
2. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions
3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions
4. Servicing instructions and lubrication charts and schedules

#### 1.04 QUALITY ASSURANCE

- A. Codes: Provide all electrical Work in accordance with applicable local codes, regulations and ordinances. If there is a conflict between the requirements specified in the Contract Documents and the codes, follow the more stringent requirements as determined and approved.
- B. Testing: As a minimum, provide standard factory and field tests for each type of equipment. Other tests may be specified in the applicable equipment section.
- C. Labeling: Provide electrical equipment and materials that are listed and approved by Underwriters Laboratories or other OSHA recognized testing laboratories with the testing agency's label attached.
- D. Standard Products: Unless otherwise indicated, provide electrical materials and equipment which are the standard products of manufacturers regularly engaged in the production of such materials and equipment. Provide the manufacturer's latest standard design that conforms to these Specifications. Provide the products of the same manufacturer when two or more units of the same class of material and equipment are required.
- E. Seismic Testing: All equipment shall conform to seismic requirements of the NYCBC.

#### 1.05 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows.

- B. Shipping and Packing: Provide materials and equipment suitably boxed, crated or otherwise completely enclosed and protected during shipment, handling, and storage. Clearly label such boxes, crates or enclosures with manufacturer's name, and name of material or equipment enclosed.
- C. Acceptance at Site: Conform to acceptance requirements described in Division 1.
  - 1. Repair or replace all materials and equipment damaged by handling and storage as directed at no additional cost to the City.
- D. Storage and Protection: Protect materials and equipment from exposure to the elements and keep them dry at all times. Handle and store to prevent damage and deterioration in accordance with manufacturer's recommendations.

#### 1.06 PROJECT CONDITIONS

- A. General: The Contract Drawings indicate the extent and general arrangement of the principal electrical elements, outlets, devices and circuit layouts. Install and connect all electrical elements and devices to form a complete workable system as required by the Contract Documents, regardless of whether all system components are specifically stated in the Specifications or shown. Provide necessary materials and installation wherever required to conform to the specific requirements of the furnished equipment and for proper installation of the Work.
- B. Schematics: In general the runs of feeders are shown schematically and are not intended to show exact routing and locations of raceways. Verify actual and final arrangement, equipment locations, and prepare circuit and raceway layouts before ordering materials and equipment. Equipment locations are approximate and are subject to modifications as determined by approved equipment dimensions.
- C. Coordination of Work: Coordinate the Work so that the electrical equipment may be installed without altering building components, other equipment or installations.
- D. Departure from Design: If departures are deemed necessary due to structural conditions, obstructions or other problems, provide details of such departures and the reasons for requesting approval as soon as practicable but not later than the submittal of the raceway layout drawings. Do not make any departures without written approval.

#### PART 2 PRODUCTS (Not Used)

#### PART 3 EXECUTION

##### 3.01 ROUGH-IN

- A. Final Location: Verify final locations for rough-ins with field measurements and with the requirements of the actual equipment to be connected.

### 3.02 ELECTRICAL INSTALLATIONS

A. General: Sequence, coordinate, and integrate the various elements of electrical systems, materials, and equipment. Comply with the following requirements:

1. Coordinate electrical systems, equipment, and materials installation with other building components.
2. Verify all dimensions by making field measurements.
3. Arrange for chases, slots, and openings in other building components as construction progresses to provide for electrical installations.
4. Coordinate the installation of required supporting devices and sleeves to be set in cast-in-place concrete and other structural components, as they are constructed.
5. Sequence, coordinate, and integrate installations of electrical materials and equipment for efficient flow of the Work. Give particular attention to large equipment requiring positioning prior to closing in the building.
6. Where mounting heights are not detailed or dimensioned, install systems, materials, and equipment to provide the maximum possible headroom.
7. Coordinate connection of electrical systems with exterior underground and overhead utilities and services. Comply with requirements of governing regulations, franchised service companies, and controlling agencies. Provide all required connections for each service.
8. Install systems, materials, and equipment to conform with approved submittal data, including coordination drawings, to greatest extent possible. Conform to arrangements indicated by the Contract Drawings, recognizing that portions of the Work are shown only in diagrammatic form. Where coordination requirements conflict with individual system requirements, refer conflict to the Engineer for resolution.
9. Where installed exposed in finished spaces, install systems, materials, and equipment level and plumb, parallel and perpendicular to other building systems and components.
10. Provide electrical equipment to facilitate servicing, maintenance, and repair or replacement of equipment components. As much as practical, connect equipment for ease of disconnecting, with minimum of interference with other installations.
11. Provide access panels or doors where units are concealed behind finished surfaces.

12. Install systems, materials, and equipment providing right-of-way priority to systems required to be installed at a specified slope.
13. Certain 120/240 volt or 277 volt equipment, including receptacles, single phase motors, lighting and controls as well as low voltage communication/paging, security, fire detection and alarm systems – do not indicate raceways connecting them to other equipment of the same type or system or to the source of service. This is to permit the Contractor to supply their experience and ingenuity in routing same – within the guidelines presented in various sections of these specifications and the applicable codes.

### 3.03 CUTTING AND PATCHING

- A. General: Perform cutting and patching as specified in Division 1. In addition to the requirements specified in Division 1, the following requirements apply:

1. Perform cutting, fitting, and patching of electrical equipment and materials required to:
  - a. Uncover Work to provide for installation of ill-timed Work.
  - b. Remove and replace defective Work.
  - c. Remove and replace Work not conforming to requirements of the Contract Documents.
  - d. Remove samples of installed Work as specified for testing.
  - e. Install equipment and materials in existing structures.
  - f. Locate existing structural reinforcing with a pachometer where core drilled penetrations are required so as not to cut the steel reinforcing.
2. Cut, remove, and properly dispose of selected electrical equipment, components, and materials as indicated. Included are the removal of electrical items indicated to be removed and items made obsolete by the new Work. Deliver all removed serviceable apparatus to the City as directed.
3. Protect the structure, furnishings, finishes, and adjacent materials not indicated or scheduled to be removed.
4. Provide and maintain adequate temporary partitions or dust barriers that prevent the spread of dust and dirt to adjacent areas.
5. Protection of Installed Work: During cutting and patching operations, protect adjacent installations.

6. Patch finished surfaces and building components using new materials that are compatible with the original installation and applied by experienced installers.

**-END OF SECTION-**

**Section 16055****ELECTRICAL REQUIREMENTS FOR SHOP-ASSEMBLED EQUIPMENT****PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for furnishing, installing and testing shop-assembled equipment as indicated, in accordance with the Contract Documents. Shop-assembled equipment panels and other items are specified under the driven equipment sections and may require external field connection to ancillary devices and other system components for interlocks and alarms. Provide all field wiring as required by the system and equipment specified under the driven equipment sections. This field wiring may not be specified or shown. This equipment includes but is not limited to the following:

1. Air Compressors
2. Air conditioning units
3. Air monitoring equipment
4. Booster Pumps
5. Container Lidding system
6. Constant tension mooring winches
7. Electric hoists and cranes
8. Electrical Heat Trace system
9. Electric water coolers
10. Fire Pump and related equipment
11. Fan equipment
12. Dust suppression system
13. Fuel Dispensing, Monitoring, Distribution and Storage System.
14. Fluids Dispensing, Monitoring and Storage System.
15. Miscellaneous control equipment
16. Mooring capstans
17. Odor control equipment
18. Overhead doors
19. Pump equipment
20. SCADA System
21. Service water system
22. Sewage Pumps
23. Sump pump equipment
24. Temperature control systems
25. Scales and related equipment.

### 1.03 REFERENCES

- A. Codes and standards referred to in this Section are:

- 1. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)

2. UL 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors
3. NEC - National Electrical Code
4. NYCBC - New York City Building Code
5. UL-508A - Industrial Control Panels
6. NEC-409 - Industrial Control Panels

#### 1.04 SYSTEM DESCRIPTION

- A. Design Requirements: Provide the Shop Assembled equipment using the components and appurtenances meeting the requirements specified in Division 16.

#### 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Product Data and Information: Furnish manufacturer's data on all equipment and devices in the assembly, including voltages, number of phases, current ratings, capacities and other relevant data.
- C. Shop Drawings: Furnish shop drawings for the shop-assembled equipment, including the following:
1. Layout drawings of the assembly showing accurately scaled basic equipment sections, auxiliary compartments and combination sections. Show special relationships of assemblies to associated equipment, including plan and front views of the equipment. Furnish a device summary.
  2. Furnish wiring diagrams for assemblies that show connections to electrical power. Clearly differentiate between shop-installed portions of wiring and field installed portions.
  3. Furnish construction drawings for equipment requiring field assembly. Clearly differentiate between shop-assembled portions and field-assembled portions.
  4. A manufacturer's standard connection diagram or schematic showing more than one method of connection is not acceptable unless the intended method is clearly identified.
- D. Quality Control: Furnish manufacturer's test reports and certified performance records of all equipment installed. Furnish field test reports after equipment is installed.

## 1.06 QUALITY ASSURANCE

- A. Codes: Comply with local codes and all other applicable codes.
- B. Regulatory Requirements: Comply with applicable Regulatory Agency requirements.

## PART 2 PRODUCTS

## 2.01 FABRICATION

- A. General: Provide shop-assembled equipment as standard products manufactured by companies regularly engaged in the manufacture of such equipment.
- B. Factory Assembled Requirements: Provide control panels for shop-assembled equipment as complete factory assembled units that require only external connections for installation including main disconnect and all electrical features necessary for the proper operation of the units.

## C. Controls

## 1. Motors 1/2 Hp and Larger

- a. Provide motors suitable for 480-volt, 3-phase, 60-hertz operation, with all controls at 115 volts or less.
- b. Provide a combination circuit breaker along with all required control transformers, relays, timers, heaters and other necessary incidentals to form a complete functioning unit.
- c. Provide NEMA Size 1 or larger starters.

## 2. Motors less than 1/2 Hp

- a. Provide motors suitable for 120-volt, single-phase operation.
- b. Provide manual motor starter with neon pilot light.

## 3. Provide all controls and equipment as specified in Section 16491 – Control Components and Devices.

- D. Control Components: Install principal control components in NEMA 250 rated enclosures as follows:

AREA	ENCLOSURE
Above grade indoor	NEMA 12 - Industrial
Outdoor and below grade elevation indoor	NEMA 4 - Watertight
Corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown.	NEMA 4X - Watertight and corrosion-resistant stainless steel with stainless steel external hardware. Provide all external operators made of the same materials as that of the enclosures

E. Miscellaneous Controls

1. Provide float switches, pressure switches, limit switches, thermostats and other auxiliary control devices to satisfy the intended service.
2. Provide contacts rated at 10-amperes, 120 volts, 60-hertz ac, unless otherwise specified.
3. Provide limit switches that function in accordance with contact development charts.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install shop-assembled equipment as indicated, in accordance with manufacturer's written instructions.
- B. Coordination: Coordinate cabling and wiring as necessary to interface installation of shop-assembled equipment.
- C. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals in accordance with UL Standard 486A.
- D. Grounding Connections: Make equipment grounding connections for the shop-assembled equipment as specified and shown. Tighten connections in accordance with UL Standard 486A to assure permanent and effective grounding.

- E. Adjustments: Make all necessary adjustments to the equipment to provide complete and satisfactory operation upon completion of the Contract.

3.02 PAINTING

- A. Shop Painting: Paint the shop-assembled equipment enclosures as specified in Section 09912 - Interior Painting.
- B. Field Painting: Clean and touch up scratched and marred surfaces to match original finish.

-END OF SECTION-

## Section 16060 GROUNDING

### PART 1 GENERAL

#### 1.01 SUMMARY

- A. Section Includes: Requirements for providing a complete grounding system as specified and shown. Grounding includes but is not limited to: electrical equipment enclosures, transformers, switchgear, motor control centers, electrical generators and derived system neutrals, ground grid systems, grounding rods, grounding conductors, bonding jumpers, waterpipe connections and structural metal frames and members as required.

#### 1.02 RELATED SPECIFICATIONS

- A. Section 13100 - Lightning Protection Systems
- B. Section 16050 - Basic Electrical Materials and Methods
- C. Section 16080 - Electrical Testing Requirements
- D. Section 16121 - Wires and Cables - 600 Volts and Below
- E. Section 16130 - Electrical Raceway Systems

#### 1.03 REFERENCES

- A. Codes and Standards: The following codes and standards are referred to in this Section:
  - 1. NEC - National Electrical Code
  - 2. NYCEC - Electrical Code for the City of New York
  - 3. UL-96A - Installation Requirements for Lightning Protection Systems

#### 1.04 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Furnish manufacturer's catalog data for the following:
  - 1. Grounding and grounded conductors
  - 2. Grounding connectors, clamps and bushings
  - 3. Grounding rods
  - 4. Bonding jumpers
  - 5. Thermite Welding Products
- C. Shop Drawings: Furnish shop drawings showing the locations and length of grounding rods. Label the size and material used for grounding rods. Furnish details pertaining to grounding electrode conductors, grounding and grounded

conductors, grounding connections and the ground grid for buildings, structures, lighting units, manholes and handholes.

- D. Quality Control: Furnish a field report of the system ground impedance test results.

## 1.05 QUALITY ASSURANCE

- A. Codes and Standards: Construct a complete grounding system in accordance with applicable ANSI, IEEE Standards and the Electrical Code for the City of New York, NEC.UL-96A and local codes.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for review.

#### 1. Grounding and Grounded Conductors

- a. Southwire
- b. United Copper Industries

#### 2. Ground Plates

- a. Burndy Corporation
- b. OZ/Gedney Company
- c. Erico Products
- d. Thomas & Betts

#### 3. Grounding Rods

- a. Harger Lightning Protection, Inc.
- b. Thomson Industries, Inc.
- c. Carolina Galvanizing Utility Products Division
- d. Erico Products
- e. Superior Grounding Systems

#### 4. Ground Rod Access Box

- a. Strongwell – Quazite
- b. Hartford Concrete Products, Inc.

### 2.02 MATERIALS

- A. General: Provide conductor sizes as shown or required.

- B. Materials: Provide conductors in accordance with the requirements specified in Section 16121 - Wires and Cables - 600 Volts and Below.
- C. Bare Conductors: Provide bare copper conductor where buried in earth, embedded in concrete or exposed.
- D. Insulated Conductors: Provide copper conductor with green color insulation rated at 600 volts where installed in conduits or other enclosed raceways.

## 2.03 CONNECTORS

- A. Grounding Clamps and Bolted Connectors: Provide grounding clamps and bolted connectors suitable for devices or cables being connected.
- B. Ground Plates: Provide two-hole, cast, copper alloy, ground plates suitable for installation in concrete. Fabricate the ground plates with two ½-inch diameter threaded holes and a 4/0 stud for connection to the grounding system.
- C. Welding: Provide the exothermic welding process for buried, concealed and accessible connections to structural members, ground rods, and case grounds. Clean and paint welds embedded in the ground or encased in concrete with asphalt base paint.
- D. Bolted Connectors: Provide bolted connectors for grounding to ground buses and equipment.
- E. Pipe Grounding: Provide copper, brass, or bronze grounding clamps for grounding pipes. Do not provide strap type clamps.
- F. Grounding Bushings: Provide grounding bushings for conduits where conduits are not effectively grounded by firm contact to the grounded enclosure and where the raceway is required to be bonded at both ends.

## 2.04 GROUNDING RODS

- A. Length and Size: Provide grounding rods 3/4-inch in diameter and 10 feet long.
- B. Grounding Rod Material: Stainless steel.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General
  - 1. Install conductors to preclude exposure to physical damage.
  - 2. Install connections firm and tight.

3. Arrange conductors and connectors without placing strain on the connections.
4. Bury equipment grounding conductors as shown, or at a minimum of 12 inches below grade.
5. Bring loops or taps up for connection to equipment or other items to be grounded.
6. Install an insulated grounding conductor in all conduits.
7. When raceways are used to contain and protect grounding conductors, install in accordance with Section 16130- Electrical Raceway Systems of the Electrical Contract, Electrical Code for the City of New York and NEC.
8. Where conductors are installed in nonmetallic raceway, provide the grounding conductor in addition to the neutral wire, sized in accordance with Electrical Code for the City of New York and NEC or as scheduled.
9. Perform exothermic welding with properly sized molds and in strict compliance with the manufacturer's instructions.
10. All concealed ground connections not subject to inspection or test shall be made with exothermic welds.

**B. Grounding Rod Installation**

1. Install grounding rods as shown with the top of the rod a minimum of 12 inches below grade.
2. Drive grounding rods into permanently moist soil.
3. Provide additional ground rod sections as required to reach permanently moist soil.
4. Provide cast iron junction box without bottom for access to grounding rod and conductor where shown.

**C. Equipment Grounding**

1. Ground each piece of electrical equipment using a conductor in the raceway feeding the equipment in accordance with Electrical Code for the City of New York and NEC.
2. Unless specified otherwise, connect transformer enclosures and neutrals to the grounding system. Connect the neutral ground connection at the transformer terminal. Make the connection from the ground grid to the

ground bus and enclosures of switchgears and motor control centers, lighting and distribution panelboards, and control, relay and instrumentation panels.

3. Provide two separate, independent, diagonally opposite connections for power transformers so removal of one connection will not impair continuity of the ground system. Provide ground plates that are imbedded in the concrete pad so that transformers can be removed without damaging grounding system. Install a copper ground connect between ground plates and the transformers.
  4. Connect the Engine Generator neutral and the enclosure to the enclosure ground bus and to a ground electrode.
- D. Grounding Conductors: Connect the grounding conductor between the equipment and the grounding system. Where a ground bar is furnished with the panelboard, connect the grounding conductor to the bar.
- E. Miscellaneous Grounding: Provide grounding for the following:
1. Ground receptacles and switches and their metal plates through positive ground connection to the yoke/strap, outlet box and grounding system grounding wire installed in the conduit.
  2. Ground racks, supports, frames, covers and metal parts in manholes or handholes, controllers, motor frames, surge capacitors, arrestors, lighting fixtures, metal structures (including fences), exposed noncurrent carrying metal, mechanical equipment, hoist beams, cranes and similar items.
  3. Provide ground connections to equipment using ground plates imbedded in the concrete pad so that the equipment can be removed without damaging grounding system. Provide a copper ground connection between ground plates and the equipment.

### 3.02 FIELD QUALITY CONTROL

- A. Tests: Conduct a witnessed test to determine the ground impedance for the entire system using a ground loop impedance tester. Provide a maximum impedance of 2 ohms at any point of the test. Add additional grounding rods if necessary to meet this requirement.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16071**  
**SUPPORTING DEVICES**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section Includes: Requirements for providing supporting devices for electrical equipment and raceways in accordance with the Contract Documents. The supporting devices shall be a complete system for the equipment. The work shall include providing all required support devices to properly mount and secure all equipment furnished under this Contract. This section also includes equipment anchorage and restraints suitable to meet the specified seismic requirements.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods  
B. Section 16130 - Electric Raceway System  
C. Section 16210 - Electric Services

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
1. ASTM A569 - Specification for Steel, Carbon, Hot-Rolled Sheet and Strip Commercial Quality
  2. ASTM A570 - Specification for Steel, Sheet and Strip, Carbon, Hot-Rolled, Structural Quality
  3. ASTM B633 - Specification for Electrodeposited Coatings of Zinc On Iron and Steel
  4. AISI - Standard for Stainless Steel
  5. MFMA-1 - Standard Publication for Metal Framing
  6. ANSI/NFPA 70 - National Electrical Code
  7. NYCBC - New York City Building Code

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.

- B. Product Data: Furnish manufacturer's catalog cuts for the supporting devices proposed for use with specifications and other data required to demonstrate compliance with the specified requirements.
- C. Working Drawings: Furnish scaled working drawings showing dimensions and locations of all items and clearance requirements.

#### 1.05 QUALITY ASSURANCE

- A. Codes: Provide all materials and workmanship to meet the requirements of the NYCBC and ANSI/NFPA 70 National Electrical Code.
- B. Regulatory Requirements: Provide UL listed components.
- C. Design Standard: Design all support devices as follows:
  - 1. All channels, fittings and hardware used in the supporting system shall be in accordance with MFMA-1.
  - 2. The design of the support system shall be the responsibility of the Contractor. The Contractor shall provide the proper sized rods, channels, fittings, brackets and appurtenances necessary to adequately support the equipment.
  - 3. Quality Control: Furnish a signed and sealed certification from a Professional Engineer registered in New York stating that the design calculations and drawings for the support details for equipment exceeding 50 pounds in weight were prepared by that Professional Engineer or under his direct supervision.
- D. Seismic requirements: Provide support devices designed for following seismic requirements:
  - 1. Equipment assemblies such as secondary unit substations, switchgear, motor control centers and panelboards shall be certified to meet seismic requirements in accordance with the requirements specified in the applicable sections of the Specifications.
  - 2. The Contractor shall provide equipment anchorage details for all equipment certified to meet seismic requirements. The details shall be coordinated with the manufacturer's equipment mounting provisions.
  - 3. Electric conduit shall include seismic restraints.
- E. Quality Control: Furnish a signed and sealed certification from a Professional Engineer registered in New York stating that the design calculations and drawings for the seismic anchorage and restraint details were prepared by that Professional Engineer or under his direct supervision.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Allied Tube and Conduit
2. B-Line Systems, Inc.
3. Kindorf
4. Enduro
5. Strut Tech
6. Unistrut

### 2.02 CHANNELS, FITTINGS AND BRACKETS

- A. Provide channels, fittings, brackets and related hardware for mounting and supporting the electrical equipment. Anchor bolts, concrete inserts and related hardware for proper support of equipment shall also be provided. All equipment necessary to meet the seismic requirements specified shall be provided.
- B. Provide channels conforming to ASTM A569 or A570. Channels shall have a minimum thickness of 12-gauge. The cross sectional width dimension shall be 1-1/2 inch minimum. The depth shall be as required to satisfy load requirements but not less than 1-1/2 inch.
- C. Provide factory punched attachment holes, when required, on hole centers approximately equal to the cross sectional width and 9/16-inch diameter.
- D. Provide fittings and brackets having 9/16-inch diameter holes on centers identical to the channel or as required to align with the channel holes. Provide fittings and brackets having the same width as the channel and shall be 1/4 inch thick minimum. Provide fittings and brackets that mates properly with the channel.
- E. Provide all channels, fittings, brackets and related hardware manufactured from steel and having an electro-plated zinc finish according to ASTM B633.
- F. In corrosive areas, provide type 316 stainless steel or PVC coated channels, fittings, brackets and related hardware.

### 2.03 CONDUIT HANGERS, SUPPORTS AND INSERTS

- A. Provide channels, rods, straps, anchors and related hardware for support of the exposed electric conduit system as specified in Section 16130 – Electric Raceway System.
- B. Provide anchor bolts, concrete inserts and related hardware for proper support of equipment. Provide all equipment necessary to meet the seismic requirements.

- C. Provide conduit hangers, supports and inserts in accordance with Section 16130 - Electric Raceway System.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Provide all supporting devices installed level, parallel and perpendicular to building walls and floors, such that the support system is installed in a neat and professional manner.
- B. Provide all holes in hung ceilings for support rods and other equipment made adjacent to bars where possible, to facilitate removal of ceiling panels.
- C. Provide channels, fittings and brackets that are rigidly bolted together and braced to make a substantial supporting framework support system.
- D. Where motor control centers, switchgear, unit substations and other electrical equipment are being installed on concrete pads, furnish leveling channels for installation in the concrete pads. Anchor seismic certified equipment in accordance with the seismic anchorage details.
- E. Provide all equipment fastenings to steel columns, beams and trusses by beam clamps. In lieu of beam clamps, equipment may be welded to steel structures, subject to Engineer approval.
- F. Do not drill holes in any steel columns, beams and trusses.
- G. Provide hanger rod supports installed such that threaded rod is parallel and perpendicular to building walls and floors.
- H. When galvanized steel channel is cut in the field, the cut ends shall be treated with a rust preventative to retard corrosion.

-END OF SECTION-

**Section 16075**  
**ELECTRICAL IDENTIFICATION**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Requirements for providing materials for the identification of electrical equipment, components, conduits, cables and wiring, and furnishing and installing safety signs.

**1.02 REFERENCES**

- A. Codes and standards referred to in this Section are:
1. ANSI C2 - National Electrical Safety Code (NESC)
  2. ANSI Z535.1 - Safety Color Code
  3. ANSI Z535.2 - Environmental and Facility Safety Signs
  4. ANSI Z535.3 - Criteria for Safety Symbols
  5. OSHA - Occupational Safety and Health Act
  6. OTCR - Office Technical Certification and Research
  7. NYCEC - New York City Electrical Code

**1.03 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1.
- B. Product Data and Information: Furnish manufacturer's catalog data for safety signs, nameplates, labels and markers.
1. Furnish manufacturer's instructions indicating application conditions and limitations of use; and storage, handling, protection, examination and installation of product.
- C. Contractor's Record Drawings: Furnish Contractor's Record Drawings accurately showing actual location of markers for underground ducts, handholes and manholes, at completion of the Project.

**1.04 SPARE PARTS**

- A. Furnish the following spare parts.
1. Ten safety signs of each size and wording.
- B. Packaging: Package spare parts in containers bearing labels clearly designating contents. Identify all spare parts with information needed for reordering. Deliver spare parts in original factory packages.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. W. H. Brady Company
2. Seton
3. Thomas & Betts

## 2.02 MATERIALS AND COMPONENTS

- A. General: Provide identification materials listed and classified by OTCR, UL or tested by an acceptable Electrical Testing Company certifying the equivalence of the materials to UL listing requirements and OSHA approved.

- B. Laminated Plastic Nameplates: Provide engraved three-layer laminated plastic nameplates with black letters on white background and fastened with corrosion-resistant screws. Do not use mounting cement for fastening nameplates.

1. Provide nameplates with 1-inch high lettering for switchgears, switchboards, motor control centers, control panels, relay panels, contactor panels, panelboards, and similarly grouped equipment, transformers and disconnect switches.
2. Provide nameplates with ½-inch high lettering for individual components of a group such as main breakers, switchgear units, switchboard units, motor control center units and similar devices.
3. Provide nameplates with ¼-inch high lettering for remote motor controllers, control stations, relays and similar equipment.
4. Provide nameplates for each motor identifying service or function and lettering of an appropriate size to suit each motor.
5. Provide approved laminated directories of circuits with typewritten designations of each branch circuit in each panelboard.
6. Provide smaller lettering for a neat, legible nameplate where the amount of lettering makes for excessively large nameplates.

- C. Wire Markers: Identify wire bundles and each individual wire.

1. Wire bundles: Provide a brass or rigid fiber identifying tag attached with nylon self locking "Ty-Raps".

2. Wire identification markers: Provide a printed white, heat-shrink, seamless tubing type with black bold lettering for wires size No. 10 AWG and smaller. Provide a printed self-laminating white, vinyl type with black bold lettering for wires No. 8 AWG and larger.
- D. Safety Signs: Provide safety signs in accordance with OSHA standard meeting the requirements of ANSI C2, ANSI Z535.1, ANSI Z535.2 and ANSI Z535.3.
1. Provide safety signs manufactured from vinyl having a minimum thickness of 60 mils with red and black letters and graphics on a white background.
  2. Size: 10 inches by 14 inches except signs 7-inch by 10-inch may be provided where the larger size cannot be applied.
  3. Mount safety signs using corrosion-resistant screws. Do not use mounting cement.
- E. Arc Flash: Provide Arc Flash Hazard Tags of the type required by NFPA 110.16.

### PART 3 EXECUTION

#### 3.01 PREPARATION

- A. Surface Preparation: Degrease and clean surfaces to receive nameplates, labels and marking paint.

#### 3.02 INSTALLATION

- A. General: Install nameplates on the front of equipment, parallel to the equipment lines and secured with corrosion resistant screws.
1. Install laminated nameplates identifying:
    - a. Each electrical equipment enclosure
    - b. Individual equipment and devices
- B. Wire Markers: Identify wire bundles and each individual wire with identification tags as follows:
1. Wire Bundles: Install an identifying tag engraved with the conduit number where conduits enter motor control centers, switchgear, switchboards, control panels, terminal boxes and the like.
  2. Wire identification markers: Provide wire identification markers on each wire at all termination points.
    - a. On power and lighting circuits: The branch circuit or feeder number as indicated on Contract Drawings

- b. On control circuits terminated in motor control centers, switchgears, control panels and alike: The field device and terminal number of the opposite end connection.
    - c. On control circuits at each field device: The panel or compartment number and terminal number of the opposite end connection.
  - 3. Oversize wire markers so that after heat shrinking the wire marker can be rotated on the wire. Rotate wire markers so that wire identification number is visible.
- C. Safety Signs: Provide safety signs as follows or as shown:
  - 1. Type DS-1
    - a. Wording: "DANGER - BATTERY CHARGING AREA, NO SMOKING"
    - b. Location: Within 3 feet of all battery racks.
  - 2. Type DS-2
    - a. Wording: "DANGER - ELECTRICAL EQUIPMENT, AUTHORIZED PERSONNEL ONLY"
    - b. Location: At each entrance to electrical rooms, and enclosed outdoor electrical equipment.
  - 3. Type DS-3
    - a. Wording: "DANGER - HIGH VOLTAGE, KEEP OUT"
    - b. Location: At each entrance to electrical rooms, and enclosed outdoor electrical equipment operating at over 600 Volts. Also, on the sides of fences or walls which enclose outdoor equipment operating at over 600 Volts.
  - 4. Type DS-4
    - a. Wording: "DANGER - HIGH VOLTAGE"
    - b. Location: Outside all equipment operating at over 600 Volts.
  - 5. Type DS-5
    - a. Wording: "DANGER - POWERED FROM MORE THAN ONE SOURCE"

- b. Location: Outside all equipment that operates from more than one power source.
- 6. Type DS-6
  - a. Wording: "NOTICE - KEEP DOOR CLOSED"
  - b. Location: On all doors with another safety sign installed.
- 7. Type DS-7
  - a. Wording: "CAUTION - CONTROLS & INTERLOCKS POWERED FROM MULTIPLE SOURCES"
  - b. Location: On all control panel doors.
- 8. Arc Flash: Provide Arc Flash Hazard Tags of the type required by NFPA 70 110.16

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 16080**  
**ELECTRICAL TESTING REQUIREMENTS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements of field acceptance testing of materials and equipment provided under various other sections to determine suitability for installation and energization. Requirements of field testing and certification of electrical equipment and materials provided under various other sections to assess their meeting the requirements of the City of New York and equivalence to UL Inc. listing/labeling.

**1.02 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NETA - International Electrical Testing Association
2. NIST - National Institute of Standards and Technology
3. OTCR- Office of Technical Certification and Research
4. NYCBC - New York City Building Code

**1.03 SUBMITTALS**

- A. General: Furnish all submittals including the following, as specified in Section - 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.

1. Acceptance Testing Reports: Furnish acceptance testing reports for all equipment and materials including the following information:
  - a. Summary of the test
  - b. Description of material or equipment tested
  - c. Description of test including acceptable test values
  - d. Test results
  - e. Analysis of test results with recommendations
2. UL Testing: Furnish standard test parameters in accordance with the acceptable codes and standards for all the equipment and materials tested for equivalence to UL listing.
3. UL Test Reports and Certificates: Furnish test reports and certificates for all equipment and materials tested for equivalence to UL listing, for approval.
4. All submittals shall comply with the requirements of the OTCR.

## PART 2 PRODUCTS

### 2.01 TESTING COMPANIES

A. Acceptable testing companies are as listed below:

1. MET Electrical Testing Co., Inc.
2. ASET Power Systems Services, Inc.
3. Electric Power Systems, Inc.
4. Electro-Test, Inc.
5. High Voltage Maintenance Corp.
6. UL Underwriters Laboratories, Inc.
7. Other OTCR, OSHA and NETA approved testing facilities

### 2.02 SOURCE QUALITY CONTROL

- A. Tests: Furnish all testing and certification in accordance with the latest NETA, ANSI, IEEE and NEMA Standards to meet the UL requirements, NFPA Standards, OTCR, NYCBC and NEC.
- B. Test Equipment: Furnish all testing equipment, cables and appurtenances required to perform all tests and certifications in accordance with the following:
1. Use instruments that have been calibrated, to assure that they are within rated accuracy in accordance with NIST.
  2. Select test instruments that are appropriate for the variable being measured.

## PART 3 EXECUTION

### 3.01 TESTING AND CERTIFICATION

- A. Furnish the test reports and certifications for UL equivalence prior to acceptance of all materials and equipment requiring such tests and certifications.
- B. All materials that require acceptance shall be subject to the OTCR procedures and processes.

### 3.02 ACCEPTANCE TESTING

- A. Furnish acceptance test reports prior to acceptance of all materials, equipment and installations requiring such tests.

-END OF SECTION-

**Section 16085**  
**SHORT CIRCUIT AND COORDINATION STUDY**

**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Short circuit and coordination study for the entire power distribution system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16080 - Electrical Testing Requirements
- B. Section 16210 - Electric Service
- C. Section 16220 - Electric Motors
- D. Section 16230 - Packaged Engine Generator Systems
- E. Section 16411 - Disconnect Switches
- F. Section 16430 - 480 Volt Switchgear
- G. Section 16445 - Motor Control Centers
- H. Section 16443 - Panelboards
- I. Section 16415 - Automatic Transfer Switches
- J. Section 16491 - Control Components and Devices

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. IEEE 242, "IEEE Recommended Practices for Protection and Coordination of Industrial and Commercial Power Systems"
  - 2. IEEE 399, "IEEE Recommended Practices for Industrial and Commercial Power Systems Analysis"
  - 3. NEC - National Electrical Code
  - 4. NYCBC - New York City Building Code

**1.04 SYSTEM DESCRIPTION**

- A. Furnish a short circuit and coordination study for the entire distribution system. Include the following in the short circuit study:
  - 1. One-line diagram of the entire distribution system identifying all components considered and ratings of all power devices. Use ANSI device numbers to identify all protective devices.
  - 2. Calculation of momentary and interrupting fault duties for each bus.

3. Calculation of bus-to-bus impedance values reduced to a common MVA base.
4. Individually consider all motors 100 horsepower and greater. Group motors less than 100 horsepower into one equivalent motor at the motor control center bus or switchboard distribution section.
5. A table indicating the rating of each interrupting device related to the calculated duty, and suggest changes when appropriate.
6. A table showing settings for all adjustable devices. Furnish these settings as a practical compromise between protection of equipment and coordination of downstream devices.
7. Time-current coordination curves to illustrate the protection and coordination achieved. Furnish these curves that include:
  - a. Appropriate NYCBC and NEC protection points
  - b. Appropriate ANSI protection points
  - c. Transformer magnetizing inrush and through-fault protective curve
  - d. Motor starting characteristics
  - e. Cable damage limit levels
  - f. One-line diagram of system plotted
  - g. Short circuit current levels at system start and at operating voltage.
8. Analysis and recommended settings for all adjustable overvoltage, undervoltage and voltage unbalance protective devices. Include voltage and time delay settings.

#### 1.05 SUBMITTALS

- A. Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings.
  1. An executive summary of the study results and data
  2. A tabulation of all protective device ratings compared with calculated fault duties
  3. A tabulation of settings for all adjustable protective devices
  4. Copies of all time-current coordination curves
  5. Analysis of the data that led to the conclusions and recommendations included in the executive summary
  6. The one-line diagram of the system studied, including all rating and identifications

7. Copies of all computed results referenced to the one-line diagram and the impedance listing
  8. Furnish six bound copies of the final report
  9. Furnish four CD-ROM containing the following:
    - a. Complete copy of the report in PDF format
    - b. Acrobat Reader
    - c. Distribution system one-line diagrams in AutoDesk AutoCAD latest version drawing format.
    - d. All short circuit and coordination study input data and component library files in format suitable for input into SKM PowerTools.
    - e. All voltage data.
  - B. A preliminary estimate of the available short circuit levels for major electrical equipment shall be submitted with the equipments' shop drawing to verify the ratings of same are adequate for this application.
- 1.06 QUALITY ASSURANCE
- A. Qualifications: Conduct the study using a power-system engineering, study or analysis organization with the following qualifications:
    1. Three or more years experience on this type of work
    2. A proven computer program for performing 3-phase fault-duty calculations
    3. Demonstrated capability for calibrating and setting protective devices
    4. Furnish the services of a lead individual for the study who has a minimum of three years experience in performing 3-phase, fault-duty calculations.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. General: Gather the necessary data to complete the short circuit and protective curve coordination calculations. Obtain from field surveys and shop drawings informational data pertaining to product manufacturer, type and rating of PT's, CT's circuit breakers, fusing, relays, auxiliaries, and the like. Distribution equipment and shop drawing data may be reviewed at the site.

- B. Data: Estimate the lengths and sizes of cables shown on the one-line diagrams from the Contract Drawings or from field observations and measurements.

### 3.02 SHORT CIRCUIT STUDY AND PROTECTIVE DEVICE EVALUATION STUDY

- A. General: Include in the input data for the short circuit study the power company's short circuit contribution, resistance and reactance components of the branch impedances, the X/R ratios, base quantities selected, and other source impedances.
- B. Calculations: Calculate the three-phase, bolted, short circuit and single-phase, line-to-ground short circuit current values. Calculate close and latch duty values and interrupting duty values on the basis of calculated three-phase, bolted, short circuit currents at each bus. Buses include, but are not limited to, transformers, switchgears, medium-voltage motor control centers, switchboards, low-voltage motor control centers, distribution panelboards, pertinent branch circuit panels, automatic transfer switches and other significant locations throughout the system. Include in the short circuit tabulations symmetrical fault currents and X/R ratios. List for each fault location, the total duty on the bus, as well as the individual contribution from each connected branch, with its respective X/R ratio.
- C. Protective Device Evaluation Study: Perform a protective device evaluation study to determine the adequacy of circuit breakers, molded case switches, automatic transfer switches, and fuses by tabulating and comparing the short circuit ratings of these devices with the calculated fault currents. Apply appropriate multiplying factors based on system X/R ratios and protective device rating standards.

### 3.03 PROTECTIVE DEVICE COORDINATION STUDY

- A. General: Perform a protective device coordination study to provide the necessary calculations and logic decisions required to select or to check the selection of power-fuse ratings, protective-relay characteristics and settings, ratios and characteristics of associated current transformers, and low-voltage, breaker trip characteristics and settings.
- B. Study Items: Include in the coordination study all medium and low voltage classes of equipment from the building or plant service protective devices down to and including the highest rated device in the low-voltage motor control centers, Automatic Transfer Switches and panelboards. Include the phase and ground overcurrent protection as well as the settings of all other adjustable protective devices.
- C. Plotted Data: Plot the time-current characteristics of the specified protective devices on log-log paper. On the plots, include complete titles, representative one-line diagram and legends, significant motor starting characteristics, complete parameters of transformers, and the complete operating bands of low-voltage, circuit breaker, trip curves and fuses. Indicate the types of protective devices selected, proposed relay taps, time dial and instantaneous trip settings, transformer

magnetizing inrush and ANSI transformer withstand parameters, cable thermal overcurrent withstand limits and significant symmetrical and asymmetrical fault currents. Adhere to all restrictions of the Electrical Code for the City of New York, National Electrical Code and proper coordination intervals and maintain separation of characteristic curves. Furnish the coordination plots for phase and ground protective devices on a system basis. Use a sufficient number of separate curves to clearly indicate the coordination achieved.

- D. Tabulation of Data: Furnish the selections and settings of the protective devices separately, in tabulated form, listing circuit identification; IEEE device number; current transformer ratios and connection; manufacturer and type; range of adjustment and recommended settings. Furnish a tabulation of the recommended power fuse selection for the medium-voltage fuses where applied in the system.
- E. Settings: Furnish the protective relay characteristics; tap and time dial settings required by the coordination study to the switchgear manufacturer for selection of protective devices.
- F. Provide a preliminary version of the Short Circuit Study that will enable evaluation of the projects' major electrical equipment ratings prior to shop drawing submittal.

### 3.04 STUDY REPORT

- A. General: Summarize the results of the power system study in a final report.
- B. Presentation of Report: Include the following sections in the report:
  - 1. Executive Summary
  - 2. Description, purpose, basis and scope of the study and a one line diagram of that portion of the power system which is included within the scope of the study
  - 3. Tabulations of circuit breaker, fuse and other protective device ratings versus calculated short circuit duties, and commentary regarding the same
  - 4. Protective-device, time-versus-current, coordination curves; tabulations of relay and circuit breaker trip settings; fuse selections, and commentary regarding the same
  - 5. Fault current calculations including a definition of terms and guide for interpretation of computer printout

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16121**  
**WIRES AND CABLES - 600 VOLTS AND BELOW**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing all wires and cables rated at 600 volts and below for complete electrical systems as shown.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods
- B. Section 16075 - Electrical Identification
- C. Section 16741 - Paging System
- D. Section 16751 - Access Control System
- E. Section 16752 - Digital Video System
- F. Section 13851 - Fire Alarm and Detection System
- G. Section 16723 - Fiber Optic Cable
- H. Division 17 - Instrumentation

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. ASTM B 3 - Standard Specifications for Soft or Annealed Copper Wire
  - 2. ASTM B 8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
  - 3. ASTM B33 - Standard Specification for Tinned and Annealed Copper Wire.
  - 4. ASTM B496 - Standard Specification for Compact Round Concentric Lay Stranded Copper Wire
  - 5. TIA/EIA 568-A - Commercial Building Telecommunications Cabling Standard
  - 6. NYCBC - New York City Building Code

**1.04 SUBMITTALS**

- A. Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's catalog data for each type of wire and cable furnished.

## 1.05 QUALITY ASSURANCE

- A. General: Furnish wire and cable in accordance with applicable IEEE and NEMA standards, meeting the requirements of the NYCBC, NEC and UL listed.
- B. Tests: Furnish cables factory tested prior to shipment in accordance with ICEA standards for the insulation specified.
- C. Installer Qualifications: Cabling installer must have on staff personnel certified by Building Industry Consulting Service International.
  - 1. Installation Supervision: Installation shall be under the direct supervision of a registered technician.
- D. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory.
  - 1. Testing Agency's Field Supervisor: Person currently certified by Building Industry Consulting Service International as a Registered Communications Distribution Designer (RCDD) to supervise field quality control testing.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle wire and cable in accordance with the manufacturer's instructions and as specified in Division 1.
- B. Storage: Store cable reels on concrete or other hard surface or on 2x4 wood laggings.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Wire and Cable
    - a. United Copper Industries
    - b. Southwire Company
    - c. Cerrowire
    - d. The Okonite Company

2. Instrumentation Cable
  - a. Belden
  - b. Dekoron
  - c. The Okonite Company
3. Multiconductor Cable (Power)
  - a. The Okonite Company
  - b. Southwire Company
4. Voice, Data (Local Area Network), Data Highway, Access Control System and Digital Video Cables
  - a. Belden
  - b. Alpha
  - c. Dearborn Wire and Cable
5. Paging Cable
  - a. ComTrol International
  - b. Gai-Tronics Corporation
6. Wire Connectors
  - a. Thomas & Betts
  - b. 3 M/Electrical Products Division
  - c. Ideal
7. Color Coding Marker
  - a. W. H. Brady Company
  - b. Thomas & Betts
8. Fire Alarm Cables
  - a. Lake Cable
  - b. Belden
  - c. Rockbestos Superant

## 2.02 MATERIALS

- A. Conductors: Provide soft drawn or annealed copper conductors with 98 percent minimum conductivity, meeting requirements of ASTM B 3 (solid) or ASTM B 8 (stranded). Use stranded conductors except solid No. 12 and No. 10 AWG may be used in lighting fixture and convenience outlet wiring.

B. Insulation: Provide wires and cables with insulation as follows:

1. Power, control and lighting wiring

a. Single Conductor: Provide insulation as follows:

<u>Conductor Size</u>	<u>NEC Type Letter</u>	<u>Insulation Material</u>
Nos. 14, 12 and 10 AWG	XHHW	Cross-linked Polyethylene
No. 8 AWG and Larger up to and including 500 kcmil	RHW	Cross-linked Polyethylene
600 kcmil and Larger	XHHW	Cross-linked Polyethylene

b. Multiconductor Cables: Insulate individual conductors with 15 mils of polyethylene or PVC and 4-mil nylon jacket. Wrap the conductors with binder and an outer jacket not less than 45 mils of PVC. Use ICEA Method 1 for color coding wires.

2. Instrumentation Wiring: The manufacturer's name and catalog numbers shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.

a. Two conductor or single pair: Stranded No. 16 AWG wire, 600 volt polyethylene insulation, twisted conductors, tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and outer jacket of PVC. Belden Cat. No. 8719.

b. Three Conductor: Stranded No. 16 wire, 600 volt polyethylene insulation, twisted conductors, tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and outer jacket of PVC. Belden Cat. No. 8618.

c. Multiple Pairs or Triads: Provide individually shielded pairs or triad of stranded No. 16 AWG wire with overall shield. Insulate each wire for 600 volts with 15 mils of PVC and a 4-mil nylon jacket. Assemble pairs or triads with tinned copper drain wire and metalized tape shield providing 100 percent shield coverage. Cable pairs or triads together with tinned copper drain wire and overall metalized tape shield.

3. Voice and Data (Local Area Network) Cable: The manufacturer's name and catalog numbers shown below are for the purpose of establishing quality and

general configuration. Equivalent products of other manufacturers may be submitted for approval.

- a. Voice Cable: Category 6, provide cable having third party verification to TIA/EIA 568-B.2-1 Category 6 requirements and constructed of four pair of stranded No. 23 AWG solid copper wire, polyethylene or polypropylene insulation and outer jacket of gray PVC. Belden Cat. No. 1872A.
  - b. Data Cable: Category 6, provide cable having third party verification to TIA/EIA 568-A Category 6 requirements and constructed of four pair of stranded No. 23 AWG solid copper wire, polyethylene or polypropylene insulation and outer jacket of blue PVC. Belden Cat. No. 1872 -EE 3A.
4. Data Highway Cable: The manufacturer's name and catalog number shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
    - a. Twinaxial: Provide stranded No. 20 AWG tinned copper wire (9.5 ohms/ 1000'), 78 ohm nominal impedance, 300 volt polyethylene insulation, tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and 55 percent tinned copper braid shield (4.1 ohms/1000') and outer jacket of blue PVC. Belden Cat. No. 9463.
  5. Constant Tension Winch Encoder Cable: The manufacturer's name and catalog number shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
    - a. Four pair: Provide individually shielded pairs of tinned No. 24 AWG copper wire, 300 volt polyethylene insulation, twisted conductors, tinned No. 24 AWG copper drain wire, overlapped metalized tape providing 100 percent shield coverage and outer jacket of PVC. Belden Cat. No. 9728.
  6. Paging System Cable: Provide cables compatible with the paging system specified in Section 16741 - Paging System. The manufacturer's name and catalog number shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
    - a. Paging cable: Provide sixteen soft drawn bare copper conductor cable consisting of one twisted pair #18 AWG (page line); five twisted pairs #18 AWG (party lines); one 18 AWG (control); one twisted pair #14

AWG (power) and one #14 AWG (ground). ComTrol International Cat No. WI2913.

7. Access Control System Cables: Provide cables compatible with the access control system specified in Section 16751 – Access Control System. The manufacturer's name and catalog numbers shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
  - a. Twelve conductor-Twenty Four Volt Power Cable: Provide stranded conductor No. 16 AWG wire, 600 volt PVC insulation, twisted conductors and outer jacket of PVC. Belden Cat. No. 7427A.
  - b. Door Position Cable: Provide stranded two conductor No. 18 AWG wire, 600 volt PVC insulation, twisted conductors and outer jacket of PVC. Belden Cat. No. 7409A.
  - c. Electrical Strike/Electric Mortise Lock Cable: Provide stranded two conductor No. 18 AWG wire, 600 volt PVC insulation, twisted conductors and outer jacket of PVC. Belden Cat. No. 7409A.
  - d. Exit Push-button Cable: Provide stranded two conductor No. 18 AWG wire, 600 volt PVC insulation, twisted conductors and outer jacket of PVC. Belden Cat. No. 7409A.
  - e. Entry Card Reader Cable: Provide stranded seven conductor No. 20 AWG wire, 600 volt PVC insulation, twisted conductors, tinned copper braid shield and outer jacket of PVC. Belden Cat. No. 7404AS.
8. Digital Video System Cable: Provide cables compatible with the digital video system specified in Section 16752 – Digital Video System. The manufacturer's name and catalog numbers shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
  - a. Twelve conductor-Twenty Four Volt Power Cable: Provide stranded two conductor No. 16 AWG wire, 600 volt PVC insulation, twisted conductors and outer jacket of PVC. Belden Cat. No. 7427A.
  - b. Four Conductor: Stranded No. 16 wire, 600 volt PVC insulation and outer jacket of PVC. Belden Cat. No. 7423A.
  - c. Digital Video Category 6 Cable: Category 6, provide cable having third party verification to TIA/EIA 568-B 2-1 Category 6 requirements and constructed of four pair of twisted No. 23 AWG solid copper wire,

polyethylene or polypropylene insulation and outer jacket of orange PVC. Belden Cat. No. 1872A.

- d. Digital Video Coax RG-59/U Cable: Provide coaxial cable with 75-ohm nominal impedance with a maximum attenuation of 8 dB/100 ft from 7 to 1000 MHz consisting of No. 20 AWG, solid, copper conductor; gas-injected, foam-HDPE insulation. Double shielded with 100 percent aluminum polyester tape and a copper braid, orange PVC jacket Belden Cat. No. 1505A.
9. Fire Alarm Cable: Provide cables compatible with the fire alarm system specified in Section 13851 Fire Alarm and Detection System. The manufacturer's name and catalog numbers shown below are for the purpose of establishing quality and general configuration. Equivalent products of other manufacturers may be submitted for approval.
- a. Plenum Cable: Provide NEC Type FPLP cable consisting of two solid conductor No.16 AWG, 300 volt FEP insulation, tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and red Flamarrest outer jacket. Belden Cat. No. 6220FK.
  - b. Riser Cable: Provide NEC Type FPLR-CIC cable consisting of two solid conductor No.16 AWG, 300 volt silicone rubber insulation with tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and red FRPE outer jacket. Belden Cat. No. 5220FZ.
  - c. General Purpose Cable: Provide NEC Type FPL cable consisting of two solid conductor No.16 AWG, 300 volt foam high-density polyethylene insulation with tinned copper drain wire, overlapped metalized tape overall shield providing 100 percent shield coverage and red PVC outer jacket. Belden Cat. No. 5220FJ.
- C. Printed Data on Covering: Provide the following information printed on the surface of all wires and cables at regular intervals throughout the entire length.
1. Manufacturer or trade name
  2. Size of conductor
  3. Type of insulation
  4. Voltage classification

## 2.03 WIRE CONNECTIONS AND CONNECTING DEVICES

- A. Connectors for No. 10 AWG and Smaller: Provide insulated compression type butt connectors.

- B. Connectors for No. 8 AWG and Larger: Provide UL, Inc. listed compression type tube connectors for parallel or butt splices. Provide companion preformed plastic insulating covers or tape to provide insulation equal to conductor insulation.
- C. Miscellaneous Connectors: Provide preinsulated spring connectors for lighting and receptacle splices and pigtails using solid conductors. For small gage stranded conductors use connectors approved for that application.
- D. Solderless Lugs: Provide solderless terminal lugs for stranded and multiple solid conductors at connection to terminals or use UL listed crimp tool compression style lugs. All solderless lugs shall be copper. No aluminum or copper/aluminum lugs will be accepted.
- E. Control Wire Terminations: Provide spade lug or pressure type control conductor connection terminations for control wiring terminations. Provide lug bolting at devices or bus bars with a flat washer, a Belleville washer and a locknut.

## 2.04 COLOR CODING

- A. Use a vinyl impregnated cloth tape resistant to oil, dirt and heat for conductor color coding.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Swab new and existing conduits to be used to clear debris and remove moisture before conductor installation. Install conductors in raceways with no splices between boxes.
- B. Pulling Equipment
  - 1. Pull conductors using proper equipment without exceeding manufacturer's recommendation for maximum pulling tension. Protect conductor insulation jacket at all times from twists, kinks, scrapes, punctures and other damage. Replace damaged conductors. Pull wires and cables into ducts and conduit without the use of lubricants, except where such use is necessary and approved by the cable manufacturer and the Engineer. Use UL listed lubricating compound compatible with the conductor insulated jacket and with the raceway.
  - 2. Use lines of nylon or polypropylene, propelled by carbon dioxide, or compressed air, to snake or pull wire and cable into conduits. Do not use flat steel tapes or steel cables.
- C. Conductor Support: Support conductors in vertical risers with woven grips to prevent loading on conductor connectors.

- D. Seals: Provide a seal between the conductor and conduit for conduits entering buildings or from areas where the temperature change may cause condensation or moisture. Seal the conduits after the conductors are in place.
- E. Identification: Identify all cables as specified in Section 16075 - Electrical Identification.
- F. Color Coded Tape
1. Apply color coding tape at all terminations and splices with overlapping turns for a minimum length of two inches, starting two inches back from the termination point. Provide color code tape in all boxes and manholes.
  2. Provide color coding throughout the entire network for service, feeder, branch, control and low energy signal circuit conductors. Use the following color code for conductors.

COLOR CODING					
<u>SYSTEM</u>	<u>PHASE</u> <u>A</u>	<u>PHASE</u> <u>B</u>	<u>PHASE</u> <u>C</u>	<u>NEUTRAL</u>	<u>GROUND</u>
208Y/120 three phase	Black	Red	Blue	White	Green
240/120 Single phase	Black	Red	Blue	White	Green
480 & 480Y/277 three phase	Brown	Orange	Yellow	White	Green
Control and low- energy signal	Red	---	---	White	Green
Gas . Fire De- tection and Alarm Systems	Red	---	---	---	---
Instru- mentation	Tan	---	---	---	---

- G. Terminations: Leave a minimum of six inches of free conductor at each connected outlet and a minimum of nine inches at unconnected outlets.
- H. Code Requirements: Install wiring in accordance with applicable provisions of NYCBC, National Electrical Code, and as indicated.
- I. Conductor Sizing: Size conductors in accordance with the NYCBC, NEC and the following:
  - 1. Size for branch lighting circuits so that the greatest voltage drop between lighting panel and center of load does not exceed two percent at rated load.
  - 2. Size conductors to limit the maximum conductor temperature to less than 75 degrees C, except where specifically stated otherwise.
  - 3. Use minimum conductor sizes as follows:
    - a. Power and lighting branch circuits, No. 12 AWG
    - b. 120-volt control circuits, No. 14 AWG
    - c. Instrumentation and signal wiring, 2 or 3 conductors No. 16 AWG stranded shielded
  - 4. Size conductors as shown or as required by the actual load to be served, whichever is larger.
- J. Splicing: Install continuous cables without splices in all duct systems.
- K. Instrumentation wiring: Install instrumentation wiring as follows:
  - 1. Wherever possible provide continuous instrumentation wiring without splices from field device to instrument. Where connections are required, make all connections in terminal boxes.
  - 2. Terminate instrumentation wiring at terminal blocks only.
  - 3. Where instrumentation wire is required to be connected in a terminal box, provide an isolated terminal for each shield.
  - 4. Ground instrumentation shields and drain wires only at the panel end of loop.
  - 5. Install clear, heat-shrink, seamless tubing over exposed shields and drain wires in all terminal boxes, junction boxes, panels and field devices.

L. Category 6 Wiring: Install instrumentation wiring as follows:

1. Install UTP cables using techniques, practices, and methods that are consistent with Category 6 rating of components and that ensure Category 6 performance of completed and linked signal paths, end to end.
2. Do not untwist more than 1/2 inch of Categories 6 cables at connector terminations.

M. Accuracy of Information: The number and sizes of wires and conduits indicated are for guidance only and are not necessarily the correct number and sizes necessary for actual equipment installed. Install as many wires and conduits of the required size as necessary for a complete electrical system, and provide adequately for the equipment actually installed.

### 3.02 CONDUCTOR IDENTIFICATION

- A. Labeling: Label each wire at both termination points and at each splice point in junction boxes. Carry individual conductor or circuit identification throughout, with circuit numbers or other identification clearly stamped on terminal boards and printed on directory cards in distribution cabinets and panelboards.
- B. Identification: Where the total number of control and signal wires is three or more and no terminal board is provided, identify each wire in junction boxes and cabinets by means of plastic slip-on wire marker.
- C. Plastic Tags: In manholes, identify each wire by laminated plastic tag located so it can be easily seen.
- D. Color Coordination: Connect circuit conductors of the same color to the same phase throughout the installation.

### 3.03 WIRE AND CABLE CONNECTIONS TO EQUIPMENT

- A. Provide electrical connections to all equipment in strict accordance with the manufacturer's approved wiring diagrams, the Contract Drawings, or as approved. Repair or replace any damaged equipment resulting from erroneous connections.

### 3.04 CONNECTOR AND TERMINAL LUG INSTALLATION

- A. UL Requirements: Install all connectors and terminal lugs in accordance with UL requirements and manufacturer's recommendations.

### 3.05 QUALITY ASSURANCE

- A. Field Tests: Test the following 600-volt wires and cables after installation but before final connections are made up in accordance with Section 16080 - Electrical Testing Requirements:

1. All secondary feeders from the Utility transformers.
  2. All feeders between and from the low voltage switchgear assemblies.
  3. All feeders from motor control centers and Power Panels to motors 30 hp and larger.
  4. All feeders from motor control centers, to lighting panels and dry-type transformers.
  5. For the above listed cables, apply a test voltage of 1,500 volts ac for a period of 1 minute between all conductors in the same conduit, and between each conductors and ground.
  6. Any feeder or branch circuit that may have been damaged by installation conditions (excessive length of pull, unexpected resistance, pulling through a conduit body) shall be tested to determine its suitability to provide service life equal to a new undamaged cable of similar characteristic.
- B. Test Results: Make all tests and submit certified test results. Replace any cables that fail the tests.
- C. Continuity Test: Perform continuity test to demonstrate proper cable connection.
- D. Category 6 Cabling Tests: Perform the following test on the Category 6 installation:
1. Test instruments shall meet or exceed applicable requirements in TIA/EIA-568-B.2.
  2. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
  3. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
  4. Wire-map test that reports open circuits, short circuits, crossed pairs, reversed pairs, split pairs, and improper terminations.
  5. Channel and permanent link tests for cable length, insertion loss, near-end crosstalk loss, power sum near-end crosstalk loss, equal-level far-end crosstalk loss, power sum equal-level far-end crosstalk, return loss, propagation delay, and delay skew. Performance shall comply with minimum criteria in TIA/EIA-568-B.2.

6. Channel and permanent link tests shall be performed with a tester that complies with performance requirements in TIA/EIA-568-B.2, Level III. Include tests for longitudinal or transverse conversion loss.
7. Performance shall comply with minimum criteria in TIA/EIA-568-B.2.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 16122**  
**MEDIUM VOLTAGE CABLES**

**PART 1 GENERAL**

**1.01 SUMMARY**

- A. Section Includes: Requirements for providing single conductor medium voltage cables and accessories as indicated, in accordance with the Contract Documents.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electric Materials and Methods
- B. Section 16075 - Electrical Identification
- C. Section 16080 - Electrical Testing Requirements
- D. Section 16210 - Electric Service
- E. Section 16132 - Underground Electric Distribution System

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
- 1. ASTM B 8 - Specification for Concentric Lay Stranded Copper Conductors, Hard, Medium-Hard, or Soft
  - 2. ASTM B 496 - Standard Specification for Compact Round Concentric-Lay-Stranded Copper Conductors
  - 3. AEIC CS8 - Specifications for Extruded Dielectric Shielded Power Cables Rated 5 through 46 kV
  - 4. UL 1072 - Medium Voltage Power Cables
  - 5. IEEE 400 - IEEE Guide for Making High-Direct-Voltage Tests on Power Cable Systems in the Field
  - 6. NEC - National Electrical Code
  - 7. NYCEC - New York City Electrical Code
  - 8. EO-17 - Con Edison MV Cable Purchase Specification.

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electric Materials and Methods.

- B. Product Data and Information: Furnish physical and electrical catalog data for all cables and cable components and working drawings for splice kits and terminations.
- C. Quality Control: Furnish certified Shop Test Reports for all cable lengths shipped, and AEIC Qualification Test Reports.
- D. Number of Copies: Submit six copies of certification and warranties as described.

#### 1.05 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Handling: Handle the cables carefully to avoid twists and kinks or other damage to the insulation.
- C. Storage: Store cable reels on concrete or other hard surface or on 2 x 4 wood lagging.

#### 1.06 WARRANTY

- A. Written Warranty: Furnish a written 40-year minimum warranty from the cable manufacturer that the cable is free of any factory-incurred defects.
- B. Replacement if Found Defective: In the event the cable is found defective in design, material, or workmanship within the 40-year design life of the cable, remove and replace the defective portion of the cable with another cable meeting the original design specifications for the failed cable. Provide the replacement cable with the same warranty as the replaced cable and at no additional cost to the City.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. The Kerite Company
  - 2. The Okonite Company

#### 2.02 MATERIALS

- A. General: Provide single medium voltage power cable consisting of stranded copper conductors, conductor screen, insulation, insulation screen, metallic shield and outer jacket, suitable for use in wet and dry locations in conduit, underground

concrete encased ducts, directly buried, and aerial installation. Provide cables rated 90 degrees C for continuous operation, 130 degrees C for emergency overload operation and 250 degrees C for short circuit conditions, UL listed as Type MV-105 in accordance with UL 1072 and manufactured in accordance with AEIC CS8.

- B. Conductors: Provide soft drawn, annealed and uncoated copper conductors with 98 percent minimum conductivity in accordance with the requirements of ASTM B 8, with Class B stranding or compact stranding meeting the requirements of ASTM B 496. Provide conductor sizes as scheduled and as required.
- C. Conductor Screen (Shield): Provide conductor screen of an extruded layer of semiconducting, thermosetting compound.
- D. Insulation: Provide conductor insulation other than black or grey in color of a compound based on a thermosetting ethylene-propylene elastomer extruded in tandem with and inseparably bonded to the conductor screen. Provide insulation resistant to heat, moisture, impact, ozone and electrical discharge. Provide the insulation thickness as shown below:
  - 1. For nominal 13.2 kV applications
    - a. Voltage rating 15,000 volts
    - b. Insulation thickness 220 mils
    - c. Insulation level 133 percent
  - 2. For nominal 27 kV applications
    - a. Voltage rating 35,000 volts
    - b. Insulation thickness 345 mils
    - c. Insulation level 100 percent
- E. Insulation Screen (Shield): Provide insulation screen of an extruded semiconducting compound. Provide insulation screen that is easily removed without requiring the use of heat or special tools.
- F. Metallic Shield: Provide 5-mil thick helically applied coated copper tape shield over insulation screen with a 20 percent minimum overlap.
- G. Outer Jacket: Provide an outer jacket of heavy-duty thermoplastic black polyvinyl chloride (PVC).

## 2.03 COMPONENTS

- A. Splice Kit: Provide splice kits and terminations specifically designed for the application as recommended by the cable manufacturer.

- B. Connections: Provide splice and connections made up with closed end compression connectors and terminal lugs. Provide fittings and compression tools of the circular or hexagonal compression type rated for the voltage of the cable.

2.04 SOURCE QUALITY CONTROL

- A. General: Perform the following shop tests in accordance with the requirements of AEIC and furnish certified test reports for all cable lengths shipped.
1. Qualification tests
  2. High voltage ac and dc tests
  3. Insulation resistance test
  4. Partial discharge test
- B. Test Reports: Furnish certified test report for all cable lengths shipped.
- C. Cables shall comply with Con Edison applicable standards for material, installation and testing.

PART 3 EXECUTION

3.01 PREPARATION

- A. Conduit Preparation: Mandrel all new and existing conduits and duct lines before installation and swab to remove accumulated moisture and debris before cables are pulled.

3.02 INSTALLATION

- A. General: Install all medium voltage cables in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Initial Pulls: Use lines of limited stretch to pull wire and cable into conduits. Do not use flat steel tapes and steel cables.
- C. Lubricants: Provide cable lubricants recommended by the manufacturer when pulling the cables into ducts and conduits.
- D. Pull Setup: Provide complete cable pulling setup, including winches, cable reel, support frames, turning sheaves, guides and the like.
- E. Tension Meters: Connect a pulling tension meter to the pulling setup. Arrange the pulling equipment and apply pulling methods so that pulling tensions do not exceed the manufacturer's permissible limits for the cable furnished.
- F. Cable Groupings: Arrange cables securely tied, neatly bundled and racked in manholes.

- G. Splices: Do not make splices within the conduit system. Do not make splices within handholes or manholes unless approved.
- H. Fireproofing (Arcproofing): Fireproof (arcproof) all medium voltage cables installed in manholes and pullboxes. Provide fireproofing (arcproofing) with approximately 30 mils thick by 3 inches wide fireproofing tape and applied tightly around each cable spiral in one-half lapped wrapping or in a butt jointed wrapping with a second wrapping covering joints of the first wrapping. Smooth irregularities in cables, such as at splices, with insulating putty before applying fireproofing tape. Install the tape with coated side toward the cable to extend not less than one inch into conduit. Install a random wrapping of glass cloth electrical tape around installed fireproofing tape to prevent unraveling. Provide fireproofing (arcproofing) tape consisting of a flexible, conformable fabric with one side coated with a flame retardant, flexible, polymeric coating or a chlorinated elastomer. Provide tape that is non-combustive and noncorrosive to the cable sheath.
- I. Terminators: Install medium voltage termination as recommended by the cable manufacturer.
- J. Lug Bolting: Provide connections at terminals, devices and bus bars made up of a flat Belleville or equal washer, and a locknut.
- K. Unacceptable Connections: Do not use indenter type compression fittings. Mechanical splices or lugs are not acceptable.

### 3.03 IDENTIFICATION OF CIRCUITS

- A. Identify all cables in accordance with the requirements contained in Section 16075 - Electrical Identification and as follows.
- B. Color code the cables with the following color code scheme.

Phase A	-	Brown
Phase B	-	Orange
Phase C	-	Yellow
Neutral	-	White
Ground	-	Green

- C. Coding Tape: When using color coding tape apply the tape with overlapping turns for a minimum length of 2 inches starting 2 inches back from the termination point.

### 3.04 FIELD QUALITY CONTROL

- A. Inspection: Arrange inspection of the cable (including splices and terminations) installation by the manufacturer. Furnish manufacturer's certificate that the cable was installed properly.

- B. Field Tests: Arrange the performance of following field tests in presence of the Resident Engineer after terminations have been made up, but before final connections are made to equipment terminals.

1. Cable continuity test using a test light or a buzzer.
2. Cable insulation level (high voltage dc) test using approved dc HI-POT equipment in accordance with IEEE 400 for the voltage rating and insulation thicknesses given below; by an independent testing agency in accordance with Section 16080 - Electrical Testing Requirements:

Voltage Rating	Insulation Thickness	dc Test Voltage	Time of Application
15,000 volts	220 mil	65 kV	15 Minutes
35,000 volts	345 mil	100 kV	15 Minutes

-END OF SECTION-

**Section 16130**  
**ELECTRICAL RACEWAY SYSTEMS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing electrical raceway systems as indicated, in accordance with the Contract Documents.

**1.02 RELATED SPECIFICATIONS**

1. Section 09912 - Interior Painting
2. Section 16050 - Basic Electrical Materials and Methods
3. Section 16071 - Supporting Devices
4. Section 16132 - Underground Electrical Distribution System

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. ANSI C80.1 - Specifications for Rigid Steel Conduit, Zinc Coated
2. ANSI C80.3 - Specifications for Electrical Metallic Tubing, Zinc Coated
3. ANSI/NFPA 70 - National Electrical Code
4. NEMA RN1 - Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit
5. NEMA TC2 - Electrical Plastic Tubing (EPT) and Conduit (EPC-40 and EPC-80)
6. NEMA TC14 - Reinforced Thermosetting Resin Conduit (RTRC) and Fittings
7. UL 1 - Flexible Metal Conduit
8. UL 6 - Rigid Metal Conduit
9. UL 360 - Liquid-Tight Flexible Steel Conduit
10. UL 651 - Schedule 40 and 80 Rigid PVC Conduit
11. UL 797 - Electrical Metallic Tubing

- 12. NYCBC - New York City Building Code.
- 13. ETL PVC001 - Intertek SEMCO Coating Adhesion Test

#### 1.04 SUBMITTALS

- A. Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
  - 1. Certification of training for installation of PVC Coated RGS raceways for each individual installer and supervisor/foreman. Certificates shall be issued and signed by the raceways manufacturer or their representative.
  - 2. Manufacturers' product data and engineering information for each product they supply under this section of the specification.
  - 3. Raceway layouts for equipment indicated on the project plans, as required by section 16050. This includes raceways, pull/junction boxes and terminal boxes.
  - 4. Raceway layouts for all branch circuits that supply lighting, receptacles, 1 phase motors and heaters, telephone/data/paging, security (access control and CCTV), fire detection and alarm and other loads where raceway layouts are not indicated on the plans.

#### 1.05 QUALITY ASSURANCE

- A. Codes: Provide all materials and workmanship to meet the requirements of the NYCBC and ANSI/NFPA 70 National Electrical Code.
- B. Regulatory Requirements: Provide UL listed components.
- C. Provide verification of PVC coated raceway and fitting coating compliance with references and applicable standards.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle all products and materials as specified in Division 1.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

## 1. Rigid Steel Conduits and Electrical Metallic Tubing

- a. Allied Tube and Conduit
- b. Wheatland Tube Company
- c. LTV Steel Tubular Products Company

## 2. PVC Coated Steel Conduits Fitting and Boxes

- a. KorKap
- b. Perma-Cote Industries
- c. Plasti-Bond

## 3. Rigid Nonmetallic Conduits

- a. Prime Company
- b. Certainteed Corporation
- c. National Pipe Company

## 4. Fiberglass Conduits

- a. Champion Fiberglass Inc.
- b. FRE Composites

## 5. Liquidtight Flexible Steel Conduit

- a. Electri-Flex Company
- b. The International Metal Hose Co.
- c. Alflec Corp.
- d. Anamet, Inc.

## 6. Conduit Fitting and Connectors

- a. Appleton Electric Company
- b. Thomas & Betts
- c. Crouse Hinds Company
- d. OZ/Gedney Company
- e. Killark
- f. Adalet-PLM

7. Boxes and Enclosures
  - a. Appleton Electric Company
  - b. Raco/Bell
  - c. Crouse Hinds Company
  - d. Thomas & Betts
  - e. Hoffman
  - f. Hope
  - g. OZ/Gedney Company
8. Fire Stop System
  - a. 3M/Electrical Products Division
  - b. International Protective Coatings
  - c. Nelson Electric
9. Terminal Blocks
  - a. Phoenix Contact
  - b. Entrelec
  - c. Weidmuller

## 2.02 RACEWAYS

- A. General: Provide minimum 3/4-inch raceways.
- B. Raceway Requirements: Provide raceways meeting the following requirements:
  1. Provide rigid steel, heavy wall, hot-dip galvanized in accordance with the requirements of UL-6 and ANSI C80.1.
  2. Provide electrical metallic tubing hot dip galvanized conduit in accordance with the requirements of UL 797 and ANSI C80.3.
  3. Provide PVC coated rigid steel in accordance with the requirements for rigid steel raceway herein and with 40 mils bonded PVC exterior coating meeting requirements of NEMA RN-1. Provide a nominal 2 mil urethane interior coating and a clear urethane coating over the galvanized threads.
  4. Provide rigid nonmetallic Schedule 40 PVC conduit in accordance with requirements of NEMA TC2 and UL 651 with solvent cement joints.
  5. Provide rigid nonmetallic fiberglass/epoxy conduit in accordance with requirements of NEMA TC14 with epoxy adhesive joints.
  6. Provide liquidtight flexible single strip steel, hot-dip galvanized conduit with PVC jacket in accordance with requirements of UL 1. Provide a continuous copper bonding conductor wound spirally between convolutions on the

inside of the conduit meeting requirements of UL 360 for conduit sizes 1-1/4-inch and smaller.

## 2.03 FITTINGS

- A. General: Provide fittings of similar material as raceways.
- B. Fittings Requirements: Provide fittings meeting the following requirements:
  - 1. Set screw or indenter type fittings are not acceptable. Provide threaded connectors for all rigid metal conduits.
  - 2. Provide solvent cement connections for all rigid nonmetallic conduits.
  - 3. Provide gland compression type fittings for all electrical metallic tubing. Provide insulated type box connectors.
  - 4. Provide insulated connectors for liquidtight flexible conduit.
  - 5. Expansion/Deflection Fittings
    - a. Provide a deflection and expansion coupling for rigid conduits that have a 3/4 inch movement in all directions from normal and a 30 degree angular deflection. Provide coupling that includes internal bonding jumper.
    - b. Provide a nonmetallic expansion coupling for nonmetallic conduits that have a 4-inch maximum expansion.
  - 6. Bushings
    - a. Provide insulated nonmetallic bushing rated 105 degrees C for all installations where bonding is not required.
    - b. Provide insulated metallic grounding and bonding bushing rated 150 degrees C where bonding is required.

## 2.04 WALL AND FLOOR PENETRATIONS

- A. Watertight
  - 1. For conduit penetrations in new exterior walls or floors provide watertight sealing sleeves consisting of a steel sleeve with pressure ring and clamps.
  - 2. For conduit penetrations in existing walls or floors, provide watertight sealing bushing consisting of a neoprene sealing ring between two PVC coated steel pressure discs. Provide stainless steel captive screws for sealing ring compression.

**B. Fire-proofing Through Fire Rated Construction**

1. Provide a permanent fire stop system for all penetrations through fire-rated walls, partitions and floors.
2. Design fire stop system to maintain the integrity of the wall or floor assembly for its rated time period.
3. Arrange fire stop system to allow normal pipe movement without being displaced.
4. Do not utilize asbestos in fire stop systems.
5. Provide an intumescent fire stop system when exposed to flame or heat.

**2.05 BOXES AND CABINETS****A. Outlet Box Requirements**

1. Provide galvanized cast iron boxes for galvanized rigid steel conduit systems.
2. Provide PVC coated boxes and covers in PVC coated conduit systems.
3. Provide pressed steel boxes and covers in electrical metallic tubing conduit systems.
4. Provide corrosion-resistant fiberglass reinforced polyester boxes with stainless steel hardware in corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown.
5. Provide watertight gasketed covers held with nonferrous screws for all cast metal boxes.

**B. Junction and Pull Box Requirements**

1. Provide cast aluminum boxes with mounting lugs, threaded hubs and gasket covers for surface mounted boxes
2. Provide fabricated sheet metal boxes when cast metal box weight exceeds 50 pounds. Construct box from 1/8-inch thick galvanized sheet steel or aluminum with sides return channel flanged around cover opening. Provide angle or channel supporting frame. Provide continuously welded and ground smooth seams. Provide mounting lugs and threaded conduit hubs.
3. Provide cast steel or fabricated 10-gauge Type 316 stainless steel for boxes either partially or fully encased in concrete. For partially encased boxes provide sides return channel flanged around cover opening. For fully

encased boxes provide flush covers. Provide continuously welded and ground smooth seams. Provide mounting lugs and threaded conduit hubs.

4. Provide watertight gasketed covers held with stainless-steel captive screw slot bolts.
5. Provide two padlocking hasps for boxes containing medium voltage cables.
6. Provide steel barriers to isolate conductors of different systems or voltages from each other where located in common boxes.
7. Provide fabricated boxes located indoors meeting NEMA 12 requirements.
8. Provide all boxes located outdoors meeting NEMA 4X requirements.

#### C. Terminal Box Requirements

1. Provide minimum 12 gauge stainless steel fabricated box with mounting lugs, floor stand, and hinged doors.
2. Provide the door with continuous piano hinge and 3 point lockable latch. Provide print pocket on inside of door.
3. Provide back plate fabricated from 12 gauge minimum steel with white enamel finish for mounting terminals and wire troughs.
4. Provide wire troughs consisting of plastic ducts with snap slot design and removable covers. Run all wiring within wire troughs.
5. Furnish a schedule of terminals with the following information
  - a. Source
  - b. Type of Signal
  - c. Function
6. Provide removable jumpers to allow operation of the equipment.
7. Separate analog terminals from all other terminals.
8. Provide number of terminals shown. Where the number of terminals is not shown, provide sufficient terminals for each wire entering the terminal box plus 20 percent but not less than 10 spare terminals.
9. Terminals
  - a. All catalog numbers refer to Phoenix Contact Type for the purpose of establishing the standard of quality and general configuration desired.

Equivalent products of other manufacturers may be submitted for approval.

- b. Provide symmetrical type steel mounting rails, DIN-EN50022.
- c. Analog Signals: Provide terminals in enclosed housing suitable for wires from 22 to 12 AWG rated 600 volts with gray body, knife disconnect and test connection socket on both sides of disconnect, Phoenix Contact Type UK 5-MTK-P/P.
- d. Control and Alarm Signals: Provide terminals suitable for wires from 30 to 10 AWG rated 18 amperes at 600 volts, blue body, Phoenix Contact Type UK5N BU.
- e. 120-Volt Power Wiring: Provide terminals suitable for wires from 18 to 10 AWG rated 30 amperes at 600 volts, hot (black body), neutral (white body), ground (green body, Phoenix Contact Type UK5N BK, UK5N WH & UK5N GN, respectively.

## 2.06 SUPPORTING DEVICES

### A. Raceway Supports: Provide raceway supports meeting Section 16071 - Supporting Devices and the following requirements:

- 1. Do not use perforated straps or plumbers tape for conduit supports.
- 2. Provide expansion bolts or inserts for fasteners in concrete, toggle bolts for hollow masonry or frame construction, and preset inserts for prestressed concrete.
- 3. Conduit Straps and Backs
  - a. For metallic conduits, provide steel or malleable iron.
  - b. For PVC coated conduits, provide PVC coated malleable iron with stainless steel anchors and bolts.
- 4. Conduit Hangers
  - a. For metallic conduits, provide steel adjustable conduit hangers or clevis hangers.
  - b. For PVC coated conduits, provide PVC coated adjustable conduit hangers with stainless steel hardware.
- 5. Beam Clamps
  - a. For metallic conduits, provide malleable iron with steel bolt.

- b. For PVC coated conduit, provide PVC coated malleable iron with stainless steel bolt.

6. Trapeze Hangers

- a. For metallic conduits provide 12 gauge 1-1/2-inch square steel channels with steel channel straps to secure conduits.
- b. For PVC coated conduit, provide either PVC coated 12 gauge 1-1/2-inch square steel channels or 1-5/8-inch square fiberglass channels. Provide PVC coated straps with stainless steel bolts for securing conduits.
- c. Provide addition channels welded together to limit the deflection to 1/240th of span.

7. Thread Rod

- a. Provide thread rod with the minimum size as follows:

- (1) Conduit Hangers

- (a) 3/4-inch to 1-1/2-inch conduit: 1/4-inch thread rod
    - (b) 2-inch to 3-1/2-inch conduit: 3/8-inch thread rod
    - (c) 4-inch and larger: 1/2-inch thread rod

- (2) Trapeze Hangers: Provide thread rod of sufficient size to support the load. Provide a minimum of 3/8-inch thread rod.

- b. For Metallic Conduit Systems: Provide continuous threaded galvanized steel rod.
- c. For PVC Coated Conduit Systems: Provide continuous threaded PVC coated galvanized steel rod.

## PART 3 EXECUTION

### 3.01 PREPARATION

- A. General: Install electrical equipment and material of the size, type and general routing as shown or required.
- B. Coordination with Reinforcing: Install raceway, fittings, boxes and cabinets free from direct contact with reinforcing steel.
- C. Alignment: Provide fasteners, anchor bolts, anchorage items and supports as required to insure proper and rigid alignment. Attach equipment with fasteners sized according to size and weight of the equipment and the thickness of the supporting surface.

- D. Aluminum Coating: Where aluminum is placed in contact with dissimilar metals, concrete or permanently moist surface, separate contact surfaces with gasket, nonabsorptive tape or coating as specified in Section 09912 - Interior Painting to prevent corrosion.
- E. Grounding: Make metallic raceways electrically and mechanically continuous and ground as required. Install conduits continuous between outlets, boxes, cabinets and panels.
- F. Provide a separate raceway systems for the Con Edison service, 480 volt loads, 240/208/120 volt loads, control (unless indicated otherwise on drawings), telephone, data, paging, security (access control and CCTV) and Fire Detection and Alarm.

### 3.02 INSTALLATION

- A. General: Unless otherwise indicated, install conduits exposed, parallel or perpendicular to building floors, ceilings and walls, and to avoid interference with other work. In architecturally finished areas, conceal conduits within finished walls, ceilings and floors. Cut conduits square and deburr the cuts to the same degree as the conduit manufacturer. Fasten conduit securely to outlets, junction, pull and terminal boxes. Provide caps and seals to prevent the entrance of foreign material and moisture during installation and before pulling wire.
  - 1. Where conduit size is not shown, provide conduits one size larger than indicated in Table 4, Chapter 9 of the NEC.
  - 2. Support raceways concealed above suspended ceilings from the slab above in same manner as exposed raceways. Do not support raceways from suspended ceiling supports.
  - 3. Keep conduit at least six inches away from high temperature piping, ducts, flues and surfaces. For mounting on concrete and masonry surfaces provide a minimum of 1/4-inch air space between conduit and mounting surface. Support and fasten conduit to building structural members spaced in accordance with electrical codes. Support conduit at least every eight feet or less in accordance with NYCBC and NEC requirements.
  - 4. When two or more exposed conduits are in the same general routing, provide parallel installation with symmetrical bends and for three or more provide trapeze hangers. Size trapeze hangers with space for 25 percent additional conduits.
  - 5. Make changes in direction with bends or pull boxes. Use factory-made bends or elbows wherever possible. Make field bends and offsets with a hand bender or conduit-bending machine. Provide a bending radius not less than 36-inches for conduits containing medium voltage cables.

6. Run conduit in buildings with no more than the equivalent of three 90-degree bends between pull points. Provide no more than 125 feet of conduit runs between pull points. Provide pull boxes where shown, specified or wherever required to install conductors and to meet the above requirement.
7. Install pull and junction boxes in accessible locations with working space in front of and around the installation. Obtain approval to locate boxes in finished areas.
8. Install an expansion fitting when a conduit crosses a structural expansion joint.
9. Unless otherwise approved, install conduits to cross at right angles to building structural expansion joints.
10. Where approved for encased installation, install conduits in slabs as close to the middle of concrete slabs as practicable without disturbing reinforcement. Do not use conduit with an outside diameter exceeding one-third of the slab thickness. Do not place conduits closer than three diameters on centers, except at cabinet locations where the slab thickness is increased.
11. Pitch conduits to outlet boxes to avoid trapping moisture. Where dips are unavoidable in exposed conduit runs, install drain fitting at low point.
12. Where raceways travel between areas of significantly different temperature then the raceway shall be sealed to prevent the formation of moisture in the raceway. Examples are raceway from heated to unheated spaces or inside to outside the building.
13. In branch circuits where raceway routing is not indicated on plans the Contractor shall make those layouts – respecting the following additional guidelines.
  - a. No raceway shall contain more than one multi-wire branch circuit (3 phase wires, one neutral and an equipment ground wire – or its equivalent number of conductors), in another arrangement.
  - b. No feed through boxes shall be installed in non-permanent partition walls.
  - c. Raceways installed in floor or ceiling slabs (where permitted) or above suspended ceiling shall be subject to all the tenets of Article 3.02.

**B. Conduit Material Types: Provide conduit as follows:**

1. Provide rigid steel conduits in all installations exposed or concealed in structures, concrete encased within structures or under structures.
2. Provide electrical metallic tubing in all installations above suspended ceilings and in partition constructed walls.
3. Provide rigid steel conduits for all instrumentation, and electronic equipment signal wiring in all exposed or concealed noncorrosive installations.
4. Provide rigid nonmetallic Schedule 40 conduits for low voltage communication/data, instrumentation, security and fire detection and alarm system underground, concrete encased or direct buried, unless specifically detailed otherwise.
5. Provide rigid nonmetallic fiberglass conduits underground, concrete encased for ConEdison primary feeders, unless specifically detailed otherwise.
6. Corrosive Locations
  - a. Corrosive locations are defined in Section 16050 - Basic Electrical Materials and Methods or are as shown:
  - b. Provide PVC coated rigid steel conduit in all installations in corrosive locations. Installation, terminations and extensions shall be performed in strict conformance to the manufacturer's instructions - in order to maintain the corrosion resistance of the installation.
7. Underground Conduits: Provide underground conduits meeting the requirements of Section 16132 - Underground Electrical Distribution System.

**C. Connections to Equipment**

1. Provide double locknuts and bushing for all boxes, enclosures and cabinets located in dry areas.
2. Provide watertight hub fittings for all boxes, enclosures and cabinets located below grade or in wet, damp or corrosive areas.
3. Provide rigid conduit connection where equipment is fixed and not subject to adjustment, mechanical movement or vibration. Provide union fittings to permit removal of equipment without cutting or breaking conduit.

4. Provide liquidtight flexible conduit connection where equipment is subject to adjustment, mechanical movement or vibration. Maximum length is 18 inches.
  5. Coat all threads in steel conduit runs with zinc dust in oil or other corrosion-preventive compound before making connections.
- D. Penetrations: Make concealed penetrations for single conduits not more than 1/4-inch larger than the diameter of the conduit. Make penetrations through walls, ceilings and floors other than concrete for exposed conduits not more than 1/4-inch larger than the diameter of the conduit. Fill the voids around conduit with caulking compound and finish the surface the same as the wall, ceiling or floor.
1. Where a conduit enters through a concrete roof or membrane waterproofed wall, floor or ceiling, provide a watertight sealing sleeve that can be tightened from one or both sides. If the sealing sleeve is not placed with the concrete, core drill the proper size hole to provide a mechanically watertight installation.
  2. Where a conduit enters through a concrete non-waterproofed wall, floor or ceiling, provide a galvanized steel sleeve, Schedule 40, and fill the space between the conduit and sleeve with a plastic expandable compound. If the sleeve is not placed with the concrete, drill the hole not less than 1/2-inch nor more than one inch larger than the sleeve, center the sleeve and grout the sleeve for the total depth of penetrated concrete with non-shrink grout, polyurethane or silicone sealant.
- E. Spare Conduit: Provide spare conduits for future use as shown or required. Provide a minimum 200-pound strength nylon pull line in each spare conduit and identify the origin and termination of the conduit at each end. Terminate spare conduits in equipment, boxes or by couplings plugged flush with the inside of building surfaces.
- F. Boxes: Provide boxes of the proper dimensions for the size and quantity of conductors enclosed.
1. For boxes mounted on steel, concrete and masonry surface, provide a minimum 1/4-inch non-metallic spacer to hold the box away from the surface.
  2. Provide pressed metal (seamless) boxes in all partition constructed walls.
  3. Provide separate support for boxes and bolt units to buildings with expansion anchors, toggle bolts or appropriate screws. For lighting fixture outlet boxes, provide supports adequate to support the weight of the fixture to be mounted on the box.

4. Remove debris including dust, dirt, wire clippings and insulation from the interior of boxes. Replace boxes with open conduit holes. Repair or replace damaged boxes as directed.
5. Unless otherwise indicated, mount outlet boxes flush with the finished wall or ceiling, with the long axis vertical. Unless otherwise shown or specified, provide mounting heights measured from the finished floor to centerline of the outlet box as follows:
  - a. For switches: 3'-2". Mount the box for lighting switches on the strike side of the door
  - b. For duplex convenience outlets: Finished areas 12 inches and unfinished areas 2 feet
  - c. For fixtures and equipment: As shown
  - d. For desk telephone and data outlets: 12 inches
  - e. For wall telephone and data outlets: 48 inches

### 3.03 FIELD PAINTING

- A. Paint conduits meeting the requirements of Section 09912 - Interior Painting.

-END OF SECTION-

**Section 16132**  
**UNDERGROUND ELECTRICAL DISTRIBUTION SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing underground electrical cables and grounding. Raceway system consisting of concrete encased conduits, direct buried conduits, manholes, handholes, and outdoor electrical equipment pads shall be provided to meet the requirements of this specification. Raceways encased in the ramp barrier structure shall also meet the requirements of this specification.

**1.02 RELATED SPECIFICATIONS**

1. Section 02316 - Excavation
2. Section 02317 - Backfilling
3. Section 03100 - Concrete Forms and Accessories
4. Section 03200 - Concrete Reinforcement
5. Section 03300 - Cast-In-Place Concrete
6. Section 16050 - Basic Electrical Materials and Methods
7. Section 16060 - Grounding
8. Section 16121 - Wire and Cable - 600 Volts and Below
9. Section 16122 - Medium Voltage Cables
10. Section 16130 - Electrical Raceway Systems
11. Section 16210 - Electric Service

**1.03 SYSTEM DESCRIPTION**

- A. Performance Requirements: Route conduits to allow pulling-in of conductors as indicated without exceeding the conductor's tension limits.

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electric Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data for conduits, manholes and handholes and all accessories.
- C. Contractor's Shop Drawings: Furnish working drawings for underground and ramp construction encased electrical raceway system showing conduits, concrete encasement, manholes, handholes, electrical equipment pads, junction and pull boxes and reinforcing. Indicate designation, type, size, location, elevations and slope.

## 1.05 PROJECT CONDITIONS

- A. Existing Conditions: Examine Record Drawings to determine the location of all obstructions along the conduit or cable route and at the sites of manholes, handholes and outdoor electrical equipment pads.
- B. Field Measurements: Field survey, and in critical areas, excavate test pits to verify locations of probable obstacles along the conduit or cable route and at the sites of manholes, handholes and outdoor electrical equipment pads.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

- 1. Conduit Spacers

- a. Prime Company
  - b. Underground Devices, Inc.

- 2. Manhole and Handhole Frames and Covers

- a. Neenah Foundry Co.

- 3. Buried warning tape

- a. Thomas & Betts
  - b. W. H. Brady Company

- 4. Manhole Accessories (pulling irons, cable rack and supports, insulators)

- a. Cooper Power Systems Division
  - b. A.B. Chance Company

## 2.02 MATERIALS

- A. Conduit: Provide conduits meeting the requirements of Section 16130 - Electrical Raceway Systems.
- B. Cable: Provide cables meeting the requirements of Sections 16121 - Wire and Cable - 600 Volts and Below and 16122 - Medium Voltage Cables.
- C. Spacers: Provide rigid plastic, conduit spacers to maintain conduit separation as indicated.

- D. Reinforcing Steel: Provide reinforcing steel meeting the requirements of Section 03200 - Concrete Reinforcement.
- E. Concrete: Provide concrete meeting the requirements of Section 03300 - Cast-In-Place Concrete. Dye all concrete used for duct bank encasements "red".
- F. Manhole Frames and Covers: Provide waterproof cast-iron manhole frame and solid bolted cover suitable for H-20 truck load. Cast the word "ELECTRIC" in the cover. Provide frame with a clear opening of 36 inches, unless otherwise shown.
- G. Grounding: Provide grounding meeting the requirements of Section 16060 - Grounding.
- H. Underground Warning Tape: Provide 6-inch wide detectable type plastic tape in red (electric), yellow (utility) and orange (communications) colors with suitable warning describing the type of buried electrical lines.

## 2.03 MANHOLE ACCESSORIES

- A. Pulling-in Irons: Provide pulling-in irons constructed of hot-forged, hot-dip galvanized steel.
- B. Cable Racks and Supports: Provide racks and supports constructed of heavy-duty, hot-dip galvanized steel.
- C. Insulators: Provide insulators made of high grade, dry process porcelain with smooth glazed surfaces.

## PART 3 EXECUTION

### 3.01 CONDUIT INSTALLATION

- A. General: Install underground, ramp and bridge encased, concrete encased and direct buried conduits as indicated. Coordinate closely with the ramp and bridge construction to assure adequate provisions for electric raceways concealed in those constructions.
- B. Conduit Route: Establish and mark exactly conduit or cable routing. Resolve routing near existing obstacles and coordinate with other sitework. Maintain a 12-inch minimum longitudinal clearance from the conduit bank encasement or direct buried conduit to adjacent utility lines. Maintain a 6-inch minimum vertical clearance from the conduit bank encasement or direct buried conduit to utility lines at crossovers. Adhere to lines, grades, elevations and dimensions as shown.
- C. Trench Excavation: Perform excavation work in accordance with the requirements of Section 02316 - Excavation.

- D. Workmat: Install concrete mat on trench bottom to provide an even base for concrete encased conduit bank in accordance with the requirements of Section 03300 - Cast-In-Place Concrete.
- E. Bedding: Provide a sand cover on trench bottoms for a firm and smooth surface for direct buried conduits.
- F. Spacers: Locate spacers at intervals of approximately four feet and stagger locations at each conduit tier to provide not less than 12 inches of longitudinal separation.
- G. Conduit: Place conduit in straight lines and with a minimum slope of 0.25 percent (3 inches per 100 feet). Slope conduit down to manholes, handholes, pull and junction boxes and structures. Install expansion fittings in straight runs exceeding 100-feet, coordinate with expansion joints in bridge and ramp structure. Secure conduits in place to prevent floating and movement.
- H. Bends: Install 12-foot minimum radius bends in horizontal turns and vertical deflections. For bends used at ends of conduit runs install elbows with 4-foot minimum radius for 6-inch and 5-inch conduits, and elbows with 3-foot minimum radius for 4-inch and smaller conduits.
- I. Inside Cleaning: Pull a standard flexible mandrel not less than 12-inches long, having a diameter approximately 1/4-inch less than the inside diameter of the conduit, through each conduit, then pull a brush with stiff bristles through each conduit. Replace conduit runs that do not allow the passage of the mandrel at no increase in Contract price. Use the pneumatic method to draw into conduit the nylon or polypropylene pull line. Plug and seal all conduits after cleaning.
- J. Concrete Reinforcing: Install concrete reinforcing meeting the requirements of Section 03200 - Concrete Reinforcement. Provide ductbanks with No. 5 reinforcing, spaced 12 inches on centers, top and bottom, with No. 3 ties at 18 inches, unless otherwise shown.
- K. Concrete Formwork: Install concrete formwork meeting the requirements of Section 03100 - Concrete Forms and Accessories.
- L. Outside Cleaning: Remove dirt, sand and debris around conduits and from workmat, prior to concrete placement.
- M. Concrete Placement: Place concrete meeting the requirements of Section 03300 - Cast-In-Place Concrete.
- N. Connections to Structures: Install as shown.
- O. Backfilling: Backfill meeting the requirements of Section 02317 - Backfilling. Provide a sand cover that is 6 inches over direct buried conduits or cables.

- P. Underground Warning Tape: Install one underground warning tape for each trench up to 18 inches wide. For trenches wider than 18 inches provide two underground warning tapes, one at each edge of the trench. Place the tape or tapes 12 inches below the finished grade.

### 3.02 MANHOLES AND HANDHOLES

- A. General: Provide cast-in-place reinforced concrete manholes and handholes as shown.
- B. Con Edison Manholes: Provide Con Edison electrical service manholes meeting the requirements of Con Edison and Section 16210 - Electrical Service.
- C. Location: Establish and mark manhole and handhole locations exactly. Resolve locations near existing obstacles and coordinate with other sitework. Adhere to orientation, elevations and dimensions as indicated.
- D. Manhole and Handhole Excavation: Install manhole and handhole excavations meeting the requirements of Section 02316 - Excavation.
- E. Cast-In-Place Manhole and Handhole Construction: Install cast-in-place manhole construction meeting the requirements of Sections 03200 - Concrete Reinforcement and 03300 - Cast-In-Place Concrete.
- F. Manhole Entrance: Install concrete rings and frame with cover. Adjust position of frame and cover to protrude 1-inch above adjacent unpaved ground or to be flush with the finished surface of pavement.
- G. Backfilling: Backfill meeting the requirements of Section 02317 - Backfilling.
- H. Accessories: Install pulling-in-irons, cable racks with supports and insulators, grounding system and other items as indicated.

### 3.03 OUTDOOR ELECTRICAL EQUIPMENT PADS

- A. General: Provide reinforced concrete pads for supporting Outdoor Electrical Equipment as shown.
- B. Location: Establish and mark pad locations exactly. Resolve locations near existing obstacles and coordinate with other sitework. Adhere to orientation, elevations and dimensions as shown.
- C. Site Excavation: Provide site excavation meeting the requirements of Section 02316 - Excavation.
- D. Pad Construction: Install pad construction meeting the requirements of Sections 03200 - Concrete Reinforcement and 03300 - Cast-In-Place Concrete.

- E. Conduit Entrances: Install conduit risers and laterals under pads prior to placement of pads. Separate conduits from pads as shown.
- F. Grounding: Install grounding conductors through pads meeting the requirements of Section 16060 – Grounding

**-END OF SECTION-**

**Section 16140**  
**WIRING DEVICES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing wiring devices and appurtenances as indicated, in accordance with the Contract Documents.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16060 - Grounding
- B. Section 16130 - Electrical Raceway Systems
- C. Section 16745 - Telephone System

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. Fed Spec WC 596 - Electrical Power Connector, Plug, Receptacle And Cable Outlet
  - 2. Fed Spec WS 896 - Toggle and Lock, Flush Mounted Switches
  - 3. CSA C22.2-182.1 - Industrial-type, Special-Use Attachment Plugs, Receptacles and Connectors
  - 4. UL 20 - General - Use Snap Switches
  - 5. UL 498 - Attachment Plugs and Receptacles
  - 6. UL 508 - Industrial Control Equipment

**1.04 SPARE PARTS**

- A. Furnish the following spare parts from the manufacturer approved and supplied for this project.
  - 1. Five 15-ampere, 125-volt, 2-pole, 3-wire grounding type plugs, NEMA 5-15P nylon housing, Hubbell Cat. No. HBL5266C or approved equal
  - 2. Twenty 20-ampere, 125-volt, 2-pole, 3-wire, grounding type plugs, NEMA 5-20P, nylon housing, Hubbell Cat. No. HBL5366C or approved equal

3. Ten 20-ampere, 125-volt, 2-pole, 3-wire, grounding type plugs, NEMA 5-20P, corrosion resistant, yellow nylon housing, Hubbell Cat No. HBL 53CM66C or approved equal
  4. Six 60-ampere, 600-volt, 3-pole, 4-wire plugs, thermoplastic non-metallic housing with metallic shroud and locking ring providing a NEMA 4X seal when mated with the receptacle, Hubbell Cat No. HBL460PS2W or approved equal. Provide cord grips suitable for servicing the cables for pressure washer. Install 2 plugs as described in Part 3.
  5. Ten percent but not less than 5 matching plugs for each type and rating of receptacles furnished
- B. Packaging: Package spare parts in containers bearing labels clearly designating contents. Identify all spare parts with information needed for reordering. Deliver spare parts in original factory packages.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Standard of Quality and General Configuration: Use of manufacturer's name and model or catalog number in this Section is for the purpose of establishing the desired quality and characteristic. Equivalent products of other manufacturers may be submitted for approval.
- B. Configuration and Rating: Provide NEMA specification grade wiring devices in the type, color, configuration and electrical rating for the service indicated.
- C. Symbols: See the electrical symbol list shown for identification of all device types.
- D. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  1. Hubbell Inc. Wiring Device/Kellems Division
  2. Bryant
  3. Pass and Seymour
  4. Cooper Wiring Devices
  5. Leviton
  6. Tork
  7. Tay Mac Corporation
  8. Thomas & Betts

### 2.02 LIGHTING TOGGLE SWITCHES

- A. Provide toggle switches of specification grade rated 20- amperes, 120-277 volts ac conforming to Fed. Spec. WS 896 and UL Standard 20. Manufacture switches with back and side wired binding screw type terminals, one piece spring contact

arm and terminal plate with silver alloy contacts, one piece steel mounting strap with an assured grounding clip, thermoset body color coded for identification by amperage and a brown toggle. Provide ivory toggles in finished areas.

- B. Types. Equivalent products of other manufacturers may be submitted for approval.

<u>DESCRIPTION</u>	<u>HUBBELL CAT. NO.</u>
Single pole	HBL1221
Two pole	HBL1222
Three way	HBL1223
Four way	HBL1224
SPDT center off momentary contact	HBL1557

- C. Accessories: Provide a flush neon "ON" pilot light in conjunction with switches controlling equipment whose operation is not evident at the switch location. Provide an engraved nameplate to identify equipment controlled.

## 2.03 AC MANUAL MOTOR STARTING SWITCHES

- A. Provide ac manual motor starting switches where overload protection is not required or is provided separately. Provide switches similar in construction to the lighting toggle switches except conforming to UL 508 and rated 30-amperes, 120-277 volts ac.
- B. Types. Equivalent products of other manufacturers may be submitted for approval.

<u>DESCRIPTION</u>	<u>HUBBELL CAT. NO.</u>
Single pole	HBL-3031
Double pole	HBL-3032

- C. Accessories: Provide a flush neon "ON" pilot light in conjunction with switches controlling equipment whose operation is not evident at the switch location. Provide an engraved nameplate to identify the equipment being controlled.

## 2.04 CONVENIENCE RECEPTACLES

- A. Provide specification grade convenience receptacles conforming to Fed. Spec. WC 596 UL listed, with nylon impact resistant face, one piece metal wrap around mounting strap with assured grounding clip, back and side wired binding screw type terminals, brass power contacts and a heavy duty heat stabilized thermoset plastic base. Provide brown devices in unfinished areas and ivory devices in finished areas unless otherwise specified.

- B. Types. Equivalent products of other manufacturers may be submitted for approval.

DESCRIPTION	RATING	COLOR	HUBBELL CAT. NO.
Single	NEMA 5-20R 20A, 125V, 2P, 3W	Brown/ Ivory	HBL5361/ HBL5361I
Duplex	NEMA 5-20R 20A, 125V, 2P, 3W	Brown/ Ivory	HBL5362/ HBL5362I
Single- corrosion- resistant	NEMA 5-20R 20A, 125V, 2P, 3W	Yellow	HBL53CM61
Duplex- corrosion- resistant	NEMA 5-20R 20A, 125V, 2P, 3W	Yellow	HBL53CM62
Single	NEMA 6-20R 20A, 250V, 2P, 3W	Brown/ Ivory	HBL5461/ HBL5461I
Duplex	NEMA 6-20R 20A, 250V, 2P, 3W	Brown/ Ivory	HBL5462/ HBL5462I
Quadraplex	NEMA 5-20R 20A, 125V, 2P, 3W	Brown/ Ivory	HBL420H/ HBL420HI

## 2.05 SPECIAL USE RECEPTACLES

- A. Provide special use receptacles of specification grade in accordance with applicable Fed. Specs, UL, ANSI and CSA Standards.
- B. Type. Equivalent products of other manufacturers may be submitted for approval.

DESCRIPTION	RATING	COLOR	HUBBELL CAT. NO.
Duplex-ground fault circuit interrupter	NEMA 5-20R 20A, 125V, 2P, 3W	Brown/ Ivory	GF5352L/ GF5352IL
Single-isolated ground	NEMA 5-20R 20A, 125V, 2P, 3W	Orange	IG5361
Duplex-isolated ground	NEMA 5-20R 20A, 125V, 2P, 3W	Orange	IG5362

<u>DESCRIPTION</u>	<u>RATING</u>	<u>COLOR</u>	<u>HUBBELL CAT. NO.</u>
Duplex – surge suppression w/isolated ground	NEMA 5-20R 20A, 125V, 2P, 3W	Blue	IG5352S

## 2.06 TELEPHONE/DATA COMMUNICATIONS OUTLETS

- A. Provide telephone/data communication outlets meeting the requirements of Section 16745 – Telephone System.

## 2.07 PRESSURE WASHER RECEPTACLES

- A. Provide pressure washer receptacles complete with fusible mechanically interlocked switch, receptacle, angle adapter, threaded cap. Provide the receptacle assembly that meets the requirements for NEMA 4X enclosures constructed from a thermoplastic non-metal material. Provide properly sized Class “J” fuses

- B. Types

<u>DESCRIPTION</u>	<u>RATING</u>	<u>HUBBELL CAT. NO. or approved equal</u>
Single receptacle	60A, 600V, 3P, 4W	HBL460MIFS2W

## 2.08 WELDING RECEPTACLES.

- A. General: Provide welding receptacles complete with mechanically interlocked disconnect switch, receptacle, angle adaptor and threaded cap attached to the device with a strap. Provide the assembly that meets the requirements for a NEMA 4X rating. Construct the assembly from a thermoplastic material.

- B. Types

<u>DESCRIPTION</u>	<u>RATING</u>	<u>HUBBELL CAT. NO. or approved equal</u>
Single receptacle	30A, 600V, 3P, W.GRND	HBL430MIS2W

## 2.09 FLOOR BOXES

- A. Floor Boxes: Provide cast iron floor boxes with corrosion resistant finish and fully adjustable tops to permit both vertical and angular adjustment before and after concrete is placed.

- B. Flush Covers: Provide brass flush floor box cover suitable for the devices shown. Furnish brass carpet flanges as required.
- C. Above Floor Fittings: Provide low profile above floor fitting consisting of aluminum housing and stainless steel plates suitable for the devices shown.
- D. Types. Equivalent products of other manufacturers may be submitted for approval.

DESCRIPTION	HUBBELL CAT. NO.
Single gang rectangular floor box	B2436
Two gang rectangular floor boxes	B4233
Three gang rectangular floor boxes	B4333
Rectangular flush cover for duplex receptacle	S3825
Rectangular flush cover for single receptacle or above floor fitting	S2625
Single gang rectangular carpet flange	SB3083
Two gang rectangular carpet flange	SB3084
Three gang rectangular carpet flange	SB3085
Above floor service fitting	SC3099
Duplex receptacle plate	SS309D
Single receptacle plate	SS309S
Ground fault receptacle plate	SS309DS
Telephone Bushing plate	SS309T
Blank plate	SS309B

## 2.10 OUTLET BOXES

- A. Provide outlet boxes in accordance with the requirements specified in Section 16130 - Electrical Raceway Systems.

## 2.11 PLATES AND COVERS

- A. Provide covers and plates for the various areas as follows:
  1. Architectural Finished Areas: Provide Type 302/304 stainless steel plates and covers for devices.
  2. Areas Below Grade, Corrosive and Wet Areas
    - a. For switches provide weatherproof, gasketed, covers with external operating handle.
    - b. For receptacles provide a weatherproof, gasketed, clear, flame-retardant, jumbo, polycarbonate cover a minimum of 5.4-inches deep,

suitable for use with a 10-3 cord that allows the cover to be closed even when the receptacle is in use.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install all wiring devices in accordance with manufacturer's recommendations and approved shop drawings as specified in Division 1.
- B. Toggle Switches: Install toggle switches applicable for the area environment for switching lighting or other branch circuit loads.
- C. Receptacles: Install receptacles applicable for the area environment.
- D. Grounding: Ground all devices in accordance with the requirements specified in Section 16060 - Grounding.
- E. Plug Installation: Install plugs on the cables for the following equipment:
  - 1. Pressure Washers Equipment
    - a. Ratings: 60A, 480V, 3P, 4W
    - b. Quantity: 1
  - 2. Portable Welding Equipment
    - a. Ratings: 30A, 480V, 3P, GND
    - b. Quantity: 3

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 16210**  
**ELECTRIC SERVICE**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish and install electric service system including service manholes, conduits, cables, current transformer cabinets, meter bases, blockhouse components and accessories as required for a complete installation in accordance with the Contract Drawings and Con Edison requirements.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16085 - Short Circuit and Coordination Study
- B. Section 16121 - Wires and Cables – 600 Volts and Below
- C. Section 16122 - Medium Voltage Cables
- D. Section 16130 - Electrical Raceway Systems
- E. Section 16132 - Underground Electrical Distribution System
- F. Section 16430 – 480 Volt Switchgear
- G. ConEd - Block house drawings and related specifications

**1.03 SUBMITTALS**

- A. General: Provide all submittals, including the following, as specified in Section 01330 – Shop Drawings.
- B. Correspondence: Furnish copies of all correspondence with Con Edison including available short circuit currents and X/R ratings for each feeder.
- C. Con Edison Drawings: Furnish Con Edison prepared drawings.
- D. Manufacturer's catalog data sheets for all products.

**1.04 SYSTEM DESCRIPTION**

- A. Service for the facility shall consist of two 3000 ampere feeds rated 480/277 Volt, three-phase, four-wire. The feeds will be derived from the Con Edison secondary network bus located in the new Utility block house, constructed as a part of this project. The service feeds shall extend into unscramble manholes EMH-1A & 1B near the blockhouse. The short circuit capacity at the secondary network bus located in the Blockhouse may be as much as 200,000 Amperes.
- B. The facility services will be connected to the ConEd 480 volt service feeds in manhole EMH-2A & 2B respectively. They shall extend, as shown on Contract Drawings, to the facility. Upon entering the footprint of the facility they will run under the pier level, above the pit topping slab, below the grade and support beams,

to Electric Room 1- where they will terminate in the Utility structures at each end of the Facility main switchgear.

- C. Primary, medium voltage feeders shall extend from the property line manholes EMH-1A & 1B respectively to the termination at the Utilities transformers, which are located in the Blockhouse.

#### 1.05 QUALITY ASSURANCE

- A. Contact the following Con Edison representative for specific instructions regarding electric service requirements at this facility before commencing work:

Mr. Brian Mcardle  
Customer Project Manager Consolidated Edison of New York,  
30 Flatbush Ave, 6/F  
Brooklyn, NY 11217  
Telephone number is 718-802-6386

- B. Completed installation must comply with all applicable Con Edison standards and requirements and receive Con Edison approval.

#### 1.06 PRODUCT DELIVERY, HANDLING, AND STORAGE

- A. Deliver all materials in good condition. Store in dry place until installation.

### PART 2 PRODUCTS

#### 2.01 GENERAL

- A. Provide all equipment and material not furnished by Con Edison that are needed to complete the electrical work shown in the blockhouse. Install all equipment required for the blockhouse furnished but not installed by Con Edison. All equipment and material shall conform to Con Edison "Requirements for Electric Service Installations" and all pertinent Con Edison specifications.

#### 2.02 CON EDISON METERING

- A. Revenue Meters: Meters will be furnished by Con Edison.
- B. Meter Base: Provide meter base and wiring to the Utility Metering Structure in accordance with the requirements of Con Edison.

#### 2.03 CON EDISON REQUIRMENTS

- A. All equipment and material shall conform to Con Edison "Requirements for Electric Service Installations", the Con Edison drawings issued for this installation

that are attached to the Contract Documents and all pertinent Con Edison specifications and standards.

- B. Certain equipment will be furnished by Con Edison for installation by the Contractor.

#### 2.04 SERVICE MANHOLES

- A. Customer service (property line) manholes shall be Con Edison Type M11-6 pre-cast concrete with interior dimensions of 11'-6" x 4'-6" x 6'-6" in accordance with Con Edison Spec EO-2164-B. Secondary (EMH) manholes adjacent to the Blockhouse shall also meet Con Edison requirements.
- B. All manhole depths shall be subject to duct bank slope requirements and shall be approved by Con Edison.

#### 2.05 UTILITY METERING STRUCTURES

- A. Provide utility metering structures at each end of the MTS 480-volt switchgear.
- B. The structure shall contain incoming service cable lugs, utility metering transformers, metering and protective devices.
- C. Structures shall have full capacity copper bus from the incoming cable lugs to the 480-volt switchgear connection. Cable lugs material shall be copper.
- D. The structures shall have a continuous ground bus that shall extend to the 480-volt switchgear ground bus.
- E. The structures shall contain provisions and protection for communication equipment and connections needed for the Utility to read the meters remotely.
- F. The structures shall conform to Con Edison requirements and shall match the adjacent switchgear in construction and appearance.
- G. Current Transformer (CT) cabinets shall meet Con Edison Spec 377 and shall be rated 2500-4000 Amperes.

#### 2.06 WIRE AND CABLE.

- A. Provide primary cable in compliance with the requirements of Specification Section 16122 for connection between the Con Edison property line manholes and the Blockhouse Transformers.
- B. Provide secondary cable in compliance with the requirements of Specification Section 16121 for connection from the Con Edison Blockhouse to the Main Switchgear in the Facility.

**PART 3 EXECUTION****3.01 PREPARATION**

- A. Con Edison Arrangements: The Contractor shall make arrangements with Con Edison to obtain permanent electric service to the Project and pay for any charges approved by City of New York associated with the service procurement.
- B. Coordination: Coordinate schedule of Con Edison facilities with all other work.
- C. Con Edison System Information: Obtain all information required to perform the Short Circuit and Coordination Study specified in Section 16085 - Short Circuit and Coordination Study.

**3.02 INSTALLATION**

Customer service primary property line and blockhouse secondary manholes shall be located where indicated on the Contract Drawings for termination of primary and secondary cables. These manholes and any underground duct connecting to the locations shall be provided by the Contractor.

- A. Install all equipment and accessories in the Con Edison blockhouse in accordance with Con Edison requirements and the Contract Drawings.
- B. CT cabinets and metering shall be located in the MTS Electrical Room. Meters shall be furnished by Con Edison.
- C. Primary cable shall be provided by the Contractor. The primary cable connection to the Con Edison System in the property line manhole shall be by Con Edison.

-END OF SECTION-

**Section 16220**  
**ELECTRIC MOTORS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for electric motors as specified.

**1.02 RELATED SPECIFICATIONS**

1. Section 09912 - Interior Painting
2. Section 16050 - Basic Electrical Materials and Methods
3. Section 16055 - Electrical Requirements for Shop Assembled Equipment
4. Section 16060 - Grounding
5. Section 16075 - Electrical Identification
6. Section 16130 - Electrical Raceway Systems

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. AFBMA 10 - Metal Balls
2. NEMA CP1 - Shunt Capacitors
3. NEMA MG1 - Motors and Generators
4. NEC - National Electrical Code
5. NYCBC - New York City Building Code
6. NYSEC - New York State Energy Code
7. EPAC 2007 - Energy Policy Act 2007

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's catalog data for each motor.
- C. Shop Drawings: Furnish shop drawings for each motor detailing arrangement, wiring, conduit boxes, and motor application.
- D. Certificate of Compatibility: For each motor controlled by an adjustable frequency drive, furnish a certificate that the motors are compatible with the adjustable frequency drives and the equipment loads to be driven.

E. Quality Control: Furnish test reports for motors as follows:

1. Certified standard commercial test reports for motors 5 hp through 200 hp
2. Actual shop test reports for motors over 200 hp
3. Witnessed test reports as specified

F. Operations and Maintenance Manuals: Furnish operation and maintenance manuals for all motors as specified in Section 01831.

1.05 QUALITY ASSURANCE

- A. Codes: Comply with local codes and all other applicable codes.
- B. Regulatory Requirements: Comply with requirements of the Regulatory Agencies having jurisdiction over this Project.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. General Electric Company
2. Magnetek
3. Reliance Electric
4. Siemens
5. U.S. Electrical Motors
6. TECO/Westinghouse Corp.

2.02 MATERIALS

- A. General: Provide motors and accessories with the equipment as specified under the equipment sections.
- B. Motor Requirements: Unless otherwise specified, provide motors as follows:
1. Polyphase motors of the high energy efficiency and high power factor type.
  2. Motor nameplate horsepower as specified for the driven equipment.
  3. Motors that operate continuously over the entire load range of the driven equipment without loading motor in excess of nameplate rating and its specified temperature limit.
  4. For motors rated over ½ hp, operating at 460 volts, 3-phase, 60-hertz, provide squirrel cage induction type.
  5. For motors less than ½ hp, provide 115-volt, single phase, 60-hertz type.

6. Motors suitable for continuous operation with a line voltage variation within  $\pm 10$ -percent of rated voltage.
7. Motors that operate continuously in a 40 degrees C ambient.
8. Inverter duty motors when powered from an adjustable frequency drive.

C. Frequent Start Requirements: Provide motors for frequent starting as specified.

## 2.03 MECHANICAL PROTECTION

### A. Indoor Locations

1. For motors located in dry, clean and well ventilated areas provide open drip-proof type.
2. For motors located below grade, provide totally-enclosed, fan-cooled type with removable drain plug.
3. For motors located in wet, damp or dusty areas, provide totally-enclosed, fan-cooled type with removable drain plug.
4. In corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown, provide totally-enclosed, fan-cooled, Mill and Chemical Duty type, with removable drain plug.

B. Outdoor Locations: For motors located outdoors, provide a totally-enclosed, fan-cooled Mill and Chemical Duty type, with removable drain plug.

C. Submersible Locations: For operation in a submersible location, provide a completely sealed submersible motor.

## 2.04 BOXES

A. Provide oversized conduit boxes on motors to facilitate conductor installation and auxiliary components as required.

1. Make conduit box enclosure ratings (NEMA) compatible with motor enclosures.
2. Where shown, provide additional space in the power terminal box for the mounting and wiring of the current transformers furnished under the motor protection and monitoring systems.

**2.05 NEMA DESIGN AND INSULATION**

- A. Design Classification: Provide NEMA Design B, unless otherwise specified, with NEMA Class F moisture resistant insulation and NEMA Class B, 80 degrees C temperature rise at rated nameplate load.
- B. Variable Speed Operation: Provide insulation to protect against adverse affects of a nonsinusoidal waveform.

**2.06 WINDINGS**

- A. Provide copper windings and rotor bars, unless otherwise specified.

**2.07 BEARINGS**

- A. Ball and Roller Bearings: Use antifriction ball or roller type bearings at manufacturer's option, unless otherwise specified.
- B. Regreasable Bearings: Use regreasable bearings with support side thrust loadings, with an AFBMA B-10 bearing life rated at least 100,000 hours, based on a reliability of 90 percent.

**2.08 SERVICE FACTOR AND LOADINGS**

- A. Service Factor: Provide 1.15 service factor for sinusoidal voltage waveforms and 1.0 for nonsinusoidal voltage waveforms unless otherwise specified. Where motors with a 1.0 service factor are furnished, provide motors rated at least 15 percent greater than required brake horsepower.
- B. Shaft Loading: Provide steady state shaft loading not to exceed 100 percent of full load rating under maximum load, excluding the service factor, unless otherwise specified.

**2.09 SPEED**

- A. General: Provide motor speed as specified for the driven equipment.
- B. Multispeed: Provide multispeed motors as specified for the driven equipment.
- C. Adjustable Speed: Provide motors specifically designed and rated for use with the adjustable speed device furnished.

**2.10 TORQUE**

- A. General: Provide breakdown torque of 200 percent or more of motor full load torque.

- B. Locked Rotor: Provide locked rotor torque of 80 percent or more of motor full load torque.
- C. Inertia: Provide necessary  $WK^2$  data for special loads to coordinate with motors.
- D. Special Motors: Supply special motors where torque requirements exceed standard design.

## 2.11 SLIDE RAILS AND SOLE PLATES

- A. Provide slide rails and sole plates as required for proper installation.

## 2.12 SINGLE PHASE FRACTIONAL HORSEPOWER MOTORS

- A. Provide capacitor or open split phase start, for smaller than 1/2 hp motors unless otherwise specified.

## 2.13 THREE-PHASE MOTORS

- A. Induction Motors: Provide horizontal or vertical squirrel cage induction motors for continuous duty with full voltage starting except as otherwise specified.

## 2.14 EFFICIENCY

- A. Provide motor meeting the requirements of EPAC 2007 for General Purpose Electric Motors Sub Type I and II. See NEMA MG-1 Table of Full Load Efficiencies of Premium Energy Efficient Motors. Refer to Tables 12.12 (Sub Type I) and 12.11 (Sub Type II).

## 2.15 POWER FACTOR

- A. Provide motors having the following minimum power factor ratings:

Motor Power Factor Minimum		
Horsepower	Percent	
	At 1800 RPM Power Factor	At 1200 RPM Power Factor
1	74.3	69.7
1-1/2	76.5	62.0
2	70.3	70.1
3	79.9	73.7
5	83.8	75.8
7-1/2	82.4	78.2
10	85.0	76.4
15	85.0	81.1
20	84.6	81.9
25	84.5	82.0

Motor Power Factor Minimum		
Horsepower	Percent	
	At 1800 RPM Power Factor	At 1200 RPM Power Factor
30	84.2	82.5
40	84.2	83.3
50	85.0	84.9
60	86.8	85.7
75	86.6	86.0

## 2.16 NOISE

- A. Limit motor machine noise to sound power levels listed in NEMA MG 1-12.

## 2.17 ACCESSORIES

- A. Identification: Provide identification meeting the requirements with Section 16075 - Electrical Identification.
- B. Space Heaters: Where specified or shown, provide motor space heaters to prevent moisture condensation when the motor is not operating. Provide space heaters suitable for 115-volt, single phase, 60-hertz operation.
- C. Thermal Detectors: Where specified or shown, provide motor winding temperature switches or thermal devices.

## 2.18 SOURCE QUALITY CONTROL

- A. Shop Tests: Perform actual job motor shop tests for motors over 200 hp. Include standard commercial and additional tests listed below, and special tests listed in other sections.
- B. Standard Commercial Tests: Perform the following tests in accordance with NEMA standards.
1. No load running current and speed
  2. Locked rotor current
  3. Dielectric routine tests
  4. Motor efficiency tests
  5. Motor power factor tests
- C. Additional Testing: Perform the following additional tests in accordance with NEMA standards.
1. Winding resistance
  2. Bearing inspection

3. Power factor at full,  $\frac{3}{4}$  and  $\frac{1}{2}$  load
4. Efficiency at full,  $\frac{3}{4}$  and  $\frac{1}{2}$  load
5. Motor starting torque

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install motors in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1. Make all necessary adjustments to equipment to provide a complete operational system.

#### 3.02 FIELD QUALITY CONTROL

- A. Inspections and Tests: Perform field preliminary and final inspection and testing for motors as specified in Section 01811 and as follows:

1. Preliminary Inspection

- a. Demonstrate that each motor has been properly connected.
- b. Check for proper rotation by bumping prior to connecting motor to driven equipment.

2. Final Test

- a. Measure motor applied voltage and current with equipment operating at full load.
- b. Operate equipment as specified.

#### 3.03 CLEANING AND PAINTING

- A. Shop Painting: Paint the motors in accordance with the requirements of Section 09912 - Interior Painting.
- B. Field Painting: Clean and touch up marred surfaces to match the original finish.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 16230**  
**PACKAGED ENGINE GENERATOR SYSTEMS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing packaged industrial engine generator systems rated 750kW, 480-volt, 3-phase, 60 Hz to supply emergency and standby electrical power as specified and shown. Each system consists of:
1. Diesel engine-driven generator and radiator mounted on a structural steel base
  2. Exhaust silencer and fittings
  3. Sub-base fuel storage tank, fuel pipelines and fittings
  4. Generator control and instrument panel with annunciator
  5. Generator distribution panel
  6. Battery and charger including battery rack
  7. 480-volt load center
  8. 480-208Y/120-volt transformer
  9. 208Y/120-volt load center
  10. Starters and contactors for control of auxiliary equipment
  11. Jacket water heaters
  12. Vibration isolators
  13. Weather protective enclosure
  14. Load bank
  15. Fuel Quality Maintenance System

**1.02 RELATED SPECIFICATIONS**

1. Section 01821 – Training
2. Section 09912 - Interior Painting
3. Section 11141 – Diesel Fuel Dispensing System
4. Section 15191 – Diesel Fuel Piping
5. Section 16050 - Basic Electrical Materials and Methods
6. Section 16075 - Electrical Identification
7. Section 16085 – Short Circuit and Coordination Study
8. Section 16121 – Wires and Cables – 600 Volts and Below

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. ASTM A 185 - Specification for Steel Welded Wire, Fabric, Plain, for Concrete Reinforcement
2. ASTM A 615/A615M - Specification for Deformed and Plain Billet Steel Bars for Concrete Reinforcement

3. NFPA 30 - Flammable and Combustible Liquids Code
4. NFPA 110 - Emergency and Standby Power Systems
5. UL 142 - Steel Aboveground Tanks for Flammable and Combustible Liquids
6. UL 508 - Electrical Panel Construction Methods
7. NEMA MG-1 - Motors and Generators
8. EGSA 101 - Engine Driven Generating Sets
9. NYCBC - New York City Building Code
10. EPA - Environmental Protection Agency

#### 1.04 SYSTEM DESCRIPTION

- A. The generator unit is to function as an emergency/standby power source for use in the event of failure of the incoming normal power service and during normal exercising operations. Each unit consists of a diesel engine-driven generator mounted on a structural steel base, complete with generator control and instrument panel with integral annunciator, generator circuit breaker, starting battery(s) and charger with battery rack, governor, engine jacket-water cooling system, exhaust silencer, radiator, voltage regulator, weather protective enclosure, dual wall sub-base fuel storage tank with leak detection and monitoring and all appurtenances necessary for a complete functioning engine generation system. Size each sub-base fuel storage tank to provide 24-hours of continuous operation at the generator's full load capacity.
- B. Provide a minimum generator capacity of 750 kW at 480 volts, 3-phase, 60 hertz, 0.8 power factor and 1800 rpm; at an ambient temperature ranging between -20 degrees to 105 degrees F.
- C. Provide a fuel recirculation and filter system to maintain the quality of the engine fuel supply in the storage tank.

#### 1.05 SUBMITTALS

- A. General: Furnish all submittals including the following as required in Section 16050 – Basic Electrical Materials and Methods.
  1. Furnish starting battery sizing calculations.
  2. Acoustic control calculations for outside the enclosure.
  3. Seismic support calculations.

4. Engine certificate of compliance to latest EPA requirements.
  5. Provide a chart that shows practical steps necessary to permit the engine-generator to start the required loads without exceeding permissible voltage and frequency limits – while maintaining any loads already started, in running condition.
- B. Product Data and Information: Furnish product data and information showing dimensions, weights, ratings, interconnection points, and internal wiring diagrams for engine, generator, generator control and instrument panel with integral annunciator, load bank, battery, battery rack, battery charger, exhaust silencer, vibration isolators, sub-base fuel storage tank with leak monitor and cooling system. Supply product data and information for the fuel recirculation system with interconnecting piping. Also supply product data and information for the generator set enclosure with auxiliary systems.
- C. Contractor's Shop Drawings: Furnish Contractor's shop drawings showing plan and elevation views with overall and interconnection point dimensions, fuel consumption rate curves at various loads, ventilation and combustion air requirements, and electrical diagrams including schematic and interconnection diagrams. Also furnish plans and information for the fuel recirculation equipment and for the generator set enclosure.
- D. Quality Control
1. Provide engine generator equipment, installation and testing in compliance with the requirements of NFPA 110 and the EGSA 101 series performance standards.
  2. Furnish the manufacturer's certified, shop-test report including the following tests:
    - a. Generator tests in accordance with IEEE Test Code for synchronous machines including heat run at rated output, insulation resistance and high potential.
    - b. Engine generator tests in accordance with specifications including the following:
      - (1) Two hours continuous operation at full load
      - (2) One-half hour at 75 percent of full load
      - (3) One-half hour at 50 percent of full load
  3. Furnish test reports indicating voltage, amperes, kilovolt-amperes, kilowatts, rpm and fuel consumption for each load condition as curves; and containing statements on temperature rise of oil and cooling water, vibration and other objectionable performance conditions. Furnish test data showing voltage drop

and frequency fluctuations when block loads are added and removed in 25 percent, 50 percent, 75 percent and 100 percent increments.

4. Furnish manufacturer's installation instructions.
  5. Items D2 and D3 above shall be submitted and approved before the engine-generator may be shipped to the job site.
- E. Operation and Maintenance Manuals: Furnish manufacturer's operation and maintenance manuals.
- F. Record Drawings: Furnish Record Drawings, in accordance with the provisions in Section 01332, accurately indicating the locations of engine generator, load bank, output circuit breakers, batteries, battery charger, equipment mounted in the enclosure, fuel connections, vents, fuel recirculation cabinet and engine generator enclosure including mechanical and electrical connections.

#### 1.06 WARRANTY

- A. Furnish a written manufacturer's warranty for a period of not less than two years from the date of acceptance of the system covering, but not limited to, the following:
1. Repair parts
  2. Labor
  3. Travel expense
  4. Expendables made unusable by the defect and used during a repair

#### 1.07 SPARE PARTS

- A. Furnish the following spare parts:
1. Two auxiliary relays and contactors of each type used
  2. Two fuse replacements of each type used
  3. Two replacements of all types of indicating lamps and color caps used
  4. Two time delay relays of each type used
  5. One current transformer of each type used
  6. One potential transformer of each type used
  7. Two Start/Stop push buttons and selector switch of each type used
  8. One automatic voltage regulator
  9. Three full sets of fuel, air and oil filters
  10. Two complete sets of V-belts
  11. One compression tester
  12. One complete set of maintenance manuals
  13. One complete set of parts manuals
  14. Three 12-ounce spray cans of the final finish for touch-up

- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Engine generator set and accessories

- a. Caterpillar Inc.
- b. Cummins Power Generation

2. Generator Circuit Breakers

- a. General Electric Company
- b. Cutler-Hammer

3. Battery and Charger

- a. Alcad Inc.
- b. Chloride Inc.
- c. SAFT Nife

4. Load Bank

- a. Professional Power Products, Inc.
- b. SEPHCO

5. Engine Generator Enclosures

- a. Caterpillar Inc.
- b. Cummins
- c. Professional Power Products

6. Fuel Recirculation System

- a. RCI

### 2.02 MATERIALS

- A. Engine: Provide water-cooled, vee type EPA approved diesel engine, 12 cylinders turbo-charged, four-stroke cycle, compression ignition type operating on EPA approved diesel fuel oil. Provide an engine equipped with fuel, lube-oil and air-intake filters with replaceable elements; lube-oil cooler, gear-driven coolant pump,

fuel-priming pump, fuel-transfer pump, engine-jacket water heater and pressure relief and bypass valves. Provide an engine having exhaust-valve seats replaceable with inserts. Provide the engine directly connected to the generator and the set mounted on a common structural-steel base through suitable, spring type, vibration isolators selected for the seismic conditions at this location.

1. Engine fuel/water separator: Provide a fuel/water separator mounted ahead of the fuel pump on the engine generator set to remove fuel tank condensation and to prevent water from entering the engine fuel system.
2. Engine Lubrication: Provide an engine-driven, gear-type, lubricating oil pump with removable suction screen to force oil under pressure to all main, connecting rod, piston, wrist pin and cam shaft bearings, timing gears and governor operating mechanism. Provide a full-flow, lubrication oil filter of the replaceable cartridge type and lubrication oil cooler for the engine. Provide a bypass valve in the filter assembly to allow engine lubrication in case the filter is clogged. Fill the engine crank case with approved lubricating oil in accordance with the manufacturer's instruction.
3. Engine Speed Governor: Provide an electronic, isochronous governor to control the engine speed and maintain a steady-state frequency regulation within  $\pm 0.25$  percent (0.15 hertz) from no load to full load.
4. Engine Jacket Water Heater: Provide an engine-mounted, thermal circulation type water heater incorporating a thermostatic switch to maintain the engine jacket water at 90 degrees F. Provide two heaters (one heater per each bank of cylinders), suitable for operation on 480 volts, 60 hertz.
5. Engine Generator Support Systems Power: Provide a 480-volt load center, a 480V-208Y/120V transformer and 208Y/120-volt load center to serve the total auxiliary generator loads, all enclosure and fuel recirculation needs. Provide all starters and contactor required to control jacket water heater, fans, space, generator, fuel and battery heaters and unit heaters.
6. Engine Exhaust Pipe and Silencer: Provide an exhaust pipe and silencer suitable for this installation, fabricated of welded Schedule 40 steel pipe and sweep elbows with the horizontal piping pitching downward away from the engine. Provide No. 316 stainless steel flexible connectors to connect the engine exhaust silencer and exhaust stack. Provide a valved silencer drain with a drip pocket having a minimum capacity of two gallons. Provide "Metal-On" insulation a minimum 2-inch thick with aluminum cover over exhaust pipe and silencer. Exhaust noise and other enclosure noises shall be within the limits set by the NYC Noise Control Ordinances.

7. Engine Jacket Cooling System: Provide a corrosion-inhibited cooling solution of water and ethylene glycol rated for 40 degrees F operating temperature for the cooling system.
  - a. Engine mounted radiator: Equip the engine with an engine-mounted radiator, direct drive blower fan and close fitting shroud, sized to provide cooling for the engine jacket water, lubricating oil and after-cooler water cooling requirements. Provide a rigid guard to enclose both the top and sides of all moving parts between the engine and the radiator. Provide the radiator with a duct flange.
8. Engine shall be capable of supporting the full capacity of the generator, including overload.

B. Generator

1. Provide generator rated for continuous standby service 750 kW, 937 kVA at 0.8 power factor, 480 volts, three phase, four wire, wye connected, 60 Hertz, 1800 rpm, with a temperature rise not exceeding 150 degrees C in an ambient temperature of 40 degrees C.
2. Provide generator as a 4 pole, salient pole, synchronous, revolving field, static regulated, brushless exciter with Class F insulation in a totally enclosed fan-cooled enclosure connected to the engine through a flexible coupling and a ring bolted to the flywheel housing.
3. Provide generator with the rotor dynamically balanced within .0005 in. peak-to-peak amplitude displacements at both ends of the shaft, capable of sustaining 25 percent overspeed.
4. Provide generator with stator and rotor windings of copper and in the layered form wound design with amortisseur windings furnished in pole faces having welded-type connections. Generator construction and windings shall suppress all odd harmonics.
5. Provide generator excitation system consisting of a rotating rectifier assembly, 3-phase ac exciter and solid-state voltage regulator. Provide exciters that consist of a stationary field structure and a revolving armature. Provide surge suppressors to protect the rotating rectifiers. Provide excitation support for improved short circuit performance.
6. Provide generator capable of withstanding 10 percent overload current for two hours and 50 percent overload current for one minute without injurious heating at the rated power factor and the exciter field set for normal rated load excitation.

7. Provide generator having a minimum combined efficiency of 95 percent with the exciter and voltage regulator at rated, full-load current.
8. Provide generator, exciter and regulator with radio and TV noise suppression.
9. Provide generator with adequate SCKVA to start all emergency and Switchgear B bus loads while maintaining adequate voltage and frequency.
10. Provide heaters as needed to prevent moisture from deteriorating the Generator insulation during periods of non-use.

C. Automatic Voltage Regulator

1. Provide an automatic, high-speed, solid-state, static voltage regulator mounted in the generator control panel arranged to monitor the generator output voltage in all three phases and apply corrections to generator excitation for variations in the voltage due to changes in generator load current, engine speed and load power factor.
2. Provide the voltage regulator to maintain generator output voltage within plus or minus one percent of the rated voltage from no load to full load, and momentary voltage drop at a maximum of 20 percent of rated voltage when full load is applied.

D. Generator Output Distribution Panel: Provide a generator output distribution panel consisting of one power bus feeding two separate partitioned areas with individual door covers. One area shall serve Emergency loads. The other area Normal loads. The Emergency side shall contain the Fire Pump Controller feed circuit breaker and a set of lugs to feed a remote Fire Alarm disconnect switch. The normal side shall contain two circuit breakers. One to feed the B bus of the switchgear and the other to feed the load Bank. All shall be arranged in Hot Sequence per NYCEC.

1. Provide one low-voltage, power circuit breakers rated at 1200 T/1600F amperes at 480 volts, 3-phase, 60-hertz to serve the 480 main switchgear B bus.
2. Provide one low-voltage, power circuit breakers rated at 400T/600F amperes at 480 volts, 3-phase, 60-hertz to serve the fire pump controller automatic transfer switch
3. Provide one 600T/800F ampere low voltage power circuit breaker rated at 480 volts, 3 phase, 60-hertz to serve the Load Bank.
4. Provide a 3 phase set of lugs to supply a feed to the remote fire alarm system disconnect switch.
5. Provide circuit breaker protection programming set points selectively coordinated with the loads served that will protect the generator from damage

and allow downstream O/C devices to interrupt overloads and faults without taking the Generator off-line..

6. Provide instrument and relay current transformers and potential transformers with as required within the structure housing the circuit breaker.
- E. Load Bank: Provide an integral load bank rated at 50 percent of generator capacity to provide a load to the generator during programmed exercise periods.
1. Provide contactors and controls that switch the output of the generator to the load bank during exercise periods. In the event that a power outage occurs during an exercise period, the controls will automatically transfer the generator output from the load bank to the generator distribution panel.
  2. Load removal controls for the Load Bank shall be a fail safe design.
- F. Generator Control and Instrument Panel
1. Provide an illuminated, generator control and instrument panel of solid-state or microprocessor-based design housed in a NEMA 12 enclosure and mounted on the engine-generator set base containing, but not limited to, the following:
    - a. Oil pressure gauge with low pressure cut-off switch
    - b. Water temperature gauge with high temperature cut-off switch
    - c. Emergency stop button
    - d. Frequency meter and running time meter
    - e. Overspeed and overcrank switches
    - f. Ammeter and voltmeter and phase switches for the generator
    - g. Governor and voltage controls
    - h. Manual ON and OFF switch
    - i. Generator Exerciser: Timer to schedule automatic exercising of the engine generator on the integral load bank, per the manufacturer's recommendation
    - j. Common alarm contact to signal failure of unit

- k. Alarm panel with six LED type alarm lights or digital readout with fault code program and output contacts, as follows:
    - (1) High water temperature
    - (2) Engine over crank
    - (3) Low lube oil pressure
    - (4) Engine overspeed
    - (5) Selector switch "off"
    - (6) Emergency stop
  - l. Two-wire, remote, start/stop termination
  - m. Oil low-level switch
  - n. Water low-level switch
  - o. Battery charger
  - p. Indicating lights
  - q. "Push to Test" button and circuitry to test all indicating lights
  - r. Output contact for unit operating at rated voltage
2. Provide all safety devices necessary for the protection of the engine generator set that alarm and shut down the set.

All alarm points and output contacts shall report to the facility SCADA F-PLC-01.

- G. DC Engine Starting System: Provide a dc powered, engine-starting system consisting of batteries and battery charger operating at 28-volt dc.
- 1. Batteries: Provide a set of lead-acid storage batteries of the heavy-duty, diesel starting type having the required system dc voltage and adequate ampacity for six series of four cranking cycles of 15 seconds "ON" and 10 seconds "OFF" at the worst ambient temperature without recharging. Provide the battery set mounted on a metal battery rack with the necessary cables and clamps.
  - 2. Battery Charger: Provide an automatic-float type battery charger consisting of a silicon controlled rectifier to provide a constant voltage output, with the necessary transformer to operate from a 115-volt, 1-phase, 60 Hertz lighting circuit. Provide a charger having a dc voltmeter, dc ammeter, equalizer timer and control switch, and sufficient ampere rating to maintain the charge on the engine starting battery. Provide a charger with protection against short circuits, overloads and reverse battery connections. Provide a charger capable of fully recharging the completely dead batteries in 8 hours time. During

battery recharge the charger shall be capable of cranking the engine directly – when manually selected.

#### H. Weather Protective Enclosure

1. Provide the engine generator set and all accessories factory installed within a weather protective, corrosion resistant, sound attenuating NEMA 3RX enclosure of 12-gauge steel construction suitable for a marine type environment. Provide the enclosure with at least one access door on each side and one access door in the rear, with provisions for being locked and keyed alike. Enclosure shall be rodent proof.
2. Provide the enclosure with fixed air-intake louvers and an expanded-metal exhaust-air opening. Mount the exhaust silencer on the roof of the enclosure with an exhaust elbow and rain cap. The air exhaust shall discharge so not to constitute a hazard to operating or maintenance personnel walking nearby.
3. Provide internal bracing as required.
4. Provide an enclosure suitable for sound attenuation such that the overall (enclosure, air and exhaust) noise level does not exceed 65 dBa at 23 feet, with the engine generator set operating at full load.
5. Provide interior lighting with a control switch at the door, an outdoor light fixture over the main access door controlled by a photocell and control switch at the door. Also provide duplex ground fault receptacles around the interior of the enclosure.
6. Provide thermostatically controlled unit heaters and exhaust fans to keep the temperature of devices in the generator enclosure to within the manufacturers published permissible temperature limits when the generator is not running.
7. Provide sufficient space for all fixed piping, valves, and fittings between the sub-base fuel storage tank, the engine generator set and the supply and accessory connections external to the enclosure.
8. The enclosure shall provide space for all transitions needed to accommodate connections to the fuel fill line, vents, recirculation lines and electrical raceways.
9. Provide high temperature heat detectors and a manual pull station inside the enclosure. Wire these devices to the Fire Alarm Control Panel and SCADA system in the main building, where they may be monitored.
10. Provide a ground reference bus for the engine generator, the enclosure and all equipment located within the enclosure.

11. Enclosure shall provide space for the battery rack, batteries, battery charger, power distribution panels, transformer and Electrical Monitoring and Control Panel to be mounted inside the structure and not on the engine or its supporting structure. This is intended to reduce vibration and heat effects on these items.

I. Dual Wall Sub base Fuel Storage Tank

1. Provide a dual wall sub base tank constructed of 8 gauge aluminized steel on top and 12 gauge aluminized steel on sides and bottom. Provide with manual overfill protection, internally baffled to prevent immediate resupply of heated return fuel, lockable 2-inch fill cap, fuel level gauge, tank to foundation ground clearance for visual secondary leak detection, load bearing vertical "C" channel at generator set mounting points, vertically accessible primary vent, venting in both primary and secondary containments, weatherproof secondary containment, low and high fuel level and leak detection alarms.
2. Provide a storage tank with a minimum capacity of 1500 gallons or 24 hours of fuel whichever is greater.
3. Provide a storage tank constructed in accordance with and listed to UL 142.
4. Provide the tank with all required fittings and with all pipe connections required for enclosure and external fuel piping and fueling related devices. All shall be made up at the manufacturer's facility or in the field as directed by the manufacturer.
5. Coordinate fittings and connections with the external fuel and vent piping supplier that runs lines from the fuel port.

J. FUEL RECIRCULATING SYSTEM – 11 GPM

1. A UL 508 listed fuel purification system shall be furnished to automatically circulate and clean fuel in a 1500 gallon sub-base above ground storage tank on a pre-programmed basis without the use of replaceable filter elements. The system shall be centrifugal based and capable of removing a minimum of 99.5 percent of all water, including emulsified water and 98 percent of the solid or particulate contaminants found in fuel to approximately 10 microns. The system shall be PLC based with an Operator Interface Touch Screen Panel mounted on the front door that allows for programming and alarm monitoring. The fuel purifier, Touch Screen Interface and PLC controller shall be heated to allow for operation in cold climates. In addition, an audible alarm, alarm acknowledge switch and a system HOA switch shall be mounted on the front door for easy operator use. Internal relays shall be available for providing system alarm status. The system shall include a continuous duty motor and fuel pump, operating from 208 VAC power, capable of pumping fuel at not less than 11 gallons per minute with a 1 hp motor. All system components

shall be housed in a NEMA 4X rated weather proof, key locked cabinet. The inlet and outlet openings in the cabinet shall allow for the termination of the secondary containment pipe within the cabinet. A weatherproof, duplex 120 VAC electrical outlet shall be provided in the interior of the cabinet. A full system operations test shall be conducted at the factory before shipment to verify the system is working within parameters and has no leaks in the plumbing. Factory personnel shall provide on-site start-up and operator training.

2. The factory packaged purification system shall consist of the following:
  - a. NEMA 4X Weatherproof enclosure:
    - (1) 14-gauge steel construction with welded seams and flanged door opening
    - (2) Suitable for pad or wall mounting
    - (3) Two hinged front doors
    - (4) Gasketed Operator Interface Touch Screen in front door
    - (5) Containment basin in bottom with Manual drain plug
    - (6) Key Lockable Handle
    - (7) 1-inch NPT right side inlet with shutoff ball valve, 1 inch, bronze with stainless steel ball and Teflon seal
    - (8) 1-inch NPT left side outlet with shutoff ball valve, 1 inch, bronze with stainless steel ball and Teflon seal
    - (9) Finished in white powder marine finish coating
    - (10) 3" dia openings around the inlet and outlet pipe to allow for termination of secondary containment pipe within the enclosure
    - (11) Pump
      - (a) Positive displacement gear pump
        - 1) Aluminum housing
        - 2) Steel gears
        - 3) Hardened steel shaft
        - 4) Mechanical shaft seal
        - 5) Pressure relief valve
        - 6) Priming Tee

- (b) 11 GPM at 100 psi capacity at 1800 rpm

(12) Motor

- (a) 1 HP
  - 1) 208, 1-phase, 60 Hz
  - 2) Open drip proof construction
  - 3) Integral overload protection
- (b) Flexible, self-aligning shaft coupler.

(13) Controls

- (a) Operating Range of 32 F to 122 F
- (b) PLC Based
- (c) Touch Screen Operator Interface
  - 1) Back lit
  - 2) Day Light Readable
- (d) Security Code Activated

(14) Fuel Purifier

- (a) RCI FP 1000
- (b) Flow Rate – 40 GPM
- (c) High Water Sensor
- (d) Water Drain Valve – Manual 1” Brass
- (e) Water Removal - 99.5%
- (f) Particulate Removal – 98% to 10 Microns

(15) Heaters

- (a) Purifier
- (b) PLC Controller
- (c) Touch Screen Interface

(16) System Alarms

- (a) Fuel Leak in Basin
- (b) High Water
- (c) High Pressure
- (d) Pump Fail

## (17) Interface to other devices:

## (a) 5 - Dry Contact relays, rated at 12 AMPS

- 1) 4 - Individual system alarms listed.
- 2) 1 - Alarm Summary

## (18) Audible Alarm – installed on outside of front door

## (19) Alarm Acknowledge Switch - installed on outside of front door

## (20) HOA Switch - installed on outside of front door

## (21) Pump and purifier installed with unions

## (22) Control Devices

## (a) Pump Motor Starter

- 1) 20A single pole circuit breaker
- 2) 30A DP contactor
- 3) Pump control switch
  - a) Auto, Off, Manual
  - b) Weatherproof, key operated
  - c) Control power fuses
  - d) Connection terminal blocks

3. The system shall not require the replacement or periodic cleaning of any type filter element or screens. The system shall include a magnetic fuel decontamination unit designed to help prevent the build up of microbiological contamination.
4. Factory authorized personnel shall provide start-up and operating training services.
5. Basis of design is "RCI Technologies" model FRS-660-11 UL - Automatic Recirculation System. Equivalent products of other manufacturers may be submitted for approval.

## K. Fuel Piping

1. Provide Zinc free piping and fittings for all fuel piping in accordance with the equipment manufacturer's recommendations.

2. Piping external to the sub-base engine generator and the fuel recirculation system enclosures shall be double walled containment type as specified in Section 15191 - Diesel Fuel Piping
3. Provide foot valve in the suction line pipe connecting the sub-base fuel tank to the Fuel Quality Maintenance System.
4. Provide a check valve, inside the engine-generator enclosure, in the fuel supply line to the sub-base fuel tank.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install the engine generator set, fuel storage tank, radiator and fuel recirculation system on concrete mounting pads or structures as shown; in accordance with manufacturer's instructions. Provide all required piping between generator set and remote mounted devices (radiator and fuel recirculation).
- B. Grounding and Power Connections: Install local ground for all equipment enclosures and fuel tanks. Make and test all electrical power, ground and control connections
- C. Fuel: Make and test all fuel pipeline connections. Fill storage and day tank with fuel, bleed fuel pipelines to remove air and prime fuel pumps as per manufacturer's instructions.
- D. Slope fuel piping between the sub base storage tank and the fuel recirculation system toward the recirculation cabinet.
- E. After all tests and acceptance of the Unit fill the fuel storage tank with the fuel type specified by the City of New York.
- F. Connect all level and alarm devices for remote monitoring to an interface terminal in the enclosure for extension to the main MTS building.

#### 3.02 FIELD QUALITY CONTROL

- A. Initial Test Run: Test start and run the engine generator set at no load for at least 30 minutes to check dc starting system, vibration free installation, fuel line leaks, all gauges and meters, engine rpm, generator voltage and to warm up the engine generator for the load test, as per the manufacturer's instructions.
- B. Inspections: Inspect all engine generator systems after initial test run for defects and rectify in accordance with manufacturer's instructions.
- C. Tests: Carry out a field test of the engine generator system for 4 hours at full load in the presence of the Resident Engineer. Furnish dry type load banks for the load

test and provide precise incremental loading on engine generator until it reaches full load. Check phase voltages, current frequency, vibration, and temperatures as per manufacturer's instructions.

### 3.03 OPERATION DEMONSTRATION

- A. **Manufacturer's Service Representative:** Furnish the services of the engine generator manufacturer's representative to assist in installation, start-up, field testing, calibration, placing into operation and provide training as specified in Section 01821 – Training, including the acceptance test run of the set. Have the representative carry out a thorough inspection of the installation; certify that the installation is correct and complete in accordance with the manufacturer's instructions; to confirm that the set is ready for acceptance test run; and to instruct operating personnel in the operation and maintenance of the set.
- B. **Final Acceptance Test (Demonstration) Run:** Have the manufacturer's service representative perform the final acceptance test run of the engine generator set in the presence of the Resident Engineer. Perform the final acceptance test run by simulating a power failure and observing automatic engine generator startup, acceleration to speed and assumption of available load at the site without any problems and as per claimed performance. Demonstrate the compatibility of the engine generator with the adjustable frequency drives and solid-state starters used for motors; and its capability to start and operate the loads in the desired sequence. Also demonstrate that the engine generator is capable of starting and sustaining the load with a voltage drop of not more than 20 percent of the rated value. Simulate and demonstrate that the alarm and shut down features operate satisfactorily.
- C. **Training:** Following completion of installation and field testing furnish training for 12 employees of the City in the proper operation, trouble-shooting and maintenance of the equipment as described in Section 01821 – Training.
  - 1. **Operational Training:** A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  - 2. **Maintenance Training:** A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
- D. **Provide the services of the Fuel Quality Maintenance System, the Load Bank and the Enclosure Manufacturers to provide support for the installation, start-up and testing of the equipment furnished by them. They shall certify that the equipment and installation meet their requirements for this installation.**

### 3.04 PAINTING

- A. **Shop Painting:** Paint the generator systems as specified in Section 09912 - Interior Painting.

- B. Field Painting: Touch up scratched and marred surfaces to match with original finishes.

3.05 IDENTIFICATIONS

- A. General: Provide identifications meeting the requirements of Section 16075 – Electrical Identification.
- B. Component Identification: Identify all system components, cables and wires by applicable labels indicating unit numbers, circuit numbers.

-END OF SECTION-

**Section 16264**  
**UNINTERRUPTIBLE POWER SUPPLY SYSTEMS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Section Includes: Requirements for providing and testing uninterruptible power supply (UPS) systems.
1. Three-Phase Systems: Three-phase uninterruptible power supply (UPS) systems consist of rectifier/battery charger, solid-state inverter, static transfer switch, manual bypass switch, batteries with associated controls, ac and dc protection, instrumentation and alarms; housed in suitable metal enclosures.
  2. Single-Phase Systems: Single-phase uninterruptible power supply (UPS) systems consist of rectifier/battery charger, solid-state inverter, batteries with associated controls, ac protection and alarms; housed in suitable metal enclosures.
- B. Related Work Specified in Other Sections:
1. Section 16050 - Basic Electrical Materials and Methods
  2. Section 16060 - Grounding
  3. Section 16075 - Electrical Identification
  4. Section 16121 - Wires and Cables - 600 Volts and Below
  5. Section 16130 - Electrical Raceway Systems
  6. Section 16511 - Lighting
  7. Section 16745 Telephone/Data System.
  8. Section 16751 Access Control System.
  9. Section 16752 Digital Video System.

**1.02 REFERENCES**

- A. Codes and Standards: The following codes and standards are referred to in this Section as follows:
1. UL 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors
  2. NFPA 70 - National Electrical Code
  3. NYCBC - New York City Building Codes
  4. NFPA 75 - Standard for the Protection of Electronic Computer/Data Processing Equipment

5. UL 1778 - Uninterruptible Power Systems
6. UL 924 - Emergency Lighting and Power Equipment
7. IEEE C-62.41 IEEE Guide on the Surge Environment in Low Voltage (1000 V and less) AC Power Circuits

### 1.03 SUBMITTALS

- A. General: Furnish all submittals, including the following, in accordance with the requirements contained in Division 1.
- B. Product Data and Information: Furnish manufacturers data on all equipment and devices in the assembly, including voltages, number of phases, current ratings, capacities, finishes for all the system components and other relevant data.
- C. Contractors Shop Drawings: Furnish contractors shop drawings for the shop assembled equipment, including the following:
  1. Layout drawings of the assembly showing accurately scaled basic equipment sections, auxiliary compartments, combination sections and location of various system components and their interconnection. Show special relationships of assemblies to associated equipment, including plan and front views of the equipment and layout dimensions. Provide a bill of materials.
  2. Wiring diagrams for assemblies showing connections to electrical power. Clearly differentiate between shop-installed portions of wiring and field installed portions.
  3. Furnish construction drawings for equipment requiring field assembly. Clearly differentiate between shop-assembled portions and field assembled portions.
  4. A schematic control diagram for the entire system showing connections to other related systems.
  5. Manufacturer's installation, testing and commissioning instruction for the entire system.
- D. Quality Control: Furnish manufacturers test reports and certified performance records of all equipment installed. Furnish field test reports after equipment is installed.
- E. Operations and Maintenance Manuals: Furnish Operations and Maintenance Manuals of all equipment and assemblies in accordance with Division 1.

**1.04 QUALITY ASSURANCE**

- A. Codes: Comply with local codes and all other applicable codes.
- B. Regulatory Requirements: Comply with applicable Regulatory Agency requirements.
- C. Manufacturer Qualifications: Manufacturer must maintain, within 100 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs within 24 hours maximum response time.
- D. Source Limitations: Obtain the UPS and associated components specified in this Section from a single manufacturer with responsibility for the assembly.
- E. Electrical Components, Devices, and Accessories: Listed and labeled.
- F. UL Compliance: Listed and labeled under UL 1778.
- G. NFPA Compliance: Mark UPS components as suitable for installation in computer rooms according to NFPA 75.

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. General: Deliver, store and handle all products and materials in accordance with the requirements contained in Division 1.

**1.06 WARRANTY**

- A. General: Provide warranty for all equipment and services furnished as described in Division 1 of these Specifications.
- B. Provide two years from date of substantial completion

**1.07 SPARE PARTS**

- A. General: Provide the following spare parts:
  - 1. One set of each type of fuses.
  - 2. Two batteries of each type and rating.
- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers: Acceptable manufacturers are as listed below. Other manufacturers of equivalent products may be submitted for approval for review.

1. Three-Phase UPS System.
  - a. MGE Galaxy UPS Systems Inc.
  - b. Chloride Power Systems
  - c. Liebert.
  - d. McPhilben MST
2. Single-phase UPS system including batteries.
  - a. MGE UPS Systems Inc.
  - b. American Power Conversion Corp.
3. Batteries for three-phase UPS systems
  - a. C & D
  - b. Alcad
  - c. Enersys

### 2.02 THREE-PHASE UPS SYSTEMS

- A. Operating Parameters: Provide UPS systems having the following operating parameters:
1. Nominal Power Rating: As indicated on plans or required.
  2. Input Voltage: 208 or 480 Volts, 3-phase, 3-wire – derived system with ground. Adjustable  $\pm 3\%$ .
  3. Input Power Factor: 95 percent minimum
  4. Input Harmonic Filter: Provide a filter to limit the current harmonic distortion to 10 percent.
  5. Output Voltage: 208Y/120V, 3-phase, 4-wire, adjustable  $\pm 3$  percent
  6. Output Frequency: 60 Hz  $\pm 2$  percent
  7. Overload Capability: 110 percent for 10 minutes

8. Operate under the following ambient conditions:
    - a. Ambient Temperature: 0 to 30 degrees C (+32 to +86 degrees F)
    - b. Humidity: 0 to 95 percent non-condensing
  9. Acoustical Noise: less than 65-decibels, A-weighted at 3 feet
  10. Minimum Battery Backup Time: 90 minutes at full load
  11. Install batteries in a matching cabinet.
- B. Description of Operation: Design three-phase UPS systems to operate as follows:
1. Normal Operation: Power the load continuously from the inverter. Derive the power for the rectifier/battery charger from the ac incoming line to provide dc power to the inverter while simultaneously float charging the battery.
  2. Emergency: Upon loss of the ac input power, continue to power the load from the inverter without interruption or switching while the battery provides dc power to the inverter.
  3. Battery Recharge: Upon restoration of the ac power, power the load continuously from the inverter while the rectifier/battery charger provides dc power to the inverter while simultaneously recharging the battery.
  4. Bypass Mode: Upon failure of the UPS system, transfer the load from the inverter to the ac line using a static-bypass transfer switch.
  5. Maintenance Bypass/Test Mode: Provide a manual make-before-break maintenance bypass switch to isolate the UPS for maintenance and testing.
- C. Rectifier/Battery Charger: Provide rectifier/chargers to convert the input AC power to a regulated dc voltage with the following features:
1. Solid state rectifier/charger of a modular design to facilitate maintenance.
  2. Size the rectifier/charger to serve full load of the inverter and fully recharge the battery within 10 times the rated run time at full load.
  3. Provide fuses to protect the rectifier/charger.
  4. Provide input transformers when required to obtain proper voltage outputs or control harmonics.
- D. Batteries: Use sealed, maintenance-free, high-discharge rate batteries consisting of lead acid cells. Size batteries for the specified backup time having a minimum end voltage of 1.67 volts per cell.

- E. Inverter: Provide inverters having the following features:
  - 1. Pulse width modulated (PWM) type capable of providing the output power characteristics specified.
  - 2. Design the inverter of modular assemblies to facilitate maintenance.
- F. Static-Bypass Transfer Switches: Provide solid-state transfer switches rated for continuous duty with the following operational features:
  - 1. Uninterrupted Transfer: Transfer the load to the bypass source without interruption upon sensing any of the following fault conditions:
    - a. Inverter overload
    - b. Inverter failure
    - c. Battery low voltage
  - 2. Interrupted Transfer: Transfer the load to the bypass source with an interruption not exceeding 0.2 seconds during a fault condition when any of the following occur:
    - a. Bypass voltage exceeds  $\pm 10$  percent of the UPS rated output voltage.
    - b. Bypass frequency exceeds  $\pm 2$  hertz from the UPS rated output frequency.
  - 3. Forward Transfer: Transfer the load from bypass source to the UPS automatically without an interruption when the UPS is operating within its ratings.
- G. Internal Bypass Switches: Provide internal bypass switches for maintenance of the system.
- H. Enclosures: Provide ventilated, free-standing enclosures for the electronic components of the UPS system. Provide separate free-standing battery enclosures.
- I. Controls, Indicators and Alarms
  - 1. Provide each UPS system with a visual display panel indicating the following parameters:
    - a. UPS On-line
    - b. UPS On Battery
    - c. UPS Off-line
    - d. UPS Fault
    - e. Input voltage
    - f. Bypass voltage
    - g. Bypass input frequency

- h. UPS Output voltage
    - i. UPS Output frequency
    - j. UPS Output current
    - k. UPS Output kVA
    - l. dc Voltage
    - m. Available battery capacity
  - 2. Provide each UPS system with the following dry contacts rated 10-amperes at 120V ac:
    - a. UPS On-line
    - b. UPS On Battery
    - c. Load On Bypass
    - d. UPS Fault
  - 3. Provide each UPS system having the following controls and protection:
    - a. ac circuit breaker
    - b. Inverter "ON/OFF" switch
    - c. Manual bypass switch
    - d. Float/equalize switch
    - e. Transfer test switch
    - f. Emergency Power Off switch
- J. Identification: Provide identification meeting the requirements of Section 16075.
- 2.03 SINGLE-PHASE UPS SYSTEMS
- A. Operating Parameters: Provide on-line UPS systems, UL Inc. Listed.
  - B. Emergency Lighting UPS shall have the following operating parameters:
    - 1. Nominal Power Rating: As indicated on plan or required.
    - 2. Electrical Power input: 277 volt, 1-phase, 60-hertz as indicated on plan or required
    - 3. Electrical Power output: 277 volt as indicated on plan or required, 1-phase, 60-hertz (adjustable  $\pm 5\%$ )
    - 4. Surge Protection: 240 joules
    - 5. Voltage Regulation: Automatic
    - 6. Batteries: Maintenance-free sealed lead-acid
    - 7. Acoustical Noise: Less than 40dB at 3 feet

8. User Displays:
    - a. On ac Power
    - b. On Battery
    - c. Replace Battery
    - d. Overload
    - e. Load and Battery bar-graphs
  9. Recharge time (maximum): 4 hours
  10. Temperature: 0 degrees C to +35 degrees C (+32 degrees F to +95 degrees F)
  11. Minimum Battery Backup Time:
    - a. 90 minutes for Emergency Lighting at Full Load
  12. The UPS for the Emergency Lighting System shall have the characteristics in 2.02 B through J of the Three Phase UPS above.
- C. Other single phase UPS shall have the following operating parameters:
1. Nominal Power Rating: As indicated on plan or required.
  2. Electrical Power input: 120-volt, 1-phase, 60-hertz as indicated on plan or required
  3. Electrical Power output: 120-volt as indicated on plan or required, 1-phase, 60-hertz (adjustable  $\pm 5\%$ )
  4. Surge Protection: 240 joules
  5. Voltage Regulation: Automatic
  6. Batteries: Maintenance-free sealed lead-acid
  7. Acoustical Noise: Less than 40dB at 3 feet
  8. User Displays
    - a. On ac Power
    - b. On Battery
    - c. Replace Battery
    - d. Overload
    - e. Load and Battery bar-graphs
  9. Recharge time (maximum): 4 hours

10. Temperature: 0 degrees C to +35 degrees C (+32 degrees F to +95 degrees F)

11. Minimum Battery Backup Time

a. 120 minutes

D. Identification: Provide identification meeting the requirements of Section 16075.

E. Enclosures: Single phase units (except Emergency Lighting Unit) suitable for standard 19 inch equipment racks. Three phase units suitable for floor or wall mounting. Batteries support and ventilation as required.

F. Minimum overload capacity shall be 110% for 30 seconds short circuit protected.

G. Full system self-diagnostics test on power up.

H. Voltage regulation to provided pure sine wave output on battery operation with +/- 5% RMS voltage regulation.

## 2.04 SOURCE QUALITY CONTROL

A. General: Provide complete Uninterruptible Power Supply (UPS) systems designed, assembled, wired and tested at the point of manufacture in accordance with the latest NEC (NFPA), NEMA, UL, IEEE and ANSI standards.

## PART 3 EXECUTION

### 3.01 INSTALLATION

A. General: Install all equipment as indicated, in accordance with manufacturer's written instructions and comply with requirements of NEMA Standards, NEC, NYCBC, project-applicable portions of NECA's Standard of Installation and applicable ANSI Publications.

B. Coordination: Coordinate with other work including cabling and wiring work as necessary to interface installation of shop assembled equipment with other work.

C. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals in accordance with UL Standard 486A.

D. Grounding Connections: Make equipment grounding connections for the shop assembled equipment as indicated on the Drawings. Tighten connections in accordance with UL Standard 486A to assure permanent and effective grounding.

E. Adjustments: Make all necessary adjustments to the equipment to provide complete and satisfactory operation upon completion of the Contract.

## 3.02 FIELD QUALITY CONTROL

- A. General: Perform field inspection and testing for each UPS system to demonstrate that each unit meets the following:
1. Has not been damaged during transportation and installation.
  2. Has been properly installed.
  3. Has no mechanical defects.
  4. Has been properly connected.
- B. Tests: Perform field tests as follows:
1. Inspect and test the installation with respect to the safety requirements of NEC pertaining to grounding and insulation resistance.
  2. Demonstrate proper operation of each UPS system by simulating conditions.
  3. Repair or replace defective materials at no cost to the Owner
- C. Manufacturer's Field Services: Provide the services of a qualified representative of each manufacturer of the Uninterruptible Power Supply (UPS) systems to inspect the installation of equipment make any necessary adjustments and instruct the operating personnel about operation, maintenance and provide training as specified in Section 01821.
1. Provide a service engineer when the equipment is placed into operation.
  2. Provide a service engineer at the jobsite as often as necessary until all problems are corrected and the equipment installation and operation are satisfactory.
  3. Following completion of installation and field testing provide training for 12 employees of the City of New York in the proper operation, troubleshooting and maintenance of the equipment as outlined below. Provide training at the City of New York's facilities at a time agreeable to the City of New York:
    - a. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
    - b. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

-END OF SECTION-

**Section 16266**  
**ADJUSTABLE FREQUENCY DRIVES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements for providing, installing and testing the 480-volt adjustable frequency drives. Provide drives in individual free standing enclosures, wall mounted enclosures, or incorporated into motor control centers, as shown. Furnish harmonic studies as specified.

**1.02 RELATED SPECIFICATIONS**

1. Section 01821 – Training
2. Section 09912 - Interior Painting
3. Section 15900 – HVAC Controls
4. Section 16050 - Basic Electrical Materials and Methods
5. Section 16055 – Electrical Requirements for Shop Assembled Equipment
6. Section 16075 - Electrical Identification
7. Section 16491 - Control Components and Devices

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NEMA ICS 1 - General Standards for Industrial Control and Systems
2. NEMA ICS 2 - Industrial Control and Systems Controllers, Contactors and Overload Relays Not More than 2000 Volts AC or 750 Volts DC.
3. NEMA ICS 3 - Industrial Control and Systems Factory Built Assemblies
4. NEMA ICS 7 - Industrial Control and Systems: Adjustable Speed Drives
5. NEMA ICS 7.1 - Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable Speed Drive Systems
6. NEMA 250 - Enclosures for Electrical Equipment
7. NFPA 70 - National Electrical Code
8. IEEE 85 - Test Procedure for Airborne Sound Measurements on Rotating Electric Machinery

- 9. IEEE 519 - IEEE Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems
- 10. UL 845 - Motor Control Centers

#### 1.04 SYSTEM DESCRIPTION

##### A. Design Requirements

- 1. Provide adjustable frequency drives to vary the speed of NEMA standard, 3-phase, 460-volt, induction motors and driven equipment by varying the frequency and voltage applied to the motors.
- 2. Provide adjustable frequency drives that fit in the space shown. Units exceeding the dimensions shown will not be acceptable.
- 3. Provide adjustable frequency drives that automatically restart when power is restored after a power outage. Provide control logic so the drive is allowed to restart when power is restored. Restart shall be subject to an adjustable time delay and a selectable power level of operation.

B. Rated Output Power: Provide adjustable frequency drives with an output that is at least 3 percent greater than the driven motor's full nameplate rating.

C. Torque Output: Provide variable torque or constant torque output drives as required by driven equipment.

D. 6-Pulse Drive Technology: Provide adjustable frequency drives serving motors 75 HP or smaller that utilize 6-pulse drive technology.

E. 18-Pulse Drive Technology: Provide adjustable frequency drives serving motors 100 HP or larger that utilize 18-pulse drive technology.

F. Performance Requirements: Provide adjustable frequency drives to meet the following requirements of IEEE 519:

- 1. Total harmonic distortion THD (Voltage): Maximum of five percent for general distribution systems as measured at the point of common coupling.
- 2. Total current harmonic distortion: Not to exceed the values in Table 10.3, Current Distortion Limits for General Distribution Systems (120 V through 69000 V) of IEEE-519 at the point of common coupling.
- 3. Capacitor traps for controlling harmonics that require tuning to the power system are not acceptable.
- 4. Operate at a minimum efficiency of 95 percent at rated load.

5. Operate from a 480-volt, 3-phase, 60-hertz supply with a voltage variation of plus 10-percent or minus 20-percent and a frequency variation of plus or minus 2-hertz.
6. Input power factor: Maintain a 95 percent minimum power factor over a 20 to 100 percent speed range.
7. Operate an induction motor as specified, including a high-efficiency, high-power factor, premium-duty motor, with no detriment to motor life.
8. Operate an induction motor without exceeding a motor sound and power level of 96-decibels, A-weighted, when measured in accordance with IEEE 85.
9. Operate under the following ambient conditions:
  - a. Ambient Temperature: 0 to 40 degrees C
  - b. Humidity: 0 to 95 percent

#### 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish catalog data including rating and descriptive literature of all components and systems.
- C. Shop Drawings: Furnish the following shop drawings customized for the project:
  1. Bill of materials including manufacturers name and catalog number
  2. Outline drawings showing dimensions, arrangement, elevations, identification of components and nameplate schedule for all units
  3. Interconnection wiring diagrams
  4. Individual schematic control diagrams for each unit
  5. One line diagrams
  6. Obtain and enter full performance data for all motors shown
  7. Certification that the adjustable frequency drives are compatible with the motors and the equipment loads to be driven

- D. System harmonic distortion study: Furnish a system harmonic distortion study as follows:
1. Obtain data on utility services, plant loads and plant operation. Verify electrical service rating including transformer size, short circuit capacity and X/R ratio.
  2. Prepare a harmonic distortion study of plant electrical system to determine voltage and current harmonics at the point of common coupling for worst case speed and load settings.
  3. Confirm that the submitted adjustable frequency drives limit the electrical disturbances below the 5 percent THD (voltage) and below the harmonic current distortion per Table 10.3 as established by IEEE 519.
  4. Point of Common Coupling: The point of common coupling is the motor control center or switchgear directly upstream of the adjustable frequency drive.
  5. Include analysis of all data with recommendations.
- E. Quality Control: Furnish test reports, certificates of inspection and manufacturer's instructions.
- F. Operations and Maintenance Manuals: Furnish operations and maintenance manuals as specified in Section 01831.

#### 1.06 QUALITY ASSURANCE

- A. Standards: Provide all adjustable frequency drives manufactured in accordance with referenced standards.
- B. UL Label: Provide a UL Inc. Label or certification of listing by C.S.A. or other recognized testing organization for each adjustable frequency drive.
- C. Codes: Manufacture and install each adjustable frequency drive in accordance with the NEC and local codes.
- D. Failure to Meet the Harmonic Requirement: Failure to meet the harmonic requirement as determined by field measurement: If the installed adjustable frequency drives fail to meet the harmonic limits specified, modify the adjustable frequency drives as follows:
1. Perform work at no additional cost to the City.
  2. Install additional harmonic reduction equipment until the specified limit is achieved.

3. In the event that harmonic distortion limits cannot be achieved, replace the adjustable frequency drive equipment with equipment that conforms to this specification.

#### 1.07 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:
- B. Shipping and Packing: Rigidly brace and protect against weather, damage, and undue strain, all structures, equipment and materials.
- C. Storage and Protection: Furnish clean storage facilities for all equipment delivered but not installed. Provide conditioned air for storage facilities in accordance with the equipment manufacturer's recommendations.
- D. Spare Parts: Furnish spare parts at the same time as pertaining equipment. Deliver the spare parts to the City after completion of the work.

#### 1.08 SPARE PARTS

- A. Furnish the following spare parts per each group of similar sized units.
  1. All parts recommended by the manufacturer in published literature as spare parts. As a minimum, provide the following:
    - a. Six of all sizes and types of power and control fuses
    - b. Six LED displays of each color
    - c. Two keypads of each type used
    - d. Two printed circuit boards of each type used
    - e. Four filter capacitors of each size used
    - f. Four diodes of each type used
    - g. Four transistors, gate turn off thyristors IGBT's or SCRs of each type used
    - h. Three 12-ounce spray cans of the final finish for touch-up
- B. Packaging: Package spare parts in containers bearing labels and identify all spare parts for reordering. Deliver spare parts in original factory packages.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
1. Robicon
  2. Cutler-Hammer
  3. Toshiba

## 2.02 DESIGN

- A. Input Disconnect: Provide an input circuit breaker with a minimum interrupting rating of 65,000 rms symmetrical amperes.
- B. Input Reactor: Provide input reactor or isolation transformer, if required, as determined by system harmonic distortion analysis.
- C. Converter Section: Provide input section that converts 480-volts, 60-hertz, 3-phase input to a fixed dc voltage using diodes, bridged rectifiers or SCR's.
- D. Filter Sections: Provide dc link reactor and filter capacitors as required.
- E. Inverter Section: Provide adjustable frequency drive inverter section that converts the fixed dc voltage to an adjustable frequency output. Maintain a constant volts per hertz ratio on the output with voltage boost for startup as required.
- F. Control Devices: Provide a digital operator keypad located on the front door to allow setting of all programmable parameters and the following control functions:
1. "Local-Remote" control selection
  2. Speed meter with hertz and 0-100 percent scales
  3. Output ammeter
  4. Elapsed time meter
  5. Diagnostics package with fault indication and reset push button
- G. Control Features: Provide a control system for each drive that allows the following functions:
1. Remote, isolated 4-20 ma speed control input
  2. Isolated 4-20 ma speed output
  3. Alarm outputs
  4. ON/OFF status output

H. Internal Control Adjustments: Include the following control adjustments for each drive:

1. Acceleration time, 4 to 60 seconds
2. Deceleration time, 4 to 60 seconds
3. Minimum speed limit
4. Maximum speed limit
5. Inverter current limit
6. Supply undervoltage trip

I. Protection Features: Provide the following drive protection features:

1. Input line current limiting fuses rated 200,000 rms symmetrical amperes short circuit current.
2. Electronic overcurrent protection for instantaneous overload
3. AC input line undervoltage protection, adjustable from 60-100 percent nominal voltage with time delay adjustment and low speed override.
4. Overfrequency protection
5. Phase loss protection
6. DC overvoltage protection
7. Logic supply voltage low level protection
8. Line-to-line and line-to-ground output short circuit protection
9. Line-to-line and line-to-ground surge arresters sized for 480-volt 3-phase grounded wye system
10. Overload capability of 110% of the motor FLA based on the NEC ratings for 60 seconds
11. Control circuit fuses
12. Overtemperature protection
13. Diagnostics module to indicate protection trip conditions

## 2.03 COMPONENTS

- A. General: Provide circuit breakers, fuses, transformers, push buttons, switches, indicating lights, relays and timers as specified in Section 16491 – Control Components and Devices.

- B. Power Solid State Components: Provide power solid state switching components with a one minute current rating greater than 110 percent of rated current for variable torque drives or 150 percent of rated current for constant torque drives.
- C. Control Power Transformer: Furnish a constant voltage control power transformer to maintain control power with supply voltage variations from 70-110 percent nominal.
- D. Printed Circuit Boards: Apply a clear conformal coating of acrylic to all printed circuit boards.

#### 2.04 ENCLOSURES

- A. Provide adjustable frequency drive drives in NEMA 1 filtered and gasketed enclosures with full rear cover plates. Provide other rated enclosures suitable for the environment where the drive is located.

#### 2.05 IDENTIFICATION

- A. General: Provide identification of the adjustable frequency drives and their components as specified in Section 16075 - Electrical Identification.
- B. Nameplates: Install nameplates for devices located on doors so they are readable to a person 5'-8" tall standing 3'-0" in front of the equipment.
- C. Location: Locate nameplates so that they are readily associated with items labeled.
- D. Additional Nameplate: Where nameplates are installed on removable relay or device doors, install an additional nameplate within the relay or device.
- E. Additional Engraving: Where nameplates are located on other compartments than those served, add additional engraving to identify units served.

#### 2.06 WIRING

- A. General: Provide internal wiring with stranded switchboard wire having 600-volt rated, flame-resistant, type SIS insulation. Use No. 14 AWG wire for control interconnections. Provide power connections as required for the service.
- B. Wire Marker: Provide wire markers at each end of all wires.
- C. Wiring to Door Mounted Devices: Where wiring connections are made to equipment mounted on hinged doors, provide connections with extra flexible wires suitably cabled together and cleated.
- D. Terminal Blocks: Provide wiring of all control connections to all external connections through individual, positive-latch, pull-apart type control terminal blocks rated 600-volts. Locate terminal blocks for front access.

- E. Terminal for External Connections: Provide sufficient terminals for all devices external to the adjustable frequency drive.

## 2.07 SOURCE QUALITY CONTROL

- A. Shop test each adjustable frequency drive in accordance with IEEE and NEMA standards, including high potential tests and other standard tests for that particular class of equipment. Notify the City fourteen (14) days prior to start of factory testing so that the City, at their option, may witness the testing.
  - 1. After final assembly, test each adjustable frequency drive at full load with application of line-to-line and line-to-ground bolted faults and show that the adjustable frequency drive trips electronically without device failure.
  - 2. After all tests have been performed, burn-in each adjustable frequency drive for 40 hours at 100 percent inductive or motor load.
  - 3. After the burn-in cycle is complete, subject each adjustable frequency drive to a 30 minute cycling motor load test before inspection and shipping.
- B. Operational Tests: After the equipment has been completely assembled, perform operational test to determine operating conditions and circuit continuity. Provide pushbuttons and selector switches to simulate all control input contacts and indicating lights to indicate all control outputs. Provide a 4-20ma signal generator to simulate analog signals.
- C. Test Equipment: Provide all equipment, devices, instrumentation, and personnel required to perform the tests. Upon satisfactory completion of the test, submit two (2) certified copies of the test report to the Engineer. Component failure during testing will require repeating any test associated with the failure or modified components to demonstrate proper operation.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Protective Adjustments: Set all circuit breakers per the approved short circuit and coordination study.
- C. Operational Adjustments: Set all operational devices for proper system operation.
- D. Cable Connections: Terminate and label all field wiring per approved drawings.

## 3.02 FIELD QUALITY CONTROL

- A. Inspections: Inspect, adjust and check the installation for physical alignment, cable terminations and ventilation.
- B. Tests: Perform the following field tests:
  - 1. Close and open each circuit breaker to test operation
  - 2. When site conditions permit, energize and de-energize each equipment item served by each drive, testing the complete control sequence of each item including acceleration and deceleration over complete operating range.
  - 3. Harmonic Measurement: Perform a harmonic system analysis to demonstrate full compliance with IEEE 519 voltage and current harmonic distortion requirements specified. Accurately measure the amplitude of the harmonic current imposed on the 60 hertz sine wave with a harmonic spectrum analyzer. Provide additional harmonic reduction equipment to meet the specified limits. If the harmonic distortion limits are not achieved, replace the adjustable frequency drive equipment with equipment that conforms to this specification.
  - 4. Operate each adjustable frequency drive with driven equipment at full load and test for hot spots.
  - 5. Test Reports: Furnish detailed test reports of all tests indicating test performed, discrepancies found, and corrective action taken.
- C. Manufacturer's Field Services Representative: Provide the services of a factory-trained service engineer, specifically trained on the adjustable frequency equipment to assist in installation, start-up, testing, calibration, placing into operation and provide training as specified in Section 01821 – Training.
  - 1. Provide a service engineer when each drive is placed into operation.
  - 2. Provide a service engineer at the jobsite as often as necessary until all problems are corrected and the equipment installation and operation are satisfactory.
  - 3. Following completion of installation and field testing provide training for 12 employees of the City in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the City's facilities at a time agreeable to the City:
    - a. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

- b. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

3.03 PAINTING

- A. Shop Painting: Paint the adjustable frequency drive equipment as specified in Section 09912 - Interior Painting.
- B. Field Painting: Touch up scratched and marred surfaces to match with original finishes.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16411**  
**DISCONNECT SWITCHES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing and installing enclosed fused safety switches for use as feeder and branch circuit switching and disconnect devices for motors and equipment.

**1.02 RELATED SPECIFICATIONS**

- 1. Section 09912 - Interior Painting
- 2. Section 16050 - Basic Electrical Materials and Methods

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NEC - National Electrical Code
  - 2. NYCBC - New York City Building Code
  - 3. NEMA KS1 - Enclosed Switches
  - 4. UL 198E - Class R Fuses
  - 5. UL 486A - Wire Connectors and Soldering Lugs for Use With Copper Conductors

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data indicating disconnect switch ratings and dimensions. Furnish manufacturer's data on fuses including time-current curves.

**1.05 QUALITY ASSURANCE**

- A. Codes: Provide disconnect switches meeting the requirements of NFPA, the NYCBC, National Electrical Code and local codes.

- B. Regulatory Requirements: Provide all disconnect switches designed, manufactured and tested in accordance with latest ANSI, IEEE and NEMA Standards, and UL listed.

#### 1.06 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. Twelve of each size and type fuse installed.
- B. Packaging: Plainly tag and mark spare parts for identification and for reordering and properly box and wrap spare parts to prevent deterioration. Completely identify the box on the outside.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are as listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Disconnect Switches
    - a. Square D Company
    - b. Cutler Hammer
    - c. Killark
  - 2. Fuses
    - a. Bussmann
    - b. Littelfuse

#### 2.02 DISCONNECT SWITCHES

- A. General: Provide disconnect switches of the NEMA KS-1, heavy-duty, load-interrupter, enclosed-knife switch type with externally operating handle interlocked to prevent opening of the front cover with the switch in the ON position. Provide an interlock that is defeatable from the front of the switch. Provide handle lockable in the OFF position. Where specified on Contract Drawings or required by code furnish switch with handle lockable in the "on position".
- B. Disconnect Switch Ratings: Provide disconnect switches rated for 600-volts as applicable and horsepower rated when used in motor circuits. Current ratings are as indicated. Provide short circuit withstand ratings as required in areas where high level  $I_{sc}$  are available.
- C. Service Entrance: Where shown, provide disconnect switches suitable for service entrance.

- D. Fusible Switches: Furnish switches with rejection feature to allow only Class R fuses to be installed.
- E. Disconnect Switch Housings: Provide disconnect switches housed in NEMA rated enclosures as follows:

AREA	ENCLOSURE
Outdoor and below grade elevation indoors	NEMA 4 – Watertight
Corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown	NEMA 4X - Watertight and corrosion-resistant stainless steel with stainless steel external hardware. Provide all external operators made of the same materials as that of the enclosures
Above grade indoor	NEMA 12 – Industrial

## 2.03 FUSES

- A. Characteristics: Provide UL 198E listed Class RK1 dual element, time-delay fuse with an interrupting rating of 200,000 rms symmetrical amperes.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install disconnect switches as shown or required. Comply with requirements of the NYCBC, NEC and local electrical codes.
- B. Coordination: Coordinate with other work including cabling and wiring work.
- C. Torque Requirements: Tighten electrical connectors and terminal including screws and bolts, in accordance with equipment manufacturers', published torque tightening recommendations. Where manufacturers' torque requirements are not available, tighten connectors and terminals in accordance with UL Standard 486A.
- D. Fuse: In each disconnect switch install the proper type and size fuse for the load served.
- E. Labels: Provide adhesive label on inside of door of each fusible disconnect switch indicating type and size of fuse for replacement.

### 3.02 PAINTING

- A. Paint the disconnect switches as specified in Section 09912 - Interior Painting.

-END OF SECTION-

NO TEXT FOR THIS PAGE

**Section 16415**  
**AUTOMATIC TRANSFER SWITCHES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements for providing automatic transfer switches including control modules to provide completely automatic operation.

**1.02 RELATED SPECIFICATIONS**

1. Section 09912 - Interior Painting
2. Section 13851 - Fire Alarm and Detection System
3. Section 13921 - Electric Drive Centrifugal Fire Pumps.
4. Section 16050 - Basic Electrical Materials and Methods
5. Section 16085 - Short Circuit and Coordination Study

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NFPA 70 - National Electrical Code (NEC)
2. NFPA 20 - Installation of Stationary Pumps for Fire Protection
3. NFPA 110 - Emergency and Standby Power Systems
4. NYCBC - New York City Building Code
5. NEMA ICS 10 - AC Automatic Transfer Switches
6. UL 486A - Wire Connectors and Soldering Lugs For Use With Copper Conductors
7. UL 1008 - Standard for Automatic Transfer Switches

**1.04 SYSTEM DESCRIPTION**

- A. Design Requirements: Provide equipment capable of operating in an ambient temperature range of 0 to 40 degrees C and humidity of up to 90 percent non-condensing.
1. Arrange the equipment for convenient and ready accessibility from the front, for inspection and maintenance of all devices, terminals and wiring.

## 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data for all associated equipment and devices indicating dimensions, size, voltage ratings, current ratings, withstand and interrupting ratings.
- C. Shop Drawings: Furnish shop drawings for automatic transfer switches to include the following:
  - 1. Outline drawings showing arrangement, elevations and identification of components
  - 2. Bill of materials including manufacturers' name and catalog number
  - 3. Interconnecting wiring diagrams, where required
  - 4. Individual schematic and wiring diagrams
- D. Quality Control: Furnish the following test reports and certificates as specified in Division 1:
  - 1. Certified Shop Test Reports for the automatic transfer switch and related components
- E. Operation and Maintenance Manuals: Furnish operation and maintenance manuals as specified in Section 01831.
- F. Prepare a recommended plan for the Commissioners review, to include recommendations for setting the "time delay to transfer and retransfer load" considering the interactions of the Utility sources, Switchgear automatic transfers, the Engine-Generator and other ATS in series.

## 1.06 QUALITY ASSURANCE

- A. Codes: Manufacture all automatic transfer switches in accordance with NEMA ICS10, and UL 1008.
  - 1. Manufacture and install each automatic transfer switch in accordance with the applicable portions of the NYCBC, NFPA 70, 110 and local codes.
  - 2. Automatic Transfer Switches that supply service to the fire pump controller shall comply with applicable portions of NFPA 20 and be approved and rated for that service.

3. Automatic Transfer Switches that supply the Building Wire Alarm Systems (Fire Alarm, Purge Panel and Gas Monitoring Panel) shall comply with the requirements of the NYCBC section 4000 and the rules and regulations of the NYCFD
4. Automatic Transfer Switches that are directly connected to the incoming Utility service shall be designed and rated for service entrance connection and shall comply with the direct connection requirements of Article 695 of the NYCEC

B. UL Label: Provide a UL Label on each automatic transfer switch.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store, and handle all products and materials as specified in Division 1.
- B. Shipping and Packing: Provide all structures, equipment and materials rigidly braced and protected against weather, damage, and undue strain during shipment.
- C. Storage and Protection: Store all equipment and materials in a dry, covered, heated and ventilated location. Provide any additional measures in accordance with manufacturer's instructions.

#### 1.08 SPARE PARTS

- A. Furnish the following spare parts:
  1. Two complete replacements of all indicating lamps and fuses used in the installation
  2. Two of each special tool required for maintenance
  3. Three 12-ounce spray cans of the final finish
- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

### PART 2 PRODUCTS

#### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  1. ASCO Controls 7000

2. General Electric Zenith ZTS
3. Russelectric RMT

## 2.02 AUTOMATIC TRANSFER SWITCHES

- A. Description: Provide enclosed, double-throw automatic transfer switches with single solenoid operating mechanism.
- B. Configuration: Electrically-operated, mechanically held with required relays, timers, controls, and contacts.
- C. Provide a solid equipment ground bar in all switches.

## 2.03 RATINGS

- A. Voltage: 480V
- B. Switched Poles: 3
- C. Amperage: As shown on plans.
- D. Loads: Combination tungsten, ballast, resistance, and inductive loads
- E. Withstand and Closing Ratings: 100,000 minimum rms symmetrical amperes at 480V, when used with molded-case circuit breaker. As required to meet the levels indicated for the specific application as found from the Short Circuit and Coordination Study.
- F. Thermal capacity: 20 times continuous ampere rating at 60 cycles.

## 2.04 COMPONENTS

- A. Phase Sequence: A-B-C, left to right, front to back, top to bottom.
- B. Contacts: Provide silver surfaced main contacts protected by a separate renewable arcing contact. Mechanically lock normal and emergency contacts by the operating linkage when in the open or closed position. Provide an operating linkage that will not permit a neutral position when a failure of any coil or disarrangement of any part occurs.
- C. Operating Mechanism: Isolate the mechanical driving system and mechanical interlocks to be electrically dead. Do not use molded plastic parts for the operating linkage between the electrical operator and the main operating shaft of the switch.
- D. Main Bearings: Radial, ball-bearing type
- E. Sensing and Control Relays: Continuous-duty, industrial type with wiping contacts rated 10 amperes minimum.

- F. Control Logic: Solid-state, microprocessor-based. Provide generator exercise accessories for switches with the Standby generator connected as a source. Printed circuit boards shall be conformal coated to resist degradation in the facility environment.
- G. Arc Barriers: Provide arc barriers and arc suppression for each pole.
- H. Terminations: Provide copper compression lugs for termination of large AWG conductors. Tin plated aluminum body lugs will not be acceptable for that application.
- I. Power to operate the switch, controls, indications alarms and microprocessor shall be taken from the power sources that supply the switch.

## 2.05 ACCESSORIES

- A. Indicating Lights: Provide 30.5 mm, LED type indicating lights mounted in the cover of the enclosure to indicate the following:
  - 1. Normal source available
  - 2. Standby source available
  - 3. Load connection to normal source
  - 4. Load connection to standby source
- B. Test Switch: Mount in the cover of the enclosure to simulate failure of normal source.
- C. Preferred Source Selector Switch: Mount in the cover of the enclosure to select the preferred power source.
- D. Transfer Switch Auxiliary Contacts: Provide the following auxiliary contacts rated for 10 amperes at 120 volts.
  - 1. Normal power position: 2 sets N.O., 2 sets N.C.
  - 2. Standby power position: 2 sets N.O., 2 sets N.C.
  - 3. Normal power failure monitor: 2 sets N.O., 2 sets N.C.
- E. Normal Source Monitor: Monitor voltage and frequency on each phase of the normal source. Device shall use "true RMS" sensing.
- F. Standby Source Monitor: Monitor voltage and frequency on each phase of the standby source. Device shall use "true RMS" sensing.
- G. Adjustable Time Delay Transfer Logic: Provide adjustable, solid-state, time delays for the following functions:
  - 1. Normal to standby: 0-5 minutes

2. Standby to normal: 0-30 minutes (ATS-01 and ATS-03)
3. Standby to normal: 0-120 minutes (ATS-02)

- H. Provide additional accessories as required for specific applications like an automatic transfer switch that feeds a service to the fire pump controller transfer switch or generator start contacts for switches that feed emergency or Switchgear B bus system .
- I. Provide nameplates for each switch source and load and a mimic bus to show connections

## 2.06 ENCLOSURE

- A. Enclosure: NEMA Type 12 - Industrial
- B. Accessibility: Provide an enclosure with all current carrying contacts and parts readily accessible from the front for maintenance and inspection without removal of the switch panel, disconnecting of the operating linkage, or disconnecting of power conductors.
- C. Provide watertight "Meyers" hubs for conduit entries to ATS-2 located in the fire pump room.

## 2.07 AUTOMATIC SEQUENCE OF OPERATION

- A. Controller: Provide a programmable, microprocessor-based controller to provide an automatic sequence of operation as follows:
1. Initiate transfer load to standby source: Signals from normal source monitor, emergency source monitor.
    - a. Normal Source Monitor: Initiate when normal source voltage drops below 70 percent from rated nominal value or frequency varies more than 10 percent from rated nominal value.
    - b. Emergency Source Monitor (Utility emergency source): Initiate when emergency source voltage is at least 90 percent of rated nominal value and frequency is within 5 percent of rated nominal value.
    - c. Emergency Source Monitor (Standby generator emergency source): Initiate when the standby generator source is at 98% rated voltage and 100% rated frequency.
    - d. Time Delay to Transfer Load to Emergency Source: Adjustable from 0 to 5 minutes, initially set at 2 seconds for ATS-03, 30 seconds for ATS-01 and 60 seconds for ATS-02.

2. Initiate retransfer load to normal source: Signals from normal source monitor and in-phase monitor.
  - a. Normal Source Monitor: Initiate when normal source voltage is at least 90 percent of rated nominal value and frequency is within 3 percent of rated nominal value.
  - b. Time Delay to Transfer Load to Normal Source: Adjustable from 0 to 30 minutes, set at 10 minutes. For loads connected to the emergency generator (ATS-02) the delay shall be adjustable from 0 to 120 minutes and shall be coordinated with the Standby generator controls. Bypass time delay in event of emergency source failure.
3. Final setting of timers shall be determined after Utility input is received and adjustments for series operation with other automatic transfer switches, the Engine-Generator and other switching equipment are determined.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install all equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Section 01732.
- B. Cable Connections: Terminate and label all field wiring per the approved diagrams.
- C. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening recommendations. Where manufacturers' torque requirements are not available, tighten connectors and terminals in accordance with UL Standard 486 A.
- D. Set all timers and sensor potentials per approved shop drawings and manufacturers recommendations.

#### 3.02 FIELD QUALITY CONTROL

- A. Inspections: Inspect, adjust and check the installation for physical alignment, cable terminations and ventilation.
- B. Adjustments: Make all necessary adjustments to the equipment to provide complete and satisfactory operation. The correct timing of all transfer variations shall be demonstrated.
- C. Tests: Perform field tests as follows:
  1. Inspect and test the installation with respect to the safety requirements of NYCBC, NFPA 70 pertaining to grounding and insulation resistance.

2. Demonstrate proper operation of the automatic transfer switch by simulating conditions.
  3. Repair or replace defective materials at no cost to the City.
- D. Provide the services of the automatic transfer switch manufacturer's representative to assist in installation, start-up, field testing, calibration and placing into operation as specified in Section 16050 - Basic Electrical Materials and Methods. The representative is required to carry out a thorough inspection of the installation and certify that the installation is correct and complete in accordance with the manufacturer's instruction and to confirm that the automatic transfer switch is ready for the final acceptance.

### 3.03 OPERATION DEMONSTRATION

- A. Manufacturer's Representative: Provide the services of the automatic transfer switch manufacturer's representative to provide training, as specified in Section 01821 - Training.
- B. Training: Following completion of installation and field testing provide training for 12 employees of the DSNY in the proper operation, trouble-shooting and maintenance of the equipment as outlined below. All training will be at the DSNY's facilities at a time agreeable to the DSNY:
1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

### 3.04 PAINTING

- A. Shop Painting: Paint automatic transfer switches in accordance with Section 09912 - Interior Painting.
- B. Field Painting: Clean and touch up any scratched or marred surface to match original finish.

-END OF SECTION-

**Section 16430**  
**480 VOLT SWITCHGEAR**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing, installing and testing 480-volt switchgear including the following major components:

1. Stationary structure including bus bars
2. Main and tie power air circuit breakers
3. Distribution power air circuit breakers
4. Control, protection, and metering equipment
5. Grounding System and provisions.

**1.02 RELATED SPECIFICATIONS**

1. Section 01821 - Training
2. Section 09912 - Interior Painting
3. Section 16050 - Basic Electrical Materials and Methods
4. Section 16060 - Grounding
5. Section 16080 - Electrical Testing Requirements
6. Section 16085 - Short Circuit and Coordination Study
7. Section 16121 - Wires and Cables - 600 Volts and Below
8. Section 16210 - Electric Service
9. Section 16491 - Control Components and Devices.

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NEC - National Electrical Code (NEC).
2. NYCBC - New York City Building Code
3. IEEE C37.13 - Low-Voltage AC Power Circuit Breakers Used in Enclosures
4. IEEE C37.20.1 - Metal-Enclosed Low Voltage Power Circuit Breaker
5. ANSI C37.51 - Conformance Testing of Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear Assemblies
6. IEEE C37.90 - IEEE Standard for Relays and Relay-Systems Associated with Electric Power Apparatus

7. NEMA SG3 - Low-Voltage Power Circuit Breakers
8. IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low Voltage AC Power Circuits
9. IEEE C62.45 - IEEE Guide on Surge Testing for Equipment Connected to Low Voltage AC Power Circuits
10. MIL-STD-220A - Method of Insertion-loss Measurement 12/1/59; with N1 and N2 (Fed/mil H-q)
11. NEMA SG5 - Power Switchgear Assemblies
12. UL 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors
13. UL 1283 - Electromagnetic Interference Filters
14. UL 1449 - Surge Protective Devices
15. UL 1558 - Metal-Enclosed Low Voltage Power Circuit Breaker Switchgear
16. UL1066 - Low voltage AC and DC Circuit Breakers used in Enclosures.

B. Material Workmanship Requirements: Provide all materials and workmanship meeting the requirements of ANSI/NFPA Standards and Codes.

C. Design and Testing Requirements: Provide all switchgear components designed, manufactured and tested in accordance with the latest NEMA, IEEE and ANSI Standards, NYCBC, UL listed as well as appropriate seismic requirements.

D. Installation Requirements: Install the switchgear assemblies meeting the requirements of the NYCBC, NEC, local Electrical Codes and the manufacturer's instructions.

#### 1.04 SUBMITTALS

A. General: Provide all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.

B. Product Data and Information: Furnish the following.

1. Manufacturers catalog data on switchgear assemblies and on each component detailing materials, ratings, type, model and reference number.

2. Layout drawings customized for the project including physical details, dimensions, clearances, mounting, elevations, sections, and nameplates.
  3. Electrical control schematics, wiring diagrams, internal interconnection diagrams and interconnection diagrams, including equipment external to the switchgear.
  4. Terminal lists for all connections.
  5. Furnish instruction booklets for each part included in the assembly and also time-current curves for each circuit breaker supplied.
  6. Furnish separate microprocessor-based metering systems for the A and B bus and individual circuit breaker overload protection systems address, memory map and instruction booklets.
  7. Furnish the following information on SPD Surge Protective Devices (SPD).
    - a. Verification that SPD SPD devices comply with UL 1449 and UL 1283 SVR. SPD shall have a minimum rating of 20KA and shall comply with NEC Article 285.
    - b. Actual let through voltage test data in the form of oscillograph results for both the ANSI/IEEE C62.41 Category C3 (combination wave) and B3 (ringwave) tests in accordance with ANSI/IEEE C62.45.
    - c. Spectrum analysis of each unit based on MIL-STD-220A test procedures between 50 kHz and 200 kHz verifying that the device's noise attenuation exceeds 50 dB at 100 kHz.
    - d. Test reports from a recognized independent testing laboratory verifying the suppressor components can survive published surge current ratings on both a per mode and per phase basis using the IEEE C62.41, 8 x 20 microsecond current wave. Note: Test data on individual modules are not acceptable.
- C. Contractors Drawings: Furnish switchgear installation details including concrete pad details, mounting details, conduit and cable termination details and shipping section split field connection details.

#### 1.05 QUALITY CONTROL

- A. Furnish the manufacturer's certified shop test report and field test report for each 480-volt switchgear.

## 1.06 OPERATIONS AND MAINTENANCE MANUALS

- A. Furnish operation and maintenance manuals, including spare parts lists, as specified in Section 01831.

## 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store and handle all products and materials as specified in Division 1.
- B. Storage and Protection: Store all equipment in a dry, covered, heated and ventilated location. Provide any additional measures in accordance with manufacturer's instructions.

## 1.08 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. One transfer truck with fixed and swivel wheels and rubber tires suitable for moving the largest circuit breakers
  - 2. One portable circuit breaker test kit
  - 3. Two auxiliary power modules to power breaker trip units when breaker is not in the "connected" position
  - 4. One complete solid-state sensor unit for each size furnished
  - 5. Six replacement indicating light color lens for each color furnished
  - 6. Three current transformers of each type and rating
  - 7. Two potential transformers of each type and rating
  - 8. Twelve potential transformer primary fuses
  - 9. Twelve potential transformer secondary fuses
  - 10. Two sets of control jumpers
  - 11. One hand crank per switchgear for circuit breaker withdrawal and insertion
  - 12. Three 12-ounce spray cans of the final finish for touch-up
- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

**PART 2 PRODUCTS****2.01 MANUFACTURERS**

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. 480-Volt Switchgear
  - a. Cutler-Hammer Magnum DS Low Voltage Metal Enclosed Switchgear using Magnum MDS drawout power circuit breakers with Digitrip RMS solid state tripping units.
  - b. Square D Company Power-Zone 4 Low Voltage Metal Enclosed Switchgear with Masterpact NW drawout power circuit breakers with Micrologic Ammeter RMS solid state tripping units.
2. Microprocessor Based Protective Relays and Metering Systems
  - a. Cutler-Hammer IQ-4000
  - b. Square D Company Powerlogic
3. SPDSurge Protective Devices (SPD)
  - a. Cutler-Hammer
  - b. Advanced Protection Technology
4. Programmable logic controller and Operator Interface Panel
  - a. Allen Bradley
  - b. Modicon

**2.02 SERVICE CONDITIONS**

- A. Utility Company Stationary Structure: The power supply to the switchgear will be from Consolidated Edison. Coordinate the circuit breaker trip units with the power company incoming feeder protection
- B. Switchgear
1. Provide metal enclosed switchgear with the following features:
    - a. Individually mounted, drawout power air circuit breakers
    - b. Isolate main and vertical bus from breaker compartments, cable compartments and between structures
    - c. Full insulated and isolated bus

- d. Insulated run back bus
  - e. Circuit breakers rated for 100 percent continuous ampere when installed in the switchgear enclosure
  - f. Interrupting rating of up to 200,000 rms symmetrical amperes as required by the short circuit coordination study at rated voltage
- 2. Label the switchgear suitable for use as service entrance equipment where appropriate.
  - 3. Provide all components required for complete functioning units as specified and as shown using factory built standardized units, completely dead front, totally enclosed and freestanding. Each unit comprises a stationary structure and a drawout circuit breaker.
  - 4. Design, manufacture and test all equipment in accordance with the Electrical Code for the City of New York, NFPA 70, NEMA SG3, and SG5; IEEE C37.13, C37.20.1 and C37.51 and UL 1558 Standards.
  - 5. Provide the required number of units based on the necessary controls and metering as shown and specified.
- C. Distribution System: Connect the switchgear to the Utility 480-volt, 3-phase, 60-hertz, 4-wire, solidly grounded neutral power system.

## 2.03 COMPONENTS

- A. Stationary Structure: Construct the stationary structure of the switchgear as follows:
- 1. Build each unit out of bolted structural steel members, together with formed or fitted sections of smooth sheet steel approximately 90 inches high.
  - 2. Form completely enclosed compartments for various combinations of circuit breakers and auxiliary equipment.
  - 3. Provide sufficient structural strength to support all the equipment mounted within, withstand the handling and shipment of the units, maintaining the proper alignment, and be rigid and freestanding. . Assembly shall meet seismic requirements.
  - 4. Provide a formed front door panel for each compartment consisting of concealed type hinges.
  - 5. Reinforce panels as required to retain alignment and to support instruments, relays, and control equipment mounted thereon.

6. Provide removable plates to permit access to all compartments individually.
7. Isolate circuit breaker, buses, and incoming or outgoing cables with separate compartments formed by sheet steel barriers.
8. Provide a circuit breaker cubicle that allows the front face of the circuit breaker to extend to the front of the switchgear enclosure or be enclosed behind the circuit breaker compartment door.
9. Provide suitable ventilation for the individual compartments to keep the temperature of devices and buses within the permissible temperature limits as specified by the Standards.
10. Include insulated buses, fixed portion of primary disconnect devices, instrument transformers, control devices and fuses in the stationary structure.
11. Provide a positioning mechanism for moving the removable circuit breaker to or from the connected position.
12. Provide guides for proper alignment of all engaging parts during movement of circuit breakers between the connected or disconnected position.
13. Provide stationary structure and circuit breakers that are interchangeable with every other circuit breaker of the same rating.
14. Extend the control and potential buses across all units of the switchgear.
15. Fully isolate the main bus compartment from the circuit breaker compartment and cable terminations.
16. Provide main buses rated not less than shown, consisting of rigidly supported insulated copper bars of suitable design and cross-sectional area to satisfactorily carry the rated current without exceeding the temperature rise as specified in the IEEE and NEMA standards. Bus size must also comply with the NYC Electrical Code requirements.
17. Connect the bus with bolts having locking type washers.
18. Tin plate the copper bars at current-carrying connections.
19. Equip each switchgear unit with a 1/4-inch by 2-inch bare copper ground bus with a momentary rating at least equal to the highest momentary rating of the unit's circuit breakers. Extend the ground bus the entire length of the structure and comply with all applicable codes and regulations.
20. Ground each stationary unit directly to the ground bus.

21. Provide suitable copper lug terminals on the ground bus for connections to the facility water main, the station grounding system and for termination of feeder equipment grounding conductors.
22. Construct and arrange the stationary structure so that circuit breakers are completely isolated from each other within the same section and that sections are isolated from adjoining sections.
23. Provide steel floor channels suitable for embedding into the concrete floor for leveling and anchoring the switchgear. Contractor to drill and tap the floor channels as required. Contractor to provide bolts, nuts, and washers for anchoring the switchgear to the channel.
24. Provide safety shutters to automatically isolate the breaker compartment from the main bus whenever the breaker is removed from the compartment. Also provide a removable cover to block any opening in the door when the breaker is removed.

**B. Switchgear Enclosure**

1. Provide switchgear suitable for installation indoors. Switchgear shall be rodent proof construction.

**C. Drawout Circuit Breakers and Tripping Units**

1. Provide 480 volt, 3-pole, 600-volt class, drawout-type, power fuse-less, circuit breakers with solid-state trip units rated as shown, having an interrupting rating adequate for the short circuit available at the location where it is installed. Provide breakers having a 100 percent ampere rating when installed in the switchgear enclosure. Breakers shall be listed to UL 1066.
2. Provide circuit breakers with trip free, manual-operating handles, stored-energy type trip mechanism and push-to-trip button; rated for 40 degrees C ambient operation.
3. Equip the circuit breaker with mechanical interlocks to prevent moving the circuit breaker to and from the connected position without the circuit breaker open.
4. Provide circuit breakers that cannot be closed at any point between the operating and test positions or when the key interlock is engaged.
5. Provide means to padlock the circuit breaker in the disconnect position.

6. Provide manually-operated circuit breakers except for the following electrically operated circuit breakers as shown:
  - a. Main circuit breakers
  - b. Tie circuit breaker
  - c. Generator circuit breaker
  - d. Gantry Crane circuit breakers
7. Provide electrically operated circuit breakers suitable for 120 volts ac operation. Provide all auxiliary relays, breaker contacts, electrical interlocks and cell position switches to accomplish the operation shown, specified or required. Although not shown in the breaker schematic, wire electrical interlocks and cell position switches to allow the main and tie breakers to function when any breaker is not in the connected position. Provide cell position switch contact inputs to PLC.
8. Provide control connections between the stationary structure and removable circuit breaker that have floating terminals mounted in the stationary structure and engaging mating contacts on the breaker that are engaged when the breaker is in either the connected or test position.
9. Provide each circuit breaker with true rms sensing and microprocessor-based logic circuitry having the following protection features for tripping the circuit breaker.
  - a. Trip Indicators
  - b. Long time setting and time delay
  - c. Short time setting, time delay and  $I^2t$  response.
  - d. Instantaneous setting (distribution circuit breakers only feeding single transformer or single motor).
  - e. Ground fault setting, time delay and  $I^2t$  response.
  - f. Short time and ground fault zone interlocking.
10. All circuit breakers shall be fully rated and selectively tripped. No series rated circuit breaker applications will be accepted.

#### D. Switchgear Connections and Terminals

1. Construct all current-carrying connections of copper having suitable capacity, bracing, insulation, temperature rating as the main bus.

2. Connect current transformers in such a way that the transformers may be removed and changed without damaging the connection.

E. Instrument Transformers

1. Current Transformers

- a. Provide dry type current transformers, suitable for indoor service and rated as shown.
- b. Provide sufficient thermal and mechanical capacity to withstand the maximum momentary current rating of the circuit breaker.
- c. Provide solderless, clamp type shorting terminal blocks for secondary connections.
- d. Properly identify the polarity of all current transformers with standard marking symbols.
- e. Provide current transformers having an accuracy suitable for the instruments and meters specified using the normal burdens of the various devices, and not less than ANSI Standard requirements.

2. Potential Transformers

- a. Provide dry type potential transformers, suitable for indoor service. single-phase, 60 hertz, 120 volts.
- b. Provide potential transformers that fit into and coordinate with the complete switchgear units, and with the instruments, relays, meters, and devices specified.
- c. Rate the potential transformers not less than 100-volt-amperes at 55 degrees C ambient or 150-volt-amperes at 30 degrees C ambient thermal rating.
- d. Provide potential transformers that can withstand a secondary short circuit for at least one second.
- e. Provide the transformers meeting the requirements of the ANSI Standard accuracy classifications.
- f. Provide current-limiting type primary fuses.
- g. Provide secondary fuses sized for the protection of potential transformers.

**F. Grounding**

1. Ground current and potential transformer secondaries with copper conductors not smaller than No. 10 AWG and connecting to the ground bus.
2. Ground potential transformer neutrals, where shown or required with a 600-volt green insulated copper conductor not smaller than No. 10 AWG.
3. Provide connections to the bus that can be easily disconnected and isolated for field testing individually.
4. Install each ground wire as a continuous run without intervening splices or terminal blocks.
5. Ground secondary circuits of metering and relaying transformers at one point only.
6. Effectively ground meter, relay and instrument transformer cases.

**G. Lightning Arresters and Surge Capacitors**

1. Provide lightning arresters and surge capacitors for each incoming service, if required.

**H. Control Devices**

1. Provide control switches of the standard rotary, multistage type suitable for the use specified.
2. Provide auxiliary relays, switches and mechanisms required for the particular manufacture of the breaker.
3. Provide a manually-operated trip bar or lever for each circuit breaker.
4. Provide provisions for manual closing of each circuit breaker.

**I. Microprocessor-Based Metering and Protection System: Provide a microprocessor-based metering and protection system for the Switchgear Mains, tie and each low voltage power air circuit breaker having the following features:**

1. UL recognized component meeting IEEE C37.90
2. Housed in an enclosure suitable for door mounting
3. Derive control power from metered line

4. Auto ranging metering of the following values:
    - a. AC amperes in each phase, 0.5 percent accuracy
    - b. AC voltage, phase-to-phase, phase-to-neutral, 0.5 percent accuracy
    - c. Watts, 1 percent accuracy
    - d. Vars, 1 percent accuracy
    - e. Power factor, 2 percent accuracy
    - f. Frequency, 0.5 percent accuracy
    - g. Watt demand, 1 percent accuracy with programmable 5-, 10-, 15-, 30-minute intervals
    - h. Watt-hours, 1 percent accuracy
    - i. Percent total harmonic distortion through the 31st harmonic
  5. Protection system with the following functions:
    - a. Voltage phase loss, less than 50% nominal line voltage
    - b. Current phase loss, less than 1/16 of the largest phase
    - c. Voltage phase unbalance, 5 to 40% in 5% increments
    - d. Phase voltage reversal
    - e. Overvoltage, 105 to 140% in 5% increments
    - f. Undervoltage, 95 to 60% in 5% increments
    - g. Time delay for overvoltage, undervoltage, and phase unbalance, zero to twenty seconds in one second intervals.
  6. Separate Form C (NO/NC) trip and alarm outputs contacts rated 10 amperes at 115-volt ac or 30-volt dc resistive.
- J. Transfer System: Furnish a transfer system consisting of the following features.
1. Automatic Operation: Provide automatic Operation of the transfer to follow the operational sequence in 2.05.
    - a. Programmable logic controller with operator interface panel
    - b. Operator Interface Panel: 10-inch diagonal, AMTFT, touch screen color panel, provided with replaceable backlight housed in an enclosure suitable for door mounting. Mount the screen so it is clearly visible and operable by a person standing in front of it on the floor. Provide the following graphical indication:
      - (1) Status of all breakers controlled
      - (2) Incoming Service for Utility source 1 and 2 and the generator.

- (3) A digital readout that displays each option as it is functioning and include, but not limited to the following
    - (a) Actual line-to-line voltage
    - (b) Line frequency
    - (c) Timers with count down timing
  - (4) Provide an operator keypad to allow setting of all programmable parameters.
  - (5) Provide a time delay transfer from the one utility source to the other utility source (0 seconds to 30 minutes).
  - (6) Provide a time delay transfer from the Utility source to the emergency source (0 seconds to 30 minutes).
  - (7) Provide a time delay transfer to start the standby generator (0 seconds to 120 seconds).
  - (8) Provide a time delay to confirm loss normal source after generator starts (0 seconds to 30 seconds).
  - (9) Provide a time delay to transfer from the emergency source to normal source (0 seconds to 60 minutes).
  - (10) Under voltage sensing adjustable from 50 to 90 percent of nominal.
  - (11) Under frequency sensing adjustable from 90 to 100 percent of nominal.
2. The system shall also provide manual circuit breaker control subject to the Utility requirements.
  3. Safety features and required prevention (non-paralleling of Utility sources and non-paralleling of any Utility source with the standby Engine-Generator) shall be accomplished with switches, breaker contacts and hard wired logic.
  4. Obtain Con Edison (Utility) approval for the Switchgear, the transfer scheme and Engine-Generator connection to the Switchgear. Fill out and submit any approval forms required by the Utility.

K. Surge Protective Device (SPD)

1. Provide SPD equipment that is UL Listed and Labeled, complies with UL 1449 and UL 1283 and NYCEC Article 285..

2. Provide units with a maximum continuous operating RMS voltage of 115 percent of the nominal system operating voltage.
3. Provide SPD equipment suitable for wye-configured systems.
4. Provide SPD equipment having directly connected suppression elements between line-neutral (L-N), line-ground (L-G), and neutral-ground (N-G).
5. Provide SPD equipment that distributes the surge current to all MOV components to ensure equal stressing and maximum performance and provides equal impedance paths to each matched MOV.
6. Provide high-performance EMI/RFI noise rejection filters that attenuate the electric line noise at least 55 dB at 100 kHz using the MIL-STD-220A insertion loss test method.
7. Wire internal components with connections utilizing low impedance conductors and compression fittings.
8. Provide a monitoring panel for each system that incorporates the following features:
  - a. Green/red solid state indicator light to indicate which phase(s) have been damaged
  - b. A flashing trouble light to indicate fault detection
  - c. Transient event counter
  - d. Audible alarm
  - e. Form C dry contacts for remote indication of the unit status
9. Provide each SPD for service entrance location application with a minimum total surge current capable of withstanding 250kA per phase.
10. Provide properly sized molded case circuit breaker disconnect for each SPD unit. Connections from the main bus to the SPD unit shall be of minimum length of copper bus or twisted cables.

L. Wiring

1. Completely assemble, wire and test each switchgear section at the factory, including buses, phase, neutral and ground connections, insulators, cleats, terminals, and terminal blocks.

2. Route all secondary wiring in the front of secondary compartments in wiring troughs and terminate at approved, molded-type terminal blocks with numbered marking strips, conveniently located with respect to the control conduits.
3. Provide terminal blocks with covers mounted so that the wires can be grouped and laced together.
4. Mark and identify all wiring in accordance with the manufacturer's wiring diagrams.
5. Label control wiring with an identification tag that indicates the terminal number of the opposite end connection.
6. Include wire labels and terminal numbers on schematic control and wiring diagrams.
7. Provide spade connectors for wires No. 12 and smaller and solderless lugs for larger sizes.
8. Provide terminals for all connections and an additional 15 percent spare terminals for all control and instrument wiring.
9. Provide No. 10 AWG stranded copper or larger with NEC Type SIS insulation for all current transformer secondary wiring.
10. Provide No. 14 AWG stranded copper or larger with NEC Type SIS insulation for all other control wiring.
11. Provide a fused switch or circuit breaker for each control power supply in each breaker compartment.

**M. Identification**

1. Provide identification of the switchgear and its components as specified in Section 16075 - Electrical Identification.
2. Install nameplates for devices located on doors so they are readable to a person 5'-8" tall standing 3'-0" in front of the equipment.
3. Locate nameplates so that they are readily associated with the items labeled.
4. Where nameplates are installed on removable relays or removable device doors, install a nameplate within the relay or device.
5. Where nameplates are located on other compartments than those served, add additional engraving to identify units served.

6. Provide Mimic Bus.
7. Provide labels required to comply with NYCEC 110.16 Flash Protection.

#### 2.04 ACCESSORIES

- A. Circuit Breaker Lifting Device: Provide a traveling type circuit breaker lifting device rail mounted on the top of each switchgear assembly. Provide all accessories required for lifting and lowering circuit breakers.

#### 2.05 OPERATION SEQUENCE

- A. Design the transfer logic controller system to operate as follows:
  1. Operational Overview
    - a. Coordinate and integrate the system operation and control functions such that during automatic and/or manual operation, no unsafe condition can occur including paralleling the generator with ConED.
    - b. Include a Manual-Automatic control mode selector switch in control transfer logic controller. In the Manual mode, all control functions will be manually performed by the operator. In the Automatic mode all control functions will be automatic except for specific steps described herein, which require the operator to initiate the procedure.
    - c. Automatic control of the 480 Volt Switchgear main circuit breakers (52-M1 & 52-M2); tie breaker (52-T), generator breaker (52-G1) and the gantry crane feeder breakers (52-B1 & 52-A1) will be through the transfer logic controller.
    - d. Provide electrical interlocks that allow the following when the transfer controller is in Manual mode:
      - (1) When operating from Con Edison, only two of the three main-tie main breakers can be closed at one time to prevent failure of both utility feeds due to the same event.
      - (2) When operating from the standby generator, the main breaker (52-M2) and tie breaker (52-T) has to be open to prevent paralleling the generator with ConED service. Also Gantry Breakers 52-A1 and 52-B1 shall be open whenever the generator is operating.
    - e. Provide cell-switches that functionally indicate when a breaker is in either the operating or test position. Incorporate cell switch contacts into the breaker control circuit to allow testing a breaker in the test position without affecting or tripping any other breaker.

- f. Normal operating condition of the switchgear is with both main breakers closed and the tie breaker open.
- 2. Loss of one ConEdison feeder
  - a. Design the main and tie circuit breakers to operate as follows:
    - (1) When the control mode selector switch is in the AUTOMATIC position:
      - (a) Trip associated main breaker when the transfer logic controller senses a sustained undervoltage.
      - (b) Close the tie breaker, after the affected main breaker opens. Provide interlocks to prevent closing tie breaker, if the undervoltage is due to a fault condition.
      - (c) When voltage returns on the affected service, after an adjustable time delay of 0 to 30 minutes, automatically open the Tie Breaker and then transfer back to original circuit breaker position unless the manual retransfer option is selected.
    - (2) When the control mode selector switch is in MANUAL position:
      - (a) Open and close circuit breakers by using the breaker control switch, subject to the restraints given in 2.05 A1 d..
- 3. Loss of Utility Sequence (Total Con Edison Power Failure)
  - a. Provide interconnecting control circuits to produce the following normal operating functions when both Con Edison Service Lines No. 1 and No. 2 fail.
    - (1) When the control mode selector switch is in the AUTOMATIC position:
      - (a) Failure of both Con Edison service lines, initiates an adjustable time delay of.
      - (b) At the end of the time delay, open both main breakers (52-M1 & 52-M2), tie breaker (52-T) and the gantry crane feeder breakers (52-B1 & 52-A1).
      - (c) Automatically start the generator.

- (d) Upon sensing that the generator has attained 90 percent voltage and frequency, after an adjustable time delay of 0 to 30 seconds to allow for a voltage check of both Con Edison service lines, close generator breaker (52-G1).
- (2) When the control mode selector switch is in MANUAL position:
  - (a) Open and close circuit breakers by using the breaker control switches. Provide interconnecting control circuits to produce a start command to the standby generator. Provide hard wired control logic to prevent closing the Generator breaker (52-G1) if either main breaker (52-M2) or tie breaker (52-T) are closed and prevent closing main breaker (52-M2) and tie breaker (52-T) if the generator breaker (52-G1) is closed.

#### 4. Return of Utility Sequence (Con Edison Power Available)

- a. When voltage returns to both Con Edison service lines and after an adjustable time delay of 0 to 30 minutes, initiate automatic restoration of both Con Edison service lines as follows unless manual restoration option is selected:
  - (1) Open Tie Breaker 52-T, close main breaker (52-M1), open the generator breaker (52-G1) and close the remaining main breaker (52-M2). After an adjustable time delay of 0 to 10 minutes, close gantry crane feeder breakers (52-B1) and shut down the generator.

### 2.06 SOURCE QUALITY CONTROL

- A. Conduct shop tests after the switchgear has been assembled to determine general operating condition and circuit continuity, high voltage withstand and other safety standards.
- B. Witness Tests: Carry out inspection and witness test of the completed switchgear assembly to assess its state of workmanship and standard of performance.
- C. Notify the Resident Engineer of the proposed date of testing a minimum of ten working days prior to the test.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install the switchgear in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Section 01732.

- B. Conformance: Install the switchgear as shown, in conformance with manufacturer's written instruction and recognized industry practices. Comply with requirements of NEMA standards, and applicable ANSI publications.
- C. Coordination: Coordinate with other work including cabling and wiring work as necessary to interface installation of switchgear. Also coordinate the installation of the Utility Metering Cubicles to be located at each end of the switchgear. Extend phase and ground bus for the power connection.
- D. Torque Requirements: Tighten electrical connectors and terminals including screws and bolts, in accordance with equipment manufacturer's published torque tightening values of equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals in accordance with UL Standard 486A.
- E. Fuses: Provide fuses in switchgear assemblies as required.
- F. Circuit Breaker Parameters: Set the circuit breaker protection parameters in accordance with the protective coordination study specified in Section 16085 - Short Circuit and Coordination Study.
- G. Grounding Connections: Make equipment grounding connections for the switchgear as shown. Tighten connections in accordance with UL standard 486A for permanent and effective grounding.
- H. Adjustments: Make all necessary adjustments to the equipment to provide complete and satisfactory operation of the system.
- I. Provide a full size print of the switchgear one-line, switchgear elevation and updated E-111 or actual control scheme as provided, framed under glass. Install in the Pier Level Electrical Equipment Room.

### 3.02 FIELD QUALITY CONTROL

- A. Manufacturer's Representative: Provide a factory-trained experienced, competent, and authorized representative of the switchgear manufacturer to visit the site of the Work and inspect, check, adjust if necessary, approve the equipment installation and provide training as specified in Section 01821 - Training. Provide all instruments and equipment necessary to conduct required tests, adjustments and training. Have the manufacturer's representative utilize prepared comprehensive check sheets covering inspections, checks and tests required for the assembly of the switchgear. Submit copies of these documents executed and signed by the manufacturer's representative. Have the representative present when each equipment item is placed in operation. Provide representative service as often as necessary until all problems are corrected and each equipment item is installed and operating satisfactorily.

- B. Certified Report: Furnish a written report certifying that the equipment:
1. Has been properly installed
  2. Is in accurate alignment
  3. Is free from any undue stress imposed by connections or anchor bolts, and
  4. Has been operated under full load conditions and that it operated satisfactorily
- C. Tests and Inspections: Perform the following tests and inspections. Record all tests and submit a written report for approval. Retest as necessary.
1. Check all breakers, relays, meters, power and control fuses and auxiliaries for proper size, rating, and location. Clean control panels and cubicles. Remove all shipping materials.
  2. Inspect equipment and each breaker and report installation or shipping damage, loose materials, shipping blocks or contamination.
  3. Torque test bus connections where field joints are made.
  4. Check that all control and panel circuits are numbered and tagged and panel door legends are engraved and installed as per drawings.
  5. Check equipment to determine that it is level, secured to foundations and that doors operate properly.
  6. Test insulation of all control and relay circuits to ground with a suitable megohmmeter. Take suitable precautions where electronic devices, instruments and instrument transformers are involved.
  7. After installation, but before any external connections are made to the switchgear, subject the switchgear to a 10-minute high potential test applied on the stationary structure and breakers. Use a test voltage of 75 percent of the standard factory production tests.
  8. Test all bus, cable, wire and other equipment operating at the service voltage that is energized by closing the incoming main line breakers. This test may be witnessed by the Resident Engineer.
  9. Test protective relays to verify settings and determine proper operation.

D. Training: Following completion of installation and field testing provide training for employees of the City in the proper operation, trouble-shooting and maintenance of the equipment as described in Section 01821 – Training.

1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

### 3.03 GROUNDING

- A. System Inspections: Inspect ground system for compliance with the latest approved drawings.
- B. Connection Inspections: Inspect all ground connections for evidence of looseness and/or corrosion.

### 3.04 PAINTING

- A. Shop Painting: Paint the switchgear as specified in Section 09912 - Interior Painting.
- B. Field Painting: Touch up scratched and marred surfaces to match with original finishes.

### 3.05 IDENTIFICATION

- A. General: Provide identification meeting the requirements of Section 16075 - Electrical Identification.
- B. Component Identification: Identify all system components, cables and wires by labels indicating unit numbers, circuit numbers and date of installation.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16443**  
**PANELBOARDS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements for providing lighting and distribution panelboards including circuit breakers and cabinets.

**1.02 RELATED SPECIFICATIONS**

1. Section 09912 - Interior Painting
2. Section 16050 - Basic Electrical Materials and Methods
3. Section 16075 - Electrical Identification
4. Section 16085 - Short Circuit and Coordination Study

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NEMA PB 1 - Panelboards
2. UL 67 - Panelboards
3. Fed. Spec.W-P-115 - Power Distribution Panel
4. UL50 - Cabinets
5. UL 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors
6. NEC - National Electrical Code
7. NYCBC - New York City Building Code

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish the manufacturer's catalog data for panelboards, circuit breakers and accessories.
- C. Shop Drawings: Provide drawings of all the different type of panels and cabinets to be provided. Clearly indicate all gutter sizes, bus locations, main breaker or lug

locations and any special construction required. Provide individual breaker layouts and schematics for each panel

- D. Operations and Maintenance Manuals: Furnish operation and maintenance manuals for the panelboards as specified in Section 01831.

## 1.05 QUALITY ASSURANCE

- A. Codes: Provide all materials and workmanship meeting the requirements of the NFPA, the NYCBC, National Electrical Code and local codes.

1. Design, fabricate and test the panelboards in accordance with applicable ANSI, IEEE and NEMA standards.
2. Provide panelboards suitable for operation at their standard nameplate ratings in accordance with ANSI standards.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  1. General Electric Company
  2. Cutler Hammer

### 2.02 MATERIALS

- A. General: Provide factory-assembled fully rated dead-front panelboards suitable for surface or flush mounting as indicated on the drawings. Provide branch circuit breakers individually bolted to the individual bus bars and a separate vertical main circuit breaker or main lugs as indicated, located at the top of the Panelboard.
- B. Provide panelboards with a full capacity separate ground bus and when connected to a three-phase four-wire or a single-phase three-wire service, also supply an insulated neutral bus. The total number of overcurrent protective devices shall be limited to 42 single pole connections or the equivalent multi-pole load.
  1. Provide The total number of overcurrent protective devices shall be limited to 42 single pole connections or the equivalent multi-pole load.
  2. Provide panelboards with the voltage, frequency and current ratings as indicated conforming to NEMA Standard PB 1, Fed. Spec. W-P-115, UL 67 and the NYCBC, NEC.
  3. Provide panelboards with copper main, neutral and ground buses.

4. Provide sequence phase connection of all branch circuits to the main bus.
  5. Where required, provide panelboards suitable for use as service entrance equipment.
  6. Where required to meet code, in fuel dispensing areas, provide panelboard with capacity to switch any neutral run in a branch circuit supplied from that panelboard.
  7. The total number of overcurrent protective devices shall be limited to 42 single pole connections or the equivalent multi-pole load.
- C. Bracing: Provide main bus bracing exceeding the short circuit available at the panel bus and the interrupting rating of any circuit breaker installed.
- D. Fabrication: Fabricate panelboards using galvanized steel, continuously welded to provide a NEMA 12 enclosure. Provide cabinet fronts with doors over the circuit breakers. Provide doors fastened with concealed hinges and equipped with vault handle catches.
1. Provide panelboards at least 20 inches wide, 5-3/4 inches deep, with full wiring gutters on all sides. Where larger panelboards are required they shall fit in the space available.
  2. Provide all panelboard trims exceeding five square feet in area with an inside permanently secured angle to support the trim during fastening.
  3. Panelboards shall be suitable for industrial service and for the environment where they are located.

## 2.03 CIRCUIT BREAKERS

- A. Provide bolt-on heavy duty industrial type branch and main circuit breakers. No Q frame or miniature circuit breakers shall be supplied for this project.
- B. Furnish the frame sizes, trip settings and number of poles as indicated. Mark ampere trip rating on the circuit breakers clear and visible.
1. For lighting and appliance panelboards, provide 20-ampere, single-pole, 120 or 277 volt circuit breakers, unless otherwise shown or scheduled, suitable for switching service and with HID and fluorescent lighting loads.
  2. For distribution panelboards, provide 20-ampere, three-pole, 600-volt circuit breaker, unless otherwise shown or scheduled.
- C. Provide all breakers with quick-make, quick-break, toggle mechanisms with automatic thermal-magnetic, inverse time-limit overload and instantaneous short circuit protection on all poles, unless otherwise indicated. Indicate automatic

tripping by the breaker handle assuming a clearly distinctive position from the manual ON and OFF position. Design the breaker handle to be trip-free on overloads.

- D. Interrupting Rating: 10,000 rms symmetrical amperes for circuit breakers on 240 volt systems or less, and 35,000 rms symmetrical amperes for circuit breakers on 277 or 480 volt systems but not less than the available short circuit as determined by the Short Circuit and Coordination Study in Section 16085.
- E. Provide multipole breakers that utilize a common tripping bar.
- F. Provide ground fault interrupter circuit breakers for all circuits serving receptacles located below grade and outdoors and as scheduled.
- G. Provide full 1" module size single-pole breakers. Do not install two-pole breakers in a single-pole module.
- H. All circuit breakers shall be fully rated. No series rated combinations will be acceptable.

## 2.04 ACCESSORIES

- A. Directories: Provide directories in accordance with Section 16075 - Electrical Identification. Provide frames with rigid clear plastic covers.
- B. Circuit Breaker Handle Lock: Where shown provide circuit breakers with handle clamp that holds the circuit breaker handle in the ON position.
- C. Keying: Key all panelboards alike to the City of New York's requirements.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all panelboards in accordance with manufacturer's recommendations and approved shop drawings and as specified in Section 01732 and in compliance with the requirements of NEMA standards, NYCBC, NEC, and applicable ANSI Publications.
- B. Mounting Height: Mount all panelboards either surface or flush mounted as shown such that the height of the top operating handle does not exceed 6 feet 6 inches from the floor.
- C. Coordination: Coordinate with other Work including cabling and wiring work to interface the installation of the panelboards.
- D. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with the equipment manufacturer's published

torque tightening values for the equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals in accordance with UL 486A.

- E. Circuit Breaker Handle Lock: Install circuit breaker handle clamp on each circuit breaker where shown.
- F. Directory: Provide a laminated typewritten directory with the following information:
  - 1. Circuit number
  - 2. Area served
  - 3. Utilizing equipment
- G. In damp, wet or corrosive locations, mount panelboards on standard channels to permit air to circulate behind the cabinet. Channel shall be corrosion resistant.

### 3.02 PAINTING

- A. Shop Painting: Paint the panelboards as specified in Section 09912 - Interior Painting.
- B. Field Painting: Touch up scratched and marred surfaces to match the original finish.

NO TEXT ON THIS PAGE

**Section 16445**  
**MOTOR CONTROL CENTERS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing new motor control centers.

**1.02 RELATED SPECIFICATIONS**

1. Section 01821 - Training
2. Section 09912 - Interior Painting
3. Section 16050 - Basic Electrical Materials and Methods
4. Section 16075 - Electrical Identification
5. Section 16121 - Wires and Cables - 600 Volts and Below
6. Section 16491 - Control Components and Devices

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. IEEE C37.90 - IEEE Standard for Relay and Relay Systems Associated With Electrical Power Apparatus
2. IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low Voltage AC Power Circuits
3. IEEE C62.45 - IEEE Guide on Surge Testing for Equipment Connected to Low Voltage AC Power Circuits
4. MIL-STD-220A - Method of Insertion-loss Measurement 12/1/59; with N1 and N2 (Fed/mil H-q)
5. NEMA ICS 2 - Industrial Control and Systems Controllers, Contactors and Overload Relays Not More than 2000 Volts AC or 750 Volts DC
6. NEMA ICS 3 - Industrial Control and Systems Factory Built Assemblies
7. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
8. UL 486A - Wire Connectors and Soldering Lugs for Use With Copper Conductors
9. UL 845 - Motor Control Centers

- 10. UL 1283 - Electromagnetic Interference Filters
- 11. UL 1449 - Surge Protective Devices

#### 1.04 SYSTEM DESCRIPTION

- A. Design Requirements: Provide equipment capable of operating in an ambient temperature range of 0 to 40 degrees C and humidity of up to 90 percent noncondensing.
  - 1. Provide motor control centers designed for 480-volt, three-phase, three-wire, and ground, 60-hertz operation.
  - 2. Provide all control devices in the center suitable for operation at 120-volts, 60-hertz, unless specifically noted otherwise.
  - 3. Provide all control equipment and devices that meet the requirements of the 600-volt insulation class.
  - 4. Provide motor control centers to include the indicated number of 20 or 21-inch deep sections and the components arranged as shown.
  - 5. Arrange the equipment for convenient and ready accessibility from the front for inspection and maintenance of devices, terminals and wiring.
  - 6. Where shown or required, label the motor control center suitable for use as service entrance equipment.

#### 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Provide catalog data for all associated equipment and devices.
- C. Shop Drawings: Furnish shop drawings customized to the project for motor control centers to include the following:
  - 1. Outline drawings showing dimensions, weights, arrangement, elevations, identification of components and a nameplate schedule for all units.
  - 2. Bill of materials including manufacturers' name and catalog number.
  - 3. Interconnecting wiring diagrams, where required.
  - 4. Individual schematic and wiring diagrams for each compartment.

5. Furnish details showing electrical connections between main and tie circuit breakers and corresponding main buses.
  6. Furnish instruction booklets and time-current curves for each circuit breaker supplied.
  7. Furnish microprocessor-based metering system and overload protection systems address, memory map and instruction booklets.
  8. Furnish the following information on Surge Protective Devices.
    - a. Verification that SPD devices comply with UL and NYCEC Article 285.
    - b. Let through voltage test for combination and ringwaveper ANSI/IEEE.
    - c. Spectrum analysis test verifying that the device's noise attenuation exceeds an acceptable level for this application Between 50 Hz and 200 KHz.
    - d. Test reports from a recognized independent testing laboratory verifying the suppressor components can survive at the published surge current ratings.
  9. Obtain and enter full performance details on all motors and other equipment being served on the above drawings.
  10. Supply mounting details that comply with the Seismic requirements.
- D. Quality Control: Furnish the following test reports and certificates as specified in Division 1:
1. Certified Shop Test Reports for motor control centers and related components. Provide a minimum of 15 days written notice prior to shop tests.
  2. Detailed field test reports of all tests indicating test performed as specified, discrepancies found, and corrective action taken.
- E. Operation and Maintenance Manuals: Furnish operation and maintenance manuals as specified in Section 01831.
- 1.06 QUALITY ASSURANCE
- A. Standards: Provide motor control centers in accordance with NEMA ICS 2, ICS 3, and UL Standard No. 845.

- B. Codes: Provide motor control centers in accordance with the NYCBC, NEC and local codes.
- C. UL Label: Provide a UL Label on each vertical section of each motor control center.
- D. Seismic Certification: Furnish certification of seismic testing.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. General: Deliver, store, and handle all products and materials as specified in Division 1.
- B. Shipping and Packing: Provide all structures, equipment and materials rigidly braced and protected against weather, damage, and undue strain during shipment.
- C. Storage and Protection: Store all equipment and materials in a dry, covered, heated and ventilated location. Provide any additional measures in accordance with manufacturer's instructions.

#### 1.08 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. One set of contact tips, control power transformers and operating coils for each six or less of each size of motor starter.
  - 2. One auxiliary contact unit or one set of auxiliary contact tips for each six or less motor control units.
  - 3. Ten percent but not less than two complete control, latching and timing relays of each type used in motor control centers.
  - 4. Two complete replacements of overload heater units for each catalog number installed in motor control centers and motor starters.
  - 5. Two complete replacements of all LED indicating lamps and fuses used in the installation.
  - 6. One complete magnetic starter with motor circuit protector for each size required.
  - 7. Two sets of replacement indicating light color lenses of each color furnished.
  - 8. One circuit breaker test unit.
  - 9. Three 12-ounce spray cans of the final finish for touch-up

- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
  - 1. Motor Control Centers
    - a. Cutler-Hammer 2100 Series
    - b. General Electric Company Evolution Series E9000
  - 2. Transient Voltage Surge Suppression (TVSS)
    - a. Cutler-Hammer
    - b. Advanced Protection Technology

### 2.02 MOTOR CONTROL CENTER

- A. Basic Structural Components: Provide totally enclosed, dead-front, rigid, NEMA 12, gasketed, self-supporting and freestanding structures suitable for industrial application.
  - 1. Construct the various sections from channels not less than 12 gauge, formed into proper shape, suitably reinforced and welded. Construct rigid doors and covers from a minimum 14 gage steel sheets, folded and hemmed. Grind all internal welds smooth and round off all corners to give a neat and pleasing appearance.
  - 2. Provide steel bottom plates in each compartment section.
  - 3. Cover the rear of each structure with easily removable steel panels for rear access.
  - 4. Provide both ends of a completely assembled center so that extensions can be easily added in the future.
  - 5. Provide hinges, screws, bolts, circuit breaker operating mechanisms, nameplate mounting screws and other metallic appurtenances with a non-corrodible metal covering.
  - 6. Install full height steel barriers on each side of the tie breaker structure to prevent the passage of flames and ionized gases.

7. Provide each motor control center with a three-phase bus compartment at the top and a conduit and cable compartment at the top and bottom.
8. Provide the cable compartments that run the full length of the motor control center.
9. Provide access to cable compartments by means of removable hinged doors.
10. Provide each structure with a vertical wiring space between the starter cells and side sheet for unit wiring.
11. Equip the vertical wiring space with cable supports to hold the cables and wiring in place.

**B. Motor Control Center Enclosure**

1. Provide motor control centers suitable for installation indoors in an industrial environment.
2. Assembly shall be rodent proof construction.

**C. Bus Requirements: Provide main buses of silver plated copper bars across each structure, sized in accordance with UL temperature rise of 50 degrees C based on a 40-degree C ambient temperature and in conformance with the NYCBC.**

1. Provide a 600-ampere minimum, main horizontal bus, unless otherwise shown.
2. Support all bus bars in each structure by means of bus supports fabricated from an insulating material. Construct the main bus with a minimum number of splices.
3. Connect the horizontal bus to the incoming line circuit breakers and from both sides of the tie breaker with copper bars, securely fastened in place.
4. Provide tin-plated vertical three-phase copper bus of sufficient size to carry loads served.
5. Insulate main and vertical buses over their entire length. Provide insulated covers over all bolted connections.
6. Separate the bus bar compartments from breaker and controller cubicles by insulated barriers or steel plates.
7. Provide a 300-ampere continuous uninsulated copper grounding bus in the bottom of each motor control center. Provide copper lugs for connection of all supply and distribution feeders equipment grounding conductors.

8. Brace all bus work suitably to withstand a minimum of 100,000 rms amperes symmetrical short circuit current. Substantiate construction by a certified laboratory test covering units of similar construction.
- D. Individual Units: Provide motor controller, contactor, circuit breaker or MCP spares and spacers in combinations of not less than 12-inch modular heights. Compartments with additional relays, timers and other devices that exceed the reasonable capacity of the standard 12" module may be expanded in 6" modules to gain room to provide adequate space for testing, maintenance, adjustment and replacement of parts. No unit shall be jammed with parts, wiring and devices such that it makes maintenance difficult or unsafe.
1. Provide units of the plug-in or nonremovable type in accordance with the manufacturer's standard for type and size of controller.
  2. Provide plug-in units within-plated, pressure-type line disconnecting stabs of high strength copper alloy. Hold each plug-in unit in place and arrange the units such that they can be removed or remounted readily without access to the rear of the structure.
  3. Provide units that are totally enclosed and effectively baffled to isolate ionized gases that may occur within each unit. In addition, ventilate each unit so that it can be located anywhere within the structure using the same overload heaters for the same load.
  4. Provide automatic shutter mechanism to cover the vertical bus stub area when a unit is removed.
  5. Provide spaces for future equipment in unit structures with blank hinged doors and removable metal barriers for isolation of the vertical buses.
  6. Construct doors to be drip-proof and dust-tight. Provide all doors with hinges and screw fasteners for holding the doors closed. Fabricate each door as a part of the structure and not part of the unit.
  7. Equip the doors for motor control compartments with a motor circuit protector operating mechanism, thermal overload relay reset mechanism, controls and indicating lights and other required devices as shown.
  8. Equip the doors for branch feeder equipment with a circuit breaker operating mechanism.
  9. Provide mechanical interlocks between the compartment door and circuit breaker operating mechanism to prevent opening of the door unless the breaker is in the OFF position, and to prevent closing the breaker unless the door is fully closed.

10. Provide circuit breaker operating mechanisms or handles that are padlockable in the OFF position with room for a minimum of three padlocks.
11. Provide units having devices that are serviceable from the front, without provisions for rear access.
12. Provide control power transformers, relays, timers, alternators and accessories for each unit as shown or specified.
13. Interior of the individual units shall be painted white or other approved finish to improve visibility inside the unit.

E. Wiring

1. Provide NEMA Class II Type B wiring for the motor control centers, including internal interlock and internal wiring between controller units and devices.
2. Provide internal wiring runs for interconnecting units with stranded switchboard wire having 600-volt rated, flame-resistant, type SIS insulation. Provide No. 14 AWG wire for control interconnections. Provide power connections as required for the service.
3. Provide wire markers at each end of all wires and tag all terminals to match..
4. Where wiring connections are made to equipment mounted on hinged doors, provide connections with extra flexible wires suitably cabled together and cleated.
5. Provide the wiring of all control connections to individual terminal blocks at each motor starter. Locate terminal blocks for front access.
6. Provide interlocking wiring between units of a motor control center or between units of grouped centers as internal wiring with terminals provided for external connections.
7. Provide sufficient pull apart terminal blocks for all devices external to the motor control center.
8. Provide communication cables from the microprocessor-based metering system and microprocessor-based overload protection systems to a single terminal block located in the incoming line structure.

- F. **Magnetic Starters:** Provide 480-volt, 3-phase, 60-hertz across-the-line combination motor circuit protector and magnetic starters having individual control power transformers.
1. Provide full-voltage nonreversing; full voltage reversing; full voltage two-speed nonreversing two-winding; and full voltage two-speed nonreversing one-winding starters as required.
  2. Provide starter contacts of the replaceable, spring-loaded, wedge type with silver-cadmium oxide-plated contact surfaces. Provide replaceable coils of the epoxy sealed type.
  3. **Thermal Overload Elements:** Provide each magnetic starter unit with a Class 20 thermal overload element and all required accessories. Provide size five and larger starters with current transformer operated overload relays.
    - a. Provide overload relays of the bimetallic type with an adjustment knob that allow plus or minus 15 percent adjustment of the nominal heater rating.
    - b. Provide and adjust overload relays to match the associated motor nameplate running current rating. Size the overload relays after approval of the corresponding motor.
    - c. Provide a set of isolated normally-open and normally-closed contacts for each overload relay.
  4. **Replaceability:** Provide starters having component parts that are easily replaceable.
  5. Equip each starter with all required auxiliary contacts.
- G. **Motor Circuit Protectors:** Provide a motor circuit protector for each combination starter serving a motor load using molded-case, air-break type designed for 600-volt, 60-hertz service with an interrupting capacity of 100,000 rms symmetrical amperes at 480 volts. Provide three-pole motor circuit protectors with magnetic, adjustable-trip units actuating a common tripping bar to open all poles when an overload or short circuit occurs. Provide motor circuit protectors with no thermal elements. Provide magnetic trip units capable of being adjusted from 700 to 1,300 percent of the motor full load amperes.
- H. **Contactors:** Provide NEMA sized, 30 ampere minimum, contactors for electric heating and other nonmotor loads equal to the motor starters except without overload relays or heaters.
- I. **Feeder Circuit Breakers:** Provide molded-case type, two- or three-pole feeder circuit breakers as shown, with a minimum voltage rating of 600-volt ac. Breakers

shall be heavy duty, industrial class. No Q frame or miniature circuit breakers will be accepted.

1. Interrupting Ratings: Provide an interrupting capacity of 100,000 rms symmetrical amperes at 480 volts. Base interrupting rating on the IEEE and NEMA Standard duty cycle for this class of equipment.
2. Provide circuit breakers trip units as follows:
  - a. Provide individual, thermal-magnetic trip units for all frame sizes smaller than 400 amperes.
  - b. Provide solid-state trip units for all frame sizes 400 amperes and larger.
  - c. Provide trip units that actuate a common tripping bar to open all poles when an overload or short circuit occurs on any one.
  - d. Provide trip elements with inverse time tripping and instantaneous tripping at about ten times the normal trip device rating.
  - e. Provide circuit breakers with trip-free handles.
  - f. All circuit breakers shall be fully rated and selectively tripped. No series rating applications will be accepted.
- J. Main and Tie Circuit Interrupters: Provide all main and tie circuit interrupters rated as shown, with equal construction to the circuit breaker that protects the feeder that supplies power to them and with the following additional features :
  1. Adjustable ground fault pickup and delay setting for breakers with trip ratings of 1,000 amperes or larger.
  2. Auxiliary normally open and normally closed contacts and tripped alarm contacts.
  3. Provide Kirk Key interlocks for the Main-Tie-Main circuit breakers to prevent more than two circuit breakers being closed at the same time.
- K. Surge Protective Devices (SPD)
  1. Provide SPDs equipment that complies with UL 1449 and UL 1283.
  2. Provide units with a maximum, continuous-operating voltage that exceeds 115 percent of the nominal system operating voltage.
  3. Provide SPD equipment suitable for wye configured systems.

4. Provide SPD equipment having directly connected suppression elements between line-line and (L-L), line-ground (L-G).
  5. Provide SPD equipment that distributes the surge current to all MOV components to ensure equal stressing and maximum performance and provides equal impedance paths to each matched MOV.
  6. Provide high-performance EMI/RFI noise rejection filters that attenuate the electric line noise.
  7. Wire internal components with connections utilizing low impedance conductors and compression fittings.
  8. Provide a monitoring panel for each system that incorporates the following features:
    - a. Green/red solid state indicator light to indicate which phase(s) have been damaged.
    - b. A flashing trouble light to indicate fault detection
    - c. Transient event counter
    - d. Audible alarm
    - e. Form C dry contacts for remote indication of the unit status.
  9. Provide SPD suitable for service entrance or branch location application with a minimum total surge current capable of withstanding 250kA or 160kA per phase respectively or as shown.
  10. Locate the SPD, its monitor and feeds in a separate compartment from other MCC components
- L. Control Power Transformers: Provide individual control power transformers for each starter to derive the 120 volts for the unit's control circuit meeting the requirements of Section 16491 - Control Components and Devices. Ground the unfused leg of the secondary to the enclosure.
- M. Push Buttons, Selector Switches and Indicating Lights: Provide push buttons, selector switches and indicating lights including legend plates having the same type, appearance, shape and catalog number throughout each motor control center meeting the requirements of Section 16491 - Control Components and Devices.
- N. Control Components: Provide control components including elapsed time meters, control relays, latching relays, time delay relays, reset timers, repeat cycle timers, alternators meeting the requirements of Section 16491 - Control Components and Devices.

- O. Feeder Cable Terminals: Provide closed-end, compression-type, solderless connectors and terminals, suitable for copper conductors for terminating cables in accordance with Section 16491 - Control Components and Devices.
- P. Wiring Schematic: Provide a schematic wiring diagram of each unit and affix it to the inside of the door of that unit. Schematic shall include all devices, internal and external to the unit, all required terminations for control and monitoring. Tag all terminals with number and description.
- Q. Identification: Provide nameplates having the same type, appearance and shape throughout each motor control center in accordance with the requirements of Section 16075 - Electrical Identification.

## 2.03 SOURCE QUALITY CONTROL

- A. Shop test each motor control center in accordance with IEEE and NEMA standards.
  - 1. Operational Tests: After the equipment has been completely assembled, perform operational tests to determine the general operating conditions and circuit continuity. Also, perform high potential tests and other standard tests for that particular class of equipment.
  - 2. Motor Control Centers shall be factory witness tested by representatives of the Contractor/Owner and may not be shipped to the job site before they are approved.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Adjustments: Set all motor circuit protectors and circuit breakers for the approved short circuit and coordination study. Set current switches per the recommendations of the motor supplier.
- C. Overloads: Adjust the thermal overloads on each phase of the starter units to the actual motor installed.
- D. Cable Connections: Terminate and label all field wiring per the approved diagrams.
- E. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening recommendations. Where manufacturers' torquing requirements are not available, tighten connectors and terminals in accordance with UL Standard 486 A.

- F. Provide steel floor channels suitable for embedding in the concrete floor for leveling and anchoring the Motor Control Center. Contractor shall drill and tap the floor channels as required. Contractor to provide bolts, nuts and washers for anchoring the motor control center to the channel.
- G. Provide Seismic anchoring that complies with the manufacturers requirements and the project structural engineers approval.

### 3.02 FIELD QUALITY CONTROL

- A. Inspections: Inspect, adjust and check the installation for physical alignment, cable terminations and ventilation.
- B. Tests: Perform the following field tests:
  - 1. Close and open each circuit breaker and motor circuit protector to test operation.
  - 2. Energize the motor control center and test for hot spots.
  - 3. When site conditions permit, energize and de-energize each equipment item served by each motor control center, testing the complete control sequence of each item.

### 3.03 OPERATION DEMONSTRATION

- A. Manufacturer's Representative: Furnish the services of a qualified, factory-trained service engineer to assist in installation, start-up, field testing, calibration, placing into operation and provide training of each motor control center, as specified in Section 01821 – Training.
  - 1. Furnish the services of a service engineer when the equipment is placed into operation.
  - 2. Furnish the services of a service engineer at job site as often as necessary until all problems are corrected and the equipment installation and operation are satisfactory.
  - 3. Training: Following completion of installation and field testing provide training for 12 employees of the City in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the City's facilities at a time agreeable to the City:
    - a. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
    - b. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

3.04 CLEANING AND PAINTING

- A. Shop Painting: Paint motor control centers in accordance with Section 09912 - Interior Painting.
- B. Field Painting: Clean and touch up any scratched or marred surface to match original finish.

-END OF SECTION-

**Section 16460**  
**GENERAL PURPOSE DRY TYPE TRANSFORMERS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for furnishing and installing ventilated, dry-type transformers.

**1.02 RELATED SPECIFICATIONS**

1. Section 09912 - Interior Painting
2. Section 16050 - Basic Electrical Materials and Methods

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. ASTM D 635 - Test Method for Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position
2. NEC - National Electrical Code
3. NYCBC - New York City Building Code
4. NEMA ST 20 - Dry Type Transformers for General Applications
5. EPA 2005 - Energy Policy Act 2005

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data including:
1. KVA ratings
  2. Service voltages
  3. Impedance and X/R ratio
  4. Number of phases
  5. Taps
  6. Insulation class
  7. Sound level
  8. Dimensions

9. Weights
10. Mounting details

C. Quality Control: Furnish the following as specified in Division 1.

1. Test Reports: Certified production reports for sound-level and temperature in accordance with NEMA ST 20
2. Manufacturer's Installation Instructions

D. Operations and Maintenance Manuals: Furnish manufacturer's operations and maintenance manuals as specified in Section 01831.

1.05 QUALITY ASSURANCE

- A. UL Label: Provide UL listing label or mark.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.
1. General Electric Company
  2. Cutler Hammer

2.02 MATERIALS

- A. General: Provide dry-type transformers suitable for indoor use.
- B. Insulation: Provide transformers above 15 KVA with 220-degree C temperature insulation materials. Provide transformers 15 KVA and below with a minimum of 185-degree C insulation materials.
- C. Flame Retardant Materials: Provide transformers with flame retardant materials that will not support combustion as defined in ASTM D 635.

2.03 FABRICATION

- A. Transformer Taps: Provide transformers rated over 15 KVA with at least two 2-1/2 percent full capacity taps above and below nominal in the primary winding. Provide transformers rated 15 KVA and below with two five percent taps or with four 2-1/2 percent taps below rated voltage on the primary winding.

- B. Windings: Provide separate primary and secondary windings fabricated from copper conductors. Autotransformer and "T" or Scott connected types are not acceptable.
- C. Voltage and KVA Ratings: Provide three-phase or single-phase transformers with primary and secondary voltages and kVA ratings as specified.
- D. Connections
  - 1. Three phase: Primary - 3-wire Delta; Secondary - 4-wire, solidly-grounded wye.
  - 2. Single Phase: Primary - 2-wire; Secondary - 3-wire with mid-point solidly-grounded.
- E. Continuous Operations: Provide transformers suitable for continuous operation at the rated KVA with a normal life expectancy as defined in NEMA ST 20 and the performance obtained without exceeding 115 degrees C average temperature rise by resistance or 145 degrees C hot spot temperature rise in 40-degree C maximum ambient and 30-degree C average ambient. Do not provide transformers that exceed 185-degree C maximum coil hot spot temperature.
- F. K-Factor: Provide three-phase transformers with a K-Factor not less than 13.
- G. Electrostatic Shields: Provide electrostatic shields between windings.
- H. Construction: Provide transformers with core mounting frames and enclosures of welded and bolted construction with sufficient mechanical rigidity and strength to withstand shipping, erection and short circuit stresses.
- I. Sound Levels: Transformers shall not exceed the following sound levels:

Transformer KVA	Average Sound Level in dB
	NEMA ST 20
0 - 09	40
10 - 50	45
51 - 150	50

- J. Lifting Lugs and Jacking Plates: Provide lifting lugs and jacking plates as required on the transformer.
- K. Provide copper lugs for all terminations.
- L. Connections to encapsulated transformers shall be made with 90 degree C insulated cable sized at the 75 degree C rating.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all transformers and provide guards as specified by the latest NYCBC, NEC and ANSI standards, and in accordance with manufacturer's instructions.
- B. Clearances: Provide clearance around the transformer meeting the manufacturer's recommendation.
- C. Supports: Provide suitable supports for all transformers. Mount transformers on one inch of Korfund, or equal sound-absorbent material.
- D. Primary Disconnect: Provide primary disconnect circuit breaker or disconnect switch as shown or required.

### 3.02 CLEANING AND PAINTING

- A. Shop Painting: Paint transformers meeting the requirements of Section 09912 - Interior Painting.
- B. Field Painting: Clean and touch up scratched and marred surfaces to match the original finish.

-END OF SECTION-

**Section 16471**  
**MINI-POWER CENTERS**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Requirements for providing mini-power centers consisting of a primary circuit breaker, dry-type transformer and secondary panelboard with main breaker.

**1.02 RELATED SPECIFICATIONS**

1. Section 09911 – Exterior Painting
2. Section 16050 - Basic Electrical Materials and Methods

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. ASTM D 635 - Test Method for Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position
2. NEC - National Electrical Code
3. NEMA ST 20 - Dry Type Transformers for General Applications

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.

- B. Product Data and Information: Furnish manufacturer's data including:

1. KVA ratings
2. Service voltages
3. Number of phases
4. Impedance
5. Taps
6. Insulation class
7. Sound level
8. Dimensions
9. Weights
10. Circuit breaker and panelboard ratings
11. Manufacturer's installation instructions
12. Mounting data

- C. Operations and Maintenance Manuals: Furnish manufacturer's operations and maintenance manuals as specified in Section 01831.

## 1.05 QUALITY ASSURANCE

- A. UL Label: Provide UL listing label or mark.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Cutler Hammer
2. Square D Company

### 2.02 MATERIALS

- A. General: Provide mini-power centers suitable for outdoor use in a marine environment.
- B. Insulation: Provide transformers with 180-degree C insulation system.
- C. Flame Retardant Materials: Provide transformers with flame retardant materials that will not support combustion as defined in ASTM D 635.

### 2.03 FABRICATION

- A. Transformer Taps: Provide transformers with two five percent taps below rated voltage on the primary winding.
- B. Windings: Provide primary and secondary windings fabricated from aluminum conductors completely encapsulated to provide a moisture-proof and shock-resistant seal.
- C. Voltage and KVA Ratings: Provide three-phase or single-phase mini-power centers with primary and secondary voltages and kVA ratings as shown.
- D. Connections
  1. Single Phase: Primary - 2-wire; Secondary - 3-wire with mid-point solidly-grounded.
- E. Continuous Operations: Provide transformers suitable for continuous operation at the rated kVA with a normal life expectancy as defined in NEMA ST 20 and the performance obtained without exceeding 185 degrees C temperature rise in 40-degree C maximum ambient and 30-degree C average ambient.

- F. Sound Levels: Transformers shall not exceed the following sound levels:

Transformer kVA	Average Sound Level in dB
	NEMA ST 20
0 - 09	40
10 - 30	45

- G. Main Circuit Breaker: Provide a main primary breaker with an interrupting rating of 14,000 rms symmetrical amperes at 277/480 volts.
- H. Secondary Panelboard: Provide a three-phase, four-wire or a single-phase, three-wire secondary panelboard with bolt on circuit breakers. Provide 20-ampere, single-pole, 120-volt circuit breakers, unless otherwise shown. Provide all breakers with quick-make, quick-break, toggle mechanisms with automatic thermal-magnetic, inverse time-limit overload and instantaneous short-circuit protection on all poles, unless otherwise indicated. Indicate automatic tripping by the breaker handle assuming a clearly distinctive position from the manual ON and OFF position. Provide breaker handles that are trip-free on overloads. Provide circuit breakers having an interrupting rating of 10,000 rms symmetrical amperes at 240 volts.
- I. Enclosure: Provide a totally enclosed, nonventilated, NEMA 3R stainless-steel, with lifting eyes enclosure fabricated from heavy-gauge steel. Provide an enclosure that limits the maximum temperature within the enclosure to 90 degrees C.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. General: Install all transformers and provide guards as specified by the latest NEC and ANSI standards, and in accordance with manufacturer's instructions.
- B. Clearances: Provide clearance around the transformer meeting the manufacturer's recommendation.
- C. Directory: Furnish a laminated, typewritten directory with the following information:
1. Circuit number
  2. Area served
  3. Utilizing equipment

#### 3.02 CLEANING AND PAINTING

- A. Shop Painting: Paint the mini-power centers meeting the requirements of Section 09911 - Exterior Painting.

- B. Field Painting: Clean and touch up scratched and marred surfaces to match the original finish.

-END OF SECTION-

**Section 16491**  
**CONTROL COMPONENTS AND DEVICES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Requirements for providing manual starters, motor controllers and remote control stations. In addition, the requirements for control components and devices for use in equipment provided under various other sections.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16055 - Electrical Requirements for Shop-Assembled Equipment
- B. Section 16060 - Grounding
- C. Section 16075 - Electrical Identification.
- D. Section 16085 - Basic Electrical Materials and Methods
- E. Section 16121 - Wires and Cables - 600 Volts and Below
- F. Section 16266 - Adjustable Frequency Drives
- G. Section 16445 - Motor Control Centers
- H. Section 16511 - Lighting

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NEMA ICS 2 - Industrial Control Devices, Controllers and Assemblies
  - 2. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
  - 3. UL 486A - Wire Connectors and Soldering Lugs for Use With Copper Conductors
  - 4. NYCBC - New York City Building Code

**1.04 SYSTEM DESCRIPTION**

- A. Design Requirements: Provide equipment capable of operating in an ambient temperature range of 0 to 40 degrees C and humidity of up to 90 percent noncondensing.
- B. Motor Controllers: Provide motor controllers suitable for 480-volt, three-phase, three-wire, 60-hertz operation.
- C. Control Devices: Provide control devices suitable for operation at 120-volts, 60-hertz, unless specifically noted otherwise.

- D. Insulation Class: Provide control equipment and devices that meet the requirements of the 600-volt insulation class.

#### 1.05 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish catalog data for all associated equipment and devices.
- C. Shop Drawings: Furnish shop drawings customized to the project for manual starters, motor controllers and remote control stations that include the following:
  - 1. Outline drawings showing dimensions, identification of components and a nameplate schedule for all units.
  - 2. Bill of materials including manufacturers' name and catalog number.
  - 3. Individual schematic and wiring diagrams for each motor controller
- D. Equipment Ratings: Obtain and enter full performance details on all motors and other equipment being served on the above drawings.
- E. Furnish operation and maintenance instructions as specified in Section 01831.

#### 1.06 QUALITY ASSURANCE

- A. Codes: Provide manual starters, motor controllers and remote control stations that are in accordance with NEMA ICS 2.
  - 1. Provide manual starters, motor controllers and remote control stations that are in accordance with the NYCBC, NEC and local codes.
- B. UL Listing: Provide UL-listed manual starters, motor controllers and remote control stations.

#### 1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, and handle all products and materials as specified in Division 1.
- B. Storage and Protection: Store all equipment and materials in a dry, covered, heated and ventilated location. Provide any additional measures in accordance with manufacturer's instructions.

## 1.08 SPARE PARTS

## A. Furnish the following spare parts:

1. Two control stations of each type provided
2. One of each type of manual starter provided
3. One of each type of motor controllers provided
4. Provide 10 of each type relay and timer.
5. 10 of each rating current switch
6. 2 of each type alternator
7. 10 pushbuttons
8. 10 selector and lock-out switches.
9. 10 of each color indicating light
10. 2 each of every size control power transformer

## B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

## A. Acceptable manufacturers are listed below.

1. Manuel Starters, Motor Controllers and Remote Control Stations
  - a. Cutler-Hammer
  - b. General Electric Company
  - c. Or approved equal
2. Control Relays
  - a. Cutler-Hammer
  - b. Square D Company
  - c. Or approved equal
3. Timing Relays
  - a. Agastat 7000 Series
  - b. Eagle Signal
  - c. Or approved equal
4. Reset and Repeat Cycle Timers
  - a. Eagle Signal
  - b. Automatic Timing and Controls.
  - c. Or approved equal

## 5. Current Switches

- a. Cutler- Hammer ECS
- b. Hawkeye 708/908
- c. Or approved equal

## 6. Alternators

- a. Time Mark Corp. Model 261
- b. ABB SSAC Inc. Series ABP
- c. Or approved equal

## 2.02 MANUAL MOTOR STARTERS

- A. Provide toggle-type, thermal-switch, manual motor starters with pilot lights for all 120-volt, single-phase motors rated less than ½ hp.
- B. Where shown or required, provide starters complete with a HAND/OFF/AUTO selector switch.
- C. Provide starter enclosures as specified under the section Remote Control Stations.

## 2.03 MOTOR CONTROLLERS

- A. General: Provide 480-volt, 3-phase, 60-hertz, across-the-line, combination motor circuit protector magnetic starters with individual control power transformers.
- B. Magnetic Starters: Provide magnetic starters as follows:
  - 1. Full voltage nonreversing or full voltage reversing, as required.
  - 2. Starter contacts of the replaceable, spring-loaded, wedge type with silver-cadmium oxide plated contact surfaces.
  - 3. Provide replaceable coils of the epoxy sealed type.
  - 4. Thermal Overload Elements: Class 20 thermal overload element and all required accessories. Provide size five and larger starters with current transformer operated overload relays.
    - a. Bimetallic type with an adjustment knob which allow plus or minus 15-percent adjustment of the heater's nominal rating.
    - b. Size the overload relays after approval of the corresponding motor.
    - c. Provide and adjust overload relays that match the associated motor nameplate running-current rating.

- d. Provide a set of isolated, normally-open and normally-closed contacts for each overload relay.
- 5. Provide seal in contacts for all controllers as needed.
- C. Motor Circuit Protectors: Provide a motor circuit protector for each combination starter as follows:
  - 1. Molded-case, air-break type designed for 600-volt, 60-hertz service with an interrupting capacity of 100,000 rms symmetrical amperes at 480 volts.
  - 2. Three-pole motor circuit protectors with magnetic, adjustable-trip units actuating a common tripping bar to open all poles when an overload or short circuit occurs.
  - 3. No thermal elements.
  - 4. Magnetic trip units capable of being set from 700 to 1,300 percent of the motor full-load amperes.
- D. Control Components: Provide push buttons, switches, indicating lights, transformers, relays and timers as specified under Section 16491 - Control Components and Devices.
- E. Enclosures: Provide motor controllers installed in NEMA 250 rated enclosures as follows:

AREA	ENCLOSURE
Outdoor and below grade elevation indoors	NEMA 4 – Watertight
Corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown	NEMA 4X - Watertight and corrosion-resistant stainless steel with stainless steel external hardware. Provide all external operators made of the same materials as that of the enclosures
Above grade indoor	NEMA 12 – Industrial

## 2.04 REMOTE CONTROL STATIONS

- A. General: Provide heavy-duty, oiltight remote control stations, consisting of push buttons, indicating lights, and selector switches with double-break silver contacts meeting the requirements specified under the section Control Components.

- B. Enclosures: Provide motor controllers installed in NEMA 250 rated enclosures as follows:

AREA	ENCLOSURE
Outdoor and below grade elevation indoors	NEMA 4 – Watertight
Corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown	NEMA 4X - Watertight and corrosion-resistant stainless steel with stainless steel external hardware. Provide all external operators made of the same materials as that of the enclosures
Above grade indoor	NEMA 12 – Industrial

- C. Lockout Attachments: Where shown, provide lockout attachments as follows:

1. Push buttons with padlockable attachment that holds the button depressed.
2. Selector switch with a padlockable attachment that covers the selector switch operators and allows the switch to be set in any position. Selector switch operators that use a removable key are not acceptable.

## 2.05 CONTROL COMPONENTS

- A. Push Buttons, Selector Switches and Indicating Lights

1. Provide heavy-duty, oiltight, 30.5 mm, push-button or selector-switch control stations arranged for flush-panel mounting.
2. Provide the additional switches, relays, and other electrical accessories necessary to control and safeguard the operation of the associated equipment.
3. Provide 30.5 mm, low-voltage, push-to-test, LED type indicating lights suitable for operation at 120-volt, 60-hertz ac control circuit voltages.
4. Color code indicating lights as follows:
 

Red	-	Motor running or valve open
Green	-	Motor off or valve closed
Amber	-	Capable of operation from this point
Blue	-	Alarm or trouble condition

- B. Control Power Transformer: Provide an individual, control power transformer for each starter to derive the 120 volts for the unit's control circuit. Provide transformers with sufficient capacity to meet the energy demands for all related control components including relays, solenoids and other indicated items. Provide

dual fuses on the primary and one fuse on the secondary. Ground the unfused leg of the secondary to the enclosure. All control power transformers shall be suitable for machine tool service.

- C. Elapsed Time Meters: Provide nonreset-type elapsed time meters to register up to 9999.9 hours, having square cases suitable for panel mounting and having coils for 120-volt, 60-hertz operation.
- D. Control and Latching Relays: Provide control and latching relays of 600-volt class, machine-tool quality with convertible contacts. Provide relay-operating contacts rated at a minimum of 10 amperes, 120 volts, 60 hertz.
- E. Timing Relays: Provide four-pole, double-throw, timing relays with timing ranges and ON/DELAY or OFF/DELAY operation as required. Provide contacts rated a minimum of 10 amperes at 120 volts, 60 hertz.
- F. Reset and Repeat Cycle Timers: Provide electromechanical or solid-state type reset and repeat cycle timers, with timing ranges and functions as indicated. Provide contacts rated at a minimum of 10 amperes, 120 volts, 60 hertz. Solid-state output contacts are not acceptable.
- G. Current Switches
  - 1. Provide current switches rated for operation on AC motor circuits. The device shall be self powered from the monitored line and the operating point shall be adjustable to adapt to different conditions.
  - 2. Switches shall open the contacts when the current falls below a level indicating that the motor is operating unloaded. Switch shall have 10amp 120 volt normally closed dry contacts.
- H. Alternators: Provide alternators suitable for 120-volt, 60-hertz operation.
  - 1. Provide alternator-operating double pole, double throw cross wired contacts rated at minimum of 7 amperes at 120 volts, 60 hertz.
  - 2. Provide alternators suitable for circuit design requiring alternating "lead-lag" operations.
  - 3. Provide alternators with integral three position switch "Load 1 – Alternate – Load 2" switch and LED status indicators.
  - 4. Provide 8-pin plug-in alternator with an 8-pin socket.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. General: Install all equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.
- B. Mounting: Mount manual starters, motor controllers and remote control stations 4 feet 6 inches from the finished floor up to their centerlines, unless otherwise shown. Mount all devices at least ½ inch away from concrete wall surfaces. Mount the current switches in an enclosure near the motor to be monitored. Extend wiring from the contacts back to the MCC for distribution.
- C. Adjustments: Set all motor circuit protectors and circuit breakers based on the approved short circuit and coordination study. Set the current switches per the recommendations of the motor supplier.
- D. Overloads: Adjust the thermal overloads on each phase of each starter unit for the actual motor installed.
- E. Cable Connections: Terminate and label all field wiring per the approved diagrams.
- F. Torque Requirements: Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening recommendations. Where manufacturers' torquing requirements are not available, tighten connectors and terminals in accordance with UL Standard 486 A.

### 3.02 FIELD QUALITY CONTROL

- A. Inspect, adjust and check the installation for physical alignment, cable terminations and ventilation.

-END OF SECTION-

**Section 16511  
LIGHTING****PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish and install all lighting fixtures, lamps and accessories required for a complete lighting system in accordance with the requirements specified under this section and as shown on the Contract Drawings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods
- B. Section 16491 - Control Components and Devices
- C. Section 16264 - Uninterruptible Power Systems

**1.03 REFERENCES**

- A. Lighting fixtures and devices shall comply with the latest applicable provisions and recommendations of the following:
  - 1. NEC - National Electrical Code
  - 2. NYCBC - New York City Building Code
  - 3. UL 924 - Emergency Lighting and Power Equipment
  - 4. UL 935 - Fluorescent Lamp Ballasts
  - 5. UL 1029 - High Intensity Discharge Lamp Ballasts
  - 6. UL 1570 - Fluorescent Lighting Fixtures
  - 7. UL 1571 - Incandescent Lighting Fixtures
  - 8. UL1572 - High Intensity Discharge Lighting Fixtures
  - 9. UL 1598A - Standard for Supplemental Requirements for Luminaires for Installation on Marine Vessels
  - 10. EPA - Energy Policy Act

**1.04 SUBMITTALS**

- A. Furnish all submittals, including the following, as specified in Section 01330 - Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.

B. Contractor shall submit the following:

1. Manufacturer's catalog data sheets indicating all technical information and construction details for each type of lighting fixture and control system component
2. Photometric data for each fixture type
3. Lamp type and technical information
4. Ballast type and technical information
5. Operations and maintenance manuals for lighting control system

1.05 QUALITY ASSURANCE

- A. Lighting fixtures shall be UL listed and approved for use in the City of New York. The lighting fixture types shall be in accordance with the fixture schedule as shown on the Contract Drawings. The descriptions and catalog numbers serve to establish the quality, appearance and performance of the specified lighting fixtures.
- B. All lighting fixtures shall be the products of lighting equipment manufacturers who have previously demonstrated, by performance and reputation, the ability to manufacture products of the quality specified. Such manufacturers must maintain an organization and manufacturing facility capable of actually manufacturing the specified lighting fixtures.
- C. The Contractor shall be responsible for reviewing all drawings and coordinating with the rest of the Contract work for the installation of lighting fixtures and devices. The lighting fixture and devices shall be compatible with the wall and ceiling types.
- D. All industrial fixtures shall be of the highest quality material and construction for their respective types.
- E. Lamps for all lighting fixtures shall be in accordance with the Federal Energy Legislation for reduced energy consumption.
- F. Fixtures shall be suitable for connection to concealed or exposed conduit runs as required in each particular location and shall be of sizes suitable for lamp sizes indicated on the Contract Drawings.
- G. Fittings and other materials for special fixtures not definitely shown or specified shall be of approved material, make and quality and shall have a finish that will harmonize with other parts of the fixtures. Where suitable standard materials are not available such parts of the fixtures shall be specially manufactured.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. Lighting fixtures and devices shall be delivered, stored and handled in accordance with the Specifications and the manufacturer's instructions.

## 1.07 EXTENDED WARRANTY

- A. Manufacturers of lighting control system and emergency lighting power system shall provide an extended warranty for minimum of two years.

## 1.08 SPARE PARTS

- A. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.
- B. The following spare parts shall be furnished:
  - 1. 10 percent lamps shall be provided of each wattage of each type of HID lamp, but not less than 24.
  - 2. 5 percent ballasts shall be provided of each type of HID type ballast, but not less than 2.
  - 3. 10 percent lamps shall be provided of each wattage of each type of fluorescent lamps, but not less than 24.
  - 4. 5 percent ballasts shall be provided of each type of fluorescent type ballast, but not less than 2.
  - 5. 20 percent lamps shall be provided of each type of incandescent lamp, but not less than 24.
  - 6. Lens and Globes: Provide 10 percent, but not less than 6, of each type of lens or globes provided.
- C. Packaging: Deliver all spare parts neatly wrapped or boxed, indexed and tagged with complete information for use and reordering.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. General: The lighting fixture descriptions and catalog numbers listed in the Lighting Fixture Schedule are used to indicate the acceptable quality, design and distribution characteristics of approved lighting fixtures.

- B. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Lamps

- a. General Electric Company Lamp Division
- b. Philips Lighting Company
- c. Osram Sylvania

2. Ballasts

- a. Advance Transformer Company
- b. Universal Manufacturing Corporation
- c. Osram Sylvania
- d. General Electric

3. Emergency Power System for High Intensity Discharge and Incandescent Fixtures

- a. APC Power Clone
- b. Dual-Lite

2.02 LIGHT FIXTURES

- A. A lighting fixture shall be provided at each location indicated on the Contract Drawings. Light fixtures shall be provided in accordance with the lighting fixture schedule as shown on the Contract Drawings.
- B. Light fixtures shall be provided with all necessary hangers, supports, conduit adaptors, reducers, hooks, brackets and other support hardware. All hardware shall have a protective, non-corrosive finish.
- C. Recessed fixtures shall be provided with trim moldings and frames suitable for the types of ceilings.
- D. Pendant fixtures shall be suspended by means of an enclosed and gasketed cushion type hanger. The hanger shall be suitable to be mounted directly to the fixture outlet box and shall provide a minimum of 8 degrees swing from the vertical. Fixture stems shall be threaded rigid metal conduit, 3/4-inch minimum size. In corrosive areas as defined in Section 16050 - Basic Electrical Materials and Methods or as shown. Stems shall be PVC coated.
- E. Where fixtures are subjected to moisture, or assembled of dissimilar metals, gaskets of approved material and thickness shall be provided.

- F. Fixtures shall be completely wired except where they will be directly connected to branch circuit wiring. The conductors shall be not less than No. 12 gauge, stranded, with approved heat resistant covering.
- G. Mounting heights of all fixtures shall be as shown on the Contract Drawings. For special types, the height shall be determined at the time of installation.

## 2.03 LAMPS

- A. Lamps shall have voltage ratings suitable for the voltages shown on the Contract Drawings.
- B. Fluorescent lamps shall be cool white, energy efficient rapid start type. Unless specifically indicated otherwise, fluorescent lamps shall be 32 watt T8.
- C. Metal halide lamps shall be standard-line phosphor coated with wattage as indicated in the fixture schedule.

## 2.04 BALLASTS

### A. General

- 1. Ballasts shall be matched for proper operation of lamps and shall meet the requirements for fixture light output, reliable starting and operation.
- 2. Ballasts shall be UL listed and certified by Electrical Testing Laboratories and shall conform to certified ballast manufacturer's specifications.

### B. Fluorescent Ballasts

- 1. Fluorescent ballasts shall be high power factor, energy efficient type. Ballasts shall be Class P protected with a Class A sound rating. Ballast used with fixtures in unheated areas shall be cold weather type.
- 2. Ballasts for use with 32 watt T8 lamps shall be electronic type, with total harmonic distortion less than 10 percent total. The ballast factor shall be .85 or greater with total of less than 61 watts input.
- 3. Low temperature ballasts shall be provided where indicated on the fixture schedule.

### C. High Intensity Discharge Ballasts

- 1. Ballasts shall have a power factor of not less than 90 percent for 70 watt lamps and above.
- 2. Ballasts shall be pulse-start type where specified on the fixture schedule.

3. Ballasts shall be capable of starting lamps with a lamp wall temperature of 0 degrees C or lower.
4. Ballasts, including the starter aid, shall protect itself against normal lamp failure modes and shall be capable of operation with the lamp in an open or short circuit condition for six months without accelerated loss of ballast life.
5. Ballast primary current during starting shall not exceed normal operating current.
6. Ballasts shall be capable of sustaining lamp operation with a line voltage dip or sag of 50 percent for up to 4 seconds when operating a nominal voltage lamp, with nominal line voltage applied to the ballast primary, as defined in ANSI 82.6.
7. The line power factor of the lamp/ballast system shall not drop below 90 percent for plus or minus 10 percent line voltage variations at any lamp voltage, from nominal through rated end-of-life lamp voltage, as described in ANSI 82.6.

## 2.05 OUTDOOR LIGHTING

- A. General: Provide outdoor lighting luminaires and standards as listed in the Lighting Fixture Schedule.
- B. Mounting: Mount outdoor lighting on concrete bases or structures as shown.
- C. Wind Design: Provide outdoor lighting standards and luminaires that can withstand the force caused by a 100 mile-per-hour wind with a gust factor of 1.3.
- D. Lighting Standards: Provide lighting standards complete with mast arm subbase, anchor bolts and handholes.
- E. Receptacles: Provide receptacles in light standards where shown.

## 2.06 EMERGENCY LIGHTING POWER SYSTEM

- A. Emergency lighting power system shall be provided for operation of designated emergency HID lighting fixtures as indicated on the Contract Drawings. Capacity and number of output circuits shall be as shown on the Contract Drawings.
- B. Each system shall consist of an uninterruptible power supply and battery section complete with the manufacturer's standard monitoring and diagnostic functions housed in a vented free-standing enclosure. Each system shall be UL 924 listed.

- C. The inverter shall be electronic solid-state type suitable for operating HID lighting loads. The batteries shall be sealed, maintenance-free lead acid and shall include a battery charging system and transfer relay.
- D. Each system shall operate on 277V AC single-phase normal input power supplying both the circuits and the battery charger. If the normal power is lost, the inverter shall provide AC single-phase 277V AC emergency power to operate for up to 90 minutes the emergency lighting circuits.
- E. The system output shall automatically switch to battery power upon an outage of the normal input and when restored transfer back after time delay.
- F. Emergency Circuit Interface module shall be provided for installation in fixture junction box to allow normal lamp operating parameters to be maintained.

### PART 3 EXECUTION

#### 3.01 INSTALLATION OF LUMINAIRES

- A. Luminaires shall be installed at locations shown. Luminaires locations shall be adjusted where necessary to clear conflicts and obstructions. Luminaires recessed in suspended ceilings shall be located where indicated on the architectural reflected ceiling plan for that area.
- B. All luminaires shall be installed complete with all hardware, and supporting devices necessary to make a safe complete and fully operative installation. The Contractor shall obtain from the manufacturer for each lighting fixture, diagrams, illustrations and other installation instructions. The Contractor shall install in strict conformance with such instructions and the requirements of NYC Electrical Code.
- C. Recessed fluorescent fixtures shall be installed in suspended ceiling openings in conformance with manufacturer's recommendations and to suit the architectural details of the area involved. Independent supports from structural members of the building shall be provided. Unless otherwise shown, every fluorescent fixture shall have at least two supports.
- D. Pendant mounted fixtures shall be installed with 3/4-inch pendants.
- E. All pendant stem hangers shall be furnished with suitable aligner canopies or outlet box covers so that the lighting fixtures hang vertical to the finished floor irrespective of the angle of the surface from which they are suspended. When lighting fixtures or hanger canopies are mounted flush to the ceiling or wall, and where raceways and outlet boxes serving the lighting fixtures are surface mounted to the ceiling or wall, finishing rings shall be provided to conceal the outlet box. All visible hanging devices and appurtenances shall have the same finish as the lighting fixture.

- F. Reflectors, lenses, diffusers, louvers and decorative elements of lighting fixtures shall not be installed until completion of plastering, ceiling tile work, painting, and general clean-up in the area.
- G. Emergency Battery Packs (Lunch Buckets) shall be wired to the supply circuit ahead of any switching devices.

### 3.02 INSTALLATION OF DEVICES

- A. Emergency Lighting Power System
  - 1. Equipment shall be installed in accordance with manufacturer's instructions and recommendations.
  - 2. Equipment shall be installed at locations indicated on the Contract Drawings so that sufficient access and working space is provided for ready and safe operation and maintenance.
  - 3. Install system nameplates for identification of equipment.
  - 4. Battery Pack units shall not be wired to a switched leg of a power supply circuit.

### 3.03 FIELD TESTS

- A. After installation, the completed lighting system shall be field tested for operation and conformance. The field tests shall be witnessed by the Resident Engineer and certified by the Contractor. The Contractor shall provide testing consisting of the following:
  - 1. Wiring continuity test shall be performed.
  - 2. Branch circuit load balance test shall be performed.
  - 3. Fixture and control operation test shall be performed.
  - 4. Emergency system operation and functionality test shall be performed.
- B. The Contractor shall provide a field test report. The report shall identify the test performed and the results obtained.

### 3.04 CLEANING OF LUMINAIRES

- A. Luminaires shall be cleaned inside and out to remove construction dust prior to substantial completion.
- B. Fixtures shall be re-lamped prior to substantial completion.

3.05 ADJUSTING

- A. Fixtures: Aim and adjust fixtures as shown
- B. Align adjacent fixtures horizontally and vertically
- C. Exit Sign Arrows: Adjust exit sign directional arrow as shown.
- D. Relamp fixtures that have failed lamps at substantial completion.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16723**  
**FIBER OPTIC CABLE**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. This section describes the requirements for a fiber optic cable system as used by digital video, security and computer systems. This section includes fiber optic cable, connectors and all ancillary equipment necessary to provide fully functional systems.

**1.02 RELATED SPECIFICATIONS**

- A. Under the Structures and Equipment Contract
  - 1. Section 17250 - SCADA System - Facility Wide Network Equipment
- B. Under the Electrical Contract
  - 1. Section 16050 - Basic Electrical Materials and Methods
  - 2. Section 16075 - Electrical Identification
  - 3. Section 16121 - Wires and Cables - 600 Volts and Below
  - 4. Section 16130 - Electrical Raceway Systems
  - 5. Section 16752 - Digital Video System

**1.03 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods of the Electrical Contract.
- B. Product Data and Information: Furnish manufacturer's catalog data for each type of wire and cable furnished.
  - 1. A description of the network including:
    - a. Layout drawings showing all hardware and cabling
    - b. Catalog descriptions for each component

**1.04 MAINTENANCE**

- A. Spare parts shall be furnished and shall be completely identified with a numerical system to facilitate parts inventory, control and stocking. Each part shall be properly identified by a separate number. Those parts which are identical for more than one size unit shall have the same part number. The following shall be supplied:

1. One set of all special tools, wrenches and test equipment required to disassemble, test, repair and adjust the equipment shall be provided.
2. One set of fiber optic test tools shall be furnished. The test set shall consist of Optical Light Source (OLS) MicroTest Optical Light, Tektronics TOP 130 LED light source or equal, Optical Power Meter (OPM), MicroTest Fiber eye, Tektronics TOP 200 or equal, TOP visual Fault Finder or equal.
  - a. Optical Power Meter (OPM)
    - (1) Accuracy/Linearity +/-0.2dB
    - (2) Amplifier design: Linear
    - (3) Calibrated wavelength: 850nm, 1300nm
    - (4) Calibration period: 12 months
    - (5) Display resolution: 0.01dB
    - (6) Dynamic range (Power): +3dB to -55dB
    - (7) Optical adapter: Universal
    - (8) Photodiode: Germanium
    - (9) Power Source: 2 AA batteries
    - (10) Battery Life: 100 hours
  - b. Optical Light Source
    - (1) Source type: LED
    - (2) Wavelength: 850nm, 1300nm
    - (3) Power launched into 62.5/125nm fiber @850nm: -13dBm and @1300nm: -12dBm
    - (4) Power output accuracy: +/-2dB @ 850nm and +0.5dB @ 1300nm
    - (5) Optical adapter: Universal
    - (6) Power Source: 2AA batteries
    - (7) Battery life: 8 hours
3. Splice/connectorization kit: Provide a splice and termination kit with the following minimum equipment.
  - a. Fiber cleaver - Corning Cable Systems model FBC-005 or approved equal
  - b. 50 multimode connectors of each type used. Connectors shall be of the mechanical type with a pre-polished factory stub with mechanical splice with index matching gel. Connectors shall be Corning Cable Systems Unicam multimode connectors or approved equal.
4. Additional items as recommended by equipment manufacturers or as described elsewhere in the Specifications.

5. Twenty patch cables of each type provided.
- B. Provide special tools necessary for normal operation, maintenance and diagnostic aids.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable Manufacturers: Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for review.
  1. Fiber Optic Cables
    - a. Optical Cable Corporation, DX series
    - b. Belden, Tray optics series
    - c. Phoenix Digital FOC - ECP series
    - d. Or approved equal
  2. Fiber Optic Patch Cables
    - a. Optical Cable Corporation
    - b. Siecor
    - c. Or approved equal

### 2.02 MATERIALS

#### A. General

1. Provide all necessary items for installation, including mounting brackets, interconnecting cables, hardware and appurtenances.
2. Fiber optic cable shall be utilized for CCTV and instrumentation circuits as specified in Section 16752 - Digital Video System of the Electrical Contract and instrumentation circuits as specified in Section 17250 - SCADA System - Facility Wide Network Equipment of the Structures and Equipment Contract.

#### B. Fiber Optic Cable

1. Fiber optic cable shall be installed for inter-building and inter-panel communication and digital video systems as shown.
  - a. Inter-Building And Inter-Panel Communication: The fiber optic cable for inter-building and inter-panel communication shall meet the following:

- (1) Cable shall be suitable for installation as both trunk cable and riser cable.
  - (2) Cable shall be rated for indoor/outdoor use.
  - (3) Cable shall be 62.5/125 micrometer (core/clad) multimode fiber optic cable.
  - (4) Cable shall utilize a multifiber per tube (MFPT) design consisting of 12 fibers contained in tight buffer tubes.
  - (5) Cable shall utilize a 900 um diameter tight buffer coating on each optical fiber.
  - (6) Cable shall be riser rated distribution cable.
  - (7) Cable shall have a ripcord(s) to assist in jacket removal.
  - (8) Cable shall be suitable for direct termination with standard connectors.
- b. Digital Video System: The fiber optic cable for digital video system shall meet the following:
- (1) Cable shall be suitable for installation as both trunk cable and riser cable.
  - (2) Cable shall be rated for indoor/outdoor use.
  - (3) Cable shall be 62.5/125 micrometer (core/clad) multimode fiber optic cable.
  - (4) Cable shall utilize a multifiber per tube (MFPT) design consisting of 4 fibers contained in tight buffer tubes.
  - (5) Maximum Attenuation: 3.50 dB/km at 850 nm; 1.0 dB/km at 1300 nm.
  - (6) Minimum Modal Bandwidth: 160 MHz-km at 850 nm; 500 MHz-km at 1300 nm.
  - (7) Cable shall utilize a 900 um diameter tight buffer coating on each optical fiber.
  - (8) Cable shall be riser rated distribution cable.
  - (9) Cable shall have a ripcord(s) to assist in jacket removal.

(10) Cable shall be suitable for direct termination with standard connectors.

2. Fiber Optic Patch Cables

- a. Patch cables shall be 62.5/125 micrometer (core/clad) multimode fiber optic cable.
- b. Patch cables shall be terminated with connectors as scheduled.

PART 3 EXECUTION

3.01 INSTALLATION

A. General

- 1. Install all fiber optic cable in accordance with the manufacturer's recommendations.
- 2. Provide pull boxes as needed to safely pull cable without damage.
- 3. Terminate both ends of all cables in a separate fiber optic patch panel, unless otherwise shown in a common patch panel.
- 4. Provide fiber optic jumper cables to interconnect between patch panels.
- 5. Provide support for all riser cables to reduce tensile load below eighty percent of the manufacturer's maximum long term tensile load requirements.
- 6. Inspect all fiber optic cables before and after installation.
- 7. Faulty fiber optic cables shall be removed and replaced at no additional cost to the City of New York.
- 8. Provide long radius elbows which are in excess of the manufacturer's advertised long-term minimum bending radius.
- 9. Where two cables join, provide two patch panels mounted adjacent to each other with necessary jumpers between panels provided.
- 10. Terminate all fibers in every cable with extras tagged as spare.

3.02 FIELD TESTING

- A. Provide the services of the fiber optic cable manufacturer to inspect the installation of each cable. Test each fiber between its patch panel bulkhead connectors for

optical power loss and frequency response. All fibers shall be verified to meet manufacturer's advertised specifications.

-END OF SECTION-

**Section 16724**  
**FIBER OPTIC PATCH PANELS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish all labor, materials, equipment and incidentals required to install, and place into successful operation, fiber optic patch panels as used by the telephone, security access and control, CCTV and process monitoring and control systems. This section includes all ancillary equipment necessary to provide a fully functional patch panel system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods
- B. Section 16075- Electrical Identification
- C. Section 16752 - Digital Video System
- D. Section 17250 - SCADA System - Plant Wide Network Equipment

**1.03 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish Manufacturer's product data sheets and complete construction details including physical characteristics of each patch panel.
  - 1. Overall dimension of each patch panel.
  - 2. A description of the network including:
    - a. Layout drawings showing all cabling and connections.
    - b. Catalog descriptions of each component.

**1.04 SPECIAL TOOLS**

- A. The Contractor shall provide special tools necessary for normal operation, maintenance and diagnostic aids.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Acceptable Manufacturers: Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for review.

1. Fiber Optic Patch Panels
  - a. Net Optics
  - b. Corning Cable Corp.

### 2.02 MATERIALS AND COMPONENTS

- A. General: Provide all necessary items for installation including, but not limited to, mounting brackets, interconnecting cables, hardware and appurtenances.

- B. Fiber Optic Patch Panels:

1. Wall mounted fiber optic patch panels meeting the following minimum specifications shall be installed as shown.
  - a. Capacity for 24 connectors and jumpers.
  - b. Thin modular low profile splice tray shall accommodate splicing for fusion and mechanical splices.
  - c. Dual doors shall be provided to separate the cable entry section and the patch panel side.
  - d. Provide cable routing from the top and bottom of both panel sections.
  - e. Enclosures shall be manufactured from 16-gauge, cold rolled steel.
  - f. Panels shall be provided with grounding and strain relief lugs to support the fiber cable.
  - g. Provide cable tie-down support islands to take up excess fiber optic cable and insure it does not exceed its maximum bending radius.
  - h. Provide cable bulkhead adapters pre-mounted on eight plates, six connectors per plate (dual fiber connectors count as two).
  - i. Panels shall be inspected to assure that there are no sharp edges which could damage the fiber optic cable.

- j. Patch panel dimensions shall be a minimum of 13.5" high x 22.5" wide x 4" deep.
  - k. Patch panel shall be mounted in a painted steel NEMA 12 enclosure.
2. Rack-mounted fiber optic patch panels meeting the following minimum specifications shall be installed in the CCTV and security compartments of the console and in the network interface panel as shown.
- a. Capacity for 24 connectors and jumpers.
  - b. Provide universal mounting brackets for 19 and 23 inch EIA relay racks and cabinets.
  - c. Modular low profile splice tray shall accommodate splicing for fusion and mechanical splices.
  - d. Provide access from the front, rear, left and right sides.
  - e. Panels shall be manufactured from 16-gauge, cold rolled steel.
  - f. Panels shall be provided with grounding and strain relief lugs to support the fiber cable.
  - g. Provide cable tie-down support islands to take up excess fiber optic cable and insure it does not exceed its maximum bending radius.
  - h. Panels shall be inspected to assure that there are no sharp edges which could damage the fiber optic cable.

### PART 3 EXECUTION

#### 3.01 FIBER OPTIC PATCH PANELS

- A. Install fiber optic patch panels, with enclosure, on wall or in 19" rack as shown and in accordance with manufacturer's guidelines.
- B. Where two fiber optic cables join provide two patch panels mounted adjacent to each other with necessary jumpers provided between panels.
- C. Terminate all fibers in every cable with extras tagged as spare.
- D. Label each patch panel and include a termination list attached to the inside of the door.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16741**  
**PAGING SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Furnish a complete paging/intercom system. The system shall include all necessary handset/amplifier control stations, special mounting boxes, loudspeakers, terminal boards, cable, connectors and accessories for a complete operational voice communication system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01821 – Training
- B. Section 16050 - Basic Electrical Materials and Methods
- C. Section 16121 - Wires and Cables - 600 Volts and Below
- D. Section 16130 - Electrical Raceway Systems

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NEC - National Electrical Code
  - 2. NYCBC - New York City Building Code

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Manufacturer's catalog data sheets indicating all electrical characteristics.
- C. Manufacturer's instruction manual.

**1.05 SYSTEM DESCRIPTION**

- A. General: The system shall provide voice paging and communication throughout the facility, including areas of extreme high ambient noise levels. The system shall allow amplified calling of personnel over the loudspeakers and two-way communication over one of five available party line channels.
- B. Page channel shall broadcast speech over all system speakers. Where necessary, to prevent acoustic coupling, the speaker connected to the hand set station shall be automatically muted when handset is removed from its cradle and page channel is selected.

- C. Party line channel shall provide two-way conversation capability without interference of cross talk between channels. Conversation will not be heard over the speaker system.

#### 1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the products specified in this section with minimum three years documented experience with service facilities within 100 miles of Project.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three (3) years documented experience.

#### 1.07 REGULATORY REQUIREMENTS

- A. Furnish products listed and classified by UL or testing firm acceptable to authority having jurisdiction as suitable for purpose specified and indicated.
- B. Conform to requirements of FCC.

#### 1.08 WARRANTY

- A. Furnish a written 2-year minimum warranty for parts and labor from the paging system manufacturer.

#### 1.09 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. One of each type of desk top paging station.
  - 2. Twenty percent but not less than four, of each type of wall mounted paging station.
  - 3. Twenty percent but not less than two, of each type of speaker amplifier
  - 4. Twenty percent but not less than four, of each type of wall mounted indoor speaker.
  - 5. Twenty percent but not less than four, of each type of weatherproof bullhorn speakers
- B. Packaging: Plainly tag and mark spare parts for identification and for reordering and properly box and wrap spare parts to prevent deterioration. Completely identify the box on the outside.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable manufacturers are as listed below. Other manufacturers of equivalent products may be submitted for approval.

1. ComTrol International
2. Gai-Tronics Corporation

## 2.02 DESK TOP PAGING STATION

- A. Provide desk top paging speakers that meet the following requirements:

1. Output level: 1.5volts into 33 ohm load
2. Distortion: less than 1/5%@1000Hz
3. Isolation: Output transformer
4. Output protection: Short circuit-proof
5. Controls: Amplifier Board located on PC board
6. Five Party Lines

## 2.03 WALL-MOUNTED PAGING STATION

- A. Provide wall mounted paging speakers that meet the following requirements:

1. Output level: 1.5volts into 33 ohm load
2. Distortion: less than 1/5%@1000Hz
3. Isolation: Output transformer
4. Output protection: Short circuit-proof
5. Adjustments: Side tone adjustments located on pc board. Handset amplifier pot located on PC board
6. Controls: Magnetic off-hook switch with sealed relay. Handset paging with sealed relay.
7. Five Party Lines
8. Connections: Terminal block located in back of housing
9. Housing: Type 304 stainless steel, moisture, corrosion, and vibration resistant housing with gray epoxy powder coat finish.

10. Heavy Duty Handset Cord
11. Noise Canceling Microphone

#### 2.04 SPEAKER AMPLIFIER

- A. Provide speaker amplifier that meet the following requirements:
1. Power output: 20 watts RMS to 8 ohms or 12 watts to 16 ohms
  2. Frequency response: 250 to 4000Hz +/-1.5 dB
  3. Distortion: 1% maximum @ 20 watts and 1000 Hz
  4. Hum and Noise: At least 50 dB below rated output
  5. Isolation: Input transformer on power, page, and party lines
  6. Input Sensitivity: Less than one volt for rated output
  7. Input Impedance: Greater than 50000 ohms
  8. Output protection: Instantaneous short circuit and impedance protection
  9. Adjustments: Speaker volume control located on PC board, accessible through front panel.
  10. Housing: Type 304 stainless steel, moisture, corrosion, and vibration resistant housing with gray epoxy powder coat finish.

#### 2.05 WALL-MOUNTED INDOOR SPEAKER

- A. Provide wall-mounted indoor speakers that meet the following requirements:
1. Single cone: 8-inch
  2. Frequency response: 100-8000 Hz (+/- 6 dB)
  3. Dispersion angle: 50 degrees at 4000 Hz -6 dB
  4. Sensitivity: 95 dB SPL, 1 watt/1meter
  5. Nominal free air resonance: 90 Hz
  6. Impedance: 8 ohms
  7. Power handling: 30 watts continuous
  8. Volume Control

## 2.06 WEATHERPROOF BULLHORN SPEAKER

- A. Provide weatherproof bullhorn speakers that meet the following requirements:
1. Power rating: 30 watt continuous
  2. Frequency response: 300-12000 Hz (nominal) ; 500-4500 Hz (+/- 5 dB)
  3. Sensitivity: 126 dB @30 watts (peak); 121dB @30 watts/ 1 meter 500-4500 Hz; 108 dB @1watt 1meter 500-4500 Hz
  4. Dispersion angle: 60° (-6 dB, 20000 octave band)
  5. Material: Spun aluminum with epoxy coating.

## 2.07 CONDUIT AND CABLES

- A. Conduit and boxes: Provide conduit and boxes that meet the requirements of Section 16130 - Electrical Raceway Systems.
- B. Cable: Provide cables meeting the requirements of Section 16121 - Wire and Cable - 600 Volts and Below.

## PART 3 EXECUTION

## 3.01 INSTALLATION

- A. Install paging system as shown or required. Comply with requirements of the NYCBC, NEC and local electrical codes.

## 3.02 FIELD SERVICES

- A. Manufacturer's Representative: Provide a factory-trained experienced, competent, and authorized representative of the paging system manufacturer to visit the site of the Work and inspect, check, adjust if necessary, approve the equipment installation and provide training as specified in Section 01821 – Training. Provide all instruments and equipment necessary to conduct required tests, adjustments and training. Submit copies of these documents executed and signed by the manufacturer's representative. Have the representative present when each equipment item is placed in operation. Provide representative service as often as necessary until all problems are corrected and each equipment item is installed and operating satisfactorily.
- B. Training: Following completion of installation and field testing provide training for 12 employees of the City of New York in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the DSNY's facilities at a time agreeable to the City of New York:

1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

-END OF SECTION-

**Section 16742**  
**RADIO COMMUNICATIONS SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Furnish a radio communications system complete with desktop mobile radio station, two-way mobile radios, desktop chargers, and all required accessories.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods

**1.03 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Manufacturer's catalog data sheets indicating all electrical characteristics.
- C. Manufacturer's instruction manual.
- D. Submit completed FCC license permit application(s) for review prior to submitting them to the FCC.

**1.04 SYSTEM DESCRIPTION**

- A. General: The system shall be a multiple channel two-way mobile radio system to permit communications between equipment operators throughout the facility, including gantry crane operators, lidding equipment operators, excavators, loaders, tipping level traffic managers, and dock traffic managers and between central desktop stations in the Foreman's Office and Operations Room and the equipment operators. Populate each radio with all frequency so that all four channels are active.
- B. Schedule of Equipment: Provide the radio communication equipment as follows:
  - 1. One desktop mobile radio station in the Foreman's Office
  - 2. One desktop mobile radio station in the Operations Room
  - 3. Sixty hand-held portable two-way radios
  - 4. Ten multiple-unit battery chargers
- C. Desktop Mobile Radio Station Antenna: Provide an antenna for each desktop mobile radio station that allows the radio communication system to operate throughout the transfer station with coverage extending 100 feet beyond the building.

## 1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three (3) years documented experience with service facilities within 100 miles of Project.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.

## 1.06 QUALITY CONTROL

- A. Provide the services of the radio communications manufacturer to design and guarantee the radio communications system to meet the specified requirements.

## 1.07 REGULATORY REQUIREMENTS

- A. Furnish Products listed and classified by UL or testing firm acceptable to authority having jurisdiction as suitable for purpose specified and indicated.
- B. Conform to requirements of FCC.
- C. Radio License: Complete and submit permit application(s) with the FCC for radio license(s) for the transfer station. If possible, utilize the same frequencies as other City of New York transfer stations.

## 1.08 WARRANTY

- A. Furnish a written 2-year minimum warranty for parts and labor from the radio communications system manufacturer. Furnish a written 1-year minimum replacement warranty for accessories.

## 1.09 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. Twenty 1800mAh Li-ion batteries
  - 2. One hundred headsets
  - 3. Ten hand-held portable two-way radios
  - 4. Two multiple-unit battery chargers
- B. Packaging: Pack spare parts in containers bearing labels clearly designating contents and related pieces of equipment. Deliver spare parts in original factory packages. Identify all spare parts with information needed for reordering.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Acceptable Manufacturers: Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval.

1. Motorola

## 2.02 HAND-HELD PORTABLE TWO-WAY RADIOS

- A. Provide hand-held portable radios that meet the following requirements:

1. Channel Capacity: 4-channel operation with rotary channel selector.
2. Battery: High Capacity 1800mAH Li-ion rechargeable battery, 14 hours average life
3. UHF Transmitter
  - a. RF Output: High, 4 Watts
  - b. Frequency: 438-470 M Hertz
  - c. Channel Spacing: 12.5/20/25 kHz
  - d. Frequency Stability: 0.00025%
  - e. Audio Distortion at 1000 Hertz: less than 3%
4. UHF Receiver
  - a. Frequency: 438-470 M Hertz
  - b. Band: 20/25/30 kHz
  - c. Sensitivity at 12 dB: 0.25 uV
  - d. Adjacent Channel Selectivity: -70dB
  - e. Intermodulation: -70dB
  - f. Frequency Stability: 0.00025%
  - g. Audio Output: at less than 5% Distortion: 500 mW to penetrate noisy environment
5. Whip Antenna

6. Housing: Rugged die-cast chassis with polycarbonate housing designed to withstand harsh environment, including exposure to salt fog, blowing rain, blowing dust, vibration, shock, and outdoor temperatures.
7. Push-to-Talk Button
8. Spring Action Belt Clip
9. Tri-Color LED to indicate radio status and battery level
10. Rotary On/Off and Volume Control
11. Headset with microphone for each radio to allow hands-free operation as specified below
12. Motorola Model CP200 or approved equal

## 2.03 DESKTOP MOBILE RADIO STATION

### A. Provide desktop mobile radio station that meet the following requirements:

1. Channel Capacity: 64 UHF channels
2. RF Outout: 1-25W
3. UHF Transmitter
  - a. RF Output: High, 4 Watts
  - b. Frequency: 403-470 M Hertz
  - c. Channel Spacing: 12.5/20/25 kHertz
  - d. Frequency Stability: 0.00025%
  - e. Audio Distortion: less than 3%
4. UHF Receiver
  - a. Frequency: 403-470 M Hertz
  - b. Channel Spacing: 12.5/25/25 k Hertz switchable
  - c. Sensitivity at 12 dB: 0.23 uV typical
  - d. Adjacent Channel Selectivity: -75dB at 25 kHertz
  - e. Intermodulation: -75 dB
  - f. Audio Output with 4 ohm speaker: 13 Watts external
  - g. Audio Distortion: 3%
5. Microphone and Tray
6. Front Projecting Speaker

7. 14 Character Alpha-Numeric Display
8. Radio Signal Strength Indicator
9. Caller ID
10. LED Indicators
11. Antenna as required to provide the specified coverage.
12. Housing: polycarbonate housing designed for -30 degrees C to +60 degrees C operating temperature and 95% relative humidity
13. Motorola Model CDM1250 or approved equal

#### 2.04 MULTIPLE-UNIT BATTERY CHARGERS

- A. Provide rapid rate multiple-unit battery chargers capable of charging up to 6 batteries and/or hand-held portable two-way radios simultaneously.
- B. Motorola Model WPLN4161AR or approved equal

#### 2.05 HEADSETS

- A. Provide heavy duty headsets that meet the following requirements:
  1. Behind- the-head style and capable of being worn with hard hats
  2. 24dB noise reduction
  3. Noise canceling boom microphone
  4. Push-to-talk switch on ear cup
  5. VOX module
  6. Motorola Model BDN6648C or approved equal

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install radio communications system as shown or required. Comply with requirements of the NYCBC, NEC and local electrical codes.

#### 3.02 FIELD SERVICES

- A. Manufacturer's Representative: Provide a factory-trained experienced, competent, and authorized representative of the paging system manufacturer to visit the site of the Work and inspect, check, adjust if necessary, approve the equipment installation and provide training as specified in Section 01821 – Training. Provide all instruments and equipment necessary to conduct required tests, adjustments and

training. Have the manufacturer's representative utilize prepared comprehensive check sheets covering inspections, checks and tests required for the assembly of the switchgear. Submit copies of these documents executed and signed by the manufacturer's representative. Have the representative present when each equipment item is placed in operation. Provide representative service as often as necessary until all problems are corrected and each equipment item is installed and operating satisfactorily.

- B. Training: Following completion of installation and field testing provide training for 12 employees of the City of New York in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the DSNY's facilities at a time agreeable to the City of New York:
  - 1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  - 2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
- C. Demonstration that the system performs according to specified requirements and permits communications without interference between equipment operators throughout the facility, including gantry crane operators, lidding equipment operators, excavators, loaders, tipping level traffic managers, and dock traffic managers and between central desktop stations in the Foreman's Office and Operations Room and the equipment operators.

-END OF SECTION-

**Section 16745**  
**TELEPHONE SYSTEM**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Furnish and install telecommunications system components including main and local distribution racks, voice/data outlets, telecommunication cables, and raceway system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 16050 - Basic Electrical Materials and Methods  
B. Section 16121 - Wires and Cables - 600 Volts and Below  
C. Section 16130 - Electrical Raceway Systems  
D. Section 16264 - Uninterruptible Power Supplies

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:

1. NFPA 70 - National Electrical Code
2. NYCBC - New York City Building Code
3. UL 467 - Standard for Grounding and Bonding Equipment
4. UL 1449 - Standard for Transient Voltage Surge Suppressors
5. TIA/EIA 310 - Cabinets, Racks, Panels, And Associated Equipment
6. TIA/EIA 492 - Specification for Optical Waveguide Fibers
7. TIA/EIA 568 - Commercial Building Telecommunications Cabling Standard.
8. TIA/EIA 569 - Commercial Building Standard for Telecommunications Pathways and Spaces.
9. TIA/EIA 607 - Commercial Building Grounding and Bonding Requirements for Telecommunications.
10. IEEE 802.3 - Telecommunication and Information Exchange Between

**1.04 DEFINITIONS**

- A. Abbreviations

1. FDDI: Fiber distributed data interface
2. FOCS: Fiber Optic Communication Subsystem
3. HMI Integrator: Subcontractor to Construction Manager
4. LAN: Local area network
5. Hz: Megahertz
6. Mbps: Megabits per second

7. OTDR: Optical time-domain reflectometer
8. PICS: Process Instrumentation and Control System.
9. IC System Integrator: Subcontractor to General Contractor.
10. UPS: Uninterruptible power supply.
11. WAN: Wide area network.

#### 1.05 SYSTEM DESCRIPTION

- A. The systems shall supply voice and data communications networks through-out the building using equipment rooms, terminal boards, routers, component rack system, network switches, network servers, fiber optic cables, twisted pair cables, patch panels, converters, connectors, raceways and devices.
- B. Telephone system shall connect the Utility supply and switching equipment to distribution lines connecting outlets for instruments, where indicated, through-out the building. Direct outside line connections shall be provided for designated personnel and equipment where indicated.
- C. The telephone Utility shall be supported with a UPS.
- D. The data system shall connect the Utility supply and switching equipment to distribution lines connecting outlets for PC's and equipment, where indicated, through-out the building

#### 1.06 SUBMITTALS

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Submit manufacturer catalog data sheets indicating technical data for the following:
  1. Telecommunication Mounting Elements
  2. Voice/Data Outlets
  3. Telephone Terminal Cabinets
  4. Terminal Strips and Blocks
  5. Routers
  6. Equipment Racks
  7. Network Components
  8. Patch Panels
  9. Equipment Rack and Network Interface Panels
  10. Fiber Optic Cable and Accessories
  11. Software

- C. Shop Drawings: Furnish shop drawings for the telephone and data systems including the following:
  - 1. Furnish a layout of the system indicating all equipment, devices and wiring including equipment mounting heights and details.
  - 2. Furnish wiring diagrams for any assemblies that show connections to electrical power or communications distribution or equipment.
  - 3. Cable schedule showing:
    - a. Cable identification
    - b. Fiber counts for each cable and identification of used fiber pairs
    - c. Cable length and attenuation, with two connector pairs and no splices, based on TIA/EIA 568, Annex H
  - 4. Point-to-point fiber diagrams, including fiber terminations and patch cords. All fiber cables and fiber pairs shall be identified.
  - 5. Component Data
    - a. Manufacturer and model number
    - b. General data and description
    - c. Engineering specifications and data sheet
    - d. Scaled drawings and mounting arrangements
- D. Informational Submittals
  - 1. Manufacturer's statement that installer is certified to perform installation Work.
  - 2. Subcontractor Qualifications:
    - a. FOCS Subcontractor: Minimum of three (3) years experience providing, integrating, installing, and commissioning of similar systems.
    - b. City acceptance of FOCS Subcontractor does not exempt FOCS Subcontractor or Contractor from meeting Contract Document requirements nor does it give prior acceptance of subsystems, equipment, materials, or services.
- E. Quality Control: Provide test reports and certifications for all cable and equipment furnished.

- F. Provide operations and maintenance manuals for any equipment.

1.07 QUALITY ASSURANCE

- A. Installer Qualifications: Cabling installer must have on staff personnel certified by Building Industry Consulting Service International (BICSI).
  - 1. Installation shall be under the direct supervision of a registered technician who shall be present at all times when Work of this Section is performed at Project site.
- B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7.
  - 1. Testing Agency's Field Supervisor: Person currently certified by BICSI as a registered communication distribution designer to supervise field quality-control testing.
- C. Source Limitations: Obtain all products except cables through one source from a single manufacturer.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. Comply with NFPA 70, "National Electrical Code."
- F. Contact Verizon service representative for specific instructions regarding telephone service requirements at each facility before commencing work.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Optical Fiber Cable
  - 1. Outside, Underground/Submerged: Minus 20 to 40 degrees C
  - 2. Outside, Aboveground in Conduit: Minus 40 to 80 degrees C
  - 3. Inside: 0 to 40 degrees C
- B. Equipment
  - 1. Outside, Aboveground: Minus 40 to 80 degrees C
- C. Control Rooms, Equipment Rooms and Telecommunications Closets: 30 to 55 percent relative humidity, 18 to 24 degrees C.
- D. Other Interior Areas: 0 to 100 percent relative humidity, 5 to 35 degrees C.

1.09 WARRANTY

- A. Furnish a written 2-year minimum warranty for parts and labor from the telephone system manufacturer. Furnish a written 1-year minimum replacement warranty for accessories.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable manufacturers are listed below.

- 1. Cabinets

- a. Hoffman
- b. Saginaw
- c. Hammand
- d. Or approved equal

- 2. Telecommunication Mounting Elements

- a. Ortronics
- b. CommScope
- c. Belden
- d. Or approved equal

- 3. Network Components

- a. Hirschmann
- b. Allied Telesis
- c. Cisco
- d. Or approved equal

- 4. Patch Panels

- a. Ortronics
- b. CommScope
- c. Belden
- d. Or approved equal

- 5. Equipment Rack and Network Interface Panel Accessories

- a. Ortronics
- b. CommScope
- c. Belden
- d. Or approved equal

## 6. Personnel Area Server Room Equipment Racks

- a. Ortronics
- b. CommScope
- c. Belden
- d. Or approved equal

## 7. Network Interface Panels

- a. Ortronics
- b. CommScope
- c. Belden
- d. Or approved equal

## 2.02 TELECOMMUNICATION MOUNTING ELEMENTS

- A. Backboards: Minimum of 48 inches by 48 inches by 3/4-inch, interior-grade, fire-retardant-treated plywood. Equip the backboard with all related materials for terminating and cross connecting the voice communication cables. Provide one terminal for each conductor plus minimum of 20% spare terminals.
- B. Distribution Racks: Freestanding and wall-mounting, modular-steel units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
  - 1. Module Dimension: Width compatible with EIA 310 standard 19-inch (480-mm) panel mounting
  - 2. Finish: Baked-polyester powder coat
  - 3. Power Strips: For mounting in the rack, 20-A, 120-V ac, NEMA WD 6, Configuration 5-20R receptacles, no fewer than 6, and including the following:
    - a. LED indicator lights for power and protection status
    - b. LED indicator lights for reverse polarity and open outlet ground
    - c. Circuit breaker and thermal fusing. Unit continues to supply power if protection is lost.
    - d. Close-coupled, direct plug-in line cord
    - e. Rocker-type on-off switch, illuminated when in on position
    - f. Peak Single-Impulse Surge Current Rating: 26 kA per phase

- g. Protection modes shall be line-to-neutral, line-to-ground, and neutral-to-ground. UL 1449 clamping voltage for all 3 modes shall be not more than 330 V.
    - h. One RJ11/12C telephone line protector, suitable for modem connection. Maximum clamping voltage 220 peak on pins No. 3 and No. 4.
  - 4. Telephone Terminal Cabinets: Provide cabinets with terminal boards suitable to terminate 50 pair station cables distributing between telecommunication and data rooms and hard wire emergency and notification circuits. Cabinets shall be made from galvanized steel with door and back panel. Construct panel to NEMA 1B rating and finish in grey corrosion resistant finish. Provide 25% spare terminals. Box to be Hoffman or approved equal.
  - 5. Wall-Mounting Rack: Aluminum, hinged wall bracket with provisions for power strip mounting.
  - 6. Floor-Mounting Rack: Steel, freestanding, modular, with vertical and horizontal cable management channels, top and bottom cable troughs, and grounding lug.
  - 7. Provide system of capacity sufficient for the proposed 2 T-1 system head end and local distribution equipment and as recommended by the telephone and data service provider. Rack-Mounted UPS: In accordance with Section 16264.
- 2.03 UNINTERRUPTIBLE POWER SUPPLIES.
  - A. Provide Uninterruptible Power Supplies in accordance with Division 16 Section "Uninterruptible Power Supply Systems."
- 2.04 NETWORK COMPONENTS
  - A. Gigabit Network Switch
    - 1. Full compliance with IEEE 802.3.
    - 2. Supports 10 Mbit/s Ethernet, 100 Mbit/s Fast Ethernet, and 1,000 Mbit/s Gigabit Ethernet.
    - 3. DIN-rail mounted switch operating on 120V ac power.
    - 4. Chassis provided with sufficient media modules to support all required connections. Media modules shall include a minimum of twelve 10/100 Mbit/s twisted pair ports and two 1,000 Mbit/s (Gigabit) single-mode fiber "Small Form Factor Pluggable" (SFP) ports.

5. Operating Temperature: 0 to 60 degrees C.
  6. Manufacturer and Product: Hirschmann; MS-30 plus specified media modules or approved equal.
- B. Fast Ethernet Network Switch (sub-ring switches):
1. Full compliance with IEEE 802.3.
  2. Supports 10 Mbit/s Ethernet, 100 Mbit/s Fast Ethernet.
  3. DIN-rail mounted switch operating on 120V ac power.
  4. Chassis provided with a minimum of six 10/100 Mbit/s twisted pair ports and two 100 Mbit/s single-mode fiber pair ports. Sufficient ports shall be provided to support all required connections.
  5. Operating Temperature: 0 to 60 degrees C.
  6. Manufacturer and Product: Hirschmann; RS-20 with specified ports, or approved equal.

2.05 PATCH PANELS

- A. Single-Mode Fiber Patch Panel (24 Point)
1. Panel shall come complete with a 24-point single-mode fiber patch panel, fiber management, and bend radius control. Unit shall be 19-inch rack mountable.
  2. Preloaded with 24 ST adapters.
  3. Manufacturer and Product: Ortronics; Model OR-625MMC-24PA1RB, or approved equal.
- B. RJ-45 Patch Panel (24 Port)
1. Panel shall come complete with a 24-point twisted-pair copper patch panel, fiber management, and bend radius control. Units shall be 19-inch rack mountable.
  2. Meets EIA/TIA Category 6 performance.
  3. Manufacturer and Product: Ortronics; Model OR-PSD66U24, or approved equal.

2.06 EQUIPMENT RACK AND NETWORK INTERFACE PANEL ACCESSORIES

- A. Horizontal Cable Management Panel: Panel shall provide management of patch cable horizontally.
  - 1. Manufacturer and Product: Ortronics; Model OR-808044549, or approved equal.
- B. Rack-Mounted Power Strip: 19-inch rack-mounted power strip with eight 20-amp outlets.
  - 1. Power cord length: 15 feet, minimum.
  - 2. Plug configuration: L5-20P twist-lock connector
  - 3. Manufacturer and Product: Ortronics; Model OR-50900052-TL, or approved equal.
- C. Power Distribution Panel: DIN-rail mounted circuit breakers mounted on 19-inch rack-mounted back panel.
  - 1. Manufacturer: Weidmueller; Phoenix Contact, or approved equal.

2.07 PERSONNEL AREA SERVER ROOM EQUIPMENT RACKS

- A. Four-Post Racks
  - 1. Construction
    - a. Four-post anodized aluminum frame construction
    - b. Color: Black
    - c. 19 inches wide by 36 inches deep by 84 inches high, minimum
    - d. Four vertical mounting rails 45 rack mounting units for each rack section
    - e. Solid sides and ventilated top panels
    - f. Perforated metal front and rear access doors
    - g. Manufacturer and Product: Chatsworth Products Inc.; M Series, or approved equal.

2. Major Components

- a. Network servers
- b. Horizontal cable management panel
- c. rack-mounted power strip
- d. Power distribution panel

B. Power Supply: Connect the rack-mounted power strip at each equipment rack section to its overhead receptacle using the power strip's integral power cord and L5-20P twist-lock connector. Equipment rack components will be powered from the rack-mounted power strip.

C. Two-Post Racks

1. Construction

- a. Two-post anodized aluminum frame construction
- b. Color: Black
- c. 19 inches wide by 12 inches deep by 84 inches high, minimum
- d. Two vertical mounting rails 45 rack mounting units for each rack section
- e. Double-sided, 6-inch wide, covered cable management system
- f. Manufacturer and Product: Chatsworth Products Inc.; Universal Series, or approved equal.

2. Major Components

- a. Switches
- b. Patch Panels
- c. Horizontal cable management panel.
- d. Power Supply: Connect the rack-mounted power strip at each equipment rack section to its overhead receptacle using the power strip's integral power cord and L5-20P twist-lock connector. All equipment rack components will be powered from the rack-mounted power strip.

2.08 NETWORK INTERFACE PANELS

A. Locations and Tags

1. 4S-NIP
2. 4N-NIP
3. 5S-NIP
4. 5N-NIP
5. 6S-NIP
6. 6N-NIP

B. Network Interface Panels shall house the following major components.

1. Network switches
2. Fiber patch panels
3. RJ-45 patch panels (minimum of one per NIP, whether shown or not)
4. Fiber optic cable management area
5. Horizontal cable management panel
6. One rack-mounted power strip
7. Power distribution panel

C. Configure the network equipment panel to receive power from a single UPS-backed power circuit.

2.09 FIBER OPTIC CABLE - MULTIMODE:

A. See Contract Specification 16121 – Wires and Cables – 600Vs and Below.

2.10 FIBER OPTIC CABLE ACCESSORIES

A. Fiber Connectors

1. Features

- a. In accordance with requirements of TIA/EIA 568, Section 12.4.3 or Annex F.
- b. SC and ST connectors with 12.7 millimeter spacing between ferrules.
- c. Pull Strength: 0.2 N minimum.
- d. Durability: Sustain minimum 500 mating cycles without violating other requirements.
  - (1) Ferrules: Free-floating low loss ceramic.
  - (2) Polarizing key on duplex connector systems.

2. Attenuation

- a. In accordance with requirements of TIA/EIA 568, Section 12.4.4.
- b. Maximum of 0.75 dB per connector pair.

3. Manufacturer: Ortronics, or approved equal.

B. Fiber Jumper Cables

1. In accordance with requirements of TIA/EIA 568, Section 12.5.

2. Function: To connect from fiber centers to network nodes, such as computer workstations.

3. Fiber Characteristics: In accordance with requirements for fiber optic cable.

4. Cable Configuration

- a. Individual tight-buffer thermoplastic, fibers single mode, to match fibers being jumpered.
- b. Protected with kevlar strength members and enclosed in thermoplastic jacket.

5. Length: Standard, to meet requirements shown, plus minimum 3 meters at workstations.

6. Connectors

- a. As required by Article Connectors
- b. On-axial Pull Strength: 33 N
- c. Normal-to-Axial Pull Strength: 22 N

2.11 STANDARD SOFTWARE

A. The following standard software will be supplied by the PICS System Integrator for installation by the Owner's control system programmer for use on the project:

- 1. Hirschmann Industrial HiVision – 100 Nodes Network Configuration, or approved equal. Software: One Copy.

2.12 RACEWAY SYSTEM

A. A complete raceway system shall be provided for telecommunications in accordance with riser diagrams shown meeting the requirements of Section 16130 - Electrical Raceway Systems.

B. Empty conduits shall be provided with pull wire to facilitate pulling of cables.

2.13 VOICE AND DATA OUTLETS

- A. All outlets shall be in accordance with the communication standard EIA/TIA-568B.
- B. Each outlet shall have one (1) Voice Cable and one (1) Data Cable terminated on the station side as follows:
  - 1. Four (4) RJ45 Jacks that together fit a Single Gang Opening with two (2) white receptacles (voice) for Category 6 wire (gray) and two (2) orange receptacles (data) for the Category 6 (blue) wire.
- C. Each hardwire telephone shall be connected to the telephone backboard with yellow coded jacket to distinguish it from the standard telephone connection.

2.14 CABLING

- A. Cabling between voice/data outlets and distribution racks shall meet the requirements for voice and data cable in Sections 16121 - Wire and Cable - 600 Volts and Below.
- B. All Category 6 cabling shall be in full compliance with EIA/TIA-568B Commercial Building Telecommunications Standard and EIA/TIA-569B Commercial Building Standard for Telecommunications Pathways and Spaces.
- C. Category 6 Cable Connecting Hardware: Comply with TIA/EIA-568-B.2, IDC type, using modules designed for punch-down caps or tools.
  - 1. Terminal Block Modules: Integral with connector bodies, including plugs and jacks where indicated.
  - 2. IDC Connecting Hardware: Consistent throughout project.
- D. Category 6 Patch Cords shall be factory-made, four-pair cables in 48-inch (1200-mm) lengths terminated with RJ-45 plug at each end. Use keyed plugs for data service.

2.15 GROUNDING AND BONDING

- A. Comply with NFPA 70, TIA/EIA-607 and UL 467.

## PART 3 EXECUTION

### 3.01 PREPARATION

A. Ensure that installed conduit system conforms to fiber optic system requirements, including:

1. Conduits: Size and number.
2. Access Holes, Handholes, and Pull Boxes: Location and size, to ensure cables and innerducts can be installed without exceeding manufacturer's limitations.
3. Outlet Boxes: Size to coordinate with outlet cover plates for adequate volume and bend radius.

B. Fiber Optic Cable

1. Installation by manufacturer certified installer
2. Install cables in accordance with manufacturer's requirements.
3. Install cable directly from shipping reels. Ensure that cable is not:
  - a. Dented, nicked, or kinked
  - b. Subjected to pull stress greater, or bend radius less, than manufacturer's specification
  - c. Subjected to treatment that may damage fiber strands during installation
4. If calculation indicates that cable will attenuate signals more than 8 dB, reroute may be allowed, if approved by Construction Manager.
5. Splices: None. Install fiber optic cables in unspliced lengths between fiber patch panels.
6. Identification: Identify cable on both ends and in access holes and pull points it goes through.

C. Cable Terminations

1. Terminate cables in accordance with TIA/EIA 568.
2. Fan out fiber cable to allow direct connectorization of connectors. Sleeve over individual fibers with transparent furcation tubes. At point of

convergence of furcation tubes, provide strain relief with metal or high density plastic fan-out collar.

3. Break-Out Kits

- a. Terminate cables using manufacturer-supplied break-out kits.
- b. Terminate in accordance with manufacturer's recommendations.

4. Slack

- a. Fiber Centers, Hubs, and Switches: Minimum, 3-meter slack fiber at each end, coiled neatly in cable management equipment.
- b. Communications Management Outlets: Minimum, 1-meter slack fiber, coiled neatly in outlet box.

5. Connectors

- a. Terminate 100 percent of fibers in each cable to specified connectors.
- b. Connect into fiber management system.

3.02 FIELD QUALITY CONTROL

- A. Provide equipment, instrumentation, supplies, and skilled staff necessary to perform testing. Construction Manager shall have the option to witness and participate actively in onsite tests. Advise Construction Manager at least 24 hours in advance of each test.
- B. Preinstallation Testing: To ensure that fibers conform to manufacturer's attenuation specifications and that no damage occurred to cable during shipping.
  - 1. Prior to physical placement of fiber optic cable, test each fiber while on cable spool.
  - 2. Use OTDR at wave length of 850 nm.
  - 3. Test Documentation: Hard copy of OTDR plots for each fiber.
- C. Post-Installation Testing
  - 1. After termination test all fibers. Test from Operations Building fiber optic patch panels to each end device to determine losses.
  - 2. Test in single direction with OTDR at wave lengths of 850 nm and 1,300 nm.
  - 3. Test bi-directionally with power meter and light source at wave lengths of 850 nm and 1,300 nm to determine loss.

4. All outlets shall be tested using specialized testing equipment. Record the results and turn over to City of New York.
5. Test Documentation: For each fiber:
  - a. Hard copy of OTDR plots
  - b. Results of bi-directional test with power meter and light source
  - c. A letter of certification stating compliance with EIA/TIA-568 shall be furnished along with a written report showing test results on all tested parameters.

D. Communications Infrastructure Test (CIT)

1. Test the Ethernet LAN portion of the Local Area Network by "pinging" all Ethernet nodes from an operator workstation located in the Operations Building.
2. Test Documentation: Test procedures, forms, and checklists shall be signed by the Construction Manager.

3.03 INSTALLATION

- A. General: Install telephone system as shown or required. Comply with requirements of the NYCBC, NEC and local electrical codes.
- B. Install communication outlets, conduit systems wiring, and plywood mounting panels as indicated, in accordance with the drawings and with recognized industry practices.
- C. Install Uninterruptable Power System in telephone and data system provider main terminal room.
- D. All telephone and data wire or cable shall be installed in raceway that complies with the requirements of Division 16 Section "Electric Raceway System."

3.04 LABELING

- A. All Communication Outlets, Patch Panels, Terminal Blocks are to be machine labeled in contrasting colors with a unique location number and the designation (voice or data).
- B. Each cable shall be identified on both ends using wire tags. The cable shall have 18" excess length on the communication outlet side and 36" excess at the terminal board side.
- C. Handwritten labels are not acceptable.

3.05 SEPARATION FROM EMI SOURCES

- A. Comply with BICSI TDM and TIA/EIA-569-A recommendations for minimum separation between communication cables and potential EMI sources.

3.06 TESTING

- A. At the completion of the cabling installation, all outlets shall be tested using specialized testing equipment.
- B. A letter of certification stating compliance with EIA/TIA-568 shall be furnished along with a written report showing test results on all tested parameters.

3.07 TERMINATIONS

- A. All Voice and Data Cables shall be terminated as follows:
  - 1. Voice Cables shall be terminated in Category 6 cable compliant 110 position block. All pairs shall be cut down and terminated.
  - 2. Data Cables shall be terminated in Category 6 compliant Patch Panel. Spare capacity of 20 percent shall be provided.

3.08 EXAMINATION

- A. Examine areas and conditions under which telephone conduit systems and plywood mounting panels are to be installed. Correct conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Resident Engineer.

-END OF SECTION-

**Southwest Brooklyn Marine Transfer Station**

**FMS No. S216-399A**

NO TEXT ON THIS PAGE

**Section 16751**  
**ACCESS CONTROL SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Furnish a complete access control system. The system shall include all necessary workstations, software, card reader, power supplies, door position switches, conduit, cable and accessories for a complete operational access control system.
- B. The access control system provided under this Contract must be compatible with the proximity cards and card readers located at other City of New York Transfer Stations.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01821 – Training
- B. Section 08711 – Door Hardware
- C. Section 13851 – Fire Alarm and Detection System
- D. Section 16050 - Basic Electrical Materials and Methods
- E. Section 16121 - Wires and Cables - 600 Volts and Below
- F. Section 16130 - Electrical Raceway Systems

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NEC - National Electrical Code
  - 2. NYCBC – New York City Building Code
  - 3. UL 294 - Standard for Access Control System Units

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Section 01330 – Shop Drawings and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data on all equipment and devices in the assembly, including voltages, number of phases, current ratings, capacities and other relevant data.
- C. Shop Drawings: Furnish shop drawings for the access control system including the following:
  - 1. Furnish wiring diagrams for assemblies that show connections to electrical power. Clearly differentiate between shop-installed portions of wiring and field installed portions. Wiring diagrams shall be specific for this project.

2. A manufacturer's standard connection diagram or schematic showing more than one method of connection is not acceptable unless the intended method is clearly identified.
3. Furnish system diagrams showing interconnections between different pieces of equipment. Clearly differentiate between shop-installed portions of wiring and field installed portions.
4. Furnish front elevations of panels and racks showing space allocation of equipment.

#### 1.05 REFERENCE ABBREVIATIONS

- A. This specifications references abbreviations in accordance with the following list:

1. ACS - Access Control System
2. ODBC - Open Database Connectivity
3. RDBMS - Relational Database Management System
4. ICS - Intelligent System Controller
5. ICM - Input Control Module
6. OCM - Output Control Module
7. SRI - Single Reader Interface Module (SRI)

#### 1.06 SYSTEM DESCRIPTION

- A. General: The access control system (ACS) shall provide a number of functions including the ability to regulate access through specific doors and gates to secured areas of the City's facility and provide computer generated color employee credentials for that use. The ACS shall utilize a single seamlessly integrated relational database for all functionality. This integration shall be provided with one operating environment. The ACS software shall integrate all functions (access control, alarm monitoring, ID Management, etc.) into a single program.
- B. The Intelligent Access Control System shall allow the configuration an alarm monitoring server, and an integrated workstation, which can control all functions. The System shall be expandable to support up to 5 individual module or integrated workstations. All access control field hardware shall be connected to the integrated workstation.
- C. The alarm monitoring client workstation shall be able to connect to, and monitor, field hardware devices. Administrative tasks including defining access groups, time zones, generating reports, creating floor plans, etc. shall be provided from any server on the network that is licensed to do so. The integrated server shall allow for any combination of functions of the ACS to be available from the single client workstation. All ACS data shall reside on a single database on the network and shall be accessible in real time to every / any ACS workstation connected to the network. This shall allow for automatic change propagation to all client

workstations on the ACS as well as a common database to consolidate all information and allow for better disaster recovery.

- D. System shall be capable of incorporating existing proximity access control cards from other City of New York facilities provided by HID Corporation.
- E. The System shall be designed to perform a wide variety of feature rich functions as part of a Total Security Knowledge Management Solution. These ACS functions are categorized into primary "system modules" which shall include, but not be limited to:
  - 1. Access Control: The ACS shall grant or deny access, define access levels, and set time zones and holidays. The ACS shall support features such as area control (two man control, hard, soft, and timed anti-passback), database segmentation, and time zone/holiday overrides.
  - 2. Alarm Monitoring: The ACS shall be used for alarm monitoring. Alarms are to be prioritized and displayed on the main alarm monitoring window which provides information about the time, location of the alarm and priority. The main alarm monitoring window shall allow sorting of any field. The ACS shall allow unique emergency instructions to be specified for each type of alarm such as automatic sending of alphanumeric pages or e-mail messages upon alarm arrival.
  - 3. Credential Management: The ACS shall include a seamlessly integrated ID management module. The ID management functionality shall allow the enrollment of cardholders into the database, capturing of images and signatures, and import/export of employee data. This functionality shall also allow the System Operator to assign and/or modify the access rights of a cardholder.
  - 4. System Administrative tasks such as defining permissions set-up, access groups, time zones, reports, etc. shall be provided from any workstation on the network.
  - 5. Badge Layout Creation and Editing: The access control system shall provide a badge layout creation and editing module to allow for the creation of custom badge designs to be created by the City. The system shall support credit card, government, and custom ID card sizes in either a landscape or portrait format and shall support double sided and edge to edge printing.
  - 6. Screens/Forms Creation: Provide a forms designing and editing module that gives City the ability to modify any standard field to customize the cardholder forms as desired.
  - 7. Graphical Floor Plan Creation: The system shall provide graphical floor plan creation and editing software that allows the System Administrators to

import or customized floor plans of the facility and to attach custom icons to those plans.

8. Data Import: Provide an import utility that will allow the City to import cardholder information into the ACS database.

- a. Bi-Directional Data Exchange

- (1) The system shall support a real time, bi-directional data interface to external databases. The interface shall allow data to be imported into or exported out of the system in real time or in a batch mode basis. Data used for import shall be retrieved directly from an external database or through an import file. Data provided for export shall be applied directly to an external database or through an export file. Any data shall be imported or exported including image data. The file used for import or created by export shall have the ability to be structured in a wide variety of ways, but shall always be in ASCII text format.
- (2) The system shall also support a one step download and distribution process of cardholder and security information from the external database to the system database, all the way down to the Intelligent Field Controller (ISC) database. This shall be a guaranteed process, even if the communication path between the system database server and the ISC is broken. If the communication path is broken, the data shall be stored in a temporary queue and shall be automatically downloaded once the communication path is restored.

## 1.07 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience with service facilities within 100 miles of Project.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.

## 1.08 REGULATORY REQUIREMENTS

- A. Furnish products listed and classified by UL or testing firm acceptable to authority having jurisdiction as suitable for purpose specified and indicated.

## 1.09 WARRANTY

- A. Furnish a written 2-year minimum warranty for software, programming parts and labor from the access control system manufacturer.

## 1.10 SPARE PARTS

- A. Furnish the following spare parts:
  - 1. Twenty percent but not less than four, of each type of proximity card reader
  - 2. Twenty percent but not less than two, of each type of power supply
  - 3. Two hundred blank proximity access cards
- B. Packaging: Plainly tag and mark spare parts for identification and for reordering and properly box and wrap spare parts to prevent deterioration. Completely identify the box on the outside.

## PART 2 PRODUCTS

## 2.01 MANUFACTURERS

- A. Standard of Quality and General Configuration: Use of manufacturer's name and model or catalog number is for the purpose of establishing the desired characteristics.
- B. Acceptable manufacturers are listed below.
  - 1. Access Control System
    - a. GENETEC Inc. – Synergis
    - b. S2 Security
    - c. Or approved equal

## 2.02 ACCESS SYSTEM

- A. General Requirements
  - 1. Source Code Set: All application modules, features, and functions from a single source code set using object-oriented software development techniques and compiled applications. The software has to be the product of a single manufacturer.
  - 2. All system features and functionality listed herein shall ship with each system and be provided on a CD.
  - 3. Licensing: The City shall be provided with as many a software licenses as required to allow full use of the access control system.
  - 4. Open Architecture: The access control system shall have an open architecture design and support industry standards for databases, networks, ID card printers, and video cameras. No customized or proprietary ID badge

creation software or hardware shall be required to operate the access control system.

5. Open Database Connectivity Compliance (ODBC): The access control system shall support a relational database management system with the proper drivers. The database shall be equal to MSDE 2000 and Microsoft SQL Server 2000.
6. Network Support: The access control system shall be designed to support, without limitation, the following industry standard network protocol and topology:
  - a. TCP/IP
  - b. Microsoft LAN Manager (NerBUI)
  - c. NFS Networks
7. Video Input Support
  - a. The system shall support any industry standard video input source that utilizes a Red/Green/Blue (RGB), Composite, or S-Video signal. The system shall allow cardholder photos to be taken from any one of the live video signals listed above or to be scanned in using any industry standard scanning device that utilizes an industry standard TWAIN interface.
  - b. System support for other methods of inputting a cardholder's photo, such as through the use of an industry standard digital camera with an industry standard TWAIN interface, or by importing a photo from any industry standard image file format, shall also be available.
8. The system shall be designed to support any industry standard thermal dye transfer ID card printer.
9. Easy to Use, Graphical User Interface: The access control system shall support a user friendly, Windows graphical user interface and shall be intuitive. All messages and interface text shall be in English prose. All functions shall be either keyboard or mouse driven to allow the System Operators to choose the method of navigating through the screens
10. Application Installation: The access control system shall support a simplified installation procedure using Installation Wizards. The access control system shall automatically detect previous versions installed on the client workstations for fast and efficient upgrade installations.
11. Multimedia Integration: The access control system shall extensively integrate and utilize multimedia.

12. Remote Access Services (RAS): The operating system shall support full remote diagnostics abilities through its remote access services. Full network functionality shall be available over remote links using TCP/IP protocols.
13. Security: Local security shall be available through User ID and required password log-on. The operating system shall also offer government C-2 level certifiable security.
14. Remote Intrusion and Trouble Alarms: Provide the following intrusion and trouble alarms for remote indication:
  - a. Provide a normally open dry contact that closes when any system failure alarm occurs to activate a "Trouble Alarm" at SCADA.
  - b. Provide a normally open dry contact that closes when the any system intrusion alarm occurs to activate an "Intrusion Alarm" at SCADA.

B. Client/Server Relational Database Management Systems

1. Open Database Connectivity (ODBC), shall be true client/server, high performance, and ANSI standard capable of handling high transaction rates and multiple users concurrently accessing and modifying the database. The access control system's RDBMS shall preserve data integrity in the following ways:
2. Transaction Processing: Transaction processing guarantees the consistency and recoverability of the RDBMS. Transaction processing shall assure that all transactions are performed as a single unit of work, even in the presence of a hardware or general failure.
3. Enforced Data Integrity: The RDBMS shall enforce data integrity within the database itself, guaranteeing that complex business policies will be followed. "Referential Integrity" maintains consistency between multiple tables of a database. The RDBMS shall use data integrity features such as data types, defaults, and rules to enforce data integrity. Stored procedures and triggers shall also be used to insure the integrity and security of data.
4. User-Defined Data Types: The RDBMS shall utilize data types, which provide the simplest form of data integrity by restricting what kinds of information stored.
5. Defaults: The RDBMS shall utilize defaults, which allow specify values to be inserted, if no explicit field value is entered.
6. Rules: The RDBMS shall enforce rules, which are integrity constraints. The RDBMS shall check the value against any rule that has been created for the

specified field. The RDBMS shall also provide stored procedures and triggers as follows.

- a. **Stored Procedures:** Stored procedures increase data integrity by checking command syntax to see if it makes sense and checking to see if the requester has the permissions necessary to execute the command.
- b. **Triggers:** Triggers are associated with particular pieces of data and are automatically initiated whenever attempts to modify that data are made.
- c. **Alarm Routing:** Provide capability of routing any alarm in the system to any workstation.

### C. Functional And Operational Requirements

1. **General:** The design of the access control system shall include devices and equipment to monitor and control access of cardholders to restricted areas, detect and deny unauthorized attempted entries within specific areas, annunciate alarms, and generate reports. The access control system shall also include devices and equipment to detect 'changes of state' of dry contacts for alarm points. The access control system shall also include ID management and badging capabilities for generating and managing ID badges for cardholders.
2. **Customer Responsibilities:** The system suppliers shall configure access control system, as well as creating floor plans.
3. **Operational Concept:** The access control system shall consist of equipment and devices placed at predetermined locations to ensure that only cardholders authorized to enter secured areas through certain doors or gates can do so. This shall be accomplished by means of a computer(s) and electronic devices used in conjunction with door locks, gate operators, card readers.
4. The employee data screen shall contain at a minimum 20 data entry fields of information that will include, but not be limited to, the following:
  - a. Name: Last Name, First Name, Middle Initial
  - b. Address
  - c. Home Phone
  - d. Employee ID Number
  - e. Title
  - f. Cardholder Number
  - g. Department
5. As a fundamental operation, the system shall provide a seamlessly integrated link between the ID Management and Access Control & Alarm Monitoring

functionality. This will allow specific information concerning cardholders to be automatically downloaded to all Intelligent System Controllers and to be shared by both the access control and ID management modules utilizing a single database, thus enabling the system to grant or deny access to card reader controlled access points. This is to be provided under a single operating environment.

- D. **System Capacities:** The access control system shall support up to 64 card readers. The database shall support an unlimited number of cardholders. The database server shall also support an unlimited number of access events and system operator transactions in the history file. The access control system shall support up to five (5) client workstations. A fully loaded system shall guarantee a one half-second response time for access granted/denied decisions from the time that a cardholder swipes his/her badge.
- E. **Access Control and Time Zones**
1. **Time Zones:** The system shall be capable of creating and storing up to two hundred fifty five (255) time zones. Each time zone shall have a minimum of six (6) intervals. Each interval shall be assignable to any day of the week and capable of being restricted on a minimum of eight (8) types of holidays. Time zones shall be assigned an alphanumeric name using up to 32 characters and shall act as templates to be applied to access levels, card reader modes, alarm inputs, alarm outputs, and alarm masking and logging functions.
  2. **Access Levels:** Standard and temporary access levels shall be as follows:
    - a. All cardholders shall have a minimum of 255 standard and temporary access levels based on facility, card reader, time, and day. .
    - b. The access control system shall define access levels which shall be assigned an alphanumeric name which combine card readers and time zones. Card readers shall have the ability to be assigned to any or all access levels defined in the access control system. As such, an access level can consist of any or all card readers in the system. Time zones shall be allowed to belong to any or all access levels so that the time zone only has to be defined once.
    - c. Access levels shall be able to consist of multiple card reader assignments; each card reader shall be capable of having a distinct time zone assigned.
  3. **Temporary Access Levels:** The ACS shall allow temporary access levels to be defined that combine card readers, activation date, deactivation date and time zones. Card readers shall have the ability to be assigned to all temporary

access levels and a temporary access level can consist of all card readers in the ACS.

4. Access Groups: Access Groups shall be assigned an alphanumeric name and shall allow grouping of access levels together for ease of assignment of access levels to cardholders.
5. Precision Access Levels: Provide precision access levels in addition to the 255 standard and temporary access levels.
6. Inclusion Access Levels: Provide inclusion access levels to offer the ability to assign unique inclusion access level groups (card reader/time zone combinations) for each individual cardholder, in addition to the cardholder's thirty two standard access levels.
7. Holidays and Daylight Savings Time: The access control system shall include a calendar that includes the standard holidays and daylight savings times shall automatically take effect without user intervention. The calendar shall support a minimum of one hundred (100) years beyond the current date. The designation of additional holidays shall be definable. In addition there shall be support for holiday ranges that allow a single holiday to span across multiple calendar days.
8. Field Hardware Communications
  - a. The access control system shall communicate with the field devices by either RS-485 or RS-232 EIA standard.
  - b. The ACS software shall take full advantage of its multi-tasking capabilities, allowing downloads of cardholder data and any ISC information to take place while monitoring and receiving alarms from the field hardware. Downloading database changes shall not interfere with any output control, access decisions, alarm monitoring, traces, or any other required function of the field hardware and alarm monitoring client workstation.
  - c. Upon losing and then restoring communications between the ISC and the ACS database and the local database in each ISC shall be fast and efficient. Every change made to the ISC database shall establish a time/date stamp for the change. When communications are restored, database synchronization shall occur immediately and without System Operator intervention.
9. Multi-Drop Panel Support: The access control system shall support a multi-drop architecture whereby up to eight field devices can be connected on a single RS-485 communications line and all eight panels communicate back to a single serial communications port via a RS232 to RS-485 converter

attached to the workstation. The multi-drop panel support shall be used in conjunction with other wiring support such as the star wiring configuration, home-run wire architecture, and advanced distributed network architecture.

10. Field Hardware Configuration: All field hardware configuration windows shall be accessed from either icon toolbar or from menu options in the menu bar within the configuration module of the software. When a field hardware device is configured, it shall appear in the graphical system overview tree and in all appropriate forms.
11. Alarm Masking Groups: The group alarm masking feature allows creation of groups of alarm inputs to mask or unmask multiple input control module inputs and card reader inputs simultaneously. The following events shall have the ability to be part of an alarm masking group:
  - a. Input Control Module Events
    - (1) Alarm Input Active
  - b. Card Reader Events
    - (1) Auxiliary Input Active
    - (2) Denied Count Exceeded
    - (3) Door Contact Tamper
    - (4) Door Forced Open
    - (5) Door Held Open
    - (6) Card Reader Input Tamper
12. Cardholder Use Limits: A cardholder use limit feature shall be provided to set the maximum number of times that a cardholder may use his or her ID card at card readers.
13. Extended Individual Strike Times: The extended individual strike times allows a card reader's strike to be active for an extended period of time beyond the pre-determined standard strike time on a per cardholder basis. The extended strike time shall be user definable up to 255 seconds.
14. Extended Individual Door Held Open Times: The extended individual door held open times that allows a card reader's door to be held open for an extended period of time beyond the pre-determined standard held open time on a per cardholder basis. The extended held open time shall be user definable up to 255 seconds.
15. Graphical System Overview Tree: A graphical system overview tree shall be available to depict a graphical representation of all access control field hardware, access levels, time zones, access groups, holidays, and card formats that have been configured in the access control system.

16. Pre-Alarm: A pre-alarm at the card readers in the field will sound a tone at the card reader after a valid access has been granted and then the door contact opens. If the door does not close within an adjustable 255 seconds after the pre-alarm sounds, a 'door held open' alarm shall be generated and sent to the appropriate alarm monitoring workstations
17. Alarm/Event Logging: All alarms and events in the access control system shall by default log to the database that shall be used for reporting and back-up capabilities.
18. Scheduling Utility: The scheduling utility shall allow scheduling actions to occur on a one-time or a recurring basis. Recurring schedules shall be configured to begin immediately, last indefinitely, or have optional start and end dates.
19. On-Line Contact Sensitive Help: Provide on-line contact sensitive help files to guide in the configuration and operation of the access control system. The help menu shall be available from any window in the access control system by pressing the F1 function key or clicking on the Help icon in the toolbar. Help windows shall be contact sensitive so you can move from form to form without leaving the help window. Standard Windows help commands for Contents, Search, Back, and Print shall also be available. The system shall also come with complete on-line documentation on CD.
20. Monitor Zones: The access control system shall provide the ability to segment access control system field hardware devices into various zones or areas of which alarm monitoring workstations will monitor. These zones shall be assigned an alphanumeric name and shall consist of one or more access panels, card readers, alarm panels, alarm inputs, alarm outputs, along with any associated alarm/event/time zone associations. These zones shall then be assigned to the alarm monitoring workstations that will monitor the assigned areas.
21. Alarm/Event Routing: The access control system shall be capable of routing alarms and events to various alarm monitoring workstations on the network.
22. Text Instructions: A set of text instructions to be associated with each alarm that arrives into the access control system shall be provided.
23. Alarm Attributes: The access control system shall have the capability to configure how it handles the annunciation of alarms on an individual basis. Each alarm and/or event shall have the following options:
  - a. Display at one or more alarm monitoring workstation.
  - b. Allow higher priority alarms to be displayed on the alarm monitoring workstation ahead of lower priority alarms.

- c. Require the field device, which generated the alarm to be restored to its normal state before the alarm, shall be cleared from the alarm monitoring window.
  - d. Have the alarm breakthrough to the alarm monitoring window when another application on the alarm monitoring workstation becomes active.
  - e. Require that the alarm not be deleted from the alarm monitoring window upon acknowledgment.
  - f. Display text outlining the procedures to follow when responding to the alarm.
  - g. Require a password to be entered to acknowledge the alarm.
  - h. Require acknowledgment to clear.
  - i. Allow mandatory journal entry upon acknowledgment.
  - j. Have pre-defined "canned" journal entries for alarms in the access control system.
  - k. Have the alarm appear on the alarm monitoring window with a flashing colored bar across the alarm for high priority alarms. Each priority shall have its own unique color assigned to it. A minimum of 255 colors shall be available for assignment to a minimum of 255 priority levels.
  - l. Have the alarm, when acknowledged, display a different flashing colored bar across the alarm than for the original alarm color. Each acknowledged priority shall have its own unique color assigned to it. A minimum of 255 colors shall be available for assignment to a minimum of 255 priority levels.
24. System Downloads: After configuring field hardware devices, all the database information shall be downloadable.
25. Card Reader Options: The access control system shall have the ability to set the following options for each card reader:
- a. Allow User Commands: This feature shall allow keypad functions to be performed at the card reader's keypad.
  - b. Rename Auxiliary Inputs: This feature shall allow renaming the card reader's auxiliary inputs.

- c. Rename Auxiliary Outputs: This feature shall allow renaming the card reader's auxiliary outputs.
  - d. Activate Outputs: - This feature will allow activation of auxiliary outputs attached to the card reader on a time zone basis.
- 26. Input Control Module Options: The access control system shall have the ability to set the options for each input or output configured on the Input Control Modules.
  - 27. Alarm Handling: The System Operator shall be able to select alarm/events by clicking on it with the mouse.
  - 28. Current Status Indication: The alarm monitoring window shall display the current status of alarms, card readers, ISCs and ICMs.
  - 29. Cardholder Record Call-up: The System Operator shall be able to display a cardholder record with the stored cardholder's image. This feature shall be user configurable to be automatic.
  - 30. Cardholder, Card Reader, or any Field Hardware Device Trace: The access control system shall be able to initiate several traces of cardholders, and/or field hardware devices while monitoring alarms.
  - 31. 'On the Fly' New Login of System Operators: The access control system shall allow a new operator to login over another operator who is already logged into the same workstation.
  - 32. Test Mode: The access control system shall support a Test Mode. The access control system shall be able to perform tests on input device groups, door forced open and access grants to verify that all equipment and programming are operational.
  - 33. Manual Control: From the alarm monitoring window, the access control system shall have the ability to dictate manual control of all output points or input points connected to the access control system. Control points are defined as any door strike, auxiliary card reader output, or any other relay output points.
  - 34. Real-Time, Dynamic Floor Plans: The ASC shall support real time floor plans that shall be appear in the alarm monitoring workstation either on command or when specified alarms are selected for acknowledgment.
  - 35. Manual Override of Card Readers: The ACS shall allow the System Operator to override card readers and shall be able to manually open a door from the alarm monitoring window, the floor plan. In addition, the System

Operator or based on schedule can set a door to be left unlocked to allow easier access during normal working hours.

36. Hardware Update Timer: A hardware update timer sets how often system status updates take place. These updates are reflected in the status bar and the real-time graphical system status tree. This frequency shall be defined in one-minute increments and shall be changed 'on the fly'.

F. Enrollment and Badge Creation

1. Enrollment: The access control system shall be able to enroll cardholders on a one by one basis. The enrollment system shall include the following attributes:
  - a. Name
  - b. Badge Type
  - c. Image
  - d. Deactivation Date
  - e. Access Levels
  - f. Badge Design Layout
  - g. Information to be Encoded onto the Magnetic Stripe on the back of the badge.
2. Image Capture from a Live Video Source: The Enrollment & Badging workstation shall include all equipment required to capture a high quality image with flash lighting at a minimum resolution of 1024 x 968.
3. Image Import: The access control system shall have the ability to import and modify a cardholder's image from, but not limited to the following image formats:
  - a. Bitmaps (.bmp, .dib)
  - b. JPEG (.jpg)
  - c. TIFF (.tif)
  - d. Windows Metafile (.wmf)
  - e. Adobe Photoshop (.psd)
  - f. Kodak Photo CD (.pcd)
4. Chromakey: The access control system shall support an advanced chromakey feature, which has the ability to remove the color that resides in the top left corner of the crop window, or remove the color. A tolerance setting shall be available for fine tuning images of cardholders whose shirt, hair, etc. is close to the color of the background.
5. Signature Capture: The access control system shall have the ability to capture a cardholder's signature.

6. In-line Magnetic Stripe Encoding: Utilizing a magnetic stripe encoding device, the access control system shall allow for magnetic stripe encoding of all its permanent credentials. This magnetic stripe shall conform to ABA Track II and ANSI specifications.
7. Access Control Reports: The ACS shall provide standard ACS reports that are stored in the ACS database.

## 2.03 SYSTEM WORKSTATION & PERIPHERAL REQUIREMENTS

- A. Provide a dedicated server for hosting access control system and workstations for City of New York's PC's. Access control systems servers and workstations having following minimum features:
  1. Processor: Dual Core Intel Xeon 5110 (1.60GHz, 1066MHz FSB 4MB Cache)
  2. Memory: 2GB of SDRAM
  3. Monitor: 17-inch Rack mountable LCD
  4. Hard Drive: 73GB 15K RPS SCSI hard drive
  5. Network Card: Dual 10/ 100/ 1000 Ethernet Communication
  6. 48X IDE CD-RW/DVD
  7. Digital Tape Backup System
  8. Pullout Keyboard and trackball
  9. Graphics accelerator Card
  10. Documentation: Provide all documentation, manuals and licenses
  11. Safety/Regulatory: UL, FCC B, approved
  12. Latest revision of software at time of bid required:
    - a. Windows XP Professional or approved equal
    - b. Microsoft Office Professional or approved equal
    - c. McAfee Virus Scan or approved equal
  13. Operator's Software: Provide access control system operator's software.
- B. Dedicated Server
- C. WorkStation
  1. Processor: Intel Core 2 Duo Processor E6300(1.86GHz, 2M, 1066MHz FSB)
  2. Memory: 2GB of SDRAM
  3. Monitor:
    - a. LCD Type: 19-inch TFT active matrix
    - b. Video Input Signal: Analog RGB and digital DVI-D
    - c. Pixel Pitch: No greater than 0.294 mm
    - d. Viewing Angle: 85 degrees nominal
    - e. Contract Ratio: 600:1

- f. Brightness: 250 nits
  - g. Prime Mode: 1280 x 1024 (SXGA)
  - h. Mounting: VESA-compliant adapter plate)
- 4. Graphics accelerator card
- 5. Hard Drive: 80 GB minimum
- 6. Floppy Drive: 3.5", 1.44 MB diskette
- 7. CDRW: 40X
- 8. Digital Tape Backup System
- 9. Mouse: Microsoft System Intellimouse
- 10. Network Card: 3 Com 3C905 Fast Etherlink XL 10/100 PCI Network Interface
- 11. Keyboard: 104+ keys
- 12. Documentation: Provide all documentation, manuals and licenses
- 13. Safety/Regulatory: UL, FCC B, approved
- 14. Latest revision of software at time of bid required:
  - a. Windows XP Professional or approved equal
  - b. Microsoft Office Professional or approved equal
  - c. McAfee Virus Scan or approved equal
- 15. Operator's Software: Provide access control system operator's software.
- D. Provide an ID badge printer which supports double-sided full color printing. The printer shall also support edge to edge printing.
- E. RAID Level 5: The access control system shall offer a Fault Tolerant Redundant Array of Independent Disks Level 5 (RAID Level 5). RAID 5 stripes both data and parity information across three or more drives. It exchanges the dedicated parity drive for a distributed parity algorithm, writing data and parity blocks across all the drives in the array.

## 2.04 ACCESS CONTROL FIELD HARDWARE DEVICES

- A. General: The ACS shall be equipped with the access control field hardware required to receive alarms and administer all access granted/denied decisions. All field hardware shall be designed to meet UL requirements. Depending upon the configuration, the ACS field hardware shall be able to include any or all of the following components:
  - 1. Intelligent System Controller (ISC): An Intelligent System Controller (ISC) shall link the Total Security Knowledge Management Solutions Software to all other field hardware components (Card Readers and Input Control Modules). The ISC shall provide full distributed processing of access control & alarm monitoring operations. Access levels, hardware configurations, and programmed alarm outputs assigned at the administration workstation shall be downloaded to the ISC, which shall store this information and function.

All access granted/denied decisions shall be made at the ISC to provide fast responses to card reader transactions. A fully configured ISC with 32 card readers shall require less than one-half (0.5) seconds to grant access to an authorized cardholder or deny access to an unauthorized cardholder. The ISC shall contain the following features:

- a. UL 294 and CE Certified
- b. Support for Direct Connect, Remote Dial Up, or Local Area Network (LAN) Connection
- c. Support for up to 512K of On-Board Memory
- d. LAN Support shall utilize RJ45 (10/100baseT) Ethernet Interface
- e. Flash Memory for real time program updates and overall host communications
- f. Memory storage of up to 5,000 cardholders/100,000 events
- g. Downstream ports shall be for connecting card readers and data gathering panels via RS-485 multi-drop wiring configuration
- h. Support of multiple card technologies
- i. Supervised Communications between ISC and access control system Software
- j. Support of up to eight card formats and facility codes
- k. RS-485 Full Duplex, communication channel to the access control system head-end
- l. Integration to other manufacturer's card readers
- m. Uninterruptible Power Supply (UPS) with battery backup (20 Minute Minimum)
- n. 12 VAC or 12 VDC input power
- o. Issue Code Support for Wiegand Card Format
- p. Individual Shunt Times (ADA Requirement)
- q. Up to Nine Digit PIN Codes

- r. Downstream serial RS-232 device support
  - s. Status LEDs for normal component and communication status
2. Input Control Module (ICM): The Input Control Module shall monitor all Grades A, B and AA alarm inputs.
- a. The Input Control Modules shall also be able to operate independently and in conjunction with Output Control Modules (OCM), which will send an output signal to a corresponding output device upon alarm input activation. Once an alarm has been received, the Input Control Module shall activate any or all alarm outputs within the Output Control Module. The Output Control Module shall provide 16 Form C outputs rated at 5 A @ 30 VDC. Upon an alarm input from the Input Control Module, the Output Control Module shall transmit an activating signal to a corresponding output device.
  - b. Up to 8 ICMs shall be connected to an available ISC using RS-485 cabling. Diagnostic LEDs shall indicate ISC communication, input zone scanning, and Input Control Module heartbeat.
  - c. The ICM shall contain the following features:
    - (1) UL 294 and CE Certified
    - (2) Alarm contact status scanning at up to 180 times per second for each zone
    - (3) Configuration DIP switches to assign unit addresses and communications speed.
    - (4) A low power CMOS microprocessor
    - (5) Filtered data for noise rejection to prevent false alarms
    - (6) Up to 16 Grade B, A, or AA Supervised Inputs in any Combination
    - (7) 12 VAC or 12 VDC Input Power
    - (8) 2 Form C Contacts for load switching
    - (9) 2 dedicated inputs for tamper and power status

### 3. Output Control Module (OCM)

- a. The Output Control Module shall incorporate 16 Output Relays that are capable of controlling a corresponding output device upon any input activation or on command from the system.
- b. Output relays shall be capable of responding to:
  - (1) Input alarms from a within the same ISC
  - (2) Commands from a System Operator
  - (3) Time zone control commands for automatic operation
- c. Output relays shall be capable of:
  - (1) Pulsing for a predetermined duration. Duration shall be programmable for each relay individually.
  - (2) "Following" any input point an ICM attached to the same ISC (on with alarm, off when clear, or as required).
  - (3) Responding on command from the System Operator to pulse, command on, command off, or reset to normal state.
  - (4) Each OCM shall provide 16 Form C relays rated at 5A @ 30 VDC. The OCM shall control the relays by digital communication. Upon an input from the ICM or command from the System Operator, the ICM will transmit an activating signal to a corresponding relay. The OCM shall be UL 294 and CE Certified.

### 4. Proximity Card Readers

- a. Provide proximity door and man-gate card reader and vehicle gate card readers as shown and shall have the following common features:
  - (1) Each card reader shall contain read head electronics, a micro ISC, and a sender to encode digital door control signals. A bi-color LED (s) (red and green) shall be used to indicate card reader status and access status. A solid green LED shall indicate the card reader has defaulted to an unlocked mode of operation. The green LED shall illuminate upon a valid card swipe/PIN entry for the duration of the door strike time.
  - (2) Card Readers shall be able to support a user defined downloadable off-line mode of operation (locked, unlocked, or facility code), which will go in effect during loss of communication with the ISC.

- (3) All card readers shall provide audible feedback to indicate access granted/denied decisions. All keypad buttons shall provide tactile audible feedback.
  - (4) All card readers shall provide audible feedback to indicate access granted/denied decisions.
  - (5) The card reader shall read the encoded data from the access card and/or transponder and transmit the data back to the host panel in Wiegand Protocol interface.
  - (6) The card reader shall be listed under UL 294 as an access control system unit accessory.
  - (7) The card reader shall have separate terminal control points for the green LED, the red LED, and the audible indicator.
  - (8) The card reader shall have a hold line that will buffer a card read until the panel has asserted that the information can be sent up line.
  - (9) The card reader shall have a re-present mode in which the card shall be taken from the reader field for one second before being read again. This feature is required to prevent multiple reads from a single card presentation.
  - (10) The card reader shall be fully weatherized, and shall have an operating temperature of -22 to 150 degrees Fahrenheit (-30 to 65 degrees Celsius), and shall have an operating humidity of 5-95% noncondensing. The reader shall have a lifetime warranty.
  - (11) The card reader shall be made from polycarbonate material, and shall be charcoal grey.
  - (12) The card reader shall transmit at a 125 kHz frequency. The voltage requirements of the card reader shall be 12 VDC.
- b. Door and Man-Gate Proximity Card Readers: The door and man-gate proximity card readers shall have the following additional features:
- (1) The card reader shall be a ThinLine II proximity designer series card reader, HID Corporation Model No. 5395 or approved equal
  - (2) The card reader shall be no larger than 4.65" x 3.00" x 0.68" (11.9 X 7.6 X 1.7 cm).

- (3) The card reader shall have a read range of 4" to 5.5" (10 - 14 cm), when used with the specified proximity card.
  - (4) The card reader shall be a single unit with a two-piece housing, with an epoxy-potted enclosure and a snap-on cover, and with properly sized mounting holes that allow it to be attached to a US single gang electrical box.
- c. Vehicle Gate Proximity Control Readers The vehicle gate proximity card readers shall have the following additional features:
  - (1) The card reader shall be a MaxiProx proximity card reader, HID Corporation Model No. 5375 or approved equal.
  - (2) The card reader shall be no larger than 12.0" x 12.0" x 1.0" (30.5 X 30.5 X 2.54 cm).
  - (3) The card reader shall have a read range of 16 - 24" (40 - 61 cm), when used with the specified proximity card.
  - (4) The card reader shall be provided with an internal tamper switch that will indicate an alarm condition if an unauthorized attempt is made to disassemble the unit.

5. Single Reader Interface Module (SRI)

- a. The Single Reader Interface Module shall provide an interface between the ISC and card readers. The Single Reader Interface Module shall operate with any card reader that produces a standard Wiegand (Data 1 / Data 0) communication output. As with other card reader types listed above, a single ISC shall be able to multi-drop as many as 16 Single Reader Interface Modules.
- b. Up to sixteen (16) SRIs shall be connected to each ISC. The SRI shall monitor on a per door basis, door position, exit push button, and two auxiliary alarm inputs. It shall also control the electric strike and provide two auxiliary relay outputs.
- c. The SRI shall support up to eight unique card formats.
- d. The SRI shall support an integrated card reader and shall support three access modes upon loss of communication with the ISC; locked, unlocked, and facility code.

The SRI shall offer the following features:

- (1) UL 294 and CE Certified
  - (2) 12 VDC Power
  - (3) Support for up to eight Magnetic and Wiegand Card formats
  - (4) Support for Data1/Data0 Wiegand Communications
  - (5) Programmable Inputs and 2 Programmable Relay Outputs
6. Power Supplies for field hardware shall be designed specifically for the system equipment installed. These power supplies shall be regulated, isolated versions for the ISC, ICM, Card Readers and other equipment. Each version shall be available in UPS with battery back-up and non-UPS models. All power supplies shall be housed in locked enclosures that also allow mounting space for the ISC, ICM, SRI, DRI or other device/panel required.
7. The system shall support a star configuration splitter that shall expand a single ISC communications port into eight 2 wire or four 4 wire RS-485 communications ports to be used in a star configuration. All outgoing data shall be broadcast on all eight ports.

## 2.05 PROXIMITY CARDS

A. Provide proximity card that offer the following features:

1. The proximity access cards shall be a ProxCard II proximity access control card, HID Corporation Model No. 1326 or approved equal.
2. The access card shall have a lifetime warranty.
3. The access card shall have up to 84 programmable bits of Wiegand formatted information for universal compatibility with all HID Wiegand interface reader applications.
4. The access card shall be "Passive" (non-battery operated) proximity technology.
5. The access card shall have a permanent ink jet or laser engraved identification number printed onto it. The card shall have an internal identification numbers that matches the external number.
6. The access card shall be slot punched on the short edge of the card for a vertical portrait oriented photo, shall be offered with multicolor custom graphics, and be compatible with PVC labels for use with a direct print printer.
7. The access card shall be no larger than 3.375" x 2.125" (8.57 X 5.40 cm), with a maximum thickness of 0.070" (0.18 cm).

8. The access card shall have an operating temperature of -50 to 160 degrees Fahrenheit (-45 to 70 degrees Celsius), and shall have an operating relative humidity of 5-95% noncondensing.
9. The read range of the access card shall be extremely consistent, and not be affected by body shielding or variable environmental conditions.

## 2.06 CONDUIT AND CABLES

- A. Conduit and boxes: Provide conduit and boxes that meet the requirements of Section 16130 - Electrical Raceway Systems.
- B. Cable: Provide cables meeting the requirements of Section 16121 - Wire and Cable - 600 Volts and Below.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Examine areas and conditions under which access control system conduit systems and plywood mounting panels are to be installed. Correct conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Resident Engineer.

### 3.02 INSTALLATION

- A. General: Install access control system as shown or required. Comply with requirements of the NYCBC, NEC and local electrical codes.
- B. All equipment shall be installed as per manufacturer's requirements.
- C. All equipment shall be installed by qualified personnel in accordance with NEC and local codes.

### 3.03 FIELD SERVICES

- A. Manufacturer's Representative: Provide the services of a factory-trained experienced, competent, and authorized representative of the access control system manufacturer to visit the site of the Work and inspect, check, adjust if necessary, approve the equipment installation and provide training as specified in Section 01821 - Training. Furnish all instruments and equipment necessary to conduct required tests, adjustments and training. Submit copies of these documents executed and signed by the manufacturer's representative. Have the representative present when each equipment item is placed in operation. Provide representative service as often as necessary until all problems are corrected and each equipment item is installed and operating satisfactorily.

- B. All equipment shall be tested for proper operation. Testing shall be observed by City of New York for general compliance with the intended use.
- C. Training: Following completion of installation and field testing provide training for 12 employees of the City of New York in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the DSNY's facilities at a time agreeable to the City of New York:
  - 1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  - 2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

3.04 CLEANING AND REPAIR

- A. Contractor shall clean out and discard all materials used in the construction of the system.
- B. All damage caused by the Contractor shall be repaired to the original state by the Contractor.
- C. All repairs shall meet the City's satisfaction to be acceptable.

-END OF SECTION-

NO TEXT ON THIS PAGE

**Section 16752**  
**DIGITAL VIDEO SYSTEM**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. Furnish a complete digital video system. The system shall include all necessary workstations, software, digital video recording equipment, cameras, IP Encoders, IP Decoders, command consoles, equipment racks, networking switching hardware, and real-time video monitoring equipment, power supplies, conduit, cable and accessories for a complete operational digital video system.

**1.02 RELATED SPECIFICATIONS**

- A. Section 01820 - Training
- B. Section 16050 - Basic Electrical Materials and Methods
- C. Section 16121 - Wires and Cables - 600 Volts and Below
- D. Section 16130 - Electrical Raceway Systems
- E. Section 16264 - Uninterruptible Power Supplies
- F. Section 16511 - Lighting
- G. Section 16723 - Fiber Optic Cable

**1.03 REFERENCES**

- A. Codes and standards referred to in this Section are:
  - 1. NEC - National Electrical Code
  - 2. Electrical Code for the City of New York

**1.04 SUBMITTALS**

- A. General: Furnish all submittals, including the following, as specified in Division 1 and Section 16050 - Basic Electrical Materials and Methods.
- B. Product Data and Information: Furnish manufacturer's data on all equipment and devices in the assembly, including voltages, number of phases, current ratings, capacities and other relevant data.
- C. Shop Drawings: Furnish shop drawings for the digital video system including the following:
  - 1. Furnish wiring diagrams for assemblies that show connections to electrical power. Clearly differentiate between shop-installed portions of wiring and field installed portions.

2. A manufacturer's standard connection diagram or schematic showing more than one method of connection is not acceptable unless the intended method is clearly identified.

#### 1.05 REFERENCE ABBREVIATIONS

- A. This specifications references abbreviations in accordance with the following list:

1. DVA - Digital Video Appliances
2. DVR - Digital Video Recording
3. DVRS - Digital Video Recording System
4. DVS - Digital Video Server
5. GUI - Graphical User Interface
6. LAN - Local Area Network
7. MOD - Minimum object distance
8. NTSC - National Television System Committee
9. NTU - Network Terminal Unit
10. NDVMS - Network Digital Video Management System
11. PTZ - Pan, Tilt & Zoom

#### 1.06 SYSTEM DESCRIPTION

- A. This section specifies the minimum requirements for a Digital Video Recording System (DVRS), applicable to each Marine Transfer Station.

#### 1.07 SYSTEM DESCRIPTION

- A. The DVRS shall have the capability to scale to accommodate a minimum of 100 cameras installed strategically throughout the building. The majority of the installed cameras will be placed indoors with a certain number of additional cameras to be installed outdoors. The system will support both fixed and PTZ cameras as outlined in the engineering drawings.

#### 1.08 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience with service facilities within 100 miles of Project.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.

#### 1.09 WARRANTY

- A. Furnish a written 3-year minimum warranty covering software, and all equipment associated with the digital video system including parts and labor from the digital video system manufacturer.

## 1.10 SPARE PARTS

### A. Furnish the following spare parts at each transfer station:

1. One of each type of camera provided
2. One of each type of lens provided.
3. Twenty percent but not less than two, of each type of power supply.

### B. Packaging: Plainly tag and mark spare parts for identification and for reordering and properly box and wrap spare parts to prevent deterioration. Completely identify the box on the outside.

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

#### A. Standard of Quality and General Configuration: Use of manufacturer's name and model or catalog number is for the purpose of establishing the desired.

#### B. Acceptable manufacturers are as listed below. Other manufacturers of equivalent products may be submitted for review.

##### 1. Camera and Accessories

- a. Bosch Security Systems
- b. Honeywell Silent Witness
- c. Vicon Industries Inc.

##### 2. Digital Video Servers

- a. Verint Systems Inc
- b. DVTel Inc.
- c. Vicon Industries Inc.

##### 3. Fiber Optic Transmitters and Multiplexers

- a. Optelecom-NKF Electronics
- b. GE Security (Formerly Fiber Options)

##### 4. Equipment Racks

- a. Gorilla Systems, Inc
- b. Winstead Corp.

5. Network Switch
  - a. Cisco Systems, Inc
  - b. IBM
6. Industrial Monitors
  - a. Allen Bradley
  - b. VarTech Systems Inc.

## 2.02 GENERAL STANDARDS

1. All equipment and materials used shall be standard components that are regularly manufactured and utilized in the manufacturer's system.
2. All equipment and components used shall have been thoroughly tested and proven in actual use.
3. All equipment and components used shall be CE-marked and FCC-certified.
4. All systems and components shall be provided with the availability of a toll-free (US and Canada), technical assistance program (TAP) from the manufacturer. The TAP shall allow for immediate technical assistance for either the dealer/integrator/installer or the end user at no charge.
5. Each dealer/integrator/installer and end user shall have access to a password-protected e-support Web site for Web-based technical assistance on a 24-hour basis. This site will enable downloads of software updates, manuals, review of frequently asked questions, and generation of service tickets with a 24-hour maximum response time.
6. All systems and components shall be provided with a three working days turnaround repair express and 24-hour parts replacement. The repair and parts express service shall be guaranteed by the manufacturer for warranty and non-warranty items.

## 2.03 DIGITAL VIDEO RECORDING SYSTEM MANAGEMENT

### A. Digital Video Recording System Configuration

1. General
  - a. The DVRS shall be configured to provide a minimum of 15 days of video archival, stored automatically on individual 32 input DVR unit's internal hard drive disks. The storage requirement for this system shall be based on a configuration where the cameras, described as security cameras, will be on a recording video schedule initially set for 16

hours per day, Monday through Saturday and switching to motion activated recording all other times. The other cameras are for process observation and no recording is required.

- b. Analog cameras will be distributed into Digital Video Appliances (NTU). The Digital Video Appliances will compress the Analog video signals and provide digital IP based outputs (Dual Stream MPEG4). The IP based compressed signal will then be transmitted into a Network switch. The Digital Video Recorder units will receive the data streams directly from the Network Switch via TCP/IP transmission protocols. The Digital Video Recorder units will then take the compressed video signal and store the video using internal hard drives for archival storage. The Digital Video Appliances shall offer the ability to leverage multiple quality settings (Low, Medium and High).
  - c. Recorders and servers shall consist of rack-mountable PCs connected to the Local Area Network (LAN).
  - d. Video and other data managed by the DVRS shall be accessible from the workstation PCs connected directly to the LAN.
  - e. The DVRS shall include Graphical User Interface (GUI) based client server software Suite designed to run on PC workstations running the latest version of Microsoft Windows XP Professional operating system.
  - f. The DVRS GUI software functions shall include specific software applications within the software Suite that shall include; System Setup and Administration, Live Monitoring, Live and Recorded video retrieval with PTZ camera control, Video playback; Video export, Robust alarm Global monitoring, and other capabilities as described below.
- 2. Compatibility with Analog Video Cameras: The DVRS shall work with cameras that generate a standard NTSC composite video signal. Video Appliance taking feeds from these composite Analog cameras shall use BNC connectors for Video Inputs and provide a digital CAT 6 output to supply a compressed digital signal to the Video Recorders. The DVRS shall support a wide variety of fixed and PTZ Analog Cameras.
  - 3. Compatibility with Digital Video Cameras: The DVRS shall work with a wide variety of IP Cameras for future digital camera integration. The Digital Video Recorders will utilize a standard Ethernet connection for video input via TCP/IP transmission protocols. The DVRS shall be fully scalable to accommodate future camera recording and video management up to 100 cameras.

4. Storage: The DVRS shall be capable of supporting unlimited video storage capacity by offering a hardware architecture that is scalable and configurable to allow external devices such as AIT Tape Libraries or SANS storage devices to be added in the future.
5. Workstations: The DVRS shall be a distributed, multi-user, multi-tasking system capable of supporting simultaneous request from multiple workstations for video call-up and Alarm monitoring.
6. Video Recording Tasks: The DVRS shall be capable of the following tasks:
7. Simultaneous Tasks: The DVR units shall be capable of performing multiple tasks simultaneously, and within practical limits no task shall interfere with any other task. The DVR units shall prioritize tasks so that recording and alarm processing will continue uninterrupted regardless of any number of requests being received from workstations at any given time. DVR units shall be capable of performing the following tasks simultaneously:
  - a. Recording Tasks
    - (1) Storing video to internal hard drives for storage.
    - (2) Maintain an accurate index of video files stored on local disks.
    - (3) Delete older files as needed to free up space to record newer video clips.
    - (4) Be able to selectively transfer recorded video to long-term storage media upon request, automatically if necessary.
  - b. Alarm Tasks
    - (1) Execute video image analysis algorithms including activity detection and video loss detection as well as providing detailed alarm messages.
    - (2) Alarm messages shall allow for priority color-coding of specific cameras and audible audio notification output for all cameras if required.
    - (3) Sending alarm messages to the server or workstation for proper management of alarm responses.
    - (4) Processing alarm response instructions including calling camera presents, changing recording modes, and controlling alarm relay outputs.

## c. Workstation Tasks

- (1) Supplying one or more live video streams with a maximum of 16 live streams of video in the Software GUI.
- (2) Support up to 16 windows of Live and Recorded video streams in the software GUI at the same time for review.
- (3) Enabling one or more users to play back previously recorded video, including "Instant Replay" of video recorded within the last few seconds of video capture.
- (4) Sending real-time commands to PTZ cameras for live camera control.

## 8. Recording Modes: DVR units shall support the following recording modes:

- a. Continuous Recording: DVRS shall be capable of recording 24 hours a day, 7 days a week on a full time recording schedule.
- b. Scheduled Recording: Establish a recording schedule for each camera based on hours of the day and days of the week including recorder settings such as frame rate, resolution, bandwidth and quality settings.
- c. Alarm Recording: Enable the System Administrator to define alarm responses including:
  - (1) Instructions to trigger recording of specified cameras at specified frame rates and quality settings. Alarm responses to include the following recording capabilities:
    - (a) Start recording cameras not currently being recorded.
    - (b) Supplement continuous or scheduled recording by changing the recording mode or triggering recording of the same camera on a different recorder in a different video format.
    - (c) Selectively copy video to long-term storage media upon alarm.
  - (2) System Administrators shall determine whether video will be retained on long-term storage media for each continuous or scheduled recording instruction. Automatically retain video on long-term storage media when video is recorded as a part of a defined response to an alarm event.

- d. On Demand Recording: The DVRS shall allow authorized users to stop and start recording from within the GUI application software.
9. Workstation Software
- a. Multi-Tasking: GUI application software shall enable users to manage multiple windows and perform multiple tasks simultaneously, including the following:
    - (1) Monitoring progress as one or more video clips are retrieved from a long-term storage media and made ready for playback.
    - (2) Allow for scheduling of clips to be downloaded at a specific time for a specific authorized end user.
    - (3) Exporting video to digital media or to an analog output device for permanent, long term storage or investigative usage.
10. Video Window Layouts: Users shall be able to select from the following video window layouts with live or recorded video:
- a. Single Camera view – 1 camera displayed in the entire GUI workspace.
  - b. Quad camera view – 4 cameras arranged in two rows of two individual windows displayed in the entire GUI workspace.
  - c. Three by Three (3 x 3) – 9 total cameras arranged in three rows of three individual windows displayed in the entire GUI workspace.
  - d. Four by Four (4 x 4) – 16 total cameras arranged in four rows of four individual windows displayed in the entire GUI workspace.
  - e. Free: Open, move and size multiple independent video windows as needed in a tile or cascade layout.
11. Aspect Ratio: The software shall ensure that the ratio of the width and height of the displayed video images always matches the ratio that was originally captured regardless of the size of the video window.
12. Zoom: During viewing of live and/or recorded video, the GUI shall allow the user to select an area of interest and zoom in without pausing the video.

13. Image Toolkit: When viewing live or recorded video, the software shall provide functions to work with an individual video image in a paused video window including the following capabilities:
  - a. Print the image to any standard PC based printer.
  - b. Save the image to a common image file format. Image file formats shall include, but not be limited to: .JPG, .BMP, .PSD, Tiff and Targa.
  - c. Copy the image to a clipboard so the image can be pasted into any PC based software application.
  - d. Adjust the brightness and/or contrast of the image.
  - e. Convert the image from color to grayscale.
  - f. Apply filters to the image to de-speckle, smooth, or sharpen the image.
  - g. Apply edge detection to highlight borders or surfaces of objects within the image.
  - h. Add the date and time onto the image.
  - i. Add descriptive text annotation onto the image.
14. Processing Video Requests: When a user submits a video request, the DVRS shall automatically perform whatever tasks are necessary to make the requested video available for playback, regardless of the video storage location.
15. Multiple Video Requests and Video Clips: The DVRS shall enable users to submit and manage multiple requests for video in the following fashion:
  - a. The GUI organizes video requests in a tree structure to maintain the hierarchical relationship between video requests and corresponding video clips.
  - b. Use icons and text to indicate status of requests and video clips.
  - c. The GUI shall list cameras in the group and show a separate video clip icon for each camera, if a request is based on a group of cameras.
  - d. The GUI shall show every available video clip that matches the video request when a camera recorded in more than one video format by more than one recorder at a requested time.

- e. The GUI shall facilitate viewing video clips from a sequence of camera views. For example, clips showing a subject walking through a facility or a package moving along a conveyer belt.
  - f. The GUI to enable the user to use drag-and-drop to re-order the video clips within a group to create the desired sequence of cameras.
  - g. Include a GUI hotkey to open the next video clip in sequence. A function to pause playback in the current video window and open the next video clip in sequence in a new video window. The next video clip shall be positioned to the same time where the previous video clip paused, and the next video clip shall start playing automatically. By pressing the "Next Video Clip" hotkey each time the subject is leaving the camera view, the user can conveniently follow the subject or object through the sequence of video clips.
  - h. The DVRS shall support time-synchronized playback of recorded video on up to 16 windows simultaneously.
16. Controlling Video Playback: After opening a video window to play back a video clip, the GUI shall enable a user to control all aspects of playback.
- a. Playback controls:
    - (1) Single button to start and stop video playback.
    - (2) Single button to step forward or backward through the video in single time increments.
    - (3) Single button to step forward or backward through the video in single frame increments.
    - (4) Single button to step forward or backward through the video in multiple frame increments.
    - (5) Single button for moving through the video frames in Reverse playback mode.
    - (6) The ability to cause the video to loop continuously through a recorded video clip segment.
  - b. Positioning Controls: Slider bars and buttons to quickly and conveniently position to the beginning, end or any other time period within the video clip.
  - c. Speed Control: The DVRS shall incorporate a slider bar to control the rate of playback. Enable the user to select playback speeds that are

slower than, equal to, faster than the rate at which the video was originally recorded.

17. Scanning Recorded Video for Activity: The DVRS shall provide a function to rapidly process video clips and locate images with activity. Activity scanning provides an intelligent substitute for manual "fast forward" and scanning including the following:
  - a. Enables the user, through the GUI, to specify a scanning interval to control the percentage of recorded images that will be checked for activity.
  - b. Provide a GUI function to enable the user to select one or more areas of interest and/or adjust the sensitivity for those scanned areas.
  - c. When activity is detected, the GUI will display a thumbnail of the corresponding video image with a timestamp. The sequence of thumbnails will provide high level overview of the activity in the video clip, allowing the user to make a quick assessment of whether further review is warranted.
  - d. Support Multi-tasking of other investigative functions while Activity Scanning.
  - e. Click on a thumbnail to position the video for the user in the GUI while scanning is still in progress.
  - f. Support video playback of the related clip and/or unrelated clips while scanning is in progress.
18. Requesting Live Video
  - a. The GUI shall enable the user to open live video windows by using the mouse to drag a camera or group of cameras from the camera tree directly into the video window area of the application window.
  - b. The GUI shall enable users to view live video from multiple DVR units and sites simultaneously.
19. Controlling Live Video Windows
  - a. Live video windows shall be consistent with video playback windows in appearance and operation.
  - b. Live video windows shall maintain a cache of recent images. Enable the user to pause live video and quickly review recent images, then resume live video.

- B. System Monitoring and Problem Notification
  - 1. The DVRS shall monitor each system component, and generate system alert messages to notify system administrators of any component, and generate system alert messages to notify system administrators of any component that is not operating normally.
  - 2. Provide a normally open dry contact that closes when any alarm occurs to activate a "Trouble Alarm" at SCADA.
- C. Security: The DVRS shall include login security to control the following functions available to each system user:
  - 1. Grant and/or deny rights to individual users or groups of users.
  - 2. Restrict the ability to modify the system configuration.
- D. Additional System Integration Capabilities: The DVRS shall be a non-proprietary system providing an open system architecture with the capability of being integrated with other systems (Analog or Digital) through a variety of methods.
- E. Extendible GUI with Add-On Module Architecture: The DVRS GUI shall support an add-on module architecture that enables the DVRS Manufacturer to add custom windows and menu options without modifying or recompiling the GUI application code. The DVRS Manufacturer shall provide a software development kit that enables developers to create custom applications and web pages with seamlessly integrated digital video features.
- F. Advanced DVRS Functionality
  - 1. The DVRS shall provide a flexible platform framework to allow for expansion and enhancement as technology becomes available
  - 2. Advanced Outdoor Motion Detection: The DVRS shall have the ability to leverage Intelligent Motion detection providing the ability to discriminate against motion that is not of interest based on the following parameters:
    - a. Show motion, so the user can see all movement that the motion detection algorithm sees
    - b. Target size, minimum and maximum
    - c. Compensate for distance from the camera
    - d. Target speed, minimum and maximum
    - e. Length of time target has been in field of view

- f. Global change to compensate for events like a panning camera
  - g. Target minimum movement
  - h. Mask region
  - i. Support arbitrarily shaped masks
  - j. Contrast both global and local
  - k. Target aspect ratio
3. Web Based Video Retrieval: The DVRS shall support Web Based Video View or the Internet.

#### 2.04 DVRS HARDWARE SYSTEM CONFIGURATION REQUIREMENTS:

- A. The DVRS shall be configured to provide the specific hardware specifications outlined:
- 1. DVRS Master Communication Server Component: The DVRS shall incorporate an enterprise Master Communication Server component as an integral component to the system architecture. The Master Communication Server hosts Communication Server, which is a Windows XP based service used to control all of the data flow in the DVRS. The Master Communications Server shall be a redundant component offering two, hot-swappable power sources and two mirrored drives so that the SQL database maintaining the indexing schema for the DVRS' Video clips is protected. A Master Communications Server shall be used to track where each video clip resides in the system, synchronizes all DVR unit CPU time clocks, coordinates alarm responses, and manages recorder failover functions.
  - 2. IP Based Digital Video Appliances
    - a. The DVRS shall utilize Digital Video Appliances (DVA) to compress and digitize the composite Analog video signals generated by the cameras. The DVA's shall be able to support multiple frame rates (CIF and 4 CIF) and multiple quality settings (Low, Medium, and High) for maximum user flexibility. The DVA's shall have the flexibility to support multiple digital streaming speeds from 1 Fps to 15 Fps and utilize a M-JPEG-4 compression algorithm.
    - b. IP Based Digital Video Recorders shall minimally have 32 inputs, 900 GB Hard Drive storage; DVR shall provide resolution capability of 702x480 to 352x240. DVR shall be compatible with motion JPEG.

3. IP Based Digital Video Storage Recorders: The DVRS shall be configured to provide the specific software specifications outlined:
  - a. Recording rate and scheduling: The DVRS shall record all cameras at 5 FPS. The cameras can be defined as security cameras shall be initially configured for 16 hours per day, Monday through Saturday and switching to motion recording all other times. The other cameras are for process observation and no recording is required.
  - b. Alarming functionality: The DVRS shall be fully capable of supporting robust alarm sources and offers robust alarm responses to those sources. These capabilities include the following abilities for alarm sources:
    - (1) Alarm Inputs: Include DVR units or system components that accept alarm inputs from electrical devices. Inputs shall be configurable as normally open or normally closed.
    - (2) Video Activity Detection: DVR units capable of analyzing video images to detect activity. The absence of activity to correspond to the OFF state of the alarm source, and when activity is detected the state of the alarm source shall be ON.
      - (a) Provide a way to define the area(s) of interest for activity detection for a particular camera. The GUI to provide flexible drawing tools to enable the user to include and exclude multiple areas with rectangular or irregular shapes.
      - (b) Activity detection sensitivity to be configurable. When properly configured, the Network Digital Video Management System (NDVMS) to detect all legitimate activity while avoiding excessive false detection due to minor fluctuations in lighting or other insignificant changes in the video images.
    - (3) Video Loss Detection: DVR units to detect lost camera signals.
    - (4) Serial Alarm Interfaces: The NDVMS shall be able to receive messages from access control systems and other similar systems through serial communication interfaces. The NDVMS will interpret messages from the serial interface as state changes for one or more logical alarm contacts.
    - (5) Alarm Responses: Include a comprehensive feature set for responding to alarm messages.

- (a) Alarm Responses: Include a comprehensive feature set for responding to alarm messages.
  - (b) Send instructions to multiple devices and system components in response to any alarm message, regardless of the source of the alarm message.
  - (c) Base alarm source configurations and alarm responses on a schedule. The alarm source configuration and alarm responses to depend on the time of day and/or day of the week.
  - (d) Alarm response to consist of various types of instructions to be executed by the NDVMS in response to each alarm message that can be generated by an alarm source.
  - (e) Recording Instructions: Start recording or change the recording mode for one or more cameras connected to one or more recorders.
  - (f) Video Matrix Switcher Instructions: Call camera presets and call cameras to monitors for viewing live analog video associated with the alarm event.
  - (g) Relay Output Instructions: Control the state of one or more alarm relay outputs on DVRs or other system components.
  - (h) Alarm Display Instructions: Specify how alarms shall be shown on alarm monitoring stations, including the colors to be used to indicate the alarm urgency, any messages to be displayed, whether video shall automatically display on the alarm monitoring station, etc.
  - (i) Termination Instructions: This type of instruction causes other instructions to stop.
- c. Failover Recording Mode: The DVRS shall require 32 available inputs for failover recording for the system. The failover requirement shall allow the system to have redundancy for up to 32 total cameras in the event that a single or multiple DVR units does not cause a system outage.

- d. Camera Presets: The DVRS shall provide comprehensive features to take advantage of camera presets in the System Software. The GUI software shall support the following features:
- (1) Setting Up Camera Presets: Provide GUI functions to enable authorized users to view and modify camera preset definitions when the PTZ cameras and/or the video matrix switchers allow camera presets to be defined through a computer interface.
    - (a) Each preset to have a preset number and a description.
    - (b) Provide a button in the preset setup function to set the camera shot and a separate button to call the camera shot in order to verify that the preset is working properly.
    - (c) Allow user to designate one preset as the default preset, or to specify that autopan is the default. The NDVMS to return the camera to the default preset or autopan mode when a user finishes controlling a camera or when a task ends that specified a different preset.
  - (2) Access to Camera Presets when Viewing Live Video: Provide buttons and/or a dropdown list to select a camera preset when viewing live video (either on-screen or on an analog monitor controlled via the GUI). Interface to support selection of the autopan made.
  - (3) Using Camera Presets for Scheduled Recording: Enable user to specify the camera preset to be used when defining scheduled recording tasks. The NDVMS to call the camera preset automatically when initiating the scheduled recording task.
  - (4) Using Camera Presets for Alarm Recording: Enable user to specify the camera preset to be used when defining recording instructions as part of an alarm response. The NDVMS to call the camera preset automatically when initiating the alarm recording task.
  - (5) Prioritizing Camera Presets: The NDVMS to use task priorities to determine which camera preset shall be called when multiple tasks are requesting different presets for the same camera. If a higher priority task overrides the preset for a lower priority task, the lower priority task's preset restored when the higher priority task ends.
  - (6) Using Camera Presets Associated with Camera Groups: The NDVMS to enable authorized users to define group presets for

cameras. This is a camera preset that is called whenever the user drags and drops the group onto a monitor icon.

4. Camera Tours: The DVRS shall support robust camera tour functionality so that live viewing and monitoring of the site location is made easy for the surveillance staff. The DVRS software shall support the following set of features:
  - a. Provide GUI functions to enable authorized users to view and modify camera tour definitions.
    - (1) NDVMS allows for creation of multiple camera tours.
    - (2) Each camera tour has multiple numbers of cameras.
    - (3) Each camera can have an associated preset and dwell time.
    - (4) Dwell time can be set for all cameras in a camera tour in one operation.

## 2.05 CAMERAS

### A. High Resolution Color Camera

1. Manufacturer: Bosch Security Systems Model No. LTC – 0455/21.
2. General Requirements
  - a. This product shall be manufactured by a firm whose quality system is in compliance with the I.S./ISO 9001/EN29001, QUALITY SYSTEM.
  - b. The manufacturer shall be ISO 14001 Certified and adhere to an Environmental Management System that strives to reduce the impact its products and processes have on the environment.
  - c. This camera is designed for surveillance and industrial applications requiring a compact, rugged, 1/3-inch CCD camera meeting NTSC standards. .
  - d. The camera shall provide an On-Screen Display (OSD) for access to all camera features.
  - e. In addition to the normal color mode of operation, the camera shall provide a monochrome night mode operation utilizing Night Sense Technology that automatically activates under low light conditions. When in the night mode of operation the sensitivity of the camera shall be enhanced by a factor of 3.

- f. The camera shall accept fixed iris lenses, manual iris lenses, DC auto-iris lenses, and video-iris lenses. For ease of installation, the camera shall auto detect the type of lens used and optimize performance accordingly.
- g. The camera shall provide a lens wizard during lens back focus setup to allow focusing at maximum lens opening to ensure that the object of interest within the field of view always remains in focus.
- h. The camera shall provide through-the-lens automatic tracking white balance.
- i. The camera shall provide an automatic black level feature to enhance the contrast by removing veiling glare from the picture.
- j. The camera shall provide selectable on/off backlight compensation.
- k. The camera shall provide selectable auto/flicker less/off electronic.

### 3. Electrical Specifications

- a. When powered via 24 VAC or 120 VAC 60 Hz, the camera shall be synchronized to the power line zero crossing to ensure roll-free vertical interval video switching and recording. The vertical phase delay shall be adjustable from 0 to 358 degrees.
- b. Video output: Composite video 1.0 V p-p, 75 ohms.
- c. Sensitivity
  - (1) Color Mode
    - (a) Usable picture 030 IRE: 0.30 lux (0.03 foot-candle)
    - (b) Usable picture 50 IRE: 0.65 lux (0.07 foot-candle)
    - (c) Full video picture: 2.6 lux (0.26 foot-candle)
  - (2) Night Mode
    - (a) Usable picture 30 IRE: 0.12 lux (0.012 foot-candle)
    - (b) Usable picture 50 IRE: 0.26 lux (0.026 foot-candle)
    - (c) Full video picture: 1.04 lux (0.104 foot-candle)
- d. Rated Voltage and Range
  - (1) 12 VDC (10.8-39 VDC)
  - (2) 24 VAC, 60 Hz (12-28 VAC, 45-65 Hz)
  - (3) 120 VAC, 60 Hz (85-265 VAC, 45-65 Hz)

- e. Power consumption: 4 watts (without lens)
- f. Signal-to-noise ratio: 50 dB
- g. AGC: 21 dB, (max)

4. Mechanical Specifications

- a. Video Output: BNC
- b. Video/DC-Iris connector: 4-pin EIA-J
- c. Camera Mount: ¼ inch-20, top and bottom
- d. Lens mount: C and CS
- e. Weight: 0.99 lb. (0.45 kg)
- f. Dimensions (less lens/including connectors)

(1) 2.28 H x 2.6 W x 4.8 L inch (58 x 66 122mm)

- g. Power connections:

(1) 12 VDC and 24 VAC, 50 and 60 Hz models: Push type connectors.

(2) 120 VAC, 60 Hz models: 2-wire power cord with polarized plug.

5. Environmental Specifications

- a. Operating Temperature: -4 degrees F to + 122 degrees F. (-20 degrees C to + 50 degrees C).
- b. Operating humidity: 5% to 93% non-condensing.

6. Electromagnetic Compatibility

- a. EMC immunity: EN 50130-4
- b. EMC emission: EN505022 Class B, FCC, Class B, Part 15.

7. Cameras Lens: Provide the camera fitted with the following lens in accordance with the camera equipment schedule

- a. Bosch LTC 3364/40
  - (1) Focal Length: 2.8 – 10 mm
  - (2) Iris Range: f1.4 to 360
  - (3) Focus Range (MOD): 1 ft.
  - (4) Lens Mount: CS

- (5) Iris Control: 4-pin DC control
- (6) Focus control: manual

b. Bosch Model No. LTC 3374/20

- (1) Focal Length: 5 – 50 mm
- (2) Iris Range: f1.4 to 360
- (3) Focus Range (MOD): 3.3 ft.
- (4) Lens Mount: CS
- (5) Iris Control: 4-pin DC control
- (6) Focus control: manual

B. Weatherproof Color Cameras

1. General Requirements

- a. This product shall be manufactured by a firm whose quality system is in compliance with the I.S./ISO 9001/EN 29001, QUALITY SYSTEM.
- b. The camera system shall be a variable/high speed, domed camera consisting of an integral high resolution, CCD camera with zoom and an integral 360 (pan/tilt and integral receiver/driver) meeting NTSC Standards.
- c. Envirodome Housing: The camera system shall be provided with an NEMA 4 rated, heated weather-resistant dome bubble housing. Housing located outdoors shall be finished in dark bronze matching the lighting poles specified in Section 16511 – Lighting of the Electrical Contract.
- d. The camera system shall automatically switch from daylight color operation to nighttime monochrome operation when light levels decrease below a specified threshold level. Day/night operation may also be manually switched.
- e. The camera system's 360 (pan rotation shall be divided into 16 independent sectors with 16-character title per sector.)
- f. The camera system shall provide a function so that any or all of the 16 sectors may be blanked from the operator. In addition, a privacy masking feature shall be provided that allows creation of up to six (6) rectangular masks that prohibit areas of the field of view from being seen even if the camera is panned, tilted, or zoomed.
- g. The camera address number shall settable via thumbwheel switches located within the camera.

- h. The camera system shall allow the storage of up to 99 preset scenes with each preset programmable for 16 character titles. A tour function shall be available to consecutively display each of the preset scenes for a programmed dwell time. Any or all of the presets may be included or excluded from the tour.
- i. The camera system shall be capable of recording two (2) separate tours of an operator's keyboard movements consisting of, tilt, and zoom activities for a total combined duration time of 15 minutes. Recorded tours can be continuously played back.
- j. When an operator stops manual control of the camera, and a programmed period of time is allowed to expire, the camera will execute one of the following programmable options:
  - (1) Return to preset #1
  - (2) Return to the automated tour previously executed
  - (3) Do nothing.
- k. The camera system shall ensure that any advanced commands required to program the camera are accessed via three levels of password protection ranging from low to high security.
- l. The camera system shall be designed so that an integral fiber optic transceiver module is available and capable of transmitting and receiving video and bi-phase signals up to 2.5 miles (4 km).
- m. The Camera system shall provide a feature that automatically rotates the camera to simplify tracking of a person walking directly under the camera.
- n. The camera shall be available in wall mount, mast (pole) mount, corner mount, and pipe mount versions, as the application requires.
- o. The dome bubble shall be available to meet stringent strength standards. The bubble shall be made of 3 mm thick polycarbonate and be able to withstand a 100 foot-pound impact or the equivalent of a 10 lb sledgehammer being dropped from a height of 10 feet.
- p. Electrical Specifications
  - (1) Main supply voltage, as required by the application
    - (a) 120 VAC, 60 Hz, 24 VAC, 60 Hz.
    - (b) Camera supply voltage; 21-28 VAC, 60 Hz.

## (c) Power: 50 watts total:

- 1) Camera power: 20 watts max
- 2) Heater power: 30 watts max

## q. Mechanical Specifications

- (1) Weight: 13 lb. (5.9 kg)
- (2) Pan/tilt: 360° continuous pan, -5° to 90° tilt from horizontal plane.

## r. Environmental Specifications

- (1) Humidity: 0% to 90% relative, non-condensing.
- (2) Operating Temperature: -40°C to +50° (-40°F to +122°F)
- (3) The housing shall be designed to meet NEMA-4 specifications.

## 2. Weatherproof PTZ Color Day/Night Camera with 18X zoom Specifications:

- a. Manufacturer: Bosch Security Systems Model No. ENV-D-120 -X-FT.
- b. Imager: 1/4-inch interline transfer CCD
- c. Video output: Composite video 1.0 V p-p, 75 ohms.
- d. Lens: 18x Optical Zoom (4.1 mm – 73.8mm); f1.4 to f3.0
- e. Field of View: 2.7 to 48 degrees
- f. Digital zoom: 12x
- g. Gain Control: Off/Auto with adjustable limits
- h. Synchronization: Line-lock (-120 to 120 vertical phase adjust) or internal crystal
- i. Aperture Correction: Horizontal and Vertical
- j. Sensitivity (usable video)
  - (1) Day mode w/slow shutter off: 0.025 foot-candle/0.25 lux
  - (2) Night mode w/slow shutter off: 0.0031 foot-candle/0.031 lux
  - (3) Day mode w/slow shutter on: 0.0016 foot-candle/0.016 lux
  - (4) Night mode w/slow shutter on: 0.0002 foot-candle/0.002 lux

- k. Signal to Noise Ratio: Greater than 50 dB.
  - l. Optical fiber compatibility: 50/125 mm, 62.5/125mm, low loss multimode glass fiber, rated for minimum system bandwidth of 20 MHz
3. Weatherproof PTZ Color Day/Night Camera with 26X zoom Specifications:
- a. Manufacturer: Bosch Security Systems Model No. ENV-E-120 -X-FT.
  - b. Imager: 1/4-inch Exview HAD CCD
  - c. Video output: Composite video 1.0 V p-p, 75 ohms.
  - d. Lens: 26x Optical Zoom (2.4 mm – 60mm); f1.6 to f2.7
  - e. Field of View: 2.3 to 55 degrees
  - f. Digital zoom: 12x
  - g. Gain Control: Off/Auto with adjustable limits
  - h. Synchronization: Line-lock (-120 to 120 vertical phase adjust) or internal crystal
  - i. Aperture Correction: Horizontal and Vertical
  - j. Sensitivity (usable video):
    - (1) Day mode w/slow shutter off: 0.33 lux
    - (2) Night mode w/slow shutter off: 0.025 foot-candle/0.25 lux
    - (3) Day mode w/slow shutter on: 0.013 foot-candle/0.13 lux
    - (4) Night mode w/slow shutter on: 0.0016 foot-candle/0.016 lux
  - k. Signal to Noise Ratio: Greater than 50 dB.
  - l. Optical fiber compatibility: 50/125 mm, 62.5/125mm, low loss multimode glass fiber, rated for minimum system bandwidth of 20 MHz

## 2.06 CAMERA HOUSING

### A. General

- 1. This product shall be manufactured by a firm whose quality system is in compliance with the I.S./ISO 9001/EN 29001, QUALITY SYSTEM.

2. The manufacturer shall be ISO 14001 Certified and adhere to an Environmental Management System that strives to reduce the impact its products and processes have on the environment.

**B. Indoor Ceiling Housing**

1. Manufacturer: Bosch Security Systems LTC 9369/00.
2. The indoor ceiling housing used for CCTV camera installations shall be mounted in fixed or suspended ceilings.
3. The housing specified shall be designed for use in environmental air spaces or in air handling plenums of non fire-resistant ceilings.
4. The housing specified shall be constructed of a tough 1.6 mm (0.06 in.) acrylic/PVC alloy plastic cover with window hinged to a 1 mm (0.04 in.) aluminized steel backbox.
5. The housing shall include key lock access to the camera.
6. The housing shall provide a two-piece adjustable camera mounting system.
7. The housing specified shall be mounted via eight protected 7 mm (0.27 in.) holes in the backbox. The top of the backbox shall contain two 6 mm (0.25 in.) knockouts to be used for safety cable wiring.
8. Mechanical specifications:
  - a. Weight: 3.4 kg (7.5 lbs)
  - b. Backbox size: 406 mm L x 191 mm W x 151 mm H (16 L x 7.5 W x 6 H in).
  - c. Window: 3.2 mm (0.13 in.) thick polycarbonate
  - d. Useable area: Accepts camera/lens combinations up to 330 L x 102 W x 102 H mm (13 x 4 x 4 in.)
  - e. Conduit Knockouts: Four PG13.5 (1/2 in.)

## 9. Environmental Specifications

- a. Enclosure Protection: Cover and window meet UL Flame Rating 94V-0
- b. Safety: UL
- c. EMC Requirements: FCC Class B, ICES-003

## C. Environmental Housing

- 1. Manufacturer: Bosch Security Systems TC 9346A-1
- 2. The environmental housing used for CCTV camera installations that are located either outdoor locations or indoors in process areas shall include a heater and blower.
- 3. The housing shall be constructed of aluminized and designed to accommodate large format CCD cameras.
- 4. The housing shall be finished in a gray polyester powder coat except for housing located outdoors shall be finished in dark bronze matching the lighting poles specified in Section 16511 - Lighting of the Electrical Contract.
- 5. The housing shall pad lockable.
- 6. Electrical specifications
  - a. Main supply voltage, as required by the application
    - (1) 120 VAC, 60 Hz, 24 VAC, 60 Hz.
    - (2) Camera supply voltage; 21-28 VAC, 60 Hz.
      - (a) Power: 105 watts total:
        - 1) Heater power: 90 watts max
        - 2) Blower power: 15 watts max
- 7. Mechanical Specifications
  - a. Weight: 8.15 kg (18 lbs)
  - b. Dimensions: 525.5 mm L x 267.9 mm W x 157.2 mm H (35.5 L x 10.5 W x 6.2 H in)

- c. Window: 6.35 mm (0.25 in.) thick glass 107.9 mm H x 133.3 mm W (4.25 H x 5.25 W in)
  - d. Latches: Four stainless steel side mounted latches that accept pad lock
  - e. Cable Entry: Two glands on bottom of housing
8. Environmental Specifications
- a. Humidity: 0% to 90% relative, non-condensing.
  - b. Operating Temperature: -23°C to +49° (-10°F to +120°F)
- D. Envirodome Housing
1. All Weatherproof Color Cameras are furnished in Envirodome Housing.
- 2.07 SERIES DIGITAL VIDEO SERVERS SERIES DIGITAL VIDEO SERVERS
- A. Digital Video Server
- 1. The digital video server (DVS) shall be an enterprise-class server using the MPEG-4 technology, and be capable of streaming video images from one camera input at 30 images per second (60 NTSC fields per second) under all conditions of motion in the image.
  - 2. The DVS shall be either a video transmitter compatible with NTSC cameras, or a video receiver offering a standard NTSC output.
  - 3. The DVS transmitter shall support dual encoded stream capability from a single video source to allow simultaneous and independent viewing and recording of live video at different frame rates and/or quality from the nDVR/nDVR Pro video management and storage software.
  - 4. The DVS shall comply with the VSIP Open Technical Framework for video services over IP, an open standard definition freely published by SmartSight Networks Inc. and Genetec Information systems Inc. and shall be fully compatible with nDVR.
  - 5. The DVS receiver shall be able to play live video streaming from a DVS transmitter or from nDVR on an analog monitor and shall display the time, date, camera title, and site name in text overlay. If the video being displayed originates from an event-triggered video stream, the DVS receiver shall display the alarm information.
  - 6. The DVS receiver shall be able to play back any recorded video stream originating from nDVR on an analog monitor (alternatively a VCR) with time, date, camera title, and site name in overlay. The DVS receiver shall be

able to accept start, stop, fast forward, and fast reverse commands from nDVR.

7. The DVS shall include pre/post-alarm video image capture capability. The DVS shall be capable to send the captured images to nDVR for log-term archiving. If the nDVR application is unreachable, the DVS shall be able to store the images locally in non-volatile memory.
8. The DVS firmware, including the video codec, shall be upgradeable remotely via Teinet or via the nDVR software.
9. The DVR shall support, as an option, bi-directional audio streaming with microphone or line-level input, and speaker or line-level output.
10. The DVS shall support an asynchronous serial port that can be programmed for data rates up to 23 kbps and can be set to RS-422 or RS-485 signal levels. The RS-485 mode shall support 2 wire and 4 wire interfaces.
11. The DVS shall support an RS-232 asynchronous serial port that can be programmed for data rated up to 230 kbps.
12. The DVS shall support three dry-contact inputs and one relay output.
13. The DVS shall not have a Windows operating system (OS) but instead operate from a real-time, embedded OS.
14. The DVS shall possess an internal watchdog to detect and recover from the unlikely occurrence of system lockup.
15. The DVS shall operate over a local area network (LAN) or the Internet, using a standard Ethernet 10/100 Base-T connection. The unit shall include support for DHCP and APIPA automatic IP configuration protocols. The unit shall also support Telnet remote management.
16. The DVS shall transmit or receive video using the UDP/IP unicast or UDP/IP multicast communication protocol. A return channel shall be available to implement error correction mechanisms and bandwidth throttling techniques in congested networks.
17. The DVS shall transmit all command and control messages using the TCP/IP protocol and use cryptographic keys based on the SSL V.3.0 protocol when communicating with nDVR, to prevent eavesdropping, tampering, or message forgery.

18. The DVS shall meet or exceed the following design and performance specifications:
- a. The pan-tilt zoom control latency shall be less than 125 ms, excluding network transmission latency.
  - b. The DVS shall support NTSV/PAL signal format with a programmable resolution from CIF format (352 x 240 pixels for NTSC) to 4CIF (704 x 480 pixels for NTSC).
  - c. The maximum bandwidth used by the DVS module shall be programmable from 32kbps to 4Mbps.
  - d. The average compressed image file size generated by the DVS recorder at CIF resolution shall be less than 1 kB when set for maximum compression and less than 2 kB when set for medium compression.
  - e. The DVS shall generate an alarm when the coaxial cable used between the unit and a camera is faulty or tampered with in any way that would cause loss of the video signal and/or if the camera is not operational.
  - f. The digital recorder shall provide an auto-sensing 10/100 Base-T RJ-45 LAN port.
  - g. The RS-232 port shall use a 9-PIN D type connector. The RS-422/485 port, digital input, and digital output shall use an industrial-type pluggable screw terminal block.
  - h. The DVS shall support both 12V AC and 12V DC power supply via an industrial pluggable screw terminal block and shall have a power consumption of less than 7 watts.
  - i. The DVS shall include an option for mounting of the unit in an EIA standard 19-inch rack. Up to 10 DVS shall fit in a single 4U high rack.
  - j. The DVS shall be enclosed in a compact and durable steel enclosure with size not exceeding 5.30L x 5.6W x 1.60H inches and shall be able to operate normally in an ambient temperature between 0 degrees C and 50 degrees C without using forced air cooling.
  - k. The DVS shall be designed to provide an MTBF of 100,000 hours and shall include ESD protection on all input and output signals.

## 2.08 NETWORK TERMINATING UNIT (NTU)

### A. Manufacturer: Verint Model No. Nextiva S1704E video server

1. Network terminating unit shall serve video from multiple analog signals and convert them to a high quality digital format that can be accessed for multiple computers.
2. The NTU should have a 10/100 Base-T Ethernet connection using a RJ-45 jack using the following protocols to transport signals: RTP/IP, UDP/IP, TCP/IP or Multicast IP.
3. The NTU video shall have 4 composites inputs, 1VPP into 75 ohms, (NTSC/PAL) though BNC Female connectors. It should be able to have scaleable resolution from 352-240 to 704 – 480 NTSC pixels.
4. The NTU shall have alarm contacts with 12 input dry contacts and 2 output relay contacts.
5. The NTU shall be powered from a 12V DC source.
6. The NTU shall be enclosed in a compact and durable steel enclosure with size not exceeding 17L x 6.1W x 1.7H inches and shall be able to operate normally in an ambient temperature between 0 degrees C and 50 degrees C without using forced air.

## 2.09 FIBER OPTIC TRANSCEIVERS/MULTIPLEXERS

### A. Manufacturer: Optelecom-NKF Electronics

### B. General: Contractor shall supply all components required for a fully operational system including mounting and housing hardware.

### C. Power supply Cabinet

1. The power supply cabinet shall be 19" 3HU rack mountable, while housing and powering eleven (11) single width NKF rack mount modules. Power supply cabinets shall have all connections on the front side of the cabinet. Cabinets shall have reversible mounting brackets to allow for connections to be concentrated at the front or rear of the rack. Cabinets shall have two (2) built in fans for efficient cooling. Main voltage of the power supply cabinets shall be 115 Vac with a frequency of 40-100 Hz. Maximum drop out time shall be 10ms, and power efficiency at full load shall be greater than 90%. Maximum DC output power shall be 165 Watts.

2. The operating temperature of the cabinet shall be -40 degrees C to +74 degrees C, and have dimensions of LxWxH 9.4" (23.8cm) x19.0" (48.2cm) x 5.1" (12.9cm).
3. Contractor shall supply all mounting hardware where racks are not used.
4. The power supply cabinet shall be NKF Electronic Model No. MC 11 AC-115.

D. Video Receiver/Data Transceiver

1. The video receiver/data transceiver shall receive one (1) unidirectional NTSC video signal at a 1 Vpp input level over one (1) multimode fiber. The receiver shall operate at the 850nm wavelength, and accept a minimum input power of -32dBm. The differential phase shall be less than 50, with a differential gain of less than 5%, incorporating adjustment free automatic gain control (AGC). The receiver shall also transport and receive a bi-directional data stream in the form of RS-422/485 protocols, while supporting full duplex, asynchronous, or serial transmission. The data transmission rate shall be DC to 64 kbit/s. The unit shall have one (1) 75-ohm BNC connector for video output and one (1) ST connector for optical video/data input. Data output connections shall be provided by two (2) 3-scre terminals, LED status indicators shall provide indication of DC power-on, data carrier present, and presence of video. The unit shall be environmentally hardened with an operating temperature of -40 degrees C to +74 degrees C, and be rack mount with dimensions (LxWxH) 7.5" (19.0cm) x1.4" (3.6cm) x5.0" (12.7cm), with a weight of 0.99 lbs (0.4kg).
2. The receiver shall be NKF Electronics model VDS 2210 RX.

E. MatchBox Video Transmitter/Data Transceiver

1. The video transmitter/data transceiver shall transmit one (1) unidirectional NTSC video signal at a 1 V p-p output level over one (1) multimode fiber. The transmitter shall operate at the 850/1300nm wavelength, with a minimum output power of -18dB. Bandwidth utilized shall be 8 MHz with a differential phase less than 50, and a differential gain of less than 5%, incorporating adjustment free automatic gain control (AGC). The transmitter shall also transmit and receive a bi-directional data stream in the form of RS-422/485 protocol, while supporting full duplex, asynchronous, or serial transmission. The data transmission rate shall be DC to 64kbit/s. The module shall have one (1) 75-ohm BNC connector for video input and one (1) ST connector for optical video/data output. Data input connector shall be provided by two (2) 3-screw terminals. LED status indicators shall provide indication of DC power-on and data carrier present. The unit shall be stand alone-matchbox format and powered by an external 12Vdc power source. The transmitter shall be environmentally hardened with an operating

temperature of -40 degrees C to +74 degrees C, and be dimensions (L x W x H) 3.5" (8.9cm) x 2.3" (5.8cm) x 1.3" (3.3cm), with a weight of 0.30 lbs (0.1kg).

2. The transmitter shall be NKF Electronics model VDS 2210 TX.

## 2.10 EQUIPMENT RACKS

- A. Manufacturer: Gorilla Systems 77" x 36" x 24" Server cabinet (coordinate final size requirements with final field equipment)
- B. General
  1. Racks shall be standard 23" mounting
  2. Interior power distribution for all equipment
  3. Adjustable shelving
  4. Cooling fans (sized for equipment use)

## 2.11 UPS

- A. General: Provide UPS with a minimum of 4 hours continuous running time for all digital video equipment meeting the requirements of Section 16264 - Uninterruptible Power Supplies.

## 2.12 NETWORK SWITCH

- A. Manufacturer: Cisco
- B. The Network Switch shall have the required number plus a minimum of (20) percent spare 10/100/1000 base-T ports to meet system requirements.

## 2.13 MASTER COMMUNICATIONS SERVER

- A. General
  1. The Communications Server controls all data flow.
  2. The Communications Server tracks where each video clip resides, synchronizes all CPU time clocks, coordinates alarm responses, and manages recorder fail over functions.
- B. Dedicated Server and Workstations: Provide Dedicated Server and workstations having following minimum features:

C. Dedicated Server

1. Processor: Dual Xeon, Dual Core CPU at 2.0GHz and 4MB cache, 1333 MHz FSB
2. Memory: 2GB of SDRAM
3. Monitor: 17-inch Rack mountable LCD
4. Hard Drive: 73GB 15K RPS SCSI hard drive
5. Network Card: Dual 10/ 100/ 1000 Ethernet Communication
6. 48X IDE CD-RW/DVD
7. Digital Tape Backup System
8. Pullout Keyboard and trackball
9. Graphics accelerator Card
10. Documentation: Provide all documentation, manuals and licenses
11. Safety/Regulatory: UL, FCC B, approved
12. Latest revision of software at time of bid required:
  - a. Windows XP Professional
  - b. Microsoft Office Professional
  - c. McAfee Virus Scan
13. Operator's Software: Provide access control system operator's software.

D. WorkStation

1. Processor: Dual Xeon, Dual Core at 1.6GHz and 4MB cache, 1066 MHZ FSB
2. Memory: 2GB of SDRAM
3. Monitor
  - a. LCD Type: 19-inch TFT active matrix
  - b. Video Input Signal: Analog RGB and digital DVI-D
  - c. Pixel Pitch: No greater than 0.294 mm
  - d. Viewing Angle: 85 degrees nominal
  - e. Contract Ratio: 600:1

- f. Brightness: 250 nits
  - g. Prime Mode: 1280 x 1024 (SXGA)
  - h. Mounting: VESA-compliant adapter plate)
- 4. Graphics accelerator card
- 5. Hard Drive: 80 GB minimum
- 6. Floppy Drive: 3.5", 1.44 MB diskette
- 7. CDRW: 48X
- 8. DVDRW: 4X minimum
- 9. Mouse: Microsoft Trackball Explorer
- 10. Network Card: 3 Com 3C905 Fast Etherlink XL 10/100 PCI Network Interface
- 11. Keyboard: 104+ keys
- 12. Documentation: Provide all documentation, manuals and licenses
- 13. Safety/Regulatory: UL, FCC B, approved
- 14. Latest revision of software at time of bid required:
  - a. Windows XP for workstations/ Microsoft Server for main server
  - b. Microsoft Office Professional
  - c. McAfee Virus Scan
- 15. Video Software Package: Verint review/playback software.

## 2.14 INDUSTRIAL MONITORS

### A. Manufacturer

- 1. Allen Badley Model No. 6186-M15SSTR
- 2. Vartech Systems Inc. Model No. VT150PSS with resistive touchscreen
- 3. Or approved equal

### B. Provide industrial monitors to allow viewing of specific camera locations. The industrial monitors that are UL Listed and shall have the following features:

1. Field monitors shall be a 15" stainless steel panel-mount LCD display, located in a NEMA 4X stainless steel enclosure.
  - a. LCD Type: 15-inch color TFT active matrix
  - b. Video Input Signal: Analog RGB and digital DVI-D
  - c. Contrast Ratio: 500:1
  - d. Brightness: 250 nits
  - e. Prime Mode: 1024 x 768
  - f. Anti reflective protective faceplate.
  - g. NTSC Ethernet, HD15/5BNC and coaxial cable input compatible.
  - h. Input Voltage: 120 V, 60Hz
  - i. Power Consumption: 24 W
  - j. Operational Temperature: 0°C to +50°C (32°F to +122°F)
  - k. Humidity: 10% to 90% relative, non-condensing.
  - l. Weight: (20 lbs)
  - m. Dimensions: 122 in H x 16.2 in W x 2.3 in D

## 2.15 RACEWAY SYSTEM

- A. A complete raceway system shall be provided for digital video systems in accordance with riser diagrams shown meeting the requirements of Section 16130 - Electrical Raceway Systems of the Electrical Contract.
- B. Empty conduits shall be provided with pull wire to facilitate pulling of cables.

## 2.16 CABLING

- A. Wire and cable meet the requirements for digital video system cable in Section 16121 - Wire and Cable - 600 Volts and below.
- B. Fiber optic cables meeting the requirements for digital video system cable in Section 16723 - Fiber Optic Cable.

## PART 3 DELIVERY, STORAGE, AND HANDLING

### 3.01 EXAMINATION

- A. Examine areas and conditions under which digital video system's conduit systems and plywood mounting panels are to be installed. Notify in writing conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

### 3.02 INSTALLATION

- A. General: Install digital video system as shown or required. Comply with requirements of the Electrical Code for the City of New York, NEC and local electrical codes.

- B. Pole Mounted Cameras: Coordinated mounting details for camera installed on lighting with lighting poles manufacture as specified in Section 16511 – Lighting of the Electrical Contract.
- C. Install conduit systems wiring, and plywood mounting panels as indicated and in accordance with the drawings and with recognized industry practices.
- D. Install system per the manufacturer's guidelines.
- E. Verify the operational compatibility and configuration requirements of all devices.
- F. Provide independent support from building structure for all devices.
- G. Submit typical mounting arrangement for all devices.

### 3.03 TESTING AND COMMISSIONING

- A. The supplier shall be responsible for final system hardware hook-up and checkout prior to commissioning the system to the end-user.

### 3.04 PROGRAMMING SERVICES

- A. Additional programming services shall be provided by the system manufacturer's representatives in the following areas:
  - 1. Database/importation
  - 2. Customized system programming
  - 3. Operational programming
  - 4. Custom report design/development generation
  - 5. Custom video badge design
  - 6. Graphical map design/development and test
  - 7. Camera naming
  - 8. CCTV camera call-up and recording features
  - 9. Alarm responses
  - 10. System database backup

### 3.05 SOFTWARE SUPPORT

- A. The manufacture shall supply all software upgrades and support for two (2) years after acceptance.

### 3.06 FIELD SERVICES

- A. Manufacturer's Representative: Provide a factory-trained experienced, competent, and authorized representative of the digital video system manufacturer to visit the site of the Work and inspect, check, adjust if necessary, approve the equipment installation and provide training as specified in Section 01820 - Training. Provide

all instruments and equipment necessary to conduct required tests, adjustments and training. Submit copies of these documents executed and signed by the manufacturer's representative. Have the representative present when each equipment item is placed in operation. Provide representative service as often as necessary until all problems are corrected and each equipment item is installed and operating satisfactorily.

- B. All equipment shall be tested for proper operation. Testing shall be observed by City for general compliance with the intended use.
- C. Training: Following completion of installation and field testing provide training for 12 employees of the City in the proper operation, troubleshooting and maintenance of the equipment as outlined below. All training will be at the City's facilities at a time agreeable to the City:
  - 1. Operational Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.
  - 2. Maintenance Training: A minimum of two 4-hour sessions combining both classroom and hands-on instruction, excluding travel time.

### 3.07 CLEANING AND REPAIR

- A. Contractor shall clean out and discard all materials used in the construction of their system.
- B. All damage caused under the installation of the Contractor systems shall be repaired to the original state by the Contractor.
- C. All repairs shall meet the City's satisfaction to be acceptable.

### 3.08 SCHEDULE OF CAMERA EQUIPMENT

- A. Abbreviations used in the schedule are as follows:

Service

S – Security

PO- Process Observation

Camera Types

HRCC - High Resolution Color Camera

WPCC – Weatherproof Color Camera

Housing Types

ICH - Indoor Ceiling Housing

ENH – Environmental Housing

EDH – Envirodome Housing

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 17101**  
**SCADA SYSTEM - GENERAL REQUIREMENTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, document and place in satisfactory operation a complete SCADA System as specified and as shown on the Contract Drawings. The system includes the following major equipment:

1. Operator workstations, consoles and printers
2. Control panels, operator interface terminals and programmable logic controllers (PLC)
3. Field instruments
4. System communication and interface equipment
5. Other appurtenances as specified

**1.02 RELATED SECTIONS**

- A. Section 16264 – Uninterruptible Power Supplies

**1.03 DESIGN REQUIREMENTS**

- A. The SCADA system shall be designed to monitor, store, display and log process and equipment operating information and alarms and to perform various process control functions and generate various reports. The unit processes which the SCADA system shall monitor and control are shown on the Drawings and described herein.
- B. The drawings and specifications illustrate and describe the overall SCADA system functional and operational requirements.
- C. Power Supplies
1. All electrically powered equipment and devices shall be suitable for operation on 115 volt  $\pm 10$  percent, 60 Hz  $\pm 2$  Hz power. If a different voltage or closer regulation are required, a suitable regulator or transformer shall be provided.
  2. Appropriate power supplies shall be furnished by Contractor for all two wire transmitters, loops for monitoring discrete inputs and all necessary outputs.

Power supplies shall be mounted in enclosures and installed in the appropriate Control Room or field panel.

3. Design all power supplies for a minimum of 130 percent of the maximum simultaneous current draw.
4. A power on-off switch or an air circuit breaker shall be furnished for each item requiring electrical power.
5. Provide isolation transformers, line voltage regulators and power distribution panels for the distributed digital portions of the SCADA system to eliminate electrical noise and/or transients entering on the primary power line.
6. Provide uninterruptible power supplies where shown, specified and required. Uninterruptible power supplies shall meet the requirements of Specification Section 16264 of the Electrical Contract.

#### D. Signal Requirements

##### 1. Analog Signals

- a. The control system shall be designed to use 4 to 20 mA<sub>dc</sub> analog signals, unless otherwise specified.
  - b. Signal converters and repeaters shall be provided where required. In addition, analog inputs to the SCADA system shall be through appropriate repeaters to provide signal isolation where series-looped with other devices and to allow the loop to maintain integrity even if the SCADA system is out of service. Power supplies shall be sized adequately for signal converter and repeater loads.
2. Signals shall be isolated from ground.
  3. Signals shall not have a transient dc voltage exceeding 300 volts over one millisecond nor a dc component over 300 volts.
  4. The system and associated input/output wiring will be used in a plant environment where there can be high energy ac fields, dc control pulses, and varying ground potentials between the sensors/transducers or input contact locations and the system components. The system design shall be adequate to provide proper protection against interferences from all such possible situations.

#### E. Miscellaneous

1. All instrumentation and SCADA system components shall be heavy duty types, suitable for continuous service in a municipal transfer station

environment. The system is to contain products of a single manufacturer, when possible, and to consist of equipment models which are currently in production. All equipment provided is to be of modular construction and to be capable of field expansion through the installation of plug-in circuit cards and additional cabinets as necessary. Design all logic and control loops to fail safe.

2. All instrumentation and SCADA system components shall be designed to return automatically to accurate measurement within 15 seconds upon restoration of power after a power failure or when transferred to a standby power supply.
3. Surge protection shall be provided for all instruments and all other control system components which could be damaged by electrical surges.
4. All field-mounted instruments and system components shall be designed for installation in humid and corrosive service conditions. All field mounted instrument enclosures, junction boxes and appurtenances shall conform to NEMA 4X requirements unless otherwise specified.
5. All relays with interconnections to field devices shall be wired through terminal blocks. Terminals as part of the relay base are not acceptable.
6. All panel-mounted instruments, switches, and other devices shall be selected and grouped for functionality and arranged to present a pleasing coordinated appearance. All front-of-panel-mounted devices shall be of the same manufacturer and model line.
7. All components furnished, including field and rear of panel instruments, shall be tagged with the item number and nomenclature indicated on the Contract Documents and/or approved Shop Drawings.
8. Ranges and scales specified herein shall be coordinated to suite equipment actually furnished.
9. Field-mounted devices shall be treated with an anti-fungus spray.
10. Where required, field-mounted devices shall be protected from exposure to freezing temperatures.
11. PLC, network, communication, and wireless network equipment, power supplies and other appurtenances provided under Division 17 shall be housed in enclosures as specified in Section 17320, located as shown, and meeting the environmental requirements specified elsewhere in this Section."

**F. Environmental Conditions**

1. The control system shall be designed and constructed for continuous operation under the following temperature and humidity conditions:
  - a. Control Rooms
    - (1) Air conditioned and heated
    - (2) Ambient Temperature: 60°F to 80°F normal range
    - (3) Relative Humidity: 40 to 60 percent normal range
  - b. Indoor heated locations
    - (1) Ambient Temperature: 40°F to 120°F
    - (2) Relative Humidity: 98 percent maximum
  - c. Unheated indoor locations: Similar to outdoor locations
  - d. Outdoor locations
    - (1) Ambient Temperature: -10°F to 120°F
    - (2) Relative Humidity: 100 percent maximum

**G. System Designs**

1. Range, scale and setpoint values specified or scheduled are for initial setting and configuration. Coordinate these values with actual equipment furnished to implement proper and stable process action as systems are placed in operation.
2. For any items where ranges, scales and setpoints may not have been specified, Contractor shall submit a recommendation to Commissioner for review.

**1.04 SUBMITTALS****A. Shop Drawings**

1. General
  - a. Working Drawing preparation shall not commence until after the pre-submittal conference specified below.
  - b. Manufacture of the SCADA system shall not commence until related submittals have been approved by Commissioner.
  - c. Shop Drawings shall be submitted in complete packages grouped to permit review of related items as generally outlined below.

## 2. Pre-Submittal Conference

- a. Contractor shall arrange and conduct a pre-submittal conference on the control system within 45 days of notification of preliminary acceptance of the proposed SCADA system and Supplier by Commissioner.
- b. Pre-submittal conference shall be attended by representatives of Contractor, City of New York, the SCADA system supplier, and Commissioner. Contractor shall allot one full working day for the conference.
- c. Purpose of the pre-submittal conference shall be to review informally and approve the manner in which the Supplier intends to respond to the Contract requirements before any submittals are prepared.
- d. Contractor shall prepare the items listed below for presentation at the pre-submittal conference. The information shall be submitted to Commissioner three weeks prior to the date of the conference.
  - (1) List of equipment and materials required for the control system and the brand and model which Contractor proposes to use for each item.
  - (2) List of proposed exceptions to the plans and specifications along with a brief explanation of each. Approval shall be subject to a formal submittal.
  - (3) Sample of each type of submittal specified herein. These may be submittals prepared for other projects.
  - (4) A flow chart showing the steps to be taken in preparing and coordinating each control system submittal to Commissioner, and a list of proposed submittals.
  - (5) Bar chart type schedule for all SCADA system related activities from the pre-submittal conference through start-up and training. Particular emphasis shall be given to dates relative to submittals, design, fabrication, programming, factory testing, deliveries, installation and field testing. The schedule shall be subdivided to show activities relative to each major item or group of items when everything in a given group is on the same schedule.
  - (6) General outline of the type of tests to be performed to verify that all sensors/transducers, instruments and digital processing equipment are functioning properly.

### 3. Submittal Requirements

a. Product information for all sensors/transducers and field and panel instruments. Include the following:

- (1) Manufacturer's product name and model number
- (2) Instrument tag number from Contract Documents
- (3) Manufacturer's standard catalog product data
- (4) Description of construction features
- (5) Performance and operation data
- (6) Installation and mounting details, instructions and recommendations
- (7) Service requirements
- (8) Dimensions

b. SCADA System Information:

(1) System Description:

- (a) Detailed block diagram showing system hardware configuration and identifying model numbers of system components
- (b) Software language and organization
- (c) Format, protocol and procedures for data highway communications and local communications with input/output modules and peripheral devices
- (d) Human-machine interfacing (HMI) details
- (e) Control and failure modes
- (f) On-line and off-line capabilities for programming, system utilities and diagnostics
- (g) Input/Output point listing with I/O module cross reference identification for each I/O location
- (h) Data base listing including all input/output points

- (i) Suggested detailed format and configuration of all log reports, alarm summaries, printer outputs, CRT displays and graphics
  - (j) List of spare parts and test equipment
- (2) Equipment Hardware
- (a) Layout drawings showing front, rear, end and plan views to scale of all processing equipment, I/O components, power supplies and peripheral devices
  - (b) Construction details, features and procedures
  - (c) Interconnection diagrams including termination details, cable identification list and cable length
  - (d) Plans showing equipment layout in control panels
  - (e) Installation requirements, instructions and/or recommendations
- (3) Software Description
- (a) Standard technical documentation covering all aspects of the distributed control system software functions and capabilities, including instruction set description and programming procedures related to control, monitoring, display, logging, reporting and alarming functions
  - (b) Standard technical and instructional documentation covering software for utility, system support, system documentation, display, communications, data logging and storage and diagnostic functions
  - (c) Detailed functional descriptions of application programs explaining control, display, logging and alarming features to be provided and functions to be performed
  - (d) Documentation describing memory type, size and structure and listing size of system memory, I/O and Data Table memory and size of memory available for control programs. Also define estimated control program memory requirements and processor execution times and program scan times.
  - (e) Documentation describing central monitoring station main and secondary memory types size and requirements to

perform the display, logging, reporting and alarming functions required

c. Panels, Consoles and Cabinets Information

(1) Layout Drawings, include the following:

- (a) Front, rear, end and plan views to scale
- (b) Dimensional information
- (c) Tag number and functional name of components mounted in and on panel, console or cabinet
- (d) Product information on all panel components
- (e) Nameplate location and legend including text, letter size and colors to be used
- (f) Location of anchoring connections and holes
- (g) Location of external wiring and/or piping connections
- (h) Mounting, support and installation details
- (i) Proposed layouts and sizes of graphic display panels
- (j) Calculations for heating and cooling

(2) Wiring and/or piping diagrams, include the following:

- (a) Name of panel, console or cabinet
- (b) Wiring sizes and types
- (c) Piping sizes and types
- (d) Terminal strip numbers
- (e) Color coding
- (f) Functional name and manufacturer's designation for components to which wiring and piping are connected

(3) Electrical control schematics in accordance with JIC standards

(4) Plan showing equipment layout in each area

- d. Where included, field piping diagrams, include the following:
  - (1) Piping sizes and types
  - (2) Location, functional name and manufacturer's designation of items to which piping is connected
- e. Instrument loop diagrams for all analog and digital display, control and I/O loops prepared using ISA standard symbols in accordance with ISA standard S5.4, include the following:
  - (1) Instrument tag numbers from Contract Documents
  - (2) Functional name of each item
  - (3) Manufacturer's model, product, or catalog number for each item
  - (4) Location of each item
  - (5) Software references for all points
- f. SCADA System I/O Loop Wiring Diagrams: Prepare drawings on a module-by-module basis and include the following information:
  - (1) Rack numbers, slot number, module type and module terminal point numbers. Also include location and identification of all intermediate panel terminal block and strip numbers to which I/O wiring and power supply wiring is connected. Identify all power supply circuit numbers and ratings.
  - (2) Wiring sizes, types, wire numbers and color coding
  - (3) Location, functional name, tag numbers and manufacturer model numbers of panel and field devices and instruments to which I/O wiring is connected. For discrete I/O devices use JIC electrical symbols tagged with designation shown on the Contract Documents.
- g. System Software Documentation: Prepare and submit two copies of preliminary software documentation at least four weeks prior to expected initiation of factory testing. Submittal shall be for City of New York and Commissioner information only and shall not be subject to formal approval. Software documentation shall include the following as a minimum:
  - (1) Complete hard copies of all ladder diagram programming. Documentation shall include complete external and internal I/O coil, contact and signal cross referencing, addressing and rung numbering. Documentation shall clearly distinguish between internal and real I/O and shall also incorporate extensive English language to identify all contact, coil and signal functions and for

labeling and description of program, sub-program and rung purpose and action.

- (2) Complete listing of external and internal I/O address assignments, register assignments and present constant values along with functional point descriptions. Also list all unused/undefined I/O and data table registers available.
- (3) Complete hard copies of all program documentation for all types of programs.
- (4) Detailed system memory map defining memory segments used and spare memory segments available for system memory, I/O tables, Data Tables and control program.
- (5) Complete database listing including listings for log, report and alarm file setups.
- (6) Hard copies of all system graphic displays and formats for all logs, reports and the alarm summary.
- (7) User's manuals describing procedures and providing examples for use of operator's consoles, workstations and programming terminal, accessories and system utility routines to perform control, display and logging program generation, program modification, program verification, diagnostics, program documentation, loading and backup and other required system support functions.
- (8) Graphic Displays: Submit samples of each type of display including proposed colors to be used for process equipment and piping.

**B. Control System Operation and Maintenance Manuals**

1. Furnish O&M manuals for the SCADA System in accordance with Section 01831 - Operation and Maintenance Manuals, and the supplemental requirements below:
2. The O&M manuals shall include the following:
  - a. Name, address and telephone number of the Supplier's local service representative
  - b. Complete list of supplied system hardware parts with full model numbers referred to system part designations, including spare parts and test equipment provided

- c. Copy of all approved submittal information and system shop drawings as specified herein with corrections made to reflect actual system as tested and delivered to the site for installation. Half-size black line reproductions shall be provided for all working drawings larger than 11 by 17 inches.
- d. Complete up-to-date system software documentation
- e. Manufacturer's original copies of hardware, software and installation, assembly and operations manuals for the SCADA system devices, and all other control system components. Manuals shall include the following information:
  - (1) General descriptive information covering the basic features of the equipment
  - (2) Physical description covering layout and installation requirements and all environmental constraints
  - (3) Functional and operational descriptions covering the procedures for programming, operation, start-up, shutdown, and calibration of the SCADA system equipment and explaining how the various control functions are performed
  - (4) Principles of operation explaining the logic of operation; provide information covering operation to a component level
  - (5) Maintenance procedures covering checkout, trouble-shooting, and servicing; checkout procedures shall provide the means to verify the satisfactory operation of equipment, trouble-shooting procedures shall serve as a guide in determining faulty components and servicing procedure shall cover requirements and recommended time schedule for calibration, cleaning, lubrication and other housekeeping and preventive maintenance procedures.
  - (6) Wiring, schematic and logic diagrams
  - (7) Safety considerations relating to operation and maintenance procedures

C. Record Drawings and Documentation

- 1. Contractor and Supplier shall revise all system working drawings, submittals and software documentation to reflect as-built conditions in accordance with the requirements of the Contract Documents and the supplemental requirements below.

2. Fourteen copies of all revised working drawings and documentation shall be submitted to the Commissioner to replace out-dated drawings and documentation contained in the System O&M Manuals per Section 01831 - Operation and Maintenance Manuals. Half-size black line sets shall be provided for all drawings larger than 11x17. Specific instructions for out-dated drawing removal and replacement shall be provided with the record drawing submittal.
  3. Half-size black line prints of wiring diagrams and any program or configuration printouts applicable to each control panel shall be placed inside a clear plastic envelope and stored in a suitable print pocket or container inside each control panel.
- D. Reports: Fourteen copies of the following reports shall be submitted to Commissioner.
1. Factory Test Procedures and Reports as described in Article 2.01 of this section
  2. Installation Inspection, Field Calibration, and Field Testing Reports as specified in Article 3.01 of this section
  3. Training plan as described in Article 3.02 of this section

## 1.05 QUALITY ASSURANCE

### A. General

1. The SCADA system shall be furnished by a single Supplier who shall assume responsibility for providing a complete and integrated system.
2. All equipment, components and materials required shall be furnished by the single Supplier who shall assume the responsibility for adequacy and performance of all items.
3. The Supplier shall identify those system components that are not of his manufacture.
4. The Supplier shall supply his company's quality assurance plan and for components which are not of his manufacture, the component manufacturer's quality assurance plan. The plans shall include, but not necessarily be limited to, method of construction and testing, raw material criteria, methods of documentation, station control, "Burn-In", final tests and serialization coding and packaging. Said plans shall be in accordance with M.I.L.-105D.

**B. Supplier's Qualifications**

1. Supplier shall be a financially sound firm having at least three years continuous experience in designing, implementing, supplying and supporting instrumentation and control systems at municipal facilities which are comparable to the SCADA system in terms of hardware, software, cost and complexity.
2. Supplier shall have manufactured and supported standard lines of similar processing and control equipment and application software continuously for the last three years.
3. Supplier shall have in existence, at the time of bid advertisement, an experienced engineering and technical staff capable of designing, implementing, supplying and supporting the SCADA system and handling the SCADA system submittal and training requirements.
4. Supplier shall provide system hardware components and software packages of fully developed, field proven standardized designs and therefore shall furnish a system that is not a highly unique, custom, one-of-a-kind system.
5. Supplier shall have a minimum of two years experience in operator interface software configuration and hardware application and programming of programmable logic controllers and data highway systems.
6. Supplier shall provide standard course offerings in general process control applications and in operation, programming and maintenance of the control system and equipment at a facility specifically utilized for training purposes. The facility shall have been in operation continuously for the last two years.
7. Supplier shall have a system of traceability of the manufactured units and purchased components through production, assembly and testing.
8. Supplier shall have a system of "Burn-In" for all components and available supportive documentation.
9. Supplier shall have a demonstrated record of prompt response to field failures.
10. Supplier shall have a documented program of failure analysis.
11. Supplier shall have a UL approved panel shop.
12. Supplier shall have a record of prompt shipments in accordance with contract obligations required for previous projects.

- C. Technical Proposal Requirements: The Contractor shall submit a copy of a Technical Proposal from the supplier which he has selected to provide the SCADA

system. The proposal shall be complete and contain all information as specified below.

1. Financial Statement: Include the value of distributed microprocessor based control systems delivered during the last two fiscal years. Also include the value of other process instrumentation and controls shipped during the period.
2. Experience
  - a. Provide evidence of compliance with the specific experience requirements listed in Paragraph 1.05.B. above in the form of an experience certification signed by an officer of the company.
  - b. Describe at least three completed municipal projects utilizing instrumentation and control equipment identical to or similar to (indicate which) that specified. Indicate project name, value, completion date, names and phone numbers of project representatives familiar with each project. Letters of recommendation may be submitted.
  - c. Furnish list of last three projects completed.
3. Personnel: Provide a listing of those personnel committed to be assigned to the project. List shall include project manager, project engineer, field representative, local service representative, and sales representative. Indicate addresses of personnel not based at supplier's main office. Provide documentation including resumes of personnel demonstrating experience.
4. Exceptions: List all exceptions and deviations from the requirements of these Specifications and/or the Contract Drawings. Reference section number, article, and paragraph of proposed variance and provide an explanation of why and how the proposed substitution meets or exceeds the functional or equipment requirements specified.
5. Shipment Records: Provide evidence of timely delivery of equipment on past projects.
6. SCADA System Hardware and Software
  - a. Provide a general system configuration drawing and include designations for model numbers and types of the proposed SCADA system and all other proposed system components.
  - b. Provide descriptive literature and manufacturer's catalog information covering all aspects of the hardware design and software functions and capabilities of the specific control system and data highway system proposed for the SCADA system.

## 7. Hardware and Software

- a. Provide descriptive literature and catalog information covering the features and capabilities of all proposed hardware components.
- b. Describe standard software packages proposed, including any customized software required to meet the functional intent of the system specifications. Descriptions shall address the following:
  - (1) Overview of system software including the functions, organization and interrelationship of the major software modules provided
  - (2) Estimated memory requirements to accomplish the specified graphic display, logging, reporting and alarming functional requirements
  - (3) Examples of graphic displays, methods of display access and procedures for display definition and generation, including use of the standard symbols library and capabilities for generating and storing user defined symbols in the symbol library
  - (4) Real-time data logging and reporting software features and capabilities including examples of logs and reports, procedures for automatic reporting and logging file setups, limitations on sampling and computing frequency for data acquisition and logging, and utilities for log file and report modifications and file maintenance
  - (5) Alarm handling software features and capabilities including an alarm display example, methods of defining alarms and alarm files, automatic printing of alarms, acknowledgements and return to normal conditions, chronological sorting and time-tagging of alarms, and alarm file maintenance utilities
  - (6) System programming and documentation software features and capabilities, including screen display and printout examples for a fully annotated and cross-referenced ladder diagram and the ladder diagram elements
  - (7) Use of system level diagnostics for monitoring the performance of and detecting and reporting faults associated with the distributed communications data highway

8. Instrumentation and Panel Mounted Devices: Provide descriptive literature and catalog cuts for each type of sensor, transmitter, indicator, and other such devices required by the project.

9. Training: Provide information and literature as to the organization proposed and the factory facilities to be utilized for the training specified. Indicate the qualifications of the factory training staff.
10. Availability Demonstration: Indicate how the Availability Demonstration will be accomplished.
11. Maintenance: Provide the following information:
  - a. Location of service facility along with minimum and maximum response time
  - b. Location of parts facility with delivery time and method

D. Supplier's Responsibility

1. Contractor shall retain the SCADA system Supplier to assume the responsibilities specified below. However, execution of these specified duties by the Supplier shall not relieve Contractor of ultimate responsibility for the SCADA system.
  - a. Design, fabrication, implementation and applications programming of the SCADA system and all subsystems in accordance with the Contract Documents and all referenced standards and codes
  - b. Preparation, assembly and correction of all SCADA system submittals in accordance with the Contract Documents
  - c. Proper interfacing of the SCADA system hardware, software, field devices and panels, including required interfacing with packaged control systems furnished by other equipment suppliers, and with the plant electrical system
  - d. Supervision of the installation of SCADA system, instruments, panels, consoles, cabinets, wiring and other components required
  - e. Calibration, testing and start-up of the SCADA system
  - f. Training of City of New York personnel in operation and maintenance of the SCADA system
  - g. Handling of all warranty obligations for the controls system components
  - h. Maintenance of two reproducible copies of the complete system and running software at the supplier's facility for the duration of the warranty period. Software copies shall be maintained on the bulk storage medium

used by the supplier for system program development and shall be directly loadable on the supplied system.

E. Coordination and Progress Meetings

1. Contractor shall be responsible for the scheduling and coordination of the system installation with regard to all other work on the site and in accordance with the provisions of the Contract Documents. Said coordination shall be documented on the project schedule. The purpose of the meetings shall be to review the progress of the Work involving the SCADA system and provide coordination for installation of the equipment to ensure construction schedules are met.
2. Routine progress and coordination meetings will be scheduled by Commissioner. Contractor and a representative of the Supplier shall be required to attend a minimum of one meeting per month for the length of contract.
3. Representatives at the meetings shall have the competence and authority to make any and all necessary decisions. Decisions and statements made at the meetings shall commit Contractor and Supplier to agreed procedures and schedules.

F. System Supplier Project Personnel: Contractor shall require the Supplier to provide the following project personnel:

1. Project Manager
  - a. The Supplier shall appoint a project manager who shall coordinate and schedule all work and assure that project schedule is met.
  - b. The project manager shall act as the liaison with Contractor for the installation of the monitoring and control system equipment and shall assist in all matters required for proper coordination and interfacing of the equipment and processes.
2. Field Engineer
  - a. The Supplier shall appoint a Field Engineer with responsibilities as follows:
    - (1) Provide advice and technical consultation relative to installation techniques and procedures for equipment furnished.
    - (2) Installation, system checkout, calibration, adjustment and start-up including tuning of every control loop.

- (3) Maintenance services during availability demonstration.
- (4) Involvement in the on-site system training of plant personnel.
- (5) Resolving of control problems encountered during initial start-up and testing of all plant monitoring and control equipment.

b. The field engineer shall have a minimum of three years experience in systems engineering and start-up and shall have a thorough working knowledge of both the hardware and software supplied for the SCADA system.

3. Training personnel as described in Article 3.02 of this section.

#### 1.06 REFERENCE STANDARDS

A. The following organizations' standards shall be used as guides in assuring quality and reliability of components and systems; govern nomenclature; define parameters of configuration and construction, in addition to specific requirements of the Specifications and Contract Drawings:

- 1. ISA, Instrument Society of America
- 2. API, American Petroleum Institute
- 3. UL, Underwriters' Laboratories, Inc.
- 4. NRC, Nuclear Regulatory Commission
- 5. NEMA, National Electrical Manufacturers Association
- 6. OSHA, Occupational Safety and Health Administration
- 7. ANSI, American National Standards Institute
- 8. MIL, Military Standards
- 9. NFPA, National Fire Protection Association
- 10. SAMA, Scientific Apparatus Manufacturers Association
- 11. JIC, Joint Industrial Council
- 12. IEEE, Institute of Electrical and Electronic Engineers
- 13. NEC, National Electrical Code
- 14. FM, Factory Mutual

#### 1.07 EQUIPMENT DELIVERY, HANDLING AND STORAGE

A. The SCADA system shall be packaged at the factory prior to shipment to protect each item from damage during shipment and storage. Containers shall be protected against impact, abrasion, corrosion, discoloration and/or other damages. Clearly label contents of each container and provide information on the required storage conditions necessary for the equipment. Keep City of New York and Commissioner informed of equipment delivery.

B. Transportation and handling of the SCADA system equipment and appurtenances shall comply with the requirements of Section 01651 - Transportation and Handling

of Materials and Equipment, requirements of the Supplier, and requirements of equipment manufacturers.

- C. Protection of SCADA system materials and equipment shall comply with the requirements of Section 01661 - Protection of Materials and Equipment and with manufacturer's instructions and relevant organization standards. Supplier shall notify Contractor in writing (with copies to City of New York and Commissioner) of the storage requirements and recommendations for the equipment prior to shipment.

## PART 2 PRODUCTS

### 2.01 FACTORY TESTING

- A. Factory testing shall be in accordance with Section 01431, Quality Assurance Inspection.
- B. General Requirements
  - 1. Factory testing shall be performed before shipment at the manufacturer's facility to verify that system components are functioning properly and that they meet the functional and performance requirements of the Contract Documents.
  - 2. Contractor shall submit information on factory testing procedures to verify that testing shall fulfill the requirements as specified herein. Submittal shall be made at least two months in advance of any scheduled testing and shall include dates of scheduled tests.
  - 3. Contractor shall notify Commissioner in writing at least 45 days before expected initiation of tests. City of New York and Commissioner shall be present at Contractor's facilities during operational test of system equipment, either for individual units or as an integrated system. Presence of City of New York and Commissioner during testing does not relieve Contractor from conforming to the requirements of the Contract Documents and shall in no way imply acceptance of the equipment.
  - 4. If the need should arise to retest the system or any part thereof and witnessing is deemed necessary, the Contractor shall be responsible for the same associated costs as aforementioned plus the additional costs of the City of New York's and Commissioner's staff members' time.
  - 5. When the factory tests have been successfully completed, a report shall be submitted to the Commissioner. The equipment shall not be shipped until Notice of Acceptance of the test is received by the Contractor.

C. All panels, consoles and cabinets shall be inspected. Inspection shall include, but not be limited to the following:

1. Nameplates and tags
2. Wire sizes and color coding
3. Terminal block contact ratings and numbers
4. Terminal block spares
5. Proper wiring practices and grounding
6. Enclosure flatness, finish and color

D. System Hardware Operational Testing

1. All input/output devices and components shall be tested to verify operability and basic calibration.
2. All system hardware components equipment shall be tested to verify proper operation of the equipment as stand alone units. Test shall include, but not be limited to, the following:
  - a. AC/DC power checks
  - b. Power fail/restart tests
  - c. Diagnostics checks
  - d. Test demonstrating that all specified equipment functional capabilities are working properly.
3. All system components shall be tested to verify that communication between units is working properly.
4. An integrated system test with all system equipment connected (excluding field sensors and instruments) shall be performed to verify that all equipment is performing properly as an integrated system.

E. System Software Demonstration

1. Contractor shall demonstrate all system software utility and security programs incorporated into the system to illustrate the various functions and capabilities specified.
2. Contractor shall demonstrate the operation and display of all software based on a simulation of 5 percent of total input/output count, both analog and discrete, as selected by the manufacturer. In addition, City of New York/Commissioner shall randomly select, at the time of the test, additional inputs and outputs to be simulated in an amount approximately equal to 5 percent of total input/output count. Demonstration shall show that the

monitoring and control application software associated with the input/output points performs the functions intended.

3. System performance shall be tested using a fully integrated system, including all software and hardware if applicable. To achieve this, the entire control system, including all the peripheral devices and all interconnecting cables, shall be assembled on the factory test floor and simulated inputs applied. The Contractor shall carry out a full system test, during which the entire system shall operate continuously without failure in accordance with the requirements of the Specifications and Drawings.
4. Contractor shall provide process I/O simulation panel prior to the test:
  - a. Toggle switches to simulate field or other input contacts
  - b. Indicating lights to simulate outputs from tested panels
  - c. Control relays to simulate MCC coil inputs
  - d. Time relays to simulate position switches
  - e. Indicators (mA) to indicate every 4-20 mA output from tested panel
  - f. Potentiometers to simulate 4-20 mA inputs to tested panel
5. Every device shall have nameplate with description and device's tag number. Nameplates shall be removable and interchangeable for multiple use of panel during the test.
6. Demonstration of communication between PLC's or remote I/O's shall be included in the Test Procedure where applicable.
7. Operator Interfaces: Prior to the staging and testing of the system, the display environments shall have been configured per the agreed upon display structure, loaded and data base parameters linked to the specified fields. During this phase of the factory acceptance test, the overall display structure shall be demonstrated, including environment configurations, passwords, security, etc. The memo display contents shall be reviewed to demonstrate how an operator navigates within the overall display structure. The assignment of displays to annunciator keys shall also be demonstrated. Each graphic display shall be reviewed for correctness in terms of the layout, symbols, color scheme, etc. The operation of standard alarm management displays (Current Alarm Display, Alarm History, etc.) shall also be demonstrated. A demonstration of each type of report specified shall be performed. Printing shall be an integral part of the report demonstration.

### PART 3 EXECUTION

#### 3.01 SYSTEM START-UP AND FIELD TESTING

- A. The Contractor shall retain the services of the Supplier to supervise and/or perform check-out and start-up of all system components. As part of these services, the

Supplier shall include for those equipment items not manufactured by him the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation and maintenance of the equipment.

**B. System Checkout and Start-up**

1. The Contractor, under the supervision of the SCADA system Supplier, and other instrument suppliers as applicable, shall perform the following:
  - a. Check and approve the installation of all SCADA system components and all cable and wiring connections between the various system components prior to placing the various processes and equipment into operation.
  - b. Conduct a complete system checkout and adjustment, including calibration of all instruments, tuning of control loops, checking operation functions, and testing of final control actions. When there are future operational functions included in this work, they should be included in the system checkout. All problems encountered shall be promptly corrected to prevent any delays in start-up of the various unit processes.
2. The Contractor shall provide all test equipment necessary to perform the testing during system checkout and start-up.
3. The Contractor and Supplier shall be responsible for initial operation of SCADA system and shall make any required changes, adjustment or replacements for operation, monitoring and control of the various processes and equipment necessary to perform the functions intended.
4. The Contractor shall furnish to the Commissioner certified calibration reports for field instruments and devices and panel mounted devices as soon as calibration is completed.
5. The Contractor shall furnish the Commissioner an installation inspection report certifying that all equipment has been installed correctly and is operating properly. The report shall be signed by authorized representatives of both Contractor and the Supplier.

**C. Integrated System Field Test**

1. Following the SCADA system checkout and initial operation, the Contractor, under the supervision of the supplier, shall perform a complete system test to verify that all equipment and programmed software is operating properly as a fully integrated system, and that the intended monitoring and control functions

are fully implemented and operational. Any defects or problems found during the test shall be corrected by Contractor and then retested to demonstrate proper operation.

2. Following demonstration of all system functions, the SCADA system including field sensors/transducers and instruments shall be running and fully operational for a continuous 48 hour period. The Operational Availability Demonstration specified below shall not begin until the continuous 48 hours integrated system test has been successfully completed and City of New York and Commissioner agree that the Operation Availability Demonstration can begin.

#### D. Operational Availability Demonstration

1. Operational Availability Demonstration (OAD) shall begin following completion of the integrated system field test as specified above and shall continue until a time frame has been achieved wherein the system (both hardware and software) availability meets or exceeds 99.9 percent for 60 consecutive days and no system failures have occurred which result in starting the OAD over again. During the OAD the system shall be available to plant operating personnel for use in normal operation of the plant.
2. For the purpose of the OAD the system will be defined as consisting of all operator interfaces and connected PLC's.
3. The conditions listed below shall constitute system failures which are considered critical to the operability and maintainability of the system. The OAD shall be terminated if one or more of these conditions occur. Following correction of the problem, a new 60 consecutive day OAD shall begin.
  - a. Failure to repair a hardware or software problem within 120 consecutive hours from the time of notification of a system failure.
  - b. Recurrent hardware or software problems: if the same type of problem occurs three times or more.
  - c. Software problem causing a processor to halt execution.
4. The following conditions shall constitute a system failure in determining the system availability based on the equation specified in Paragraph 3.01D.5:
  - a. Failure of any operator interface or PLC.
  - b. Loss of communications between devices on the communications network.
  - c. Failure of one or more input/output components.

- d. Failures of any type affecting ten or more input/output points simultaneously.
  - e. Failure of any type affecting one or more regulatory control loops or sequential control strategies thereby causing a loss of the automatic control of the process variable or process sequence operation.
  - f. Failure of power supply. Where redundant power supplies are provided, failure of one power supply shall not constitute a system failure provided the backup power supply operates properly and maintains supply power. Failure of the backup supply to operate properly and maintain supply power shall constitute a system failure.
  - g. Failure of three or more primary sensors/transducers or field instruments simultaneously.
5. The system availability shall be calculated based on the following equation:

$$A = \frac{TTO}{TTO + TTR} \times 100\%$$

Where:

A = system availability in percent  
TTO = total time in operation  
TTR = total time to repair

6. Time to repair shall be the period between the time that Contractor is notified of a system failure and the time that the system has been restored to proper operation in terms of hours with an allowance for the following dead times which shall not be counted as part of the time to repair period.
- a. Actual travel time for service personnel to get to the plant site up to 6 hours per incident from the time Contractor is notified of a system failure.
  - b. Time for receipt of spare parts to the plant site once requested up to 24 hours per incident. No work shall be done on the system while waiting for delivery of spare parts.
  - c. Dead time shall not be counted as part of the system available period. The dead time shall be logged and the duration of the OAD extended for an amount of time equal to the total dead time.
7. Completion of a 60 consecutive day period without any restarts of the OAD and with system availability in excess of 99.9 percent will constitute acceptance of the SCADA system by Commissioner.

8. All parts and maintenance materials required to repair the system prior to completion of the OAD shall be supplied by Contractor at no additional cost to City of New York. If parts are obtained from the required plant spare parts inventory, they shall be replaced to provide a full complement of parts as specified.
9. A SCADA System Malfunction/Repair Reporting Form shall be completed by the plant personnel and Commissioner to document system failures, to record Contractor notification, arrival and repair times and Contractor repair actions. Format of the form shall be developed and agreed upon prior to the start of the OAD.

### 3.02 TRAINING

#### A. General Requirements

1. The Contractor shall retain the services of the System Supplier to provide operation and maintenance training for all plant monitoring and control system equipment at times acceptable to the Commissioner as specified herein.
2. For equipment items not manufactured by the system supplier, on-site training shall be provided by an authorized representative of the equipment manufacturer as part of his services. The manufacturer's representative shall be fully knowledgeable in the operation and maintenance of the equipment.
3. The Contractor shall be responsible for all costs associated with training and shall provide all required materials including training facility rental, computers, simulators, texts and required supplies.
4. The Contractor's System Supplier shall provide classroom training at a local training facility or Conference Center off-site and within a 20 mile radius of the work site. If a System supplier does not have a local training facility within the 20 mile limit, he shall rent such facilities for the duration of the training. All costs associated with providing a local training facility shall be paid by the Contractor.
5. All training shall be conducted during the hours of 8:00 AM to 12:00 AM until conclusion of the training course. All training sessions shall be provided twice and shall be scheduled by the City of New York to accommodate their shift schedule.

- B. Within 90 days of the effective date of the Notice to Proceed, Contractor shall submit his plan for training. Included in the plan shall be course outlines and schedules for training to be provided.

## C. Off-Site Training

1. The Contractor shall provide a supplier who shall perform standardized, structured training courses at training facility staffed with regular full time training instructors covering both operation and maintenance of the system equipment furnished by the supplier.
2. All training shall be scheduled so that it has been completed prior to System Acceptance by the Commissioner.
3. The City of New York will send the following personnel to attend training courses:
  - a. Operations Training: 30 persons
  - b. Maintenance Training: 10 persons
  - c. System supervisor/Engineer Training: 10 persons
4. Operator Training Course
  - a. Provide a one week (5 days, 8 hours per day) course covering the structure and the functions of the SCADA system components and devices. The course shall familiarize the student with the procedures for applying the system to process control problems and develop student programming capability.
  - b. As a minimum, the course shall cover the following topics:
    - (1) Overview of systems functional capabilities
    - (2) Equipment overview including system component functions, operating principals and proper use
    - (3) Loading and start-up of the digital system hardware components
    - (4) Use of system commands
    - (5) Development of programs and control schemes
    - (6) Development and use of system displays
    - (7) Programming concepts and techniques
    - (8) Use of bulk storage device for system backup

5. Maintenance Training Course

- a. Provide a 40-hour course covering preventive and trouble-shooting maintenance for the system components. The course shall familiarize the student with diagnostic capabilities of the system, both software and hardware, and also the routine maintenance procedures on the system and the common peripheral devices. Total training hours: 80.
- b. As a minimum the course shall cover the following topics:
  - (1) System overview description including the power subsystems and logic components of the processor bus
  - (2) Description of the maintenance and trouble-shooting aids of the system including software diagnostic programs
  - (3) Description of all bus operations
  - (4) Description of peripheral and process interface devices
  - (5) The use of hardware diagnostic routines, test equipment and test procedures as required to enable the City of New York's personnel to detect and isolate system faults to the circuit board or module level and to implement repairs by replacing failed circuit boards or modules.

6. System supervisory/Engineer Training

- a. Provide a 40-hour manufacturer's standard training in the use and configuration of the specified HMI software. An instructor certified by the software manufacturer to furnish such training shall perform this training. Total training hours: 80.
- b. System supervisor/engineer training shall be performed a minimum of 30 days prior to system startup.
- c. Training shall be provided in the following subjects:
  - (1) System overview and capabilities
  - (2) Database configuration
  - (3) Graphic display configuration, including linking of data to displays
  - (4) Historical data configuration (collection, manipulation, and display)

- (5) Real-time and historical trending
- (6) Report configuration, generation, printing, and customization
- (7) Alarm configuration and management
- (8) System security
- (9) I/O driver use and configuration
- (10) System backup and recovery
- (11) DDE linking, where applicable
- (12) System command language
- (13) Trouble-shooting
- (14) System optimization
- (15) System startup and shutdown procedures
- (16) LAN and WAN communications, as appropriate

d. The course shall be structured as follows:

- (1) Fundamentals: An 8-hour course (minimum) shall be provided which shall serve as a digital control system familiarization course for project management personnel, engineers, and key operation/maintenance personnel. This course shall be a prerequisite for the advanced course described below in Item 2.
- (2) Advanced: A 24-hour course (minimum) digital system configuration and operating course shall be provided. The level of training shall be sufficient to familiarize the City of New York personnel with the configuration and application of all system programs. All essential system operating procedures shall be described as required to enable the City of New York personnel to operate the system via the various work stations and local control panels.

D. On-site Training

1. Primary Sensors/Transducers and Field Instruments

- a. Provide on-site operation and maintenance training by system supplier and the equipment manufacturer representatives prior to placing the

SCADA System – General Requirements

17101-28

equipment in continuous operation. The services of equipment manufacturer's representatives shall be provided for a minimum of eight (8) hours for each type of instrument provided.

- b. Training covering control equipment
  - (1) Provide instruction covering use and operation of the equipment to perform the intended functions.
  - (2) Provide instruction covering procedures for routine, preventive and trouble-shooting maintenance including equipment calibration.
  - (3) Explain procedures for placing the equipment in and out of operation and explain necessary actions and precautions to be taken regarding the overall plant monitoring and control system.

2. Training covering control equipment:

- a. The System Supplier shall provide 80 hours of operations training covering all system components.
- b. Training course shall accomplish the following:
  - (1) Provide all instructions necessary to operate and utilize all system components.
  - (2) Provide all instruction necessary to monitor and control the system processes from the designated control panel.
  - (3) Explain procedures for control of the system during scheduled or rescheduled shutdown and the subsequent start-up.
  - (4) Provide instructions for regular caretaking operations.

3. PLC Training: The SCADA system supplier shall provide 40 hours of training that covers PLC as follows:

- a. Provide an overview of system hardware and software.
- b. It shall train people in configuration, operation and programming PLCs.
- c. The emphasis shall be placed on how to perform set point changes, minor programming changes, range changes, diagnostics and upkeep of documentation.
- d. Instruction for hardware and software maintenance, trouble shooting and maintenance planning.

4. Training following two months of regular system operations:
  - a. The system supplier shall provide operation and maintenance covering all system equipment provided.
  - b. The training shall be of the same format, content and duration as the training described in items 1, 2 and 3 above.

-END OF SECTION-

**Section 17210**  
**SCADA SYSTEM - OPERATOR WORKSTATION**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install, calibrate, test, startup, and place into satisfactory operation the operator workstation(s).

**1.02 RELATED SECTIONS**

- A. Section 17101 - SCADA System - General Requirements
- B. Section 17213 - SCADA System - Computer Consoles

**1.03 QUALITY ASSURANCE**

- A. Comply with the requirements of Section 17101 - SCADA System - General Requirements.

**1.04 SUBMITTALS**

- A. The Contractor shall comply with the requirements specified in Section 17101 - SCADA System - General Requirements, and include the following information in the submittal for this Section:
  - 1. A description of the operator workstation displays including:
    - a. How the operator requests the display and what options are available.
    - b. What the operator can accomplish via the display and how each function is performed.
    - c. Access restriction features and the functions accessible in each access level for each display.
  - 2. A description of alarm handling. Describe how alarms are presented and how the operator used the information to access the points in alarm.
  - 3. A description of fault detection, isolation, and correction. List the on-line and off-line diagnostics. Describe how they are used and describe the various execution options available for each.

4. A description of how software is configured including but not limited to:
  - a. Input/output points
  - b. Graphic displays
  - c. Alarm/event functions
  - d. Trending functions
  - e. Standard and user defined libraries
5. A description of how the unit can be configured to address other equipment including but not limited to:
  - a. Programmable Logic Controllers (PLC).
  - b. Printers
  - c. Other peripheral options which can be furnished as part of a standard package.

#### 1.05 MAINTENANCE

- A. Provide the following spare parts:
  1. One display monitor
  2. One keyboard
  3. One PC
  4. One pointing device (mouse or trackball)
- B. Provide special tools necessary for normal operation, maintenance and diagnostic aids.
- C. Upon failure of the operator workstation, system component connections shall not affect the operation of:
  1. Data highway
  2. PLCs
  3. Other operator workstations

### PART 2 PRODUCTS

#### 2.01 MATERIALS

- A. General
  1. Provide equipment to operate on 115 volt AC, single phase, 60-hertz electrical service.

2. Provide all necessary items for installation, including mounting brackets, interconnecting cables, hardware and appurtenances.

B. Computer Hardware, minimum requirements

1. Workstation

- a. Processor: one Xeon Processor operating at 2.8Ghz
- b. Front Side Bus: 533 MHz
- c. Memory: 2GB of Registered ECC PC2100 DDR-266 memory
- d. Monitor: 20" flat panel LCD display
  - (1) LCD Type: TFT active matrix
  - (2) Video Input Signal: Analog RGB and digital DVI-D
  - (3) Pixel Pitch: No greater than 0.294 mm
  - (4) Viewing Angle: 85 degrees nominal
  - (5) Contract Ratio: 600:1
  - (6) Brightness: 250 nits
  - (7) Prime Mode: 1280 x 1024 (SXGA)
  - (8) Mounting: VESA-compliant adapter plate
- e. Graphics accelerator card: NCIDIA Quadro FX 1100 with 128 MB
- f. Hard Drive: 160 GB Ultra ATA
- g. Removable Drives: CD-RW+DVD combo and 256 MB USB drive key storage
- h. Modem: 3 Com Sportster 56K Modem w/V.90 technology
- i. Mouse: Microsoft System Intellimouse
- j. Communications Card: Integrated gigabit LAN 10/100/1000
- k. Keyboard: 104+ keys
- l. Documentation: Provide all documentation, manuals and licenses
- m. Environmental: Control Room environment (see Section 17101 for environmental requirements)
- n. Safety/Regulatory: UL, FCC B, approved

2. Latest revision of software at time of bid required

- a. Windows XP Professional
- b. Microsoft Office Professional
- c. McAfee Virus Scan

2.02 USER FUNCTIONS

- A. Connect to the data highway for display of the status of the process and equipment within the plant. See System Block Diagram for intended functionality. Load and configure Human-Machine Interface software (HMI).
- B. Permit control actions and control parameter access to allow the operation to monitor and control the process.
- C. Function as a totally independent unit by receiving data directly from the PLCs over the data highway.
- D. Provide display selection, control adjustments and control security, data entry, and other related user entry functions.
  - 1. Use cursor keys and pointing device to select targets or information.
  - 2. Use hard or soft function keys to execute commands.
  - 3. Use numeric keys for data entry.
- E. Check entries for proper sequences and logical commands. Display messages for invalid entries. State reason why command was invalid.
- F. System Security
  - 1. Provide the following password protected modes:
    - a. Display to allow only monitoring.
    - b. Operate to allow operator functions to be performed.
    - c. Configure to allow programmer/engineer functions to be performed.
  - 2. Provide password protection for each mode of user access for up to 512 user passwords.
  - 3. Provide an on-line method for a designated high level user to display and change password assignments.
- G. Provide the following functions in the display mode:
  - 1. Sign on/sign off (enter password).
  - 2. Select and view displays.
  - 3. Print displays.

H. Provide the following functions in the operate mode:

1. Display mode functions.
2. All other functions not expressly reserved for the configure mode.

I. Provide the following functions in the configure mode:

1. All display and operate mode functions.
2. Add, modify, delete passwords.
3. Add, modify, delete graphic displays:
  - a. Lay out graphics and text
  - b. Define colors
  - c. Attach dynamic data and targets.
4. Add, modify, delete input/output points.
5. Add, modify, delete reports:
  - a. Change format
  - b. Add, delete, move points
  - c. Add, delete, modify calculations
  - d. Modify automatic scheduling.
6. Change system time or date.
7. Backup to diskette.
8. Change which functions are assigned to which mode.
9. Startup, shutdown, and general programming activities.
10. Control strategy generation and modification in each PLC.

## 2.03 DIAGNOSTIC AND TEST

A. Provide a fault detection, isolation, and correction on a card level basis. Use LEDs on cards and diagnostic displays. Identify intermittent and continuous failed components. Perform self tests continuously and include as a minimum:

1. Power supply failure
2. Processor failure
3. Memory failure
4. Internal I/O bus failure
5. Communications failure

- B. Upon failure of any self check, halt operation until manually or automatically reset.
- C. Upon power up or resetting, reload the operator workstation configuration within 30 minutes. Perform this function using back-up software.

## 2.04 PRODUCT MANUFACTURERS

- A. Provide operator workstation of one of the following:
  - 1. HP
  - 2. Dell
  - 3. IBM

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Operator workstations shall be installed as shown. Provide all mounting hardware required for a seamless mounting.
- B. Mount workstation to computer console as shown, and in accordance with Specification Section 17213 - SCADA System - Computer Consoles.

### 3.02 SERVICE CONTRACT

- A. Each operator workstation shall be provided with an on site service contract for a minimum of three years from date of acceptance by the City of New York. The balance of the service contract shall be transferable from the contractor to the City of New York upon contract closeout. The cost of the service contract shall be included in the lump sum price.
- B. Upon notification of service interruption, the service contract provider shall repair the operator workstation or replace in kind with complete software restoration within two workdays.

-END OF SECTION-

**Section 17212**  
**SCADA SYSTEM - PROGRAMMABLE LOGIC CONTROLLERS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install, calibrate, test, startup, and place into satisfactory operation Programmable Logic Controllers (PLCs).
- B. PLC hardware specified herein shall be of the Process Automation Controller (PAC) type system, functioning as a PLC and including all extended features. Configuration and documentation of all Programmable Logic Controllers shall be performed by the Contractor.

**1.02 RELATED SPECIFICATIONS**

- A. Section 17101 - SCADA System - General Requirements
- B. Section 17250 - SCADA System - Plant-Wide Network Equipment
- C. Section 17320 - SCADA System - Control Panels and Enclosures

**1.03 QUALITY ASSURANCE**

- A. All materials and equipment furnished shall be new, free from defects, and of first quality, produced by manufacturers who have been regularly engaged in the manufacture of these products.
- B. Where there is more than one item of similar equipment required under the Contract, all such similar equipment shall be the product of one manufacturer. All PLCs provided under this Contract shall be of the same manufacturer.
- C. All material furnished under this Contract shall be determined safe by either Underwriters Laboratories, Inc., or Factory Mutual Engineering Corporation and all material shall be labeled, certified, or listed by the testing agency.
- D. Custom made equipment or related installation that is constructed specially for this Project will not be acceptable. Equipment furnished within this contract shall be a standard product, furnished by a supplier regularly engaged in the manufacture of such products.

**1.04 SUBMITTALS**

- A. Comply with the requirements of Section 17101.

## 1.05 SPARE PARTS, TOOLS AND SUPPLIES

- A. The Contractor shall furnish all spare parts in conformance with Section 01750 – Spare Parts and Maintenance Materials. Deliver all spare parts, tools and supplies with the equipment, neatly wrapped or boxed, indexed and tagged with complete information for use in reordering.
- B. Furnish the following spare parts:
  - 1. Ten percent spare I/O modules for each type furnished, with a minimum of one.
  - 2. Ten percent spare communication modules for each type furnished (Ethernet, Remote I/O, PLC LAN), with a minimum of one.
  - 3. Ten percent spare CPUs of each size and type furnished, with a minimum of one.
  - 4. Ten percent spare PLC rack of each type and size furnished, with a minimum of one.
  - 5. Ten percent spare Power supplies of each size furnished, with a minimum of one.
  - 6. All spare parts (Qty.1) recommended by manufacturer and listed as recommended spare parts in the manufacturer's submitted O&M manual
- C. Tools: Furnish all tools necessary to service, disassemble, repair, and adjust the equipment.

## PART 2 PRODUCTS

### 2.01 PROGRAMMABLE LOGIC CONTROLLERS

- A. General
  - 1. Provide programmable logic controllers as shown on the Contract Drawings and as specified herein. PLC's shall be provided with all necessary components to accomplish the specified requirements. Provide an interface with keypad to facilitate changes of setpoints, timer and counter presets, etc., mounted inside the panel with the PLC.
  - 2. The PLC shall be configured by Contractor to perform functions shown and specified. The Contractor shall coordinate and obtain from all equipment suppliers PLC systems of the same manufacturer and series.

3. Functions to be performed by the PLC include but are not necessarily limited to the following:
  - a. Alarm and status indication
  - b. PID control and arithmetic functions
  - c. Interlock and sequential logic control of processes and equipment operations
  - d. Collection and transmission of data and control parameters to and from other PLCs
  - e. Provide a dry contact rated 2 Amperes at 120 Volts AC for remote indication of processor failure.
4. The PLC shall be electronic type furnished with all necessary relays, timers, counters, and latches as data manipulative functions and arranged into the format required to accomplish the functions shown and specified.
5. The PLC shall be designed and constructed for the demanding requirements of real-time process management and control on a continuous basis for use in a waste transfer facility.
6. The manipulative functions shall have the capability of being rearranged into any desired format while the controller is performing other control tasks.
7. Expansion of the controller by the input/output points, internal data manipulative functions, and relays, timers and counters shall be accomplished by reprogramming.
8. The control programs and applications memory of the PLC shall be capable of being remotely (off-line) and locally (on-line) monitored, programmed, modified and displayed by use of a personal computer and documentation software which shall be provided as part of this contract. In addition, the PLC shall be capable of being programmed by an external PC compatible host device via an Ethernet communication port. The host communication interface shall allow controlled access for authorized users via password protection to all registers, I/O system fault status and I/O override.
9. The logic shall be entered and displayed in ladder diagram and functional block format. The ladder diagram format shall contain a complete cross-reference with each coil referred to in logic and identified as normally open or normally closed. Mnemonic information shall be added to each coil and to both real and internal I/O points. Alphanumeric titles and descriptions shall appear on the screen.

10. Any restructuring of the control logic shall be done at the PLC installation and shall not necessitate any removal of the mainframe to another location.
11. The controller mainframe shall be arranged in modular type design. All inputs, outputs, and logic control interface units shall be easily removed for ease in replacement or restructuring the hardware arrangement. Shut down of the processor control logic (halting of program scan) shall not occur when remote input/output modules are removed.
12. In the event of a power failure or malfunction of the logic hardware, the controller shall provide dry, Form C contact closures for remote and local indication and alarming.
13. A self-diagnostics package to determine proper processor operation shall be included. Diagnostic LED shall be provided in clear view on the front of the PLC enclosure.
14. Changing an on-line control logic process operation shall not necessitate the halting of the processor.
15. Burn-in for all printed circuit boards and modules shall be performed at the factory.
16. Equipment shall conform to NEMA ICS 3-304.
17. The primary interface to the process equipment and field devices shall be provided by the input/output system consisting of I/O modules installed in mounting racks. The input/output system hardware shall be designed with the following features:
  - a. Noise immunity and filtering
  - b. IEEE surge-withstand rating to IEEE 472
  - c. Optical isolation for all inputs and outputs to provide controller logic protection
  - d. No on board pots requiring adjustment or maintenance
  - e. Any card, any slot, plug-in packaging, with locking bars and/or screws to hold I/O modules in place
  - f. 300-volt, screw type, field wiring terminal strips sized to accommodate a minimum of two No. 14 AWG wires per terminal. Terminal strip design shall allow I/O module removal and replacement without disturbing wiring connections.

- g. A Front-of-module LED status indicator for each individual input and output point to indicate when power is applied at I/O terminals
- h. Individually fused output circuits for all output modules. Fuses shall be capable of being inspected without removal of and replaced without disassembly of the output module. For individually isolated output modules, front-of-module blown fuse LED status indicators shall be provided for each output point. For non-isolated (common output power source) output modules, common blown fuse LED status indicators shall be provided for a maximum of every four points.
- i. All outputs for contactors and relays shall be rated for a minimum of 2.0 Amps continuous at 120 VAC. Higher rated outputs and/or interposing relays inside the control center shall be provided in order to assure that ratings of the output contacts are not exceeded. Coordinate with equipment being controlled by the respective outputs.
- j. For outputs to motor contactors and other equipment type load relays, provide transient and inrush surge suppressor connected across the output contact terminal and the neutral-common terminal inside the control center to suppress the switching surge transient to lower than the continuous rating of the output contacts.
- k. The maximum number of points per I/O module shall be as follows:
  - (1) Discrete: 16
  - (2) Analog: 8
- l. The following types of I/O modules shall be provided for use with the supplied PLC System:
  - (1) Analog Inputs (12 bits minimum)
    - (a) 0-10 VDC
    - (b) 1-5 VDC
    - (c) 4-20 mA DC (250 Ohms maximum impedance)
    - (d) Millivolt signals
  - (2) Analog Outputs (12 bits minimum)
    - (a) 4-20 mA DC (load of 750 Ohms minimum)
    - (b) 0-10 VDC
    - (c) 1-5 VDC

- (3) Register Inputs and Outputs (16 bit)
  - (a) Single BCD
  - (b) Multiplexed BCD
- (4) Discrete Inputs
  - (a) 5 V, 12 V, 24 V, 48 V and 120 VAC/VDC in both isolated and common circuit types
  - (b) TTL Logic
- (5) Discrete Outputs
  - (a) 120 VAC in both isolated and common circuit types
  - (b) 12-120 VDC
  - (c) Form C Relay Contacts
  - (d) TTL Logic
- (6) High Speed Encoder/Counter
  - (a) Accept and count pulse inputs independently and unaffected by I/O scan or program scan.
  - (b) Minimum pulse rate of 50 Khz.
- (7) Remote I/O Subsystem
  - (a) Remote I/O shall be provided as designated on the Control System Block Diagram. Remote I/O shall be either PLC rack type I/O or intelligent field modules (FIELD Control I/O for GE, FLEX I/O for AB), as manufactured by the PLC manufacturer. Field modules shall meet the requirements of Input/Output Subsystems. Remote I/O processor or communication modules shall be modular and individually replaceable.
  - (b) Remote I/O shall communicate with PLC CPU using the PLC manufacturer's communication bus for remote I/O. Genius LAN for GE Fanuc PLCs, DH + for AB PLCs and Modbus Plus for Modicon PLCs. All required cabling shall be furnished under this contract and use the conduit system as indicated on the Electrical Drawings. Provide adequate lengths. Cabling will be installed under the Electrical contract. Supervision and testing of the installations shall be provided and be in conformance with Section 17250 requirements for supervision and testing.

18. Signal and control circuitry to individual input/output boards shall be arranged such that board failure shall not disable more than one half of the control loops within any group of controlled equipment (e.g., one pump out of a group of three pumps, two pumps out of four, etc.). Where possible, individual control loops and equipment shall be assigned to individual boards such that failure of the board will disable only one loop or piece of equipment. Valve actuator loops shall be assigned on a per tank basis to limit common point of failure.

**B. Required Features**

1. Construction: Modular printed circuit boards.
2. Type: Electronic components with central processing unit and software reprogramming capabilities.
3. Memory
  - a. System Memory: Electrically Erasable Non-volatile type (EEPROM) or Lithium battery-backed RAM with minimum retention time of 2 years under worst-case conditions.
  - b. Application Memory
    - (1) Type: Lithium Battery-backed RAM with minimum retention time of 2 years under worst case conditions, or RAM with EEPROM or NOVRAM backup modules.
    - (2) Size: As required for present and dedicated future I/O capacity and for performance of the specified functional requirements plus 25 percent spare capacity as a minimum.
4. Language Format: Ladder type diagrams and functional blocks.
5. Provide type and quantity of I/O as required to perform the operational and functional requirements plus 20 percent active spare (minimum of one module) for each type of I/O module used. Active spare points shall be mounted and wired ready for use and shall require only field wiring connections and software configuration to place the point in service.
6. Internal Functions: Relays, timers, counters, latches, internal storage registers, and other functions as required to perform specified functional requirements plus 25 percent spare capacity.
7. Report Generation: Processor shall have the capability to store and automatically communicate up to 198 ASCII status/ alarm/diagnostic type

messages to a peripheral display device via the RS-232C output port at rates up to 19.2 K bits/second.

8. Security Features: Key switch interlock on PLC and/or security password protection through system programmer terminal to prevent tampering of logic sequences and unauthorized programming.
9. Processor Scan Time: 2 ms per 1 K bytes of memory typical.
10. Operating Temperature: 32°F to 140°F
11. Storage Temperature: Minus 40°F to 160°F
12. Power Supply: 120 VAC,  $\pm 10$  percent with fuse or circuit breaker protection. Supplies shall be sized for a minimum of 130 percent of maximum simultaneous current draw in accordance with Section 17101.
13. Data Communications: The PLCs provided shall be capable of peer-to-peer communications with other PLCs of the same and different types by means of manufacturer standard data highway system. Highway system design shall be a token-passing, masterless, high-throughput serial communication bus that connects the PLCs by means of intelligent network interface modules at the highway drops. Minimum local highway speed shall be 50 K baud and highway system design shall be upwardly compatible with the MAP industry standard protocols (DeviceNet, ControlNet, Modbus, Ethernet). All PLC(s) shall be provided with Ethernet networking capability using TCP/IP protocol. All modules required shall be provided.
14. Clock: Battery-backed clock with typical variation of  $\pm 20$  sec. per month.
15. Programming/Documentation Software
  - a. Provide PLC programming/documentation software package (WINDOWS NT compatible) that shall be fully menu-driven and self-prompting. All software provided shall be year 2000 compliant. Furnish certification with software. Package shall provide fully integrated ladder diagram programming and documentation. The package shall allow 3 lines of mnemonics per ladder element with 6 characters per line minimum. It shall also provide for the inclusion of the following documentation information for ladder diagram contacts and coils:
    - (1) Panel I/O wiring list
    - (2) Rack number
    - (3) Module position slot number
    - (4) I/O module type
    - (5) Terminal number and wire number

- (6) Electrical and Mechanical Drawing Reference Number
  - (7) Description of up to 240 characters in length for each element
- b. The programming/documentation software displays shall allow the user to flip between documentation and the uncommented rung as it resides in the controller. Software shall also allow selection of single rung and continuous ladder diagram printouts.
- C. System configuration shall be as shown on the Drawings. Memory and processor shall be adequate for all control functions specified. PLC(s) shall be as manufactured by, or equal to, those listed in the following table.

Manufacturer	Micro	Small/Mid-Size	Large
Allen-Bradley	Flexlogix with Ethernet/IP, DeviceNet and ControlNet communication	Compact-Logix with Ethernet/IP, ControlNet and DeviceNet communication	Control-Logix w/ hot backup CPU, Ethernet/IP, ControlNet and DeviceNet communication
GE-Fanuc	Versamax with RS-485 and DeviceNet communication	PACSystems RX3i w/300 CPU with Ethernet EGD and Genius Modbus TCP communications	PACSystems RX7i with 1.8 ghz redundant CPUs with embedded Ethernet, Genius LAN and Modbus TCP over Ethernet communication
Modicon	Micro PLC with Modbus and RS-485 communication	Momentum MIE with Ethernet and Modbus communications; Quantum PLC 140 CPU 311 10.	Quantum PLC CPU 651 60 with Hot Standby, CPU Modbus and Ethernet communication

- D. No more than one word shall be required for each contact or coil including address, no more than one word for a branch, no words for spaces or connects, and no words shall be required to begin a new rung. Scan time refers to nominal memory scan time of words of relay ladder logic, with an "immediate I/O update" command to operate on instantaneous alarm information. Unprogrammed memory shall not be scanned.

- E. PLCs shall meet the following minimum performance requirements per designated type as listed in the following table.

Manufacturer	Micro	Small/Mid-Size	Large
Allen-Bradley	Flexlogix with Ethernet/IP, DeviceNet and ControlNet communication	Compact-Logix with Ethernet/IP, ControlNet and DeviceNet communication	Control-Logix w/ hot backup CPU, Ethernet/IP, ControlNet and DeviceNet communication
GE-Fanuc	Versamax with RS-485 and DeviceNet communication	PACSystems RX3i w/300 CPU with Ethernet EGD and Genius Modbus TCP communications	PACSystems RX7i with 1.8 ghz redundant CPUs with embedded Ethernet, Genius LAN and Modbus TCP over Ethernet communication
Modicon	Micro PLC with Modbus and RS-485 communication	Momentum MIE with Ethernet and Modbus communications; Quantum PLC 140 CPU 311 10.	Quantum PLC CPU 651 60 with Hot Standby, CPU Modbus and Ethernet communication

- F. PLC Operator Interface. Provide one of the following:

1. DTAM Plus Operator Interface for AB PLCs, as manufactured by Allen Bradley Company.
2. OTU 157 for GE PLCs, as manufactured by General Electric.
3. TSX Quantum Automation Series for Modicon PLCs (with ASCII operator keypad), as manufactured by Modicon.
4. Or approved equal.

## 2.02 PORTABLE PROGRAMMING UNIT

- A. The Contractor shall provide a notebook computer portable programming unit for all PLCs furnished for loading the control plan into the processor memory and monitoring the data table. The programming and monitoring equipment shall be able to interface with the controller during operation. The portable programming unit shall be furnished with Ethernet and serial (RS 232/422) communication interfaces. The portable programming unit shall have the following features as described below:

1. The portable programming unit shall be capable of continuous operation at temperature of 0-50°C (32-122°F), humidity levels of 5-95% non-condensing, vibration levels of 0.2" (9.58mm) peak to peak @ 5 to 10 Hz, and noise immunity levels as described in NEMA arc test (ICS 2-230).
  2. The portable programming unit shall contain a LCD terminal and a keyboard. There shall also be a built-in temperature sensor to alert the operator with an alarm message, if the internal temperature exceeds 60°C.
  3. The portable programming unit shall have one 3 1/2" internal floppy disk drive with 1.44 M bytes of data storage and one internal hard disk drive of 20 G-byte of data storage.
  4. The display shall be a 14.1" color TFT active matrix type.
  5. The portable programming unit shall contain a minimum of 64 Mb RAM programming memory.
  6. The portable programming shall be provided with an Intel Pentium 4 based 1.7 Ghz or greater CPU.
- B. The portable programming unit shall connect to the CPU through a non-remote I/O port, a Data Communications port, or a programming port on the CPU, depending upon the particular programmable controller device.
- C. The portable programming unit shall be capable of programming the controller system through the use of a ladder logic instruction set. It shall also be possible to observe the I/O status and the register values. Overriding of inputs and outputs shall also be possible.
- D. The portable programming unit shall be capable of basic programming functions, which shall include normally-open normally-closed contacts, latch relays, one shots, timers, and up-down counters.
- E. The portable programming unit shall contain an available field of nine (9) contacts and one (1) coil across by seven (7) contacts down, for each rung of the program.
- F. The portable programming unit shall be capable of modifying the program element-by-element or rung-by-rung. The workstation shall also be capable of complete program documentation.
- G. The portable programming unit shall have the following three modes of operation: on-line, off-line, and monitor.
- H. The portable programming unit shall be capable of displaying the status of contacts, coils, timers, counters, and registers while in the monitor mode.

- I. The portable programming unit shall be capable of normal programming in the off-line mode.
- J. The portable programming unit shall be capable of editing, and modifying the running program while in the on-line mode.
- K. The portable programming unit shall be as manufactured by Dell, Hewlett Packard or approved equal.

## PART 3 EXECUTION

### 3.01 INSTALLATION

- A. Install each item in accordance with manufacturers recommendations and in accordance with the Contract Documents.
- B. Configure PLC to prevent erroneous and nuisance alarms by using techniques including time delays and logic. For example, inhibit initiation of a seal water failure alarm when pump is not running and provide a time delay on high discharge pressure alarm.
- C. Arrange PLC data table. Repeat all status and alarm bits and analog values (including timer and counter presets) into a separate, contiguous block of memory, grouped by type. Provide 25% space in each group to allow for future expansion.
- D. Configure operator interface unit using function keys and instructional prompts so that operators can modify setpoints and presets without any special training or knowledge of the PLC program.
- E. A modular and structured approach to PLC program development shall be implemented. The programs shall be broken up in logical segments to allow easy debugging in the field.
  - 1. All real world outputs/inputs shall be grouped such that their addresses can be mapped in contiguous registers so as to allow use of matrix functions for trouble-shooting, debugging, and alarming.
  - 2. An alarm segment shall be developed for all real world outputs. The alarm segment shall be separate from the rung logic for real world outputs.
    - a. For open/close valves, the associated limit switch positions shall be compared with the PLC output. If the output calls for an open valve, the open limit switch should be made and the closed switch should not and vice versa. Any combination other than these two shall cause an alarm.
    - b. The PLC shall monitor limit switch positions for valves in transition.

- c. Valves in transition (between open and close position) shall be displayed on the operator interface with message "In Transition". The Contractor shall submit limit switch development for all valves.
  - d. For motors, the run output shall be compared to the run status with the appropriate time delays. Any mismatch between RUN output and RUN status shall cause an alarm.
- 3. Unless waived in writing by the Commissioner, application programs written for PLCs shall be written using ladder logic, showing discrete references in individual ladder rungs. Each output shall have its own complete set of logic to aid in startup and trouble-shooting. Where duplicate or repetitive logic is required subroutines shall be used to reduce program memory requirements and scan time. The program shall be written in a logical sequence with associated rungs grouped together in a manner to make the system logic clearly evident.
  - 4. Where multiple rungs use the same constants for associated presets or reference, the constant shall be in the form of a register location and shall be loaded in the beginning of the program each time it is run. All preset register values shall be part of the program and load each time the program is run. Where possible, constants that must be calculated shall have this done in the program.
  - 5. Where values must be input, whether in the program or during operation, software "traps" shall be used to prevent input of values out of range or that will cause improper operation of the system.

### 3.02 START-UP, CALIBRATION, AND TESTING AND TRAINING

- A. The Contractor shall comply with the requirements of Section 17101.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 17213**  
**COMPUTER CONSOLES**

**PART 1 GENERAL**

**1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install the control system consoles and accessories, as specified herein and as shown on the Drawings.

**1.02 RELATED SPECIFICATIONS**

- A. Section 12500 – Furniture
- B. Section 17101 - SCADA System - General Requirements
- C. Section 17210 - SCADA System - Operator Workstation

**1.03 QUALITY ASSURANCE**

- A. Comply with the requirements of Section 17101.
- B. Computer console supplier shall be ISO 9001 certified, and shall have at least three years experience in console design and manufacturing.
- C. Computer console installers shall be certified by the supplier, and shall have experience installing similar systems.

**1.04 SYSTEM DESCRIPTION**

- A. Design Requirements
  - 1. The console system shall incorporate a highly flexible system of components capable of being adapted to changing technical requirements during the life cycle of the console.
  - 2. The console shall be designed to withstand the rigors of around-the-clock control room operation and shall incorporate a wide range of ergonomic features to ensure operator comfort during extended shifts.
  - 3. The internal structure of the console shall firmly anchor a wide range of equipment mounting and operator convenience features while still providing convenient access to the equipment mounted within the console.

## 1.05 SUBMITTALS

- A. The Contractor shall comply with the requirements specified in Section 17101 and as follows:
  - 1. The console supplier shall provide design and application support by:
    - a. Determining the console functional design requirements. Coordinate with the relative equipment suppliers to ensure that all equipment specified to be mounted in console is installed correctly per manufacturer's recommendation.
  - 2. Submitting pre-fabrication review drawings and component listings.
  - 3. Samples: Submit three samples of all standard and custom work surface, module and exterior panel color options for selection and approval by the Commissioner.
  - 4. Supply experience qualifications as required in the subsection titled "Quality Assurance."

## PART 2 PRODUCTS

### 2.01 OPERATOR WORKSTATION CONSOLES

- A. Provide operator workstation consoles as specified herein and as shown on the Contract Drawings. Arrangement of console modules shall be as shown on the Contract Drawings.
- B. Description
  - 1. The console shall consist of multiple base cabinets, wedge cabinets, work surfaces, slat walls, accessories and appurtenances as shown and required to provide a complete console assembly.
  - 2. The console shall be of the open, desktop type as shown.
  - 3. The console shall include articulating arms for supporting flat panel displays as specified in Section 17210.
  - 4. The console shall be configured from standard offering, freestanding structures, capable of being reconfigured on site without cutting.

**C. Base Cabinets**

1. The base cabinet modules shall be straight modules, constructed of steel and aluminum.
2. Width: 24 inches
3. Depth: Full depth, capable of holding two tower-type personal computers facing forwards. The manufacturer shall have both full depth and reduced depth models available.
4. Configuration
  - a. Several mounting kits shall be provided to permit configuration of the interior of the base cabinets as specified and shown:
    - (1) Slide-out shelf: capable of holding two tower-type personal computers facing towards the console operator. The manufacturer shall have additional shelf types available, including a fixed type and a lower door mounted swing-out type.
    - (2) Rack mounting assembly: 19-inch EIA-standard racks, for mounting additional network and computer equipment, facing towards the console operator.
  - b. Mounting kits shall be supplied, designed to support the electronic equipment specified.
    - (1) Reconfiguration of the console shall be possible by swapping mounting kits without modifying the base cabinet or external panels.
    - (2) The mounting kits shall be constructed of heavy gauge sheet metal with perforations to ensure adequate ventilation.
    - (3) The mounting kits shall be capable of anchoring the electronic equipment specified for seismic considerations.
5. Integrated Cable Management: Each console module shall be constructed to provide continuous cable trays between modules for ease of equipment installation and maintenance.
6. Power Bars: Each console module shall be furnished with external 120 Vac outlets. Each section shall include six outlets, controlled by individual breakers rated at 15 amps.

7. Each base cabinet shall incorporate levelers to ensure that adjacent modules are perfectly aligned after installation.

D. Wedge Cabinets

1. Wedge cabinet modules shall be provided as shown.
2. The manufacturer shall have the following standard wedge angles available:
  - a. 15 degrees
  - b. 22.5 degrees
  - c. 30 degrees
  - d. 45 degrees
3. Integrated Cable Management: Each wedge module shall be constructed to provide continuous cable trays between modules for ease of equipment installation and maintenance.

E. Work Surfaces

1. Minimum one-inch core
2. Surface: High pressure laminate of the same type and pattern as that provided for furniture supplied under Section 12500 – Furniture.
3. Color selected by the Commissioner
4. Black high impact extruded work surface nosing and baseboard.

F. Slat Walls

1. Provide 6-inch rear slat wall as shown. The manufacturer shall have additional slat wall sizes available, including 12-inch and 18-inch sizes.
2. Designed as connection point for monitor arms.

G. Accessories

1. Monitor Arm
  - a. Support flat-panel computer monitors up to 25.5 lbs.
  - b. Fully adjustable, including height.
  - c. Includes slat wall mount and VESA-compliant adapter plate.
  - d. Provide monitor arms as shown and required.

2. Under Work Surface Keyboard Tray

- a. Slide out keyboard trays with integrated palm rest shall be furnished below each base cabinet work surface.
- b. Provide cable pass through.
- c. The tray shall accommodate keyboards up to 20" wide in a low profile configuration to provide maximize operator knee space.

3. Fans

- a. Integral ventilation fans shall be included in each base cabinet module.
- b. Fans shall be 120 VAC powered and UL listed
- c. Output: No less than 30 cfm
- d. Noise: Less than 30 dBA

H. Exterior Panels

1. Exterior panels shall include the console front, back and side panels. The panels shall be supported by, and enclose, the cabinet structural frame. The panels shall be easily removed for convenient access to the equipment mounted within the console. Individual panels under the work surface shall be hinged to facilitate access to the console interior.
2. The console shall be furnished with a ventilation grill assembly.
3. The exterior panels and cabinets shall be designed to ensure an air intake at the bottom of the console and exhaust at the top in order to provide proper ventilation of the equipment housed within the console.
4. External panels, modules and accessories shall be provided with scratch resistant baked enamel coating, in colors selected by the Engineer.

I. Product and Manufacturer: Provide one of the following.

1. Axiom Series, as manufactured by Evans Consoles, Inc.
2. 3600 Series, as manufactured by Tresco Consoles
3. Or approved equal.

PART 3 EXECUTION

3.01 INSTALLATION

- A. The Contractor, via the console supplier, shall provide factory certified personnel to supervise the site installation of console by the Contractor. The Contractor shall provide the console manufacturer's certification to the Engineer that the console was

installed per the console manufacturer's recommended installation procedures and requirements.

- B. The adjacent modules shall be leveled and bolted together to form a structural cage.
- C. The equipment installed within the console shall be wired and tested prior to application of the external cladding panels.
- D. A minimum of one day of manufacturer's services on site shall be included.

-END OF SECTION-

**Section 17230**  
**SCADA SYSTEM - HMI SOFTWARE REQUIREMENTS**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall supply the HMI software capable of performing the tasks specified in Division 17 of these specifications.

**1.02 RELATED SPECIFICATIONS**

- A. Detailed Specification 17101 - SCADA System - General Requirements

**1.03 REFERENCES AND CODES**

- A. The following organizations have generated standards that are to be used as guides in assuring quality and reliability of components and systems; govern nomenclature; define parameters of configuration and construction, in addition to specific details in this Specification and the Contract Drawings:
  - 1. ISA - International Society for Measurement and Control
  - 2. ISO - International Standards Organization

**1.04 SUBMITTALS**

- A. The Contractor shall submit working drawings, shop drawings and material specifications for the approval of the Commissioner in accordance with Section 01300 - Shop Drawings.

**1.05 SCADA SYSTEM SOFTWARE**

- A. The purpose of this Specification is for the Contractor to install, configure and test in all the operator workstations under this Contract the HMI software. The HMI software shall be used for all operator interfaces furnished under this Contract. The SCADA System Software, henceforth referred to as the HMI software, shall be standardized throughout the facility. For the purposes of this Section, the term workstation shall be used to indicate all computers used for operator interface, data acquisition and archiving, alarm and control. These shall include, but not be limited to, desktop/tower type PCs, console-mounted PCs, Network servers, NEMA-rated operator interface units/terminals and all local operator interface terminals that are running Microsoft Windows XP operating system.
- B. A single software package shall be used for all workstations throughout the Project. The Contractor shall install the appropriate number of copies of HMI software on the designated servers and workstations for this Contract. Once installed and operating, and the project is completed and accepted, all licenses,

media, documentation and packaging shall be turned over to the City of New York. It is the responsibility of the Contractor to maintain all items entrusted to him in excellent condition. Any damaged items or items not returned will be replaced at the Contractor's expense. A minimum of two (2) of the servers shall be capable of configuration with the balance being used for runtime support.

- C. It shall be the responsibility of the Contractor, through the services of the SCADA system supplier, to install, setup, configure and place in optimum working order the HMI software, as well as all other software referenced herein. All software shall be installed and configured with strict adherence to manufacturers recommendations and the requirements of this Specification on all workstations supplied under this Contract.
- D. The HMI software shall be sized for an unlimited number of tags.
- E. The site license shall include the latest version at bid time of the following software options:
  - 1. Server Redundancy
  - 2. Historical Data Analyzer
  - 3. Pager
  - 4. Action Calendar
  - 5. PLC Communication Drivers

## PART 2 PRODUCTS

### 2.01 MANUFACTURERS

- A. Proficy (iFix Edition)
- B. Rockwell RS View 32
- C. Or approved equal

### 2.02 MONITORING AND CONTROL FUNCTIONALITY AND OPERATIONAL OVERVIEW

- A. The following sections provide a general overview of the expected functionality of the system. Subsequent sections deal more directly with the expectation for specific product characteristics and the requirements in those sections shall be applied to the individual products and solutions provided.
- B. Graphical Representation
  - 1. The core aspect of the overall system is a network of graphical screens specifically designed for the day-to-day operation of the facility. These graphical images shall be created and maintained to provide symbolic representation of the overall working of the actual equipment and the associated processes.

2. The graphical screens shall contain a wide variety of textual and graphical animation to represent the process. This animation shall include, but not be limited to, color changes, object rotation, object filling, etc.
  3. The screens shall be networked in a hierarchy to allow for context sensitive access to the system and varying levels of detailed information. There shall be a high level screen showing a site overview with built-in transitions to "zoom" into various areas. The amount of detailed information on the particular areas shall increase as the user "zooms" closer to the operation level of the individual control areas.
  4. At the remote control locations, the operator interface shall be restricted to the graphical HMI interface. This shall be accomplished through configuration of automatic boot-up into the HMI application and the disabling of soft key access to anything but the graphical application. The graphical application shall be forced to full screen with no other options available to the operator.
  5. In the control room, the same HMI software must support more of an "engineering workstation" look and feel. It must be possible to dynamically resize the graphical interface as one of many windows in a multi-tasking display. The graphical window shall scale so that the entire extent of the screen continue to be visible regardless of the size of the window that the user selects. There shall be no cropping of the image or the requirement to pan inside the window to access the entire image. This shall increase the control room productivity by accessing multiple related applications such as the HMI graphics, the PC programmer, etc.
- C. Alarming: The system shall provide for the asynchronous generation and management of alarms. The alarms shall be generated on a system wide basis with the ability to view and/or acknowledge any of the alarms from any of the workstations. An alarm viewer shall be available as a separate distinct application window or as an imbedded object in a general purpose graphic screen. There shall be built-in, quick-access menu selections for resorting or filtering the alarms to allow for selectively viewing subsets of the alarms. In order to facilitate access to the correct alarms, the system shall automatically filter alarms by user roles and scope of authority.
- D. Data Logging, Reporting and Historical Analysis
1. The system shall provide for the recording of historical data. This historical data shall be directly recorded into a relational database to maximize its usability. This relational database shall be a general-purpose, commercially available software product and not a proprietary data repository from the HMI vendor. The use of a general-purpose database such as Microsoft SQL Server or ORACLE shall allow the system to utilize fast-paced, market-driven access tools.

2. The system shall support the logging of individual point and alarm records. The system shall also support the "group" logging of related values, such as pump parameters directly into a database table. This shall allow for the access of data in time-sensitive packages and greatly increase the performance of historical data access.
3. The historically-logged database must be configurable to be "self-maintaining" in terms of size and data retention. The user must be able to describe maintenance actions that shall automatically purge or archive data that is no longer necessary for run time support. This shall ensure that the system does not eventually fill its disk storage and cease to operate.
4. The system shall be capable of producing a base line of production reports that include daily, weekly, and monthly reports. The reporting capability shall be based on commercially available software. This software may be inherent in the relational database product selected or it may be a separate reporting package with standard interfaces to databases. The reporting function shall not be a closed, proprietary extension of the HMI software. The use of a general-purpose reporting software shall allow the system to utilize fast-paced, market-driven access tools.

E. Trending

1. The system shall include an integrated trending capability for evaluating both short and long term analog values. All trend charts shall be imbedded into the graphical screens. Short term trends can be used to provide a dynamically changing "strip chart" look and feel to users who are monitoring real time changes in the process. Long term trends shall directly access the relational database to provide for the evaluation of values over longer time periods.
2. All trends shall allow for the dynamic addition of values and corresponding lines to the trend to allow for ad-hoc evaluation of the process. It shall not be necessary to reconfigure a graphic or switch between run time and development systems to add a line to a trend. This shall allow operators and engineering personnel to react to conditions and implement the appropriate solution.
3. The system shall also provide a "Quick Trend" option which will allow the user to point to any scalar value on any graphic, right click, and instantly create a dynamic trend of that value. This shall allow the user to do true "ad hoc" evaluation of a particular process variable.

F. Configuration and System Maintainability

1. The HMI software shall be configured primarily through fill in the blank and menu selection. Script writing shall be available for supplementing basic functionality in the form of Visual Basic for Applications. However, scripting

or other code-writing activity shall be kept to a minimum. This shall allow for faster, more-uniform development and make the system much more maintainable.

2. The system shall support dynamic configuration for all aspects of the system that are typically changed or may be added. Dynamic configuration is the ability to make changes to the underlying definition of the run time system without interrupting service to the on-going data collection and/or user support. Changes in data point configuration and/or alarm limits shall not require interruption of service to what is a continuous operation. Dynamic configuration shall include the following:
  - a. Addition of new data collection points to existing PLCs.
  - b. Modification of existing point data including address and/or alarm limits.
  - c. Creation of trend charts or modifications to existing trend charts.
  - d. Creation of graphic screens or modifications to existing graphic screens.
3. The synchronization of the HMI variable/point database and the PLC programmers' variable database shall be supported through standard manufacturer software. The addition or modification of a variable within the PLC logic shall be available to the HMI database through a simple automated process. It shall be possible to apply these changes in dynamic mode without interrupting service to the on-going data collection.

## 2.03 HMI ARCHITECTURE

- A. Overview: The overall HMI architecture shall consist of a number of PC-based workstations that utilize off-the-shelf software to provide a wide variety of application functionality. The software shall be configurable in a true client-server orientation. The following section describes the required implementation. There shall be a plant-wide system that allows for control room access to all data contained in all control devices (PLCs).
- B. Vendor: The HMI software shall be a standard off-the-shelf general-purpose software.
- C. Operating System: The HMI software shall load and run on the standard Microsoft Windows XP operating system.
- D. Architectural Functionality: Redundant Servers
  1. The primary architecture shall be supported by a pair of HMI servers. One pair of servers shall be furnished under this Contract. These HMI servers shall have the ability to perform data collection to all of the remote PLCs via an TCP/IP ETHERNET network. The servers shall communicate to each other and to additional clients/viewers via a separate TCP/IP ETHERNET network from the PC to ETHERNET network furnished under this Contract as

shown on the Contract Drawings. The network architecture is shown on the Contract Drawings.

2. The pair of servers shall act in "host" redundant mode. The HMI software shall provide through straight-forward configuration the identification of a primary and secondary server. Upon failure of the primary server, the secondary shall automatically assume primary responsibility for data collection and alarming. This coordination of servers shall provide uninterrupted access by the remote clients in terms of reading and writing of current data values to the PLCs. Upon verification of proper operating conditions of the primary, the system shall automatically switch back to the primary server.
3. This redundancy shall be accomplished using commercially available software offering supported by the manufacturer of the HMI software. In order to minimize initial engineering effort and maximize maintainability, no extensive scripting shall be required to provide for this server redundancy.
4. Each of the servers shall be fully capable of acting as a full function operator station with access to all graphics and alarming screens.
5. The operator workstations shall include any additional tools required for report customization or off-line analysis of historical data.
6. The Programming/Engineering Workstation shall have a running, licensed copy of the programming package for all of the PLCs. This workstation shall serve as the master for all PLC programs and contain on its hard disk master copies of all of the PLC programs. This workstation shall access the PLCs directly across the ETHERNET LAN that is used by the servers for data collection.
7. The system shall be supported by printers as shown. These shall be available on the client/server ETHERNET network (not the PLC data collection network) to allow for sharing of their capabilities from the distinct workstations.
8. Configuration for any of the HMI stations shall be possible directly from the control room consoles. This shall allow for the commercial acquisition of run time only licenses minimize duplication of configuration files. There shall be no reason for extensive file movement between the control room servers. There shall also be no need to write custom scripts to coordinate the configuration.

**E. Architectural Functionality - Remote Client Workstations**

1. The system shall also provide for the support of remote client workstations as follows as shown on the Contract Drawings.
2. Each of these workstations are general purpose PCs who shall act as clients to the monitoring and control system on an as-needed basis. These PCs shall access both real-time and historical data from the PLCs through the redundant servers in the control room. Each of these workstations shall have identical access to screens, alarms, graphics, and setpoint capability that is available on the servers themselves. These workstations and their respective users shall be limited in access and setpoint capability through inherent password/capability configuration of the HMI software.
3. Connectivity to the control room servers shall be via an ETHERNET LAN separate and distinct from the primary data collection ETHERNET LAN to the PLCs. These workstations shall also have access to the data collection ETHERNET LAN through a separate ETHERNET card in the PC.
4. Each of the workstations shall have a local printer which shall be ETHERNET capable to allow for sharing between the workstations.
5. The control room servers shall also be capable of supporting remote access via a dial-up modem. This access shall be facilitated using standard Windows NT Remote Access Service (RAS). RAS shall allow the serial modem line to function like a local TCP/IP connection. This connection shall allow a remote laptop to access and monitor the current status of both the HMI system and the PLCs. With proper password and privilege, the remote user shall also be able to perform setpoints and view access PLC logic. This remote access shall not require additional software products and shall not interrupt the availability of either control room server to the plant operators.

**2.04 GENERAL HMI PRODUCT REQUIREMENTS**

- A. **Scope:** This specification covers the technical requirements for a Microsoft Windows XP based SCADA system. A SCADA system exchanges data in the form of discrete and analog values from I/O devices and/or control devices such as programmable, motion or computer numerical controllers. A SCADA system also typically performs graphical display, alarming, logical functions, analysis, data handling operations and can communicate with external systems over a network.
- B. **Definitions**
  1. **HMI:** Human Machine Interface. Used to provide a graphic representation of data from a process and to accept user commands to be fed back to the process.

2. Ethernet: A very high performance local area network standard providing the two lower levels of the ISO/OSI seven layer reference model, the physical layer and the data link layer (IEEE-302.3).
3. TCP/IP: A protocol widely used across Ethernet networks for connecting computers and programmable controllers.
4. Data Concentrator: A physical device that translates analog and digital information from attached I/O devices to a protocol that can be used with an HMI.
5. Communications Protocol: A formal set of conventions governing the control of Inputs and Outputs between the two communicating processes.
6. Network: An interconnected group of nodes, a series of devices, nodes or stations connected by communications channels.
7. Operating System: A program that controls the entire overall operation of the computer system hardware/software.

## 2.05 SYSTEM ARCHITECTURE

- A. Overall Design: The software system shall be designed to operate on a variety of computer platforms and operating systems. It shall support industry standards, be modular in design, and provide application program interfaces to allow easy customization.
- B. Client/Server
  1. In order to reduce the overhead of multiple independent systems, the SCADA system shall support a distributed architecture including Human Machine Interfaces, Data Servers, and Viewers (clients). Each of these components shall work in conjunction with the others using industry standard Ethernet networks.
  2. The HMI shall support a true client server architecture. HMI Servers shall poll and collect data from devices. This data is to be seamlessly shared among other HMI Servers and to Viewers. HMI Viewers shall act as clients to the HMI Servers, seamlessly receiving their data.
  3. In a true client server environment, data is to be configured once. The HMI shall support one time configuration of data points. For example, points to be polled from a device shall be configured once on that server and other Servers or Viewers need only reference that data item to use it for their applications.
  4. Alarms shall be configured once and served across multiple HMI Servers and Viewers.

5. HMI Viewers shall be able to simultaneously access data from one or more HMI Servers. Data from multiple Servers may be used within the same graphic screen. Viewers shall require only a valid TCP/IP connection to the Server to obtain this data. This TCP/IP link may typically be across a local area Ethernet network (LAN) although it may be across a wide area network (WAN) and make use of telephone lines, radio, and/or satellite links. In this way end users shall be able to quickly and readily integrate HMIs provided by multiple vendors or suppliers. This shall be supported through a seamless interface across HMI Servers and HMI Viewers and the ability to configure data in one place yet use it in many.

C. Human Machine Interface Servers (HMI)

1. The HMI Server software shall be configurable to provide for the process monitoring and control of all points, loops, and systems through graphic display screens and hard copy (printer output) reports. These shall include but not be limited to:
  - a. Parameter Displays for signal control
  - b. Control Loop Status Displays
  - c. Real Time and Historical Data Trend Displays
  - d. Event Displays and Log Reports
  - e. Alarm Displays and Log Reports
  - f. Equipment Diagnostic Displays and Reports
2. HMI Servers shall be capable of operating independently but shall be configurable to share data with other HMI Servers on the network. In addition, Servers shall be capable of supplying data services to networked viewers.

2.06 VIEWERS

- A. Viewer Systems shall provide occasional system users with easy access to plant floor data using the same graphical user interface as HMI Servers.
- B. Viewers shall be capable of both displaying and modifying data. Viewers shall be capable of monitoring the process and access data using the latest version at time of bid of a standard Web Browser (Microsoft Internet Explorer, Netscape Navigator).
- C. The computer platform for HMI servers shall be a PC compatible personal computer running Windows NT latest version at time of bid.

## 2.07 REAL TIME DATA MANAGEMENT

- A. The software shall provide a real time, distributed, memory resident database of current process data values. These data ("point" or "tag") values may be from definable device points representing the value of a physical data collection item on a resource, or virtual points representing values calculated from one or more device point values used in a mathematical expression.
- B. Math and Function Support
  - 1. The following math and logic capabilities are required.
    - a. Event Driven Math and Logic
    - b. Visual Basic compliant scripting language support
    - c. Logical operators (and, or, compares, etc.)
    - d. Alarm Status
    - e. Timers
    - f. Four Function Math (+, -, /, \*)
    - g. Exponential and Logarithmic
    - h. Statistics (average, mean, min, max, median, etc.)
    - i. Trigonometric (sine, cosine, etc.)
    - j. Bit manipulation
    - k. String functions
    - l. Conversions (BCD, ASCII, etc.)
- C. Data Sharing
  - 1. Point values shall be stored, retrieved and manipulated across one or more computers using the software's distributed architecture. Data integrity must be automatically and continuously ensured.
  - 2. Writing of custom software shall not be required to provide simple data sharing among HMI Servers, and/or Viewers. Viewers shall simply "connect" to Servers to obtain data.
  - 3. Application program interfaces shall be published and available to permit users to write custom software to support interfacing the HMI and Servers to other computer systems and applications. To ensure that these "APIs" provide adequate support for device data collection, the HMI supplier shall use these APIs in the implementation of the HMI itself.
  - 4. The HMI shall also support data sharing using DDE. In this mode, the HMI acts as the "server" and applications such as Microsoft Excel act as the "client".

**D. Data Collection Methods**

1. Data collection methods shall including scheduled polling, on-change, unsolicited, timed interval, "on demand", triggered reads, and array support, among others. Engineering Unit conversions on collected data and reverse engineering units conversions for setpoints are required.
2. HMI Servers shall have configurable support for obtaining data from supported plant floor devices.
3. Application program interfaces shall be published and available to permit users to write custom software to support additional devices for data collection. To ensure that these "APIs" provide adequate support for device data collection, the HMI supplier shall use these APIs in the implementation of the HMI itself.
4. The HMI shall also support data collection from DDE servers using both the DDE and Advance DDE protocol standards. In this mode, the HMI operates as a client. This capability permits the use of third party software to extended data collection support.

**E. Required Data Types**

1. The following Data Types shall be supported:
  - a. Global
  - b. Floating point
  - c. Analog (Signed and Unsigned)
  - d. Discrete
  - e. String
  - f. Arrays
  - g. Structures

**F. Device Communications**

1. The HMI must be capable of supporting hundreds of different models, makes, manufacturers, and protocols of programmable and industrial control devices. Support for the following PLCs shall be included as a minimum:
  - a. GEFANUC
  - b. Allen Bradley
  - c. Modicon

The protocol shall be Ethernet TCP/IP; no other protocols will be accepted.

2. The HMI shall also support use of DDE servers to provide device communications.

3. PC I/O drivers shall not require the use of proprietary hardware for Ethernet TCP/IP communications.

## 2.08 APPLICATION MODULES

- A. The SCADA system shall be implemented in a modular fashion with a "base" module and one or more "option" modules. Use of option modules shall require the use of the base module. Multiple option modules may be combined with the base module to provide additional functionality.
- B. Graphical User Interface/Status Process Monitoring:
  1. The Graphical User Interface shall provide a set of tools for graphically representing process status. A graphic editor shall be provided to enable creation of graphic screens to represent current process information.
  2. For ease of use, the editor shall include cut & paste as well as drag and drop support within a single window and among multiple windows and shall include undo/redo support. Support for grouping and ungrouping sets of objects and for readily editing them while grouped are to be included. Object alignment and spacing tools are required so those objects can be properly arranged on the screen.
  3. The editor shall include a utility or tool for determining which points are referenced in a screen, which objects reference them, and which points are not currently defined or known to the software. This tool shall also include provision to search and replace point names - for both single objects and groups of objects.
  4. A test animation capability shall display the screen currently being developed in the run time environment for rapid prototyping and testing.
  5. The editor software shall include the ability to Create/Edit Points from within the Editor. It shall also be possible to browse the network to locate computers and projects for available points. The editing package shall include a Wizard/Symbol/Object Library to permit the inclusion of pre-developed or third party graphic objects.
  6. A procedure editor shall be included to control setpoints and to perform window management. The graphic editor shall include a scripting expression editor to develop application logic.
  7. Graphic objects on these screens shall be linked by name to actual device and virtual data through the distributed point database. Objects on the graphics screens shall be configured with animation features, causing them to change color and/or position. Text information shall be printed to the screen alerting

personnel to current point status. Objects shall be dynamically scalable - both horizontally and vertically.

8. The software shall support the following dynamic attributes:
  - a. Annunciation, movement, blink, rotation, and fill (unidirectional and bi-directional)
  - b. Gradient fill
  - c. Object border animation
  - d. Object visibility
  - e. Transfer tags for screen transfer or popup windows
  - f. Procedure tags to invoke user defined scripts/programs
  - g. Object and or application help screens
  - h. Alarm information
  - i. Trends charts
  - j. Setpoint tags for point value changes
  - k. Animated frames that can include other graphic objects
  - l. Zoom to Best Fit, Resize Window to Zoom
  - m. Automatic font scaling when changing window sizes
  - n. 1.5 Million Colors
9. Graphic objects shall include:
  - a. Imported metafile objects
  - b. Embedded OLE, including ActiveX objects, sound, video, clip art, spreadsheets, etc
  - c. SPC charts
  - d. Trend charts
  - e. Historical Data displays
  - f. Alarm displays
  - g. Arcs
  - h. Lines
  - i. Circles
  - j. Ellipses
  - k. Lines
  - l. Polylines
  - m. Polygons
  - n. Rectangles
  - o. Text strings
  - p. Buttons
10. Tag types shall include:
  - a. Constant - downloads constants to a point
  - b. Variable - allows operator input of desired value
  - c. Ramp - downloads values in configured increments

- d. Slide - increment/decrement of point values
  - e. Toggle - sets digital points to opposite state
11. Graphics screens shall support a Visual Basic compliant scripting language. Data items and variables can be manipulated by the screen scripting to provide additional functionality in dynamically controlling screen characteristics.
  12. The graphical editor and viewer shall be capable of being an ActiveX container. It shall be capable of using ActiveX objects provided with the HMI package or third party ActiveX controls supplied by others.
  13. The graphical user interface shall support ActiveX "methods" to allow the user to interact with ActiveX control objects. Interaction may be through the association of a method to a button or object, which the operator initiates, or methods may be used by the Visual Basic compliant scripting language for advanced functionality and additional control of the ActiveX components.

#### C. Alarming

1. The software shall provide alarm annunciation and routing capabilities. The alarm text associated with each alarm shall be user configurable. Alarms are to be applied as follows:
  - a. Digital Points - the alarm generating condition (0 or 1) shall be selectable.
  - b. Analog Points - the alarm generating conditions shall be evaluated based on alarm criteria selected:
    - (1) Absolute - There shall be two levels of high alarming, HI-1 and HI-2, and two levels of low alarming, LO-1 and LO-2. HI-1 and LO-1 are also known as warning alarms. For high alarming, an alarm shall be generated when the point value reaches or exceeds the value specified for HI-1 or HI-2. For low alarming, an alarm shall be generated when the point value reaches or falls below the value specified for LO-1 or LO-2.
    - (2) Deviation - Alarm limits for deviation alarms shall be given in positive values. The HI-2 and HI-1 alarms shall be generated when the difference between the current point value and the Deviation Point value is positive and reaches or exceeds the specified limits. The LO-1 and LO-2 alarms shall be generated when the difference between the current point value and the Deviation Point value is negative and the absolute value of the difference reaches or exceeds the specified limits.
    - (3) Rate of Change - Rate of Change alarms shall be provided to detect either a faster or slower than expected change in the value of a point.

- (4) Duration - The Alarm Display shall include total time in alarm state.
  - (5) Alarms shall be configurable to be filtered and asynchronously sent to users based on user role and scope of responsibilities.
- 2. Alarms shall be configurable with respective priorities, divided into classes, and color-coded for display. There shall be user defined logging criteria, user-defined acknowledgment and deletion criteria, user-specific textual messages and operator help text. The alarm list can be toggled between dynamic and static display and quickly filtered to limit the current view to a particular alarm set of interest.
  - 3. The system shall support "alarm blocking". Users shall be able to define an alarm hierarchy and block the generation of "lower level" alarms if a "higher level" alarm is present. This allows operators to concentrate on primary causes rather than receive all the resulting secondary problems. For example, if a conveyor stops then all machines feeding it would also stop. The operator needs to determine why the conveyor stopped - the operator does not need to see the other alarms. In this example, fixing the conveyor shall fix those alarms as well.
  - 4. The system shall provide for an automatic routing of configured alarm messages to display type pagers. The routing shall be configurable as to personnel or pager ID receiving the message. It shall be possible to upgrade the paging system to support dual outputs - allowing messages to be sent to local pagers, or to a dial-up paging system.

#### D. Data Logging and Reporting

- 1. Data collected by the Process Monitoring and Control System shall be logged into a relational database to support historical reporting and analysis. The system shall support multiple SQL compatible databases and/or formats. Configurable logging of points, alarms, and events shall be supported without forcing the application developer to understanding database internals. Custom application software must not be required to log data. Configuration of the logging characteristics of a point shall automatically configure the database that shall store the data. A variety of database management systems shall be available for use.

2. Point and alarm data is to be logged upon a "trigger" event. The following triggers for logging point and alarm data are required.

Point Data	Alarm Data
At Time of Day	On Generation
On Time Interval	On Reset
On Point Update	On Acknowledgment
On Event	On Deletion
Gated Based on Logical Expression	

Point attributes, which shall be available for logging, include

- a. Point Value
  - b. Previous Value
  - c. Raw Value
  - d. Alarm State
  - e. Resource
  - f. Time Last Logged
  - g. Engineering units
3. The logging module shall support the logging of multiple point attributes into a single record based on a single trigger. The logging module shall also support logging multiple points and their attributes to a single table. The logging module shall support the simultaneous logging of multiple tables of data consisting of combinations of single points, multiple points, alarms, and events. This supports the creation of custom database tables unique to an application.
4. Through configuration alone, the logging utility shall support "store and forward" to selected database management products. Data shall be buffered on the node collecting it and automatically forwarded to the node where it is to be logged. During a communications outage between the two nodes, the data collection node shall continue to buffer data. Upon restoration of communications, the data collection node shall automatically forward the buffered data to the logging node for storage.
5. User configurable database maintenance actions, which are executed automatically, based on database size or number of records shall be supported. Examples of these actions include exporting data to a CSV file then purging the records from the database. No custom software shall be required to implement this support.

6. A set of standard reports shall be provided for generation. Reports shall provide a tool to summarize logged data for data analysis. Reports shall be configurable to be automatically printed and/or stored in the computer. The software shall have the ability to generate reports on the following basis:
  - a. At Time of Day.
  - b. Periodically at a Specified Interval.
  - c. On Event.
  - d. Manually Triggered.
7. Additional reports using the logged data may be generated using standard third party database management tools such as spreadsheets and report writers.

**E. DDE Client and Server Interface**

1. The HMI shall support a DDE interface in both client and server modes. In the server mode, DDE aware applications (clients) such as Microsoft Excel shall be able to access data managed by the Process Monitoring and Control System. The DDE client interface support the use of third party applications to monitor, analyze, report, and modify point data.
2. Required Services for the HMI server support include:
  - a. Request Point Configuration Data (e.g. alarm limits, engineering units labels)
  - b. Request Point On-Change (DDE Peek)
  - c. Request Point Update (DDE Poke)
3. In the client mode, DDE server applications such as device communications drivers shall be able to act as a source of data to the HMI, for both reading and writing of data down to factory floor devices or external systems. For maximum flexibility in selecting third party servers and for maximum software performance, the HMI shall support both the DDE and Advance DDE protocols.

**F. Application Development**

1. Application development shall be done in the context of a "project". A given system shall support concurrent application development and execution of multiple projects. All the data related to a project including communication ports, field devices, alarms, users, and graphic screens is stored in a project folder. Project folders shall be easily transportable from system to system. Configuration of a project shall be fully dynamic so that objects may be added to or modified within the project without requiring a system restart.

2. System shall be furnished with application development tools for configuring projects. Utility shall provide for interactive fill-in-the-blank transactions for configuring individual items as well as a Configuration Wizard which guides a developer through the entire process.
3. To support rapid configuration of large systems, an import/export utility shall be provided to allow for external management and replication of configuration data. This external file format shall be CSV format to facilitate the use of standard tools such as MS Excel and MS Access.
4. An interactive Graphics Editor package shall be required to develop screen layouts and to animate a given application.
5. In cases where standard software functions do not support a given requirement, a set of documented application programming interfaces (API) shall be available for developers. APIs shall be C language or Visual Basic (see earlier section).

G. Data Trending

1. The trending module shall be capable of supporting one or more embedded trends within the run time graphics user interface. The following types of trends shall be supported:
  - a. Trends with Multiple Y Axes
  - b. Trends with Multiple X Axes
  - c. Trends-with multiple time periods
  - d. Reference curves
2. The trending option shall support display of an unlimited number of pens on a single trend chart. Each pen shall display either dynamically updating data or provide seamless access to historical values based on user request. In addition, user shall be able to compare data from different time periods.
3. Trending shall support the creation and re-display of files with reference data from the currently displayed trend. This export capability shall produce "CSV" format files so as to be compatible with standard office automation tools such as spreadsheets and databases.
4. Users shall be able to analyze trend data by scrolling through time, changing the range for point displays, zooming into an area of the trend and selecting a new time period to display.
  - a. Printing of trend charts is required.

5. The trending module shall support reading data from "CSV" files for the display of data collected or generated by other applications within the HMI framework.
6. Trend layout shall be highly configurable including colors, tick marks, legends, title, and fonts. The update rate for data being displayed from log files shall be configurable. The data being trended shall be configurable. This configuration shall be modifiable at run time without requiring a development system or license.
7. Trend data can be supplied from multiple sources including current point data, data from CSV files, and data logged to a database. Data displayed by the trend manager shall support time-based or on-change based sampling.
8. Trending shall support the display of array points. Arrays can be interpreted as independent variables or as a time series of a single variable. The latter case supports buffering of data in high speed sampling applications.

#### H. Equipment Control

1. The SCADA system shall provide the capability to configure logic and schedule events based on the following criteria:
  - a. Time of day
  - b. Time Interval
  - c. Production event
  - d. Point change
  - e. Alarm Generation
2. In response to configured events, the system shall invoke configurable actions that include:
  - a. Log Event
  - b. Acknowledge Alarms
  - c. Enable/Disable an Alarm
  - d. Recipe Upload/Download
  - e. Execute a Script
  - f. Set a Point Value
  - g. Copy a Point Value
  - h. Execute a Procedure
3. Scripts shall be modular and re-usable. Scripts shall be in a Visual Basic compliant language.

An event editor shall be included to permits users to configure, monitor and debug applications.

4. Users shall be able to monitor the progress of control programs and dynamically modify their operating characteristics. The event editor shall at least support these debug tools:
  - a. Run in Single Step Mode Start/Stop Scripts
  - b. Set Break Points
  - c. Step into or Over Sub-Scripts
  - d. Watch variables change
5. Control programs shall have access to all of the application programming interfaces (APIs) within other SCADA applications such as DDE interfaces, equipment/device interfaces, production tracking, and system alarming and logging.

PART 3 EXECUTION (Not Used)

-END OF SECTION-

**Section 17250**  
**SCADA SYSTEM - PLANTWIDE NETWORK EQUIPMENT**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, test, and place into satisfactory operation all network equipment specified herein and on the Contract Drawings. Network equipment, furnished by the Contractor, shall include, but not be limited to: Ethernet rail switches, wireless access points and network management system components.

**1.02 RELATED SPECIFICATIONS**

- |    |               |   |  |
|----|---------------|---|--|
| A. | Section 14511 | - | Container Transport System                           |
| B. | Division 16   | - | Electrical, various sections and as modified herein. |
| C. | Section 17101 | - | SCADA System - General Requirements                  |
| D. | Section 17210 | - | SCADA System – Operator Workstation                  |
| E. | Section 17212 | - | SCADA System - Programmable Logic Controllers        |
| F. | Section 17320 | - | SCADA System - Control Panels and Enclosures         |

**1.03 QUALITY ASSURANCE**

- A. A single manufacturer shall furnish all network equipment provided under this contract except as otherwise noted.
- B. References
- |    |             |   |                            |
|----|-------------|---|----------------------------|
| 1. | IEEE-802.3  | - | Ethernet Standard          |
| 2. | IEEE-802.11 | - | Wireless Ethernet Standard |
| 3. | UL 1950     | - | Underwriters Laboratory    |

**1.04 SUBMITTALS**

- A. Comply with requirements of Specification 17101.

**1.05 DESIGN REQUIREMENTS**

- A. All network equipment shall be of first class workmanship and shall be entirely designed and suitable for the intended services. All materials used in fabricating the equipment shall be new and undamaged. All network switching equipment shall meet the requirements of UL 1950, FCC Class A.
- B. The network infrastructure shall be installed in the facility as shown.

- C. Ethernet rail switches shall be DIN rail mounted and shall be installed with power supplies and surge suppressors as shown or specified. The LAN shall utilize Ethernet rail switches to form a redundant ring with dual uplinks. Install the Ethernet rail switches as shown to form the facility wide global network.
- D. The network topology shall be switched 10/100 Mbps Ethernet to each attached device, interconnected via Ethernet switch modules.
- E. Global communication between devices on the network shall be encapsulated for inter-switch transmission, and unencapsulated at the far-end switch as needed.
- F. Redundant management/controller modules in the chassis shall be installed to maintain backplane timing and management functions. If one module fails or is removed, the other shall immediately take over and continue processing packets from the network.
- G. All equipment in the infrastructure shall support SNMP (Simple Network Management Protocol) for detailed management functionality.
- H. All 100 BASE-FX and Ethernet rail switch network equipment will accommodate multimode 62.5/125 fiberoptic cable connections.
- I. Wireless access points shall feature a modular design allowing future upgrades to provide a scalable solution with complete backward compatibility for legacy clients.
- J. A wireless Ethernet network shall be provided to connect the container transport system to the LAN, as shown and as specified in Section 14511 - Container Transport System. Wireless access points shall be connected to the Ethernet rail switches to extend connectivity to the wireless clients throughout the facility. A minimum number of wireless access points shall be installed in the facility as shown.
- K. A radio study shall be performed to determine the coverage area of the wireless network. Provide 4 additional wireless access points as spare parts. Install up to 2 additional wireless access points as indicated by the radio study to ensure that the radio frequency losses are compensated such that all clients within the coverage area defined herein communicate to the LAN with a transfer speed of at least 24Mbps. Any additional wiring and conduit shall be included under this section.

#### 1.06 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements of Section 17101.

## 1.07 NETWORK COMPONENTS

### A. Equipment

1. Ethernet rail switches
2. Fiberoptic cable (Division 16)
3. Fiberoptic patch panels
4. Ethernet switch modules
5. Redundant power supplies
6. Wireless access points

- B. Additional items as recommended by equipment manufacturers or as described elsewhere in the Specifications shall be provided.

## PART 2 PRODUCTS

### 2.01 POWER SUPPLIES

- A. Dual power supplies shall be furnished installed for each Ethernet rail switch chassis to prevent a single power supply failure from rendering a portion of the network inoperable.
- B. Dual power supplies shall be powered from 120 Vac, 60 Hz. Provide two battery-backed rail mounted 24 Vdc power supplies. Size batteries to provide at least 10 minutes of reserve capacity.
- C. Dual power supplies shall be mounted in the networking enclosure and shall be sized for the network equipment furnished.

### 2.02 ETHERNET RAIL SWITCHES

- A. Ethernet rail switches shall be provided to form the LAN as shown or specified.
- B. Each network access point shall be provided with an enclosure to house the rail switch and all networking components required for a complete system.
- C. A wall mounted external (to network access point) or rack mounted internal fiberoptic patch panel with sufficient capacity to terminate all fibers of all cables shown at each network access point shall be provided. The Ethernet rail switch shall be connected to the patch panel via factory made jumper cables installed in conduit.
- D. Ethernet rail switches shall meet the following design requirements:
1. Backbone ports consisting of two pair of multimode duplex SC fiberoptic ports operating at 100 Mbaud.

2. Operating power shall be 24Vdc.
  3. Media redundancy of less than 300 ms.
  4. Five auto-sensing Rj45 type TP/TX ports.
  5. Operating temperature range of 0° to 60°C.
  6. Hirschmann Model RS2-FX/FX or approved equal.
- E. Additional Ethernet switch modules shall be provided at each Ethernet rail switch where required. Provide sufficient Ethernet interfaces at each rail switch to provide the required Ethernet interfaces as shown with at least 2 spares.
1. Ethernet switch modules shall operate on 24Vdc.
  2. Ethernet switch modules shall be from the same manufacturer as the Ethernet rail switch.
  3. Ethernet switch shall have a minimum of 8 auto-sensing 10/100 Base-T ports.
  4. Operating temperature range of 0° to 60°C.
  5. Hirschmann Model RS2-TX/TX or approved equal.
- F. Where shown installed in the Foreman's Office or in the Operations Room console, Ethernet switches shall meet the requirements specified above, but shall be of the rack-mounted type.

## 2.03 PATCH PANELS

### A. Fiberoptic Patch Panels

1. Rack-mounted fiberoptic patch panels:
  - a. Capacity for 24 connectors and splices.
  - b. Universal mounting brackets for 19 and 23 inch EIA relay racks and cabinets.
  - c. Modular splice tray shall accommodate splicing for fusion and mechanical splices.
  - d. Provide access from the front, rear, left and right sides.
  - e. Panels shall be manufactured from 16-gauge, cold rolled steel.

- f. Panels shall be provided with grounding and strain relief lugs to support the fiber cable.
  - g. Provide cable tie-down support islands to take up excess fiberoptic cable and insure it does not exceed its maximum bending radius.
  - h. Provide cable bulkhead adapters pre-mounted on four plates, six connectors per plate (dual fiber connectors count as two). Provide type ST connectors.
  - i. Panel dimensions shall not exceed 6 inches in height and 12 inches in depth.
  - j. Panels shall be inspected to assure that there are no sharp edges which could damage the fiberoptic cable.
  - k. Where shown mounted in the Foreman's Office console and the Operations Room console, rack-mounted patch panels shall be installed.
2. Wall-mounted fiberoptic patch panels
- a. Capacity for 24 connectors and splices.
  - b. Universal mounting brackets for wall or side of network access panel.
  - c. Modular splice tray shall accommodate splicing for fusion and mechanical splices.
  - d. Provide access from the front and at least one side.
  - e. Panels shall be manufactured from 16-gauge, cold rolled steel.
  - f. Panels shall be provided with grounding and strain relief lugs to support the fiber cable.
  - g. Provide cable tie-down support islands to take up excess fiberoptic cable and insure it does not exceed its maximum bending radius.
  - h. Provide cable bulkhead adapters pre-mounted on four plates, six connectors per plate (dual fiber connectors count as two). Provide type ST connectors.
  - i. Panel dimensions shall not exceed 6 inches in height and 12 inches in depth.
  - j. Panels shall be inspected to assure that there are no sharp edges that could damage the fiberoptic cable.

B. Product Manufacturer: Provide patch panels of one of the following:

1. Net Optics
2. Corning Cable Systems
3. Or approved equal

2.04 WIRELESS NETWORK

A. General: A wireless network shall be provided to provide connectivity to the container transport system shuttle cars as specified in Section 14511.

1. Coverage area for the shuttle car wireless network shall include the entire path of each car.

B. Wireless Access Points

1. Wireless access points shall provide dual connectivity supporting both IEEE 802.11b and IEEE 802.11g wireless Ethernet clients.
2. Security: Provide support for 802.1x including EAP via secure tunneling with Microsoft Challenge Authentication Protocol Version 2 and EAP- Subscriber Identity Module to yield mutual authentication and dynamic, per-user, per-session encryption keys. Additionally, provide support for MAC address and standard 802.11 authentication mechanisms.
3. Encryption: AES-CCMP, TKIP, message integrity check (MIC) and broadcast key rotation. Provide support for static and dynamic IEEE 802.11 WEP keys of 40 and 128 bits.
4. Install in NEMA 4X enclosure.
5. Provide support for installation in environmental air spaces, UL 2043 approved.
6. Support power over Ethernet and direct connection. Connect with CAT-6 cable providing power and communication to Ethernet rail switches. Provide power supplies and connectors at rail switches.
7. Frequency: 2.412 to 2.462GHZ with 11 channels.
8. Modulation: direct sequence spread spectrum.
9. Range: 110 feet @54 Mbps outdoor and 90 feet @ 54 Mbps indoor.
10. Manufacturer: Cisco Aironet 1200 series or approved equal.

## PART 3 EXECUTION

### 3.01 REQUIREMENTS

- A. The Contractor shall provide, install and test all network equipment under this Contract.
- B. Assign IP address pool to server utilizing addresses from 10.1.1.1 to 10.1.1.255.
- C. Enable wireless access point 128 bit encryption.
- D. Submit Network Configuration Report including a listing of all client computers, their configurations, and all passwords and codes. Include all software installed on each computer or PLC along with custom system restoration disks containing all supplemental programs and data files necessary to restore the computer to operational status after reformatting of its hard disk drives.

### 3.02 FIELD TESTS

- A. After installation of the equipment, controls and all appurtenances, the Contractor shall field test the equipment for system operation and conformance to the specified performance parameters. The Contractor shall perform field tests in accordance with Section 01811 - Preliminary and Final Field Tests.
- B. After installation of the base wireless network, the signal strength shall be verified along the defined coverage area. Any locations that do not have sufficient signal strength to allow the wireless client to operate a data transfer rate of at least 24 Mbps, shall be compensated by adding additional wireless access points to the system as indicated by the radio test. Submit test results along with verification that the communication system meets the contract requirements throughout the coverage area as defined herein. Upon installation of any additional wireless access points, an additional radio verification test shall be performed and its results submitted for verification.

### 3.03 MANUFACTURER'S FIELD SERVICES

- A. The Contractor shall provide the services of factory certified technicians who shall adequately supervise the installation and testing of all equipment under this Contract and instruct the Contractor's personnel and the City of New York's personnel in its maintenance and operation.
- B. The Contractor shall provide equipment start-up services and training in accordance with Section 01821 and as described in Detailed Specification 17101.

- C. The Contractor shall provide the services of the manufacturer representative for the following minimum durations:
- |  |                        |
|--|------------------------|
| 1. Equipment Installation and Inspection | 3 visits of 1 day each |
| 2. Field Tests                           | 6 visits of 1 day each |
| 3. Initial Operation                     | 3 visits of 1 day each |
| 4. Training                              | 3 visits of 1 day each |
- D. Any additional time required to achieve successful installation and operation shall be at the expense of the Contractor. The manufacturer's representative shall sign in and out at the office of the Commissioner on each day of arrival at the project.
- E. TCP/IP Address Assignments: Networking services shall be installed for each Personal Computer (PC) workstation, Server, Operator Interface Terminal (OIT) and Ethernet LAN connected Programmable Logic Controllers, Container Shuttle Cars provided. Networking services shall include assignment of IP addresses. All IP addresses shall be assigned and coordinated by each contract from a designated pool of addresses. The following networking components shall be installed and fully configured:
1. Client for Microsoft Networks
  2. NETBEUI
  3. Network Interface Card support
  4. TCP/IP protocol
  5. TCP/IP printing
- F. Programmable Logic Controllers and other intelligent devices that are connected to the network shall communicate via TCP/IP protocol. IP addresses shall be assigned using DHCP from the file server or router.

-END OF SECTION-

**Section 17260**  
**SCADA SYSTEM - LASER PAGE PRINTER**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install, calibrate, test, startup, and place into satisfactory operation one laser page printer at each transfer station.

**1.02 SUBMITTALS**

- A. The Contractor shall comply with the requirements specified in Section 17101 and include the following information in the submittal for this section:

1. Data sheet and catalog literature
2. Interface and cable data

**1.03 MAINTENANCE**

- A. The Contractor shall provide the following expendables at each site:

1. Four (4) replacement toner cartridges
2. Eight (8) 5,000 sheet (ten 500 sheet packages) boxes of 20 pound, plain white, 8.5 by 11 inch paper for each device the Contractor shall provide
3. Four (4) 5,000 sheet (ten 500 sheet packages) boxes of 20 pound, plain white, 11 by 17 inch paper for each device the Contractor shall provide

**PART 2 PRODUCTS****2.01 LASER PAGE PRINTER**

- A. The Contractor shall furnish Laser Printers which meet the following requirements:

- |                      |   |
|----------------------|---|
| 1. Printing:         | Electrostatic print drum                              |
| 2. Print Speed:      | Twenty-one (21) pages per minute                      |
| 3. Print Modes:      | Portrait and landscape                                |
| 4. Typefaces:        | 80 built in scalable PCL and 80 internal postscript   |
| 5. Print Resolution: | 1200 x 1200 dots per inch                             |
| 6. Memory:           | 32 Mbytes, expandable to 192 Mbytes                   |
| 7. Print Language:   | HP PLC6, HP PLC5e and Adobe postscript level 2        |
| 8. Paper Feed:       | Three trays   |
| 9. Paper:            | Plain paper sizes: 8.5 x 11 inches and 11 x 17 inches |

- 10. Noise Level: Not to exceed 55 dB as measured 2 feet from the unit in any direction
  - 11. Mounting: Desktop
  - 12. Quantity: One (1)
- B. The Contractor shall provide a printer which is "network ready", with a pre-installed network interface card to allow easy connection to an Ethernet-based local area network. Include any related network printer management utilities.
- C. The Contractor shall provide cables and any other required devices to connect the printer to an Ethernet-based local area network.
- D. Product and manufacturer: Provide one of the following:
- 1. LaserJet 5100tn, as manufactured by Hewlett-Packard
  - 2. Or approved equal

### PART 3 EXECUTION

- 3.01 The Contractor shall install printer according to manufacturer's instructions.

-END OF SECTION-

**Section 17270**  
**SCADA SYSTEM - MONITORING AND CONTROL CRITERIA**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide the services of the SCADA System Supplier, as described in Section 17101 - SCADA System - General Requirements, to load, configure, develop, test, document and place in satisfactory operation all software associated with the SCADA System and all its ancillary devices, as described herein, required by other sections, indicated on the Contract Drawings and as necessary to provide a properly operating and integrated system.
- B. In general, the software packages the Contractor will be required to furnish, install, customize, configure and develop shall include but shall not be limited to:
  - 1. Workstation and Server Operating Systems
  - 2. Workstation and Server Networking Software
  - 3. Workstation and Server Data Management Software (Spread sheets, Databases, Word Processing, etc)
  - 4. Workstation and Server Utility Programs (Virus scan, remote communication, etc)
  - 5. PLC Ladder Logic Development and Documentation Software
  - 6. PLC Ladder Logic Application Software
  - 7. PLC Specialty Software and Programming Languages

**1.02 RELATED SPECIFICATIONS**

- A. Section 17101 - SCADA System - General Requirements
- B. Section 17210 - Operator Workstations
- C. Section 17250 - SCADA System - Plantwide Network
- D. Section 17280 - SCADA System - I/O Points List
- E. Section 17600 - SCADA System - Control Strategies

### 1.03 REFERENCES AND CODES

- A. The following organizations have generated standards that are to be used as guides in assuring quality and reliability of components and systems; govern nomenclature; define parameters of configuration and construction, in addition to specific details in this Specification and the Contract Drawings:
1. ISA, Instrument Society of America
  2. API, American Petroleum Institute
  3. UL, Underwriters' Laboratories, Inc.
  4. NRC, Nuclear Regulatory Commission
  5. NEMA, National Electrical Manufacturers Association
  6. OSHA, Occupational Safety and Health Administration
  7. ANSI, American National Standards Institute
  8. MIL, Military Standards
  9. NFPA, National Fire Protection Association
  10. SAMA, Scientific Apparatus Manufacturers Association
  11. JIC, Joint Industrial Council
  12. IEEE, Institute of Electrical and Electronic Engineers
  13. NEC, National Electrical Code
  14. FM, Factory Mutual

### 1.04 SUBMITTALS

- A. The Contractor shall submit working drawings, shop drawings and material specifications for the approval of the Commissioner in accordance with the requirements of Section 17101 - SCADA System - General Requirements and Section 01300 - Shop Drawings.
- B. The Supplier shall submit, through the Contractor, the following information for approval prior to beginning actual work developing software for the project:
1. Qualifications and certifications of system software engineers
  2. A listing of all proposed software packages indicating quantities and where they will be installed
- C. The Supplier shall submit all completed items to the Commissioner for record drawings. As a minimum, the items to be submitted shall include but shall not be limited to:
1. PLC ladder logic with full documentation and annotation
  2. A full color copy of each graphic display screen (do not provide typicals)
  3. Screen animation and control
  4. Databases
  5. Alarm and event log lists, formats and messages

## 1.05 SCADA SYSTEM MONITORING AND CONTROL SYSTEM SOFTWARE

- A. For the purposes of this section, the term workstation shall be used to indicate all computers used for operator interface, data acquisition, archiving, alarming and control. These shall include, but not be limited to, desktop/tower type PCs, console-mounted PCs, network servers, NEMA rated operator interface units/terminals and all local operator interface terminals.
- B. A single software package shall be used for all workstations throughout the project. Once installed and operating and the project completed and accepted, all licenses, media, documentation and packaging shall be turned over to the City of New York. It is the responsibility of the Contractor to maintain all items entrusted to him in excellent condition. Any damaged items or items not turned over, shall be replaced at the Contractor's expense.
- C. It shall also be the responsibility of the Contractor, through the services of the Supplier to install, setup, configure and place in optimum working order the HMI Software as well as all other software referenced herein. All software shall be installed and configured, with strict adherence to manufacturer's recommendations and the requirements of this specification, on all workstations supplied under this Contract.

## 1.06 QUALITY ASSURANCE AND QUALIFICATIONS

- A. Personnel: The Supplier shall utilize system and software engineers who have been factory trained and certified on the respective software packages, to perform all programming functions, develop control strategies, create graphic displays, customize applications, document all work and coordinate the software interface. They shall be intimately familiar with the details of this project, wastewater treatment facility instrumentation and control in general and the project goals and requirements.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 GENERAL CONTROL PHILOSOPHY

- A. In order to provide the most reliable and fault tolerant system of control and monitoring, a distributed approach to programming shall be implemented.
- B. All control logic, loop control, critical alarming and I/O shall be done at the local PLC level.
- C. Local workstations shall contain the database for their attached PLCs. Remote workstations shall access needed data from the respective local workstation as shown.

- D. Workstations shall send only valid data to the PLC where it shall be "latched in" until such time as new valid data is made available. A failure of the workstation shall not prevent PLC from continuing to function normally using the last valid data it received.
- E. All workstations, PLC's and network components, shall be monitored for failures through the use of "watchdog timers" programmed into the software. Failure of any component shall be alarmed and annunciated at the next level of control and the information shall be immediately made available on the network. Provide for RS232 connections from PLC's and workstations to Uninterruptible Power Supplies (UPS's) so that items identified in Section 17370 are monitored at the Operator Workstation (OWS). All configuration and drivers required shall be provided.
- F. Workstations shall monitor and display all digital and analog data available on their connected PLCs and all pertinent data available on the plant-wide network. Where possible, the software shall be configured to verify the validity of that data. Data that is in disagreement or out of valid range shall indicate as such through the extensive use of displays and alarms.

### 3.02 PLC PROGRAMMING CONVENTIONS

#### A. General

1. All logic, sequencing, interlocking, safety and critical alarm and control shall be implemented at the PLC level using ladder type logic. Individual "rungs" shall be provided for each logic function. Subroutines shall be used where repetitive logic is required. Alarm logic shall not be performed in subroutines as they may not be active at all times.
2. Commands such as start, stop, open, close, operating mode, sequence selection, etc, that are sent from the workstation by operator initiative or response, shall be "pulsed" and "latched" into the PLC logic.
3. All analog loop control such as temperature, flow or level shall be performed at the PLC level, not in the workstation. All calculations and logic necessary to keep an individual loop in operation, in the event of failure of communication with the workstation, shall also be done in the PLC.
4. All data points, both analog and digital, associated with the PLC based control, shall be available to the operator at the workstation and fully displayed and adjustable (where possible).
5. The PLC ladder program shall be written so that the operator, via a local or remote workstation, can select the mode in which he wants each individual control loop to operate (i.e. manual/auto). He shall also be able to view and manually adjust all parameters such as setpoint or output from the

workstation. Once entered, the valid data shall remain stored in the PLC until such time as new valid data is received.

#### B. Program Structure

1. All programming shall be implemented using ladder logic style programming only. Other styles of programming shall only be used with the prior written permission of the Commissioner and only when the task cannot be performed using ladder type logic.
2. The program shall be written using a well organized and well documented structured approach. All common elements shall be grouped together as much as possible. For example, all logic for a single piece of equipment such as start/stop logic, indication, fault and alarm logic shall be grouped together to allow easy startup and trouble shooting.

#### C. Safeties and Interlocks

1. Upon initial startup or a subsequent restart of the PLC, the program shall be written to first initialize all logic and data; next, bring all equipment and controls to a safe and ready status as allowed by safety and interlock status and only then allow equipment to be started as indicated in the individual control strategies. When the system has decided that all conditions are satisfied, it shall then issue a "ready" status for each piece of affected equipment, for display by the HMI.
2. Upon startup or restart of equipment and/or systems after a power failure, the program shall retain the status of all equipment prior to the interruption. Upon restoration of stable power, with a suitable and adjustable time delay on each piece of equipment, the program shall check the status of all controlled equipment and systems for faults and/or safety trips and only then allow equipment to be started as indicated in the individual control strategies. Items indicating a faulted or unsafe condition shall be immediately locked out and the appropriate alarms generated for display by the HMI.
3. Where at all possible, all preset values (for timers, counters, etc.) and variables shall be stored in register memory and shall be made available to the operator at the HMI for both display and adjustment.

### 3.03 WORKSTATION PROGRAMMING CONVENTIONS

#### A. General

1. The operator interface to the System Software shall be through an organized system of graphic displays and tabular data displayed on the workstations and interface units throughout the system. In general the graphic displays shall be based on a schematic representation of the process, as shown on the Contract

Drawings and general equipment arrangement. While only one of each type of equipment may be depicted on the Drawings, all equipment, instrumentation and devices shall be represented on graphic displays (no typical depictions shall be used).

2. Displays of process equipment and piping shall be neatly laid out so as to be uncluttered and easily interpreted at a distance of 3 feet from the screen. Systems shall be displayed on multiple screens, where necessary, to allow all equipment and data to be shown clearly. When possible, displays of process piping and vessels shall be color coded to match the colors listed in the process piping schedules and shall match painting color schemes. This will allow the operators to easily identify, by color, what process is being viewed. If no color has been assigned to a certain process, the Contractor shall notify the Commissioner who shall assign one.
3. Because of the complexity of the process control system and the advanced capabilities of the System Software, extensive use of animation, color and appearance change and sound shall be employed.
4. Logon and password protection shall be required for all functions other than viewing general displays. The Commissioner shall decide the operator access level for each function the Contractor shall provide.

#### B. Display System Structure

1. Displays shall be generally organized into groups based on the process with which they are associated. An area index screen shall be provided showing "links" which when picked, will access all other screens in that system. There shall also be provided a general station-wide index screen, accessible from the area index screen, having links to access all other area index screens.
2. All displays throughout the station shall have certain common elements. These elements shall include but shall not be limited to the following.
  - a. There shall be a group of quick access "buttons" located at the top of each screen. Each of these buttons shall be assigned to a system screen and shall provide a link, which when picked, will display the assigned screen. When there are no alarms present on a given screen, the button shall be blank and disabled. When there is any unacknowledged alarm present on a screen, its assigned button shall flash the system name in amber. These screen names shall be assigned by the Commissioner. When the alarm(s) has (have) been acknowledged but is (are) still present, the system name shall show steady amber on the button. The relative position of these buttons shall not change from screen to screen within an area.

- b. There shall be additional buttons that the Contractor shall provide at the bottom of each screen allowing access to frequently needed items.
  - (1) The first items shall be an alarm SILENCE button and an ACKNOWLEDGE button. The SILENCE button shall silence alarms generated on any screen from any screen. This button shall silence both workstation audio alarms and any audible devices in the field and control room. The ACKNOWLEDGE button shall only acknowledge alarms generated on that screen. All alarms and alarms not associated with a given screen shall be acknowledged from the alarm history screen.
  - (2) The second item shall be an ALARM HISTORY button. This button shall immediately bring up the alarm history tabular display screen with the most recent alarms on the top of the list.
  - (3) The third common item shall be an INDEX button. This button shall immediately bring up on the display the area index screen previously described.
  - (4) The remaining bottom buttons shall be used to provide direct links to other screens associated with the current screen. Some of these associated screens will be defined later. When possible, buttons for links to a particular screen shall occupy the same relative position from screen to screen.
- C. Equipment Control Location Status: Each piece of process equipment controlled by the SCADA system shall have a field selector switch to transfer control of the equipment to the workstation level. The graphic representation for each unit shall have an adjacent text field indicating where the current control location is. The text background shall read "CONSOLE" on a blue background when control is at the workstation and read "DRIVE" or "FIELD" as appropriate on a gray background when control is elsewhere.
- D. Equipment Start/Stop Control
  - 1. All equipment started and stopped by the SCADA System shall have an operator graphic display on one or more of the graphic display screens. As shown or specified, each piece of equipment shall have a specific method of starting and stopping via the graphic display. Starting, stopping or changing operating mode of any equipment or system shall require double action followed by a confirming dialog box.
  - 2. The operator shall "double click" on a predefined pick box within the desired equipment symbol causing a dialog box to appear. The dialog box shall contain buttons for the different mode selections available to the operator for that piece of equipment or system. An "OK" button shall also appear in the

box which shall confirm the selection. Once completed, a second dialog box shall appear to reconfirm the selection with dialog such as "DO YOU WISH TO PLACE PUMP 3 IN RUN MODE?" The operator shall select a "YES" or "NO" button to confirm the selection. All dialog boxes shall have a "CANCEL" button which shall leave the system unchanged.

#### E. Alarms

1. Provide (8) levels of alarming for each analog variable. There shall be high-high-high, high-high, high, deviation high, deviation low, low, low-low, low-low-low.
2. Provide eight security levels. Annunciate alarm with horn provided in console(s) and display appropriate alarm. Assign alarm to alarm log.
  - a. The software shall display alarm status via color change or blink in line, text, or fill attributes.
  - b. The software shall have both alarm summary and alarm history displays with configurable message text including: DATE, TIME, TAGNAME, ALARM EVENT, ALARM TYPE, VALUE, SETPOINT, and SEVERITY.
  - c. The alarm summary and alarm history displays shall be configurable for color of alarm window, new alarms, acknowledge (ACK) alarms, and returned to normal (RTN) alarms.
  - d. Momentary alarms shall be reported by the software if the signal made a transition from the normal state to the alarm state and back to the normal state between the polling sequences of a remote unit.
  - e. Momentary normal states shall be reported by the software if the signal made a transition from the alarm state to the normal state and back to alarm state between the polling sequences of a remote unit.
  - f. Multiple alarm and multiple normal states shall be reported by the software if multiple transitions were made between polling sequences.
  - g. Alarms shall be able to be routed to screen, printer, and/or disk file.

#### F. Trending

1. Software shall allow the configuration of real-time trend displays which update continuously as new values are acquired.
2. Real-time trend display shall be in variable versus time format.

3. Real-time trend display shall support scaling of both variable and time axes.
4. Real-time trend display shall support 4 variables per graph.
5. Software shall allow any number of real-time trend graphs per screen.
6. Software shall allow configuration of real-time trends and historical trends on same screen.
7. Software shall allow configuration of trend graphs and other animation (bar-charts, push buttons, etc) on the same screen.
8. Real-time trend shall support trending result of arithmetic and/or logical expressions involving tag names by typing in the expression in the desired pen field.
9. The Supplier shall develop and assign real-time trends for all monitored system analog variables, and shall submit proposed trend plot groupings as part of the system software documentation submittal.

G. Historical Data Management:

1. The server shall contain a Historical Data Base Utility which provides for long term storage of data collected from remote processors or manually entered from the keyboard.
2. The historical data shall be collected from the real-time data base and from these samples; the historical system shall be configurable to calculate the average, maximum, minimum, standard deviation and total values over sampled data time intervals configurable on a per point basis.
3. The software shall allow for historical data to be manually entered from the keyboard to facilitate entry of other information to be used in generating historical plant performance calculations.
4. Signal values from the historical database shall be available for graphic displays, reports and trending.
5. The size of the historical database shall be limited only by available disk space.
6. The historical data management software shall provide utility routines to archive data to long-term storage devices on demand, or automatically based on a user configurable time schedule.
7. The historical database shall be organized as a series of Time Classes, each of which stores sampled or calculated values over a specified time interval. Up

to 63 time classes shall be configurable, and each time class shall accommodate over 13,000 values.

#### H. Reports

1. Software shall support printing of any screen created by the system integrator, whether or not it is the current active screen used by the operator.
2. Software shall allow screen prints based on demand (i.e. push button), event, time, or combination thereof.
3. Supplier shall submit actual copies of suggested report layouts for review and approval in accordance with the requirements of this Section.
4. The process report generation software shall provide the means to process, store, and print data for historical records.
5. Configuration shall be flexible so that contents of the reports can be easily modified.
6. As a minimum, the following data collection functions shall be provided for all analog variables:
  - a. Instantaneous value; value at the end of the data collection interval.
  - b. Average value over the time interval.
  - c. Totalization over the time interval.
  - d. Highest value over the time interval.
  - e. Lowest value over the time interval.
7. Equipment run times shall be monitored, calculated and reported for all major process equipment items in the system. Report data developed shall include year-to-date and month-to-date run times and starts for each item.
8. As a maximum, report data shall be collected and stored at ten-minute intervals.
9. Each log report page shall have the capability to contain information for ten log points as a minimum.
10. Periodic log reports shall be printed automatically at the end of the time period.
11. A calculation extension capability shall be provided to perform calculations on data that has been accumulated for report generation. Calculations shall consist of addition, subtraction, multiplication, and division functions for calculations of such items as engineering unit changes, totalization values

where measurement values are different, and performance indexes. Provisions shall be made for a minimum of 200 calculation extensions.

12. All reports shall be free form, thereby printing all general information, headings and data in an established format at the time of generation. Pre-printed sheets will not be acceptable. Each page of a report shall have printed the plant name, type of report, date and time the report was printed, and page numbers.
13. Software shall be provided for generation of special event, hourly, daily, monthly and annual reports. Reports shall be generated using process input/output, event information, analog, digital, manual and/or computed point information from records in database.

I. Process Variable Indicators and Controllers

1. Where indicated on the Contract Drawings, required by the specifications or wherever available, all analog data whether real or calculated shall be graphically displayed on the screen in its relative position in the process or in tabular form as required.
2. Workstation process indicators shall be provided with all of the following features.
3. Each indicator shall be displayed with the sending device's or instrument's tag number, which shall appear using the same format as the contract drawings.
4. Adjacent to the tag number, the current "real time" value of the variable, in engineering units, shall be displayed. Next to this shall appear the appropriate units. All analog values, whether real or calculated, shall have alarm points configured in the software. Those of a critical nature or where used to control equipment shall have this performed in the PLC while being set and monitored from the workstation. While within the normal range, the variable shall appear in black. When the variable moves outside the normal range, the text shall flash in red and the bubble shall flash amber. Once acknowledged, both will cease flashing and remain steady colors until the condition is corrected. A signal out of range or containing invalid data shall cause the text to display question marks on a flashing red background.
5. The operator shall be able to "double click" the tag number and cause a dialog box to appear. This box shall contain the full tag number of the instrument, measured variable name (i.e. Service Water Pump 1 Flow), calibrated range and current alarm points. One button shall be provided in the box to edit the alarm setpoints. A second button shall allow the operator to display a trend graph, on a partial screen, of the variable against a time base of minutes or hours (selectable).

- J. Accumulators: Provide HMI configuration for accumulations. Include run time for each piece of equipment. Include number of starts for each motor. Include totaled values for all flows.
- K. Security
  - 1. System protection from unauthorized access shall be provided by means of software interlocks.
  - 2. Software interlocks shall provide a minimum of four levels of security, system operator, supervisor, station superintendent and system engineer.
  - 3. Workstation mode software interlocks shall be provided to allow operators access to only the HMI software. Only system engineers shall be allowed to exit the software for access to the operating system and other resident software applications for PLC programming and editing. Program editing access shall require entry of a six-character entry code assigned within the controller program.
  - 4. All system users shall be required to log on to the WINDOWS software with a predefined user name and password. All defined user names and passwords shall be associated with a set security level.
  - 5. Each display shall be assigned a security level required to access it. All signals and control functions shall have separately assignable security levels.

### 3.04 GRAPHIC ELEMENTS

#### A. Display Screen Contents

- 1. Developers shall provide a hierarchal set of screens that include depictions of all of the equipment and systems covered by the Contract.
- 2. At the lowest level a single process system or subsystem shall be shown. At this level all mechanical equipment, pipelines and control devices in these lines that are a part of the normally operating process shall be shown, including all tanks; all mechanical equipment including pumps, heat exchangers, etc.; and all in-line valves (manual or automatic). Drain and overflow lines and manually operated sample valves and sample lines are optional and shall be shown only if space and clarity allow. Auxiliary lines such as flushing water lines not in use during normal process operation shall not be shown.
- 3. At succeeding higher levels a grouping of the levels below shall be shown. Little detail is required at these levels but a means of accessing the lower level screens is required.

4. At the highest level shall be two Station Overview screens which show the station as a whole. One screen shall provide a graphical representation of the plant site and the other shall provide an array of buttons labeled with all the various process areas of the plant. The graphical screen shall have hot zones that allow the operator to go to an area screen for a particular process area in the plant. The button type screen shall do the same by clicking on the button labeled with the process of interest.

B. Display Screen Resolution

1. Operator Workstations (OWS) and Area Control Stations (ACS): The process display screens shall have a resolution of 1024 pixels horizontal by 768 pixels vertical. Color resolution shall be 24-bit minimum (True Color).

C. Display Screen Background Color: All display screens shall use the default color.

D. Piping Representations

1. Process piping shall normally be shown as solid lines using a line width of 9pt. Thinner 5 pt lines shall be used for auxiliary service lines. Flow direction in pipelines should be shown by the use of arrows in the lines.
2. All process pipelines shall be shown in the colors that those lines are to be painted in the field. The colors follow Federal Standard 595B.
3. Where two different services are shown on the same screen having identical, or very similar, colors; one of the services shall use an alternative line display.
4. Each process screen shall contain a small legend block to help the operator clearly distinguish between the services. The legend shall contain the approved abbreviation of the service and an example of the graphical representation of the process service line. Area overview screens that show a large number of services in very small scale need not include the legend block.

E. Equipment and Valve Representations: The graphical representation of equipment and valves will use selections made by Operations from the HMI symbol library.

F. All equipment monitored or controlled by the SCADA System shall be shown in the following colors:

1. Green, if the equipment is stopped but ready to run
2. Red, if the equipment is running
3. Amber, if the equipment is in a malfunction alarm condition

4. Gray, if the equipment is not ready to run due to lack of power to the control circuits or prevented from running by an interlocking safety device. (Only if supported by installed hardware.).
- G. Coloring of Valves: All valves shown on the process screens shall be shown in the following colors:
1. Manually operated valves without position indication shall be shown in the same color of the pipeline in which they are installed.
  2. Manually operated valves with position indication shall change color depending on valve position, green if they are closed or red if they are open.
  3. Automatic valves shall be shown in green if they are closed or red if they are open. Also automatic valves shall be shown with a symbol for a valve operator (e.g. solenoid, motor, etc.). If an automatic valve has a malfunction alarm associated with the operator the operator shall be shown in amber if a malfunction occurs.
  4. Modulating valves shall be shown in green if they are fully closed or red if they are in any position other than fully closed. In addition, a small window positioned near the valve shall show the percent open of the valve.
- H. Equipment Names and Tag Numbers
1. The names for mechanical process equipment shall be shown beneath the piece of equipment in bold text and be underlined. The names should be in plain English. Valves and other controls shall not have names.
  2. Tag numbers for equipment and controls shall be hidden. The tag numbers shall be made visible if the equipment is in an alarm state or if the operator wants to see the tag by placing the mouse pointer over the tag. The tag shall be made visible by changing the point attribute based on either a change of alarm state, or a change of state caused by the "highlight" action.
- I. Mouse or Keyboard Actions: Any user action that involves the single click of a pointer device such as a mouse that causes an action to be carried out should happen on "mouse up" or "key up". An example would be screen navigation.
- J. Toolbars and Screen Navigation: Each full screen display shall have a toolbar at the top of the screen. The toolbar shall be the full width of the screen and be no more than 120 pt in height. The toolbar shall be identical for all screens for the project. The toolbar shall contain the following as a minimum.
1. Back: Pressing the Back button shall change the display to the previous screen in the queue.

2. Forward: Pressing the Forward button shall change the display to the next screen in the queue.
3. Alarms: Pressing the Alarms button shall change the display to the Alarm Summary screen. The button shall be configured to change the background from the default Text Button background color to flashing yellow whenever an unacknowledged alarm exists in the system.
4. Home or Station Overview: Pressing this button shall change the display to a screen that shows all of the process areas in the Station.
5. Security: Pressing the Security button shall cause the login screen to pop up. With the login screen shown a person can either log off the current user and/or sign in as a new user.
6. Trend: Pressing the Trend button shall open a selection screen listing all of the pre-configured historical trends available.
7. Report: Pressing the Report button shall open a selection screen listing all of the pre-configured reports available.
8. Print Screen: Pressing the Print Screen button shall print the current display screen.
9. Help: Pressing the help button shall open a pop-up screen with any help text screens related to the screen currently on display.

- K. Security Access Levels: There shall be four levels of security for the HMI application. An operator must log on to the system to change displays or take any control actions. Each operator shall be setup with a USER ID, a PASSWORD, and a Security Level. The Security Level assigned to each operator shall determine which items they can control. The control level assignments are described below.

Security Level	Description
Navigator	Allows screen navigation and monitoring.
Operator	Same as Navigator as well as Acknowledge alarms, start/stop motors, and open/close valves.
Supervisor	Same as Operator as well as change alarm high/low setpoints, change setpoints.
Administrator	Same as Supervisor as well as change interlocking alarm limits and tuning parameters. Also full access to user setup/modifications and ability to get to operating system.

- L. Trending: Trending shall be as defined in the Specifications.

M. Reports: All reports shall be generated and printed using black text and no background color. Reports shall be organized by equipment systems.

1. Daily Reports: Daily reports for any given day are to cover a day that is defined as the period of 6:00:01 AM of the given day to 6:00:00 AM of the following day. Each of the 24 hourly readings starting at 7:00 AM and ending at 6:00 AM is to represent the hourly period ending at the time shown. For example the data on the line for 10:00 AM would include all the data from 9:00:01 AM through 10:00:00 AM.
2. Monthly Reports: Monthly reports are to include the data of 28 to 31 Days depending upon the month. For months of less than 31 days, any unused lines in the report form are not to be included in any process calculations.

N. Alarms and Events

1. Alarm Priority Levels: There should be at least four alarm priority levels:
  - a. High priority level alarms shall indicate the malfunction or failure of either a critical piece of process equipment or a failure or malfunction of a SCADA system. High priority alarms are to be displayed on the Alarm Summary screen and logged in the alarm historian.
  - b. Medium priority level alarms shall indicate the malfunction or failure of a non-critical piece of process equipment. Non-critical equipment is defined as equipment that does not have an immediate impact on the process. An example would be where there is an automatic replacement of the failed equipment with a lag or standby unit. Medium priority level alarms are to be displayed on the Alarm Summary screen and logged in the alarm historian.
  - c. Low priority (warning) level alarms shall indicate an impending problem that should be monitored by the operator. Low priority level alarms are to be displayed on the Alarm Summary screen and logged in the alarm historian.
  - d. Events that are not process related. Events shall include the starting or stopping of a piece of equipment, the logon or logoff of an operator or the change of a monitoring system parameter such as a setpoint or tuning parameter. Events are not to be displayed on the Alarm Summary screen but are to be logged by the alarm or event historian.
2. Alarm States: Each alarm shall have four states:
  - a. Normal, or not in an alarm condition. The normal state is neither displayed nor logged.

- b. Active but not acknowledged. The change of alarm state from normal to active is logged. An active but not acknowledged alarm is displayed on the Alarm Summary screen.
  - c. Active and acknowledged. The changes of alarm state from active but not acknowledged to active and acknowledged are logged. An active and acknowledged alarm is displayed on the Alarm Summary screen.
  - d. Return to normal. The return to normal condition is logged and causes a change in the display of the alarm on the Alarm Summary screen.
3. Alarm Display Colors
- a. High Priority Alarms
    - (1) A high priority alarm that is active but not acknowledged shall be displayed on the Alarm Summary screen with black text on a flashing yellow background. The flash rate shall be once per second.
    - (2) A high priority alarm that is active and acknowledged shall be displayed on the Alarm Summary screen with black text on a steady yellow background.
    - (3) A high priority alarm that has returned to normal but is not acknowledged shall be displayed on the Alarm Summary screen as black text on a flashing lime background. The flash rate shall be once per two seconds.
  - b. Medium Priority Alarms
    - (1) A medium priority alarm that is active but not acknowledged shall be displayed on the Alarm Summary screen with black text on a flashing orange background. The flash rate shall be once per two seconds.
    - (2) A medium priority alarm that is active and acknowledged shall be displayed on the Alarm Summary screen with black text on a steady orange background.
    - (3) A medium priority alarm that has returned to normal but is not acknowledged shall be displayed on the Alarm Summary screen as black text on a flashing lime background. The flash rate shall be once per two seconds.

c. Low Priority Alarms

- (1) A low priority alarm that is active but not acknowledged shall be displayed on the Alarm Summary screen with black text on a flashing aqua background. The flash rate shall be once per second.
- (2) A low priority alarm that is active and acknowledged shall be displayed on the Alarm Summary screen with black text on a steady aqua background.
- (3) A low priority alarm that has returned to normal but is not acknowledged shall be displayed on the Alarm Summary screen as black text on a steady white background.

- d. All Alarms: Once an alarm has both been acknowledged and has returned to normal it shall be removed from the Alarm Summary screen.

-END OF SECTION-

**Section 17280**  
**SCADA SYSTEM - INPUT/OUTPUT POINT LIST**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. This Section describes the input/output (I/O) point list, which follows this Section and requirements for configuring the control system database.
- B. The I/O list information is available from the Commissioner on diskette. Allow 30 days from request to deliver this diskette.

**1.02 RELATED SPECIFICATION**

- A. Section 17212 - Programmable Logic Controllers

**1.03 SUBMITTALS**

- A. For each I/O attribute listed in the I/O list that cannot be used exactly as listed, submit an explanation of the reason for the deviation and propose a method to modify the I/O list information. Do not proceed with any configuration until a method of resolving deviations is approved.
- B. Include the control system I/O database information in the PLC specific submittals for Section 17212.

**1.04 I/O POINT LIST DESCRIPTION**

- A. The I/O point list contains the information necessary to configure the PLC I/O interface hardware and to indicate range conversion or signal functions.
  - 1. I/O Location: Termination point for interface to SCADA equipment.
  - 2. Signal Tag: An alphanumeric character string that uniquely identifies the signal.
  - 3. Signal Description/Location: An alphanumeric character string that describes the signal purpose.
  - 4. Signal Type: One of the following:
    - a. AI designates an analog input.
    - b. DI designates a discrete input.
    - c. DO designates a momentary, maintained or latched discrete output.
    - d. Ethernet designates an Ethernet data connection.
    - e. Modbus designates a Modbus data connection.

5. Input From / Output To: Indicates the signal origin for PLC inputs or the signal destinations for PLC outputs.
6. Remarks: Indicate the location, drawing number, and any additional information.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 I/O CONFIGURATION

- A. Implement the control system database fields in a consistent manner by using the following procedures:
  1. Use abbreviations and acronyms already established in the Contract Documents, and, in particular, use the information in the I/O list.
  2. Use only one abbreviation or acronym for a word or group of words respectively.
  3. Use the same subject and word order within data fields.
  4. Use the same term (phrase, word or acronym) to denote the same meaning. Do not use multiple terms for a single meaning.
  5. Use the point names, descriptions, logic state descriptions, ranges and units of measurement exactly the same wherever the point is referenced.
  6. Show point names and descriptions for all point references on documentation.
  7. Spell correctly.
  8. Maintain lists of acronyms and abbreviations used.

### 3.02 I/O HARDWARE CONFIGURATION

- A. Partition the I/O among cards within an I/O enclosure to provide control loop integrity.
  1. Put all inputs of the same I/O type associated with a device (e.g. fan) on the same card.
  2. Put all inputs of the same I/O type for devices arranged in process trains (e.g. a pump, its inlet valve and its outlet valve) on the same card or cards if more than one card is needed to accommodate the points.

3. Put all outputs of the same I/O type associated with a device or group of devices in a process train on the same card.
4. Where the preceding requirements specified in this subparagraph would cause more than 20 percent spare points on a card, points for a device or process train may be split between two consecutive cards.
5. Make unused terminals resulting from partitioning the I/O into pre-wired spares. Provide pre-wired spare points with all cabling and termination internal to the enclosure as done for other I/O points.

### 3.03 SPARES UTILIZATION

- A. If I/O is added by change order, incorporate pre-wired spare points into the active point database at no increase in Contract price.
  1. Include changing point names, descriptions, ranges, or statuses from spare to the new point.
  2. Include adding points to group displays and summary displays.
  3. Include related documentation changes.
- B. Spares utilization will be subject to the following limitations:
  1. The incorporation will not alter the control software configuration except to make the point accessible to displays, reports and future control software configuration.
  2. The incorporation will not alter the local area panels or field wiring to the device.
  3. Additions will not increase the size of reports or number of displays beyond that specified.
  4. The change will not be made subsequent to the shop drawing approval for a given process area.
- C. Treat changing of active points to spare points in the same manner as incorporation of spares.

### 3.04 POINT DATA FIELDS

- A. I/O point data fields will be subject to review and modification by the Commissioner during the shop drawing review phase. Incorporate changes directed by the Commissioner completely into the entire system at no increase in Contract price subject to the following limitations:

1. Limit the total number of modifications to 20 percent of the total number of I/O points.
2. Each unique change will count as one modification. For example, modifying the description, range, and engineering unit on an analog input count as 3 modifications.
3. Analog input alarm limit definition will not be counted as a modification.

3.05 INPUT/OUTPUT SCHEDULE (Starts on Next Page)

**NO TEXT ON THIS PAGE**

**Section 17320**  
**SCADA SYSTEM - CONTROL PANELS AND ENCLOSURES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, start-up and place into satisfactory operation all control panels and/or enclosures.

**1.02 RELATED SPECIFICATIONS**

- A. Section 02317 - Backfilling
- B. Section 03300 - Cast-in-Place Concrete
- C. Section 05120 - Structural Steel
- D. Section 17101 - SCADA System - General Requirements
- E. Section 17330 - SCADA System - Panel Instruments and Devices
- F. Section 17600 - SCADA System - Control Strategies

**1.03 QUALITY ASSURANCE****A. Standards, Codes and Regulations**

- 1. Construction of panels and the installation and interconnection of all equipment and devices mounted within shall comply with applicable provisions of the following standards, codes and regulations:
  - a. JIC - Joint Industrial Council Standards
  - b. NEC - National Electrical Code
  - c. NEMA - National Electrical Manufacturer's Association Standards
  - d. ASTM - American Society for Testing and Materials
  - e. OSHA - Operational Safety and Health Administration Regulations
  - f. State and Local code requirements.
  - g. Where any conflict arises between codes or standards, the more stringent requirement shall apply.

- 2. All materials and equipment shall be new and all panels shall be built in an Underwriters Laboratory (UL), Inc., approved panel shop and bear the UL label.

**B. General Design Requirements**

- 1. The Contractor shall comply with the requirements of Section 17101 - SCADA System - General Requirements.

2. The Contractor shall comply with the control description of Section 17600 - SCADA System - Control Strategies.
- C. Factory Assembly and Testing: The Contractor shall comply with the requirements of Section 17101 - SCADA System - General Requirements.

#### 1.04 SUBMITTALS

- A. Comply with the requirements of Section 17101 - SCADA System - General Requirements.

### PART 2 PRODUCTS

#### 2.01 GENERAL CONSTRUCTION REQUIREMENTS

- A. The Contractor shall provide all electrical and/or pneumatic components and devices, support hardware, fasteners, interconnecting wiring and/or piping required to make the control panels and/or enclosures complete and operational.
- B. The Contractor shall locate and install all devices and components so that connections can be easily made and that there is ample room for servicing each item.
- C. Components for installation on panel exterior shall be located generally as shown. Layouts shall be submitted for approval as per Section 17101 - SCADA System - General Requirements.
- D. Where permitted by location and layout as shown, panels and enclosures shall have full height rear access doors. Where rear doors are not possible, panels shall have full height front access doors.
- E. The Contractor shall adequately support and restrain all devices and components mounted on or within the panel to prevent any movement.
- F. The Contractor shall provide sub-panels for installation of all relays and other internally mounted components.
- G. All wiring to panel connections from field instruments, devices, and other panels shall be terminated at master numbered terminal strips, unless otherwise specified.
- H. The Contractor shall provide copper grounding studs for all panel equipment.
- I. The Contractor shall provide the following convenience accessories inside of each full height control panel:
  1. One 120 Vac, 20A duplex, grounding type receptacle.

2. One 120 Vac fluorescent light fixture with 40 Watt lamp and protective shatter resistant plastic shield
  3. One 120 Vac, 20A, snap switch, to turn on the light, mounted in an outlet box with a cover and located so that it is easily accessible from access door.
  4. Service light with switch and duplex receptacle shall have its own circuit breaker and separate power feed.
- J. The bottom 12 inches of free standing panels shall be free of all devices, including terminal strips, to provide ease of installation and testing.
- K. No device shall be mounted less than 36 inches above the operating floor level, unless otherwise specified.

## 2.02 IDENTIFICATION

- A. The Contractor shall provide laminated plastic nameplates for identification of panels and components mounted thereon as follows:
1. Nameplates shall be of 3/32-inch thick laminated phenolic type with white matte finish surface and black letter engraving.
  2. Panel identification nameplates to have 1/2-inch high letter engravings.
  3. Panel-mounted component (i.e., control devices, indicating lights, selector switches, etc.) identification nameplates to have 1/4-inch high letter engravings.
  4. Nameplates shall be attached to the panel face with two stainless steel self-tapping screws, unless the NEMA rating of the panel would be compromised, where adhesive bonding is permissible.
  5. Nameplate engravings shall include the instrument or equipment tag number and descriptive title as shown and specified.
- B. Tag all internally mounted instruments in accordance with the following requirements:
1. Tag numbers shall be as specified.
  2. The identifying tag number shall be permanently etched or embossed onto a stainless steel tag which shall be fastened to the device housing with stainless steel rivets or self tapping screws of appropriate size.

3. Where neither of the above fastenings can be accomplished, tags shall be permanently attached to the device by a circlet of 1/16-inch diameter stainless steel wire rope.
  4. Identification tag shall be installed so that the numbers are easily visible to service personnel.
  5. Front of panel mounted instruments shall have the tag attached to rear of device.
- C. Tagging of the following items shall be accomplished with the use of adhesive plastic Brady USA, Inc. labels, or equal.
1. Tag all electrical devices (i.e., relays, timers, power supplies) mounted within control panels and enclosures.
  2. Tag all pneumatic lines.
  3. Numerically tag all terminal blocks.
  4. Color code and numerically tag wiring at each end.

## 2.03 PANELS AND ENCLOSURES

### A. General

1. Panels and enclosures shall meet the NEMA requirements for the type specified.
2. Sizes shown are estimates. Contractor shall furnish panels and enclosures amply sized to house all equipment, instruments, front panel mounted devices, power supplies, power distribution panels, wiring, tubing and other components installed within.
3. I/O cabinets are to match in height and depth the adjacent enclosures.

### B. Construction Features

1. Control panels located inside control or electrical room areas shall be NEMA 12 rated.
  - a. Fabricate enclosures using minimum 14 gage steel for wall or frame mounted enclosures and minimum 12 gage for free standing enclosures. Steel shall be free of pitting and surface blemishes.

- b. The Contractor shall continuously weld all exterior seams and grind smooth. Also, surface grind complete removal of corrosion, burrs, sharp edges and mill scale.
- c. Reinforce sheet steel with steel angles where necessary to adequately support equipment and ensure rigidity and to preclude resonant vibrations.
- d. Panel shall be flat within 1/16-inch over a 24-inch by 24-inch area, or flat within 1/8-inch for a larger surface. Flatness shall be checked by using a 72-inch long straight edge. Out-of-flatness shall be gradual, in one direction only, and shall not consist of obvious depressions or a series of wavy sections.
- e. Panel shall use pan type construction for doors. Door widths shall not exceed 36 inches.
- f. Doors shall be mounted with full-length heavy-duty piano hinge with stainless steel hinge pins.
- g. The Contractor shall provide oil resistant gasket completely around each door or opening.
- h. The Contractor shall provide handle-operated, oil-tight, key-lockable three-point stainless steel latching system with rollers on latch-rods for easy door closing.
- i. The Contractor shall use stainless steel fasteners throughout.
- j. The Contractor shall provide interior mounting panels and shelves constructed of minimum 12 gage steel with a white enamel finish.
- k. The Contractor shall provide steel print pocket with white enamel finish.
- l. The Contractor shall provide enclosure mounting supports as required for floor, frame, or wall mounting.
- m. The Contractor shall provide all holes and cutouts for installation of conduit and equipment. Cable and piping to enter the enclosure through the bottom unless otherwise noted. All conduit and piping openings and all conduits shall be sealed watertight.
- n. The Contractor shall completely clean all interior and exterior surfaces so they are free of corrosive residue, oil, grease and dirt. Zinc phosphatize for corrosion protection.

- o. One coat of primer shall be applied to all interior and exterior surfaces immediately after corrosion protection has been applied. Exterior surfaces shall then be given sufficient coats of primer surfacer, applied with sanding and cleaning between coats, until a Grade 1 finish can be produced on the finish coat.
  - p. All interior surfaces shall be painted with 2 coats of semi-gloss white polyurethane enamel.
  - q. All exterior surfaces shall be painted with a minimum of 3 finish coats of polyurethane enamel to ultimately produce a Grade 1 finish (super smooth; completely free of imperfections). Color to be selected by Commissioner from complete selection of standard and custom color charts furnished by the manufacturer. Provide one extra quart of touch-up paint for each exterior finish color.
  - r. Primer and finish paint shall be compatible and shall be a low VOC, high solids polyurethane enamel, Hi-Solids Polyurethane B65 W300 Series as manufactured by Sherwin-Williams, Inc. or equal.
  - s. Provide one extra quart of touch-up paint for each exterior finish color.
2. Control panels located in field (non-control room environment) shall be NEMA 4X rated.
- a. Panels shall be Type 316L stainless steel construction with a minimum thickness of 12 gage for all surfaces (except those areas requiring reinforcement) having a smooth brushed finish.
  - b. Panel shall be furnished with stainless steel screw clamp assemblies on three sides of each door.
  - c. Panels shall be furnished with rolled lip around three sides of door and along top of enclosure opening.
  - d. Panels shall be furnished with hasp and staple for padlocking.
  - e. Panels shall be provided with a clear plastic, gasketed lockable hinged door to encompass all non-NEMA 4 front of panel instruments.
  - f. Provide 3-inch high channel base assembly, with solid bottom, drilled to mate the panel to its floor pad.
  - g. Floor Pad: Refer to Part 3 of this Specification Section.

3. Where the application applies and with the approval of Commissioner, wall mounted enclosures may be provided. The enclosure shall comply with Paragraph B.1. or B.2., except for the following:
  - a. Locations shall be as shown on the Contract Drawings or as specified under other Sections.
  - b. Doors shall be full height.
  - c. Corrosion-resistant polyester quick release latches shall be provided.
  - d. No extra holes or knockouts shall be provided. No light or convenience outlet need be provided.

### C. Electrical Systems

#### 1. Control of Environment

##### a. Outdoor Panels and Indoor Panels in Unheated Areas

- (1) Shall be furnished with adequately sized automatically controlled 120 V AC strip heaters to automatically maintain temperature inside each enclosure above 40°F to maximum of 80°F when the outside temperature is -20°F through 40°F.
- (2) Shall be provide with automatically controlled closed loop ventilation fans or closed loop air conditioners with filtered air louvers if required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure. Air conditioner shall have a minimum capacity of 4000 BTU. Housing shall be constructed of corrosion resistant materials.
- (3) The Contractor shall provide calculations to prove that cooling is not required.
- (4) Shall be provided with thermostats to automatically control heating and cooling requirements without need of manual operation of a heating/cooling transfer switch.

##### b. Panels in Heated Areas

- (1) Shall be furnished with adequately sized, automatically controlled 120 V AC strip heaters to maintain temperature 10°F above ambient for condensation prevention inside panels.

(2) Shall be provided with automatically controlled closed loop ventilation fans or closed loop air conditioners with filtered air louvers if required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure.

(3) Air conditioner shall have a minimum capacity of 4,000 BTU.

## 2. Power Source and Internal Power Distribution

- a. General: Control panel power supply source, type, voltage, number of circuits and circuit ratings shall be as shown on the Electrical Drawings.
- b. Panels shall be provided with an internal 120 V AC power distribution panel with number of circuits and separate circuit breakers sized as required to distribute power to the panel components. Distribution panel shall contain two spare breakers minimum.

## 3. Wiring

- a. Internal wiring shall be Type MTW stranded copper wire with thermo-plastic insulation rated for 600 V at 85 C for single conductors, color coded and labeled with wire identification.
- b. For DC panel signal wiring, use No. 18 minimum AWG shielded.
- c. For AC power wiring, use No. 12 minimum AWG. For a-c signal and control wiring, use No. 16 minimum AWG. For wiring carrying more than 15 Amps, use sizes required by NEC and JIC standards.
- d. Low voltage signal wiring and shielded wiring shall be separated from power and control wiring by a minimum of 6 inches.
- e. Parallel runs of wire shall be grouped or bundled using covered troughs. Maximum bundle size to be 1 inch. Troughs shall have 40 percent spare capacity.
- f. Wire troughs along horizontal or vertical routes shall be installed to present a neat appearance. Angled runs are not acceptable.
- g. The Contractor shall adequately support and restrain all wiring runs to prevent sagging or other movement.
- h. The Contractor shall terminate all field wiring at 600 V rated compression-type barrier terminal strips with screwed connections and permanently affixed numeric identifiers beside each connection. Identifiers to be self-stick plastic tape strips with permanent type,

machine printed numbers. All terminal strips shall be capable of handling No. 12 wiring (minimum). Provide Phoenix Contact, Entelec or Allen Bradley.

- i. All wiring shall be installed such that if wires are removed from any one device, power will not be disrupted to any other device.
- j. All alarms generated external to the panel, spare alarm, and repeat contacts shall be wired out to terminal blocks.
- k. The Contractor shall provide spare terminals equal in number to 20 percent of the terminals used for each type of wiring (i.e., DC signal and AC power).
- l. The Contractor shall provide a separate terminal for grounding each shielded cable.
- m. The Contractor shall use separate 5/16-inch diameter copper grounding studs for instrument signal cable shields and AC power.
- n. Where wires pass through panel walls, provide suitable bushings to prevent cutting or abrading of insulation.
- o. When DC power and/or low voltage AC power is required, provide and install the necessary power supplies and transformers in the panel.
- p. The Contractor shall provide circuit breakers to protect each circuit, with no more than six instruments on a single circuit.
- q. The Contractor shall provide complete wiring diagram showing "as built" circuitry. Diagram shall be enclosed in transparent plastic and placed in easily accessible pocket built into panel door.

#### 4. Surge Protection

- a. General: Surge protection shall be provided to protect the electronic instrumentation system from surges propagating along the signal and power supply lines. The protection systems shall be such that the protection level shall not interfere with normal operation, but shall be lower than the instrument surge withstand level, and be maintenance free and self-restoring. Instruments shall be housed in suitable metallic cases, properly grounded. Ground wires for all surge protectors shall be connected to a good earth ground and where practical each ground wire run individually and insulated from each other. These protectors shall be mounted within the instrument enclosure or a separate junction box (compatible with the area designation) coupled to the enclosure.

- b. The units shall be as manufactured by Phoenix Contact, Innovative Technology, or equal.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. The Contractor shall install equipment in conformance with NEC.
- B. Unless otherwise noted, the Contractor will install indoor freestanding NEMA 4X panels on 4-inch concrete pad. Extend pad 4 inches beyond outside dimensions of base, all sides. Lay grout after panel sills have been securely fastened down.
- C. Unless otherwise noted, install outdoor free-standing NEMA 4X panels on a reinforced concrete pedestal:
  - 1. Minimum Thickness: 8 inches with No. 4 steel reinforcing bars at 12 inches on centers, each way.
  - 2. Minimum Size: 12 inches larger than outer dimensions of base, all sides.
  - 3. The Contractor shall provide excavation and backfill work in conformance with Section 02316 - Excavation and Section 02317 - Backfilling.
  - 4. The Contractor shall provide concrete work in conformance with Section 03300 - Cast-in-Place Concrete.
- D. The Contractor shall install anchor bolts and anchor in accordance with Section 05120 - Structural Steel.
- E. The Contractor shall install and interconnect all equipment, devices, electrical hardware, instrumentation and controls and process controller components into and out of and among the enclosures as indicated on the Drawings.

#### 3.02 TESTING AND ADJUSTMENTS

- A. The Contractor shall perform system testing and make any adjustments necessary in accordance with this Section and Sections 17101 - SCADA System - General Requirements.
- B. The Contractor shall perform power supply, voltage adjustments to tolerances required by the appurtenant equipment.

### 3.03 SPARE PARTS AND TEST EQUIPMENT

- A. The Contractor shall furnish and deliver the spare parts and test equipment as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification Section.
- B. Spare parts shall be packed in containers suitable for long term storage, bearing labels clearly designating the contents and the pieces of equipment for which they are intended.
- C. The following shall constitute the minimum spare parts:
  - 1. Five of each type input-output relay for each 40 or less furnished for this Contract.
  - 2. One replacement power supply for each type and size furnished for this Contract.
  - 3. One dozen of each type and size of fuse used in control panels and enclosures.
- D. The following shall constitute the minimum test and calibration equipment.
  - 1. Two Fluke, Hewlett-Packard, or equal (latest in series) digital multimeter plus amprobe, high voltage probe, test leads, case and all other recommended spares and accessories.
  - 2. All tooling required to insert, extract and connect any internal or external connector, including edge connectors.
  - 3. All special calibration equipment required for system calibration.
  - 4. A thermocouple calibrator including case.
  - 5. One signal simulator (4-20 mA; 1-5 Vdc) including cases. One simulator shall be battery powered and shall include charger.
- E. All spare parts shall have been operated and tested in the factory as part of factory testing prior to shipment of the control system.

- F. For process sensors and all other analog instruments, the supplier shall submit a separate quotation for a recommended list of spare parts and test equipment. Each item recommended shall be listed and priced separately. The spare parts quotation shall contain a statement that the prices quoted are firm for a period of one year from the installation date of the equipment, and that the supplier understand that the City of New York reserves the right to purchase none, any, or all of the parts quoted. The supplier is required to show that a stock of spare-parts and test-equipment is obtainable within a 48-hour period.

-END OF SECTION-

**Section 17330****SCADA SYSTEM - PANEL-MOUNTED INSTRUMENTS AND DEVICES****PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, adjust and place into satisfactory operation panel instruments and devices.
- B. Drawings and Specifications illustrate and specify functional and general construction requirements of the panel components and do not necessarily show or specify all components, wiring, piping and accessories required to make a completely integrated system. The Contractor shall provide all piping, wiring, accessories and labor required for a complete, workable and integrated system.
- C. Coordination: Contractor shall coordinate the installation of all items specified herein and required to ensure the complete and proper interfacing of all the components and systems.

**1.02 RELATED SPECIFICATIONS**

- A. Section 17101 - SCADA System - General Requirements
- B. Section 17320 - SCADA System - Control Panels and Enclosures

**1.03 QUALITY ASSURANCE**

- A. Comply with the requirements of Section 17101 - SCADA System - General Requirements.
- B. Acceptable Manufacturers
  - 1. Contractor shall furnish instruments and devices by the named manufacturers or equal equipment by other manufacturers.
  - 2. The named manufacturers have been specified to establish the standard of quality and performance of the equipment to be supplied.
  - 3. Contractor shall obtain all instruments or devices of a given type from the same manufacturer.
- C. Manufacturers' Responsibilities and Services shall include:
  - 1. Design and manufacture the instruments and devices in accordance with the applicable general design requirements specified in Section 17101 - SCADA System - General Requirements and the specifications herein.

2. Field supervision, inspection, start-up and training in accordance with the requirements of Section 17101 - SCADA System - General Requirements.

- D. Instruments and devices shall not be assembled in the panels until all product information and system shop drawings for respective components have been approved.

#### 1.04 SUBMITTALS

- A. Comply with the requirements of Section 17101 - SCADA System - General Requirements.

#### 1.05 IDENTIFICATION TAGS

- A. All panel instruments and devices shall have an identification tag meeting the following requirements:
  1. Tag numbers shall be as listed in the Instrument Index.
  2. Identifying tag number shall be permanently etched or embossed onto a stainless steel tag which shall be fastened to the device housing with stainless steel rivets or self tapping screws of appropriate size.
  3. Where neither of the above fastenings can be accomplished, tags shall be permanently attached to the device by a circlet of 1/16-inch diameter stainless steel wire rope.
  4. All instruments and devices mounted within panels shall have the stainless steel identification tag installed so that the numbers are easily visible to service personnel. Front of panel-mounted components shall have the tag attached to the rear of the device.
  5. Front of panel-mounted components shall have nameplates which comply with the requirements specified in Section 17320.

### PART 2 PRODUCTS

#### 2.01 CURRENT ISOLATOR

- A. General: The isolating unit shall be a two wire, loop powered device. It shall accept a 4-20 mA input signal and deliver a 4-20 mA output.
- B. Required Features
  1. Repeatability:  $\pm 1$  percent of span
  2. Ambient Temperature Range: -15°F to +185°F

3. Linearity:  $\pm 0.1$  percent of full scale
4. Provide one spare isolator.

C. Product Manufacturer: Provide current isolator of one of the following:

1. Rochester Instrument System
2. Acromag
3. Moore Industries
4. Or equal

## 2.02 CONTROL RELAY

A. Type: General purpose, plug-in type rated for continuous duty

B. Coil Voltages: 24 Vdc and 120 Vac as required

C. Contacts

1. Silver cadmium oxide rated not less than 5 Amperes resistive at 120 Vac or 28 V DC continuous
2. For switching low energy circuits (less than 200 mA) fine silver, gold flashed contacts rated not less than 3 Amperes resistive at 120 Vac or 28 Vdc continuous shall be provided.

D. Relays to have clear plastic dust cover.

E. Relays to be UL recognized.

F. Product and Manufacturer: Provide one of the following:

1. IDEC
2. Potter & Brumfield
3. Allen-Bradley
4. Or approved equal

## 2.03 SELECTOR SWITCHES, PUSH BUTTONS AND INDICATING LIGHTS

A. General

1. Selector switches, push buttons and indicating lights shall be supplied by one manufacturer and be of the same series or model type.
2. Type: Heavy duty, oil tight.
3. Provide legend plate for indication of switch, push button or light function (i.e. Open-Closed, Hand-Off-Auto).

4. Mounting: Flush mounted on control panel front, unless otherwise noted.
5. NEMA rated to match panel in which mounted.
6. Size: 30 mm nominal

**B. Selector Switches**

1. Type: Provide selector switches with number of positions as required to perform intended functions as shown and specified.
2. Contacts:
  - a. Provide number and arrangement of contacts as required to perform intended functions specified but not less than one single pole, double throw contact.
  - b. Type: Double break, silver contacts with movable contact blade providing scrubbing action.
  - c. Rating: Compatible with AC or DC current with devices simultaneously operated by the switch contacts but not less than 10 Amperes resistive at 120 Volts AC or DC continuous.
3. Switch Operator: Standard black knob.

**C. Push Buttons (Standard or Illuminated)**

1. Type: Provide momentary lighted and/or unlighted, single and/or dual type push buttons as required to perform intended functions specified and shown.
2. Contacts: Comply with the requirements specified for selector switches.

**D. Indicating Lights**

1. Type: LED
2. Lamps: 120 Volts
3. Common, push to test circuitry shall be provided for each panel to simultaneously test all indicating lights on the panel using a single push button.

**E. Button and Lens Colors**

1. Red for indication of open, on, running.
2. Green for indication of closed, off (ready), stopped.

3. Amber for indication of equipment malfunction, process trouble and alarms (i.e. high level, low level, etc.).
4. White for indication of electrical control power on.

F. Rotary Cam Switches

1. Provide rotary cam switches with number of positions and poles as required to perform the required signal switching function specified and shown.
2. Contacts:
  - a. Gold-flashed contacts housed in mechanical contact blocks with number and arrangement of contacts as required to perform intended functions.
  - b. Contact Rating: Compatible with AC or DC through-put current of signals and devices simultaneously operated by the switch contacts but not less than 20 Amperes at 600 VAC or 250 V DC continuous.
3. Switch Operator: Standard black knob

G. Product and Manufacturer: Provide one of the following:

1. Type E30, as manufactured by Cutler-Hammer
2. Series 800, as manufactured by Allen Bradley
3. Or approved equal

2.04 CURRENT ALARM RELAY

- A. Type: Programmable direct current alarm
- B. Input: 4-20 mA DC; 1-5 V DC
- C. Output: Dual alarms SPDT relays rated @ 5A, 117 V AC non-inductive.
- D. Indicator: 3 1/2 digit LCD Digital indication of trip points in engineering unit with LEDs on front panel indicating alarm status.
- E. Diagnostics: Error message display for sensor break, lost of communication; output shall default to programmable state.
- F. Signal retransmission: Isolated 4-20 mA DC retransmission of input signal.
- G. Transmitter excitation: 2-wire transmitter power supply.
- H. Display accuracy: +/- 0.05% of span includes repeatability, hysteresis, and adjustment resolution.

- I. Trip point repeatability:  $\pm 0.05\%$  of input span
- J. Dead Band: 1% of span.
- K. Signal response: -3dB @ 5 Hz.
- L. Isolation: 500 V AC, input to output to power.
- M. Alarm response: 150 msec. Max.
- N. RFI/EMI Effect: Unit shall not go into alarm with field strengths 10 V/m present at 20-500 MHz unless process variable is within  $\pm 1\%$  of trip point.
- O. Ambient temperature: 0 to 150 Deg. F.
- P. Housing: DIN style rail mounting with removable terminal blocks.
- Q. Adjustments: Front panel push-button control settings for zero, span, alarm trip points.
- R. Power: 24V DC  $\pm 10\%$ .
- S. Product and Manufacturer: Provide one of the following:
  - 1. SPA series as manufactured by Moore Industries.
  - 2. Or approved equal

## 2.05 POWER SUPPLIES

- A. General: Single unit and multiple unit power supplies, located in control room panels, remote terminal units and field panels as required.
- B. Single Unit Required Features
  - 1. Solid state circuitry
  - 2. Surface mounting
  - 3. Input Voltage: 117 V AC  $\pm 10$  percent, 60 Hz
  - 4. Output Voltage: 24 V DC or as required
  - 5. Line/Load Regulation:  $\pm 0.005$  percent
  - 6. Ripple: 0.25 mV RMS
  - 7. Overload Protection: Internal preset
  - 8. Include mounting brackets, fuse, and mating connector for AC power plug

## C. Multiple Unit Required Features

1. Solid state circuitry
2. Standard 19-inch RETMA (EIA) rail mounting
3. Input Voltage: 120 V AC  $\pm$  10 percent, 60 Hz
4. Output Voltage: 24 V DC or as required.
5. Include over-voltage protection, output current limiting protection, power supply failure alarm contacts, provisions for paralleling power supplies and front panel-mounted indicating fuses, test jacks and adjustments.
6. If the power supplies are connected in parallel, provide isolation diodes in series with the positive lead of each of the parallel connected power supplies.
7. Connections: Twist-lock AC power connector, or DC power terminal strip.

## D. Product Manufacturer: Provide power supply units of one of the following:

1. Acopian
2. Or approved equal

## 2.06 LOOP-POWERED METER

- A. Type: 3.5 digit, loop-powered, backlit digital meter
- B. Input: 4-20 mA
- C. Display: 0.5 inch high LCD, 3.5 digits with backlighting; user selectable decimal point
- D. Calibration: 2 Step; non-interacting zero and span
- E. Maximum Input Current: 30 mA
- F. Maximum Voltage Drop: 1.5 VDC @ 20 mA; 3.5 VDC @ 20 mA
- G. Accuracy:  $\pm$  0.1% of span
- H. Connections: Removable screw terminal block
- I. Operating Temperature: -40 to 85°C
- J. Enclosure: NEMA 4X, Explosion Proof as specified.

K. Product Manufacturer: Provide one of the following:

1. PD 660-B as manufactured by Precision Digital.
2. Or approved equal

## 2.07 STROBE WARNING LIGHT

A. General: The light shall provide a visual warning where a potential hazard may occur.

B. Required Features

1. Strobe Light: 1,000 effective candle power
2. Lens Color: Amber
3. Enclosure: Cast aluminum housing, corrosion resistant
4. Power: 120 Vac
5. Surface mountable (mount kit, LWMB2)
6. UL Listed

C. Product and Manufacturer: Provide one of the following:

1. Model 371 DST, as manufactured by Federal Signal
2. Or equal

## 2.08 SPARE PARTS AND TEST EQUIPMENT

A. The Contractor shall furnish and deliver the spare parts and test equipment as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this Specification.

B. The spare parts shall be packed in containers suitable for long term storage, bearing labels clearly designating the contents and the pieces of equipment for which they are intended.

C. The following shall constitute the minimum spare parts:

1. Five of each type of input-output relay for each 40 or less furnished for this Contract.
2. One replacement power supply for each type and size furnished for this Contract.
3. One per ten (two, if fewer than twenty) of each type of panel-mounted instrument including lights, push buttons

4. Lamps for Indicating Lights
    - a. 50 percent spare lamps of each color of incandescent lamp provided
    - b. Two of each color of LED-type lamp provided
  5. One dozen of each type and size of fuse used in panels and instruments.
- D. The following shall constitute the minimum test and calibration equipment:
1. All tooling required to insert, extract and connect any internal or external connector, including edge connectors.
  2. All tooling required to insert, extract and connect any internal or external connector, including edge connectors.
- E. All spare parts shall have been operated and tested in the factory as part of factory testing prior to shipment of the control system.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Install each item in accordance with manufacturer's recommendations and in accordance with the Contract Documents.
- B. All items shall be mounted and anchored in compliance with Section 17320 - SCADA System - Control Panels and Enclosures.

#### 3.02 START-UP, CALIBRATION, AND TESTING AND TRAINING

- A. Comply with the requirements of Section 17101 - SCADA System - General Requirements.

-END OF SECTION-

**NO TEXT ON THIS PAGE**

**Section 17600**  
**SCADA SYSTEM - CONTROL STRATEGIES**

**PART 1 GENERAL****1.01 SECTION INCLUDES**

- A. Contractor shall furnish control strategy diagrams, configuration sheets and control strategy descriptions as shop drawings for approval.
- B. Contractor shall perform all programming, configuration and tuning.

**1.02 RELATED SPECIFICATIONS**

- A. Section 17101 - SCADA System - General Requirements
- B. Section 17270 - SCADA System - Monitoring and Control Criteria

**1.03 SUBMITTALS**

- A. The control strategies are written descriptions of the basic configuration and/or programming required to implement monitoring and control of the unit processes as shown on the Contract Drawings. They do not in all cases describe the process characteristics fully, many of which may become apparent only during start-up. Control strategies shall fully reside in the memory of the designated PLC. The process inputs/outputs referred to in the Control Strategies are shown or specified. Any additional I/O (Maximum 20%) required shall be added during Shop Drawing Review. It shall be provided at no additional cost to the City of New York.
- B. Process Control Functions: Process control function shall be structured to permit the realization of all control strategy requirements. In addition, each control function shall be designed so that bumpless, balance free transfers are obtained during operating mode changeover and initialization. Where applicable, user-changeable parameters shall be automatically defaulted to a preset value if a specific value is not given during system generation.
  - 1. Provision shall be made to include certain control functions that apply to all analog inputs, virtual variables, analog controllers and discrete control whether or not shown on the P&IDs, even though one or more of the functions may be disabled by the user for a given data base point:
    - a. Analog Data Scaling: Scale all analog inputs to a common span and shall normalize the digital representation of each analog input to a percent of the operating span. The processed value shall be expressed as a binary number that specifies the analog input's position on a straight line lying between zero and full scale as defined for a given input by the zero span values in the data base.

- b. Amplitude Limit Check: Perform dual level, high/low amplitude limit checking and shall identify a limit violation every time a measured or virtual variable goes out-of-limits and returns back into limits. The control function shall determine the time at which each limit excursion occurred. A deadband shall be provided on each limit and shall be expressed as a percentage of span or in engineering units. Low and high limiting default values will be set-up for each measured or calculated variables used in the process control loops.
- c. Engineering Unit Conversion: This control function shall convert scaled analog data to engineering units by means of the following equation:

$$Y = (H - L) (D/DH) + L$$

where:

Y = value in engineering units.

H = high value of span, expressed in engineering units.

L = low value of span, expressed in engineering units.

D = digitized scaled input value in counts.

DH = full scale digitized value in counts

- d. Manual Control: It shall be possible for operator or plant engineer to interrupt any sequence, loop or automatic operation and operate the same manually through operator workstation.
  - e. Verification Of Digital Outputs: Verify that the equipment has responded to the digital commands before proceeding to next step during automatic operation. If any discrepancy is detected, an alarm will be annunciated.
- C. Hardware: The Contractor shall provide all the hardware, whether or not shown or specified that maybe necessary to implement the control strategies as described.
  - D. Configuration: All set points, tuning parameters and engineering scales etc. shall be documented for each control point and each control strategy on configuration sheets or similar documents. These documents shall be updated during factory testing and finally during start-up.
  - E. Control Strategy Displays shall be submitted for review. Displays shall clearly show initial conditions, start, and progression of the control strategies. Each control strategy shall be displayed in a minimum number of displays for ease of monitoring by the operator.

- F. Plant Power Failure: Plant equipment controlled by the PLC shall be programmed to automatically reset upon failure.
- G. Restart: All equipment and motors shall be automatically restarted after power failure by the control system in an orderly fashion approved by the Commissioner.
- H. All relays, training parameters, scales, configuration values, mathematical constants, equations and set points given in the control strategies are adjustable over a wide range. Initial values are given and may change during shop drawing review and may have to be readjusted during start-up.

## PART 2 PRODUCTS (Not Used)

## PART 3 EXECUTION

### 3.01 CONTROL STRATEGIES

#### A. General Requirements

1. The following pages describe the control strategies to be implemented by the Contractor under this Specification Section. The following requirements are general in nature, and are to be used throughout the programming for the system. Time delays, set points, and other variables used in programming shall be adjustable by the user.
2. Control strategies shall be implemented in accordance with Section 17270 – SCADA System – Monitoring and Control Criteria.
3. General Motor Control
  - a. When a motor is to be started by the SCADA system
    - (1) Verify SCADA mode signal is true
    - (2) Verify failure or trouble signal is not true
    - (3) Activate run command signal
    - (4) After a preset adjustable time period, verify running feedback signal is true
    - (5) After a preset adjustable time period, verify positive feedback signal is true, if available
    - (6) Disable and alarm if any step fails.

- b. When a motor is to be stopped by the SCADA system
  - (1) De-activate run command signal
  - (2) After a preset adjustable time period, verify running feedback signal is false
  - (3) Disable and alarm if any step fails.
- 4. Running Feedback Signals: Calculate cumulative running hours based on the status of each running feedback signal.
- 5. Output Signals
  - a. Each output signal shall be capable of being controlled by the operator directly. Provide a control point, accessible from a display, for each output signal.
  - b. Some outputs shall also be capable of being controlled automatically by the results of software strategies specified herein. Provide these output signals with a software selector switch, accessible from a display, allowing the operator to select between control by the operator, or by the software strategy.
- 6. General Lead-Lag Routine
  - a. Where a set of controlled equipment is specified as lead-lag service, provide a software selector switch to allow the operator to designate the lead and lag equipment.
  - b. When the strategy calls for an additional piece of equipment, the next available device, based on the lead-lag sequence selected, shall be put in service.
  - c. When the strategy calls for a piece of equipment to be removed from service, the next available device, based on the lead-lag sequence selected, shall be taken out of service.
  - d. A failed device, or one that is not in SCADA mode, will be bypassed when starting or stopping device based on lead-lag sequencing.
- 7. General Automatic Failover Routine
  - a. Where a set of controlled equipment has multiple devices capable of providing a common service, provide an automatic failover routine for each device, including the following steps:

- (1) Check that the standby device is not running
    - (2) Check that the standby device is not failed
    - (3) Check that the standby device is in SCADA mode
    - (4) Remove the failed device from service
    - (5) Start the standby device
  - b. Disable and alarm if the routine fails on a failure of any step above within a given time delay.
  - c. Where multiple standby devices are available, use the lead-lag settings to determine the order of standby devices.
- B. M01: Dust Suppression System (F-DSS-01) Pumping
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: none
  3. Display: Provide a screen display showing all major equipment comprising the dust suppression system, including the pumping station and the distribution piping and zone valves. The display shall be a flow schematic diagram, and shall indicate signal values graphically on the display.
- C. M02: Dust Suppression Zone Valves (F-DSV-01 to F-DSV-09)
1. Monitoring: Monitor signals scheduled and shown. Signals shall be received from the dust suppression system control panel as shown and specified in Section 11570.
  2. Control: Control signals scheduled and as shown. . Signals shall be sent to the dust suppression system control panel as shown and specified in Section 11570. Set outputs based on operator input via screen display.
  3. Display: Provide a screen display showing all dust suppression zones. The display background shall be a plan view of the tipping and loading levels. Provide mode and status of each zone on display. Provide software switch to control each zone valve.
- D. M03: Odor Control System (F-OCS-01) Pumping
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: none
  3. Display: Provide a screen display showing all major equipment comprising the odor control system, including the pumping station and the distribution

pipng and solenoid valves. The display shall be a flow schematic diagram, and shall indicate signal values graphically on the display.

E. M07: Constant Tension Winches (F-CTW-01, -02)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

F. M12: Heat Tracing System (F-HTS-01)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

G. M17: Tipping Bay Traffic Signaling System (F-TSS-09 to -14)

1. Monitoring: none
2. Control: Control signals scheduled and as shown. Set outputs based on operator input via screen display.
3. Display: Provide a screen display showing all major equipment comprising the tipping bay traffic signaling system. The display shall be a plan view of the tipping floor, indicating signal locations. Indicate signal output values graphically on the display. Provide software toggle switch to set red, green, or neither output on.

H. M18: Container Transport System (F-CTS-01 to -04)

1. Monitoring: Monitor signals scheduled and shown. Signals shall be received from the shuttle car network as shown. Information transferred shall include the following for each shuttle car:
  - a. Shuttle car failure
  - b. Shuttle car safety stop
  - c. Shuttle bay door open
  - d. Shuttle bay door closed
  - e. Shuttle bay door failure
2. Control: None
3. Display:
  - a. Indicate shuttle car alarms on alarm display package.

- b. Indicate position of shuttle bay doors on the graphic for Architectural system A2 below.
- I. M19: Fluids Monitoring (F-FMS-01))
  - 1. Monitoring: Monitor signals scheduled and shown.
  - 2. Controls: none
  - 3. Display: Indicate alarms on alarm display package.
- J. M20: Service Water System (F-SWS-01)
  - 1. Monitoring: Monitor signals scheduled and shown.
  - 2. Control: none
  - 3. Display: Provide a screen display showing all major equipment comprising the service water system, including the pumping station and the distribution piping and hose reels. The display shall be a flow schematic diagram, and shall indicate signal values graphically on the display.
- K. M21: Fuel Management System
  - 1. Monitoring: Monitor signals scheduled and shown.
  - 2. Controls: none
  - 3. Display: Indicate alarms on alarm display package.
- L. A02: Loading Level Truck Door (F-OHD-03)
  - 1. Monitoring: Monitor signals scheduled and shown.
  - 2. Control: none
  - 3. Display: Provide screen display showing all major equipment comprising architectural systems A02, A05, and A06. Display shall be a plan view of the station, indicating equipment locations. Indicate signal values graphically on the display.
- M. A05: Inbound Sanitation Truck Door (F-OHD-01)
  - 1. Monitoring: Monitor signals scheduled and shown.
  - 2. Control: none
  - 3. Display: See A02 display above.

## N. A06: Outbound Sanitation Truck Door (F-OHD-02)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See A02 display above.

## O. A08: Main Entrance Gate (F-HSG-01)

1. Monitoring: none
2. Control: Control signals scheduled and as shown. Set output based on operator input via screen display.
3. Display: Provide a screen display indicating equipment location within the facility. Indicate signal output values graphically on the display. Provide software toggle switch to set open output on.

## P. H01: Supply Fans (F-SAF-01 to -06)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: Supply fans SAF-01, -03, and -05 serve the loading area. Supply fans SAF-02, -04, and -06 serve the tipping area. Exhaust fans EAF-01 to EAF-06 serve the tipping and loading levels of the station.
  - a. Each fan is controlled by an On-Off-Auto selector switch located adjacent to the fan. Supply a software control strategy for automatic control of the fans when the fan is in the Auto mode. The strategy shall consist of automatic control based on air changes. The operator shall select the number of air changes per hour, from a selection of 4, 8, or 12 air changes per hour. Using the fan capacity table and the position of the lead-lag selector switches, the SCADA system shall operate the proper fans. Lead-lag operation shall be in accordance with the general lead-lag routine specified in this Section.
  - b. Lead-Lag Selection

Loading area supply fans: Provide a three-position software selector switch for selection of lead and lag fans. Provide selector with the following position selections: SAF-03, SAF-05 and SAF-01.

- (a) Fan lead-lag sequence SAF-03, -05, -01, -03, -05, etc.
- (b) SAF-03 Lead: operates (in order) SAF-03, -05, -01
- (c) SAF-05 Lead: operates (in order) SAF-05, -01, -03

- (d) SAF-01 Lead: operates (in order) SAF-01, -03, -05
- (2) Tipping area supply fans: Provide a three-position software selector switch for selection of lead and lag fans. Provide selector with the following position selections: SAF-04, SAF-06 and SAF-02.
- (a) Fan lead-lag sequence: SAF-04, -06, -02, -04, -06, etc.
- (b) SAF-04 Lead: operates (in order) SAF-04, -06, -02
- (c) SAF-06 Lead: operates (in order) SAF-06, -02, -04
- (d) SAF-02 Lead: operates (in order) SAF-02, -04, -06
- (3) Tipping and loading area exhaust fans: Provide a four-position software selector switch for selection of lead and lag fans.
- (a) Exhaust fans EAF-03 and -05 run continuously.
- (b) EAF-01 Lead: operates (in order) EAF-03, -05, -01, -06, -02, -04
- (c) EAF-06 Lead: operates (in order) EAF-03, -05, -06, -02, -04, -01
- (d) EAF-02 Lead: operates (in order) EAF-03, -05, -02, -04, -01, -06
- (e) EAF-04 Lead: operates (in order) EAF-03, -05, -04, -01, -06, -02

- c. Fan Operation Table: The following table indicates the correlation between air changes desired and fan operation.

Air Changes per Hr.	# of Supply Air Fans						# of Exhaust Air Fans		
	Loading			Tipping					
	1	2	3	1	2	3	2	4	6
4	✓			✓			✓		
8		✓			✓			✓	
12			✓			✓			✓

- d. Pressurization Control: An additional strategy shall be provided which allows adjustment of the number of operating fans in the Fan Operation Table specified above. The operator shall have the ability to enable this strategy via a software switch.

- (1) The SCADA system shall monitor the position of the inbound and outbound truck doors in the tipping area, and the position of the loading level truck door in the loading area of the station. In order to maintain a negative pressure within the station, the number of process fans operating shall be modified if any of these high-speed doors is open.
- (2) When the high-speed doors serving the tipping and loading areas of the station are closed, the supply and exhaust fans serving the tipping and loading areas shall be operated by the SCADA system in equal numbers, as indicated in the fan capacity table. There is no offset required.
- (3) Upon receiving a door open signal from any high-speed door serving the tipping and loading areas of the station, the SCADA system shall perform a two-fan offset.
- (4) Pressurization Offset: The SCADA system shall stop one of the operating Tipping Area supply fans. Stop the first fan in the Lead-Lag sequence. The stopped supply fan shall remain stopped until all of the high-speed doors are closed for an adjustable preset (15 minutes) time period. See the following Fan Operation Table for Pressurization Control.

Fan and Operation Table - Pressurization Control									
Air Changes per Hr.	# of Supply Air Fans						# of Exhaust Air Fans		
	Loading			Tipping					
	1	2	3	1	2	3	2	4	6
4	✓						✓		
8		✓		✓				✓	
12			✓		✓				✓

- e. Temperature Control: An additional strategy shall be provided which allows adjustment of the number of air changes per hour based upon outside air temperature. The operator shall have the ability to enable this strategy via a software switch. When this strategy is selected by the operator, the fans shall be controlled based on the space temperature in the area served.
  - (1) If the space temperature is below 32 degrees F, run fans to maintain 4 air changes per hour.
  - (2) If the space temperature is between 32 and 59 degrees F, run fans to maintain 8 air changes per hour.
  - (3) If the space temperature exceeds 59 degrees F, run fans to maintain 12 air changes per hour.

- (4) Multiple temperature sensors shall be installed at the mezzanine level. The temperature control shall be based on the lowest value of the three temperature readings.

f. Fire Override

- (1) Upon receipt of a fire signal from the Fire Alarm Control Panel, the SCADA system shall remove the run command signal from all fans.
  - (2) The SCADA system shall not resume control of the fans until the fire signal clears, and the operator resets the fans via a software switch on the display.
3. Display: Provide a screen display showing all major equipment comprising HVAC systems H01, H02, H03 and H09, including the fans and major duct runs. Display shall be a plan view of the station, indicating equipment locations. Indicate signal values graphically on the display. Include software switches as specified.

Q. H02: Exhaust Fans (F-EAF-01 to -06)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: See HVAC system H01 control above.
3. Display: See HVAC system H01 display above.

R. H03: Space Temperature Monitoring

1. Monitoring: Monitor signals scheduled and shown.
2. Control: See HVAC system H01 control above.
3. Display: See HVAC system H01 display above.

S. H04: Two Speed Supply Fan (F-SAF-08)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: Supply fan SAF-08 and EAF-08 serve the lidding area of the station.
  - a. Each fan is controlled by an On-Off-Auto selector switch located adjacent to the fan. Supply a software control strategy for automatic control of the fans when the fan is in the Auto mode. The strategy shall consist of automatic control based on air changes. The operator shall select the number of air changes per hour directly, from a selection of 6 or 12 air changes per hour. Using the fan capacity table, the SCADA system shall operate the fans at the proper speed.

- b. Fan Capacity Table: The following table indicates the correlation between air changes desired and fan operation.

Air Changes per Hour	Speed of Supply Fan SAF-08	Speed of Exhaust Fan EAF-08
6	Low	Low
12	High	High

- c. Negative Pressure Maintenance: An additional scheme shall be provided which allows for the adjustment to the operating status of the fans computed in the automatic control strategy specified above. The operator shall have the ability to turn off this additional scheme via a software switch.

- (1) The SCADA system shall monitor the position of the shuttle bay doors in the station. In order to maintain a negative pressure within the station, the speed of the process fans operating shall be modified if any shuttle bay door is open.
- (2) When all shuttle bay doors are closed, the supply and exhaust fans serving the lidding area shall be operated by the SCADA system equally; that is, supply and exhaust fans both run at low or high speed, as indicated in the fan capacity table.
- (3) Upon receiving a door open signal from any of the shuttle bay doors, the SCADA system shall perform an offset and operate the exhaust fan in accordance with the table that follows. The offset shall remain until the shuttle bay doors are closed for an adjustable preset (15 minutes) time period.
- (4) Negative Pressure Maintenance Fan Capacity Table:

Air Changes per Hour	Speed of Supply Fan SAF-08	Speed of Exhaust Fan EAF-08
6	Off	Low
12	Low	High

- d. Fire Override

- (1) Upon receipt of a fire signal from the Fire Alarm Control Panel, the SCADA system shall remove the run command signal from all fans.
- (2) The SCADA system shall not resume control of the fans until the fire signal clears, and the operator resets the fans via a software switch on the display.

3. Display: Provide a screen display showing all major equipment comprising HVAC systems H04, H05 and H11, including the fans and major duct runs. Display shall be a plan view of the station, indicating equipment locations. Indicate signal values graphically on the display. Include software switches as specified.
- T. H05: Two Speed Exhaust Fan (F-EAF-08)
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: See HVAC system H04 control above.
  3. Display: See HVAC system H04 display above.
- U. H06: Personnel Area HVAC Systems (F-ACU-01 to -05; F-RTU-02; F-HVU-01, -02)
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: none
  3. Display: Indicate alarms on alarm display package.
- V. H08: Gas Monitoring (F-GMP-01)
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: none
  3. Display: Indicate alarms on alarm display package.
- W. H09: Exhaust Fan (F-EAF-14)
1. Monitoring: Monitor signals scheduled and shown.
  2. Control: Exhaust fan EAF-14 serves the tipping area of the station.
    - a. Each fan is controlled by an On-Off-Auto selector switch located adjacent to the fan. Supply a software control strategy for automatic control of the fans when the fan is in the Auto mode. The fan shall run continuously when in the Auto mode.
    - b. Fire Override
      - (1) Upon receipt of a fire signal from the Fire Alarm Control Panel, the SCADA system shall remove the run command signal from all fans.
    - c. The SCADA system shall not resume control of the fans until the fire signal clears, and the operator resets the fans via a software switch on the display.
  3. Display: See HVAC system H01 display above.

## X. H10: Heat Tracing System (F-HTS-03)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

## Y. H11: Gallery and Ramp Area Supply and Exhaust Fan (F-SAF-07, F-EAF-07)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: Supply fan SAF-07 and exhaust fan EAF-07 serve the gallery and ramp areas of the station.
  - a. Each fan is controlled by an On-Off-Auto selector switch located adjacent to the fan. Supply a software control strategy for automatic control of the fans when the fan is in the Auto mode. The fans shall run continuously when in the Auto mode.
  - b. Fire Override
    - (1) Upon receipt of a fire signal from the Fire Alarm Control Panel, the SCADA system shall remove the run command signal from all fans.
    - (2) The SCADA system shall not resume control of the fans until the fire signal clears, and the operator resets the fans via a software switch on the display.

3. Display: See HVAC system H04 display above.

## Z. H12: Chimney Automation System (F-DIF-01, F-DIF-02)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

## AA. P02: Oil/Water Separator (F-OWS-01)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Provide screen displays showing all major equipment comprising plumbing systems P02 through P10. Displays shall indicate equipment location within the station. Indicate signal values graphically on the display.

## BB. P04: Booster Pumping (F-DWP-01)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Plumbing system P02 display above.

## CC. P06: Interstitial Space Monitoring (F-WAF-01)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Plumbing system P02 display above.

## DD. P08: Fire Pump Monitoring

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Plumbing system P02 display above.

## EE. P09: Emergency Shower/Eyewash (F-SEW-01, -02, -03, 04)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Plumbing system P02 display above.

## FF. P10: Heat Tracing System (F-HTS-02)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Plumbing system P02 display above.

## GG. E01: Switchgear (F-LSG-01)

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Provide a screen display showing all major equipment comprising Electrical systems E01, E02, and E08. Indicate signal values graphically on the display.

## HH. E02: Emergency Power

1. Monitoring
  - a. Monitor signals scheduled and shown.

- b. Determine electric power source.
  - (1) If generator breaker is closed and the generator is running, the power source is the emergency generator.
  - (2) Otherwise, the power source is the utility.
- 2. Control: The following equipment is controllable from the SCADA system for the purposes of this strategy: Supply fans SAF-03 and -04, Exhaust Fans EAF-01 and -06, and tipping bay lights TSS-09 through -14.
  - a. The control logic for each piece of equipment controllable by the SCADA system under generator power shall include a link to this control strategy. The equipment's control by the SCADA system while powered by the generator shall be via this control strategy. The equipment's normal control strategy shall provide an enable/disable software switch for this feature.
  - b. In the event of a loss of utility power, the SCADA system shall store the operating status (prior to outage) for all equipment controllable by the SCADA system.
  - c. Process Fans
    - (1) On power failure, the fans will stop. Suspend the normal algorithm.
    - (2) On generator power, the following fans will have power available: SAF-03 and -04, and EAF-01 and -06. When generator power is available, wait an adjustable time period, and then start EAF-01, then SAF-03, then EAF-06, then SAF-04, waiting an adjustable time period being each start.
    - (3) On return to utility power, return to the normal algorithm. If additional fans are requested by the normal algorithm, restart one fan at a time, similarly to the procedure for starting fans under generator power.
  - d. Tipping Bay Lights
    - (1) On power failure, the lights will de-energize.
    - (2) On generator power, energize the lights that had been on before the outage. Operator shall be able to turn lights on and off via the SCADA system in the same manner as on utility power.

- (3) On return to utility power, energize the lights that had been on during the outage.

3. Display: See E01 display above. Show electric power source on display. Indicate alarms on alarm display package.

II. E04: Security and Process CCTV

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

JJ. E06: Access Control

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

KK. E06: Fire Alarm Control Panel

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: Indicate alarms on alarm display package.

LL. E08: Network Protectors

1. Monitoring: Monitor signals scheduled and shown.
2. Control: none
3. Display: See Electrical system E01 display above.
