- A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.
- B. Prepare schematic diagrams of systems' "as-built" duct layouts.
- C. For variable-air-volume systems, develop a plan to simulate diversity.
- D. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.
- E. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.
- F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
- G. Verify that motor starters are equipped with properly sized thermal protection.
- H. Check dampers for proper position to achieve desired airflow path.
- I. Check for airflow blockages.
- J. Check condensate drains for proper connections and functioning.
- K. Check for proper sealing of air-handling-unit components.
- L. Verify that air duct system is sealed as specified in Section 233113 "Metal Ducts."

3.6 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

- A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
 - 1. Measure total airflow.
 - a. Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.
 - 2. Measure fan static pressures as follows to determine actual static pressure:

- a. Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
 - b. Measure static pressure directly at the fan outlet or through the flexible connection.
 - c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.
 - d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
3. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
 - a. Report the cleanliness status of filters and the time static pressures are measured.
 4. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.
 5. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
 6. Obtain approval from City of New York, Construction Manager, and Commissioning Authority for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in HVAC Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
 7. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.
- B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
1. Measure airflow of submain and branch ducts.
 - a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
 2. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.
 3. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.
- C. Measure air outlets and inlets without making adjustments.
1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

- D. Adjust air outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using branch volume dampers rather than extractors and the dampers at air terminals.
 - 1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
 - 2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.7 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

- A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a minimum set-point airflow with the remainder at maximum-airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
- B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
 - 1. Set outdoor-air dampers at minimum, and set return- and exhaust-air dampers at a position that simulates full-cooling load.
 - 2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
 - 3. Measure total system airflow. Adjust to within indicated airflow.
 - 4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
 - 5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
 - a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
 - 6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
 - a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
 - 7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
 - 8. Record final fan-performance data.

C. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Balance variable-air-volume systems the same as described for constant-volume air systems.
2. Set terminal units and supply fan at full-airflow condition.
3. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
4. Readjust fan airflow for final maximum readings.
5. Measure operating static pressure at the sensor that controls the supply fan if one is installed, and verify operation of the static-pressure controller.
6. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
7. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
 - a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.
8. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
 - a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

D. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
2. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
3. Set terminal units at full-airflow condition.
4. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
5. Adjust terminal units for minimum airflow.
6. Measure static pressure at the sensor.
7. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

3.8 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

- A. Prepare test reports with pertinent design data, and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against the approved pump flow rate. Correct variations that exceed plus or minus 5 percent.
- B. Prepare schematic diagrams of systems' "as-built" piping layouts.
- C. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:
 - 1. Open all manual valves for maximum flow.
 - 2. Check liquid level in expansion tank.
 - 3. Check makeup water-station pressure gage for adequate pressure for highest vent.
 - 4. Check flow-control valves for specified sequence of operation, and set at indicated flow.
 - 5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
 - 6. Set system controls so automatic valves are wide open to heat exchangers.
 - 7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
 - 8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

3.9 PROCEDURES FOR CONSTANT-FLOW HYDRONIC SYSTEMS

- A. Measure water flow at pumps. Use the following procedures except for positive-displacement pumps:
 - 1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
 - a. If impeller sizes must be adjusted to achieve pump performance, obtain approval from City of New York, Construction Manager, Commissioning Authority and comply with requirements in Section 232123 "Hydronic Pumps."
 - 2. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve. Adjust pump discharge valve until indicated water flow is achieved.
 - a. Monitor motor performance during procedures and do not operate motors in overload conditions.
 - 3. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
 - 4. Report flow rates that are not within plus or minus 10 percent of design.

- B. Measure flow at all automatic flow control valves to verify that valves are functioning as designed.
- C. Measure flow at all pressure-independent characterized control valves, with valves in fully open position, to verify that valves are functioning as designed.
- D. Set calibrated balancing valves, if installed, at calculated presettings.
- E. Measure flow at all stations and adjust, where necessary, to obtain first balance.
 - 1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.
- F. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than indicated flow.
- G. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
 - 1. Determine the balancing station with the highest percentage over indicated flow.
 - 2. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
 - 3. Record settings and mark balancing devices.
- H. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures including outdoor-air temperature.
- I. Measure the differential-pressure-control-valve settings existing at the conclusion of balancing.
- J. Check settings and operation of each safety valve. Record settings.

3.10 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

- A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

3.11 PROCEDURES FOR PRIMARY-SECONDARY HYDRONIC SYSTEMS

- A. Balance the primary circuit flow first and then balance the secondary circuits.

3.12 PROCEDURES FOR HEAT EXCHANGERS

- A. Measure water flow through all circuits.
- B. Adjust water flow to within specified tolerances.
- C. Measure inlet and outlet water temperatures.

- D. Measure inlet steam pressure.
- E. Check settings and operation of safety and relief valves. Record settings.

3.13 PROCEDURES FOR MOTORS

- A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
 - 1. Manufacturer's name, model number, and serial number.
 - 2. Motor horsepower rating.
 - 3. Motor rpm.
 - 4. Efficiency rating.
 - 5. Nameplate and measured voltage, each phase.
 - 6. Nameplate and measured amperage, each phase.
 - 7. Starter thermal-protection-element rating.
- B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass of the controller to prove proper operation. Record observations including name of controller manufacturer, model number, serial number, and nameplate data.

3.14 PROCEDURES FOR HEAT-TRANSFER COILS

- A. Measure, adjust, and record the following data for each water coil:
 - 1. Entering- and leaving-water temperature.
 - 2. Water flow rate.
 - 3. Water pressure drop.
 - 4. Dry-bulb temperature of entering and leaving air.
 - 5. Wet-bulb temperature of entering and leaving air for cooling coils.
 - 6. Airflow.
 - 7. Air pressure drop.
- B. Measure, adjust, and record the following data for each electric heating coil:
 - 1. Nameplate data.
 - 2. Airflow.
 - 3. Entering- and leaving-air temperature at full load.
 - 4. Voltage and amperage input of each phase at full load and at each incremental stage.
 - 5. Calculated kilowatt at full load.
 - 6. Fuse or circuit-breaker rating for overload protection.
- C. Measure, adjust, and record the following data for each refrigerant coil:
 - 1. Dry-bulb temperature of entering and leaving air.
 - 2. Wet-bulb temperature of entering and leaving air.
 - 3. Airflow.
 - 4. Air pressure drop.

5. Refrigerant suction pressure and temperature.

3.15 TOLERANCES

- A. Set HVAC system's air flow rates and water flow rates within the following tolerances:
 1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 10 percent.
 2. Air Outlets and Inlets: Plus or minus 10 percent.
 3. Heating-Water Flow Rate: Plus or minus 10 percent.
 4. Cooling-Water Flow Rate: Plus or minus 10 percent.

3.16 REPORTING

- A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.
- B. Status Reports: Prepare weekly progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.17 FINAL REPORT

- A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
 1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
 2. Include a list of instruments used for procedures, along with proof of calibration.
- B. Final Report Contents: In addition to certified field-report data, include the following:
 1. Pump curves.
 2. Fan curves.
 3. Manufacturers' test data.
 4. Field test reports prepared by system and equipment installers.
 5. Other information relative to equipment performance; do not include Shop Drawings and product data.
- C. General Report Data: In addition to form titles and entries, include the following data:
 1. Title page.
 2. Name and address of the TAB contractor.

3. Project name.
 4. Project location.
 5. Architect's name and address.
 6. Engineer's name and address.
 7. Contractor's name and address.
 8. Report date.
 9. Signature of TAB supervisor who certifies the report.
 10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
 11. Summary of contents including the following:
 - a. Indicated versus final performance.
 - b. Notable characteristics of systems.
 - c. Description of system operation sequence if it varies from the Contract Documents.
 12. Nomenclature sheets for each item of equipment.
 13. Data for terminal units, including manufacturer's name, type, size, and fittings.
 14. Notes to explain why certain final data in the body of reports vary from indicated values.
 15. Test conditions for fans and pump performance forms including the following:
 - a. Settings for outdoor-, return-, and exhaust-air dampers.
 - b. Conditions of filters.
 - c. Cooling coil, wet- and dry-bulb conditions.
 - d. Face and bypass damper settings at coils.
 - e. Fan drive settings including settings and percentage of maximum pitch diameter.
 - f. Inlet vane settings for variable-air-volume systems.
 - g. Settings for supply-air, static-pressure controller.
 - h. Other system operating conditions that affect performance.
- D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outdoor, supply, return, and exhaust airflows.
 2. Water and steam flow rates.
 3. Duct, outlet, and inlet sizes.
 4. Pipe and valve sizes and locations.
 5. Terminal units.
 6. Balancing stations.
 7. Position of balancing devices.
- E. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:
1. Unit Data:
 - a. Unit identification.
 - b. Location.
 - c. Make and type.
 - d. Model number and unit size.
 - e. Manufacturer's serial number.

- f. Unit arrangement and class.
- g. Discharge arrangement.
- h. Sheave make, size in inches, and bore.
- i. Center-to-center dimensions of sheave, and amount of adjustments in inches.
- j. Number, make, and size of belts.
- k. Number, type, and size of filters.

2. Motor Data:

- a. Motor make, and frame type and size.
- b. Horsepower and rpm.
- c. Volts, phase, and hertz.
- d. Full-load amperage and service factor.
- e. Sheave make, size in inches, and bore.
- f. Center-to-center dimensions of sheave, and amount of adjustments in inches.

3. Test Data (Indicated and Actual Values):

- a. Total air flow rate in cfm.
- b. Total system static pressure in inches wg.
- c. Fan rpm.
- d. Discharge static pressure in inches wg.
- e. Filter static-pressure differential in inches wg.
- f. Preheat-coil static-pressure differential in inches wg.
- g. Cooling-coil static-pressure differential in inches wg.
- h. Heating-coil static-pressure differential in inches wg.
- i. Outdoor airflow in cfm.
- j. Return airflow in cfm.
- k. Outdoor-air damper position.
- l. Return-air damper position.
- m. Vortex damper position.

F. Apparatus-Coil Test Reports:

1. Coil Data:

- a. System identification.
- b. Location.
- c. Coil type.
- d. Number of rows.
- e. Fin spacing in fins per inch o.c.
- f. Make and model number.
- g. Face area in sq. ft..
- h. Tube size in NPS.
- i. Tube and fin materials.
- j. Circuiting arrangement.

2. Test Data (Indicated and Actual Values):

- a. Air flow rate in cfm.

- b. Average face velocity in fpm.
- c. Air pressure drop in inches wg.
- d. Outdoor-air, wet- and dry-bulb temperatures in deg F.
- e. Return-air, wet- and dry-bulb temperatures in deg F.
- f. Entering-air, wet- and dry-bulb temperatures in deg F.
- g. Leaving-air, wet- and dry-bulb temperatures in deg F.
- h. Water flow rate in gpm.
- i. Water pressure differential in feet of head or psig.
- j. Entering-water temperature in deg F.
- k. Leaving-water temperature in deg F.
- l. Refrigerant expansion valve and refrigerant types.
- m. Refrigerant suction pressure in psig.
- n. Refrigerant suction temperature in deg F.
- o. Inlet steam pressure in psig.

G. Gas- and Oil-Fired Heat Apparatus Test Reports: In addition to manufacturer's factory startup equipment reports, include the following:

1. Unit Data:

- a. System identification.
- b. Location.
- c. Make and type.
- d. Model number and unit size.
- e. Manufacturer's serial number.
- f. Fuel type in input data.
- g. Output capacity in Btu/h.
- h. Ignition type.
- i. Burner-control types.
- j. Motor horsepower and rpm.
- k. Motor volts, phase, and hertz.
- l. Motor full-load amperage and service factor.
- m. Sheave make, size in inches, and bore.
- n. Center-to-center dimensions of sheave, and amount of adjustments in inches.

2. Test Data (Indicated and Actual Values):

- a. Total air flow rate in cfm.
- b. Entering-air temperature in deg F.
- c. Leaving-air temperature in deg F.
- d. Air temperature differential in deg F.
- e. Entering-air static pressure in inches wg.
- f. Leaving-air static pressure in inches wg.
- g. Air static-pressure differential in inches wg.
- h. Low-fire fuel input in Btu/h.
- i. High-fire fuel input in Btu/h.
- j. Manifold pressure in psig.
- k. High-temperature-limit setting in deg F.
- l. Operating set point in Btu/h.
- m. Motor voltage at each connection.

- n. Motor amperage for each phase.
 - o. Heating value of fuel in Btu/h.
- H. Electric-Coil Test Reports: For electric furnaces, duct coils, and electric coils installed in central-station air-handling units, include the following:
- 1. Unit Data:
 - a. System identification.
 - b. Location.
 - c. Coil identification.
 - d. Capacity in Btu/h.
 - e. Number of stages.
 - f. Connected volts, phase, and hertz.
 - g. Rated amperage.
 - h. Air flow rate in cfm.
 - i. Face area in sq. ft..
 - j. Minimum face velocity in fpm.
 - 2. Test Data (Indicated and Actual Values):
 - a. Heat output in Btu/h.
 - b. Air flow rate in cfm.
 - c. Air velocity in fpm.
 - d. Entering-air temperature in deg F.
 - e. Leaving-air temperature in deg F.
 - f. Voltage at each connection.
 - g. Amperage for each phase.
- I. Fan Test Reports: For supply, return, and exhaust fans, include the following:
- 1. Fan Data:
 - a. System identification.
 - b. Location.
 - c. Make and type.
 - d. Model number and size.
 - e. Manufacturer's serial number.
 - f. Arrangement and class.
 - g. Sheave make, size in inches, and bore.
 - h. Center-to-center dimensions of sheave, and amount of adjustments in inches.
 - 2. Motor Data:
 - a. Motor make, and frame type and size.
 - b. Horsepower and rpm.
 - c. Volts, phase, and hertz.
 - d. Full-load amperage and service factor.
 - e. Sheave make, size in inches, and bore.
 - f. Center-to-center dimensions of sheave, and amount of adjustments in inches.

- g. Number, make, and size of belts.
3. Test Data (Indicated and Actual Values):
- a. Total airflow rate in cfm.
 - b. Total system static pressure in inches wg.
 - c. Fan rpm.
 - d. Discharge static pressure in inches wg.
 - e. Suction static pressure in inches wg.
- J. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:
1. Report Data:
- a. System and air-handling-unit number.
 - b. Location and zone.
 - c. Traverse air temperature in deg F.
 - d. Duct static pressure in inches wg.
 - e. Duct size in inches.
 - f. Duct area in sq. ft..
 - g. Indicated air flow rate in cfm.
 - h. Indicated velocity in fpm.
 - i. Actual air flow rate in cfm.
 - j. Actual average velocity in fpm.
 - k. Barometric pressure in psig.
- K. Air-Terminal-Device Reports:
1. Unit Data:
- a. System and air-handling unit identification.
 - b. Location and zone.
 - c. Apparatus used for test.
 - d. Area served.
 - e. Make.
 - f. Number from system diagram.
 - g. Type and model number.
 - h. Size.
 - i. Effective area in sq. ft..
2. Test Data (Indicated and Actual Values):
- a. Air flow rate in cfm.
 - b. Air velocity in fpm.
 - c. Preliminary air flow rate as needed in cfm.
 - d. Preliminary velocity as needed in fpm.
 - e. Final air flow rate in cfm.
 - f. Final velocity in fpm.
 - g. Space temperature in deg F.

L. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:

1. Unit Data:
 - a. System and air-handling-unit identification.
 - b. Location and zone.
 - c. Room or riser served.
 - d. Coil make and size.
 - e. Flowmeter type.
2. Test Data (Indicated and Actual Values):
 - a. Air flow rate in cfm.
 - b. Entering-water temperature in deg F.
 - c. Leaving-water temperature in deg F.
 - d. Water pressure drop in feet of head or psig.
 - e. Entering-air temperature in deg F.
 - f. Leaving-air temperature in deg F.

M. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:

1. Unit Data:
 - a. Unit identification.
 - b. Location.
 - c. Service.
 - d. Make and size.
 - e. Model number and serial number.
 - f. Water flow rate in gpm.
 - g. Water pressure differential in feet of head or psig.
 - h. Required net positive suction head in feet of head or psig.
 - i. Pump rpm.
 - j. Impeller diameter in inches.
 - k. Motor make and frame size.
 - l. Motor horsepower and rpm.
 - m. Voltage at each connection.
 - n. Amperage for each phase.
 - o. Full-load amperage and service factor.
 - p. Seal type.
2. Test Data (Indicated and Actual Values):
 - a. Static head in feet of head or psig.
 - b. Pump shutoff pressure in feet of head or psig.
 - c. Actual impeller size in inches.
 - d. Full-open flow rate in gpm.
 - e. Full-open pressure in feet of head or psig.
 - f. Final discharge pressure in feet of head or psig.
 - g. Final suction pressure in feet of head or psig.

- h. Final total pressure in feet of head or psig.
- i. Final water flow rate in gpm.
- j. Voltage at each connection.
- k. Amperage for each phase.

N. Instrument Calibration Reports:

1. Report Data:

- a. Instrument type and make.
- b. Serial number.
- c. Application.
- d. Dates of use.
- e. Dates of calibration.

3.18 INSPECTIONS

A. Initial Inspection:

- 1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the final report.
- 2. Check the following for each system:
 - a. Measure airflow of at least 10 percent of air outlets.
 - b. Measure water flow of at least 10 percent of terminals.
 - c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
 - d. Verify that balancing devices are marked with final balance position.
 - e. Note deviations from the Contract Documents in the final report.

B. Final Inspection:

- 1. After initial inspection is complete and documentation by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by Construction Manager and Commissioning Authority.
- 2. The TAB contractor's test and balance engineer shall conduct the inspection in the presence of Construction Manager and Commissioning Authority.
- 3. Construction Manager and Commissioning Authority shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
- 4. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
- 5. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

- C. TAB Work will be considered defective if it does not pass final inspections. If TAB Work fails, proceed as follows:
 - 1. Recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.
 - 2. If the second final inspection also fails, City of New York may contract the services of another TAB contractor to complete TAB Work according to the Contract Documents and deduct the cost of the services from the original TAB contractor's final payment.
- D. Prepare test and inspection reports.

3.19 ADDITIONAL TESTS

- A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.
- B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

END OF SECTION 230593

This Page Intentionally Left Blank

SECTION 230713

DUCT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes insulating the following duct services:
 - 1. Indoor, concealed supply and outdoor air.
 - 2. Indoor, exposed supply and outdoor air.
 - 3. Indoor, concealed return located in unconditioned space.
 - 4. Indoor, exposed return located in unconditioned space.
 - 5. Indoor, concealed, Type I, commercial, kitchen hood exhaust.
 - 6. Indoor, exposed, Type I, commercial, kitchen hood exhaust.
 - 7. Outdoor, concealed supply and return.
 - 8. Outdoor, exposed supply and return.
- B. Related Sections:
 - 1. Section 230716 "HVAC Equipment Insulation."
 - 2. Section 230719 "HVAC Piping Insulation."
 - 3. Section 233113 "Metal Ducts" for duct liners.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory- and field-applied if any).
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 - 2. Detail insulation application at elbows, fittings, dampers, specialties and flanges for each type of insulation.

3. Detail application of field-applied jackets.
 4. Detail application at linkages of control devices.
- D. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use. Sample sizes are as follows:
1. Sheet Form Insulation Materials: 12 inches square.
 2. Sheet Jacket Materials: 12 inches square.
 3. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Provide a completed VOC submittal form per Section 01 81 13.
- C. Product data Credit IEQ 4.1 / 4.2: For each adhesive, sealant, paint or coating product applied within the vapor barrier, documentation including printed statement of VOC content.
- D. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
- E. Field quality-control reports.
- F. LEED Submittal Requirements
 1. For all installed products and materials of this Section which are within the LEED boundary, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractors or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post –industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 2. Provide back-up documentation to validate information provided on LEED MATERIALS REPORTING forms, except Cost data. For each material listed on the

Forms, provide documentation to certify each of the material attributes (e.g., recycled content, regional content).

3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
 4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required.
- G. Product Pre-Review Documentation: Provide the following in compliance with Section 01 81 13 "Sustainable Design Requirements":
1. List of the materials or products that will be submitted under this Specification Section. All alternatives being considered shall be noted.
 2. Product data detailing the material components of each assembly, if applicable.
 3. Completed Materials Inquiry Forms for each material or product.
 4. MSDS or other manufacturer data stating the chemical components of each product, including the Chemical Abstracts Service (CAS) numbers.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- C. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by Architect. Use materials indicated for the completed Work.
1. Ductwork Mockups:
 - a. One 10-foot section each of rectangular and round straight duct.
 - b. One each of a 90-degree mitered round and rectangular elbow, and one each of a 90-degree radius round and rectangular elbow.
 - c. One rectangular branch takeoff and one round branch takeoff from a rectangular duct. One round tee fitting.
 - d. One rectangular and round transition fitting.
 - e. Four support hangers for round and rectangular ductwork.

- f. Each type of damper and specialty.
2. For each mockup, fabricate cutaway sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
3. Notify Architect seven days in advance of dates and times when mockups will be constructed.
4. Obtain Architect's approval of mockups before starting insulation application.
5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
7. Demolish and remove mockups when directed.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- B. Coordinate clearance requirements with duct Installer for duct insulation application. Before preparing ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.
- C. Coordinate installation and testing of heat tracing.

1.8 SCHEDULING

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

- A. Low emitting materials: Adhesive, sealant, paint and coating products used within the vapor barrier shall comply with VOC limits in Section 01 81 19.
- B. Comply with requirements in "Duct Insulation Schedule, General," "Indoor Duct and Plenum Insulation Schedule," and "Aboveground, Outdoor Duct and Plenum Insulation Schedule" articles for where insulating materials shall be applied.
- C. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- D. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- E. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- F. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- G. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Products: Subject to compliance with requirements, provide the following:
 - a. CertainTeed Corp.; SoftTouch Duct Wrap.
 - b. Johns Manville; Microlite.
 - c. Knauf Insulation; Friendly Feel Duct Wrap.
 - d. Manson Insulation Inc.; Alley Wrap.
 - e. Owens Corning; SOFTR All-Service Duct Wrap.
- H. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Products: Subject to compliance with requirements, provide the following:
 - a. CertainTeed Corp.; Commercial Board.
 - b. Fibrex Insulations Inc.; FBX.
 - c. Johns Manville; 800 Series Spin-Glas.
 - d. Knauf Insulation; Insulation Board.
 - e. Manson Insulation Inc.; AK Board.
 - f. Owens Corning; Fiberglas 700 Series.

- I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied FSK jacket complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, provide the following:

- a. CertainTeed Corp.; CrimpWrap.
- b. Johns Manville; MicroFlex.
- c. Knauf Insulation; Pipe and Tank Insulation.
- d. Manson Insulation Inc.; AK Flex.
- e. Owens Corning; Fiberglas Pipe and Tank Insulation.

2.2 FIRE-RATED INSULATION SYSTEMS

- A. Fire-Rated Board: Structural-grade, press-molded, xonolite calcium silicate, fireproofing board suitable for operating temperatures up to 1700 deg F. Comply with ASTM C 656, Type II, Grade 6. Tested and certified to provide a 2-hour fire rating by an NRTL acceptable to authorities having jurisdiction.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following or approved equal:

- a. Johns Manville; Super Firetemp M.
- b. Unifrax Corporation
- c. 3M

- B. Fire-Rated Blanket: High-temperature, flexible, blanket insulation with FSK jacket that is tested and certified to provide a 2-hour fire rating by an NRTL acceptable to authorities having jurisdiction.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. CertainTeed Corp.; FlameChek.
- b. Johns Manville; Firetemp Wrap.
- c. Nelson Fire Stop Products; Nelson FSB Flameshield Blanket.
- d. Thermal Ceramics; FireMaster Duct Wrap.
- e. 3M; Fire Barrier Wrap Products.
- f. Unifrax Corporation; FyreWrap.

2.3 ADHESIVES

- A. Materials shall be compatible with jackets and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-82.
 - b. Eagle Bridges - Marathon Industries; 225.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 85-50.Mon-Eco Industries, Inc.; 22-25.
 - 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. PVC Jacket Adhesive: Compatible with PVC jacket.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Dow Corning Corporation; 739, Dow Silicone.
 - b. Johns Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
 - c. P.I.C. Plastics, Inc.; Welding Adhesive.
 - d. Speedline Corporation; Polyco VP Adhesive.
 - 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 3. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.4 MASTICS

- A. Vapor-Barrier Mastic: Water based; suitable for indoor use on below ambient services.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-80/30-90.
 - b. Vimasco Corporation; 749.
 - 2. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, 0.013 perm at 43-mil dry film thickness.
 - 3. Service Temperature Range: Minus 20 to plus 180 deg F.
 - 4. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
 - 5. Color: White.

B. Vapor-Barrier Mastic: Solvent based; suitable for indoor use on below ambient services.

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-30.
 - b. Eagle Bridges - Marathon Industries; 501.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-35.
 - d. Mon-Eco Industries, Inc.; 55-10.
2. Water-Vapor Permeance: ASTM F 1249, 0.05 perm at 35-mil dry film thickness.
3. Service Temperature Range: 0 to 180 deg F.
4. Solids Content: ASTM D 1644, 44 percent by volume and 62 percent by weight.
5. Color: White.

C. Vapor-Barrier Mastic: Solvent based; suitable for outdoor use on below ambient services.

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; Encacel.
 - b. Eagle Bridges - Marathon Industries; 570.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 60-95/60-96.
2. Water-Vapor Permeance: ASTM F 1249, 0.05 perm at 30-mil dry film thickness.
3. Service Temperature Range: Minus 50 to plus 220 deg F.
4. Solids Content: ASTM D 1644, 33 percent by volume and 46 percent by weight.
5. Color: White.

D. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services.

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-10.
 - b. Eagle Bridges - Marathon Industries; 550.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 46-50.
 - d. Mon-Eco Industries, Inc.; 55-50.
 - e. Vimasco Corporation; WC-1/WC-5.
2. Water-Vapor Permeance: ASTM F 1249, 1.8 perms at 0.0625-inch dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: 60 percent by volume and 66 percent by weight.
5. Color: White.

2.5 LAGGING ADHESIVES

- A. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
1. For indoor applications, use lagging adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-50 AHV2.Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-36.
 - b. Vimasco Corporation; 713 and 714.
 3. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over duct insulation.
 4. Service Temperature Range: 0 to plus 180 deg F.
 5. Color: White.

2.6 SEALANTS

A. FSK and Metal Jacket Flashing Sealants:

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.Eagle Bridges - Marathon Industries; 405.
 - b. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 95-44.
 - c. Mon-Eco Industries, Inc.; 44-05.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.
6. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. ASJ Flashing Sealants, and Vinyl and PVC Jacket Flashing Sealants:

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: White.

6. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.7 FACTORY-APPLIED JACKETS

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
 1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
 2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
 3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
 4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.
 5. Vinyl Jacket: White vinyl with a permeance of 1.3 perms when tested according to ASTM E 96/E 96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.8 FIELD-APPLIED FABRIC-REINFORCING MESH

- A. Woven Glass-Fiber Fabric: Approximately 6 oz./sq. yd. with a thread count of 5 strands by 5 strands/sq. in. for covering ducts.
- B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for ducts.

2.9 FIELD-APPLIED JACKETS

- A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
- B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.
- C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Johns Manville; Zeston.
 - b. P.I.C. Plastics, Inc.; FG Series.
 - c. Proto Corporation; LoSmoke.
 - d. Speedline Corporation; SmokeSafe.
 2. Adhesive: As recommended by jacket material manufacturer.
 3. Color: White.

D. Metal Jacket:

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; Metal Jacketing Systems.
 - b. ITW Insulation Systems; Aluminum and Stainless Steel Jacketing.
 - c. RPR Products, Inc.; Insul-Mate.
2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
 - a. Sheet and roll stock ready for shop or field sizing.
 - b. Finish and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
3. Stainless-Steel Jacket: ASTM A 167 or ASTM A 240/A 240M.
 - a. Sheet and roll stock ready for shop or field sizing.
 - b. Material, finish, and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.

E. Self-Adhesive Outdoor Jacket: 60-mil- thick, laminated vapor barrier and waterproofing membrane for installation over insulation located aboveground outdoors; consisting of a rubberized bituminous resin on a crosslaminated polyethylene film covered with white aluminum-foil facing.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Polyguard Products, Inc.; Alumaguard 60.

2.10 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. ABI, Ideal Tape Division; 428 AWF ASJ.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0836.
 - c. Compac Corporation; 104 and 105.
 - d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.

2. Width: 3 inches.
 3. Thickness: 11.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:
 - a. ABI, Ideal Tape Division; 491 AWF FSK.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
 - c. Compac Corporation; 110 and 111.
 - d. Venture Tape; 1525 CW NT, 1528 CW, and 1528 CW/SQ.
 2. Width: 3 inches.
 3. Thickness: 6.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following:
 - a. ABI, Ideal Tape Division; 370 White PVC tape.
 - b. Compac Corporation; 130.
 - c. Venture Tape; 1506 CW NS.
 2. Width: 2 inches.
 3. Thickness: 6 mils.
 4. Adhesion: 64 ounces force/inch in width.
 5. Elongation: 500 percent.
 6. Tensile Strength: 18 lbf/inch in width.
- D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, provide one of the following:
 - a. ABI, Ideal Tape Division; 488 AWF.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
 - c. Compac Corporation; 120.
 - d. Venture Tape; 3520 CW.
 2. Width: 2 inches.
 3. Thickness: 3.7 mils.

4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

2.11 SECUREMENTS

A. Bands:

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. ITW Insulation Systems; Gerrard Strapping and Seals.
 - b. RPR Products, Inc.; Insul-Mate Strapping, Seals, and Springs.
2. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316; 0.015 inch thick, 3/4 inch wide with wing seal or closed seal.
3. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal or closed seal.
4. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated.
 - a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) AGM Industries, Inc.; CWP-1.
 - 2) GEMCO; CD.
 - 3) Midwest Fasteners, Inc.; CD.
 - 4) Nelson Stud Welding; TPA, TPC, and TPS.
2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
 - a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) AGM Industries, Inc.; CHP-1.
 - 2) GEMCO; Cupped Head Weld Pin.
 - 3) Midwest Fasteners, Inc.; Cupped Head.
 - 4) Nelson Stud Welding; CHP.
3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

- a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) AGM Industries, Inc.; Tactoo Perforated Base Insul-Hangers.
 - 2) GEMCO; Perforated Base.
 - 3) Midwest Fasteners, Inc.; Spindle.
 - b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - c. Spindle: Copper- or zinc-coated, low-carbon steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
- a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) GEMCO; Nylon Hangers.
 - 2) Midwest Fasteners, Inc.; Nylon Insulation Hangers.
 - b. Baseplate: Perforated, nylon sheet, 0.030 inch thick by 1-1/2 inches in diameter.
 - c. Spindle: Nylon, 0.106-inch- diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches.
 - d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
5. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) AGM Industries, Inc.; RC-150.
 - 2) GEMCO; R-150.
 - 3) Midwest Fasteners, Inc.; WA-150.
 - 4) Nelson Stud Welding; Speed Clips.
 - b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
6. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

- a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) GEMCO.
 - 2) Midwest Fasteners, Inc.
- C. Staples: Outward-clinching insulation staples, nominal 3/4-inch- wide, stainless steel or Monel.
- D. Wire: 0.080-inch nickel-copper alloy.

2.12 CORNER ANGLES

- A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.
- B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.
- C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 - 1. Verify that systems to be insulated have been tested and are free of defects.
 - 2. Verify that surfaces to be insulated are clean and dry.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

3.3 GENERAL INSTALLATION REQUIREMENTS

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of ducts and fittings.
- B. Install insulation materials, vapor barriers or retarders, jackets, and thicknesses required for each item of duct system as specified in insulation system schedules.

- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Keep insulation materials dry during application and finishing.
- G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- H. Install insulation with least number of joints practical.
- I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
- J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- K. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
 - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches o.c.
 - a. For below ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct flanges and fittings.
- L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

- N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

3.4 PENETRATIONS

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
 - 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
 - 4. Seal jacket to wall flashing with flashing sealant.
- C. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.
- D. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Terminate insulation at fire damper sleeves for fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least 2 inches.
 - 1. Comply with requirements in Section 078413 "Penetration Firestopping" firestopping and fire-resistive joint sealers.
- E. Insulation Installation at Floor Penetrations:
 - 1. Duct: For penetrations through fire-rated assemblies, terminate insulation at fire damper sleeves and externally insulate damper sleeve beyond floor to match adjacent duct insulation. Overlap damper sleeve and duct insulation at least 2 inches.
 - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.5 INSTALLATION OF MINERAL-FIBER INSULATION

- A. Blanket Insulation Installation on Ducts and Plenums: Secure with insulation pins.
1. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
 - b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
 - e. Impale insulation over pins and attach speed washers.
 - f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
 2. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
 - a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.
 3. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.
 4. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 5. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch- wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.
- B. Board Insulation Installation on Ducts and Plenums: Secure with insulation pins.
1. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:

- a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
 - b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
 - e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
2. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
 - a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.
 3. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 4. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch- wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.6 FIELD-APPLIED JACKET INSTALLATION

- A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.
 1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
 2. Embed glass cloth between two 0.062-inch- thick coats of lagging adhesive.
 3. Completely encapsulate insulation with coating, leaving no exposed insulation.
- B. Where FSK jackets are indicated, install as follows:
 1. Draw jacket material smooth and tight.
 2. Install lap or joint strips with same material as jacket.
 3. Secure jacket to insulation with manufacturer's recommended adhesive.

4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
 5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.
- C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.
- D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.7 FIRE-RATED INSULATION SYSTEM INSTALLATION

- A. Where fire-rated insulation system is indicated, secure system to ducts and duct hangers and supports to maintain a continuous fire rating.
- B. Insulate duct access panels and doors to achieve same fire rating as duct.
- C. Install firestopping at penetrations through fire-rated assemblies. Fire-stop systems are specified in Section 078413 "Penetration Firestopping."

3.8 FINISHES

- A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 099000.
 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- C. Do not field paint aluminum or stainless-steel jackets.

3.9 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.

C. Tests and Inspections:

1. Inspect ductwork, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each duct system defined in the "Duct Insulation Schedule, General" Article.

- D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.10 DUCT INSULATION SCHEDULE, GENERAL

A. Plenums and Ducts Requiring Insulation:

1. Indoor, concealed supply and outdoor air.
2. Indoor, exposed supply and outdoor air.
3. Indoor, concealed return located in unconditioned space.
4. Indoor, exposed return located in unconditioned space.
5. Indoor, concealed, Type I, commercial, kitchen hood exhaust.
6. Indoor, exposed, Type I, commercial, kitchen hood exhaust.
7. Outdoor, concealed supply and return.
8. Outdoor, exposed supply and return.

B. Items Not Insulated:

1. Fibrous-glass ducts.
2. Metal ducts with duct liner of sufficient thickness to comply with energy code and ASHRAE/IESNA 90.1.
3. Factory-insulated flexible ducts.
4. Factory-insulated plenums and casings.
5. Flexible connectors.
6. Vibration-control devices.
7. Factory-insulated access panels and doors.

3.11 DUCTWORK AND PLEUNUM INSULATION AND JACKET SCHEDULE

Ductwork System	Application	Jacket Type	Insulation Thickness & min. nom. density
Outdoor Air Supply (From OAHU's)	Exposed inside Roof MER's	Outdoor	2" (R = 6), 3.0lb/cu.ft
Outdoor Air Supply (From OAHU's)	Concealed inside building	Outdoor	2" (R = 6), 3.0lb/cu.ft
Supply Air	In Shaft	Indoor	1" (R = 3.5), 1.5lb/cu.ft
Return Air	In Shaft	Indoor	1" (R = 3.5), 1.5lb/cu.ft
Relief/Return Air	Inside of Space	Indoor	1" (R = 3.5), 1.5lb/cu.ft
Relief/Return Air	Exposed inside Roof MER's	Outdoor	2" (R = 6), 3.0lb/cu.ft
Outdoor Air Intake Plenums & Ductwork	Exposed inside Roof MER's	Outdoor	2" (R = 6), 3.0lb/cu.ft

Exhaust Ductwork	After Enthalpy wheel to exhaust plenum	Outdoor	1" (R = 3.5), 1.5lb/cu.ft
Exhaust Plenum	Exposed inside Roof MER's	Outdoor	2" (R = 6), 3.0lb/cu.ft
Garage Ductwork	Garage	Outdoor	1" (R = 3.5), 1.5lb/cu.ft

END OF SECTION 230713

SECTION 230716

HVAC EQUIPMENT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes insulating the following HVAC equipment that is not factory insulated:
1. Heat exchangers.
 2. Dual-temperature heating and cooling water pumps.
 3. Radiant floor water pumps.
 4. Expansion/compression tanks.
 5. Air separators.
 6. Thermal storage tanks.
 7. Deaerators.
 8. Piping system filtration unit housings.
- B. Related Sections:
1. Section 230713 "Duct Insulation."
 2. Section 230719 "HVAC Piping Insulation."

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory- and field-applied if any).
- B. LEED Submittals: -
1. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 2. Detail attachment and covering of heat tracing inside insulation.
 3. Detail removable insulation at equipment connections.
 4. Detail application of field-applied jackets.
 5. Detail application at linkages of control devices.

6. Detail field application for each equipment type.
- D. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use. Sample sizes are as follows:
1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.
 2. Sheet Form Insulation Materials: 12 inches square.
 3. Sheet Jacket Materials: 12 inches square.
 4. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.
- E. Product Pre-Review Documentation: Provide the following in compliance with Section 01 81 13 "Sustainable Design Requirements":
1. List of the materials or products that will be submitted under this Specification Section. All alternatives being considered shall be noted.
 2. Product data detailing the material components of each assembly, if applicable.
 3. Completed Materials Inquiry Forms for each material or product.
 4. MSDS or other manufacturer data stating the chemical components of each product, including the Chemical Abstracts Service (CAS) numbers.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Provide a completed VOC submittal form per Section 01 81 13.
- C. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
- D. Field quality-control reports.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

C. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by Architect. Use materials indicated for the completed Work.

1. Equipment Mockups:

- a. One dual temperature water pump
- b. One dedicated boiler pump.
- c. One tank or vessel.
- d. One Heat Exchanger

- 2. For each mockup, fabricate cutaway sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
- 3. Notify Architect seven days in advance of dates and times when mockups will be constructed.
- 4. Obtain Architect's approval of mockups before starting insulation application.
- 5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
- 6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
- 7. Demolish and remove mockups when directed.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- B. Coordinate clearance requirements with equipment Installer for equipment insulation application.
- C. Coordinate installation and testing of heat tracing.

1.8 SCHEDULING

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

- A. Low emitting materials: Adhesive, sealant, paint and coating products used within the vapor barrier shall comply with VOC limits in Section 01 81 19.
- B. Comply with requirements in "Breeching Insulation Schedule" and "Equipment Insulation Schedule" articles for where insulating materials shall be applied.
- C. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- D. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- E. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- F. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- G. Calcium Silicate:
 - 1. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.
- H. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Block Insulation: ASTM C 552, Type I.
 - 2. Special-Shaped Insulation: ASTM C 552, Type III.
 - 3. Board Insulation: ASTM C 552, Type IV.
 - 4. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.
- I. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. CertainTeed Corp.; SoftTouch Duct Wrap.
 - b. Johns Manville; Microlite.
 - c. Knauf Insulation; Friendly Feel Duct Wrap.

- d. Manson Insulation Inc.; Alley Wrap.
 - e. Owens Corning; SOFTR All-Service Duct Wrap.
- J. High-Temperature, Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type V, without factory-applied jacket.
- 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Industrial Insulation Group (IIG); MinWool-1200 Flexible Batt.
 - b. Johns Manville; HTB 26 Spin-Glas.
 - c. Roxul Inc.; Roxul RW.
- K. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. Provide insulation with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. CertainTeed Corp.; CertaPro Commercial Board.
 - b. Fibrex Insulations Inc.; FBX.
 - c. Johns Manville; 800 Series Spin-Glas.
 - d. Knauf Insulation; Insulation Board.
 - e. Manson Insulation Inc.; AK Board.
 - f. Owens Corning; Fiberglas 700 Series.
- L. High-Temperature, Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type III, without factory-applied jacket.
- 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Fibrex Insulations Inc.; FBX. Industrial Insulation Group (IIG); MinWool-1200 Industrial Board.
 - b. Rock Wool; Delta Board.
 - c. Roxul Inc.; RHT and RockBoard.
 - d. Thermafiber, Inc.; Thermafiber Industrial Felt.
- M. Mineral-Fiber, Preformed Pipe Insulation:
- 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Fibrex Insulations Inc.; Coreplus 1200.
 - b. Johns Manville; Micro-Lok.
 - c. Knauf Insulation; 1000-Degree Pipe Insulation.
 - d. Manson Insulation Inc.; Alley-K.
 - e. Owens Corning; Fiberglas Pipe Insulation.

2. Type I, 850 Deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ-SSL. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 3. Type II, 1200 Deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type II, Grade A, with factory-applied ASJ-SSL.
 4. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- N. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied FSK jacket complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. CertainTeed Corp.; CrimpWrap.
 - b. Johns Manville; MicroFlex.
 - c. Knauf Insulation; Pipe and Tank Insulation.
 - d. Manson Insulation Inc.; AK Flex.
 - e. Owens Corning; Fiberglas Pipe and Tank Insulation.
- O. Phenolic:
1. Block insulation of rigid, expanded, closed-cell structure. Comply with ASTM C 1126, Type II, Grade 1.
 2. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.
 3. Factory-Applied Jacket: ASJ. Requirements are specified in "Factory-Applied Jackets" Article.
- P. Polyisocyanurate: Unfaced, preformed, rigid cellular polyisocyanurate material intended for use as thermal insulation.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Dow Chemical Company (The); Trymer 2000 XP.
 - b. Duna USA Inc.; Corafoam.
 - c. Dyplast Products; ISO-25.
 - d. Elliott Company of Indianapolis; Elfoam.
 2. Comply with ASTM C 591, Type I or Type IV, except thermal conductivity (k-value) shall not exceed 0.19 Btu x in./h x sq. ft. x deg F at 75 deg F after 180 days of aging.
 3. Flame-spread index shall be 25 or less and smoke-developed index shall be 50 or less for thickness up to 1 inch as tested by ASTM E 84.
 4. Fabricate shapes according to ASTM C 450 and ASTM C 585.
 5. Factory-Applied Jacket: Requirements are specified in "Factory-Applied Jackets" Article.

a. Equipment Applications: ASJ-SSL.

- Q. Polyolefin: Unicellular, polyethylene thermal plastic insulation. Comply with ASTM C 534 or ASTM C 1427, Type I, Grade 1 for tubular materials and Type II, Grade 1 for sheet materials.
- R. Polystyrene: Rigid, extruded cellular polystyrene intended for use as thermal insulation. Comply with ASTM C 578, Type IV or Type XIII, except thermal conductivity (k-value) shall not exceed 0.26 Btu x in./h x sq. ft. x deg F after 180 days of aging. Fabricate shapes according to ASTM C 450 and ASTM C 585.

2.2 ADHESIVES

- A. Materials shall be compatible with jackets and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-82.
 - b. Eagle Bridges - Marathon Industries; 225.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 85-50.
 - d. Mon-Eco Industries, Inc.; 22-25.
 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. PVC Jacket Adhesive: Compatible with PVC jacket.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Dow Corning Corporation; 739, Dow Silicone.
 - b. Johns Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
 - c. P.I.C. Plastics, Inc.; Welding Adhesive.
 - d. Speedline Corporation; Polyco VP Adhesive.
 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.3 MASTICS

- A. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.
1. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, 0.013 perm at 43-mil dry film thickness.
 2. Service Temperature Range: Minus 20 to plus 180 deg F.
 3. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
 4. Color: White.
- B. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-10.
 - b. Eagle Bridges - Marathon Industries; 550.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 46-50.
 - d. Mon-Eco Industries, Inc.; 55-50.
 - e. Vimasco Corporation; WC-1/WC-5.
 2. Water-Vapor Permeance: ASTM F 1249, 1.8 perms at 0.0625-inch dry film thickness.
 3. Service Temperature Range: Minus 20 to plus 180 deg F.
 4. Solids Content: 60 percent by volume and 66 percent by weight.
 5. Color: White.

2.4 LAGGING ADHESIVES

- A. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
1. For indoor applications, use lagging adhesives that have a VOC content of 70 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-50 AHV2.
 - b. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-36.
 - c. Vimasco Corporation; 713 and 714.
 3. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over equipment insulation.
 4. Service Temperature Range: 0 to plus 180 deg F.
 5. Color: White.

2.5 SEALANTS

A. Joint Sealants:

1. Joint Sealants for Cellular-Glass, Phenolic, and Polyisocyanurate Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-45.
 - d. Mon-Eco Industries, Inc.; 44-05.
 - e. Pittsburgh Corning Corporation; Pittseal 444.
2. Joint Sealants for Polystyrene Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-70.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-45.
 - d. Mon-Eco Industries, Inc.; 44-05.
3. Materials shall be compatible with insulation materials, jackets, and substrates.
4. Permanently flexible, elastomeric sealant.
5. Service Temperature Range: Minus 100 to plus 300 deg F.
6. Color: White or gray.
7. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. FSK and Metal Jacket Flashing Sealants:

1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 95-44.
 - d. Mon-Eco Industries, Inc.; 44-05.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.
6. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250 deg F.
4. Color: White.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.6 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.
5. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.
6. PVDC Jacket for Outdoor Applications: 6-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.01 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 25 when tested according to ASTM E 84.
7. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.
8. Vinyl Jacket: White vinyl with a permeance of 1.3 perms when tested according to ASTM E 96/E 96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.7 FIELD-APPLIED FABRIC-REINFORCING MESH

- A. Woven Glass-Fiber Fabric: Approximately 6 oz./sq. yd. with a thread count of 5 strands by 5 strands/sq. in. for covering equipment.
- B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for equipment.

2.8 FIELD-APPLIED JACKETS

- A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
- B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.
- C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Johns Manville; Zeston.
 - b. P.I.C. Plastics, Inc.; FG Series.
 - c. Proto Corporation; LoSmoke.
 - d. Speedline Corporation; SmokeSafe.
 - 2. Adhesive: As recommended by jacket material manufacturer.
 - 3. Color: White.
 - 4. Factory-fabricated tank heads and tank side panels.
- D. Metal Jacket:
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; Metal Jacketing Systems.
 - b. ITW Insulation Systems; Aluminum and Stainless Steel Jacketing.
 - c. RPR Products, Inc.; Insul-Mate.
 - 2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
 - a. Sheet and roll stock ready for shop or field sizing.
 - b. Finish and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - e. Factory-Fabricated Fitting Covers:
 - 1) Same material, finish, and thickness as jacket.
 - 2) Preformed two-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - 3) Tee covers.
 - 4) Flange and union covers.
 - 5) End caps.
 - 6) Beveled collars.

- 7) Valve covers.
 - 8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
3. Stainless-Steel Jacket: ASTM A 167 or ASTM A 240/A 240M.
- a. Sheet and roll stock ready for shop or field sizing.
 - b. Material, finish, and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - e. Factory-Fabricated Fitting Covers:
 - 1) Same material, finish, and thickness as jacket.
 - 2) Preformed two-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - 3) Tee covers.
 - 4) Flange and union covers.
 - 5) End caps.
 - 6) Beveled collars.
 - 7) Valve covers.
 - 8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
- E. Self-Adhesive Outdoor Jacket: 60-mil- thick, laminated vapor barrier and waterproofing membrane for installation over insulation located aboveground outdoors; consisting of a rubberized bituminous resin on a crosslaminated polyethylene film covered with white stucco-embossed aluminum-foil facing.
- F. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.
- G. PVDC Jacket for Outdoor Applications: 6-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.01 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 25 when tested according to ASTM E 84.
- H. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.

2.9 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:

- a. ABI, Ideal Tape Division; 428 AWF ASJ.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0836.
 - c. Compac Corporation; 104 and 105.
 - d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
2. Width: 3 inches.
 3. Thickness: 11.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 491 AWF FSK.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
 - c. Compac Corporation; 110 and 111.
 - d. Venture Tape; 1525 CW NT, 1528 CW, and 1528 CW/SQ.
 2. Width: 3 inches.
 3. Thickness: 6.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 370 White PVC tape.
 - b. Compac Corporation; 130.
 - c. Venture Tape; 1506 CW NS.
 2. Width: 2 inches.
 3. Thickness: 6 mils.
 4. Adhesion: 64 ounces force/inch in width.
 5. Elongation: 500 percent.
 6. Tensile Strength: 18 lbf/inch in width.
- D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:

- a. ABI, Ideal Tape Division; 488 AWF.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
 - c. Compac Corporation; 120.
 - d. Venture Tape; 3520 CW.
2. Width: 2 inches.
 3. Thickness: 3.7 mils.
 4. Adhesion: 100 ounces force/inch in width.
 5. Elongation: 5 percent.
 6. Tensile Strength: 34 lbf/inch in width.
- E. PVDC Tape for Indoor Applications: White vapor-retarder PVDC tape with acrylic adhesive.
1. Width: 3 inches.
 2. Film Thickness: 4 mils.
 3. Adhesive Thickness: 1.5 mils.
 4. Elongation at Break: 145 percent.
 5. Tensile Strength: 55 lbf/inch in width.
- F. PVDC Tape for Outdoor Applications: White vapor-retarder PVDC tape with acrylic adhesive.
1. Width: 3 inches.
 2. Film Thickness: 6 mils.
 3. Adhesive Thickness: 1.5 mils.
 4. Elongation at Break: 145 percent.
 5. Tensile Strength: 55 lbf/inch in width.

2.10 SECUREMENTS

A. Bands:

1. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316; 0.015 inch thick, 3/4 inch wide with wing seal or closed seal.
2. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal or closed seal.
3. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated.
 - a. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - 1) AGM Industries, Inc.; CWP-1.
 - 2) GEMCO; CD.

- 3) Midwest Fasteners, Inc.; CD.
 - 4) Nelson Stud Welding; TPA, TPC, and TPS.
2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
 - a. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - 1) AGM Industries, Inc.; CHP-1.
 - 2) GEMCO; Cupped Head Weld Pin.
 - 3) Midwest Fasteners, Inc.; Cupped Head.
 - 4) Nelson Stud Welding; CHP.
 3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place.
 - a. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - 1) AGM Industries, Inc.; Tactoo Perforated Base Insul-Hangers.
 - 2) GEMCO; Perforated Base.
 - 3) Midwest Fasteners, Inc.; Spindle.
 - b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - c. Spindle: Copper- or zinc-coated, low-carbon steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place.
 - a. Baseplate: Perforated, nylon sheet, 0.030 inch thick by 1-1/2 inches in diameter.
 - b. Spindle: Nylon, 0.106-inch- diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches.
 - c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 5. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place.

- a. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - 1) AGM Industries, Inc.; Tactoo Self-Adhering Insul-Hangers, Series.
 - 2) GEMCO; Peel & Press.
 - 3) Midwest Fasteners, Inc.; Self Stick.
 - b. Baseplate: Galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - c. Spindle: Copper- or zinc-coated, low-carbon steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - d. Adhesive-backed base with a peel-off protective cover.
6. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- a. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - 1) AGM Industries, Inc.; RC-150.
 - 2) GEMCO; R-150.
 - 3) Midwest Fasteners, Inc.; WA-150.
 - 4) Nelson Stud Welding; Speed Clips.
 - b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
7. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- C. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel.
 - D. Wire: 0.080-inch nickel-copper alloy.

2.11 CORNER ANGLES

- A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.
- B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.
- C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 - 1. Verify that systems and equipment to be insulated have been tested and are free of defects.
 - 2. Verify that surfaces to be insulated are clean and dry.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Surface Preparation: Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
 - 1. Stainless Steel: Coat 300 series stainless steel with an epoxy primer 5 mils thick and an epoxy finish 5 mils thick if operating in a temperature range between 140 and 300 deg F. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.
 - 2. Carbon Steel: Coat carbon steel operating at a service temperature between 32 and 300 deg F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.
- C. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.
- D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment.
- B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Keep insulation materials dry during application and finishing.
- G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- H. Install insulation with least number of joints practical.
- I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 4. Cover inserts with jacket material matching adjacent insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- K. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
 - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
 - a. For below ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints.
- L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

O. For above ambient services, do not install insulation to the following:

1. Vibration-control devices.
2. Testing agency labels and stamps.
3. Nameplates and data plates.
4. Manholes.
5. Handholes.
6. Cleanouts.

3.4 INSTALLATION OF EQUIPMENT, TANK, AND VESSEL INSULATION

A. Mineral-Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with anchor pins and speed washers.

1. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
2. Protect exposed corners with secured corner angles.
3. Install self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
 - a. Do not weld anchor pins to ASME-labeled pressure vessels.
 - b. Select insulation hangers that are compatible with service temperature and with substrate.
 - c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
 - d. Do not overcompress insulation during installation.
 - e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
 - f. Impale insulation over anchor pins and attach speed washers.
 - g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
4. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
5. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
6. Stagger joints between insulation layers at least 3 inches.
7. Install insulation in removable segments on equipment access doors, manholes, handholes, and other elements that require frequent removal for service and inspection.

8. Bevel and seal insulation ends around manholes, handholes, ASME stamps, and nameplates.
9. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

B. Insulation Installation on Pumps:

1. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch- diameter fasteners with wing nuts. Alternatively, secure the box sections together using a latching mechanism.
2. Fabricate boxes from galvanized steel, at least 0.040 inch thick.
3. For below ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.

3.5 INSTALLATION OF CALCIUM SILICATE INSULATION

A. Insulation Installation on Boiler Breechings:

1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation material.
2. Install two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
3. On exposed applications without metal jacket, finish insulation surface with a skim coat of mineral-fiber, hydraulic-setting cement. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth. Thin finish coat to achieve smooth, uniform finish.

3.6 INSTALLATION OF PHENOLIC INSULATION

- A. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
- B. Install two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with 0.062-inch wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.

3.7 FIELD-APPLIED JACKET INSTALLATION

- A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.
 1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
 2. Embed glass cloth between two 0.062-inch- thick coats of lagging adhesive.
 3. Completely encapsulate insulation with coating, leaving no exposed insulation.

- B. Where FSK jackets are indicated, install as follows:
1. Draw jacket material smooth and tight.
 2. Install lap or joint strips with same material as jacket.
 3. Secure jacket to insulation with manufacturer's recommended adhesive.
 4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
 5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.
- C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.
- D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.
- E. Where PVDC jackets are indicated, install as follows:
1. Jacket can be wrapped in cigarette fashion along length of roll for insulation systems with an outer circumference of 33-1/2 inches or less. 33-1/2-inch- circumference limit allows for 2-inch- overlap seal. Using the length of roll allows for longer sections of jacket to be installed at one time. Use adhesive on the lap seal. Visually inspect lap seal for "fishmouthing," and use PVDC tape along lap seal to secure joint.
 2. Repair holes or tears in PVDC jacket by placing PVDC tape over the hole or tear and wrapping a minimum of 1-1/4 circumferences to avoid damage to tape edges.

3.8 FINISHES

- A. Equipment Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 099000
1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Color: Final color as selected by Commissioner. Vary first and second coats to allow visual inspection of the completed Work.
- C. Do not field paint aluminum or stainless-steel jackets.

3.9 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.
- C. Tests and Inspections: Inspect field-insulated equipment, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each type of equipment defined in the "Equipment Insulation Schedule" Article. For large equipment, remove only a portion adequate to determine compliance.
- D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.10 BREECHING INSULATION SCHEDULE

- A. Round, exposed breeching and connector insulation shall be one of the following:
 - 1. Calcium Silicate: 4 inches thick.
 - 2. High-Temperature Mineral-Fiber Blanket: 3 inches thick and 3-lb/cu. ft. nominal density.
 - 3. High-Temperature Mineral-Fiber Board: 3 inches thick and 3-lb/cu. ft. nominal density.
- B. Round, concealed breeching and connector insulation shall be one of the following:
 - 1. Calcium Silicate: 4 inches thick.
 - 2. High-Temperature Mineral-Fiber Blanket: 3 inches thick and 3-lb/cu. ft. nominal density.
 - 3. High-Temperature Mineral-Fiber Board: 3 inches thick and 3-lb/cu. ft. nominal density.

3.11 EQUIPMENT INSULATION SCHEDULE

- A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.
- B. Insulate indoor and outdoor equipment that is not factory insulated.
- C. Heat-exchanger (water-to-water) insulation shall be one of the following:
 - 1. Calcium Silicate: 3 inches thick.
 - 2. Cellular Glass: 3 inches thick.
 - 3. Mineral-Fiber Board: 2 inches thick and 3-lb/cu. ft. nominal density.
 - 4. Mineral-Fiber Pipe and Tank: 2 inches thick.
- D. Dual-service heating and cooling water pump insulation shall be one of the following:
 - 1. Cellular Glass: 3 inches thick.
 - 2. Mineral-Fiber Board: 2 inches thick and 3-lb/cu. ft. nominal density.

3. Phenolic: 2 inches thick.
- E. Radiant floor water pump insulation shall be one of the following:
1. Cellular Glass: 3 inches thick.
 2. Mineral-Fiber Board: 2 inches thick and 3-lb/cu. ft. nominal density.
 3. Phenolic: 2 inches thick.
- F. Thermal storage water tank insulation shall be one of the following:
1. Cellular Glass: 1-1/2 inches thick.
 2. Mineral-Fiber Board: 1 inch thick and 3-lb/cu. ft. nominal density.
 3. Mineral-Fiber Pipe and Tank: 1 inch thick.
 4. Phenolic: 1 inch thick.
 5. Polyisocyanurate: 1 inch thick.
 6. Polyolefin: 1 inch thick.
- G. Dual-service heating and cooling water air-separator insulation shall be one of the following:
1. Cellular Glass: 1-1/2 inches thick.
 2. Mineral-Fiber Board: 1 inch thick and 3-lb/cu. ft. nominal density.
 3. Mineral-Fiber Pipe and Tank: 1 inch thick.
 4. Phenolic: 1 inch thick.
 5. Polyisocyanurate: 1 inch thick.
 6. Polyolefin: 1 inch thick.
- H. Radiant floor water air-separator insulation shall be one of the following:
1. Cellular Glass: 2 inches thick.
 2. Mineral-Fiber Board: 1 inch thick and 3-lb/cu. ft. nominal density.
 3. Mineral-Fiber Pipe and Tank: 1 inch thick.
 4. Phenolic: 1 inch thick.
 5. Polyisocyanurate: 1 inch thick.
 6. Polyolefin: 1 inch thick.
- I. Deaerator insulation shall be one of the following:
1. Calcium Silicate: 3 inches thick.
 2. Cellular Glass: 3 inches thick.
 3. Mineral-Fiber Board: 2 inches thick and 3-lb/cu. ft. nominal density.
 4. Mineral-Fiber Pipe and Tank: 2 inches thick.
- J. Piping system filter-housing insulation shall be one of the following:
1. Cellular Glass: 3 inches thick.
 2. Mineral-Fiber Board: 2 inches thick and 3-lb/cu. ft. nominal density.
 3. Mineral-Fiber Pipe and Tank: 2 inches thick.

3.12 INDOOR, FIELD-APPLIED JACKET SCHEDULE

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Equipment, Concealed:
 - 1. PVC, Color-Coded by System: 30 mils thick.
 - 2. Aluminum, Smooth: 0.024 inch thick.
 - 3. Painted Aluminum, Smooth: 0.024 inch thick.
 - 4. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.024 inch thick.
- D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:
 - 1. PVC, Color-Coded by System: 30 mils thick.
 - 2. Aluminum, Smooth: 0.024 inch thick.
 - 3. Painted Aluminum, Smooth: 0.024 inch thick.
 - 4. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.024 inch thick.
- E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger Than 72 Inches:
 - 1. Painted Aluminum, Smooth with 1-1/4-Inch- Deep Corrugations: 0.024 inch thick.
 - 2. Stainless Steel, Type 304 or Type 316, Smooth, with 1-1/4-Inch- Deep Corrugations: 0.024 inch thick.

3.13 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Equipment, Concealed:
 - 1. PVC, Color-Coded by System: 30 mils thick.
 - 2. Aluminum, Smooth: 0.024 inch thick.
 - 3. Painted Aluminum, Smooth: 0.024 inch thick.
 - 4. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.024 inch thick.
- D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:
 - 1. Painted Aluminum, Smooth with Z-Shaped Locking Seam: 0.024 inch thick.
 - 2. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish with Z-Shaped Locking Seam: 0.024 inch thick.
- E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger Than 72 Inches:
 - 1. Painted Aluminum, Smooth with 1-1/4-Inch- Deep Corrugations: 0.032 inch thick.

2. Stainless Steel, Type 304 or Type 316, Smooth, with 1-1/4-Inch- Deep Corrugations:
0.024 inch thick.

END OF SECTION 230716

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 230719

HVAC PIPING INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes insulating the following HVAC piping systems:

1. Condensate drain piping, indoors.
2. Dual-service heating and cooling piping, indoors
3. Radiant floor water piping, indoors
4. Ground source "Source Water" piping, indoors

- B. Related Sections:

1. Section 230713 "Duct Insulation."
2. Section 230716 "HVAC Equipment Insulation."
3. Section 232113 "Hydronic Piping" U/G piping included in Hydronic piping

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied if any).

- B. Provide a completed VOC submittal form per Section 01 81 13.

- C. LEED Submittals:

1. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.

- D. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
2. Detail attachment and covering of heat tracing inside insulation.
3. Detail insulation application at pipe expansion joints for each type of insulation.
4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.

5. Detail removable insulation at piping specialties.
 6. Detail application of field-applied jackets.
 7. Detail application at linkages of control devices.
- E. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use.
1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.
 2. Sheet Form Insulation Materials: 12 inches square.
 3. Jacket Materials for Pipe: 12 inches long by NPS 2.
 4. Sheet Jacket Materials: 12 inches square.
 5. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.
- F. Product Pre-Review Documentation: Provide the following in compliance with Section 01 81 13 "Sustainable Design Requirements":
1. List of the materials or products that will be submitted under this Specification Section. All alternatives being considered shall be noted.
 2. Product data detailing the material components of each assembly, if applicable.
 3. Completed Materials Inquiry Forms for each material or product.
 4. MSDS or other manufacturer data stating the chemical components of each product, including the Chemical Abstracts Service (CAS) numbers.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
- C. Field quality-control reports.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.

2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- C. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by Architect. Use materials indicated for the completed Work.
1. Piping Mockups:
 - a. One 10-foot section of NPS 2 straight pipe.
 - b. One each of a 90-degree threaded, welded, and flanged elbow.
 - c. One each of a threaded, welded, and flanged tee fitting.
 - d. One NPS 2 or smaller valve, and one NPS 2-1/2 or larger valve.
 - e. Four support hangers including hanger shield and insert.
 - f. One threaded strainer and one flanged strainer with removable portion of insulation.
 - g. One threaded reducer and one welded reducer.
 - h. One pressure temperature tap.
 - i. One mechanical coupling.
 2. For each mockup, fabricate cutaway sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
 3. Notify Architect seven days in advance of dates and times when mockups will be constructed.
 4. Obtain Architect's approval of mockups before starting insulation application.
 5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
 7. Demolish and remove mockups when directed.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

- C. Coordinate installation and testing of heat tracing.

1.8 SCHEDULING

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

- A. Low emitting materials: Adhesive, sealant, paint and coating products used within the vapor barrier shall comply with VOC limits in Section 01 81 19.
- B. Comply with requirements in the Piping Insulation schedule included as part of this specification (or requirements of latest energy code, whichever is more stringent) for where insulating materials shall be applied.
- C. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- D. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- E. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- F. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- G. Calcium Silicate:
 - 1. Preformed Pipe Sections: Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.
 - 2. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.
 - 3. Prefabricated Fitting Covers: Comply with ASTM C 450 and ASTM C 585 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.
- H. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Block Insulation: ASTM C 552, Type I.
 2. Special-Shaped Insulation: ASTM C 552, Type III.
 3. Board Insulation: ASTM C 552, Type IV.
 4. Preformed Pipe Insulation without Jacket: Comply with ASTM C 552, Type II, Class 1.
 5. Preformed Pipe Insulation with Factory-Applied ASJ-SSL: Comply with ASTM C 552, Type II, Class 2.
 6. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.
- I. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin; for operating temperature higher than 250 deg F. Comply with ASTM C 1290, Type I for insulation without jackets, Type II for insulation with vinyl jackets, and Type III for insulation with FSK or FSP jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. CertainTeed Corp.; SoftTouch Duct Wrap.
 - b. Johns Manville; Microlite.
 - c. Knauf Insulation; Friendly Feel Duct Wrap.
 - d. Manson Insulation Inc.; Alley Wrap.
 - e. Owens Corning; SOFTR All-Service Duct Wrap.
- J. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied FSK jacket complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. CertainTeed Corp.; CrimpWrap.
 - b. Johns Manville; MicroFlex.
 - c. Knauf Insulation; Pipe and Tank Insulation.
 - d. Manson Insulation Inc.; AK Flex.
 - e. Owens Corning; Fiberglas Pipe and Tank Insulation.
- K. Phenolic:
1. Preformed pipe insulation of rigid, expanded, closed-cell structure. Comply with ASTM C 1126, Type III, Grade 1.
 2. Block insulation of rigid, expanded, closed-cell structure. Comply with ASTM C 1126, Type II, Grade 1.
 3. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.
 4. Factory-Applied Jacket: Requirements are specified in "Factory-Applied Jackets" Article.
 - a. Preformed Pipe Insulation: ASJ.

- L. Polyisocyanurate: Unfaced, preformed, rigid cellular polyisocyanurate material intended for use as thermal insulation.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Dow Chemical Company (The); Trymer 2000 XP.
 - b. Duna USA Inc.; Corafoam.
 - c. Dyplast Products; ISO-25.
 - d. Elliott Company of Indianapolis; Elfoam.
 - 2. Comply with ASTM C 591, Type I or Type IV, except thermal conductivity (k-value) shall not exceed 0.19 Btu x in./h x sq. ft. x deg F at 75 deg F after 180 days of aging.
 - 3. Flame-spread index shall be 25 or less, and smoke-developed index shall be 50 or less for thickness up to 1 inch as tested by ASTM E 84.
 - 4. Fabricate shapes according to ASTM C 450 and ASTM C 585.
 - 5. Factory-Applied Jacket: Requirements are specified in "Factory-Applied Jackets" Article.
 - a. Pipe Applications: ASJ-SSL.
- M. Polyolefin: Unicellular, polyethylene thermal plastic insulation. Comply with ASTM C 534 or ASTM C 1427, Type I, Grade 1 for tubular materials and Type II, Grade 1 for sheet materials.
- N. Polystyrene: Rigid, extruded cellular polystyrene intended for use as thermal insulation for outdoor; its flame-spread/smoke-developed indexes are unsuitable for most indoor applications.. Comply with ASTM C 578, Type IV or Type XIII, except thermal conductivity (k-value) shall not exceed 0.26 Btu x in./h x sq. ft. x deg F after 180 days of aging. Fabricate shapes according to ASTM C 450 and ASTM C 585.

2.2 ADHESIVES

- A. Materials shall be compatible with jackets and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-82.
 - b. Eagle Bridges - Marathon Industries; 225.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 85-50.
 - d. Mon-Eco Industries, Inc.; 22-25.

2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. PVC Jacket Adhesive: Compatible with PVC jacket.

1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Dow Corning Corporation; 739, Dow Silicone.
 - b. Johns Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
 - c. P.I.C. Plastics, Inc.; Welding Adhesive.
 - d. Speedline Corporation; Polyco VP Adhesive.
2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.3 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-PRF-19565C, Type II.

1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. Vapor-Barrier Mastic: Water based; suitable for indoor use on below-ambient services.

1. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, 0.013 perm at 43-mil dry film thickness.
2. Service Temperature Range: Minus 20 to plus 180 deg F.
3. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
4. Color: White.

C. Breather Mastic: Water based; suitable for indoor and outdoor use on above-ambient services.

1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-10.
 - b. Eagle Bridges - Marathon Industries; 550.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 46-50.
 - d. Mon-Eco Industries, Inc.; 55-50.
 - e. Vimasco Corporation; WC-1/WC-5.
2. Water-Vapor Permeance: ASTM F 1249, 1.8 perms at 0.0625-inch dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: 60 percent by volume and 66 percent by weight.
5. Color: White.

2.4 LAGGING ADHESIVES

- A. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
1. For indoor applications, use lagging adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-50 AHV2.
 - b. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-36.
 - c. Vimasco Corporation; 713 and 714.
 3. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over pipe insulation.
 4. Service Temperature Range: 0 to plus 180 deg F.
 5. Color: White.

2.5 SEALANTS

- A. Joint Sealants:
1. Joint Sealants for Cellular-Glass, Phenolic, and Polyisocyanurate Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-45.
 - d. Mon-Eco Industries, Inc.; 44-05.
 - e. Pittsburgh Corning Corporation; Pittseal 444.
 2. Joint Sealants for Polystyrene Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-70.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-45.
 - d. Mon-Eco Industries, Inc.; 44-05.
 3. Materials shall be compatible with insulation materials, jackets, and substrates.
 4. Permanently flexible, elastomeric sealant.
 5. Service Temperature Range: Minus 100 to plus 300 deg F.

6. Color: White or gray.
7. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. FSK and Metal Jacket Flashing Sealants:

1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-76.
 - b. Eagle Bridges - Marathon Industries; 405.
 - c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 95-44.
 - d. Mon-Eco Industries, Inc.; 44-05.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.
6. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250 deg F.
4. Color: White.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.6 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.
5. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.

6. PVDC Jacket for Outdoor Applications: 6-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.01 perm when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 25 when tested according to ASTM E 84.
7. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.
8. Vinyl Jacket: White vinyl with a permeance of 1.3 perms when tested according to ASTM E 96/E 96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.7 FIELD-APPLIED FABRIC-REINFORCING MESH

- A. Woven Glass-Fiber Fabric: Approximately 2 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in. for covering pipe and pipe fittings.
- B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for pipe.

2.8 FIELD-APPLIED JACKETS

- A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
- B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.
- C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. Johns Manville; Zeston.
 - b. P.I.C. Plastics, Inc.; FG Series.
 - c. Proto Corporation; LoSmoke.
 - d. Speedline Corporation; SmokeSafe.
 2. Adhesive: As recommended by jacket material manufacturer.
 3. Color: White.
 4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
 - a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
- D. Metal Jacket:
 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:

- a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; Metal Jacketing Systems.
 - b. ITW Insulation Systems; Aluminum and Stainless Steel Jacketing.
 - c. RPR Products, Inc.; Insul-Mate.
2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
- a. Sheet and roll stock ready for shop or field sizing.
 - b. Finish and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - e. Factory-Fabricated Fitting Covers:
 - 1) Same material, finish, and thickness as jacket.
 - 2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - 3) Tee covers.
 - 4) Flange and union covers.
 - 5) End caps.
 - 6) Beveled collars.
 - 7) Valve covers.
 - 8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
3. Stainless-Steel Jacket: ASTM A 167 or ASTM A 240/A 240M.
- a. Sheet and roll stock ready for shop or field sizing.
 - b. Material, finish, and thickness are indicated in field-applied jacket schedules.
 - c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
 - e. Factory-Fabricated Fitting Covers:
 - 1) Same material, finish, and thickness as jacket.
 - 2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - 3) Tee covers.
 - 4) Flange and union covers.
 - 5) End caps.
 - 6) Beveled collars.
 - 7) Valve covers.
 - 8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
- E. Self-Adhesive Outdoor Jacket: 60-mil- thick, laminated vapor barrier and waterproofing membrane for installation over insulation located aboveground outdoors; consisting of a

rubberized bituminous resin on a crosslaminated polyethylene film covered with white aluminum-foil facing.

- F. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perms when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.
- G. PVDC Jacket for Outdoor Applications: 6-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.01 perms when tested according to ASTM E 96/E 96M and with a flame-spread index of 5 and a smoke-developed index of 25 when tested according to ASTM E 84.
- H. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.

2.9 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 428 AWF ASJ.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0836.
 - c. Compac Corporation; 104 and 105.
 - d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
 - 2. Width: 3 inches.
 - 3. Thickness: 11.5 mils.
 - 4. Adhesion: 90 ounces force/inch in width.
 - 5. Elongation: 2 percent.
 - 6. Tensile Strength: 40 lbf/inch in width.
 - 7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
 - 1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 491 AWF FSK.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
 - c. Compac Corporation; 110 and 111.
 - d. Venture Tape; 1525 CW NT, 1528 CW, and 1528 CW/SQ.
 - 2. Width: 3 inches.
 - 3. Thickness: 6.5 mils.
 - 4. Adhesion: 90 ounces force/inch in width.

5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 370 White PVC tape.
 - b. Compac Corporation; 130.
 - c. Venture Tape; 1506 CW NS.
 2. Width: 2 inches.
 3. Thickness: 6 mils.
 4. Adhesion: 64 ounces force/inch in width.
 5. Elongation: 500 percent.
 6. Tensile Strength: 18 lbf/inch in width.
- D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, provide one of the following or approved equal:
 - a. ABI, Ideal Tape Division; 488 AWF.
 - b. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
 - c. Compac Corporation; 120.
 - d. Venture Tape; 3520 CW.
 2. Width: 2 inches.
 3. Thickness: 3.7 mils.
 4. Adhesion: 100 ounces force/inch in width.
 5. Elongation: 5 percent.
 6. Tensile Strength: 34 lbf/inch in width.
- E. PVDC Tape for Indoor Applications: White vapor-retarder PVDC tape with acrylic adhesive.
1. Width: 3 inches.
 2. Film Thickness: 4 mils.
 3. Adhesive Thickness: 1.5 mils.
 4. Elongation at Break: 145 percent.
 5. Tensile Strength: 55 lbf/inch in width.
- F. PVDC Tape for Outdoor Applications: White vapor-retarder PVDC tape with acrylic adhesive.
1. Width: 3 inches.
 2. Film Thickness: 6 mils.
 3. Adhesive Thickness: 1.5 mils.
 4. Elongation at Break: 145 percent.

5. Tensile Strength: 55 lbf/inch in width.

2.10 SECUREMENTS

A. Bands:

1. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316; 0.015 inch thick, 3/4 inch wide with wing seal or closed seal.
2. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal or closed seal.
3. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

B. Staples: Outward-clinching insulation staples, nominal 3/4-inch- wide, stainless steel or Monel.

C. Wire: 0.080-inch nickel-copper alloy.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.

1. Verify that systems to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of pipe system as specified in insulation system schedules.

- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- G. Keep insulation materials dry during application and finishing.
- H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- I. Install insulation with least number of joints practical.
- J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- L. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with 3-inch- wide strips; of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
 - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
 - a. For below-ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

- M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.
- P. For above-ambient services, do not install insulation to the following:
 - 1. Vibration-control devices.
 - 2. Testing agency labels and stamps.
 - 3. Nameplates and data plates.
 - 4. Manholes.
 - 5. Handholes.
 - 6. Cleanouts.

3.4 PENETRATIONS

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
 - 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
 - 4. Seal jacket to wall flashing with flashing sealant.
- C. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

- D. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
 - 1. Comply with requirements in Section 078413 "Penetration Firestopping" for firestopping and fire-resistive joint sealers.
- E. Insulation Installation at Floor Penetrations:
 - 1. Pipe: Install insulation continuously through floor penetrations.
 - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.5 GENERAL PIPE INSULATION INSTALLATION

- A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.
- B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
 - 1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
 - 2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
 - 3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
 - 4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
 - 5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.
 - 6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
 - 7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for

- above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
 9. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.
- C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- D. Install removable insulation covers shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
 2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
 3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.
 4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
 5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.6 INSTALLATION OF CALCIUM SILICATE INSULATION

- A. Insulation Installation on Straight Pipes and Tubes:
1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
 2. Install two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
 3. Apply a skim coat of mineral-fiber, hydraulic-setting cement to insulation surface. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth or tape. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth or tape. Thin finish coat to achieve smooth, uniform finish.
- B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as pipe insulation.
4. Finish flange insulation same as pipe insulation.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed insulation sections of insulation are not available, install mitered sections of calcium silicate insulation. Secure insulation materials with wire or bands.
3. Finish fittings insulation same as pipe insulation.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install mitered segments of calcium silicate insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
2. Install insulation to flanges as specified for flange insulation application.
3. Finish valve and specialty insulation same as pipe insulation.

3.7 INSTALLATION OF CELLULAR-GLASS INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as pipe insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.8 INSTALLATION OF MINERAL-FIBER INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as straight segments of pipe insulation when available.

2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.9 INSTALLATION OF PHENOLIC INSULATION

A. General Installation Requirements:

1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
2. Install 2-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with 0.062-inch wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.

B. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets with vapor retarders on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

C. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as pipe insulation.

D. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

E. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.

3. Install insulation to flanges as specified for flange insulation application.

3.10 INSTALLATION OF POLYISOCYANURATE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with tape or bands and tighten without deforming insulation materials. Orient longitudinal joints between half sections in 3- and 9-o'clock positions on the pipe.
2. For insulation with factory-applied jackets with vapor barriers, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive or tape as recommended by insulation material manufacturer and seal with vapor-barrier mastic.
3. All insulation shall be tightly butted and free of voids and gaps at all joints. Vapor barrier must be continuous. Before installing jacket material, install vapor-barrier system.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, same thickness of adjacent pipe insulation, not to exceed 1-1/2-inch thickness.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polyisocyanurate block insulation of same thickness as pipe insulation.

C. Insulation Installation on Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of polyisocyanurate insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.11 INSTALLATION OF POLYSTYRENE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation with tape or bands and tighten bands without deforming insulation materials. Orient longitudinal joints between half sections in 3- and 9-o'clock positions on the pipe.
2. For insulation with factory-applied jackets with vapor barriers, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive or tape as recommended by insulation material manufacturer and seal with vapor-barrier mastic.

3. All insulation shall be tightly butted and free of voids and gaps at all joints. Vapor barrier must be continuous. Before installing jacket material, install vapor-barrier system.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, and make thickness same as adjacent pipe insulation, not to exceed 1-1/2-inch.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polystyrene block insulation of same thickness as pipe insulation.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed section of polystyrene insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.12 FIELD-APPLIED JACKET INSTALLATION

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch- thick coats of lagging adhesive.
3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications. Seal with manufacturer's recommended adhesive.

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

- D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.
- E. Where PVDC jackets are indicated, install as follows:
 - 1. Apply three separate wraps of filament tape per insulation section to secure pipe insulation to pipe prior to installation of PVDC jacket.
 - 2. Wrap factory-presizes jackets around individual pipe insulation sections with one end overlapping the previously installed sheet. Install presized jacket with an approximate overlap at butt joint of 2 inches over the previous section. Adhere lap seal using adhesive or SSL, and then apply 1-1/4 circumferences of appropriate PVDC tape around overlapped butt joint.
 - 3. Continuous jacket can be spiral-wrapped around a length of pipe insulation. Apply adhesive or PVDC tape at overlapped spiral edge. When electing to use adhesives, refer to manufacturer's written instructions for application of adhesives along this spiral edge to maintain a permanent bond.
 - 4. Jacket can be wrapped in cigarette fashion along length of roll for insulation systems with an outer circumference of 33-1/2 inches or less. The 33-1/2-inch- circumference limit allows for 2-inch- overlap seal. Using the length of roll allows for longer sections of jacket to be installed at one time. Use adhesive on the lap seal. Visually inspect lap seal for "fishmouthing," and use PVDC tape along lap seal to secure joint.
 - 5. Repair holes or tears in PVDC jacket by placing PVDC tape over the hole or tear and wrapping a minimum of 1-1/4 circumferences to avoid damage to tape edges.

3.13 FINISHES

- A. Pipe Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."
 - 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Color: Final color as selected by Commissioner. Vary first and second coats to allow visual inspection of the completed Work.
- C. Do not field paint aluminum or stainless-steel jackets.

3.14 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.

C. Tests and Inspections:

1. Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, two locations of welded strainers, three locations of threaded valves, and three locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.
- D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.15 PIPING INSULATION SCHEDULE, GENERAL

- A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.
- B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
1. Drainage piping located in crawl spaces.
 2. Underground piping.
 3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.16 PIPING INSULATION SCHEDULE

- A. Condensate and Equipment Drain Water:
1. All Pipe Sizes: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
 - c. Phenolic: 1 inch thick.
 - d. Polyisocyanurate: 1 inch thick.
 - e. Polyolefin: 1 inch thick.
- B. Dual-Service Heating and Cooling Water:
1. NPS 3 and Smaller: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
 - d. Polyisocyanurate: 2 inch thick.
 2. NPS 4 to NPS 12: Insulation shall be one of the following:

- a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
 - d. Polyisocyanurate: 2 inch thick.
3. NPS 14 and Larger: Insulation shall be one of the following:
- a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
- C. Radiant Floor Water:
1. NPS 12 and Smaller: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
 - d. Polyisocyanurate: 2 inch thick.
 2. NPS 14 and Larger: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
- D. Ground Source "Source Water" Water:
1. NPS 12 and Smaller: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
 - d. Polyisocyanurate: 2 inch thick.
 2. NPS 14 and Larger: Insulation shall be one of the following:
 - a. Cellular Glass: 1-1/2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe, Type I or Pipe Insulation Wicking System: 2 inches thick.
 - c. Phenolic: 2 inches thick.
 - d. Polyisocyanurate: 2 inches thick.

3.17 INDOOR, FIELD-APPLIED JACKET SCHEDULE

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Piping, Concealed:
 - 1. PVC: 30 mils thick.
 - 2. Aluminum, Smooth: 0.024 inch thick.
 - 3. Painted Aluminum, Smooth: 0.024 inch thick.
 - 4. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.020 inch thick.
- D. Piping, Exposed:
 - 1. PVC: 30 mils thick.
 - 2. Aluminum, Smooth: 0.024 inch thick.
 - 3. Painted Aluminum, Smooth: 0.024 inch thick.
 - 4. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.020 inch thick.

3.18 PIPING INSULATION AND JACKET SCHEDULE

- A. For all piping insulation and jackets, the following thermal properties must be maintained to comply with the energy code associated with New York City Code, Energy Code and LEED requirements. Where this schedule does not meet current code, current energy code requirements shall be met.

Piping System	Application	Insulation Type, Jacket Type	Insulation thickness and thermal rating
Dual-service, Indoor Rated, 3" and smaller	Concealed in Building	Indoor	1.5", 0.27 Btu*in/(h*ft2*F)
Dual-service, Indoor Rated, larger than 3"	Concealed in Building	Indoor	2", 0.27 Btu*in/(h*ft2*F)
Radiant floor Water, Indoor, 3" and smaller	Concealed in Building	Indoor	1.5", 0.27 Btu*in/(h*ft2*F)
Radiant floor Water, Indoor, larger than 3"	Concealed in Building	Indoor	2", 0.27 Btu*in/(h*ft2*F)
Condensate, Indoor	Concealed in Building	Indoor	1", 0.27 Btu*in/(h*ft2*F)
Ground source, Indoor, 1.5" and smaller	Concealed in Building	Indoor	1.5", 0.27 Btu*in/(h*ft2*F)
Ground source, Indoor, larger than 1.5"	Concealed in Building	Indoor	2", 0.27 Btu*in/(h*ft2*F)

END OF SECTION 230719

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 230800

COMMISSIONING OF HVAC AND PLUMBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes commissioning process requirements for HVAC&R systems, assemblies, and equipment.
- B. Section also includes commissioning process requirements for Plumbing Systems.
- C. Related Sections:
 - 1. Section 019113 "General Commissioning Requirements" for general commissioning process requirements.

1.3 DEFINITIONS

- A. Commissioning Plan: A document that outlines the organization, schedule, allocation of resources, and documentation requirements of the commissioning process.
- B. CxA: Commissioning Authority.
- C. HVAC&R: Heating, Ventilating, Air Conditioning, and Refrigeration.
- D. Systems, Subsystems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, equipment, and components.

1.4 INFORMATIONAL SUBMITTALS

- A. Certificates of readiness.
- B. Certificates of completion of installation, prestart, and startup activities.

1.5 CONTRACTOR'S RESPONSIBILITIES

- A. Perform commissioning tests at the direction of the CxA.

- B. Attend construction phase controls coordination meeting.
- C. Attend testing, adjusting, and balancing review and coordination meeting.
- D. Participate in HVAC&R systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the CxA.
- E. Provide information requested by the CxA for final commissioning documentation.
- F. Provide measuring instruments and logging devices to record test data, and provide data acquisition equipment to record data for the complete range of testing for the required test period.
- G. Provide City of New York/operator with minimum 2 weeks advanced notice of training for operator use of all equipment.
- H. Provide CxA with 2-week construction progress look-aheads in order to allow for scheduling of Cx activities
- I. Provide full sequence of operations documentation to CxA
- J. Train building O&M personnel in systems operation (may be provided by system manufacturer where approved)

1.6 CxA'S RESPONSIBILITIES

- A. Provide Project-specific construction checklists and commissioning process test procedures for actual HVAC&R systems, assemblies, equipment, and components to be furnished and installed as part of the construction contract.
- B. Review of applicable contractor submittals before approval by design team and acquisition by contractor.
- C. Direct commissioning testing.
- D. Verify testing, adjusting, and balancing of Work are complete.
- E. Verify appropriateness and completeness of training of building O&M personnel by contractor.
- F. Provide test data, inspection reports, systems operating manuals and certificates in Systems Manual.
- G. Review systems performance within 10 months after substantial completion, and develop a plan for resolving any outstanding commissioning related issues found.

1.7 COMMISSIONING DOCUMENTATION

- A. Provide the following information to the CxA for inclusion in the commissioning plan:

1. Plan for delivery and review of submittals, systems manuals, and other documents and reports.
2. Identification of installed systems, assemblies, equipment, and components including design changes that occurred during the construction phase.
3. Process and schedule for completing construction checklists and manufacturer's prestart and startup checklists for HVAC&R systems, assemblies, equipment, and components to be verified and tested.
4. Certificate of completion certifying that installation, prestart checks, and startup procedures have been completed.
5. Certificate of readiness certifying that HVAC&R systems, subsystems, equipment, and associated controls are ready for testing.
6. Test and inspection reports and certificates.
7. Corrective action documents.
8. Verification of testing, adjusting, and balancing reports.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 TESTING PREPARATION

- A. Certify that HVAC&R systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.
- B. Certify that HVAC&R instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.
- C. Certify that testing, adjusting, and balancing procedures have been completed and that testing, adjusting, and balancing reports have been submitted, discrepancies corrected, and corrective work approved.
- D. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
- E. Inspect and verify the position of each device and interlock identified on checklists.
- F. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.
- G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the CxA.

3.2 Testing AND BALANCING VERIFICATION

- A. Prior to performance of testing and balancing Work, provide copies of reports, sample forms, checklists, and certificates to the CxA.
- B. Notify the CxA at least 14 days in advance of testing and balancing Work, and provide access for the CxA to witness testing and balancing Work.
- C. Provide technicians, instrumentation, and tools to verify testing and balancing of HVAC&R systems at the direction of the CxA.
 - 1. The CxA will notify testing and balancing Contractor or Subcontractor 10 days in advance of the date of field verification. Notice will not include data points to be verified.
 - 2. The testing and balancing Contractor or Subcontractor shall use the same instruments (by model and serial number) that were used when original data were collected.
 - 3. Failure of an item includes, other than sound, a deviation of more than 10 percent. Failure of more than 10 percent of selected items shall result in rejection of final testing, adjusting, and balancing report. For sound pressure readings, a deviation of 3 dB shall result in rejection of final testing. Variations in background noise must be considered.
 - 4. Remedy the deficiency and notify the CxA so verification of failed portions can be performed.

3.3 GENERAL TESTING REQUIREMENTS

- A. Provide technicians, instrumentation, full sequences of operation, and tools to perform commissioning test at the direction of the CxA.
- B. Scope of HVAC&R testing shall include entire HVAC&R and installation, from central equipment for heat generation and refrigeration through distribution systems to each conditioned space. Testing shall include measuring capacities and effectiveness of operational and control functions.
- C. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.
- D. The CxA along with the HVAC&R Contractor, testing and balancing Contractor or Subcontractor, and HVAC&R Instrumentation and Control Contractor or Subcontractor shall prepare detailed testing plans, procedures, and checklists for HVAC&R systems, subsystems, and equipment.
- E. Tests will be performed using design conditions whenever possible.
- F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

- G. The CxA may direct that set points be altered when simulating conditions is not practical.
- H. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- I. If tests cannot be completed because of a deficiency outside the scope of the HVAC&R system, document the deficiency and report it to the City of New York. After deficiencies are resolved, reschedule tests.
- J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

3.4 HVAC&R SYSTEMS, SUBSYSTEMS, AND EQUIPMENT TESTING PROCEDURES

- A. Boiler Testing and Acceptance Procedures: Testing requirements are specified in HVAC boiler Sections. Provide submittals, test data, inspector record, and boiler certification to the CxA.
- B. HVAC&R Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Section 230900 "Instrumentation and Control for HVAC" and Section 230993 "Sequence and Operations for HVAC Controls." Assist the CxA with preparation of testing plans.
- C. Pipe system cleaning, flushing, hydrostatic tests, and chemical treatment requirements are specified in HVAC piping Sections. HVAC&R Contractor shall prepare a pipe system cleaning, flushing, and hydrostatic testing plan. Provide cleaning, flushing, testing, and treating plan and final reports to the CxA. Plan shall include the following:
 - 1. Sequence of testing and testing procedures for each section of pipe to be tested, identified by pipe zone or sector identification marker. Markers shall be keyed to Drawings for each pipe sector, showing the physical location of each designated pipe test section. Drawings keyed to pipe zones or sectors shall be formatted to allow each section of piping to be physically located and identified when referred to in pipe system cleaning, flushing, hydrostatic testing, and chemical treatment plan.
 - 2. Description of equipment for flushing operations.
 - 3. Minimum flushing water velocity.
 - 4. Tracking checklist for managing and ensuring that all pipe sections have been cleaned, flushed, hydrostatically tested, and chemically treated.
- D. Energy Supply System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of gas and hot-water systems and equipment at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.
- E. Refrigeration System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of chillers, cooling towers, refrigerant compressors and condensers, heat pumps, and other refrigeration systems. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.

- F. HVAC&R Distribution System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of air, steam, and hydronic distribution systems; special exhaust; and other distribution systems, including HVAC&R terminal equipment and unitary equipment.
- G. Vibration and Sound Tests: Provide technicians, instrumentation, tools, and equipment to test performance of vibration isolation and seismic controls.
- H. ERV and outdoor air units (all) Distribution System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of air, and hydronic distribution systems; heat recovery wheel and other distribution systems, including HVAC&R terminal equipment and unitary equipment.

3.5 PLUMBING COMMISSIONING

- A. Related Documents:
 - 1. Drawings and general provisions of the Subcontract apply to this Section.
 - 2. Review these documents for coordination with additional requirements and information that apply to work under this Section.
- B. Section Includes:
 - 1. General requirements that apply to implementation of commissioning of plumbing systems, assemblies and components.
- C. Related Sections:
 - 1. Division 01 Section "General Requirements."
 - 2. Division 01 Section "Special Procedures."
 - 3. Division 22 Plumbing Sections.

3.6 REFERENCES

- A. General:
 - 1. The following documents form part of the Specifications to the extent stated. Where differences exist between codes and standards, the one affording the greatest protection shall apply.
 - 2. Unless otherwise noted, the referenced standard edition is the current one at the time of commencement of the Work.
 - 3. Refer to Division 01 Section "General Requirements" for the list of applicable regulatory requirements.
 - 4. Refer to Division 22 Section "Common Results for Plumbing" for codes and standards, and other general requirements.

3.7 DESCRIPTION

- A. The purpose of commission is to ensure that work has been completed as specified and that systems are functioning in the manner as described in the specified system operating criteria. It will assist operating staff training and familiarization with new systems. It will serve as a tool

to reduce post-occupancy critical systems operational difficulty or failure. It will, also, be used to develop test protocol and record the associated test data in an effort to advance the building systems from a state of substantial completion to a full dynamic operation.

- B. Commission will commence after preliminary punch list items are completed by Subcontractors.
- C. The steps associated with commissioning are outlined below:
 - 1. Step One - Installation Verification
 - 2. Step Two - System Start-Up.
 - 3. Step Three – Functional Performance Testing.
- D. Operational staff training is essential to the commission process and will run concurrently with steps one through three.
- E. The Commissioning Team will include representatives of the Facility, Construction and Installing Subcontractors, Test and Balance Subcontractor, FMCS Subcontractor and Construction Subcontractor's Commissioning Agent. Equipment manufacturer's representatives will be present for start-up as specified in the equipment specification sections and for equipment training.

3.8 SYSTEMS TO BE COMMISSIONED

- A. Commissioning will be performed on the following systems:
 - 1. Facility Monitoring and Control System (FMCS)
 - 2. Hot Water System.
 - 3. Storm Water Reclamation Skid
 - 4. Booster Pumps
 - 5. Circulating Pumps
 - 6. Sewage and Storm Water Pumps

3.9 SUBMITTALS

- A. Submit under provisions of Division 01 Section "General Requirements."
- B. Commissioning Plan as prepared by the prime Subcontractor or his Commissioning Agent.
- C. Prime subcontractors or his Commissioning Agent shall provide Functional Performance Tests (FPT) procedures for the above listed systems. Prime subcontractors or his Commissioning Agent shall provide system narrative descriptions as part of the FPT procedures.

3.10 Commissioning plan

- A. The commissioning plan shall outline the organization, scheduling, team members, and documentation pertaining to the overall commissioning process.

3.11 NARRATIVE DESCRIPTIONS

- A. A narrative description of the design intents of the systems and their intended modes of sequences of operation.

3.12 FUNCTIONAL PERFORMANCE TESTS (FPT) PROCEDURES

A. General Requirements

1. This section provides brief descriptions of the testing and support the Installer and installers will be required to provide to perform the functional testing of the equipment for the project.
2. The Cx Authority will further define the tests and procedures in the Testing and Acceptance Modules as well as the individuals required to support the testing.

B. Domestic Water Production

1. The contractor(s) will be required to demonstrate all safeties (personnel and mechanical e.g. loss of flow, high temperature, etc.); local device operation; any local controls including temperature control; and integrated 3rd party Building Management System controls including all related devices and sequence of operations.

C. Pumping Equipment

1. The installer(s) and the manufacturer's representative will be required to demonstrate that all pumps are properly aligned, the pumps operate in the proper direction and that the overload protective devices are installed properly and set to the proper settings.
2. The installer(s) will be required to demonstrate in writing (TAB Report) that the pumps are balanced to achieve the specified design flows, including motor performance data as specified in the TAB specifications.
3. The controls representative will be required to demonstrate that the pumps can start, stop, modulate speed (if required) and the lead/lag sequence performs as per the sequence of operations.
4. A PC representative will be required to manually operate all hand valves.

3.13 GENERAL

- A. The Subcontractors shall be responsible for performing procedures presented in specification and contract drawings as detailed in the Functional Performance Tests (FPT). Members of the designated Commissioning Team shall witness various portions of the commissioning process. Responsibilities for these activities are listed in the following paragraphs. Commissioning Team members shall sign-off on appropriate sections after verifying installation, operation, or documentation. Final sign-off shall be by the Facility and Commissioning Agent.
- B. Any test ports, gauges, test equipment, etc., needed to accomplish the functional performance tests shall be provided by Subcontractors.
- C. Subcontractors shall provide to the Commissioning Team documentation of calibration of controls. Documentation shall include dates, setpoints, calibration coefficients, control loop

verification, and other data required to verify system check-out. Documentation shall be dated and initialed by field engineer or technician performing the work.

3.14 OPERATIONAL STAFF TRAINING

- A. System narrative descriptions will be prepared by the Commission Agent and supported by flow diagrams, one line diagrams, and appropriate specification sections for major systems to be commissioned. The Commission Agent will coordinate "system description" meetings with members of facility management and maintenance department groups to review system description documentation. The meetings will provide an overview of major system features, components, and arrangements.
- B. The Subcontractor and associated manufacturer's representatives shall provide required training to operational staff after the system description meetings have occurred. The Subcontractor training sessions shall provide a more detailed analogy of systems operation and maintenance.

3.15 INSTRUMENTATION

- A. Instrumentation will be provided by the Subcontractor. Instruments used for measurements shall be accurate. Calibration histories for each instrument shall be available for examination. Calibration and maintenance of instruments shall be in accordance with the requirements of NEBB or AABC Standards.
- B. Application of instruments and accuracy of measurements shall be in accordance with NEBB or AABC Standards.

3.16 DOCUMENTATION

- A. The installing Subcontractor shall be responsible for collection of pertinent data during system start-up and functional performance testing. The Subcontractor shall submit to the Commissioning Agent documentation of tests performed prior to and after system start-up. Documentation shall also include start-up procedures as approved by Commissioning Team.
- B. Documentation is to be typewritten on 8-1/2 by 11 inches (200 by 280 mm) paper and inserted in a 2 inches (50 mm) to 3 inches (75 mm) thick three ring binder. Indicate the project name, number, volume number, and volume title on the end panel of each binder.
- C. Provide a title sheet for each volume and list the following:
 - 1. Volume Title and Section Name and Number requiring this submittal.
 - 2. Project name, project number, and address.
 - 3. Subcontractor name, address, and phone number.
 - 4. Name, title, signature, and date of person making the submittal.
 - 5. Name of Facility, a blank line for signature, and the date of person accepting the submittal.
 - 6. Name, address, and phone number of Commission Agent; a blank line for signature; and date of person accepting the submittal.

- D. Provide a Table of Contents for multiple submittals. List each submittal and page number. Number each page, centered on the bottom in sequential numerical order. Provide tabs for multiple submittals in a single binder.

3.17 STEP ONE - INSTALLATION VERIFICATION

- A. General Commissioning responsibilities:
 - 1. Before system start-up begins, the Commission Team shall conduct a final installation verification audit. The Subcontractor shall be responsible for completion of work including change orders and punch list items to the Facility's satisfaction. The audit shall include, but not be limited to, checking of:
 - a. Piping specialties including balance, control, and isolation valves.
 - b. Ductwork specialty items including turning devices, balance, fire, smoke, control dampers, and access doors.
 - c. Control sensor types and location.
 - d. Identification of piping, valves, equipment, controls, etc.
 - e. Major equipment, pumps, valves, starters, gauges, thermometers, etc.
 - f. Documentation of prestart-up tests performed, including manufacturer's factory tests.
 - 2. If work is found to be incomplete, incorrect, or non-functional, the Subcontractor shall correct the deficiency before system start-up work proceeds.

3.18 STEP TWO – SYSTEM START UP

- A. General Commissioning Responsibilities:
 - 1. A start-up plan shall be developed and submitted by the installing Subcontractor. Start-up plan to include the following:
 - a. Flushing and cleaning of pipe.
 - b. Filters, strainers, and screens.
 - c. Valve/damper positions.
 - d. Electrical tests.
 - e. Pressure tests.
 - f. Safeties.
 - g. Chemical treatment.
 - h. Manufacturer's tests.
 - 2. The start-up plan will be reviewed and a prestart-up inspection performed by designated members of the Commissioning Team. The installing Subcontractor shall commence with system start-up after approval has been given to start-up plan and the prestart-up inspection is completed. Designated members of the Commissioning Team shall witness system start-up and list system and equipment deficiencies noted during start-up. The Subcontractor shall take corrective action on system deficiencies noted and demonstrate to the Commissioning Team members suitable system operation.
 - 3. Designated systems requiring test and balance work shall have this activity commence after systems have successfully completed start-up. System and equipment deficiencies observed during this activity is to be noted and corrected.

3.19 STEP THREE - FUNCTIONAL PERFORMANCE TESTING

- A. General Commissioning Responsibilities:
1. Functional Performance Testing begins after operational testing, adjusting, and balancing of the systems have been completed by the Subcontractors; and the System Description and Hands-on Training sessions have been completed.
 2. The objective of the Functional Performance Testing is to advance the building systems from a state of substantial completion to full dynamic operation in accordance with the specified design requirements and design intent.
 3. Attaining this object will be accomplished by developing individual systems testing protocols which, when implemented by the Subcontractor, will allow the Commissioning Team to observe, evaluate, identify deficiencies, recommend modifications, tune, and document the systems and systems equipment performance over a range of load and functional levels.
 4. Functional Performance tests for the systems to be commissioned are defined in the Commissioning Plan. These tests are intended to be conclusive but may require minor modifications as system operation dictates.

3.20 DEFERRED TESTING

- A. Unforeseen Deferred Tests – If any inspection or test cannot be completed due to the building structure, required occupancy condition or other deficiency, execution of inspections and functional testing may be delayed upon approval of the PM or City of New York. These tests will be conducted in the same manner as the seasonal test as soon as possible. Services of necessary parties will be negotiated.
- B. Seasonal Testing – During the warranty period, seasonal testing (tests delayed until weather conditions are closer to the system’s design) shall be completed as part of this contract. The CxA shall coordinate this activity. Tests will be executed, documented and deficiencies corrected by the appropriate CTRs, with facilities staff and the CxA witnessing. Any final adjustments to the O&M manuals and as-builts due to the testing will be made.

END OF SECTION 230800

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 230900

INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 WORK INCLUDED

- A. Furnish a totally native BACnet-based system, including an operator's workstation using Microsoft Windows 2000 Professional or XP Professional as the operating system and shall be based on a distributed control system in accordance with this specification. The operator's workstation, all building controllers, application controllers, and all input/output devices shall communicate using the protocols and network standards as defined by ANSI/ASHRAE Standard 135-2001, BACnet. In other words, all workstations and controllers, including unitary controllers, shall be native BACnet devices. No gateways shall be used for communication to controllers installed under this section. Gateways may be used for communication to existing systems or to systems installed under other sections. Provide all necessary BACnet-compliant hardware and software to meet the system's functional specifications. Provide Protocol Implementation Conformance Statement (PICS) for Windows-based control software and every controller in system, including unitary controllers.
- B. Prepare individual hardware layouts, interconnection drawings, and software configuration from project design data.
- C. Implement the detailed design for all analog and binary objects, system databases, graphic displays, logs, and management reports based on control descriptions, logic drawings, configuration data, and bid documents.
- D. Provide and install all equipment cabinets, panels, data communication network cables needed, and all associated hardware.
- E. Provide and install all interconnecting cables between supplied cabinets, application controllers, and input/output devices.
- F. Provide and install all power wiring to control panels and control devices requiring power.
- G. Provide interconnecting control wiring for mechanical, electrical and plumbing systems as specified herein.

- H. Provide complete manufacturer's specifications for all items that are supplied. Include vendor name of every item supplied.
- I. Provide supervisory specialists and technicians at the job site to assist in all phases of system installation, startup, and commissioning.
- J. Provide a comprehensive operator and technician instruction program as described herein. Contractor to provide two weeks' notice to the City of New York and commissioning agent for the date of all instruction for all systems.
- K. Provide as-built documentation, full sequence of operations, operator's interface head end PC software, dedicated workstation, diagrams, and all other associated project operational documentation (such as technical manuals) on approved media, the sum total of which accurately represents the final system.
- L. Provide new sensors, dampers, valves, and install only new electronic actuators. No used components shall be used as any part or piece of installed system.
- M. All standard, devices and system set up shall conform to City of New York procedures and standards.

1.3 SYSTEM DESCRIPTION

- A. A distributed logic control system complete with all software and hardware functions shall be provided and installed. System shall be completely based on ANSI/ASHRAE Standard 135-2001, BACnet. This system is to control all mechanical equipment, including all unitary equipment such as electric duct heaters, AC units, etc. and all air handlers, boilers, chillers, and any other listed equipment using native BACnet-compliant components. Non-BACnet-compliant or proprietary equipment or systems (including gateways) shall not be acceptable and are specifically prohibited.
- B. Operator's workstation software shall be Microsoft Windows 2000 Professional or XP Professional as the computer operating system. The Energy Management and Control System (EMCS) application program shall be written to communicate specifically utilizing BACnet protocols. Software functions delivered on this project shall include password protection, scheduling (including optimum start), alarming, logging of historical data, full graphics including animation, after-hours billing program, demand limiting, full suite of field engineering tools including graphical programming and applications. Systems using operating systems other than that described above are strictly prohibited. All software required to program application specific controllers and all field level devices and controllers will be left with the City of New York. All software passwords required to program and make future changes to the system will also become the property of the City of New York. All software required to make any program changes anywhere in the system along with scheduling, and trending applications will be left with the City of New York. All software passwords required to program and make future changes to schedules, trends and related program changes will also become the property of the City of New York. All software required for all field engineering tools including graphical programming and applications will be left with the City of New York. All software passwords required to program and make future

changes to field engineering tools including graphical programming and applications will be left with the City of New York.

- C. Building controllers shall include complete energy management software, including scheduling building control strategies with optimum start and logging routines. All energy management software and firmware shall be resident in field hardware and shall not be dependent on the operator interface panel. Operator interface panel software is to be used for access to field-based energy management functions only. Provide zone-by-zone direct digital logic control of space temperature, scheduling, runtime accumulation, equipment alarm reporting, and override timers for after-hours usage.
- D. All application controllers for every terminal unit (AC Unit, etc.) air handler, all central plant equipment, and any other piece of controlled equipment shall be fully programmable. Application controllers shall be mounted next to controlled equipment and communicate with building controller via BACnet LAN.
- E. Room sensors shall be provided with digital readout that allows the user to view room temperature, view outside air temperature, adjust the room setpoint within preset limits and set desired override time. User shall also be able to start and stop unit from the digital sensor. Include all necessary wiring and firmware such that room sensor includes field service mode. Field service mode shall allow technician to balance VAV zones and access any parameter in zone controller.
 - 1. All control equipment used to perform any or all of the specified smoke control sequences shall be UL-864 UUKL listed. This includes all field controllers and global control devices. Non UUKL rated equipment shall not be networked to any devices on the network performing smoke control sequences unless isolated by a UUKL rated device. See drawings for actual sequence of operations.

1.4 APPROVED MANUFACTURER

- A. Johnson Controls by HTSny
- B. Alerton
- C. Siemens
- D. Approved equal

1.5 QUALITY ASSURANCE

- A. The Building Management System (BMS) shall be engineered and installed, commissioned and serviced by factory trained personnel. BMS contractor shall have an in-place support facility within 2 hours response time of the site with technical staff, spare parts inventory and necessary test and diagnostic equipment.
- B. The BMS contractor shall provide full time, on site, experienced project manager for this work, responsible for direct supervision of the design, installation, start up and commissioning of the BMS system.

- C. The Installer shall be regularly engaged in the installation and maintenance of BMS systems and shall have demonstrated technical expertise and experience in the installation and maintenance of BMS systems similar in size and complexity to this project. Installers shall provide projects, similar in size and scope to this project completed within the past 3 years.
- D. Materials and equipment shall be the catalogued products of manufacturers regularly engaged in production and installation of automatic temperature control systems and shall be manufacturer's latest standard design that complies with the specification requirements.
- E. All BMS peer-to-peer network controllers, central system controllers and local user displays shall be UL Listed under Standard UL 916, category PAZX.
- F. All electronic equipment shall conform to the requirements of FCC Regulation, Part 15, Governing Radio Frequency Electromagnetic Interference and be so labeled.

1.6 REFERENCE STANDARDS

- A. The latest edition of the following standards and codes in effect and amended as of supplier's proposal date, and any applicable subsections thereof, shall govern design and selection of equipment and material supplied:
 - 2. American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
 - 3. ANSI/ASHRAE Standard 135-2001, BACnet.
 - 4. Uniform Building Code (UBC), including local amendments.
 - 5. UL 916 Underwriters Laboratories Standard for Energy Management Equipment. Canada and the US.
 - 6. National Electrical Code (NEC).
 - 7. FCC Part 15, Subpart J, Class A
 - 8. EMC Directive 89/336/EEC (European CE Mark)
 - 9. UL-864 UUKL listing for Smoke Controls for any equipment used in smoke control sequences
 - 10. City, county, state, and federal regulations and codes in effect as of contract date.
- B. Except as otherwise indicated the system supplier shall secure and pay for all permits, inspections, and certifications required for his work and arrange for necessary approvals by the governing authorities.

1.7 SUBMITTALS

- A. Drawings
- B. The system supplier shall submit engineered drawings, control sequence, and bill of materials for approval.
- C. Drawings shall be submitted in the following standard sizes: 11" x 17" (ANSI B).
- D. Eight complete sets (copies) of submittal drawings shall be provided.
- E. Drawings shall be available on CD-ROM.
- F. System Documentation
 - 1. Include the following in submittal package:
 - 2. System configuration diagrams in simplified block format.
 - 3. All input/output object listings and an alarm point summary listing.
 - 4. Electrical drawings that show all system internal and external connection points, terminal block layouts, and terminal identification.
 - 5. Complete bill of materials, valve schedule and damper schedule.
 - 6. Manufacturer's instructions and drawings for installation, maintenance, and operation of all purchased items.
 - 7. Overall system operation and maintenance instructions—including preventive maintenance and troubleshooting instructions.
 - 8. For all system elements—operator workstation, building controller(s), application controllers, routers, and repeaters,—provide BACnet Protocol Implementation Conformance Statements (PICS) as per ANSI/ASHRAE Standard 135-2001.
 - 9. Provide complete description and documentation of any proprietary (non-BACnet) services and/or objects used in the system.
 - 10. A list of all functions available and a sample of function block programming that shall be part of delivered system.
- G. Project Management
 - 1. The vendor shall provide a detailed project design and installation schedule with time markings and details for hardware items and software development phases. Schedule shall show all the target dates for transmission of project information and documents and shall indicate timing and dates for system installation, debugging, and commissioning.

H. BACnet Device Object Naming Conventions

1. The BMS manufacturer's representative shall submit a BACnet Device Object Naming Convention Plan (DONCP) to the City of New York and consulting engineer during the submittal process. The plan must be approved by the Commissioner and consulting engineer prior to implementation. It is the responsibility of the BMS contractor to coordinate the DONCP with the Commissioner and consulting engineer.
2. The DONCP shall be designed to eliminate any confusion between individual points in a facility/campus wide EMCS system. It will also be designed to allow for future expansion and consistency. Each device on a BACnet internetwork (including other manufacturer's devices) must have a unique device instance. This is a major consideration when adding to an existing system or interconnecting networks. Thorough and accessible site documentation is critical.
3. A consistent object (point) naming convention shall be used to facilitate familiarity and operational ease across an eventual large campus or inventory of facilities. The following section is designed as recommendations only. It is the responsibility of the BMS contractor to coordinate the DONCP with the Commissioner and consulting engineer.
4. BACnet requires that all devices have a Device object name that is unique throughout the entire work. To comply with this requirement all BACnet devices should be configured with a Device Object Name that is based on the naming conventions described in this section. This includes all physical devices as well as any logical BACnet devices that are represented by gateways. The vendor shall coordinate with the Commissioner's staff to ensure that the correct names are used. Device Object Name properties shall support strings of at least 50 characters in length.
5. Network numbers - Identifies the network to which a BACnet device belongs. Every network on a BACnet LAN has a unique numerical identifier—a network number. This network number is used by BACnet devices only; it does not rely on nor does it affect any other network protocols. LANs connected by a router must have different network numbers. No interconnected BACnet networks can have the same network number. Network number range is 1–65534, for a maximum of 65534 interconnected BACnet networks.
6. MAC addresses - Hardware-oriented. The MAC address uniquely identifies a device on its particular network. Each network type—Ethernet and MS/TP—has its own MAC addressing scheme. A device that exists on two or more networks will have a MAC address for each one. Devices can have the same MAC addresses as long as they are on networks with different network numbers.
7. Ethernet devices - For Ethernet LANs, the IEEE assigns a certain range of MAC addresses to manufacturers of Ethernet products. Manufacturer then assigns a unique MAC address to each of its Ethernet devices.
8. MS/TP devices - For devices on an MS/TP LAN, you assign the MAC address for each controller. For BACTalk VLCs, these are assigned with DIP switches. Devices on an MS/TP LAN are designated as either masters or slaves, which

affects how they can be addressed. This is a requirement of the BACnet specification. All BACtalk MS/TP devices are masters.

9. Device instances - Software-oriented. The device instance identifies the device to the BACnet software and is the address most often encountered. The device instance is a shortcut to having to specify a MAC address and network number each time an operation is performed. Device instances range from 0–4194302.

1.8 GUARANTEE

- A. Guarantee shall cover all costs for labor, associated travel, and expenses for a period of one year from completion of system acceptance.
- B. Hardware and software personnel supporting this guarantee agreement shall provide on-site or off-site service in a timely manner after failure notification to the vendor. The maximum acceptable response time to provide this service at the site shall be 24 hours Monday through Friday, 48 hours on Saturday and Sunday.
- C. This guarantee shall apply equally to both hardware installed by this labor and software.

1.9 RELATED WORK IN OTHER SECTIONS

- A. Refer to DDC General Conditions for related contractual requirements.
- B. Refer to Section 230100 for General Mechanical Provisions
- C. Refer to Section 260500 for General Electrical Provisions

PART 2 - PRODUCTS

2.1. NETWORK ARCHITECTURE

- A. Building Intranet Network
 1. The BMS contractor shall be responsible for installation of primary and secondary LAN's required to support the complete BMS system. The Operator Workstation for the building shall be located as advised by the Commissioner.
- B. BACnet Primary LAN
 1. Primary LAN for the building automation system shall consist of a high speed network utilizing BACnet over Ethernet or BACnet/IP. The Primary LAN shall be used for communications between BACnet B-BC devices, B-AAC devices, B-ASC devices, and the Operator Workstation.
- C. BACnet Secondary LAN
 1. A secondary LAN, separate from the Primary LAN shall be used for communications between B-ASC devices and the B-BC or B-AAC that provides BACnet router services for the device. The Secondary LAN shall utilize BACnet MS/TP for communications. The intent of the separate Primary LAN and

Secondary LAN is to isolate traffic between B-BC's or B-AAC's and their associated B-ASC devices from the primary LAN.

2.2 BROWSER BASED OPERATOR INTERFACE

- A. The system shall be capable of supporting an unlimited number of clients using standard Web browser such as Internet Explorer. Systems requiring additional software (to enable a standard Web browser) to be resident on the client machine, or manufacture-specific browsers shall not be acceptable.
- B. The Web browser software shall run on any operating system and system configuration that is supported by the Web browser. Systems that require specific machine requirements in terms of processor speed, memory, etc., in order to allow the Web browser to function with the Building Automation System (BAS), shall not be acceptable.
- C. The Web browser client shall support at a minimum, the following functions:
 - 1. User log-on identification and password shall be required. If an unauthorized user attempts access, notice of access failure shall be displayed. Security using authentication and encryption techniques to prevent unauthorized access shall be implemented.
 - 2. HTML programming shall not be required to display system graphics or data on a Web page. HTML editing of the Web page shall be allowed if the user desires a specific look or format.
 - 3. Storage of the graphical screens shall be in the Network Area Controller (NAC), without requiring any graphics to be stored on the client machine. Systems that require graphics storage on each client are not acceptable.
 - 4. Real-time values displayed on a Web page shall update automatically without requiring a manual "refresh" of the Web page.
 - a) Users shall have administrator-defined access privileges. Depending on the access privileges assigned, the user shall be able to perform the following:
 - 5. Modify common application objects, such as schedules and setpoints in a graphical manner.
 - 6. Commands binary objects to start and stop.
 - 7. View logs and charts.
 - 8. View alarms.
 - 9. Graphic screens on the Web Browser client shall support hypertext links to other locations on the Internet or on Intranet sites, by specifying the Uniform Resource Locator (URL) for the desired link.
- D. Alarms
 - 1. Alarm feature shall allow user configuration of criteria to create, route, and manage alarms and events. It shall be possible for specific alarms from specific points to be routed to specific alarm recipients. The alarm management portion of the user interface shall, at the minimum, provide the following functions:

- a. Allow configuration to generate alarms on any numeric, binary, or data point in the system.
- b. Generate alarm records that contain a minimum of a timestamp, original state, acknowledged state, alarm class and priority.
- c. Allow the establishment of alarm classes that provide the routing of alarms with similar characteristics to common recipients.
- d. Allow a user, with the appropriate security level, to manage alarms - including sorting, acknowledging, and tagging alarms.

E. Reports and Summaries

- 1. Reports and Summaries shall be generated and directed to the user interface displays, with subsequent assignment to printers, or disk. As a minimum, the system shall provide the following reports:
 - a. All points in the BAS
 - b. All points in each BAS application
 - c. All points in a specific controller
 - d. All points in a user-defined group of points
 - e. All points currently in alarm
 - f. All BAS schedules
 - g. All user defined and adjustable variables, schedules, interlocks and the like.
- 2. Reports shall be exportable to .pdf, .txt, or .csv formats.
- 3. The system shall allow for the creation of custom reports and queries.

11.

F. Schedules

- 1. A graphical display for time-of-day scheduling and override scheduling of building operations shall be provided. At a minimum, the following functions shall be provided:
 - a. Regular schedules
 - b. Repeating schedules
 - c. Exception Schedules
- 2. Weekly schedules shall be provided for each group of equipment with a specific time use schedule.
- 3. It shall be possible to define one or more exception schedules for each schedule including references to calendars
- 4. Monthly calendars shall be provided that allow for simplified scheduling of holidays and special days. Holidays and special days shall be user-selected with the pointing device or keyboard.

G. Password

- 1. Multiple-level password access protection shall be provided to allow the user/manager to user interface control, display, and database manipulation capabilities deemed appropriate for each user, Based on an assigned password.

2. Each user shall have the following: a user name, a password, and access levels.
3. The system shall provide the capability to require a password of minimum length and require a combination of characters and numerical or special characters.
4. When entering or editing passwords, the system shall not echo the actual characters for display on the monitor.
5. The system shall provide unlimited flexibility with access rights. A minimum of four levels of access shall be provided along with the ability to customize the system to provide additional levels.
6. A minimum of 100 unique passwords shall be supported.
7. Operators shall be able to perform only those commands available for their respective passwords. Display of menu selections shall be limited to only those items defined for the access level of the password used to log-on.
8. The system shall automatically generate a report of log-on/log-off and system activity for each user.
9. All log data shall be available in .pdf, .txt, and .csv formats.
5. Weekly schedules shall be provided for each group of equipment with a specific time use schedule.
6. It shall be possible to define one or more exception schedules for each schedule including references to calendars
7. Monthly calendars shall be provided that allow for simplified scheduling of holidays and special days. Holidays and special days shall be user-selected with the pointing device or keyboard.

H. Dynamic Color Graphics

1. The graphics application program shall be supplied as an integral part of the User Interface.
2. The graphics applications shall include a create/edit function and a runtime function. The system architecture shall support an unlimited number of graphics documents (graphic definition files) to be generated and executed.
3. The graphics shall be able to display real-time data that is acquired, derived, or entered.
4. Graphics runtime functions –Each graphic application shall be capable of the following functions:
 - a. All graphics shall be fully scalable
 - b. The graphics shall support a maintained aspect ratio.
 - c. Multiple fonts shall be supported.

- d. Unique background shall be assignable on a per graphic basis.
 - 5. Operation from graphics – It shall be possible to change values (setpoints) and states in systems controlled equipment within the Web browser interface.
 - 6. Graphic editing tool – A graphic editing tool shall be provided that allows for the creation and editing of graphic files. The graphic editor shall be capable of performing/defining all runtime binding.
- I. Historical Data Collection
 - 1. All numeric, binary or data points in the system database shall allow their values to be logged over time (trend log). Each historical record shall include the point's name, a time stamp including time zone, and the point's value.
 - 2. The configuration of the historical data collection shall allow for recording data based on change of value or on a user-defined time interval.
 - 3. The configuration of the historical data collection shall allow for the collection process to stop or rollover when capacity has been reached.
 - 4. A historical data viewing utility shall be provided with access to all history records. This utility shall allow historical data to be viewed in a table or chart format.
 - 5. The history data table view shall allow the user to hide/show columns and to filter data based on time and date. The history data table shall allow exporting to .txt, .csv, or .pdf file formats.
 - 6. The historical data chart view shall allow different point histories to be displayed simultaneously, and also provide panning and zooming capabilities.
 - J. Audit Log
 - 1. For each log entry, provide the following data;
 - 2. Time and date
 - 3. User ID
 - 4. Change or activity: i.e., Change setpoint, add or delete objects, commands, etc.
 - K. Database Backup and Storage
 - 1. The user shall have the ability to backup the System Controller databases.

2.3 BUILDING CONTROLLERS

A. BACnet Devices

1. Network Area Controller (NAC)

a The NAC must provide the following hardware features as a minimum:

- 1) Communications
 - a) One 10/100 Mb Ethernet Port – RJ-45 connection
 - b) One RS-232 port
 - c) One RS-485 port (up to 57,600 baud)
 - d) Optional internal auto-dial/auto-answer 56K modem. All required protocol drivers are included.
- 2) Inputs/Outputs
 - a) Four form C SPDT relay outputs rated for 24 VAC/DC @ 2Amps resistive each with individual LED indicators
 - b) Six Universal Inputs for 10K NYC, 4-20 mA, 1-10 V, Dry contact
- 3) Battery Backup
 - a) Battery backup provided for all on board functions including I/O
 - b) Battery is monitored and trickle charged
 - c) Battery maintains processor operation through power failures for a pre-determined interval, and then writes all data to flash memory, shuts the processor down, and maintains the clock for five years.
- 4) Environment
 - a) Must be capable of operation over a temperature range of 0°C to 55°C.
 - b) Must be capable of withstanding storage temperatures of between 0°C and 70°C.
 - c) Must be capable of operation over a humidity range of 5% to 95% RH, non-condensing
- 5) Performance
 - a) Supports up to 100 devices.

2. The Network Area Controller (NAC) shall be a fully user-programmable device capable of providing all of the capability described in Section 2.3 Part A.

a Automation network – The Network Area Controller (NAC) shall reside on the automation network. Each NAC shall support one or more sub-networks of controllers.

b User Interface – Each Network Area Controller (NAC) shall have the ability to deliver a web based user interface as previously described. All computers connected physically or virtually to the automation network shall have access to the web based UI.

c Power Failure – In the event of the loss of normal power, The Network Area Controller (NAC) shall continue to operate for a define period after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software. Flash memory shall be incorporated for all critical controller configuration data.

d During a loss of normal power, the control sequences shall go to the normal system shutdown conditions.

e Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.

f Certification – All controllers shall be listed by Underwriters Laboratories (UL).

3. Advanced Application Controller

a Control of AO's and BO's and monitoring of AI's and BI's are permitted on devices that conform to the requirements for the BACnet Advanced Application Controller (B-AAC) as identified in ASHRAE Standard 135. B-ASC's shall be provided with all supporting BACnet services as a local function. The device shall not depend upon any other devices for the functionality of schedule or alarm activities. Alternatively, the B-ASC's or B-BC's that the device is dependent upon shall utilize an Uninterruptible Power Supply (UPS). A single piece of equipment shall utilize a single controller. Control functions for a single piece of equipment may not be divided among controllers.

4. Application Specific Controllers

a Control of AO's and BO's and monitoring of AI's and BI's are permitted on devices that conform to the requirements for the BACnet Application Specific Controller (B-ASC) as identified in ASHRAE Standard 135. Where B-ASC's are utilized, any supporting B-BC or B-ASC must be provided with an Uninterruptible Power Supply (UPS) to avoid any unintentional loss in the support of BACnet services due to a power outage for the B-BC while the B-ASC is functional.

5. Gateways

a Gateways between BACnet and any other protocols shall not be allowed for this project.

6. Smart Sensor/Actuator

a BACnet Smart sensors (B-SS) and actuators (B-SA) shall not be permitted for use on this project. All system I/O must be connected directly to a B-AAC or B-ASC device.

2.4 SENSORS AND MISCELLANEOUS DEVICES

A. General - Field Devices

1. The project that is the subject of this specification may not require all types of hardware listed in this section.
2. Provide field devices for input and output of digital (binary), and analog, signals into BACnet devices. Provide signal conditioning and/or filtering for all field devices as recommended by field device manufacturers, and as required for proper operation of the system.
3. It the responsibility of the building automation contractor to provide equipment as identified in this specification section. This section may identify devices which are not required to be provided in the scope of this project (i.e. The ep transducer is included in this section, but may not be required on a project where all electric controls are found).
4. It shall be this building automation contractor's responsibility to assure that all field devices are compatible with the controllers to be used on the project.
5. Transmitters specified herein are generally 4-20 ma "two-wired" type transmitters, with power for the device expected to be supplied from the transformer powering the controller.
6. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, the building automation contractor shall furnish and install proper device. Such devices shall have accuracy equal to, or better than, the accuracy listed for respective field devices.
7. Accuracy, as stated in this section, shall include combined effects of non-linearity, non-repeatability and hysteresis.

B. Temperature Sensors

1. Sensor range: when matched with a/d converter of the controller, sensor range shall provide a resolution of no larger than .4°f (unless noted otherwise).
2. Room temperature sensor shall be an element contained within a ventilated cover, suitable for wall mounting. Sensors located in mechanical areas, plenums, garages, or designated institutional locations shall be a flat plate sensor with no possible adjustment. Security screws shall be used in institutional settings as deemed necessary by the design engineer. The building automation contractor shall coordinate requirements with the design engineer during the submittal process. Provide an insulated base when used on an outside wall, on an interior wall within 18 inches of an outside wall, or on a wall adjacent to an unconditioned space. The following sensing elements are acceptable:
 - a. Sensing element - platinum RTD, thermistor, or integrated circuit, +/- 0.8°F accuracy at calibration point.

C. Intelligent room sensor with LCD readout

1. Sensor shall contain a backlit LCD digital display and user function keys along with temperature sensor. Controller shall function as room control unit, and shall allow occupant to raise and lower setpoint, and activate terminal unit for override use—all within limits as programmed by building operator. Sensor shall also

allow service technician access to hidden functions as described in sequence of operation.

2. Intelligent room sensor shall simultaneously display room setpoint, room temperature, outside temperature, and fan status (if applicable) at each controller. This unit shall be programmable, allowing site developers the flexibility to configure the display to match their application. The site developer should be able to program the unit to display time-of-day, room humidity and outdoor humidity. Unit must have the capability to show temperatures in Fahrenheit or Centigrade.
3. Override time may be set and viewed in half-hour increments. Override time count down shall be automatic, but may be reset to zero by occupant from the sensor. Time remaining shall be displayed. Display shall show the word "off" in unoccupied mode unless a function button is pressed.
4. See sequence of operation for specific operation of LCD displays and function keys in field service mode and in normal occupant mode. Provide intelligent room sensors as specified in point list.
5. Field service mode shall be customizable to fit different applications. If intelligent room sensor is connected to vav controller, VAV box shall be balanced and all air flow parameters shall be viewed and set from the intelligent room sensor with no computer or other field service tool needed.

D. Single point duct temperature sensor

1. Single point duct temperature sensor shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise. Temperature range as required for resolution indicated in paragraph (a) below. Sensor probe shall be 300 or 400 series corrosion resistant steel (cres).
2. Sensing element - platinum RTD, thermistor, or integrated circuit, +/- 0.8°F accuracy at calibration point.

E. Single point duct temperature sensor

1. Averaging duct temperature sensor shall consist of an averaging element, junction box for wiring connections and gasket to prevent air leakage. Provide enough sensors to give one lineal foot of sensing element for every three square feet of cooling coil face area. Temperature range as required for resolution indicated in paragraph (2) below.
2. Sensing element - platinum RTD, thermistor, or integrated circuit, +/- 0.8°F accuracy at calibration point.

F. Liquid immersion temperature sensor

1. Liquid immersion temperature sensor shall include stainless steel (or brass for copper piping) thermo well, sensor and connection head for wiring connections.

2. Sensing element for chilled water applications - platinum RTD, thermistor, or integrated circuit, +/- 0.8°F accuracy at calibration point. Temperature range shall be as required for resolution indicated in paragraph 3.
3. Sensing element for non-chilled water applications - platinum rtd, +/- 0.2°F accuracy at calibration point. Temperature range shall be as required for resolution of no worse than 0.1°F.

G. Outdoor air condition sensor

1. Outside air temperature and humidity station shall consist of a single device with a ventilated non-metallic sun shield, utility box for terminations, and water tight gasket to prevent water seepage. These devices shall be mounted at least 10 feet above ground level in a north-facing location that is not exposed to the draft from an exhaust fan, cooling tower exhaust, AHU relief air, flue vent from a gas combustion heater, or any source of conditioned air. In the event a suitable wall mounting location cannot be found, the devices may be mounted in an open location provided they are supplied with a housing intended for mounting in such a location. Temperature range shall be as required for resolution indicated in paragraphs (a) and (b) below.
2. Sensing element - platinum RTD, thermistor, or integrated circuit, +/- 0.4°F temperature accuracy at calibration point.
3. Accuracy (% rh): +/- 3% 0-100% rh at 68°F, including hysteresis, linearity and repeatability.

H. Humidity transmitters

1. Units shall be suitable for duct, wall (room) or outdoor mounting. Unit shall be two-wire transmitter utilizing bulk polymer resistance change or thin polymer film capacitance change humidity sensor. Unit shall produce linear continuous output of 4-20ma for percent relative humidity (% rh). Sensors shall have the following minimum performance and application criteria:
2. Input range: 0 to 100% RH
3. Accuracy (% RH): +/- 2% 0-100% RH at 68°F, including hysteresis, linearity and repeatability.

I. Differential pressure sensor, air

1. The differential pressure sensor for air applications shall provide a current or voltage signal (4-20 ma, 0-10 vdc, or 0-5 vdc) with an accuracy of +/- 1% fs (including non-linearity, hysteresis, and non-repeatability). Accuracy for pressure sensors used in flow measurement applications shall be +/- 0.5%. Operating temperature range and compensated temperature range shall be as appropriate for the temperature extremes of the environment where it is used and the application it is intended for.

J. Differential pressure sensor, water

1. Sensor shall be two-wire 4-20 ma output kele & associates model 160c with a 5-valve manifold (kele bva-5) or a similar sensor and manifold from veris industries.

K. Fluid flow meters

1. Differential pressure-sensing insertion style flow meters (air or water) or dual-turbine impeller style insertion flow meters shall be used to monitor flow. The insertion style liquid flow sensors shall be as manufactured by Rosemount (Annubar) or Onicon (f-1210 or f-1211). Air flow sensing tubes may be mounted in the fan inlet as approved by the manufacturer for AHU applications.
2. as an alternative; provide non intrusive flow measuring device similar to ultra sonic Controlotron meters model 1010. refer to manufacturer for recommendation installation, control and accessories.

L. Airflow Measuring Stations

1. Airflow measuring stations required to accomplish the specified control sequence shall be furnished under this section but installed under the sheet metal section. Airflow measuring stations shall be of heavy gauge metal construction, and shall be furnished with an air straightening section with an open face area of not less than 97%.
2. Each airflow measuring station shall measure airflow by means of a network of static and total pressure sensors factory positioned and connected in parallel to produce an averaged velocity pressure. The measured velocity pressure converted to airflow (CFM) shall have an accuracy of 2% of the full scale throughout the velocity range from 700 to 4,000 FPM when measured under ideal laboratory conditions. The location of stations shall meet manufacturer's guidelines.
3. The maximum resistance to airflow shall not exceed 0.6 times the velocity head. The unit shall be suitable to withstand temperatures up to 250°F.
4. All interconnecting tubing between the air measuring and any remote metering or control shall be furnished and installed by the supplier of the station. A minimum of one static and one total pressure sensor shall be used for every 16 sq. Inches of duct cross sectional area for ducts up to four sq.ft. In cross section. For larger ducts, a minimum of one static and one total pressure sensor shall be used for every 36 sq. Inches of duct cross sectional area.
5. Interconnecting sensor manifolds shall equalize and relate each type of sensor measurement into one total pressure and one static pressure metering port. The permanent system pressure loss created by the unit shall not exceed .15 of a velocity head. Each airflow measuring station shall consist of 16-gauge sheet metal casing and an air straightening section with an open face area not less than 97%. The sheet metal contractor shall install air measuring stations.

6. Provide air monitor Fan-E or equal with an accuracy of + 2%, a turndown of 6 to 1, and no pressure loss across the station.
7. Final locations to be coordinated with sheet-metal contractor and manufacturer to ensure installed actual accuracy meets specifications.

M. Current switches

1. Current switch (input only) shall consist of 0 to 135 a continuous amperage rating, adjustable trip set-point to +/- 1% of range, .1a @ 110 vac resistive rating. Direct drive motors are permitted to utilize a current switch without an adjustable setpoint. Non direct-drive motors shall utilize a device with an adjustable setpoint as well as status and power led indication.
2. Current switch and load control relay (input/output device) shall consist of 0 to 135 a continuous amperage rating current switch, adjustable trip set-point to +/- 1% of range, .1a @ 110 vac resistive rating. Load control relay shall be capable of 5a @ 240 vac resistive. The device shall have adjustable trip setpoint as well as status, power, and relay command status led indication.
3. Current switches for VFD-controlled loads shall be specifically designed for this purpose. A Veris H-934 or approved equivalent device shall be used.

N. Damper end switch

1. Damper end switches shall be devices that directly detect the desired position of the damper blades. The switch shall not be a component of the actuator nor shall it be mounted on the damper shaft. The end switch shall be as manufactured by square d, Allen Bradley, cutler hammer, or approved equal.

O. Air Differential Pressure Switch

1. Air differential pressure switches shall be diaphragm type, die-cast aluminum housing, adjustable set point, with a SPDT switch. Rating shall be a minimum of 5 amps at 120 vac. Switch pressure range shall be suited for the application. Provide Dwyer or equal.

P. Low Temperature Detector (Freeze-Stat)

1. Low temperature detector (LTD) shall be automatic reset, DPDT type. LTD shall be installed in a serpentine fashion across the coil in the air stream in accordance with the manufacturer's recommendations. Element shall be arranged to lock out the associated fan should the temperature at any point along the sensing element fall below 35 °f for an adjustable time period.

Q. Single Point Leak Detector

1. Provide Liebert It-410 or equal. The alarm module shall indicate that water has contacted the sensors by actuating two output relays. The relays shall remain activated until the module is reset.

R. Zone Leak Detector

1. Provide Liebert It-460 or equal. The alarm module shall indicate that water has contacted the sensors cable by actuating two output relays. The relays shall remain activated until the module is reset.

S. Carbon Dioxide Sensor

1. Sensor shall employ non-dispersive infrared technology. (N.D.I.R.)
2. Sensor repeatability shall be +/- 20 ppm +/- 1% of measured value.
3. Sensor accuracy shall be +/- 30ppm +/-5% of measured value.
4. Sensor response time shall be less than 1 minute.
5. Sensor shall employ reference channel design for long-term stability.
6. Sensor shall have field selectable 0-10vdc, 0-5vdc, or 4-20ma output.
7. Sensor power requirement shall be less than 3w.
8. Sensor input voltage shall be 20 to 30vac/dc.
9. Sensor operating temperature range shall be 32oF to 122oF.
10. Sensor shall be Johnson Controls model CDL or equal.
11. Sensor shall have a field programmable set-point relay.

T. Room Pressure Monitor

1. The room pressure monitoring system shall be as described below:
2. Acceptable Manufacturers: Tek-Air Systems, Inc., Iso-Tek room pressure monitor, TSI Incorporated Model 8630-SM PRESSURA Room Pressure Monitor or equal.
3. The system shall include the Room Pressure Monitor, sensing probes, special cables, and special mounting hardware as required.

U. Room Pressure Monitor;

1. Shall consist of a transmitter module and two sensing probes. The transmitter module shall be mounted above the ceiling line, in the corridor adjacent to the room to be monitored.
2. Room sensing probes shall be mounted adjacent to the doorway. Reference probes shall be mounted in the hallway.

3. The transmitter module shall be microprocessor based and shall include the air velocity sensor. The transmitter module shall be powered by 24VAC. It shall be provided with a 4-20mA analog output, a SPDT alarm relay output.
4. The pressure sensor shall accurately measure room pressure from -0.20000 to +0.20000 inches H₂O. The sensor shall be accurate to 2% of range. The sensor shall be bi-directional to determine the proper direction of pressure.
5. The transmitter module shall be provided with two wire communications for interface to the BMS via an open protocol. The controller shall be capable of communicating the transfer air velocity, high and low alarm conditions, and high and low alarm settings to a remote digital system. The BMS shall be capable of transmitting high and low alarm set points.

V. Room Alarm Status Display;

1. A wall mounted display module shall be provided to alert staff to the presence of an unsafe pressure condition. The display module shall incorporate lights to indicate the following conditions:
2. Red - ALARM conditions. Red shall indicate the pressure is outside of alarm tolerances, the current flow direction, and relative magnitude.
3. Green - NORMAL or safe pressure condition. Green shall indicate the pressure is within alarm tolerances.
4. The module shall have an audible alarm horn and an alarm mute (acknowledge) button.
5. Alarm limits shall be capable of being set at the display module.
6. An audible alarm horn shall be provided. When an alarm condition occurs and exceeds the selected time delay period, the alarm horn shall sound. Personnel may then silence the horn by pressing the Mute button.
7. The display module shall be capable of being mounted on a standard, 4"x 4" handi-box, and shall include tamper proof screws for mounting. The monitor shall be capable of being mounted up to 50 feet from the transmitter module.

W. Electric control components

1. Limit switches (LS): limit switches shall be UL listed, with adjustable trim arm. Limit switches shall be as manufactured by Square "D", Allen Bradley or approved equal; SPDT or DPDT type.
2. Control relays: all control relays shall be UL listed, with contacts rated for the application, and mounted in minimum Nema 1 enclosure.
3. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:

4. Poles – relays having a single pole or single-throw type shall not be used. Relays shall be double-throw type with a minimum of two poles.
5. Relays shall incorporate an led that indicates when the relay coil is energized.
6. Ac coil pull-in voltage range of +10%, -15% or nominal voltage.
7. Coil – sealed, with required volt amperes (va) not greater than four (4) va.
8. Silver cadmium form c (SPDT) contacts in a dust-proof enclosure, with 8 or 11 pin or spade type plug.
9. Pilot light indication of power-to-coil shall be provided for relays installed remotely from the controlling device.
10. Relays shall be Allen Bradley - model 700hk, Idec RH-series or approved equal.
11. Relays used for remote start/stop control of motors and shall have a current rating at least 1.5 times full load amps of the load it is controlling. In addition to the relays specified above, the functional devices ribulc is also permitted for use here.
12. Relays used for stop/start control shall have low voltage coils (30 vac or less), and shall be provided with transient and surge suppression devices at the controller interface.
13. Control transformers: furnish and install control transformers as required. Control transformers shall be machine tool type, and shall be us and CSA listed. Primary and secondary sides shall be fused in accordance with the NEC. Transformer shall be proper size for application, and mounted in minimum Nema 1 enclosure. Each controller device requiring a low voltage power supply to operate shall be provided with a dedicated transformer.
14. Westinghouse, Square “D”, Jefferson or approved equal shall manufacture transformers.
15. Electric push button switch: switch shall be momentary contact, oil tight, push button, with number of N.O. and/or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 vac operation. Switch shall be 800t type, as manufactured by Allen Bradley or approved equal.
16. Pilot light: panel-mounted pilot light shall be oil tight, transformer type, with screw terminals, led type, rated for 24 vac or 120 vac. Unit shall be as manufactured by Allen Bradley or approved equal.
17. Network connection tool
18. Network connection tool shall allow technician to connect a laptop to any ms/tp network or at any ms/tp device and view and modify all information throughout

the entire BACnet network. Laptop connection to tool shall be via Ethernet or PTP.

19. Provide quick connect to ms/tp Lan at each controller. Tool shall be able to adjust to all ms/tp baud rates specified in the BACnet standard.

2.5 ELECTRONIC ACTUATORS AND VALVES

A. Quality Assurance for Actuators and Valves

1. UL Listed Standard 873 and C.S.A. Class 4813 02 certified.
2. Refer to Section GENERAL REQUIREMENTS FOR HVAC WORK for system pressure temperature requirements.
3. NEMA 2 rated enclosures for inside mounting, provide with weather shield for outside mounting.
4. Five-year manufacturer's warranty. Two-year unconditional and three-year product defect from date of installation.
 - a. Execution Details for Actuators and Valves
5. Furnish a Freeze-stat and install "Hard Wire" interlock to disconnect the mechanical spring return actuator power circuit for fail-safe operation. Use of the control signal to drive the actuators closed is not acceptable.
6. Each DDC analog output point shall have an actuator feedback signal, independent of control signal, wired and terminated in the control panel for true position information and troubleshooting. Or the actuator feedback signal may be wired to the DDC as an analog input for true actuator position status.
7. Booster-heat valve actuation shall be Floating type or Analog (2-10vdc, 4-20ma).
8. Primary valve control shall be Analog (2-10vdc, 4-20ma).

B. Actuators for Damper and Control Valves ½" to 6" shall be Electric unless otherwise specified, provide actuators as follows:

1. UL Listed Standard 873 and Canadian Standards association Class 481302 shall certify Actuators.
2. NEMA 2 rated actuator enclosures are. Use additional weather shield to protect actuator when mounted outside.
3. 5 year Manufacturers Warranty. Two-year unconditional + Three year product defect from date of installation.
4. Mechanical spring shall be provided when specified. Capacitors or other non-mechanical forms of fail-safe are not acceptable.
5. Position indicator device shall be installed and made visible to the exposed side of the Actuator. For damper short shaft mounting, a separate indicator shall be provided to the exposed side of the Actuator.
6. Overload Protection: Actuators shall provide protection against actuator burnout by using an internal current limiting circuit or digital motor rotation sensing circuit. Circuit shall insure that actuators cannot burn out due to stalled damper or mechanical

and electrical paralleling. End switches to deactivate the actuator at the end of rotation are acceptable only for Butterfly Valve actuators.

7. A push button gearbox release shall be provided for all non-spring actuators.
8. Modulating actuators shall be 24Vac and consume 10VA power or less.
9. Conduit connectors are required when specified and when code requires it.

C. Damper Actuators:

1. Outside Air and Exhaust Air Damper Actuators shall be Mechanical Spring Return. Capacitors or other non-mechanical forms of fail-safe are not acceptable. The actuator mounting arrangement and spring return feature shall permit normally open or normally closed positions of the damper as required.
2. Economizer Actuators shall utilize Analog control 2-10 VDC, Floating control is not acceptable.
3. Electric damper actuators (including VAV box actuators) shall be direct shaft mounted and use a V-bolt and toothed V-clamp causing a cold weld effect for positive gripping. Single bolt or setscrew type fasteners are not acceptable.
4. One electronic actuator shall be direct shaft mounted per damper section. No connecting rods or jackshafts shall be needed. Small outside air and return air economizer dampers may be mechanically linked together if one actuator has sufficient torque to drive both and damper drive shafts are both horizontal installed.
5. Multi-section dampers with electric actuators shall be arranged so that each damper section operates individually. One electronic actuator shall be direct shaft mounted per damper section. (See below execution section for more installation details.)

D. Valve Actuators ½" to 6"

1. Mechanical spring shall be provided on all actuators for pre-heat coil and actuators for AHU heating or cooling coil when units are mounted outside. See plans for fail save flow function: Normal Open or Normal Closed. Capacitors or other non-mechanical forms of fail-safe are not acceptable.
2. All zone service actuators shall be non-spring return unless otherwise specified.
3. The valve actuator shall be capable of providing the minimum torque required for proper valve close off for the required application.
4. All control valves actuators shall have an attached 3-foot cable for easy installation to a junction box.
5. Override handle and gearbox release shall be provided for all non-spring return valve actuators.

E. Control Dampers.

1. All dampers used for modulating service shall be opposed blade type arrange for normally open or normally closed operation as required. The damper is to be sized so that when wide open the pressure drop is a sufficient amount of its close-off pressure drop for effective throttling.
2. All dampers used for two-position or open-close control shall be parallel blade type arranged for normally open or closed operation as required.
3. Damper linkage hardware shall be constructed of aluminum or corrosion resistant zinc & nickel-plated steel and furnished as follows:
4. Bearing support bracket and drive blade pin extension shall be provided for each damper section. Sheet metal contractor shall install bearing support bracket and drive
5. blade pin extension. Sheet metal contractor shall provide permanent indication of blade position by scratching or marking the visible end of the drive blade pin extension.
6. Drive pin may be round only if V-bolt and toothed V-clamp is used to cause a cold weld effect for positive gripping. For Single bolt or set-screw type actuator fasteners, round damper pin shafts must be milled with at least one side flat to avoid slippage.
7. Damper manufacturer shall supply alignment plates for all multi-section dampers.

F. Control Valves ½" to 6":

1. The BMS contractor shall furnish all specified motorized control valves and actuators. BMS contractor shall furnish all control wiring to actuators. The Plumbing contractor shall install all valves. Equal Percentage control characteristic shall be provided for all water coil control valves. Linear valve characteristic is acceptable for 3-way valves 2½ inches and above. Johnson Controls or Belimo as standard.
2. Characterized Control Valves shall be used for hydronic heating or cooling applications and small to medium AHU water coil applications to 100GPM. Actuators are non-spring return for terminal unit coil control unless otherwise noted. If the coil is exposed to the Outside Air stream then see plans for Spring Return requirement.
3. Leakage is Zero percent, Close-off is 200psi, and Maximum differential is 30psi. Rangeability is 500:1.
4. Valves 1/2 inch through 2 inches shall be nickel-plated forged brass body, NPT screw type connections.
5. Valves 1/2 inch through 1-1/4 inches shall be rated for ANSI Class 600 working pressure. Valves 1-1/2 inch and 2 inches shall be rated for ANSI Class 400 working pressure.
6. The operating temperature range shall be 0° to 250° F.
7. Stainless steel ball & stem shall be furnished on all modulating valves.
8. Seats shall be fiberglass reinforced Teflon.
9. Two-way and three-way valves shall have an equal percentage control port. Full stem rotation is required for maximum flow to insure stable BTU control of the coil.
10. Three-way valve shall be applicable for both mixing and diverting.
11. The characterizing disc is made of TEFZEL and shall be keyed and held secure by a retaining ring.
12. The valves shall have a blow out proof stem design.

13. The stem packing shall consist of 2 lubricated O-rings designed for on-off or modulating service and require no maintenance.
14. The valves shall have an ISO type, 4-bolt flange, for mounting actuator in any orientation parallel or perpendicular to the pipe.
15. A non-metallic thermal isolation adapter shall separate valve flange from actuator.
16. One fastening screw shall secure the direct coupling of the thermal isolation adapter between the actuator and the valve. This will prevent all lateral or rotational forces from affecting the stem and its packing O-rings.
17. Globe valves ½" to 2" shall be used for steam control or water flow applications.
18. Valves shall be bronze body, NPT screw type, and shall be rated per job pressure/temperature requirements.
19. Valves 1/2 inch (DN15) through 2 inches (DN50) with spring return actuators shall close off against 50 psi pressure differential with Class III leakage (.1%).
20. The operating temperature range shall be 20° to 280° F.
21. Spring loaded TFE packing shall protect against leakage at the stem.
22. Two-way valves shall have an equal percentage control port.
23. Three-way valves shall a linear control and bypass port.
24. Mixing and diverting valves must be installed specific to the valve design.

G. Globe Valve 2 ½ to 6"

1. Valves 2-1/2 inch (DN65) through 6 inches (DN50) shall be iron body, 125 lb. flanged with Class III (.1%) close-off leakage at 50 psi differential.
2. Valves with spring return actuators shall close off against 50 psi pressure differential with Class III leakage (.1%).
3. Flow type for two-way valves shall be equal percentage. Flow type for three-way valves shall be linear.
4. Mixing and diverting valves must be installed specific to the valve design.
5. Butterfly valves

Butterfly Valves shall be sized for modulating service at 60-70 degree stem rotation. Isolation valves shall be line-size. Design velocity shall be less than 12 feet per second when used with standard EPDM seats.

- a. Body is Cast Iron.
- b. Disc is Aluminum Bronze standard.
- c. Seat is EPDM Standard.
- d. Body Pressure is 200 psi, -30F to 275F.
- e. Flange is ANSI 125/250.

- f. Media Temperature Range is -22F to 240F.
- g. Maximum Differential Pressure is 200 psi for 2" to 6" size.

H. Actuators

1. Actuators shall be approved under Canadian Standards Association or other Nationally Recognized Testing Laboratory to UL standards. CSA Class 4813 02 or equal. Enclosure shall be NEMA 4 (weatherproof) enclosure and will have an industrial quality coating.
2. Actuator shall have a motor rated for continuous duty. The motor shall be fractional horsepower; permanent split capacitor type designed to operate on a 120 VAC, 1 pH, 60 Hz supply. Two adjustable cam actuated end travel limit switches shall be provided to control direction of travel. A self-resetting thermal switch shall be imbedded in the motor for overload protection.
3. Reduction gearing shall be designed to withstand the actual motor stall torque. Gears shall be hardened alloy steel, permanently lubricated. A self-locking gear assembly or a brake shall be supplied.
4. Actuator shall have a 6 ft wiring harness provided for ease in field wiring (above 1500 in-lbs). Two adjustable SPDT cam-actuated auxiliary switches, rated at 250 VAC shall be provided for indication of open and closed position. Actuator shall have heater and thermostat to minimize condensation within the actuator housing.
5. Actuator shall be equipped with a hand wheel for manual override to permit operation of the valve in the event of electrical power failure or system malfunction. Hand wheel must be permanently attached to the actuator and when in manual operation electrical power to the actuator will be permanently interrupted. The hand wheel will not rotate while the actuator is electrically driven.
6. The actuator shall be Analog, floating, or two position as called out in the control sequence of operation. All Analog valves shall be positive positioning, and respond to a 2-10 VDC, 4-20 mA, or adjustable signal as required. Analog actuators shall have a digital control card allowing any voltage input for control and any DC voltage feedback signal for position indication.

a.. Performance Verification Test

1. Control loops shall cause productive actuation with each movement of the actuator and actuators shall modulate at a rate which is stable and responsive. Actuator movement shall not occur before the effects of previous movement have affected the sensor.
2. Actuator shall have capability of signaling a trouble alarm when the actuator Stop-Go Ratio exceeds 30%.
7. Actuator Mounting for Damper and Valve arrangements shall comply with the following:
 - a. Damper Actuators: Shall not be installed in the air stream

b. A weather shield shall be used if actuators are located outside. For Damper Actuators use clear plastic enclosure.

c. Damper or valve actuator ambient temperature shall not exceed 122 degrees F through any combination of medium temperature or surrounding air. Appropriate air gaps, thermal isolation washers or spacers, standoff legs, or insulation shall be provided as necessary

d. Actuator cords or conduit shall incorporate a drip leg if condensation is possible. Water shall not be allowed to contact actuator or internal parts. Location of conduits in temperatures dropping below dew point shall be avoided to prevent water from condensing in conduit and running into actuator.

e. Damper mounting arrangements shall comply with the following:

1. The ventilation subcontractor shall furnish and install damper channel supports and sheet metal collars.
2. No jack shafting of damper sections shall be allowed.
3. Multi-section dampers shall be arranged so that each damper section operates individually. One electronic actuator shall be direct shaft mounted per section.

f. Size damper sections based on actuator manufacturers specific recommendations for face velocity, differential pressure and damper type. In general:

1. Damper section shall not exceed 24 ft-sq. with face velocity 1500 FPM.
2. Damper section shall not exceed 18 ft-sq. with face velocity 2500 FPM.
3. Damper section shall not exceed 13 ft-sq. with face velocity 3000 FPM.

g. Multiple section dampers of two or more shall be arranged to allow actuators to be direct shaft mounted on the outside of the duct.

h. Multiple section dampers of three or more sections wide shall be arranged with a 3-sided vertical channel (8" wide by 6" deep) within the duct or fan housing and between adjacent damper sections. Vertical channel shall be anchored at the top and bottom to the fan housing or building structure for support. The sides of each damper frame shall be connected to the channels. Holes in the channel shall allow damper drive blade shafts to pass through channel for direct shaft mounting of actuators. Open side of channel shall be faced down stream of the airflow, except for exhaust air dampers.

i. Multiple section dampers to be mounted flush within a wall or housing opening shall receive either vertical channel supports as described above or sheet metal stand out collars. Sheet metal collars (12" minimum) shall bring each damper section out of the wall to allow direct shaft mounting of the actuator on the side of the collar.

I. Valve Sizing for Water Coil

J. On/Off Control Valves shall be line size.

K. Modulating Control Valve Body Size may be reduced at most two pipe sizes from the line size or not less than ½ the pipe size. The BMS contractor shall size all water coil control valves for the application as follows:

1. Booster-heat valves shall be sized not to exceed 4-9psi differential pressure. Size valve for 50% Valve Authority. Valve design pressure drop is equal to the sum of coil drop plus the balance valve drop.
2. Primary valves shall be sized not to exceed 5-15psi differential pressure. Size valve for 50% Valve Authority. Valve design pressure drop is equal to the sum of coil drop plus the balance valve drop.
3. Butterfly valves shall be sized for modulating service at 60-70 degree rotation. Design velocity shall be 12 feet per second or less when used with standard EPDM seats.

L. Valve Mounting arrangements shall comply with the following:

1. Unions shall be provided on all ports of two-way and three-way valves.
2. Install three-way equal percentage Characterized Control valves in a mixing configuration with the "A" port piped to the coil.
3. Install 2½ inch and above, Three-Way globe valves, as manufactured for mixing or diverting service to the coil.

2.6 ENCLOSURES

- A. All controllers, power supplies and relays shall be mounted in enclosures.
- B. Enclosures may be NEMA 1 when located in a clean, dry, indoor environment. Indoor enclosures shall be NEMA 12 when installed in other than a clean environment.
- C. Enclosures shall have hinged, locking doors.
- D. Provide laminated plastic nameplates for all enclosures in any mechanical room or electrical room. Include location and unit served on nameplate. Laminated plastic shall be 1/8" thick sized appropriately to make label easy to read.

3.0 EXECUTION

3.1 EXAMINATION

- A. Prior to starting work, carefully inspect installed work of other trades and verify that such work is complete to the point where work of this Section may properly commence.
- B. Notify the Commissioner in writing of conditions detrimental to the proper and timely completion of the work.
- C. Do not begin work until all unsatisfactory conditions are resolved.

3.2 INSTALLATION (GENERAL)

- A. Install in accordance with manufacturer's instructions.

- B. Provide all miscellaneous devices, hardware, software, interconnections installation and programming required to ensure a complete operating system in accordance with the sequences of operation and point schedules.

C Operator's terminal

- 1. The BMS contractor shall provide a portable operator terminal for programming purposes. The terminal shall be configured as follows:
 - a. Personal laptop computer
 - b. 512 MB RAM (minimum) – windows 2000 or XP.
 - c. SVGA 1024x768 resolution color display
 - d. Complete workstation software packages, including any hardware or software.
 - e. Software registration cards for all included software shall be provided to the City of New York.
 - f. External power supply/battery charger
- 2. Software
 - a. Portable operator terminals shall support all controllers within the system on a direct-connect communications basis.
 - b. When used to access first or second tier controllers, the portable operator terminal shall utilize the standard operator workstation software, as previously defined.
 - c. When used to access application specific controllers, the portable operator terminal shall utilize either the standard operator workstation software, as previously defined, or controller-specific utility software.

3.3 LOCATION AND INSTALLATION OF COMPONENTS

- A. Locate and install components for easy accessibility; in general, mount 48 inches above floor with minimum 3'-0" clear access space in front of units. Obtain approval on locations from Commissioner prior to installation.
- B. All instruments, switches, transmitters, etc., shall be suitably wired and mounted to protect them from vibration, moisture and high or low temperatures.
- C. Identify all equipment and panels. Provide permanently mounted tags for all panels.
- D. Provide stainless steel or brass thermowells suitable for respective application and for installation under other sections—sized to suit pipe diameter without restricting flow.

3.4 INTERLOCKING AND CONTROL WIRING

- A. Provide all interlock and control wiring. All wiring shall be installed neatly and professionally, in accordance with Specification Division 26 and all national, state and local electrical codes.

- B. Provide wiring as required by functions as specified and as recommended by equipment manufacturers, to serve specified control functions. Provide shielded low capacitance wire for all communications trunks.
- C. Control wiring shall not be installed in power circuit raceways. Class 2 signal wiring and 24VAC power can be run in the same conduit. Power wiring 120VAC and greater cannot share the same conduit with Class 2 signal wiring. Magnetic starters and disconnect switches shall not be used as junction boxes. Provide auxiliary junction boxes as required. Coordinate location and arrangement of all control equipment with the Commissioner prior to rough-in.
- D. Provide auxiliary pilot duty relays on motor starters as required for control function.
- E. Provide power for all control components from nearest electrical control panel or as indicated on the electrical drawings—coordinate with electrical contractor. Power circuits used for the BMS shall be dedicated to the BMS and shall not be used for any other purposes. DDC terminal unit controllers may use AC power from motor power circuits. Power shall be derived from emergency power panels for any controls that are connected to life/safety systems.
- F. All control wiring in the mechanical, electrical, telephone and boiler rooms to be installed in raceways. All other wiring to be installed neatly and inconspicuously per local code requirements. If local code allows, control wiring above accessible ceiling spaces may be run with plenum rated cable (without conduit). Where conduit is required, it shall be steel electric metallic tubing (EMT), except that it shall be galvanized intermediate steel conduit where located within 8'-0" of the floor in mechanical spaces (or is otherwise exposed to mechanical damage), is located outdoors, or is intended for embodiment in concrete.
- G. Surge transient protection shall be incorporated in the design of system to protect electrical components in all DDC control panels.
- H. All systems requiring interconnecting control wiring as specified herein for all mechanical systems including but not limited to the fuel oil system, emergency generators, chillers, water treatment, AC units, condensing units, PIMs, cooling towers, expansion tanks, VFDs, unit heaters, filtration systems (air and water), terminal units, fan coil units, electric heaters, house tanks, chiller control system, kitchen equipment, fans, H&V, cabinet heaters, hot water heater, ejectors, sump pits, domestic water system, steam PRV stations, underground pipe leak detection system, and plumbing systems.

3.5 DDC OBJECT TYPE SUMMARY

- A. Provide all database generation.
- B. Displays
 - 1. System displays shall show all analog and binary object types within the system. They shall be logically laid out for easy use by the City of New York. Provide

outside air temperature indication on all system displays associated with economizer cycles.

C. Run Time Totalization

1. At a minimum, run time totalization shall be incorporated for each monitored supply fan, return fan, exhaust fan, hot water and chilled water pumps. Warning limits for each point shall be entered for alarm and or maintenance purposes.

D. Trend Log

1. All binary and analog object types (including zones) shall have the capability to be automatically trended.

E. Alarm

1. All analog inputs (High/Low Limits) and selected binary input alarm points shall be prioritized and routed (locally or remotely) with alarm message per City of New York's requirements.

F. Database Save

1. Provide back-up database for all stand-alone application controllers on disk.

3.6 FIELD SERVICES

- A. Prepare and start logic control system under provisions of this section.
- B. Start-up and commission systems. Allow sufficient time for start-up and commissioning prior to placing control systems in permanent operation.
- C. Provide the capability for off-site monitoring at control contractor's local or main office. At a minimum, off-site facility shall be capable of system diagnostics and software download. City of New York shall provide phone line for this service for 1 year or as specified.
- D. Provide Commissioner with spare parts list. Identify equipment critical to maintaining the integrity of the operating system.

3.7 INSTRUCTION

- A. Provide application engineer to instruct an appropriate representative of The City of New York in operation of systems and equipment.
- B. Provide system operator's instruction to include (but not limited to) such items as the following: modification of data displays, alarm and status descriptors, requesting data,

execution of commands and request of logs. Provide this instruction to a minimum of 3 persons.

- C. Provide on-site instruction above as required, up to 16 hours as part of this contract.
- D. Demonstrate complete operating system to Commissioner.
- E. Provide certificate stating that control system has been tested and adjusted for proper operation.

END OF SECTION 230900

SECTION 230993

SEQUENCE OF OPERATIONS FOR HVAC CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

B. HVAC Drawings include operational profiles and relationship diagrams which should be used in conjunction with the requirements of this specification to create control hierarchy and relationship systems.

1.2 SUMMARY

A. This Section includes the basic requirements and point types to support control sequences for HVAC systems, subsystems, and equipment, where the sequences may be found primarily on drawings:

1. Miscellaneous Fans
2. Electric Duct Heaters
3. Water to Water Heat Pump Units
4. Fan Coil Units
5. Fin Tube Radiators
6. Radiant floor hydronic systems
7. Energy Recovery Ventilators
8. Pumps
9. Unit Heaters
10. Manufacturer Control Packaged Boilers

B. Related Sections include the following:

1. Section 230900 "Instrumentation and Control for HVAC" for control equipment and devices and for submittal requirements.

1.3 DEFINITIONS

- A. DDC: Direct digital control.
- B. VAV: Variable air volume.
- C. DTS: Dual temperature system
- D. FCU: Fan Coil Unit

- E. FTR: Fin Tube Radiator
- F. Source Water: Dewatering source water from outside bounds of project, used for radiant free cooling and as water-water heat pump source.

1.4 HYDRONIC HEATING AND COOLING CONTROL SEQUENCES

DTS provides heating and cooling. Common elements for heating and cooling are described.

A. Water Supply Temperature Control:

1. Input Device: Thermistor temperature sensor.
2. Output Device: Control valve/boiler mode/heat pump mode
3. Action: Modulate control valve to maintain heating-water supply temperature.
4. Display:
 - a. Heating-water supply temperature.
 - b. Heating-water supply temperature set point.
 - c. Control-valve position.

B. Water Supply Temperature Reset (heating):

1. Input Device: Outdoor-air sensor.
2. Output Device: DDC system software.
3. Action: Reset heating-water supply temperature in straight-line relationship with outdoor-air temperature for the following conditions:
 - a. 140 deg F heating water when outdoor-air temperature is 14 deg F or lower.
 - b. 90 deg F heating water when outdoor-air temperature is 55 deg F.

Generation of heating water switches from water source heat pump to boiler based on sump water temperature. When sump water temperature is too low for the water source heat pump, boilers shall be engaged. See M-800 for relationship.

4. Display:
 - a. Outdoor-air temperature.
 - b. Heating-water supply temperature.
 - c. Heating-water supply temperature set point.

C. Control Primary Circulating Pump(s):

1. Input Device: DDC system.
2. Output Device: DDC system command to starter relay.
3. Action: Energize pump(s) when occupied and not in natural ventilation mode or when equipment calls for heating or cooling.
4. Display:
 - a. Outdoor-air temperature.

- b. Operating status of primary circulating pump(s).

1.5 Water To Water Heat Pump and Boiler System SEQUENCES

A. Start and Stop P-4, HP-1,2, P-2C/H, B-1,2 depending on mode:

1. Enable P-4, HP-1,2, heat pump circulation pumps: When water is present in Pump One sump:
 - a. Input Device: Water level sensor/float.
 - b. Output Device: Hard wired through motor starter; DDC system binary output.
 - c. Action: Confirm water in Pump One sump.
2. Enable: When space conditions are out of range and building is not in natural ventilation mode OR when outdoor air conditions dictate that the building should be in heating or cooling mode OR when space equipment calls for heating or cooling:
 - a. Input Device: Space thermostat OR DDC system outdoor-air temperature.
 - b. Output Device: Hard wired through motor starter; DDC system binary output.
 - c. Action engage cooling: Confirm outdoor-air temperature is above 78 deg F.
 - d. Action engage heating: confirm outdoor-air temperature is below 50 deg F.
3. Enable: When demand conditions are met:
 - a. Input Device: DDC system software demand.
 - b. Action: Confirm cooling demand from ventilation system(s).
4. Initiate:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: Binary output.
 - c. Action: Enable heating and cooling system sequences.
5. Display:
 - a. Low-level 'Pump One' sump water alarm.
 - b. Outdoor-air temperature.
 - c. Cooling (software) demand indication.
 - d. Time and time schedule.
 - e. All pump(s) on-off status.
 - f. All pump(s) on-off indication.

B. Start and Stop DTS circulation Pump(s):

1. Input Device: Flow switch in heat pump/boiler circuit.
2. Output Device: DDC system command to starter relay.
3. Action: Energize pump(s).
4. Display:

- a. Chilled-water flow indication.
- b. Chilled-water pump(s) on-off status.
- c. Chilled-water pump(s) on-off indication.

C. Start and Stop Heat Pumps

- 1. Input Device: Flow switch in P-4 circuit, DTS circuit.
- 2. Output Device: DDC system command to starter relay.
- 3. Action: stage heat pump(s) on.
- 4. Display:
 - a. Sump pump water flow indication.
 - b. DTS flow indication
 - c. Heat pump on-off indication.
 - d. Water supply and return temperature

D. Start and Stop Boilers

- 1. Input Devices: Reset schedule temperature requirement exceeds heat pump capacity.
Flow switch in P-2H circuit.
- 2. Output Device: DDC system command to starter relay.
- 3. Action: stage boiler(s) on.
- 4. Display:
 - a. DTS flow indication.
 - b. Boiler on-off indication.
 - c. Water supply and return temperature
 - d. Water temperature control-point adjustment.

E. Alarm Heat Pump(s) Start Failure:

- 1. Input Device: Heat Pump software signal.
- 2. Output Device: DDC system alarm.
- 3. Action: Signal alarm.
- 4. Display: Chiller "failure-to-start" indication.

F. Dual Temperature System Water Level:

- 1. Input Device: Expansion tank level switch.
- 2. Output Device: DDC system alarm.
- 3. Action: Signal alarm.
- 4. Display: Expansion tank low-level alarm.

G. Dual Temperature System Supply Temperature:

- 1. Input Device: Temperature sensor in common water supply piping.
- 2. Output Device: DDC system signal to heat pump control panel. DDC system signal to boiler control panel.

3. Action: Maintain constant leaving dual temperature water temperature (cooling mode)
OR reset according to highest heating demand in heating mode
 - a. Display: Dual temperature water system supply temperature.

H. Operator Station Display: Indicate the following on operator workstation display terminal:

1. DDC system graphic.
2. DDC system status, on-off.
3. Low-level 'Pump One' sump alarm.
4. Outdoor-air temperature.
5. Cooling (software) demand indication.
6. Time and time schedule.
7. Condenser-water pump(s) (P-4) on-off status.
8. Condenser-water pump(s) (P-4) on-off indication.
9. Condenser-water flow indication.
10. Chilled-water pump(s) on-off status.
11. Chilled-water pump(s) on-off indication.
12. Chilled-water flow indication.
13. Refrigeration machine on-off indication.
14. Dual temperature water supply temperature.
15. Dual temperature return temperature.
16. Dual temperature temperature control-point adjustment.
17. Chiller(s) on-off status.
18. Chiller(s) on-off indication.
19. Chiller "failure-to-start" indication.
20. Expansion tank low-level alarm.
21. Condenser-water sump (return) control-point temperature.
22. Condenser-water sump (return) temperature.
23. Condenser-water control-valve position.
24. Condenser-water supply temperature.
25. 'Pump One' sump temperature low temperature alarm (shutdown P-4, heat pumps).
26. Chilled-water pressure drop through chiller.
27. Entering condenser-water temperature.
28. Leaving condenser-water temperature.
29. Condenser-water pressure drop through chiller.
30. Chiller condenser-water supply and return temperature.
31. Chiller chilled-water supply and return temperature.
32. System capacity in tons.

1.6 AIR-HANDLING-UNIT CONTROL SEQUENCES

A. Start and Stop Supply Fan(s):

1. Enable: Smoke Control (ERV-7 only):
 - a. Input Device: Duct-mounted smoke detector, located in return air.
 - b. Output Device: Hard wired through motor starter; DDC system alarm.
 - c. Action: Allow start if duct is free of products of combustion.

2. Initiate: Occupied Time Schedule:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: Binary output to motor starter.
 - c. Action: Energize fan(s).
3. Initiate: Unoccupied Time Schedule:
 - a. Input Device: DDC system demand.
 - b. Output Device: Binary output to motor starter.
 - c. Action: Energize fan(s).
4. Unoccupied Ventilation:
 - a. Input Device: DDC system time schedule and output.
 - b. Output Device: DDC system binary output to motor starter.
 - c. Action: Cycle fan(s) during unoccupied periods.
5. Display: Supply-fan on-off indication.

B. Supply Fan(s) Variable-Volume Control:

1. Occupied Time Schedule:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: Binary output.
 - c. Action: Enable control.
2. Volume Control:
 - a. Input Device: DDC System based on system hierarchy and space thermostat
 - b. Output Device: DDC system analog output to motor speed controller. Set variable-speed drive to minimum speed when fan is stopped.
 - c. Action: Modulate fan and coil control valve to maintain space set point
3. Display:
 - a. Supply-fan airflow rate.
 - b. Supply-fan speed.

C. Filters: During occupied periods, when fan is running, differential air-pressure transmitters exist.

1. Occupied Time Schedule:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: DDC system output.
 - c. Action: Enable control.
2. Differential Pressure:
 - a. Input Device: Differential-pressure switches.

- b. Output Device: DDC system alarm.
 - c. Action: Signal alarm on low- and high-pressure conditions.
3. Display:
- a. Filter air-pressure-drop indication.
 - b. Filter low-air-pressure set point.
 - c. Filter high-air-pressure set point.
- D. Hydronic Coil:
- 1. Occupied Time Schedule:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: Binary output.
 - c. Action: Enable control.
 - 2. Supply-Air Temperature:
 - a. Input Device: Duct-mounted thermostat.
 - b. Output Device: Normally open modulating control valve.
 - c. Action: Maintain supply-air temperature set point calculated based on space thermostat, modulating to meet space needs.
 - 3. Unoccupied Time Schedule:
 - a. Input Device: DDC system time schedule and output.
 - b. Output Device: DDC system binary output.
 - c. Action: Enable normal control when fan is cycled on.
 - 4. Display:
 - a. Fan-discharge air-temperature indication.
 - b. Fan-discharge air-temperature set point.
 - c. Heating-coil air-temperature indication.
 - d. Heating-coil air-temperature set point.
 - e. Heating-coil pump operation indication.
 - f. Heating-coil control-valve position.
 - g. Hot-deck air-temperature indication.
 - h. Hot-deck air-temperature set point.
- E. Coordination of Air-Handling Unit Sequences: Ensure that heating mode, cooling mode, ventilation control dampers and the radiant heating/cooling systems and FCU coils have common inputs and do not overlap in function. All threshold temperatures to be user adjustable.
- F. Operator Station Display: Indicate the following on operator workstation display terminal:
- 1. DDC system graphic.
 - 2. DDC system on-off indication.
 - 3. DDC system occupied/unoccupied mode.

4. Outdoor-air-temperature indication.
5. Supply-fan on-off indication.
6. Supply-fan-discharge static-pressure indication.
7. Supply-fan-discharge static-pressure set point.
8. Supply-fan airflow rate.
9. Supply-fan speed.
10. Return-fan on-off indication.
11. Return-air static-pressure indication.
12. Return-air static-pressure set point.
13. Return-fan airflow rate.
14. Return-fan speed.
15. Building static-pressure indication.
16. Building static-pressure set point.
17. Preheat-coil air-temperature indication.
18. Preheat-coil air-temperature set point.
19. Preheat-coil pump operation indication.
20. Preheat-coil control-valve position.
21. Mixed-air-temperature indication.
22. Mixed-air-temperature set point.
23. Mixed-air damper position.
24. Relative humidity indication.
25. Relative humidity set point.
26. Relative humidity control-valve position.
27. Filter air-pressure-drop indication.
28. Filter low-air-pressure set point.
29. Filter high-air-pressure set point.
30. Fan-discharge air-temperature indication.
31. Fan-discharge air-temperature set point.
32. Heating-coil air-temperature indication.
33. Heating-coil air-temperature set point.
34. Heating-coil pump operation indication.
35. Heating-coil control-valve position.
36. Hot-deck air-temperature indication.
37. Hot-deck air-temperature set point.
38. Cooling-coil air-temperature indication.
39. Cooling-coil air-temperature set point.
40. Cooling-coil control-valve position.
41. Cold-deck air-temperature indication.
42. Cold-deck air-temperature set point.
43. Room temperature indication.
44. Room temperature set point.
45. Multizone damper position.

1.7 TERMINAL UNIT OPERATING SEQUENCE

- A. Unit Heater, Electric: Room thermostat cycles fan and sequences stages of heating.
- B. Radiant Heating Panel, Hydronic:

1. Room Temperature:
 - a. Input Devices: Room thermostat, slab temperature sensors
 - b. Output Device: DDC evaluation; see M-800 for duty relationships. Packaged skid pumps, Radiant manifold three-way control valve.
 - c. Action: Activate radiant heating/cooling system in appropriate mode and control to space/slab setpoints.

2. Display:
 - a. Room temperature indication.
 - b. Room temperature set point.
 - c. RMB status and all other outputs from RMB.

- C. Two-Pipe, Single-Coil, Fan-Coil Unit:
 1. Occupied Time Schedule:
 - a. Input Device: DDC system time schedule.
 - b. Output Device: Binary output.
 - c. Action: Start and stop fan and enable control.

 2. Room Temperature:
 - a. Input Device: Room thermostat in room.
 - b. Output Device: Electronic control-valve operator.
 - c. Action: Modulate valve to maintain temperature.

 3. DDC System Changeover:
 - a. Input Device: Thermostat and DDC system.
 - b. Output Device: DDC system software.
 - c. Action: Reverse control-valve action to switch from heating to cooling.

 4. Display:
 - a. DDC system graphic.
 - b. DDC system on-off indication.
 - c. DDC system occupied/unoccupied mode.
 - d. Room temperature indication.
 - e. Room temperature set point.
 - f. Control-valve position.
 - g. Supply-water temperature indication.
 - h. Fan speed.

- D. Unit Ventilator: Room thermostat modulates heating-and-cooling control valves; airstream thermostats modulate outdoor- and return-air dampers as follows:
 1. Occupied Time Schedule:

- a. Input Device: DDC system time schedule.
- b. Output Device: Binary output.
- c. Action: Start and stop fan, move outdoor- and return-air dampers to minimum outdoor-air position, and enable outdoor air damper control.

E. Radiators and Convectors, Hydronic:

1. Occupancy:

- a. Input Device: Occupancy sensor.
- b. Output Device: DDC system binary output.
- c. Action: Report occupancy and enable occupied temperature set point.

2. Room Temperature:

- a. Input Device: Room thermostat, DDC based on system hierarchy.
- b. Output Device: Electronic control-valve operators.
- c. Action: Modulate valve to maintain temperature.

- 1) Occupied Temperature: 68 deg F (24 deg C).
- 2) Unoccupied Temperature: 60 deg F (18 deg C).

3. Display:

- a. Room/area served.
- b. Room temperature indication.
- c. Room temperature set point.
- d. Room temperature set point, occupied.
- e. Room temperature set point, occupied standby.
- f. Room temperature set point, unoccupied.
- g. Control-valve position as percent open.

1.8 VENTILATION SEQUENCES

- A. Exhaust Fan: Occupancy sensor cycles fan.
- B. Kitchen Exhaust Fan: Occupancy sensor starts fan and energizes makeup air fan.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION (Not Applicable)

END OF SECTION 230993

SECTION 232113

HYDRONIC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes pipe and fitting materials, joining methods, special-duty valves, and specialties for the following:
 - 1. Dual-temperature heating and cooling water piping.
 - 2. Radiant floor water piping.
 - 3. Ground source "Source water" water piping.
- B. Related Sections include the following:
 - 1. Section 232123 "Hydronic Pumps" for pumps, motors, and accessories for hydronic piping.

1.3 PERFORMANCE REQUIREMENTS

- A. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature:
 - 1. Dual-Temperature Heating and Cooling Water Piping: 150 psig at 200 deg F.
 - 2. Radiant Floor Water Piping: 150 psig at 150 deg F.
 - 3. Ground-source "Source Water" Piping: 150 psig at 150 deg F.
 - 4. Makeup-Water Piping: 80 psig at 150 deg F.
 - 5. Condensate-Drain Piping: 150 deg F.
 - 6. Blowdown-Drain Piping: 200 deg F.
 - 7. Air-Vent Piping: 200 deg F.
 - 8. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of the following:
 - 1. Valves. Include flow and pressure drop curves based on manufacturer's testing for calibrated-orifice balancing valves and automatic flow-control valves.
 - 2. Air control devices.

3. Chemical treatment.
4. Hydronic specialties.

B. LEED Submittals:

1. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
2. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

- C. Shop Drawings: Detail, at 1/4 scale, the piping layout, fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to the building structure. Detail location of anchors, alignment guides, and expansion joints and loops.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.
- B. Welding certificates.
- C. Field quality-control test reports.
- D. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For air control devices, hydronic specialties, and special-duty valves to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Water-Treatment Chemicals: Furnish enough chemicals for initial system startup and for preventive maintenance for one year from date of Substantial Completion.
- B. Differential Pressure Meter: For each type of balancing valve and automatic flow control valve, include flowmeter, probes, hoses, flow charts, and carrying case.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications:

- B. Steel Support Welding: Qualify processes and operators according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- C. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
 - 1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
 - 2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
- D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

- A. Drawn-Temper Copper Tubing: ASTM B 88, Type L.
- B. Annealed-Temper Copper Tubing: ASTM B 88, Type K.
- C. DWV Copper Tubing: ASTM B 306, Type DWV.
- D. Wrought-Copper Fittings: ASME B16.22.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 2. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 - a. Anvil International, Inc.
 - b. S. P. Fittings; a division of Star Pipe Products.
 - c. Victaulic Company.
 - 3. Grooved-End Copper Fittings: ASTM B 75, copper tube or ASTM B 584, bronze casting.
 - 4. Grooved-End-Tube Couplings: Rigid pattern, unless otherwise indicated; gasketed fitting. Ductile-iron housing with keys matching pipe and fitting grooves, prelubricated EPDM gasket rated for minimum 230 deg F for use with housing, and steel bolts and nuts.
- E. Wrought-Copper Unions: ASME B16.22.

2.2 STEEL PIPE AND FITTINGS

- A. Steel Pipe: ASTM A 53/A 53M, black steel with plain ends; type, grade, and wall thickness as indicated in Part 3 "Piping Applications" Article.
- B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250 as indicated in Part 3 "Piping Applications" Article.
- C. Malleable-Iron Threaded Fittings: ASME B16.3, Classes 150 and 300 as indicated in Part 3 "Piping Applications" Article.
- D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 "Piping Applications" Article.
- E. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced as indicated in Part 3 "Piping Applications" Article.
- F. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.
- G. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
 - 1. Material Group: 1.1.
 - 2. End Connections: Butt welding.
 - 3. Facings: Raised face.
- H. Grooved Mechanical-Joint Fittings and Couplings:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 2. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 - a. Anvil International, Inc.
 - b. Central Sprinkler Company; a division of Tyco Fire & Building Products.
 - c. National Fittings, Inc.
 - d. S. P. Fittings; a division of Star Pipe Products.
 - e. Victaulic Company.
 - 3. Joint Fittings: ASTM A 536, Grade 65-45-12 ductile iron; ASTM A 47/A 47M, Grade 32510 malleable iron; ASTM A 53/A 53M, Type F, E, or S, Grade B fabricated steel; or ASTM A 106, Grade B steel fittings with grooves or shoulders constructed to accept grooved-end couplings; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.
 - 4. Couplings: Ductile- or malleable-iron housing and synthetic rubber gasket of central cavity pressure-responsive design; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.

- I. Steel Pipe Nipples: ASTM A 733, made of same materials and wall thicknesses as pipe in which they are installed.

2.3 JOINING MATERIALS

- A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
 1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
 - a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
 - b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
- B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- D. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.
- E. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- F. Gasket Material: Thickness, material, and type suitable for fluid to be handled and working temperatures and pressures.

2.4 DIELECTRIC FITTINGS

- A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
- B. Dielectric Unions:
 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Capitol Manufacturing Company.
 - b. Central Plastics Company.
 - c. Hart Industries International, Inc.
 - d. Jomar International Ltd.
 - e. Matco-Norca, Inc.
 - f. McDonald, A. Y. Mfg. Co.
 - g. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
 - h. Wilkins; a Zurn company.

2. Description:
 - a. Standard: ASSE 1079.
 - b. Pressure Rating: 150 psig.
 - c. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Capitol Manufacturing Company.
 - b. Central Plastics Company.
 - c. Matco-Norca, Inc.
 - d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
 - e. Wilkins; a Zurn company.
2. Description:
 - a. Standard: ASSE 1079.
 - b. Factory-fabricated, bolted, companion-flange assembly.
 - c. Pressure Rating: 150 psig.
 - d. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

2.5 VALVES

- A. Gate, Globe, Check, Ball, and Butterfly Valves: Comply with requirements specified in Section 230523 "General-Duty Valves for HVAC Piping."
- B. Automatic Temperature-Control Valves, Actuators, and Sensors: Comply with requirements specified in Section 230900 "Instrumentation and Control for HVAC."
- C. Bronze, Calibrated-Orifice, Balancing Valves:
 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 2. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 - a. Armstrong Pumps, Inc.
 - b. Bell & Gossett Domestic Pump; a division of ITT Industries.
 - c. Flow Design Inc.
 - d. Gerand Engineering Co.
 - e. Griswold Controls.
 - f. Taco.

3. Body: Bronze, ball or plug type with calibrated orifice or venturi.
4. Ball: Brass or stainless steel.
5. Plug: Resin.
6. Seat: PTFE.
7. End Connections: Threaded or socket.
8. Pressure Gage Connections: Integral seals for portable differential pressure meter.
9. Handle Style: Lever, with memory stop to retain set position.
10. CWP Rating: Minimum 125 psig.
11. Maximum Operating Temperature: 250 deg F.

D. Cast-Iron or Steel, Calibrated-Orifice, Balancing Valves:

1. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 - a. Armstrong Pumps, Inc.
 - b. Bell & Gossett Domestic Pump; a division of ITT Industries.
 - c. Flow Design Inc.
 - d. Gerand Engineering Co.
 - e. Griswold Controls.
 - f. Taco.
 - g. Tour & Andersson; available through Victaulic Company.
2. Body: Cast-iron or steel body, ball, plug, or globe pattern with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Stem Seals: EPDM O-rings.
5. Disc: Glass and carbon-filled PTFE.
6. Seat: PTFE.
7. End Connections: Flanged or grooved.
8. Pressure Gage Connections: Integral seals for portable differential pressure meter.
9. Handle Style: Lever, with memory stop to retain set position.
10. CWP Rating: Minimum 125 psig.
11. Maximum Operating Temperature: 250 deg F.

E. Diaphragm-Operated Safety Valves:

1. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 - a. Amtrol, Inc.
 - b. Armstrong Pumps, Inc.
 - c. Bell & Gossett Domestic Pump; a division of ITT Industries.
 - d. Conbraco Industries, Inc.
 - e. Spence Engineering Company, Inc.
 - f. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Body: Bronze or brass.
3. Disc: Glass and carbon-filled PTFE.
4. Seat: Brass.

5. Stem Seals: EPDM O-rings.
6. Diaphragm: EPT.
7. Wetted, Internal Work Parts: Brass and rubber.
8. Inlet Strainer: Steel, removable without system shutdown.
9. Valve Seat and Stem: Noncorrosive.
10. Valve Size, Capacity, and Operating Pressure: Comply with ASME Boiler and Pressure Vessel Code: Section IV, and selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.

F. Automatic Flow-Control Valves:

1. Body: Brass or ferrous metal.
2. Piston and Spring Assembly: Stainless steel, tamper proof, self cleaning, and removable.
3. Combination Assemblies: Include bronze or brass-alloy ball valve.
4. Identification Tag: Marked with zone identification, valve number, and flow rate.
5. Size: Same as pipe in which installed.
6. Performance: Maintain constant flow, plus or minus 5 percent over system pressure fluctuations.
7. Minimum CWP Rating: 175 psig.
8. Maximum Operating Temperature: 200 deg F.

2.6 AIR CONTROL DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Amtrol, Inc.
2. Armstrong Pumps, Inc.
3. Bell & Gossett Domestic Pump; a division of ITT Industries.
4. Taco.

B. Manual Air Vents:

1. Body: Bronze.
2. Internal Parts: Nonferrous.
3. Operator: Screwdriver or thumbscrew.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/8.
6. CWP Rating: 150 psig.
7. Maximum Operating Temperature: 225 deg F.

C. Automatic Air Vents:

1. Body: Bronze or cast iron.
2. Internal Parts: Nonferrous.
3. Operator: Noncorrosive metal float.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/4.
6. CWP Rating: 150 psig.

7. Maximum Operating Temperature: 240 deg F.

D. Expansion Tanks:

1. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature, with taps in bottom of tank for tank fitting and taps in end of tank for gage glass. Tanks shall be factory tested with taps fabricated and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Air-Control Tank Fitting: Cast-iron body, copper-plated tube, brass vent tube plug, and stainless-steel ball check, 100-gal. unit only; sized for compression-tank diameter. Provide tank fittings for 125-psig working pressure and 250 deg F maximum operating temperature.
3. Tank Drain Fitting: Brass body, nonferrous internal parts; 125-psig working pressure and 240 deg F maximum operating temperature; constructed to admit air to compression tank, drain water, and close off system.
4. Gage Glass: Full height with dual manual shutoff valves, 3/4-inch- diameter gage glass, and slotted-metal glass guard.

E. Bladder-Type Expansion Tanks:

1. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test with taps fabricated and supports installed and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Bladder: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.
3. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.

F. Tangential-Type Air Separators:

1. Tank: Welded steel; ASME constructed and labeled for 125-psig minimum working pressure and 375 deg F maximum operating temperature.
2. Air Collector Tube: Perforated stainless steel, constructed to direct released air into expansion tank.
3. Tangential Inlet and Outlet Connections: Threaded for NPS 2 and smaller; flanged connections for NPS 2-1/2 and larger.
4. Blowdown Connection: Threaded.
5. Size: Match system flow capacity.

G. In-Line Air Separators:

1. Tank: One-piece cast iron with an integral weir constructed to decelerate system flow to maximize air separation.
2. Maximum Working Pressure: Up to 175 psig.
3. Maximum Operating Temperature: Up to 300 deg F.

2.7 HYDRONIC PIPING SPECIALTIES

A. Y-Pattern Strainers:

1. Body: ASTM A 126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: 40-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
4. CWP Rating: 125 psig.

B. Basket Strainers:

1. Body: ASTM A 126, Class B, high-tensile cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: 40-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
4. CWP Rating: 125 psig.

C. Stainless-Steel Bellow, Flexible Connectors:

1. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket.
2. End Connections: Threaded or flanged to match equipment connected.
3. Performance: Capable of 3/4-inch misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.

D. Spherical, Rubber, Flexible Connectors:

1. Body: Fiber-reinforced rubber body.
2. End Connections: Steel flanges drilled to align with Classes 150 and 300 steel flanges.
3. Performance: Capable of misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.

E. Expansion fittings are specified in Section 230516 "Expansion Fittings and Loops for HVAC Piping."

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

- A. Dual-temperature heating and cooling water piping, radiant floor water piping, and ground-loop heat pump water piping, aboveground, NPS 2 and smaller, shall be any of the following:
1. Type L, drawn-temper copper tubing, wrought-copper fittings, and soldered or brazed joints.
 2. Schedule 40 steel pipe; Class 125, cast-iron fittings; cast-iron flanges and flange fittings; and threaded joints.

- B. Dual-temperature heating and cooling water piping, radiant floor water piping, and ground-loop heat pump water piping, aboveground, NPS 2-1/2 and larger, shall be any of the following:
 1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.
 2. Schedule 40 steel pipe; grooved, mechanical joint coupling and fittings; and grooved, mechanical joints.
- C. Dual-temperature heating and cooling water piping, radiant floor water piping, and ground-loop heat pump water piping, installed belowground and within slabs shall be either of the following:
 1. Type K, annealed-temper copper tubing, wrought-copper fittings, and soldered or brazed joints. Use the fewest possible joints.

3.2 VALVE APPLICATIONS

- A. Install shutoff-duty valves at each branch connection to supply mains, and at supply connection to each piece of equipment.
- B. Install calibrated-orifice, balancing valves at each branch connection to return main.
- C. Install calibrated-orifice, balancing valves in the return pipe of each heating or cooling terminal.
- D. Install check valves at each pump discharge and elsewhere as required to control flow direction.
- E. Install safety valves at hot-water generators and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install drip-pan elbow on safety-valve outlet and pipe without valves to the outdoors; and pipe drain to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.
- F. Install pressure-reducing valves at makeup-water connection to regulate system fill pressure.

3.3 PIPING INSTALLATIONS

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- B. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

- E. Install piping to permit valve servicing.
- F. Install piping at indicated slopes.
- G. Install piping free of sags and bends.
- H. Install fittings for changes in direction and branch connections.
- I. Install piping to allow application of insulation.
- J. Select system components with pressure rating equal to or greater than system operating pressure.
- K. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
- L. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.
- M. Install piping at a uniform grade of 0.2 percent upward in direction of flow.
- N. Reduce pipe sizes using eccentric reducer fitting installed with level side up.
- O. Install branch connections to mains using mechanically formed tee fittings in main pipe, with the branch connected to the bottom of the main pipe. For up-feed risers, connect the branch to the top of the main pipe.
- P. Install valves according to Section 230523 "General-Duty Valves for HVAC Piping."
- Q. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.
- R. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.
- S. Install strainers on inlet side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS 3/4 nipple and ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.
- T. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Section 230516 "Expansion Fittings and Loops for HVAC Piping."
- U. Identify piping as specified in Section 230553 "Identification for HVAC Piping and Equipment."
- V. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

- W. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

3.4 HANGERS AND SUPPORTS

- A. Hanger, support, and anchor devices are specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment." Comply with the following requirements for maximum spacing of supports.
- B. Seismic restraints are specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- C. Install the following pipe attachments:
 - 1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
 - 2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
 - 3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
 - 4. Spring hangers to support vertical runs.
 - 5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
 - 6. On plastic pipe, install pads or cushions on bearing surfaces to prevent hanger from scratching pipe.
- D. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:
 - 1. NPS 3/4: Maximum span, 7 feet; minimum rod size, 1/4 inch.
 - 2. NPS 1: Maximum span, 7 feet; minimum rod size, 1/4 inch.
 - 3. NPS 1-1/2: Maximum span, 9 feet; minimum rod size, 3/8 inch.
 - 4. NPS 2: Maximum span, 10 feet; minimum rod size, 3/8 inch.
 - 5. NPS 2-1/2: Maximum span, 11 feet; minimum rod size, 3/8 inch.
 - 6. NPS 3: Maximum span, 12 feet; minimum rod size, 3/8 inch.
 - 7. NPS 4: Maximum span, 14 feet; minimum rod size, 1/2 inch.
 - 8. NPS 6: Maximum span, 17 feet; minimum rod size, 1/2 inch.
 - 9. NPS 8: Maximum span, 19 feet; minimum rod size, 5/8 inch.
 - 10. NPS 10: Maximum span, 20 feet; minimum rod size, 3/4 inch.
 - 11. NPS 12: Maximum span, 23 feet; minimum rod size, 7/8 inch.
 - 12. NPS 14: Maximum span, 25 feet; minimum rod size, 1 inch.
 - 13. NPS 16: Maximum span, 27 feet; minimum rod size, 1 inch.
 - 14. NPS 18: Maximum span, 28 feet; minimum rod size, 1-1/4 inches.
 - 15. NPS 20: Maximum span, 30 feet; minimum rod size, 1-1/4 inches.
- E. Install hangers for drawn-temper copper piping with the following maximum spacing and minimum rod sizes:
 - 1. NPS 3/4: Maximum span, 5 feet; minimum rod size, 1/4 inch.
 - 2. NPS 1: Maximum span, 6 feet; minimum rod size, 1/4 inch.

3. NPS 1-1/2: Maximum span, 8 feet; minimum rod size, 3/8 inch.
 4. NPS 2: Maximum span, 8 feet; minimum rod size, 3/8 inch.
 5. NPS 2-1/2: Maximum span, 9 feet; minimum rod size, 3/8 inch.
 6. NPS 3: Maximum span, 10 feet; minimum rod size, 3/8 inch.
- F. Plastic Piping Hanger Spacing: Space hangers according to pipe manufacturer's written instructions for service conditions. Avoid point loading. Space and install hangers with the fewest practical rigid anchor points.
- G. Fiberglass Piping Hanger Spacing: Space hangers according to pipe manufacturer's written instructions for service conditions. Avoid point loading. Space and install hangers with the fewest practical rigid anchor points.
- H. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

3.5 PIPE JOINT CONSTRUCTION

- A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- C. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- D. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.
- E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- F. Welded Joints: Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
- G. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- H. Plastic Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.

2. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
 3. PVC Pressure Piping: Join ASTM D 1785 schedule number, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule number PVC pipe and socket fittings according to ASTM D 2855.
 4. PVC Nonpressure Piping: Join according to ASTM D 2855.
- I. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.
 - J. Grooved Joints: Assemble joints with coupling and gasket, lubricant, and bolts. Cut or roll grooves in ends of pipe based on pipe and coupling manufacturer's written instructions for pipe wall thickness. Use grooved-end fittings and rigid, grooved-end-pipe couplings.
 - K. Mechanically Formed, Copper-Tube-Outlet Joints: Use manufacturer-recommended tool and procedure, and brazed joints.
 - L. Pressure-Sealed Joints: Use manufacturer-recommended tool and procedure. Leave insertion marks on pipe after assembly.

3.6 HYDRONIC SPECIALTIES INSTALLATION

- A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.
- B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Manual vents at heat-transfer coils and elsewhere as required for air venting.
- C. Install piping from boiler air outlet, air separator, or air purger to expansion tank with a 2 percent upward slope toward tank.
- D. Install in-line air separators in pump suction. Install drain valve on air separators NPS 2 and larger.
- E. Install tangential air separator in pump suction. Install blowdown piping with gate or full-port ball valve; extend full size to nearest floor drain.
- F. Install bypass chemical feeders in each hydronic system where indicated, in upright position with top of funnel not more than 48 inches above the floor. Install feeder in minimum NPS 3/4 bypass line, from main with full-size, full-port, ball valve in the main between bypass connections. Install NPS 3/4 pipe from chemical feeder drain, to nearest equipment drain and include a full-size, full-port, ball valve.
- G. Install expansion tanks above the air separator. Install tank fitting in tank bottom and charge tank. Use manual vent for initial fill to establish proper water level in tank.
 1. Install tank fittings that are shipped loose.
 2. Support tank from floor or structure above with sufficient strength to carry weight of tank, piping connections, fittings, plus tank full of water. Do not overload building components and structural members.

- H. Install expansion tanks on the floor. Vent and purge air from hydronic system, and ensure tank is properly charged with air to suit system Project requirements.

3.7 TERMINAL EQUIPMENT CONNECTIONS

- A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.
- B. Install control valves in accessible locations close to connected equipment.
- C. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.
- D. Install ports for pressure gages and thermometers at coil inlet and outlet connections according to Section 230519 "Meters and Gages for HVAC Piping."

3.8 FIELD QUALITY CONTROL

- A. Prepare hydronic piping according to ASME B31.9 and as follows:
 - 1. Leave joints, including welds, uninsulated and exposed for examination during test.
 - 2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
 - 3. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.
 - 4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
 - 5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.
- B. Perform the following tests on hydronic piping:
 - 1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
 - 2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
 - 3. Isolate expansion tanks and determine that hydronic system is full of water.
 - 4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
 - 5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.

6. Prepare written report of testing.
- C. Perform the following before operating the system:
1. Open manual valves fully.
 2. Inspect pumps for proper rotation.
 3. Set makeup pressure-reducing valves for required system pressure.
 4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
 5. Set temperature controls so all coils are calling for full flow.
 6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
 7. Verify lubrication of motors and bearings.

END OF SECTION 232113

This Page Intentionally Left Blank

SECTION 232123

HYDRONIC PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:

- 1. Close-coupled, in-line centrifugal pumps.
- 2. Separately coupled, base-mounted, double-suction centrifugal pumps.
- 3. Automatic condensate pump units.

1.3 DEFINITIONS

- A. Buna-N: Nitrile rubber.
- B. EPT: Ethylene propylene terpolymer.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of pump. Include certified performance curves and rated capacities, operating characteristics, furnished specialties, final impeller dimensions, and accessories for each type of product indicated. Indicate pump's operating point on curves.
- B. Shop Drawings: For each pump.
 - 1. Show pump layout and connections.
 - 2. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.
 - 3. Include diagrams for power, signal, and control wiring.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Mechanical Seals: One mechanical seal(s) for each pump.

PART 2 - PRODUCTS

2.1 CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:
 - 1. Armstrong Pumps Inc.
 - 2. Aurora Pump; Division of Pentair Pump Group.
 - 3. Crane Pumps & Systems.
 - 4. Flowserve Corporation.
 - 5. Grundfos Pumps Corporation.
 - 6. ITT Corporation; Bell & Gossett.
 - 7. Mepco, LLC.
 - 8. PACO Pumps.
 - 9. Patterson Pump Co.; a subsidiary of the Gorman-Rupp Co.
 - 10. Peerless Pump Company.
 - 11. TACO Incorporated.
 - 12. Thrush Company Inc.
- B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, close-coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally or vertically.
- C. Pump Construction:
 - 1. Casing: Radially split, cast iron, with threaded gage tappings at inlet and outlet, replaceable bronze wear rings, and threaded companion-flange connections.
 - 2. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For constant-speed pumps, trim impeller to match specified performance.
 - 3. Pump Shaft: Steel, with copper-alloy shaft sleeve.
 - 4. Seal: Packing seal consisting of stuffing box with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
 - 5. Pump Bearings: Permanently lubricated ball bearings.
- D. Motor: Single speed and rigidly mounted to pump casing.

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - a. Enclosure: Open, dripproof.
 - b. Enclosure Materials: Cast iron.
 - c. Motor Bearings: Permanently lubricated ball bearings.
 - d. Unusual Service Conditions:
 - 1) Ambient Temperature: 90 deg F.
 - 2) Altitude: 696 above sea level.
 - 3) High humidity.
 - e. Efficiency: Premium efficient.
 - f. NEMA Design: 3.
 - g. Service Factor: 1.5.

- E. Capacities and Characteristics:
1. See mechanical schedules

2.2 SEPARATELY COUPLED, BASE-MOUNTED, DOUBLE-SUCTION CENTRIFUGAL PUMPS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Armstrong Pumps Inc.
 2. Aurora Pump; Division of Pentair Pump Group.
 3. Crane Pumps & Systems.
 4. Flowserve Corporation.
 5. ITT Corporation; Bell & Gossett.
 6. Mepco, LLC.
 7. PACO Pumps.
 8. Patterson Pump Co.; a subsidiary of the Gorman-Rupp Co.
 9. Peerless Pump Company.
 10. TACO Incorporated.
- B. Description: Factory-assembled and -tested, centrifugal, impeller-between-bearings, separately coupled, double-suction pump as defined in HI 1.1-1.2 and HI 1.3; designed for base mounting, with pump and motor shafts horizontal.
- C. Pump Construction:
1. Casing: Vertically split, cast iron, with replaceable bronze wear rings, threaded gage tappings at inlet and outlet, drain plug at bottom and air vent at top of volute, and

- ASME B16.1, Class 250 flanges. Casing supports shall allow removal and replacement of impeller without disconnecting piping.
2. Impeller: ASTM B 584, low zinc silicon bronze; statically and dynamically balanced, and keyed to shaft. For pumps not frequency-drive controlled, trim impeller to match specified performance.
 3. Pump Shaft: Solid 416 stainless steel.
 4. Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless-steel spring, and EPT bellows and gasket.
 5. Seal: Packing seal consisting of stuffing box with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
 6. Pump Bearings: Grease-lubricated ball bearings in cast-iron housing with grease fittings.
- D. Shaft Coupling: Molded-rubber insert and interlocking spider capable of absorbing vibration. Couplings shall be drop-out type to allow disassembly and removal without removing pump shaft or motor.
- E. Coupling Guard: Dual rated; ANSI B15.1, Section 8; OSHA 1910.219 approved; steel; removable; attached to mounting frame:
- F. Mounting Frame: Welded-steel frame and cross members, factory fabricated from ASTM A 36/A 36M channels and angles. Fabricate to mount pump casing, coupling guard, and motor.
- G. Motor: Single speed, secured to mounting frame, with adjustable alignment.
1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - a. Enclosure: Totally enclosed, fan cooled.
 - b. Enclosure Materials: Cast iron.
 - c. Motor Bearings: Grease lubricated.
 - d. Unusual Service Conditions:
 - 1) Ambient Temperature: 90 deg F.
 - 2) Altitude: 696 ft above sea level.
 - 3) High humidity.
 - e. Efficiency: Premium efficient.
 - f. NEMA Design: 3.
 - g. Service Factor: 1.5.
- H. Capacities and Characteristics:
1. See mechanical schedules.

2.3 AUTOMATIC CONDENSATE PUMP UNITS

- A. Manufacturers: Subject to compliance with requirements provide products by one of the following:
1. Beckett Corporation.
 2. Hartell Pumps Div.; Milton Roy Co.
 3. Little Giant Pump Co.
 4. Mepco, LLC.
- B. Description: Packaged units with corrosion-resistant pump, plastic tank with cover, and automatic controls. Include factory- or field-installed check valve and a 72-inch- (1800-mm-) minimum, electrical power cord with plug.
- C. Capacities and Characteristics:
1. Capacity: 205 gallons per hour at 1' head.
 2. Shutoff Head: 10'.
 3. Switch on level: 2.5".
 4. Switch off level: 1.5".
 5. Outlet Size: 1/4" MNPT.
 6. Motor Horsepower: 1/150 HP.
 7. Electrical Characteristics:
 - a. Volts: 115.
 - b. Phase: Single.
 - c. Hertz: 60.
 - d. Full-Load Amperes: 1.1.

2.4 PUMP SPECIALTY FITTINGS

- A. Suction Diffuser:
1. Angle pattern.
 2. 175-psig pressure rating, cast-iron body and end cap, pump-inlet fitting.
 3. Bronze startup and bronze or stainless-steel permanent strainers.
 4. Bronze or stainless-steel straightening vanes.
 5. Drain plug.
 6. Factory-fabricated support.
- B. Triple-Duty Valve:
1. Angle or straight pattern.
 2. 175-psig pressure rating, cast-iron body, pump-discharge fitting.
 3. Drain plug and bronze-fitted shutoff, balancing, and check valve features.
 4. Brass gage ports with integral check valve and orifice for flow measurement.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.
- C. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PUMP INSTALLATION

- A. Comply with HI 1.4 and HI 2.4.
- B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.
- C. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.
- D. Automatic Condensate Pump Units: Install units for collecting condensate and extend to open drain.
- E. Equipment Mounting:
 - 1. Install base-mounted pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration Controls for HVAC."
- F. Equipment Mounting: Install in-line pumps with continuous-thread hanger rods and spring hangers with vertical-limit stop of size required to support weight of in-line pumps.
 - 1. Comply with requirements for seismic-restraint devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."
 - 2. Comply with requirements for hangers and supports specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."

3.3 ALIGNMENT

- A. Engage a factory-authorized service representative to perform alignment service.

- B. Comply with requirements in Hydronics Institute standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt motor to base frame. Do not use grout between motor feet and base frame.
- C. Comply with pump and coupling manufacturers' written instructions.
- D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.4 CONNECTIONS

- A. Where installing piping adjacent to pump, allow space for service and maintenance.
- B. Connect piping to pumps. Install valves that are same size as piping connected to pumps.
- C. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.
- D. Install check, shutoff, and throttling valves on discharge side of pumps.
- E. Install suction diffuser and shutoff valve on suction side of pumps.
- F. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.
- G. Install pressure gages on pump suction and discharge or at integral pressure-gage tapping, or install single gage with multiple-input selector valve.
- H. Install check valve and gate or ball valve on each condensate pump unit discharge.
- I. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- J. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.5 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Check piping connections for tightness.
 - 3. Clean strainers on suction piping.
 - 4. Perform the following startup checks for each pump before starting:
 - a. Verify bearing lubrication.
 - b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.

- c. Verify that pump is rotating in the correct direction.
5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
6. Start motor.
7. Open discharge valve slowly.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain hydronic pumps.

END OF SECTION 232123

SECTION 232500

HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes the following HVAC water-treatment systems:

- 1. Closed Loop Water Treatment Systems (all)

1.3 DEFINITIONS

- A. EEPROM: Electrically erasable, programmable read-only memory.
- B. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.
- C. RO: Reverse osmosis.
- D. TDS: Total dissolved solids.
- E. UV: Ultraviolet.

1.4 PERFORMANCE REQUIREMENTS

- A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or the environment.
- B. Base HVAC water treatment on quality of water available at the project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.
- C. Closed hydronic systems, including hot-water heating and chilled water, shall have the following water qualities:
 - 1. pH: Maintain a value within 9.0 to 10.5.
 - 2. "P" Alkalinity: Maintain a value within 100 to 500 ppm.

3. Boron: Maintain a value within 100 to 200 ppm.
4. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
5. Soluble Copper: Maintain a maximum value of 0.20 ppm.
6. TDS: Maintain a maximum value of 10 ppm.
7. Ammonia: Maintain a maximum value of 20 ppm.
8. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm.
9. Microbiological Limits:
 - a. Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
 - b. Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/ml.
 - c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
 - d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
 - e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

D. Open hydronic systems, including condenser water, shall have the following water qualities:

1. pH: Maintain a value within 8.0 to 9.1.
2. "P" Alkalinity: Maintain a maximum value of 100 ppm.
3. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
4. Soluble Copper: Maintain a maximum value of 0.20 ppm.
5. TDS: Maintain a maximum value of 10 ppm.
6. Ammonia: Maintain a maximum value of 20 ppm.
7. Free "OH" Alkalinity: Maintain a maximum value of 0 ppm
8. Microbiological Limits:
 - a. Total Aerobic Plate Count: Maintain a maximum value of 10,000 organisms/ml.
 - b. Total Anaerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
 - c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
 - d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
 - e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

9. Polymer Testable: Maintain a minimum value within 10 to 40.

E. Passivation for Galvanized Steel: For the first 60 days of operation.

1. pH: Maintain a value within 7 to 8.
2. Calcium Carbonate Hardness: Maintain a value within 100 to 300 ppm.
3. Calcium Carbonate Alkalinity: Maintain a value within 100 to 300 ppm.

1.5 ACTION SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for the following products:

1. Bypass feeders.
2. Water meters.
3. Inhibitor injection timers.
4. pH controllers.
5. TDS controllers.

6. Biocide feeder timers.
7. Chemical solution tanks.
8. Injection pumps.
9. Ozone generators.
10. UV-irradiation units.
11. Chemical test equipment.
12. Chemical material safety data sheets.
13. Water softeners.
14. RO units.
15. Multimedia filters.
16. Self-cleaning strainers.
17. Bag- or cartridge-type filters.
18. Centrifugal separators.

B. Shop Drawings: Pretreatment and chemical treatment equipment showing tanks, maintenance space required, and piping connections to HVAC systems. Include plans, elevations, sections, details, and attachments to other work.

1. Wiring Diagrams: Power and control wiring.

1.6 INFORMATIONAL SUBMITTALS

A. Field quality-control test reports.

B. Manufacturer Seismic Qualification Certification: Submit certification that water filtration units and components will withstand seismic forces defined in Section 230548 "Vibration and Seismic Controls for HVAC." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Other Informational Submittals:

1. Water-Treatment Program: Written sequence of operation on an annual basis for the application equipment required to achieve water quality defined in the "Performance Requirements" Article above.
2. Water Analysis: Illustrate water quality available at Project site.
3. Passivation Confirmation Report: Verify passivation of galvanized-steel surfaces, and confirm this observation in a letter to Commissioner.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For sensors, injection pumps, water filtration units, and controllers to include in emergency, operation, and maintenance manuals.

1.8 QUALITY ASSURANCE

- A. HVAC Water-Treatment Service Provider Qualifications: An experienced HVAC water-treatment service provider capable of analyzing water qualities, installing water-treatment equipment, and applying water treatment as specified in this Section.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.9 GUARANTEE SERVICE

- A. Scope of Guarantee Service: Provide chemicals and service program to maintain water conditions required above to inhibit corrosion, scale formation, and biological growth for cooling, chilled-water piping heating, hot-water piping condenser-water piping and equipment. Services and chemicals shall be provided for a period of one year from date of Substantial Completion, and shall include the following:
 - 1. Initial water analysis and HVAC water-treatment recommendations.
 - 2. Startup assistance for Contractor to flush the systems, clean with detergents, and initially fill systems with required chemical treatment prior to operation.
 - 3. Periodic field service and consultation.
 - 4. Customer report charts and log sheets.
 - 5. Laboratory technical analysis.
 - 6. Analyses and reports of all chemical items concerning safety and compliance with government regulations.

PART 2 - PRODUCTS

2.1 CLOSED LOOP WATER TREATMENT SYSTEMS

- A. Provide and maintain the quality of water as specified herein this request for water treatment service. The water treatment chemicals shall be dispensed through the use of an automatic water treatment chemical dispensing equipment – by pass and filter feeder - for the closed water system. The chemical feed system shall include, but not necessarily be limited to, the following:
 - 1. Provide a liquid organic inhibitor formulated for closed system chemical treatment engineered to prevent scale formation on heat exchanger surfaces and protect against corrosion of ferrous and non-ferrous metals. The product must contain inhibitors which minimize corrosion of ferrous and non-ferrous metals with corrosion rates not to exceed 0.5 mil per year for ferrous metals and 0.1 mil per year for non-ferrous.

2. Make regular systematic analytical examinations of the circulating heat transfer medium in the recirculating system, to insure that the inhibitor has not been depleted.
 3. The recirculating system shall be treated in such a manner as to control the pH value as determined by the chemical manufacturer to provide adequate protection.
- B. The water treatment performance tests must be conducted at least monthly on operating equipment. These tests shall only be performed by a fully qualified and fully licensed employee of the Water Treatment Contractor, who is experienced in the field of water treatment and whose sole duty is the performance of such tests. This employee shall be fully qualified, licensed and/or certified in strict accordance with any/all Municipal, Local, State and Federal Laws, Regulations and Codes to transport and dispense water treatment chemicals and perform water treatment performance/diagnostic tests. A copy of the results of these water treatment performance tests shall be posted in the on-site water treatment log book and a copy submitted to the City of NY via either U.S. Mail or via electronic mail (e-Mail) for their review immediately after performing these tests and in no case shall delivery of the test results Property Manager exceed five (5) calendar days
- C. The Water Treatment Contractor shall establish and maintain a Water Treatment Log at each location, which documents and records all water treatment performance/diagnostic test(s) by date, time, testing employee and results. The Water Treatment Contractor shall provide specific instructions on how the Water Treatment Contractor's employees will maintain the water treatment logs and how the results of the each water treatment performance/diagnostic test(s) will be documented and analyzed in order to ensure compliance to the specifications as detailed in this request for proposal. These instructions shall cover all water treatment performance/diagnostic test(s) required, proper interpretation of these test(s), and proper chemical feeding methods. The instructions shall describe the types and concentrations of chemical to be fed into the respective water systems as called for by the water test analysis

2.2 STAINLESS-STEEL PIPES AND FITTINGS

- A. Stainless-Steel Tubing: Comply with ASTM A 269, Type 316.
- B. Stainless-Steel Fittings: Complying with ASTM A 815/A 815M, Type 316, Grade WP-S.
- C. Two-Piece, Full-Port, Stainless-Steel Ball Valves: ASTM A 351, Type 316 stainless-steel body; ASTM A 276, Type 316 stainless-steel stem and vented ball, carbon-filled TFE seats, threaded body design with adjustable stem packing, threaded ends, and 250-psig SWP and 600-psig CWP ratings.
- D. Three-Piece, Full-Port, Stainless-Steel Ball Valves: ASTM A 351, Type 316 stainless-steel body; ASTM A 276, Type 316 stainless-steel stem and vented ball, threaded body design with adjustable stem packing, threaded ends, and 150-psig SWP and 600-psig CWP rating.

PART 3 - EXECUTION

3.1 WATER ANALYSIS

- A. Perform an analysis of supply water to determine quality of water available at Project site.

3.2 INSTALLATION

- A. Install chemical application equipment on concrete bases, level and plumb. Maintain manufacturer's recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor chemical tanks and floor-mounting accessories to substrate.
- B. Install seismic restraints for equipment and floor-mounting accessories and anchor to building structure. Refer to Section 230548 "Vibration and Seismic Controls for HVAC" for seismic restraints.
- C. Install water testing equipment on wall near water chemical application equipment.
- D. Install interconnecting control wiring for chemical treatment controls and sensors.
- E. Mount sensors and injectors in piping circuits.
- F. Bypass Feeders: Install in closed hydronic systems, including hot-water heating, chilled water, and equipped with the following:
 - 1. Install bypass feeder in a bypass circuit around circulating pumps, unless otherwise indicated on Drawings.
 - 2. Install water meter in makeup water supply.
 - 3. Install test-coupon assembly in bypass circuit around circulating pumps, unless otherwise indicated on Drawings.
 - 4. Install a gate or full-port ball isolation valves on inlet, outlet, and drain below feeder inlet.
 - 5. Install a swing check on inlet after the isolation valve.

3.3 WATER SOFTENER INSTALLATION

- A. Install water softener equipment on concrete bases, level and plumb. Maintain manufacturer's recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor mineral and brine tanks and floor-mounting accessories to substrate.
- B. Install seismic restraints for tanks and floor-mounting accessories and anchor to building structure. Refer to Section 230548 "Vibration and Seismic Controls for HVAC" for seismic restraints.
- C. Install brine lines and fittings furnished by equipment manufacturer but not factory installed.

- D. Prepare mineral-tank distribution system and underbed for minerals and place specified mineral into mineral tanks.
- E. Install water-testing sets on wall adjacent to water softeners.

3.4 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Make piping connections between HVAC water-treatment equipment and dissimilar-metal piping with dielectric fittings. Dielectric fittings are specified in Section 232113 "Hydronic Piping."
- D. Install shutoff valves on HVAC water-treatment equipment inlet and outlet. Metal general-duty valves are specified in Section 230523 "General-Duty Valves for HVAC Piping."
- E. Refer to Section 221119 "Domestic Water Piping Specialties" for backflow preventers required in makeup water connections to potable-water systems.
- F. Confirm applicable electrical requirements in electrical Sections for connecting electrical equipment.
- G. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- H. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Inspect field-assembled components and equipment installation, including piping and electrical connections.
 - 2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
 - 3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.

4. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
 5. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 6. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
 7. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
 8. Repair leaks and defects with new materials and retest piping until no leaks exist.
- C. Remove and replace malfunctioning units and retest as specified above.
- D. Sample boiler water at one-week intervals after boiler startup for a period of five weeks, and prepare test report advising City of New York of changes necessary to adhere to Part 1 "Performance Requirements" Article for each required characteristic. Sample boiler water at four-week intervals following the testing noted above to show that automatic filtration systems are maintaining water quality within performance requirements specified in this Section.
- E. At four-week intervals following Substantial Completion, perform separate water analyses on hydronic systems to show that automatic chemical-feed systems are maintaining water quality within performance requirements specified in this Section. Submit written reports of water analysis advising City of New York of changes necessary to adhere to Part 1 "Performance Requirements" Article.
- F. Comply with ASTM D 3370 and with the following standards:
1. Silica: ASTM D 859.
 2. Steam System: ASTM D 1066.
 3. Acidity and Alkalinity: ASTM D 1067.
 4. Iron: ASTM D 1068.
 5. Water Hardness: ASTM D 1126.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment. Refer to DDC General Conditions.
- B. Instruction: Provide a "how-to-use" self-contained breathing apparatus video that details exact operating procedures of equipment.

END OF SECTION 232500

SECTION 233113

METAL DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Single-wall rectangular ducts and fittings.
2. Sheet metal materials.
3. Duct liner.
4. Sealants and gaskets.
5. Hangers and supports.
6. DuraSystem Fire Rated Ductwork

B. Related Sections:

1. Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for metal ducts.
2. Section 233300 "Air Duct Accessories" for dampers, sound-control devices, duct-mounting access doors and panels, turning vanes, and flexible ducts.

1.3 PERFORMANCE REQUIREMENTS

- A. Design Criteria Submittal: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and performance requirements and design criteria indicated in "Duct Schedule" Article.
- B. Structural Performance: Duct hangers and supports shall withstand the effects of gravity and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and ASCE/SEI 7.
- C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Low emitting materials: Adhesive, sealant, paint and coating products used within the vapor barrier shall comply with VOC limits in Section 01 81 19.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of the following products:

1. Liners and adhesives.
2. Sealants and gaskets.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that duct systems comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
2. Product Data for Prerequisite EA 2: Documentation indicating that duct systems comply with ASHRAE/IESNA 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."
3. Leakage Test Report for Prerequisite EA 2: Documentation of work performed for compliance with ASHRAE/IESNA 90.1, Section 6.4.4.2.2 - "Duct Leakage Tests."
4. Duct-Cleaning Test Report for Prerequisite IEQ 1: Documentation of work performed for compliance with ASHRAE 62.1, Section 7.2.4 - "Ventilation System Start-up."
5. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
6. Provide a completed VOC submittal form per Section 01 81 13.

C. Shop Drawings:

1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
2. Factory- and shop-fabricated ducts and fittings.
3. Duct layout indicating sizes, configuration, liner material, and static-pressure classes.
4. Elevation of top of ducts.
5. Dimensions of main duct runs from building grid lines.
6. Fittings.
7. Reinforcement and spacing.
8. Seam and joint construction.
9. Penetrations through fire-rated and other partitions.
10. Equipment installation based on equipment being used on Project.
11. Locations for duct accessories, including dampers, turning vanes, and access doors and panels.
12. Hangers and supports, including methods for duct and building attachment, and vibration isolation.

D. Design Submittal:

1. Sheet metal thicknesses.
2. Joint and seam construction and sealing.
3. Reinforcement details and spacing.
4. Materials, fabrication, assembly, and spacing of hangers and supports.
5. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation for selecting hangers and supports .

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Duct installation in congested spaces, indicating coordination with general construction, building components, and other building services. Indicate proposed changes to duct layout.
 2. Suspended ceiling components.
 3. Structural members to which duct will be attached.
 4. Size and location of initial access modules for acoustical tile.
 5. Penetrations of smoke barriers and fire-rated construction.
 6. Items penetrating finished ceiling including the following:
 - a. Lighting fixtures.
 - b. Air outlets and inlets.
 - c. Speakers.
 - d. Sprinklers.
 - e. Access panels.
 - f. Perimeter moldings.
- B. Welding certificates.
- C. Field quality-control reports.

1.6 QUALITY ASSURANCE

- A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.
- B. Welding Qualifications: Qualify procedures and personnel according to the following:
1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
 2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports.
 3. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.
- C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-up."
- D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."
- E. Mockups:
1. Before installing duct systems, build mockups representing static-pressure classes in excess of 3-inch wg. Build mockups to comply with the following requirements, using materials indicated for the completed Work:

- a. Five transverse joints.
 - b. One access door(s).
 - c. Two typical branch connections, each with at least one elbow.
 - d. Two typical flexible duct or flexible-connector connections for each duct and apparatus.
 - e. One 90-degree turn(s) with turning vanes.
 - f. One fire damper(s).
 - g. Perform leakage tests specified in "Field Quality Control" Article. Revise mockup construction and perform additional tests as required to achieve specified minimum acceptable results.
2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

PART 2 - PRODUCTS

2.1 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.
- B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.2 SHEET METAL MATERIALS

- A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

- B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
 - 1. Galvanized Coating Designation: G90.
 - 2. Finishes for Surfaces Exposed to View: Mill phosphatized.
- C. PVC-Coated, Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
 - 1. Galvanized Coating Designation: G90.
 - 2. Minimum Thickness for Factory-Applied PVC Coating: 4 mils thick on sheet metal surface of ducts and fittings exposed to corrosive conditions, and minimum 1 mil thick on opposite surface.
 - 3. Coating Materials: Acceptable to authorities having jurisdiction for use on ducts listed and labeled by an NRTL for compliance with UL 181, Class 1.
- D. Carbon-Steel Sheets: Comply with ASTM A 1008/A 1008M, with oiled, matte finish for exposed ducts.
- E. Stainless-Steel Sheets: Comply with ASTM A 480/A 480M, Type 304 or 316, as indicated in the "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in the "Duct Schedule" Article.
- F. Aluminum Sheets: Comply with ASTM B 209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.
- G. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
 - 1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.
- H. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.3 DUCT LINER

- A. The duct lining shall have the following minimum R values:

Thickness (in)	R Value (hrft ² F/BTU)
1	4.3
1.5	6.3
2	8.7

The minimum duct lining sound absorption coefficients shall be as follows:

Thickness (in.)	NRC

1	.75
1.5	.90
2	1.00

B. Fibrous-Glass Duct Liner: Comply with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. CertainTeed Corporation; Insulation Group.
- b. Johns Manville.
- c. Knauf Insulation.
- d. Owens Corning.
- e. Maximum Thermal Conductivity:

- 1) Type I, Flexible: 0.27 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
- 2) Type II, Rigid: 0.23 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.

2. Water-Based Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C 916.

- a. For indoor applications, adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- b. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Flexible Elastomeric Duct Liner: Preformed, cellular, closed-cell, sheet materials complying with ASTM C 534, Type II, Grade 1; and with NFPA 90A or NFPA 90B.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. Aeroflex USA Inc.
- b. Armacell LLC.
- c. Rubatex International, LLC

2. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

3. Liner Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A or NFPA 90B.

- a. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- D. Natural-Fiber Duct Liner: 85 percent cotton, 10 percent borate, and 5 percent polybinding fibers, treated with a microbial growth inhibitor and complying with NFPA 90A or NFPA 90B.
- 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bonded Logic, Inc.
 - b. Reflectix Inc.
 - 2. Maximum Thermal Conductivity: 0.24 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature when tested according to ASTM C 518.
 - 3. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to ASTM E 84; certified by an NRTL.
 - 4. Liner Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A or NFPA 90B.
 - a. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- E. Insulation Pins and Washers:
- 1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
 - 2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick galvanized steel; with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- F. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 7-11, "Flexible Duct Liner Installation."
- 1. Adhere a single layer of indicated thickness of duct liner with at least 90 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.
 - 2. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.
 - 3. Butt transverse joints without gaps, and coat joint with adhesive.

4. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.
5. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and dimensions of standard liner make longitudinal joints necessary.
6. Apply adhesive coating on longitudinal seams in ducts with air velocity of 2500 fpm.
7. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
8. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:
 - a. Fan discharges.
 - b. Intervals of lined duct preceding unlined duct.
 - c. Upstream edges of transverse joints in ducts where air velocities are higher than 2500 fpm or where indicated.
9. Secure insulation between perforated sheet metal inner duct of same thickness as specified for outer shell. Use mechanical fasteners that maintain inner duct at uniform distance from outer shell without compressing insulation.
 - a. Sheet Metal Inner Duct Perforations: 3/32-inch diameter, with an overall open area of 23 percent.
10. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

2.4 2HR FIRE AND IMPACT RATED DUCT PRODUCT DESCRIPTION

- A. Prefabricated flanged duct sections with an overall wall thickness of 16.52 mm having the required pcf density and thickness to provide 2-hour fire resistance with a galvanized or stainless liner and galvanized or stainless steel impact resistant barrier determined by the nature of the installed environment.
- B. The duct assembly shall be listed to achieve a 2-hour fire resistance rating when tested to ISO 6944. Each duct section shall bear the cULus mark.
- C. The duct assembly shall be pressure tested to 8" w.c. positive pressure and 6" w.c. negative pressure.
- D. The duct assembly shall provide a minimum transmission loss rating of Hz/dB as follows: 63Hz/21dB; 125/24; 250/29; 500/30; 1000/34; 2000/37; 4000/36; 8000/36.
- E. Product is manufactured by DuraSystems Barriers Inc. 199 Courtland Ave. Vaughan, Ontario L4K 4T2 (905)-660-4455, (866)-338-0988. Please Contact Gerry Saieva.
- F. DuraDuct GNX - 2 hour cULus Listed Fire Resistance Rating

2.5 SEALANT AND GASKETS

- A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
- B. Two-Part Tape Sealing System:
1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
 2. Tape Width: 6 inches.
 3. Sealant: Modified styrene acrylic.
 4. Water resistant.
 5. Mold and mildew resistant.
 6. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
 7. Service: Indoor and outdoor.
 8. Service Temperature: Minus 40 to plus 200 deg F.
 9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum.
 10. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 11. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Water-Based Joint and Seam Sealant:
1. Application Method: Brush on.
 2. Solids Content: Minimum 65 percent.
 3. Shore A Hardness: Minimum 20.
 4. Water resistant.
 5. Mold and mildew resistant.
 6. VOC: Maximum 75 g/L (less water).
 7. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
 8. Service: Indoor or outdoor.
 9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.
- D. Solvent-Based Joint and Seam Sealant:
1. Application Method: Brush on.
 2. Base: Synthetic rubber resin.
 3. Solvent: Toluene and heptane.
 4. Solids Content: Minimum 60 percent.
 5. Shore A Hardness: Minimum 60.
 6. Water resistant.
 7. Mold and mildew resistant.
 8. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

9. VOC: Maximum 395 g/L.
10. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
11. Maximum Static-Pressure Class: 10-inch wg, positive or negative.
12. Service: Indoor or outdoor.
13. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

E. Flanged Joint Sealant: Comply with ASTM C 920.

1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.
6. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
7. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

F. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

2.6 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size,"
- D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.
- E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.
- F. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- H. Trapeze and Riser Supports:
 1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
 2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.

3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 - EXECUTION

3.1 DUCT INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.
- B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.
- C. Install ducts with fewest possible joints.
- D. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.
- E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
- F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- G. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.
- H. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.
- I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.
- J. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Section 233300 "Air Duct Accessories" for fire and smoke dampers.
- K. Protect duct interiors from moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings Under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines."

3.2 INSTALLATION OF EXPOSED DUCTWORK

- A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.
- B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.
- C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.
- D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.
- E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.3 ADDITIONAL INSTALLATION REQUIREMENTS FOR COMMERCIAL KITCHEN HOOD EXHAUST DUCT

- A. Install commercial kitchen hood exhaust ducts without dips and traps that may hold grease, and sloped a minimum of 2 percent to drain grease back to the hood.
- B. Install fire-rated access panel assemblies at each change in direction and at maximum intervals of 20 feet in horizontal ducts, and at every floor for vertical ducts, or as indicated on Drawings. Locate access panel on top or sides of duct a minimum of 1-1/2 inches from bottom of duct.
- C. Do not penetrate fire-rated assemblies except as allowed by applicable building codes and authorities having jurisdiction.

3.4 DUCT SEALING

- A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- B. Seal ducts to the following seal classes according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":
 - 1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
 - 2. Outdoor, Supply-Air Ducts: Seal Class A.
 - 3. Outdoor, Exhaust Ducts: Seal Class C.
 - 4. Outdoor, Return-Air Ducts: Seal Class C.
 - 5. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class B.
 - 6. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
 - 7. Unconditioned Space, Exhaust Ducts: Seal Class C.

8. Unconditioned Space, Return-Air Ducts: Seal Class B.
9. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class C.
10. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class B.
11. Conditioned Space, Exhaust Ducts: Seal Class B.
12. Conditioned Space, Return-Air Ducts: Seal Class C.

3.5 HANGER AND SUPPORT INSTALLATION

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
 1. Where practical, install concrete inserts before placing concrete.
 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
- C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.
- D. Hangers Exposed to View: Threaded rod and angle or channel supports.
- E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet.
- F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.6 CONNECTIONS

- A. Make connections to equipment with flexible connectors complying with Section 233300 "Air Duct Accessories."
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.7 PAINTING

- A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Section 099000.

3.8 FIELD QUALITY CONTROL

- A. Perform tests and inspections.

- B. Leakage Tests:

1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
2. Test the following systems:
 - a. Systems with a Design Static Pressure of Less than 2" Positive or Negative: Before installing exterior duct insulation, test all supply, return, outdoor air, and exhaust ductwork for air leakage. Conduct the tests per the latest edition of the SMACNA HVAC Air Duct Leakage Test Manual. The test pressure must be 25 percent greater than the design duct operating pressure. The total allowable leakage must not exceed 5.0 percent of the total system flow. When partial sections of the duct system are tested, the summation of all sections must not exceed the 5.0 percent total allowable leakage for the system. The test must be witnessed by an independent testing agency.
 - b. Systems with a Design Static Pressure of More than 2" Positive or Negative: Before installing exterior duct insulation, test all supply, return, outdoor air, and exhaust ductwork for air leakage. Conduct the tests per the latest edition of the SMACNA HVAC Air Duct Leakage Test Manual. The test pressure must be 25 percent greater than the design duct operating pressure. The total allowable leakage must not exceed 1.0 percent of the total system flow. When partial sections of the duct system are tested, the summation of all sections must not exceed the 1.0 percent total allowable leakage for the system. The test must be witnessed by an independent testing agency.
3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
4. Test for leaks before applying external insulation.
5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
6. Give seven days' advance notice for testing.

- C. Duct System Cleanliness Tests:

1. Visually inspect duct system to ensure that no visible contaminants are present.
2. Test sections of metal duct system, chosen randomly by City of New York, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."

- a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.
- D. Duct system will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

3.9 DUCT CLEANING

- A. Clean new duct system(s) before testing, adjusting, and balancing.
- B. Use service openings for entry and inspection.
 - 1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Section 233300 "Air Duct Accessories" for access panels and doors.
 - 2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
 - 3. Remove and reinstall ceiling to gain access during the cleaning process.
- C. Particulate Collection and Odor Control:
 - 1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
 - 2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.
- D. Clean the following components by removing surface contaminants and deposits:
 - 1. Air outlets and inlets (registers, grilles, and diffusers).
 - 2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
 - 3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
 - 4. Coils and related components.
 - 5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
 - 6. Supply-air ducts, dampers, actuators, and turning vanes.
 - 7. Dedicated exhaust and ventilation components and makeup air systems.
- E. Mechanical Cleaning Methodology:
 - 1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.

2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for wash-down procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

3.10 START UP

- A. Air Balance: Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC."

3.11 DUCT SCHEDULE –

A. Supply Ducts:

1. Ducts Connected to Fan Coil Units, Furnaces, Heat Pumps, and Terminal Units:
 - a. Pressure Class: Positive 2-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
2. Ducts Connected to Variable-Air-Volume Air-Handling Units:
 - a. Pressure Class: Positive 3-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 6.
3. Ducts Connected to Equipment Not Listed Above:
 - a. Pressure Class: Positive 2-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 6.

B. Return Ducts:

1. Ducts Connected to Fan Coil Units, Terminal Units:
 - a. Pressure Class: Positive or negative 2-inch wg.

- b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 2. Ducts Connected to Air-Handling Units:
 - a. Pressure Class: Positive or negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 3. Ducts Connected to Equipment Not Listed Above:
 - a. Pressure Class: Positive or negative 2-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 6.
- C. Exhaust Ducts:
- 1. Ducts Connected to Fans Exhausting (ASHRAE 62.1, Class 1 and 2) Air:
 - a. Pressure Class: Negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A if negative pressure, and A if positive pressure.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 2. Ducts Connected to Air-Handling Units:
 - a. Pressure Class: Positive or negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A if negative pressure, and A if positive pressure.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 3. Ducts Connected to Commercial Kitchen Hoods: Comply with NFPA 96.
 - a. Exposed to View: Type 304, stainless-steel sheet, No. 4 finish.
 - b. Concealed: Type 304, stainless-steel sheet, No. 2D finish.
 - c. Welded seams and joints.
 - d. Pressure Class: Positive or negative 3-inch wg.
 - e. Minimum SMACNA Seal Class: Welded seams, joints, and penetrations.
 - f. SMACNA Leakage Class: 3.
 - 4. Ducts Connected to Equipment Not Listed Above:
 - a. Pressure Class: Positive or negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A if negative pressure, and A if positive pressure.
 - c. SMACNA Leakage Class for Rectangular: 12.
- D. Outdoor-Air (Not Filtered, Heated, or Cooled) Ducts:
- 1. Ducts Connected to Fan Coil Units, Terminal Units:

- a. Pressure Class: Positive or negative 2-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 2. Ducts Connected to Air-Handling Units:
 - a. Pressure Class: Positive or negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - 3. Ducts Connected to Equipment Not Listed Above:
 - a. Pressure Class: Positive or negative 3-inch wg.
 - b. Minimum SMACNA Seal Class: A.
 - c. SMACNA Leakage Class for Rectangular: 12.
- E. Intermediate Reinforcement:
- 1. Galvanized-Steel Ducts: Galvanized steel or carbon steel coated with zinc-chromate primer.
 - 2. PVC-Coated Ducts:
 - a. Exposed to Airstream: Match duct material.
 - b. Not Exposed to Airstream: Match duct material.
 - 3. Stainless-Steel Ducts:
 - a. Exposed to Airstream: Match duct material.
 - b. Not Exposed to Airstream: Match duct material.
 - 4. Aluminum Ducts: Aluminum or galvanized sheet steel coated with zinc chromate.
- F. Liner:
- 1. LEED Prerequisite EA 2 requires that duct insulation R-value comply with ASHRAE/IESNA 90.1 tables titled "Minimum Duct Insulation R-Value, Cooling and Heating Only Supply Ducts and Return Ducts" and "Minimum Duct Insulation R-Value, Combined Heating and Cooling Supply Ducts and Return Ducts." If using liner alone to satisfy thermal requirements, verify that material selected is available in thickness needed to provide thermal performance without jeopardizing other requirements.
 - 2. Flexible elastomeric insulation is available in thicknesses through 1-1/2 inches (38 mm), which comply with NFPA 90A. Some options in subparagraphs below may create a restrictive proprietary specification. Verify availability of performance with manufacturers.
- G. The duct lining shall have the following minimum R values:

Thickness (in)	R Value (hrft ² F/BTU)
----------------	-----------------------------------

233113 - 18

Metal Ducts

1	4.3
1.5	6.3
2	8.7

The minimum duct lining sound absorption coefficients shall be as follows:

Thickness (in.)	NRC
1	.75
1.5	.90
2	1.00

H. Elbow Configuration:

1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."
 - a. Velocity 1000 fpm or Lower:
 - 1) Radius Type RE 1 with minimum 0.5 radius-to-diameter ratio.
 - 2) Mitered Type RE 4 without vanes.
 - b. Velocity 1000 to 1500 fpm:
 - 1) Radius Type RE 1 with minimum 1.0 radius-to-diameter ratio.
 - 2) Radius Type RE 3 with minimum 0.5 radius-to-diameter ratio and two vanes.
 - 3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."
 - c. Velocity 1500 fpm or Higher:
 - 1) Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
 - 2) Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
 - 3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."
2. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."
 - a. Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
 - b. Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.

- c. Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."

I. Branch Configuration:

- 1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-6, "Branch Connection."
 - a. Rectangular Main to Rectangular Branch: 45-degree entry.

END OF SECTION 233113

SECTION 233300

AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Manual volume dampers.
2. Control dampers.
3. Fire dampers.
4. Smoke dampers.
5. Combination fire and smoke dampers.
6. Flange connectors.
7. Turning vanes.
8. Remote damper operators.
9. Duct-mounted access doors.
10. Flexible connectors.
11. Flexible ducts.
12. Duct accessory hardware.

B. Related Requirements:

1. Section 283111 "Digital, Addressable Fire-Alarm System" for duct-mounted fire and smoke detectors.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. For duct silencers, include pressure drop and dynamic insertion loss data. Include breakout noise calculations for high transmission loss casings.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
2. Product Data for Prerequisite EA 2: Documentation indicating that duct insulation R-values comply with tables in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air Conditioning."

- C. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.
 - 1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:
 - a. Special fittings.
 - b. Manual volume damper installations.
 - c. Control-damper installations.
 - d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
 - e. Duct security bars.
 - f. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted access panels and access doors required for access to duct accessories are shown and coordinated with each other, using input from Installers of the items involved.
- B. Source quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

PART 2 - PRODUCTS

2.1 ASSEMBLY DESCRIPTION

- A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise

indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

2.2 MATERIALS

- A. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
 - 1. Galvanized Coating Designation: G90.
 - 2. Exposed-Surface Finish: Mill phosphatized.
- B. Stainless-Steel Sheets: Comply with ASTM A 480/A 480M, Type 304, and having a No. 2 finish for concealed ducts and No. 2 finish for exposed ducts.
- C. Aluminum Sheets: Comply with ASTM B 209, Alloy 3003, Temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.
- D. Extruded Aluminum: Comply with ASTM B 221, Alloy 6063, Temper T6.
- E. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.
- F. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.3 MANUAL VOLUME DAMPERS

- A. Standard, Steel, Manual Volume Dampers:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Air Balance Inc.; a division of Mestek, Inc.
 - b. American Warming and Ventilating; a division of Mestek, Inc.
 - c. Flexmaster U.S.A., Inc.
 - d. McGill AirFlow LLC.
 - e. Nailor Industries Inc.
 - f. Pottorff.
 - g. Ruskin Company.
 - h. Trox USA Inc.
 - i. Vent Products Company, Inc.
 - 2. Standard leakage rating, with linkage outside airstream.
 - 3. Suitable for horizontal or vertical applications.
 - 4. Frames:
 - a. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel.
 - b. Mitered and welded corners.
 - c. Flanges for attaching to walls and flangeless frames for installing in ducts.

5. Blades:
 - a. Multiple or single blade.
 - b. Parallel- or opposed-blade design.
 - c. Stiffen damper blades for stability.
 - d. Galvanized-steel, 0.064 inch thick.
 6. Blade Axles: Galvanized steel.
 7. Bearings:
 - a. Oil-impregnated bronze.
 - b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
 8. Tie Bars and Brackets: Galvanized steel.
- B. Low-Leakage, Steel, Manual Volume Dampers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Air Balance Inc.; a division of Mestek, Inc.
 - b. American Warming and Ventilating; a division of Mestek, Inc.
 - c. McGill AirFlow LLC.
 - d. Nailor Industries Inc.
 - e. Pottorff.
 - f. Ruskin Company.
 - g. Trox USA Inc.
 - h. Vent Products Company, Inc.
 2. Comply with AMCA 500-D testing for damper rating.
 3. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.
 4. Suitable for horizontal or vertical applications.
 5. Frames:
 - a. Hat shaped.
 - b. 0.094-inch- thick, galvanized sheet steel.
 - c. Mitered and welded corners.
 - d. Flanges for attaching to walls and flangeless frames for installing in ducts.
 6. Blades:
 - a. Multiple or single blade.
 - b. Parallel- or opposed-blade design.
 - c. Stiffen damper blades for stability.
 - d. Galvanized, roll-formed steel, 0.064 inch thick.
 7. Blade Axles: Galvanized steel.
 8. Bearings:

- a. Oil-impregnated bronze.
 - b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
- 9. Blade Seals: Neoprene.
 - 10. Jamb Seals: Cambered stainless steel.
 - 11. Tie Bars and Brackets: Galvanized steel.
 - 12. Accessories:
 - a. Include locking device to hold single-blade dampers in a fixed position without vibration.
- C. Jackshaft:
- 1. Size: 1-inch diameter.
 - 2. Material: Galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.
 - 3. Length and Number of Mountings: As required to connect linkage of each damper in multiple-damper assembly.
- D. Damper Hardware:
- 1. Zinc-plated, die-cast core with dial and handle made of 3/32-inch- thick zinc-plated steel, and a 3/4-inch hexagon locking nut.
 - 2. Include center hole to suit damper operating-rod size.
 - 3. Include elevated platform for insulated duct mounting.

2.4 CONTROL DAMPERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- 1. American Warming and Ventilating; a division of Mestek, Inc.
 - 2. Arrow United Industries; a division of Mestek, Inc.
 - 3. Cesco Products; a division of Mestek, Inc.
 - 4. Greenheck Fan Corporation.
 - 5. Lloyd Industries, Inc.
 - 6. McGill AirFlow LLC.
 - 7. Metal Form Manufacturing, Inc.
 - 8. Nailor Industries Inc.
 - 9. NCA Manufacturing, Inc.
 - 10. Pottorff.
 - 11. Ruskin Company.
 - 12. Vent Products Company, Inc.
 - 13. Young Regulator Company.
- B. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.

C. Frames:

1. Hat shaped.
2. 0.094-inch- thick, galvanized sheet steel.
3. Mitered and welded corners.

D. Blades:

1. Multiple blade with maximum blade width of 6 inches.
2. Opposed-blade design.
3. Galvanized-steel.
4. 0.064 inch thick single skin or 0.0747-inch- thick dual skin.
5. Blade Edging: Closed-cell neoprene.
6. Blade Edging: Inflatable seal blade edging, or replaceable rubber seals.

E. Blade Axles: 1/2-inch- diameter; galvanized steel; blade-linkage hardware of zinc-plated steel and brass; ends sealed against blade bearings.

1. Operating Temperature Range: From minus 40 to plus 200 deg F.

F. Bearings:

1. Oil-impregnated bronze.
2. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
3. Thrust bearings at each end of every blade.

2.5 FIRE DAMPERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Air Balance Inc.; a division of Mestek, Inc.
2. Arrow United Industries; a division of Mestek, Inc.
3. Cesco Products; a division of Mestek, Inc.
4. Greenheck Fan Corporation.
5. Nailor Industries Inc.
6. NCA Manufacturing, Inc.
7. Pottorff.
8. Prefco; Perfect Air Control, Inc.
9. Ruskin Company.
10. Vent Products Company, Inc.
11. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Type: Static and dynamic; rated and labeled according to UL 555 by an NRTL.

C. Closing rating in ducts up to 4-inch wg static pressure class and minimum 2000-fpm velocity.

D. Fire Rating: 1-1/2 and 3 hours.

- E. Frame: Curtain type with blades outside airstream; fabricated with roll-formed, 0.034-inch-thick galvanized steel; with mitered and interlocking corners.
- F. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
 - 1. Minimum Thickness: 0.138 inch thick, as indicated, and of length to suit application.
 - 2. Exception: Omit sleeve where damper-frame width permits direct attachment of perimeter mounting angles on each side of wall or floor; thickness of damper frame must comply with sleeve requirements.
- G. Mounting Orientation: Vertical or horizontal as indicated.
- H. Blades: Roll-formed, interlocking, 0.024-inch-thick, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch-thick, galvanized-steel blade connectors.
- I. Horizontal Dampers: Include blade lock and stainless-steel closure spring.
- J. Heat-Responsive Device: Replaceable, 165 deg F rated, fusible links.
- K. Heat-Responsive Device: Electric, resettable link and switch package, factory installed, 165 deg F rated.

2.6 SMOKE DAMPERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Air Balance Inc.; a division of Mestek, Inc.
 - 2. Cesco Products; a division of Mestek, Inc.
 - 3. Greenheck Fan Corporation.
 - 4. Nailor Industries Inc.
 - 5. Pottorff.
 - 6. Ruskin Company.
- B. General Requirements: Label according to UL 555S by an NRTL.
- C. Smoke Detector: Integral, factory wired for single-point connection.
- D. Frame: Hat-shaped, 0.094-inch-thick, galvanized sheet steel, with welded or mechanically attached corners and mounting flange.
- E. Blades: Roll-formed, horizontal, interlocking, 0.034-inch-thick, galvanized sheet steel.
- F. Leakage: Class II. Not to exceed 10 CFM per square feet at 1" WG.
- G. Rated pressure and velocity to exceed design airflow conditions.
- H. Mounting Sleeve: Factory-installed, 0.05-inch-thick, galvanized sheet steel; length to suit wall or floor application with factory-furnished silicone caulking.

- I. Damper Motors: Modulating or two-position action.
- J. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - 2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Section 230900 "Instrumentation and Control for HVAC."
 - 3. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
 - 4. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
 - 5. Outdoor Motors and Motors in Outdoor-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
 - 6. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
 - 7. Electrical Connection: 115 V, single phase, 60 Hz.
- K. Accessories:
 - 1. Auxiliary switches for signaling, fan control or position indication.
 - 2. Test and reset switches, remote mounted.

2.7 COMBINATION FIRE AND SMOKE DAMPERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Air Balance Inc.; a division of Mestek, Inc.
 - 2. Cesco Products; a division of Mestek, Inc.
 - 3. Greenheck Fan Corporation.
 - 4. Nailor Industries Inc.
 - 5. Pottorff.
 - 6. Ruskin Company.
- B. Type: Dynamic; rated and labeled according to UL 555 and UL 555S by an NRTL.
- C. Closing rating in ducts up to 4-inch wg static pressure class and minimum 2000-fpm velocity.
- D. Fire Rating: 1-1/2 and 3 hours.
- E. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel, with welded or mechanically attached corners and mounting flange.

- F. Heat-Responsive Device: Resettable, 165 deg F rated, fusible links.
- G. Heat-Responsive Device: Electric resettable link and switch package, factory installed, rated.
- H. Smoke Detector: Integral, factory wired for single-point connection.
- I. Blades: Roll-formed, horizontal, interlocking, 0.034-inch- thick, galvanized sheet steel.
- J. Leakage: Class II.
- K. Rated pressure and velocity to exceed design airflow conditions.
- L. Mounting Sleeve: Factory-installed, 0.05-inch- thick, galvanized sheet steel; length to suit wall or floor application with factory-furnished silicone caulking.
- M. Master control panel for use in dynamic smoke-management systems.
- N. Damper Motors: Modulating action.
- O. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - 2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Section 230900 "Instrumentation and Control for HVAC."
 - 3. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
 - 4. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
 - 5. Outdoor Motors and Motors in Outdoor-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
 - 6. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
 - 7. Electrical Connection: 115 V, single phase, 60 Hz.
- P. Accessories:
 - 1. Auxiliary switches for fan control or position indication.
 - 2. Test and reset switches, remote mounted.

2.8 FLANGE CONNECTORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ductmate Industries, Inc.
 - 2. Nexus PDQ; Division of Shilco Holdings Inc.
 - 3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Description: Add-on or roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.
- C. Material: Galvanized steel.
- D. Gage and Shape: Match connecting ductwork.

2.9 TURNING VANES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ductmate Industries, Inc.
 - 2. Duro Dyne Inc.
 - 3. Elgen Manufacturing.
 - 4. METALAIRE, Inc.
 - 5. SEMCO Incorporated.
 - 6. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
 - 1. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.
- C. Manufactured Turning Vanes for Nonmetal Ducts: Fabricate curved blades of resin-bonded fiberglass with acrylic polymer coating; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
- D. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."
- E. Vane Construction: Single wall for ducts up to 48 inches wide and double wall for larger dimensions.

2.10 REMOTE DAMPER OPERATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Pottorff.
 2. Ventfabrics, Inc.
 3. Young Regulator Company.
- B. Description: Cable system designed for remote manual damper adjustment.
- C. Tubing: Copper.
- D. Cable: Stainless steel.
- E. Wall-Box Mounting: Recessed.
- F. Wall-Box Cover-Plate Material: Stainless steel.

2.11 DUCT-MOUNTED ACCESS DOORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. American Warming and Ventilating; a division of Mestek, Inc.
 2. Cesco Products; a division of Mestek, Inc.
 3. Ductmate Industries, Inc.
 4. Elgen Manufacturing.
 5. Flexmaster U.S.A., Inc.
 6. Greenheck Fan Corporation.
 7. McGill AirFlow LLC.
 8. Nailor Industries Inc.
 9. Pottorff.
 10. Ventfabrics, Inc.
 11. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2, "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."
1. Door:
 - a. Double wall, rectangular.
 - b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
 - c. Vision panel.
 - d. Hinges and Latches: 1-by-1-inch butt or piano hinge and cam latches.
 - e. Fabricate doors airtight and suitable for duct pressure class.
 2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
 3. Number of Hinges and Locks:
 - a. Access Doors Less Than 12 Inches Square: No hinges and two sash locks.
 - b. Access Doors up to 18 Inches Square: Continuous and two sash locks.

- c. Access Doors up to 24 by 48 Inches: Continuous and two compression latches with outside and inside handles.
- d. Access Doors Larger Than 24 by 48 Inches: Continuous and two compression latches with outside and inside handles.

C. Pressure Relief Access Door:

- 1. Door and Frame Material: Galvanized sheet steel.
- 2. Door: Double wall with insulation fill with metal thickness applicable for duct pressure class.
- 3. Operation: Open outward for positive-pressure ducts and inward for negative-pressure ducts.
- 4. Factory set at 3.0- to 8.0-inch wg.
- 5. Doors close when pressures are within set-point range.
- 6. Hinge: Continuous piano.
- 7. Latches: Cam.
- 8. Seal: Neoprene or foam rubber.
- 9. Insulation Fill: 1-inch-thick, fibrous-glass or polystyrene-foam board.

2.12 DUCT ACCESS PANEL ASSEMBLIES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ductmate Industries, Inc.
 - 2. Flame Gard, Inc.
 - 3. 3M.
- B. Labeled according to UL 1978 by an NRTL.
- C. Panel and Frame: Minimum thickness 0.0528-inch carbon steel.
- D. Fasteners: Carbon steel. Panel fasteners shall not penetrate duct wall.
- E. Gasket: Comply with NFPA 96; grease-tight, high-temperature ceramic fiber, rated for minimum 2000 deg F.
- F. Minimum Pressure Rating: 10-inch wg, positive or negative.

2.13 FLEXIBLE CONNECTORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ductmate Industries, Inc.
 - 2. Duro Dyne Inc.
 - 3. Elgen Manufacturing.
 - 4. Ventfabrics, Inc.

5. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Materials: Flame-retardant or noncombustible fabrics.
- C. Coatings and Adhesives: Comply with UL 181, Class 1.
- D. Metal-Edged Connectors: Factory fabricated with a fabric strip 5-3/4 inches wide attached to two strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Provide metal compatible with connected ducts.
- E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
1. Minimum Weight: 26 oz./sq. yd..
 2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
 3. Service Temperature: Minus 40 to plus 200 deg F.
- F. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
1. Minimum Weight: 24 oz./sq. yd..
 2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.
 3. Service Temperature: Minus 50 to plus 250 deg F.
- G. High-Temperature System, Flexible Connectors: Glass fabric coated with silicone rubber.
1. Minimum Weight: 16 oz./sq. yd..
 2. Tensile Strength: 285 lbf/inch in the warp and 185 lbf/inch in the filling.
 3. Service Temperature: Minus 67 to plus 500 deg F.
- H. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with chemical-resistant coating.
1. Minimum Weight: 14 oz./sq. yd..
 2. Tensile Strength: 450 lbf/inch in the warp and 340 lbf/inch in the filling.
 3. Service Temperature: Minus 67 to plus 500 deg F.
- I. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression, and with a load stop. Include rod and angle-iron brackets for attaching to fan discharge and duct.
1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
 2. Outdoor Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
 3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
 4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
 5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
 6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.

7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.

2.14 FLEXIBLE DUCTS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Flexmaster U.S.A., Inc.
 2. McGill AirFlow LLC.
 3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Noninsulated, Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire.
 1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 10 to plus 160 deg F.
- C. Noninsulated, Flexible Duct: UL 181, Class 1, black polymer film supported by helically wound, spring-steel wire.
 1. Pressure Rating: 4-inch wg positive and 0.5-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 175 deg F.
- D. Noninsulated, Flexible Duct: UL 181, Class 1, multiple layers of aluminum laminate supported by helically wound, spring-steel wire.
 1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 210 deg F.
- E. Noninsulated, Flexible Duct: UL 181, Class 1, aluminum laminate and polyester film with latex adhesive supported by helically wound, spring-steel wire.
 1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 210 deg F.
- F. Noninsulated, Flexible Duct: UL 181, Class 0, interlocking spiral of aluminum foil.
 1. Pressure Rating: 8-inch wg positive or negative.
 2. Maximum Air Velocity: 5000 fpm.
 3. Temperature Range: Minus 100 to plus 435 deg F.
- G. Insulated, Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.

1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 10 to plus 160 deg F.
 4. Insulation R-value: Comply with ASHRAE/IESNA 90.1.
- H. Insulated, Flexible Duct: UL 181, Class 1, black polymer film supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.
1. Pressure Rating: 4-inch wg positive and 0.5-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 175 deg F.
 4. Insulation R-Value: Comply with ASHRAE/IESNA 90.1.
- I. Insulated, Flexible Duct: UL 181, Class 1, multiple layers of aluminum laminate supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.
1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 210 deg F.
 4. Insulation R-value: Comply with ASHRAE/IESNA 90.1.
- J. Insulated, Flexible Duct: UL 181, Class 1, aluminum laminate and polyester film with latex adhesive supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.
1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
 2. Maximum Air Velocity: 4000 fpm.
 3. Temperature Range: Minus 20 to plus 210 deg F.
 4. Insulation R-value: Comply with ASHRAE/IESNA 90.1.
- K. Insulated, Flexible Duct: UL 181, Class 0, interlocking spiral of aluminum foil; fibrous-glass insulation; polyethylene vapor-barrier film.
1. Pressure Rating: 8-inch wg positive or negative.
 2. Maximum Air Velocity: 5000 fpm.
 3. Temperature Range: Minus 20 to plus 250 deg F.
 4. Insulation R-value: Comply with ASHRAE/IESNA 90.1.
- L. Flexible Duct Connectors:
1. Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action in sizes 3 through 18 inches, to suit duct size.
 2. Non-Clamp Connectors: Adhesive plus sheet metal screws.

2.15 DUCT ACCESSORY HARDWARE

- A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

- B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.
- B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.
- C. Install control dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.
- D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.
 - 1. Install steel volume dampers in steel ducts.
 - 2. Install aluminum volume dampers in aluminum ducts.
- E. Set dampers to fully open position before testing, adjusting, and balancing.
- F. Install test holes at fan inlets and outlets and elsewhere as indicated.
- G. Install fire and smoke dampers according to UL listing.
- H. Install duct security bars. Construct duct security bars from 0.164-inch steel sleeve, continuously welded at all joints and 1/2-inch- diameter steel bars, 6 inches o.c. in each direction in center of sleeve. Weld each bar to steel sleeve and each crossing bar. Weld 2-1/2-by-2-1/2-by-1/4-inch steel angle to 4 sides and both ends of sleeve. Connect duct security bars to ducts with flexible connections. Provide 12-by-12-inch hinged access panel with cam lock in duct in each side of sleeve.
- I. Connect ducts to duct silencers rigidly.
- J. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
 - 1. On both sides of duct coils.
 - 2. Upstream and downstream from duct filters.
 - 3. At outdoor-air intakes and mixed-air plenums.
 - 4. At drain pans and seals.

5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
 6. Adjacent to and close enough to fire or smoke dampers, to reset or reinstall fusible links. Access doors for access to fire or smoke dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
 7. At each change in direction and at maximum 50-foot spacing.
 8. Upstream from turning vanes.
 9. Upstream or downstream from duct silencers.
 10. Control devices requiring inspection.
 11. Elsewhere as indicated.
- K. Install access doors with swing against duct static pressure.
- L. Access Door Sizes:
1. One-Hand or Inspection Access: 8 by 5 inches.
 2. Two-Hand Access: 12 by 6 inches.
 3. Head and Hand Access: 18 by 10 inches.
 4. Head and Shoulders Access: 21 by 14 inches.
 5. Body Access: 25 by 14 inches.
 6. Body plus Ladder Access: 25 by 17 inches.
- M. Label access doors according to Section 230553 "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.
- N. Install flexible connectors to connect ducts to equipment.
- O. For fans developing static pressures of 5-inch wg and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.
- P. Connect terminal units to supply ducts directly or with maximum 12-inch lengths of flexible duct. Do not use flexible ducts to change directions.
- Q. Connect diffusers or light troffer boots to ducts directly or with maximum 60-inch lengths of flexible duct clamped or strapped in place.
- R. Connect flexible ducts to metal ducts with adhesive plus sheet metal screws.
- S. Install duct test holes where required for testing and balancing purposes.
- T. Install thrust limits at centerline of thrust, symmetrical on both sides of equipment. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop of fans.

3.2 FIELD QUALITY CONTROL

- A. Tests and Inspections:

1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
4. Inspect turning vanes for proper and secure installation.
5. Operate remote damper operators to verify full range of movement of operator and damper.

END OF SECTION 233300

SECTION 233416

CENTRIFUGAL HVAC FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes: For each product.
 - 1. Airfoil centrifugal fans.
 - 2. Backward-inclined centrifugal fans.

1.3 ACTION SUBMITTALS

- A. Product Data:
 - 1. Include rated capacities, furnished specialties, and accessories for each fan.
 - 2. Certified fan performance curves with system operating conditions indicated.
 - 3. Certified fan sound-power ratings.
 - 4. Motor ratings and electrical characteristics, plus motor and electrical accessories.
 - 5. Material thickness and finishes, including color charts.
 - 6. Dampers, including housings, linkages, and operators.
- B. Shop Drawings:
 - 1. Include plans, elevations, sections, and attachment details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include diagrams for power, signal, and control wiring.
 - 4. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - 5. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Show fan room layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.
- B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For centrifugal fans to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Belts: One set(s) for each belt-driven unit.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. AMCA Compliance:
 - 1. Comply with AMCA performance requirements and bear the AMCA-Certified Ratings Seal.
 - 2. Operating Limits: Classify according to AMCA 99.
- B. Unusual Service Conditions:
 - 1. Ambient Temperature: 86 deg F.
 - 2. Altitude: 639 feet above sea level.
 - 3. High humidity.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Capacities and Characteristics:
 - 1. Total Airflow: refer to mechanical schedules.
 - 2. External Static Pressure: refer to mechanical schedules.
 - 3. Class: refer to mechanical schedules.
 - 4. Arrangement: refer to mechanical schedules.
 - 5. Housing Material: Reinforced steel.
 - 6. Special Housing Coating: Hot-dip galvanized;
 - 7. Wheel Size (Diameter): refer to mechanical schedules.
 - 8. Wheel Material: Steel.
 - 9. Special Wheel Coating: Hot-dip galvanized;

10. Brake Horsepower: refer to mechanical schedules.
11. Drive Type: refer to mechanical schedules.
12. Fan Rpm: refer to mechanical schedules.
13. Outlet Velocity: refer to mechanical schedules.
14. Motor:
 - a. Motor Enclosure: Totally enclosed, air over.
 - b. Enclosure Materials: Cast iron.
 - c. Efficiency: Premium efficient.
 - d. NEMA Design: 4.
 - e. Service Factor: refer to mechanical schedules.
 - f. Electrical Characteristics:
 - 1) Motor Size: refer to mechanical schedules.
 - 2) Motor Rpm: refer to mechanical schedules.
 - 3) Volts: refer to mechanical schedules.
 - 4) Phase: refer to mechanical schedules.
 - 5) Hertz: 60.
 - 6) Full-Load Amperes: refer to mechanical schedules.
 - 7) Minimum Circuit Ampacity: refer to mechanical schedules.
 - 8) Maximum Overcurrent Protection: refer to mechanical schedules.
15. Discharge Sound Power:
16. refer to mechanical schedules
17. Vibration Isolators: Spring isolators having a static deflection of 1 inch.
18. Spark-Resistance Class: A.

2.2 AIRFOIL CENTRIFUGAL FANS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Acme Engineering & Mfg. Corp.
 2. Chicago Blower Corporation.
 3. Cincinnati Fan.
 4. CML Northern Blower Inc.
 5. Howden Buffalo Inc.
 6. Loren Cook Company.
 7. New York Blower Company (The).
- B. Description:
 1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
 2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
 3. Factory-installed and -wired disconnect switch.

C. Housings:

1. Formed panels to make curved-scroll housings with shaped cutoff.
2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
3. Horizontally split, bolted-flange housing.
4. Spun inlet cone with flange.
5. Outlet flange.

D. Airfoil Wheels:

1. Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange.
2. Heavy backplate.
3. Hollow die-formed, airfoil-shaped blades continuously welded at tip flange and backplate.
4. Cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws.

E. Shafts:

1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Prelubricated and Sealed Shaft Bearings:

1. Self-aligning, pillow-block-type bearings.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

G. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, tapered roller bearings with double-locking collars and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

H. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

I. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.

4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

J. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.
2. Scroll Drain Connection: NPS 1 steel pipe coupling welded to low point of fan scroll.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Variable Inlet Vanes: With blades supported at both ends with two permanently lubricated bearings of same material as housing. Variable mechanism terminating in single control lever with control shaft for double-width fans.
5. Discharge Dampers: Assembly with opposed blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
6. Inlet Screens: Grid screen of same material as housing.
7. Shaft Cooler: Metal disk between bearings and fan wheel, designed to dissipate heat from shaft.
8. Spark-Resistant Construction: AMCA 99.
9. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
10. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

2.3 BACKWARD-INCLINED CENTRIFUGAL FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following :

1. Acme Engineering & Mfg. Corp.
2. Aerovent; a Twin City Fan company.
3. Central Blower Company.
4. Chicago Blower Corporation.
5. Cincinnati Fan.
6. CML Northern Blower Inc.
7. Howden Buffalo Inc.
8. Loren Cook Company.
9. New York Blower Company (The).

B. Description:

1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.

2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
3. Factory-installed and -wired disconnect switch.

C. Housings:

1. Formed panels to make curved-scroll housings with shaped cutoff.
2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
3. Horizontally split, bolted-flange housing.
4. Spun inlet cone with flange.
5. Outlet flange.

D. Backward-Inclined Wheels:

1. Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange, backplate, backward-inclined blades, and fastened to shaft with set screws.
2. Welded or riveted to flange and backplate; cast-iron or cast-steel hub riveted to backplate.

E. Shafts:

1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Prelubricated and Sealed Shaft Bearings:

1. Self-aligning, pillow-block-type ball bearings.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

G. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, tapered roller bearings with double-locking collars and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

H. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

I. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.

4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

J. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.
2. Scroll Drain Connection: NPS 1 steel pipe coupling welded to low point of fan scroll.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Variable Inlet Vanes: With blades supported at both ends with two permanently lubricated bearings of same material as housing. Variable mechanism terminating in single control lever with control shaft for double-width fans.
5. Discharge Dampers: Assembly with opposed blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
6. Inlet Screens: Grid screen of same material as housing.
7. Shaft Cooler: Metal disk between bearings and fan wheel, designed to dissipate heat from shaft.
8. Spark-Resistant Construction: AMCA 99.
9. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
10. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

2.4 MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

2.5 SOURCE QUALITY CONTROL

- A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.
- B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210/ASHRAE 51, "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install centrifugal fans level and plumb.
- B. Disassemble and reassemble units, as required for moving to the final location, according to manufacturer's written instructions.
- C. Lift and support units with manufacturer's designated lifting or supporting points.
- D. Equipment Mounting:
 - 1. Install centrifugal fans on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration Controls for HVAC."
- E. Curb Support: Install roof curb on roof structure, level and secure, according to "The NRCA Roofing and Waterproofing Manual," Low-Slope Membrane Roofing Construction Details Section, Illustration "Raised Curb Detail for Rooftop Air Handling Units and Ducts." Install and secure centrifugal fans on curbs, and coordinate roof penetrations and flashing with roof construction. Secure units to curb support with anchor bolts.
- F. Unit Support: Install centrifugal fans level on structural curbs. Coordinate wall penetrations and flashing with wall construction. Secure units to structural support with anchor bolts.
- G. Isolation Curb Support: Install centrifugal fans on isolation curbs, and install flexible duct connectors and vibration isolation and seismic-control devices.
 - 1. Comply with requirements in Section 233300 "Air Duct Accessories" for flexible duct connectors.
 - 2. Comply with requirements in Section 230548 "Vibration and Seismic Controls for HVAC" for vibration isolation and seismic-control devices.
- H. Install units with clearances for service and maintenance.
- I. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

- A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."
- B. Install ducts adjacent to fans to allow service and maintenance.

- C. Install piping from scroll drain connection, with trap with seal equal to 1.5 times specified static pressure, to nearest floor drain with pipe sizes matching the drain connection.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Verify that shipping, blocking, and bracing are removed.
 - 2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
 - 3. Verify that cleaning and adjusting are complete.
 - 4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
 - 5. Adjust belt tension.
 - 6. Adjust damper linkages for proper damper operation.
 - 7. Verify lubrication for bearings and other moving parts.
 - 8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
 - 9. See Section 230593 "Testing, Adjusting, and Balancing For HVAC" for testing, adjusting, and balancing procedures.
 - 10. Remove and replace malfunctioning units and retest as specified above.
- D. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain centrifugal fans.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 233600

AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:

- 1. Shutoff, single-duct air terminal units.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of the following products, including rated capacities, furnished specialties, sound-power ratings, and accessories.

- 1. Air terminal units.
 - 2. Liners and adhesives.
 - 3. Sealants and gaskets.
 - 4. Seismic-restraint devices.

- B. LEED Submittals:

- 1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

- C. Shop Drawings: For air terminal units. Include plans, elevations, sections, details, and attachments to other work.

- 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Wiring Diagrams: For power, signal, and control wiring.
 - 3. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation.

- D. Design Submittal:

- 1. Materials, fabrication, assembly, and spacing of hangers and supports.

2. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation for selecting hangers and supports and seismic restraints.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
 1. Ceiling suspension assembly members.
 2. Size and location of initial access modules for acoustic tile.
 3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
- B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in DDC General Conditions, include the following:
 1. Instructions for resetting minimum and maximum air volumes.
 2. Instructions for adjusting software set points.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Fan-Powered-Unit Filters: Furnish one spare filter(s) for each filter installed.

1.7 QUALITY ASSURANCE

- A. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and ASCE/SEI 7 SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems".

1. Seismic Hazard Level B: Seismic force to weight ratio, 0.30.

2.2 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 SHUTOFF, SINGLE-DUCT AIR TERMINAL UNITS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Anemostat Products; a Mestek Company.
2. Carnes.
3. Environmental Technologies, Inc.
4. Krueger.
5. METALAIRE, Inc.
6. Nailor Industries Inc.
7. Phoenix Controls Corporation.
8. Price Industries.
9. Titus.
10. Trane; a business of American Standard Companies.
11. Trox USA Inc.; a subsidiary of the TROX GROUP.
12. Tuttle & Bailey.
13. Warren Technology.

- B. Configuration: Volume-damper assembly inside unit casing with control components inside a protective metal shroud.

- C. Casing: 0.034-inch steel, single wall.

1. Casing Lining: Adhesive attached, 1-inch- thick, coated, fibrous-glass duct liner complying with ASTM C 1071, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.

- a. Cover liner with nonporous foil.

2. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
3. Air Outlet: S-slip and drive connections, size matching inlet size.
4. Access: Removable panels for access to parts requiring service, adjustment, or maintenance; with airtight gasket.
5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

- D. Regulator Assembly: System-air-powered bellows section incorporating polypropylene bellows for volume regulation and thermostatic control. Bellows shall operate at temperatures from 0 to 140 deg F, shall be impervious to moisture and fungus, shall be suitable for 10-inch wg static pressure, and shall be factory tested for leaks.

- E. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
 - 1. Maximum Damper Leakage: ARI 880 rated, 2 percent of nominal airflow at 3-inch wg inlet static pressure.
 - 2. Damper Position: Normally open.

- F. Attenuator Section: 0.034-inch steel sheet.
 - 1. Lining: Adhesive attached, 1-inch- thick, coated, fibrous-glass duct liner complying with ASTM C 1071, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.
 - a. Cover liner with nonporous foil.
 - 2. Lining: Adhesive attached, 3/4-inch- thick, polyurethane foam insulation complying with UL 181 erosion requirements, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.
 - 3. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

- G. Hydronic Coils: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch, and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain valve.
 - 1. Nickel chrome 80/20 heating elements.
 - 2. Airflow switch for proof of airflow.
 - 3. Fan interlock contacts.

- H. Electronic Controls: Bidirectional damper operator and microprocessor-based thermostat with integral airflow transducer and room sensor. Control devices shall be compatible with temperature controls specified in Section 230900 "Instrumentation and Control for HVAC" and shall have the following features:
 - 1. Damper Actuator: 24 V, powered closed, powered open.
 - 2. Velocity Controller: Factory calibrated and field adjustable to minimum and maximum air volumes; shall maintain constant airflow dictated by thermostat within 5 percent of set point while compensating for inlet static-pressure variations up to 4-inch wg; and shall have a multipoint velocity sensor at air inlet.
 - 3. Thermostat: Wall-mounted electronic type with temperature set-point display in Fahrenheit and Celsius.

- I. Direct Digital Controls: Single-package unitary controller and actuator specified in Section 230900 "Instrumentation and Control for HVAC."
 - 1. Room Sensor: Wall mounted with temperature set-point adjustment and access for connection of portable operator terminal.

- J. Control Sequence:

1. Suitable for operation with duct pressures between 0.25- and 3.0-inch wg inlet static pressure.
2. System-powered, wall-mounted thermostat.

2.4 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Steel Cables: Galvanized steel complying with ASTM A 603.
- D. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- E. Air Terminal Unit Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- F. Trapeze and Riser Supports: Steel shapes and plates for units with steel casings; aluminum for units with aluminum casings.
- G. Hanger Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.
- H. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

2.5 SOURCE QUALITY CONTROL

- A. Factory Tests: Test assembled air terminal units according to ARI 880.
 1. Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."
- B. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.
- C. Install wall-mounted thermostats.

3.2 HANGER AND SUPPORT INSTALLATION

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
 - 1. Where practical, install concrete inserts before placing concrete.
 - 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 - 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes and for slabs more than 4 inches thick.
 - 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes and for slabs less than 4 inches thick.
 - 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Hangers Exposed to View: Threaded rod and angle or channel supports.
- D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.3 SEISMIC-RESTRAINT-DEVICE INSTALLATION

- A. Install hangers and braces designed to support the air terminal units and to restrain against seismic forces required by applicable building codes. Comply with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems." ASCE/SEI 7.
- B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.
- C. Install cables so they do not bend across edges of adjacent equipment or building structure.
- D. Install cable restraints on air terminal units that are suspended with vibration isolators.
- E. Install seismic-restraint devices using methods approved by an evaluation service member of the ICC Evaluation Service and an agency acceptable to authorities having jurisdiction.
- F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- G. Drilling for and Setting Anchors:
 - 1. Identify position of reinforcing steel and other embedded items before drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify the Commissioner if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
 - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Wedge Anchors: Protect threads from damage during anchor installation. Install heavy-duty sleeve anchors with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Set anchors to manufacturer's recommended torque, using a torque wrench.
5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.4 CONNECTIONS

- A. Install piping adjacent to air terminal unit to allow service and maintenance.
- B. Hot-Water Piping: In addition to requirements in Section 232113 "Hydronic Piping", connect heating coils to supply with shutoff valve, strainer, control valve, and union or flange; and to return with balancing valve and union or flange.
- C. Connect ducts to air terminal units according to Section 233113 "Metal Ducts."
- D. Make connections to air terminal units with flexible connectors complying with requirements in Section 233300 "Air Duct Accessories."

3.5 IDENTIFICATION

- A. Label each air terminal unit with plan number, nominal airflow, and maximum and minimum factory-set airflows. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for equipment labels and warning signs and labels.

3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
- D. Tests and Inspections:
 1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
 2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- E. Air terminal unit will be considered defective if it does not pass tests and inspections.

- F. Prepare test and inspection reports.

3.7 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
 - 3. Verify that controls and control enclosure are accessible.
 - 4. Verify that control connections are complete.
 - 5. Verify that nameplate and identification tag are visible.
 - 6. Verify that controls respond to inputs as specified.

3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain air terminal units.

END OF SECTION 233600

SECTION 233713

DIFFUSERS, REGISTERS, AND GRILLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Round ceiling diffusers.
2. Rectangular and square ceiling diffusers.
3. Perforated diffusers.
4. Louver face diffusers.
5. Linear bar diffusers.
6. Linear slot diffusers.
7. Ceiling-integral continuous diffusers.
8. Light troffer diffusers.
9. Linear floor diffuser plenums.
10. Modular core supply grilles.
11. Continuous tubular diffusers.
12. Adjustable bar registers and grilles.
13. Linear bar grilles.

B. Related Sections:

1. Section 233300 "Air Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to diffusers, registers, and grilles.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated, include the following:

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
2. Diffuser, Register, and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

B. Samples for Initial Selection: For diffusers, registers, and grilles with factory-applied color finishes.

- C. Samples for Verification: For diffusers, registers, and grilles, in manufacturer's standard sizes to verify color selected.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
 - 1. Ceiling suspension assembly members.
 - 2. Method of attaching hangers to building structure.
 - 3. Size and location of initial access modules for acoustical tile.
 - 4. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
 - 5. Duct access panels.
- B. Source quality-control reports.

PART 2 - PRODUCTS

2.1 CEILING DIFFUSERS

- A. Round Ceiling Diffuser:
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anemostat Products; a Mestek company.
 - b. Carnes.
 - c. Hart & Cooley Inc.
 - d. METALAIRE, Inc.
 - e. Nailor Industries Inc.
 - f. Price Industries.
 - g. Titus.
 - h. Tuttle & Bailey.
 - 2. Devices shall be specifically designed for variable-air-volume flows.
 - 3. Material: Refer to Schedule Sheet.
 - 4. Finish: Refer to Schedule Sheet
 - 5. Face Style: Refer to Schedule Sheet.
 - 6. Mounting: Duct connection.
 - 7. Pattern: Refer to Schedule Sheet
 - 8. Dampers: Refer to Schedule Sheet
 - 9. Accessories:
 - a. Equalizing grid.
 - b. Plaster ring.

- c. Safety chain.
- d. Wire guard.
- e. Sectorizing baffles.
- f. Operating rod extension.

B. Rectangular and Square Ceiling Diffusers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. A-J Manufacturing Co., Inc.
- b. Anemostat Products; a Mestek company.
- c. Carnes.
- d. Hart & Cooley Inc.
- e. Krueger.
- f. METALAIRE, Inc.
- g. Nailor Industries Inc.
- h. Price Industries.
- i. Titus.
- j. Tuttle & Bailey.

2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Refer to Schedule Sheet
4. Finish: Refer to Schedule Sheet
5. Face Size: Refer to Schedule Sheet
6. Face Style: Refer to Schedule Sheet
7. Mounting: Refer to Schedule Sheet
8. Pattern: Refer to Schedule Sheet
9. Dampers: Refer to Schedule Sheet
10. Accessories:

- a. Equalizing grid.
- b. Plaster ring.
- c. Safety chain.
- d. Wire guard.
- e. Sectorizing baffles.
- f. Operating rod extension.

C. Perforated Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. Air Research Diffuser Products, Inc.
- b. A-J Manufacturing Co., Inc.
- c. Anemostat Products; a Mestek company.
- d. Carnes.
- e. Hart & Cooley Inc.

- f. Krueger.
 - g. METALAIRE, Inc.
 - h. Nailor Industries Inc.
 - i. Price Industries.
 - j. Titus.
 - k. Tuttle & Bailey.
 - l. Warren Technology.
2. Devices shall be specifically designed for variable-air-volume flows.
 3. Material: Steel backpan and pattern controllers, with steel face.
 4. Finish: Refer to Schedule Sheet
 5. Face Size: Refer to Schedule Sheet
 6. Duct Inlet: Refer to Schedule Sheet
 7. Face Style: Refer to Schedule Sheet
 8. Mounting: Refer to Schedule Sheet
 9. Pattern Controller: Refer to Schedule Sheet
 10. Dampers: Refer to Schedule Sheet
 11. Accessories:
 - a. Equalizing grid.
 - b. Plaster ring.
 - c. Safety chain.
 - d. Wire guard.
 - e. Sectorizing baffles.
 - f. Operating rod extension.

D. Louver Face Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. A-J Manufacturing Co., Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. METALAIRE, Inc.
 - e. Nailor Industries Inc.
 - f. Price Industries.
 - g. Titus.
 - h. Tuttle & Bailey.
2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Refer to Schedule Sheet
4. Finish: Refer to Schedule Sheet
5. Face Size: Refer to Schedule Sheet
6. Mounting: Refer to Schedule Sheet
7. Pattern: Refer to Schedule Sheet
8. Dampers: Refer to Schedule Sheet
9. Accessories:

- a. Square to round neck adaptor.
- b. Adjustable pattern vanes.
- c. Throw reducing vanes.
- d. Equalizing grid.
- e. Plaster ring.
- f. Safety chain.
- g. Wire guard.
- h. Sectorizing baffles.
- i. Operating rod extension.

2.2 CEILING LINEAR SLOT OUTLETS

A. Linear Bar Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Air Research Diffuser Products, Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Dayus Register & Grille Inc.
 - e. Hart & Cooley Inc.
 - f. Krueger.
 - g. METALAIRE, Inc.
 - h. Nailor Industries Inc.
 - i. Price Industries.
 - j. Titus.
 - k. Tuttle & Bailey.
2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Refer to Schedule Sheet
4. Finish: Refer to Schedule Sheet
5. Spacing Arrangement: Refer to Schedule Sheet
6. Frame: Refer to Schedule Sheet
7. Mounting Frame: Refer to Schedule Sheet
8. Mounting: Refer to Schedule Sheet
9. Damper Type: Refer to Schedule Sheet
10. Accessories: Refer to Schedule Sheet

B. Linear Slot Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Air Research Diffuser Products, Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.

- d. Hart & Cooley Inc.
- e. Krueger.
- f. METALAIRE, Inc.
- g. Nailor Industries Inc.
- h. Price Industries.
- i. Titus.
- j. Tuttle & Bailey.

- 2. Devices shall be specifically designed for variable-air-volume flows.
- 3. Material - Shell: Refer to Schedule Sheet
- 4. Material - Pattern Controller and Tees: Refer to Schedule Sheet.
- 5. Finish - Face and Shell: Refer to Schedule Sheet
- 6. Finish - Pattern Controller: Refer to Schedule Sheet
- 7. Finish - Tees: Refer to Schedule Sheet
- 8. Slot Width: Refer to Schedule Sheet
- 9. Number of Slots: Refer to Schedule Sheet
- 10. Length: Refer to Schedule Sheet
- 11. Accessories: Refer to Schedule Sheet.

C. Ceiling-Integral Continuous Diffuser:

- 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Air Research Diffuser Products, Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Hart & Cooley Inc.
 - e. Krueger.
 - f. METALAIRE, Inc.
 - g. Nailor Industries Inc.
 - h. Price Industries.
 - i. Titus.
 - j. Tuttle & Bailey.
- 2. Slot Width: TBD
- 3. Section Length: Refer to Schedule Sheet
- 4. Straight and curved sections as required to accommodate layout.
- 5. Mitered tees and corners.
- 6. Pattern Controllers: Refer to Schedule Sheet
- 7. Material: Aluminum, extruded, heavy wall.
- 8. Finishes:
 - a. Exterior: Standard white.
 - b. Interior: Standard black.
- 9. Throw: Refer to Schedule Sheet
- 10. Mounting: Refer to Schedule Sheet
- 11. Plenum: Refer to Schedule Sheet

12. Other Features:

- a. Painted interior.
- b. Blank-offs.

D. Light Troffer Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. Anemostat Products; a Mestek company.
- b. Carnes.
- c. Hart & Cooley Inc.
- d. Krueger.
- e. METALAIRE, Inc.
- f. Nailor Industries Inc.
- g. Price Industries.
- h. Titus.
- i. Tuttle & Bailey.

2. Devices shall be specifically designed for variable-air-volume flows.

3. Material: Refer to Schedule Sheet

4. Finish: Refer to Schedule Sheet

5. Slot Width: Refer to Schedule Sheet

6. Number of Sides: Refer to Schedule Sheet

7. Length: Refer to Schedule Sheet

8. Pattern: Refer to Schedule Sheet

9. Inlet: Refer to Schedule Sheet

10. Inlet Size: Refer to Schedule Sheet

2.3 UNDERFLOOR AIR DISTRIBUTION DIFFUSERS

A. Round Induction Diffusers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. Air Research Diffuser Products, Inc.
- b. Anemostat Products; a Mestek company.
- c. Carnes.
- d. Hart & Cooley Inc.
- e. Krueger.
- f. METALAIRE, Inc.
- g. Nailor Industries Inc.
- h. Price Industries.
- i. Titus.

2. Airflow Principle: Swirl-pattern induction.
3. Material: Plastic, high impact, and resistant to cart and foot traffic.
4. Color: TBD
5. Components:
 - a. Diffuser core.
 - b. Flow regulator.
 - c. Dirt and liquid catch pan.
 - d. Spacer flange.
 - e. Gasketed, underfloor compression ring.

B. Linear Floor Diffuser Plenums:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Air Research Diffuser Products, Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Hart & Cooley Inc.
 - e. Krueger.
 - f. METALAIRE, Inc.
 - g. Nailor Industries Inc.
 - h. Price Industries.
 - i. Titus.
2. Material: Steel.
3. Finish: White baked acrylic.
4. Deflection: Refer to Schedule Sheet
5. Components:
 - a. Aluminum diffuser core.
 - b. Diffuser frame.
 - c. Plenum, 0.034-inch steel.

2.4 FLEXIBLE DIFFUSION OUTLETS

A. Continuous Tubular Diffuser:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Air Distribution Concepts.
 - b. Airmax International.
 - c. DuctSox Corp.
 - d. Fabric Duct Systems.
 - e. FabricAir Inc.

2. Material: TBD
3. Duct Connection: Round.
4. Duct Connection Size: Refer to Schedule Sheet
5. Diffusion Hole Size: Refer to Schedule Sheet
6. Diffusion Hole Frequency - Number per 100 Feet: Refer to Schedule Sheet
7. Accessories:
 - a. Quick-connect joint.
 - b. Snap hooks.
 - c. Cleanout zipper.
 - d. Condensate drain.

2.5 REGISTERS AND GRILLES

A. Adjustable Bar Register:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. A-J Manufacturing Co., Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Dayus Register & Grille Inc.
 - e. Hart & Cooley Inc.
 - f. Krueger.
 - g. METALAIRE, Inc.
 - h. Nailor Industries Inc.
 - i. Price Industries.
 - j. Titus.
 - k. Tuttle & Bailey.
2. Material: Refer to Schedule Sheet
3. Finish: Refer to Schedule Sheet
4. Face Blade Arrangement: Refer to Schedule Sheet
5. Core Construction: Refer to Schedule Sheet
6. Rear-Blade Arrangement: Refer to Schedule Sheet
7. Frame: Refer to Schedule Sheet.
8. Mounting Frame: Refer to Schedule Sheet
9. Mounting: Refer to Schedule Sheet
10. Damper Type: Refer to Schedule Sheet
11. Accessories:
 - a. Refer to Schedule Sheet

B. Adjustable Bar Grille:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. A-J Manufacturing Co., Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Dayus Register & Grille Inc.
 - e. Hart & Cooley Inc.
 - f. Krueger.
 - g. METALAIRE, Inc.
 - h. Nailor Industries Inc.
 - i. Price Industries.
 - j. Titus.
 - k. Tuttle & Bailey.
2. Material: Refer to Schedule Sheet
3. Finish: Refer to Schedule Sheet
4. Face Blade Arrangement: Refer to Schedule Sheet
5. Core Construction: Refer to Schedule Sheet
6. Rear-Blade Arrangement: Refer to Schedule Sheet
7. Frame: Refer to Schedule Sheet
8. Mounting Frame: Refer to Schedule Sheet
9. Mounting: Refer to Schedule Sheet

C. Linear Bar Grille:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. A-J Manufacturing Co., Inc.
 - b. Anemostat Products; a Mestek company.
 - c. Carnes.
 - d. Dayus Register & Grille Inc.
 - e. Hart & Cooley Inc.
 - f. Krueger.
 - g. Nailor Industries Inc.
 - h. Price Industries.
 - i. Titus.
 - j. Tuttle & Bailey.
2. Material: Refer to Schedule Sheet
3. Finish: Refer to Schedule Sheet
4. Face Arrangement: Refer to Schedule Sheet
5. Distribution plenum.
 - a. Internal insulation.
 - b. Inlet damper.

6. Frame: TBD.
7. Mounting Frame: Refer to Schedule Sheet
8. Mounting: Refer to Schedule Sheet
9. Damper Type: Refer to Schedule Sheet

2.6 SOURCE QUALITY CONTROL

- A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install diffusers, registers, and grilles level and plumb.
- B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Commissioner for a determination of final location.
- C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.3 ADJUSTING

- A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 233713

This Page Intentionally Left Blank

SECTION 234100

PARTICULATE AIR FILTRATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

B. For filters associated with Air Handling Units and Fan Coil Units and other devices in the project specifications, refer to that particular section.

1.2 SUMMARY

A. Section Includes:

1. Metal panel filters.
2. Flat panel filters.
3. Pleated panel filters.
4. V-bank cell filters.
5. Front- and rear-access filter frames.
6. Side-service housings.
7. Filter gages.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
2. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
3. Laboratory Test Reports for Credit IEQ 4: For adhesives and sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

- C. Shop Drawings: For air filters. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show filter rack assembly, dimensions, materials, and methods of assembly of components.
 - 2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.
 - 3. Wiring Diagrams: For power, signal, and control wiring.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For each type of filter and rack to include in emergency, operation, and maintenance manuals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Provide one complete set(s) of filters for each filter bank. If system includes prefilters, provide only prefilters.
 - 2. Provide one container(s) of red oil for inclined manometer filter gage.

1.6 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ASHRAE Compliance:
 - 1. Comply with applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality"; Section 5 - "Systems and Equipment"; and Section 7 - "Construction and Startup."
 - 2. Comply with ASHRAE 52.1 for arrestance and ASHRAE 52.2 for MERV for methods of testing and rating air-filter units.
- C. Comply with NFPA 90A and NFPA 90B.

1.7 COORDINATION

- A. Coordinate sizes and locations of concrete bases. Cast anchor-bolt inserts into bases.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. All outdoor intakes shall have MERV 13 filters. Fans shall be sized with static to suit and meet design criteria through associate filters.
- B. Comply with all LEED requirements for filtration throughout.

2.2 METAL PANEL FILTERS

- A. Description: Factory-fabricated, self-supported, cleanable, all-metal, impingement-type, panel-type, permanent air filters with holding frames.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. AAF International.
 - b. Airguard.
 - c. Camfil Farr.
 - d. Filtration Group.
 - e. Flanders-Precisionaire.
 - f. Koch Filter Corporation.
 - g. Purafil, Inc.
 - h. Research Products Corp.
- B. Media: Six alternate layers of galvanized-steel flat and herringbone-crimp screen.
 - 1. Nonoiled for grease removal application.
 - 2. Adhesive coating.
 - a. Adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Filter-Media Frame: Galvanized steel, hinged, and with pull and retaining handles fastened to the media.
 - 1. Drain holes.
- D. Capacities and Characteristics:
 - 1. Refer to mechanical drawings.

2.3 FLAT PANEL FILTERS

- A. Description: Factory-fabricated, self-supported, flat, nonpleated, panel-type, disposable air filters with holding frames.
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. AAF International.
 - b. Airguard.
 - c. Camfil Farr.
 - d. Columbus Industries, Inc.
 - e. CRS Industries, Inc.; CosaTron Division.
 - f. D-Mark.
 - g. Filtration Group.
 - h. Flanders-Precisionaire.
 - i. Koch Filter Corporation.
 - j. Purafil, Inc.
 - k. Research Products Corp.
 - l. Tri-Dim Filter Corporation.
- B. Filter Unit Class: UL 900, Class 2.
- C. Media: Interlaced glass or synthetic fibers coated with nonflammable adhesive.
1. Adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
 3. Media shall be coated with an antimicrobial agent.
 4. Metal Retainer: Upstream side and downstream side.
- D. Filter-Media Frame: Galvanized steel with metal grid on outlet side and steel rod grid on inlet side, hinged, with pull and retaining handles sealed or bonded to the media.
- E. Mounting Frames: Welded galvanized steel, with gaskets and fasteners; suitable for bolting together into built-up filter banks.
- F. Capacities and Characteristics:
1. Refer to mechanical drawings.

2.4 PLEATED PANEL FILTERS

- A. Description: Factory-fabricated, self-supported, extended-surface, pleated, panel-type, disposable air filters with holding frames.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. AAF International.
- b. Airguard.
- c. Camfil Farr.
- d. Columbus Industries, Inc.
- e. CRS Industries, Inc.; CosaTron Division.
- f. D-Mark.
- g. Filtration Group.
- h. Flanders-Precisionaire.
- i. Koch Filter Corporation.
- j. Purafil, Inc.
- k. Research Products Corp.
- l. Tri-Dim Filter Corporation.

B. Filter Unit Class: UL 900, Class 2.

C. Media: Interlaced glass or synthetic fibers coated with nonflammable adhesive.

1. Adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
3. Media shall be coated with an antimicrobial agent.
4. Separators shall be bonded to the media to maintain pleat configuration.
5. Welded wire grid shall be on downstream side to maintain pleat.
6. Media shall be bonded to frame to prevent air bypass.
7. Support members on upstream and downstream sides to maintain pleat spacing.

D. Filter-Media Frame: Galvanized steel with metal grid on outlet side and steel rod grid on inlet side, hinged, with pull and retaining handles sealed or bonded to the media.

E. Mounting Frames: Welded galvanized steel, with gaskets and fasteners; suitable for bolting together into built-up filter banks.

F. Capacities and Characteristics:

1. Refer to mechanical drawings.

2.5 V-BANK CELL FILTERS

A. Description: Factory-fabricated, adhesive-coated, disposable, packaged air filters with media angled to airflow, and with holding frames.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. AAF International.
- b. Airguard.
- c. Camfil Farr.
- d. Columbus Industries, Inc.
- e. CRS Industries, Inc.; CosaTron Division.
- f. D-Mark.
- g. Filtration Group.
- h. Flanders-Precisionaire.
- i. Koch Filter Corporation.
- j. Purafil, Inc.
- k. Research Products Corp.
- l. Tri-Dim Filter Corporation.

B. Filter Unit Class: UL 900, Class 2.

C. Media: Fibrous material constructed so individual pleats are maintained in tapered form under rated-airflow conditions by flexible internal supports.

- 1. Adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 3. Media shall be coated with an antimicrobial agent.

D. Filter-Media Frames: Galvanized steel.

E. Mounting Frames: Welded galvanized steel, with gaskets and fasteners; suitable for bolting together into built-up filter banks.

F. Capacities and Characteristics:

- 1. Refer to mechanical drawings.

2.6 FRONT- AND REAR-ACCESS FILTER FRAMES

A. Framing System: Galvanized-steel framing members with access for either upstream (front) or downstream (rear) filter servicing, cut to size and prepunched for assembly into modules. Vertically support filters to prevent deflection of horizontal members without interfering with either filter installation or operation.

- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. AAF International.
 - b. Airguard.
 - c. Camfil Farr.
 - d. Columbus Industries, Inc.
 - e. CRS Industries, Inc.; CosaTron Division.
 - f. D-Mark.

- g. Filtration Group.
- h. Flanders-Precisionaire.
- i. Koch Filter Corporation.
- j. Purafil, Inc.
- k. Research Products Corp.

- B. Prefilters: Incorporate a separate track with spring clips, removable from front or back.
- C. Sealing: Factory-installed, positive-sealing device for each row of filters, to ensure seal between gasketed filter elements and to prevent bypass of unfiltered air.

2.7 SIDE-SERVICE HOUSINGS

- A. Description: Factory-assembled, side-service housings, constructed of galvanized steel with flanges to connect to duct or casing system.
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. AAF International.
 - b. Airguard.
 - c. Camfil Farr.
 - d. Columbus Industries, Inc.
 - e. CRS Industries, Inc.; CosaTron Division.
 - f. D-Mark.
 - g. Filtration Group.
 - h. Flanders-Precisionaire.
 - i. Koch Filter Corporation.
 - j. Purafil, Inc.
 - k. Research Products Corp.
- B. Prefilters: Integral tracks to accommodate 2-inch- deep, disposable or washable filters.
- C. Access Doors: Hinged, with continuous gaskets on perimeter and positive-locking devices, and arranged so filter cartridges can be loaded from either access door.
- D. Sealing: Incorporate positive-sealing gasket material on channels to seal top and bottom of filter cartridge frames and to prevent bypass of unfiltered air.

2.8 FILTER GAGES

- A. Diaphragm-type gage with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- a. Airguard.
 - b. Dwyer Instruments, Inc.
2. Diameter: 2 inches.
 3. Scale Range for Filter Media Having a Recommended Final Resistance of 0.5-Inch wg or Less: 0- to 0.5-inch wg.
 4. Scale Range for Filter Media Having a Recommended Final Resistance of 0.5- to 1.0-Inch wg or Less: 0- to 1.0-inch wg.
 5. Scale Range for Filter Media Having a Recommended Final Resistance of 1.0- to 2.0-Inch wg or Less: 0- to 2.0-inch wg.
 6. Scale Range for Filter Media Having a Recommended Final Resistance of 2.0- to 3.0-Inch wg or Less: 0- to 3.0-inch wg.
 7. Scale Range for Filter Media Having a Recommended Final Resistance of 3.0- to 4.0-Inch wg or Less: 0- to 4.0-inch wg.
- B. Manometer-Type Filter Gage: Molded plastic, with epoxy-coated aluminum scale and logarithmic-curve tube gage with integral leveling gage, graduated to read from 0- to 3.0-inch wg, and accurate within 3 percent of the full scale range.
- C. Accessories: Static-pressure tips, tubing, gage connections, and mounting bracket.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.
- B. Install filters in position to prevent passage of unfiltered air.
- C. Install filter gage for each filter bank.
- D. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing with new, clean filters.
- E. Install filter-gage, static-pressure taps upstream and downstream from filters. Install filter gages on filter banks with separate static-pressure taps upstream and downstream from filters. Mount filter gages on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gages.
- F. Coordinate filter installations with duct and air-handling-unit installations.

3.2 FIELD QUALITY CONTROL

- A. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:

1. Operate automatic roll filters to demonstrate compliance with requirements.
2. Test for leakage of unfiltered air while system is operating.

C. Air filter will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.3 CLEANING

- A. After completing system installation and testing, adjusting, and balancing of air-handling and air-distribution systems, clean filter housings and install new filter media.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 235533

FUEL-FIRED UNIT HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes gas-fired unit heaters.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of fuel-fired unit heater indicated. Include rated capacities, operating characteristics, and accessories.
- B. Shop Drawings: For fuel-fired unit heaters; signed and sealed by a qualified professional engineer. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Prepared by or under the supervision of a qualified professional engineer detailing fabrication and assembly of fuel-fired unit heaters, as well as procedures and diagrams.
 - 2. Design Calculations: Calculate requirements for selecting vibration isolators and for designing vibration isolation bases.
 - 3. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 4. Wiring Diagrams: Power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, elevations, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Structural members to which equipment will be attached.
 - 2. Items penetrating roof and the following:
 - a. Vent and gas piping rough-ins and connections.
- B. Field quality-control test reports.

- C. Warranty: Special warranty specified in this Section.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fuel-fired unit heaters to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- 1. Fan Belts: One for each belt-driven fan size.

1.7 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace heat exchanger of fuel-fired unit heater that fails in materials or workmanship within specified warranty period.

- 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GAS-FIRED UNIT HEATERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:

- 1. Lennox Industries, Inc.
- 2. Modine Manufacturing Company.
- 3. Reznor/Thomas & Betts Corporation.
- 4. Sterling HVAC Products; Div. of Mestek Technology Inc.
- 5. Solaronics.

- B. Description: Factory assembled, piped, and wired, and complying with ANSI Z83.8/CSA 2.6.

- C. Fuel Type: Design burner for natural gas having characteristics same as those of gas available at Project site.
- D. Type of Venting: Gravity vented.
- E. Housing: Steel, with integral draft hood and inserts for suspension mounting rods.
 - 1. External Casings and Cabinets: Baked enamel over corrosion-resistant-treated surface.
- F. Heat Exchanger: Stainless steel.
- G. Burner Material: Stainless steel.
- H. Unit Fan: Formed-steel propeller blades riveted to heavy-gage steel spider bolted to cast-iron hub, dynamically balanced, and resiliently mounted.
 - 1. Fan-Blade Guard: Galvanized steel, complying with OSHA specifications, removable for maintenance.
 - 2. General requirements for motors are specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
- I. Unit Fan: Steel, centrifugal fan dynamically balanced and resiliently mounted.
 - 1. Belt-Driven Drive Assembly: Resiliently mounted to housing, with the following features:
 - a. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - b. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
 - c. Pulleys: Cast-iron, adjustable-pitch motor pulley.
 - 2. General requirements for motors are specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
- J. Controls: Regulated redundant gas valve containing pilot solenoid valve, electric gas valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.
 - 1. Gas Control Valve: Single stage.
 - 2. Ignition: Electronically controlled electric spark with flame sensor.
 - 3. Fan Thermal Switch: Operates fan on heat-exchanger temperature.
 - 4. Vent Flow Verification: Flame rollout switch.
 - 5. High Limit: Thermal switch or fuse to stop burner.
 - 6. Thermostats: No thermostat is required. Provide manually-actuated timer with maximum on-time of 30 minutes.
- K. Accessories:
 - 1. Discharge Nozzle: Discharge at 50 to 90 degrees (0.87 to 1.57 radians) from horizontal.
 - 2. Four-point suspension kit.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install and connect gas-fired unit heaters and associated fuel and vent features and systems according to NFPA 54, applicable local codes and regulations, and manufacturer's written installation instructions.
- B. Suspended Units: Suspend from substrate using threaded rods, spring hangers, and building attachments. Secure rods to unit hanger attachments. Adjust hangers so unit is level and plumb. Install in accordance with all manufacturer's recommendations.

3.2 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to fuel-fired unit heater to allow service and maintenance.
- C. Gas Piping: Comply with all relevant codes and standards. Connect gas piping to gas train inlet; provide union with enough clearance for burner removal and service.
- D. Vent Connections: Comply with all relevant codes and standards, and manufacturers' recommendations.
- E. Electrical Connections: Comply with applicable requirements in electrical Sections.
 - 1. Install electrical devices furnished with heaters but not specified to be factory mounted.

3.3 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.
- B. Tests and Inspections:
 - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 2. Verify bearing lubrication.
 - 3. Verify proper motor rotation.
 - 4. Test Reports: Prepare a written report to record the following:
 - a. Test procedures used.
 - b. Test results that comply with requirements.
 - c. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

- C. Remove and replace malfunctioning units and retest as specified above.

3.4 ADJUSTING

- A. Adjust initial temperature set points.
- B. Adjust burner and other unit components for optimum heating performance and efficiency.

3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and service fuel-fired unit heaters. Refer to DDC General Conditions.

END OF SECTION 235533

This Page Intentionally Left Blank

SECTION 235700

HEAT EXCHANGERS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes plate and frame heat exchangers.

1.3 DEFINITIONS

- A. TEMA: Tubular Exchanger Manufacturers Association.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, and furnished specialties and accessories.
- B. Shop Drawings: Signed and sealed by a qualified professional engineer. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Design Calculations: Calculate requirements for selecting seismic restraints and for designing bases.
 - 2. Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.
- C. Design Submittal: Details and design calculations for seismic restraints for heat exchangers.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Equipment room, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Tube-removal space.
 - 2. Structural members to which heat exchangers will be attached.

- B. Seismic Qualification Certificates: For heat exchanger, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Heat Exchanger: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of heat exchanger anchorage devices on which certification is based and their installation requirements.
- C. Product Certificates: For each type of shell-and-tube heat exchanger. Documentation that shell-and-tube heat exchangers comply with "TEMA Standards."
- D. Source quality-control reports.
- E. Field quality-control reports.
- F. Sample Warranty: For manufacturer's warranty.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals.

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of domestic-water heat exchangers that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures including heat exchanger, storage tank, and supports.
 - b. Faulty operation of controls.
 - c. Deterioration of metals, metal finishes, and other materials beyond normal use.
 - 2. Warranty Periods: From date of Substantial Completion.
 - a. Plate, Heat Exchangers:
 - 1) Plate-and-Frame Type: 2 year(s).

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Engineering Services: Engage a qualified professional engineer, to design seismic restraints for heat exchangers.

- B. Seismic Performance: Heat exchangers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Component Importance Factor is 1.5.

2.2 GASKETED-PLATE HEAT EXCHANGERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
 - 1. Alfa Laval Inc.
 - 2. API Heat Transfer Inc.
 - 3. APV; a brand of SPX Corporation.
 - 4. Armstrong Pumps, Inc.
 - 5. Delta T Heat Exchangers.
 - 6. ITT Corporation; Bell & Gossett.
 - 7. Mueller, Paul, Company.
 - 8. Polaris Plate Heat Exchangers.
 - 9. SEC Heat Exchangers.
 - 10. TACO Incorporated.
 - 11. Thermo Dynamics Ltd.
 - 12. Tranter, Inc.
- B. Configuration: Freestanding assembly consisting of frame support, top and bottom carrying and guide bars, fixed and movable end plates, tie rods, individually removable plates, and one-piece gaskets.
- C. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1.
- D. Frame:
 - 1. Capacity to accommodate 30 percent additional plates.
 - 2. Painted carbon steel with provisions for anchoring to support.
- E. Top and Bottom Carrying and Guide Bars: Painted carbon steel, aluminum, or stainless steel.
 - 1. Fabricate attachment of heat-exchanger carrying and guide bars with reinforcement strong enough to resist heat-exchanger movement during seismic event when heat-exchanger carrying and guide bars are anchored to building structure.
- F. End-Plate Material: Painted carbon steel.
- G. Tie Rods and Nuts: Steel or stainless steel.
- H. Plate Material: 0.024 inch thick before stamping; Type 304 stainless steel.

- I. Gasket Materials: Nitrile rubber.
 - 1. Glue: Chlorine free.
- J. Piping Connections: Factory fabricated of materials compatible with heat-exchanger shell. Attach tappings to shell before testing and labeling.
 - 1. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
 - 2. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.
- K. Enclose plates in solid stainless-steel removable shroud.
- L. Capacities and Characteristics:
 - 1. Refer to mechanical drawings.

2.3 ACCESSORIES

- A. Hangers and Supports:
 - 1. Custom, steel supports for mounting on floor (concrete pad).
 - 2. Factory-fabricated steel supports to ensure both horizontal and vertical support of heat exchanger. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- B. Shroud: Stainless-steel sheet.
- C. Pressure Relief Valves: Steel, 2 inch, ASME rated and stamped.
 - 1. Pressure relief valve setting: as per TAB technician report.

2.4 SOURCE QUALITY CONTROL

- A. Factory Tests: Test and inspect heat exchangers according to ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1. Affix ASME label.
- B. Hydrostatically test heat exchangers to minimum of one and one-half times pressure rating before shipment.
- C. Heat exchangers will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.
- B. Examine roughing-in for heat-exchanger piping to verify actual locations of piping connections before equipment installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 GASKETED-PLATE HEAT-EXCHANGER INSTALLATION

- A. Install gasketed-plate heat exchanger on custom-designed wall supports anchored to structure as indicated on Drawings.
- B. Install metal shroud over installed gasketed-plate heat exchanger according to manufacturer's written instructions.

3.3 CONNECTIONS

- A. Comply with requirements for piping specified in other Section 232113 "Hydronic Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Maintain manufacturer's recommended clearances for tube removal, service, and maintenance.
- C. Install piping adjacent to heat exchangers to allow space for service and maintenance of heat exchangers. Arrange piping for easy removal of heat exchangers.
- D. Install shutoff valves at heat-exchanger inlet and outlet connections.
- E. Install relief valves on heat-exchanger heated-fluid connection and install pipe relief valves, full size of valve connection, to floor drain.
- F. Install vacuum breaker at heat-exchanger steam inlet connection.
- G. Install hose end valve to drain shell.
- H. Install thermometer on heat-exchanger and inlet and outlet piping, and install thermometer on heating-fluid inlet and outlet piping. Comply with requirements for thermometers specified in Section 230519 "Meters and Gages for HVAC Piping."
- I. Install pressure gages on heat-exchanger and heating-fluid piping. Comply with requirements for pressure gages specified in Section 230519 "Meters and Gages for HVAC Piping."

3.4 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Heat exchanger will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.5 CLEANING

- A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain heat exchangers.

END OF SECTION 235700

SECTION 237200 - AIR-TO-AIR ENERGY RECOVERY EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Heat wheels.
2. Packaged energy recovery units.

1.3 PERFORMANCE REQUIREMENTS

- A. Engineering Criteria Submittal: Provide vibration isolation and seismic-restraint details, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and engineering criteria indicated.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. LEED Submittals:
1. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.
 2. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Shop Drawings: For air-to-air energy recovery equipment. Include plans, elevations, sections, details, and attachments to other work.
1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 2. Wiring Diagrams: For power, signal, and control wiring.
- D. Engineering Services Submittal: For air-to-air energy recovery equipment indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail fabrication and assembly of air-to-air energy recovery equipment.
2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
3. Design Calculations: Calculate requirements for selecting vibration isolators and for designing vibration isolation bases.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, elevations, and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
 1. Suspended ceiling components.
 2. Structural members to which equipment or suspension systems will be attached.
- B. Seismic Qualification Certificates: For air-to-air energy recovery equipment, accessories, and components, from manufacturer.
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For air-to-air energy recovery equipment to include in maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Filters: One set(s) of each type of filter specified.
 2. Fan Belts: One set(s) of belts for each belt-driven fan in energy recovery units.
 3. Wheel Belts: One set(s) of belts for each heat wheel.

1.8 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ARI Compliance:

1. Capacity ratings for air-to-air energy recovery equipment shall comply with ARI 1060, "Performance Rating of Air-to-Air Heat Exchangers for Energy Recovery Ventilation Equipment."
2. Capacity ratings for air coils shall comply with ARI 410, "Forced-Circulation Air-Cooling and Air-Heating Coils."

C. ASHRAE Compliance:

1. Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
2. Capacity ratings for air-to-air energy recovery equipment shall comply with ASHRAE 84, "Method of Testing Air-to-Air Heat Exchangers."

D. NRCA Compliance: Roof curbs for roof-mounted equipment shall be constructed according to recommendations of NRCA.

E. UL Compliance:

1. Packaged heat recovery ventilators shall comply with requirements in UL 1812, "Ducted Heat Recovery Ventilators"; or UL 1815, "Nonducted Heat Recovery Ventilators."
2. Electric coils shall comply with requirements in UL 1995, "Heating and Cooling Equipment."

1.9 COORDINATION

- A. Coordinate layout and installation of air-to-air energy recovery equipment and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided.
- C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.10 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of air-to-air energy recovery equipment that fail in materials or workmanship within specified warranty period.
 1. Warranty Period for Packaged Energy Recovery Units: Two years.
 2. Warranty Period for Fixed-Plate Total Heat Exchangers: 10 years.

PART 2 - PRODUCTS

2.1 HEAT WHEELS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Advanced Thermal Technologies.
 2. Airxchange Inc.
 3. American Energy Exchange, Inc.
 4. Loren Cook Company.
 5. SEMCO Incorporated.
 6. Trane; American Standard Companies, Inc.
- B. Casing:
1. Steel with standard factory-painted finish.
 2. Integral purge section limiting carryover of exhaust air to between 0.05 percent at 1.6-inch wg and 0.20 percent at 4-inch wg differential pressure.
 3. Casing seals on periphery of rotor and on duct divider and purge section.
 4. Support vertical rotors on grease-lubricated ball bearings having extended grease fittings or permanently lubricated bearings. Support horizontal rotors on tapered roller bearing.
- C. Rotor: Aluminum segmented wheel strengthened with radial spokes.
1. Maximum Solid Size for Media to Pass: 900 micrometer.
- D. Drive: Fractional horsepower motor and gear reducer, with speed changed by variable frequency controller and self-adjusting multilink belt around outside of rotor.
1. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
- E. Controls:
1. Starting relay, factory mounted and wired, and manual motor starter for field wiring.
 2. Variable frequency controller, factory mounted and wired, permitting input of field connected 4-20 mA or 1-10-V control signal.
 3. Variable frequency controller, factory mounted and wired, with exhaust-air sensor to vary rotor speed and maintain exhaust temperature above freezing.
 4. Variable frequency controller, factory mounted and wired, with exhaust- and outdoor-air sensors, automatic changeover thermostat and set-point adjuster, to vary rotor speed and maintain air differential temperature above set point. Rotor speed shall increase to maximum when exhaust-air temperature is less than outdoor-air temperature.

5. Pilot-Light Indicator: Display rotor rotation and speed.
6. Speed Settings: Adjustable settings for maximum and minimum rotor speed limits.

2.2 PACKAGED ENERGY RECOVERY UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Advanced Thermal Technologies.
 2. American Energy Exchange, Inc.
 3. Applied Air; Mestek Technology, Inc.
 4. Carnes.
 5. Des Champs Technologies.
 6. Engineered Air.
 7. Fairchild Industrial Products Company.
 8. Gaylord Industries, Inc.
 9. Greenheck Fan Corporation.
 10. Loren Cook Company.
 11. Mitsubishi Electric & Electronics USA, Inc.; HVAC Advanced Products Division.
 12. Mitsubishi Electric Sales Canada Inc.
 13. RenewAire LLC.
 14. SEMCO Incorporated.
 15. Trane; American Standard Companies, Inc.
 16. Venmar CES Inc.
 17. Wing, L. J.; Mestek Technology, Inc.
- B. Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- C. Housing: Manufacturer's standard construction with corrosion-protection coating and exterior finish, hinged access doors with neoprene gaskets for inspection and access to internal parts, minimum 1-inch- thick thermal insulation, knockouts for electrical and piping connections, exterior drain connection, and lifting lugs.
- D. Heat Recovery Device: Fixed-plate heat exchanger.
- E. Supply and Exhaust Fans: Forward-curved, centrifugal fan with spring isolators and insulated flexible duct connections.
 1. Motor and Drive: Belt driven with adjustable sheaves, motor mounted on adjustable base.
 2. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 4. Spring isolators on each fan having 1-inch static deflection.
- F. Disposable Panel Filters:

1. Comply with NFPA 90A.
 2. Filter Holding Frames: Arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lift out from access plenum.
 3. Factory-fabricated, viscous-coated, flat-panel type.
 4. Thickness: 2 inches.
 5. Minimum Arrestance: 80, according to ASHRAE 52.1.
 6. Minimum Merv: 5, according to ASHRAE 52.2.
 7. Media: Interlaced glass fibers sprayed with nonflammable adhesive.
 8. Frame: Galvanized steel with metal grid on outlet side, steel rod grid on inlet side, hinged, and with pull and retaining handles.
- G. Piping and Wiring: Fabricate units with space within housing for piping and electrical conduits. Wire motors and controls so only external connections are required during installation.
1. Indoor Enclosure: NEMA 250, Type 12 enclosure contains relays, starters, and terminal strip.
 2. Outdoor Enclosure: NEMA 250, Type 3R enclosure contains relays, starters, and terminal strip.
 3. Include nonfused disconnect switches.
 4. Variable-speed controller to vary fan capacity from 100 to approximately 50 percent.
- H. Accessories:
1. Low-Leakage, Isolation Dampers: Double-skin, airfoil-blade, dampers with compressible jamb seals and extruded-vinyl blade edge seals, in opposed or parallel-blade arrangement with steel operating rods rotating in stainless-steel sleeve bearings mounted in a single frame, with operating rods connected with a common linkage, and electric damper operator factory wired. Leakage rate shall not exceed 5 cfm/sq. ft. at 1-inch wg and 9 cfm/sq. ft. at 4-inch wg.
 2. Duct flanges.
 3. Rubber-in-shear isolators for ceiling-mounted units.
 4. Hinged access doors with quarter-turn latches.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine casing insulation materials and filter media before air-to-air energy recovery equipment installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for electrical services to verify actual locations of connections before installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install heat wheels so supply and exhaust airstreams flow in opposite directions and rotation is away from exhaust side to purge section to supply side.
 - 1. Install access doors in both supply and exhaust ducts, both upstream and downstream, for access to wheel surfaces, drive motor, and seals.
 - 2. Install removable panels or access doors between supply and exhaust ducts on building side for bypass during startup.
 - 3. Access doors and panels are specified in Section 233300 "Air Duct Accessories."
- B. Suspended Units: Suspend units from structural-steel support frame using threaded steel rods and spring hangers. Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration Controls for HVAC Piping and Equipment."
- C. Install units with clearances for service and maintenance.
- D. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.
- E. Pipe drains from drain pans to nearest floor drain; use ASTM B 88, Type L, drawn-temper copper water tubing with soldered joints, same size as condensate drain connection.
- F. Pipe drains from drain pans to nearest floor drain; use ASTM D 1785, Schedule 40 PVC pipe and solvent-welded fittings, same size as condensate drain connection.
 - 1. Requirements for Low-Emitting Materials:
 - a. PVC solvent cement shall have a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

3.3 CONNECTIONS

- A. Comply with requirements for piping specified in Section 232113 "Hydronic Piping." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to unit to allow service and maintenance.
- C. Connect piping to units mounted on vibration isolators with flexible connectors.
- D. Comply with requirements for ductwork specified in Section 233113 "Metal Ducts."
- E. Install electrical devices furnished with units but not factory mounted.

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
- C. Tests and Inspections:
 - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 2. Adjust seals and purge.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 4. Set initial temperature and humidity set points.
 - 5. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- D. Air-to-air energy recovery equipment will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain air-to-air energy recovery units.

END OF SECTION 237200

SECTION 237313

MODULAR INDOOR CENTRAL-STATION AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:
1. Variable-air-volume, single-zone air-handling units

1.3 PERFORMANCE REQUIREMENTS

- A. Engineering Criteria Submittal: Provide vibration isolation and seismic-restraint details, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of $L/200$ where "L" is the unsupported span length within completed casings.

1.4 ACTION SUBMITTALS

- A. Product Data: For each air-handling unit indicated.
1. Unit dimensions and weight.
 2. Cabinet material, metal thickness, finishes, insulation, and accessories.
 3. Fans:
 - a. Certified fan-performance curves with system operating conditions indicated.
 - b. Certified fan-sound power ratings.
 - c. Fan construction and accessories.
 - d. Motor ratings, electrical characteristics, and motor accessories.
 4. Certified coil-performance ratings with system operating conditions indicated.
 5. Dampers, including housings, linkages, and operators.
 6. Filters with performance characteristics.
- B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Engineering Services Submittal: For vibration isolation indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
1. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
 2. Design Calculations: Calculate requirements for selecting vibration isolators and for designing vibration isolation bases.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Mechanical-room layout and relationships between components and adjacent structural and mechanical elements.
 2. Support location, type, and weight.
 3. Field measurements.
- B. Source quality-control reports.
- C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Filters: One set(s) for each air-handling unit.
 2. Gaskets: One set(s) for each access door.
 3. Fan Belts: One set(s) for each air-handling unit fan.

1.8 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- C. ARI Certification: Air-handling units and their components shall be factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.
- D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- E. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- F. Comply with NFPA 70.

1.9 COORDINATION

- A. Coordinate sizes and locations of concrete bases with actual equipment provided.
- B. Coordinate sizes and locations of structural-steel support members, if any, with actual equipment provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
 1. Carrier Corporation; a member of the United Technologies Corporation Family.
 2. Mammoth Inc.
 3. McQuay International
 4. Trane; American Standard Inc.
 5. YORK International Corporation.
 6. Haakon.
 7. SEMCO

2.2 UNIT CASINGS

- A. General Fabrication Requirements for Casings:
 1. Forming: Form walls, roofs, and floors with at least two breaks at each joint.
 2. Casing Joints: Sheet metal screws or pop rivets.
 3. Sealing: Seal all joints with water-resistant sealant.
 4. Factory Finish for Steel and Galvanized-Steel Casings: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on enamel finish, consisting of prime coat and thermosetting topcoat.

5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- B. Casing Insulation and Adhesive:
1. Materials: ASTM C 1071, Type II.
 2. Location and Application: Encased between outside and inside casing.
- C. Inspection and Access Panels and Access Doors:
1. Panel and Door Fabrication: Formed and reinforced, single- or double-wall and insulated panels of same materials and thicknesses as casing.
 2. Inspection and Access Panels:
 - a. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.
 - b. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - c. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.
 3. Access Doors:
 - a. Hinges: A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever-type latches, operable from inside and outside. Arrange doors to be opened against air-pressure differential.
 - b. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - c. Size: At least 24 inches wide by full height of unit casing up to a maximum height of 72 inches.
 4. Locations and Applications:
 - a. Fan Section: Doors and inspection and access panels.
 - b. Access Section: Doors.
 - c. Coil Section: Inspection and access panel.
 - d. Damper Section: Inspection and access panels.
 - e. Filter Section: Inspection and access panels large enough to allow periodic removal and installation of filters.
 - f. Mixing Section: Doors.
 - g. Humidifier Section: Doors.
- D. Condensate Drain Pans:
1. Fabricated with two percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from humidifiers and to direct water toward drain connection.
 - a. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
 - b. Depth: A minimum of 2 inches deep.

2. Formed sections.
 3. Double-wall, galvanized-steel sheet with space between walls filled with foam insulation and moisture-tight seal.
 4. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.
 - a. Minimum Connection Size: NPS 1 (DN 25).
 5. Pan-Top Surface Coating: Asphaltic waterproofing compound.
 6. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.
- E. Air-Handling-Unit Mounting Frame: Formed galvanized-steel channel or structural channel supports, designed for low deflection, welded with integral lifting lugs.

2.3 FAN, DRIVE, AND MOTOR SECTION

- A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.
1. Shafts: Designed for continuous operation at maximum-rated fan speed and motor horsepower, and with field-adjustable alignment.
 - a. Turned, ground, and polished hot-rolled steel with keyway. Ship with a protective coating of lubricating oil.
 - b. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.
- B. Centrifugal Fan Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.
1. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.
 2. Horizontal-Flanged, Split Housing: Bolted construction.
 3. Housing for Supply Fan: Attach housing to fan-section casing with metal-edged flexible duct connector.
 4. Flexible Connector: Factory fabricated with a fabric strip 3-1/2 inches wide attached to 2 strips of 2-3/4-inch- wide, 0.028-inch thick, galvanized-steel sheet or 0.032-inch- thick aluminum sheets; select metal compatible with casing.
 - a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.
 - 1) Fabric Minimum Weight: 26 oz./sq. yd.
 - 2) Fabric Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
 - 3) Fabric Service Temperature: Minus 40 to plus 200 deg F
- C. Plenum Fan Housings: Steel frame and panel; fabricated without fan scroll and volute housing.

- D. Backward-Inclined, Centrifugal Fan Wheels: Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange, backplate, backward-inclined blades welded or riveted to flange and backplate; cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws.
- E. Forward-Curved, Centrifugal Fan Wheels: Inlet flange, backplate, and shallow blades with inlet and tip curved forward in direction of airflow and mechanically fastened to flange and backplate; cast-steel hub swaged to backplate and fastened to shaft with set screws.
- F. Fan Shaft Bearings:
 - 1. Prelubricated and Sealed, Ball Bearings: Self-aligning, pillow-block type with a rated life of 120,000 hours according to ABMA 9.
- G. Belt Drives: Factory mounted, with adjustable alignment and belt tensioning, and with 1.5 service factor based on fan motor.
 - 1. Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
 - 2. Motor Pulleys: Adjustable pitch for use with 5-hp motors and smaller; fixed pitch for use with motors larger than 5 hp. Select pulley size so pitch adjustment is at the middle of adjustment range at fan design conditions.
 - 3. Belts: Oil resistant, nonsparking, and nonstatic; in matched sets for multiple-belt drives.
- H. Internal Vibration Isolation: Fans shall be factory mounted with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 2 inches
- I. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - 1. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.
 - 2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - 3. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 - 4. Mount unit-mounted disconnect switches on exterior of unit.
- J. Variable Frequency Controllers:
 - 1. Description: NEMA ICS 2, IGBT, PWM, VFC; listed and labeled as a complete unit and arranged to provide variable speed of an NEMA MG 1, Design B, 3-phase induction motor by adjusting output voltage and frequency.
 - 2. Output Rating: 3-phase; 6 to 60 Hz, with voltage proportional to frequency throughout voltage range.
 - 3. Unit Operating Requirements:
 - a. Input ac voltage as described on drawings.
 - b. Input frequency tolerance of 50/60 Hz, plus or minus 6 percent.
 - c. Minimum Efficiency: 96 percent at 60 Hz, full load.
 - d. Minimum Displacement Primary-Side Power Factor: 96 percent.

- e. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
 - f. Starting Torque: 100 percent of rated torque or as indicated.
 - g. Speed Regulation: Plus or minus 1 percent.
4. Isolated control interface to allow controller to follow control signal over an 11:1 speed range.
 5. Internal Adjustability Capabilities:
 - a. Minimum Speed: 5 to 25 percent of maximum rpm.
 - b. Maximum Speed: 80 to 100 percent of maximum rpm.
 - c. Acceleration: 2 to a minimum of 22 seconds.
 - d. Deceleration: 2 to a minimum of 22 seconds.
 - e. Current Limit: 50 to a minimum of 110 percent of maximum rating.
 6. Self-Protection and Reliability Features:
 - a. Input transient protection by means of surge suppressors.
 - b. Undervoltage and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
 - c. Adjustable motor overload relays capable of NEMA ICS 2, Class 10 performance.
 - d. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
 - e. Instantaneous line-to-line and line-to-ground overcurrent trips.
 - f. Loss-of-phase protection.
 - g. Reverse-phase protection.
 - h. Short-circuit protection.
 - i. Motor overtemperature fault.
 7. Automatic Reset/Restart: Attempts three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load.
 8. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped.
 9. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
 10. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
 11. Door-mounted LED status lights shall indicate the following conditions:
 - a. Power on.
 - b. Run.
 - c. Overvoltage.
 - d. Line fault.
 - e. Overcurrent.
 - f. External fault.

12. Panel-Mounted Operator Station: Start-stop and auto-manual selector switches with manual-speed-control potentiometer and elapsed time meter.
13. Meters or digital readout devices and selector switch, mounted flush in controller door and connected to indicate the following controller parameters:
 - a. Output frequency (Hertz).
 - b. Motor speed (rpm).
 - c. Motor status (running, stop, fault).
 - d. Motor current (amperes).
 - e. Motor torque (percent).
 - f. Fault or alarming status (code).
 - g. Proportional-integral-derivative (PID) feedback signal (percent).
 - h. DC-link voltage (volts direct current).
 - i. Set-point frequency (Hertz).
 - j. Motor output voltage (volts).
14. Control Signal Interface:
 - a. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
 - b. Remote signal inputs capable of accepting any of the following speed-setting input signals from the control system:
 - 1) 0 to 10-V dc.
 - 2) 0-20 or 4-20 mA.
 - 3) Potentiometer using up/down digital inputs.
 - 4) Fixed frequencies using digital inputs.
 - 5) RS485.
 - 6) Keypad display for local hand operation.
 - c. Output signal interface with a minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
 - 1) Output frequency (Hertz).
 - 2) Output current (load).
 - 3) DC-link voltage (volts direct current).
 - 4) Motor torque (percent).
 - 5) Motor speed (rpm).
 - 6) Set-point frequency (Hertz).
 - d. Remote indication interface with a minimum of 2 dry circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
 - 1) Motor running.
 - 2) Set-point speed reached.
 - 3) Fault and warning indication (overtemperature or overcurrent).
 - 4) High- or low-speed limits reached.
15. Communications: RS485 interface allows VFC to be used with an external system within a multidrop LAN configuration. Interface shall allow all parameter settings of VFC to be

programmed via BMS control. Provide capability for VFC to retain these settings within the nonvolatile memory.

16. Integral Disconnecting Means: NEMA AB 1, molded-case switch, – OR - NEMA KS 1, nonfusible switch, - OR - NEMA KS 1, fusible switch, - ALL with lockable handle.
17. Accessories:
 - a. Devices shall be factory installed in controller enclosure unless otherwise indicated.
 - b. Push-Button Stations, Pilot Lights, and Selector Switches: NEMA ICS 2, heavy-duty type.
 - c. Standard Displays:
 - 1) Output frequency (Hertz).
 - 2) Set-point frequency (Hertz).
 - 3) Motor current (amperes).
 - 4) DC-link voltage (volts direct current).
 - 5) Motor torque (percent).
 - 6) Motor speed (rpm).
 - 7) Motor output voltage (volts).

2.4 COIL SECTION

A. General Requirements for Coil Section:

1. Comply with ARI 410.
2. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).
3. For multizone units, provide air deflectors and air baffles to balance airflow across coils.
4. Coils shall not act as structural component of unit.

2.5 AIR FILTRATION SECTION

A. General Requirements for Air Filtration Section:

1. Comply with NFPA 90A.
2. Provide minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV8) according to ASHRAE 52.2.
3. Provide filter holding frames arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lifted out from access plenum.

B. Disposable Panel Filters:

1. Factory-fabricated, viscous-coated, flat-panel type.
2. Thickness: 2 inches
3. Dust-Holding Capacity: 10 lb
4. Initial Resistance: 0.25 inches wg
5. Recommended Final Resistance: 1.00 inches wg

6. Merv (ASHRAE 52.2): 8.
7. Media: Interlaced glass fibers sprayed with nonflammable adhesive.
8. Frame: Galvanized steel, with metal grid on outlet side, steel rod grid on inlet side, hinged, and with pull and retaining handles.

C. Filter Gage:

1. 3-1/2-inch- diameter, diaphragm-actuated dial in metal case.
2. Vent valves.
3. Black figures on white background.
4. Front recalibration adjustment.
5. 2 percent of full-scale accuracy.
6. Range: 0- to 3.0-inch wg (0 to 750 Pa).
7. Accessories: Static-pressure tips with integral compression fittings, 1/4-inch aluminum tubing, and 2- or 3-way vent valves.

2.6 DAMPERS

- A. General Requirements for Dampers: Leakage rate, according to AMCA 500, "Laboratory Methods for Testing Dampers for Rating," shall not exceed 2 percent of air quantity at 2000-fpm face velocity through damper and 4-inch wg pressure differential.
- B. Damper Operators: Comply with requirements in Section 230900 "Instrumentation and Control for HVAC."
- C. Zone Dampers: Two single-blade, galvanized-steel dampers offset 90 degrees from each other on steel operating rod rotating in sintered bronze or nylon bearings mounted in a single galvanized-steel frame. Provide blade gaskets and edge seals, and mechanically fasten blades to operating rod.
- D. Outdoor- and Return-Air Dampers: Low-leakage, double-skin, airfoil-blade, galvanized-steel dampers with compressible jamb seals and extruded-vinyl blade edge seals in opposed-blade arrangement with steel operating rods rotating in stainless-steel sleeve bearings mounted in a single galvanized-steel frame, and with operating rods connected with a common linkage. Leakage rate shall not exceed 5 cfm/sq. ft. at 1-inch wg and 9 cfm/sq. ft. at 4-inch wg
- E. Mixing Section: Multiple-blade, air-mixer assembly located immediately downstream of mixing section.
- F. Combination Filter and Mixing Section:
 1. Cabinet support members shall hold 2-inch- thick, pleated, flat, permanent or throwaway filters.
 2. Multiple-blade, air-mixer assembly shall mix air to prevent stratification, located immediately downstream of mixing box.

2.7 CAPACITIES AND CHARACTERISTICS

A. Heating Coil:

1. Coil Type: Continuous circuit Self-draining Cleanable.
2. Tube Material: Copper.
3. Fin Type: Plate.
4. Fin Material: Aluminum.
5. Fin and Tube Joint: Mechanical bond.
6. Headers:
 - a. Cast iron with cleaning plugs and drain and air vent tappings extended to exterior of unit.
 - b. Seamless copper tube with brazed joints, prime coated.
 - c. Fabricated steel, with brazed joints, prime coated.
 - d. Provide insulated cover to conceal headers exposed outside casings.
7. Frames: Channel frame, 0.064-inch thick galvanized steel.
8. Coil Working-Pressure Ratings: 200 psig , 325 deg F

B. Cooling Coil:

1. Coil Type: Continuous circuit Self-draining Cleanable.
2. Tube Material: Copper.
3. Fin Type: Plate.
4. Fin Material: Aluminum.
5. Fin and Tube Joint: Mechanical bond.
6. Headers:
 - a. Cast iron with cleaning plugs and drain and air vent tappings extended to exterior of unit.
 - b. Seamless copper tube with brazed joints, prime coated.
 - c. Fabricated steel, with brazed joints, prime coated.
 - d. Provide insulated cover to conceal headers exposed outside casings.
7. Frames: Channel frame, 0.064-inch- thick galvanized steel.
8. Coil Working-Pressure Ratings: 200 psig (1380 kPa), 325 deg

2.8 SOURCE QUALITY CONTROL

- A. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.
- B. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."
- C. Water Coils: Factory tested to 300 psig according to ARI 410 and ASHRAE 33.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for steam, hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Equipment Mounting: Install air-handling units on concrete bases without vibration isolation devices. Secure units to anchor bolts installed in concrete bases. Comply with requirements for concrete bases specified in Section 033000 "Cast-in-Place Concrete." Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- B. Arrange installation of units to provide access space around air-handling units for service and maintenance.
- C. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.
- D. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

3.3 CONNECTIONS

- A. Comply with requirements for piping specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to air-handling unit to allow service and maintenance.
- C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.
- D. Connect condensate drain pans using NPS 1-1/4 (DN 32), ASTM B 88, Type M (ASTM B 88M, Type C) copper tubing. Extend to nearest equipment or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.

- E. Hot- and Chilled-Water Piping: Comply with applicable requirements in Section 232113 "Hydronic Piping." Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.
- F. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 233300 "Air Duct Accessories."

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks.
 - 2. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.
- D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that shipping, blocking, and bracing are removed.
 - 3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
 - 4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
 - 5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
 - 6. Verify that zone dampers fully open and close for each zone.
 - 7. Verify that face-and-bypass dampers provide full face flow.
 - 8. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
 - 9. Comb coil fins for parallel orientation.
 - 10. Verify that proper thermal-overload protection is installed for electric coils.
 - 11. Install new, clean filters.
 - 12. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

- B. Starting procedures for air-handling units include the following:
 - 1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace fan and motor pulleys as required to achieve design conditions.
 - 2. Measure and record motor electrical values for voltage and amperage.
 - 3. Manually operate dampers from fully closed to fully open position and record fan performance.

3.6 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for air-handling system testing, adjusting, and balancing.

3.7 CLEANING

- A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain air-handling units.

END OF SECTION 237313

SECTION 238146

WATER-SOURCE UNITARY HEAT PUMPS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.02 SUMMARY

- A. This Section includes the following types of water-source heat pumps:
 - 1. Exposed, floor-mounted console units.

1.03 SUBMITTALS

- A. Product Data: Include rated capacities, furnished specialties, and accessories for each model.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Wiring Diagrams: Power, signal, and control wiring.
- C. Coordination Drawings: Floor plans, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Structural members to which heat pumps will be attached.
 - 2. Housekeeping slabs for heat pumps
 - 3. Racks for heat pumps mounted one above other
- D. Samples for Initial Selection: For units with factory-applied color finishes.
- E. Samples for Verification: For each type of unit indicated.
- F. Product Certificates: For each type of water-source heat pump, signed by product manufacturer.

- G. Manufacturer Seismic Qualification Certification: Submit certification that water-source heat pumps, accessories, and components will withstand seismic forces defined in Division 23 Section "Mechanical Vibration and Seismic Controls." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- H. Field quality-control test reports.
- I. Operation and Maintenance Data: For water-source heat pumps to include in emergency, operation, and maintenance manuals.
- J. Warranty: Special warranty specified in this Section.

1.04 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of water-source heat pumps and are based on the specific system indicated. Refer to DDC General Conditions.
 - 1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with ASHRAE 15.
- D. Comply with minimum COP/efficiency levels according to ASHRAE/IESNA 90.1.
- E. Comply with NFPA 70.
- F. Comply with safety requirements in UL 484 for assembly of free-delivery water-source heat pumps.
- G. Comply with safety requirements in UL 1995 for duct-system connections.

1.05 COORDINATION

- A. Coordinate layout and installation of water-source heat pumps and suspension components with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system components, and partition assemblies.
- B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

1.06 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of water-source heat pumps that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, refrigeration components.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 - 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 WATER SOURCE HEAT PUMPS (REVERSIBLE WATER CHILLERS)

- A. Manufacturers
 - 1. Water Furnace EW Series
 - 2. Climate Master
 - 3. FHP Manufacturing Inc
 - 4. York International

5. Florida Heat Pump
 6. Multistack
- B. Description: Factory assembled and tested, single packaged water-source heat pump consisting of 10 gauge welded steel frame with powder coat paint, sealed refrigerant circuit including two compressors, two refrigerant to water heat exchangers, bi-directional thermal expansion valve, reversing valve, and reverse cycle refrigeration controls. The unit and all refrigeration components shall be rated for use with R-410A refrigerant. Field conversion of refrigerants will not be allowed.
 - C. Acoustical Enclosure: Provide heavy gauge galvanized steel casing with electrostatically painted finish. Provide access panels for inspection and access to internal components. Insulate panels with a minimum ½ inch thick, 15 lb./cu.ft. density, coated fiberglass insulation. All insulation must meet NFPA 90A.
 - D. Refrigerant to Water Heat Exchangers: Brazed plate type heat exchangers with 316 stainless steel plates capable of withstanding 650 psig working pressure on the refrigerant side and 450 psig on the water side. Heat exchangers are to be insulated with ½” inch thick, 1.5 lb./cu.ft. density, closed cell polyethylene foam insulation. Heat exchangers to have interlaced water circuit with individual refrigerant circuits.
 - E. Compressor: Provide hermetic, high efficiency, scroll type compressor installed on neoprene isolators and enclosed in acoustically treated enclosure. Provide high and low temperature cutouts, and compressor motor overload protection. Provide capability to reset compressor lockout circuit at either remote thermostat or circuit breaker.
 - F. Refrigeration Components: Provide 4-way, electro-magnetically activated solenoid refrigerant reversing valve designed for fail-safe operation in the cooling position. The solenoid coil assembly must be detachable from valve body. Provide a bi-directional, thermostatic expansion valve to deliver proper superheat over the complete range of operating water temperatures. Provide liquid line filter dryers on each refrigerant circuit.
 - G. Water Piping Connections: The unit shall have one set of entering and leaving water connections The connection shall be a 2 inch Victaulic type
 - H. Unit Controls:
 1. Provide factory-mounted and factory-wired controls for sequenced operation of compressors and reversing valves. A 24-volt, minimum 75VA transformer with integral circuit breaker shall provide power to the low voltage controls. Provide safety lockout control with refrigerant high-pressure switch, refrigerant low-pressure or loss of charge switch, and water freeze protection. The lockout circuit shall be capable of being reset by either resetting the low voltage power supply or the main unit circuit breaker.
 2. Microprocessor Control: Provide a factory installed programmable, microprocessor control that sequences all unit functions and modes of operation.

- Microprocessor to have minimum run times, internal lead lag, minimum off times, compressor start delays, and minimum changeover times.
3. The control shall be capable of interface with supervisory controllers using N2 Open, BAC-Net communication protocols.
 4. Microprocessor to have the following temperatures available at the unit or on the network
 - a. Entering Source Fluid Temperature
 - b. Leaving Source Fluid Temperature
 - c. Entering Load Fluid Temperature
 - d. Leaving Load Fluid Temperature
 - e. Circuit 1 Source Refrigerant Temperature
 - f. Circuit 2 Source Refrigerant Temperature
 - g. Circuit 1 Load Refrigerant Temperature
 - h. Circuit 2 Load Refrigerant Temperature
 5. Microprocessor to have the following binary values available at the unit or on the network
 - a. Compressor 1 ENABLE
 - b. Compressor 2 ENABLE
 - c. Reversing Valve ENABLE
 - d. Compressor 1 STATUS
 - e. Compressor 2 STATUS
 - f. Compressor 1 COMMANDED STATUS
 - g. Compressor 2 COMMMANDED STATUS
 - h. Reversing Valve COMMANDED STATUS
 - i. Load Flow Switch STATUS
 - j. Source Flow Switch STATUS
 6. Unit to have the following alarms
 - a. Source Freeze Circuit 1
 - b. Source Freeze Circuit 2
 - c. Load Freeze Circuit 1

- d. Load Freeze Circuit 2
 - e. Source Flow Switch
 - f. Load Flow Switch
 - g. High Pressure Circuit 1
 - h. High Pressure Circuit 2
 - i. Low Pressure Circuit 1
 - j. Low Pressure Circuit 2
 - k. Low Refrigerant Charge Circuit 1
 - l. Low Refrigerant Charge Circuit 2
7. Unit to have adjustable freeze protection settings. Refrigerant sensors on liquid line to be used for freeze protection.
 8. Unit to have four network programmable binary outputs for valve and pump control.
 9. Unit to have terminal strip
 10. Control Display: Provide a factory installed LCD display. The 4 z 20 digit backlit screen shall be capable of displaying all internal analog and binary values. LCD display to be used for alarm monitoring, status, and settings.

2.03 Chiller Plant Master Controller

- A. Heat Pump manufacturer to provide master controller that will control all units, primary pumps, and source water valves. Master controller to be Tridium JACE 201 or equal. Master controller to stage heat pumps in order to maintain a common leaving water set point.
- B. Heat pump manufacturer to provide water temperature sensors to the ATC for control purposes. Each system will have a common entering and leaving water sensor located in the primary piping. The sensor will be installed by the ATC and wired back to the master controller.
- C. Load pumps to be controlled by the unit. Flow proving will be done by current switches. Current switches are to be provided by the ATC and wired to the unit control board. One pump per system to be running at all times when the system is enabled to ensure proper flow over the temperature sensors.
- D. Source water valves to be controlled by the unit. Flow proving will be done by DP switches. DP switches are to be provided by the ATC and wired to the unit control board. Source water valves are to be provided by the ATC – valves shall be two way, normally closed, spring return, 24V.
- E. Communication between the master controller and the BAS shall be BACnet IP

- F. BMS Vendor shall provide and install all control wiring
- G. Master controller will have no control over the secondary pumps.
- H. BMS to send the following commands over BACnet IP
 - 1. System 1 enable/disable
 - 2. System 1 mode – heating or cooling
 - 3. System 1 heating set point
 - 4. System 1 cooling set point
 - 5. System 2 enable/disable
 - 6. System 2 mode – heating or cooling
 - 7. System 2 heating set point
 - 8. System 2 cooling set point
- I. BMS to monitor all temperatures and alarms from the units through the master controller
- J. Maximum entering load water temperature for system change over is 85F – from heating to cooling.
- K. Heat pump manufacturer to perform factory start up and network integration assistance on site.
- L. Heat pump manufacturer to provide two extra water temperature sensors to ATC. Sensors to be kept on site at all times.

2.04 PUMP MODULE

- A. See schedules on drawings

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of water-source heat pumps.
- B. Examine roughing-in for piping and electric installations for water-source heat pumps to verify actual locations of piping connections and electrical conduit before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Concrete Bases: Install floor mounting units on 4-inch- high concrete bases. See Division 23 Section "Mechanical General Conditions " for concrete base materials and fabrication requirements.
- B. Mount water-source heat pumps on concrete base with vibration isolators and seismic restraints. Vibration isolators are specified in Division 23 Section "Mechanical Vibration and Seismic Controls."
 - 1. Units with Internally Isolated Fans and Compressors: Support on concrete bases using neoprene pads with minimum 0.125-inch static deflection. Secure units to anchor bolts installed in concrete bases.
 - 2. Floor-Mounted Units: Support on concrete bases using housed-spring isolators with minimum 1-inch static deflection. Secure units to anchor bolts installed in concrete bases.
- C. Install wall-mounting thermostats, humidistats, and switch controls in electrical outlet boxes at heights to match lighting controls or as required in Division 23 Section "HVAC Instrumentation and Controls."

3.03 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:
 - 1. Connect supply and return hydronic piping to heat pump with unions and shutoff valves or hose kits.
 - 2. Connect heat-pump condensate drain pan to indirect waste connection with condensate trap of adequate depth to seal against the pressure of fan. Install cleanouts in piping at changes of direction.
- B. Duct installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of ducts. Specific connection requirements are as follows:
 - 1. Connect supply and return ducts to water-source heat pumps with flexible duct connectors specified in Division 23 Section "Duct Accessories."
 - 2. Install ducts to termination in roof curb.
 - 3. Remove roof decking only as required for passage of ducts. Do not cut out decking under entire roof curb.
 - 4. Terminate return-air duct through roof structure and insulate space between roof and bottom of unit with 2-inch- thick, acoustic duct liner.
 - 5. Install normal-weight, 3000 psi, compressive-strength (28-day) concrete mix inside roof curb, 4 inches thick. Concrete, formwork, and reinforcement are specified in Division 3.
- C. Install electrical devices furnished by manufacturer but not specified to be factory mounted.

- D. Install piping adjacent to machine to allow service and maintenance.
- E. Ground equipment according to Division 26 Section "Grounding and Bonding."
- F. Connect wiring according to Division 26 Section "Conductors and Cables."

3.04 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform the following field tests and inspections and prepare test reports:
 - 1. After installing water-source heat pumps and after electrical circuitry has been energized, test units for compliance with requirements.
 - 2. Inspect for and remove shipping bolts, blocks, and tie-down straps.
 - 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.

3.05 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Complete installation and startup checks according to manufacturer's written instructions and do the following:
 - 1. Inspect for visible damage to unit casing.
 - 2. Inspect internal insulation.
 - 3. Verify that labels are clearly visible.
 - 4. Verify that clearances have been provided for servicing.
 - 5. Verify that controls are connected and operable.
 - 6. Adjust vibration isolators.
 - 7. Start unit according to manufacturer's written instructions.
 - 8. Complete startup sheets and attach copy with Contractor's startup report.
 - 9. Inspect and record performance of interlocks and protective devices; verify sequences.
 - 10. Operate unit for an initial period as recommended or required by manufacturer.
 - 11. Verify thermostat and humidistat calibration.
 - 12. Inspect controls for correct sequencing of heating, refrigeration, and normal and emergency shutdown.

3.06 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose.

3.07 CLEANING

- A. Replace filters used during construction prior to air balance or substantial completion.
- B. After completing installation of exposed, factory-finished water-source heat pumps, inspect exposed finishes and repair damaged finishes.

3.08 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain water-source heat pumps.

END OF SECTION

SECTION 238219

FAN COIL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes fan-coil units and accessories.

1.3 DEFINITIONS

- A. BAS: Building automation system.

1.4 ACTION SUBMITTALS

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Wiring Diagrams: Power, signal, and control wiring.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of fan-coil unit indicated.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, reflected ceiling plans, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Ceiling suspension components.
 - 2. Structural members to which fan-coil units will be attached.
 - 3. Method of attaching hangers to building structure.
 - 4. Size and location of initial access modules for acoustical tile.

5. Items penetrating finished ceiling, including the following:
 - a. Lighting fixtures.
 - b. Air outlets and inlets.
 - c. Speakers.
 - d. Sprinklers.
 - e. Access panels.
 6. Perimeter moldings for exposed or partially exposed cabinets.
- B. Manufacturer Seismic Qualification Certification: Submit certification that fan-coil units, accessories, and components will withstand seismic forces defined in Section 230548 "Vibration and Seismic Controls for HVAC." Include the following:
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control test reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fan-coil units to include in emergency, operation, and maintenance manuals. Additionally, include the following:
1. Maintenance schedules and repair part lists for motors, coils, integral controls, and filters.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Fan-Coil-Unit Filters: Furnish 1 spare filter(s) for each filter installed.
 2. Fan Belts: Furnish 1 spare fan belt(s) for each unit installed.

1.8 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.9 COORDINATION

- A. Coordinate layout and installation of fan-coil units and suspension system components with other construction that penetrates or is supported by ceilings, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.
- B. Coordinate size and location of wall sleeves for outdoor-air intake.

PART 2 - PRODUCTS

2.1 FAN-COIL UNITS

- A. Manufacturers:
 - 1. Carrier Corporation.
 - 2. Engineered Air Ltd.
 - 3. Environmental Technologies, Inc.
 - 4. International Environmental Corporation.
 - 5. McQuay International.
 - 6. Trane.
 - 7. YORK International Corporation.
- B. Description: Factory-packaged and -tested units rated according to ARI 440, ASHRAE 33, and UL 1995.
- C. Coil Section Insulation: 1-inch thick, coated glass fiber complying with ASTM C 1071 and attached with adhesive complying with ASTM C 916.
 - 1. Fire-Hazard Classification: Insulation and adhesive shall have a combined maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
 - 2. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Main and Auxiliary Drain Pans: Stainless steel. Fabricate pans and drain connections to comply with ASHRAE 62.1. Drain pans shall be removable.
- E. Chassis: Galvanized steel where exposed to moisture. Floor-mounting units shall have leveling screws.
- F. Cabinet: Steel with baked-enamel finish in manufacturer's standard paint color as selected by Commissioner.

1. Vertical Unit Front Panels: Removable, steel, with integral stamped steel discharge grille and channel-formed edges, cam fasteners, and insulation on back of panel.
 2. Horizontal Unit Bottom Panels: Fastened to unit with cam fasteners and hinge and attached with safety chain; with integral stamped discharge grilles.
 3. Stack Unit Discharge and Return Grille: Aluminum double-deflection discharge grille, and louvered- or panel-type return grille; color as selected by Commissioner from manufacturer's custom colors. Return grille shall provide maintenance access to fan-coil unit.
 4. Steel recessing flanges for recessing fan-coil units into ceiling or wall.
- G. Filters: Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
1. Washable Foam: 70 percent arrestance and 3 MERV.
 2. Glass Fiber Treated with Adhesive: 80 percent arrestance and 5 MERV.
 3. Pleated Cotton-Polyester Media: 90 percent arrestance and 7 MERV.
- H. Hydronic Coils: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch, rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain valve.
- I. Fan and Motor Board: Removable:
1. Fan: Forward curved, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.
 2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."
 3. Wiring Termination: Connect motor to chassis wiring with plug connection.
- J. Factory, Hydronic Piping Package: ASTM B 88, Type L copper tube with wrought-copper fittings and brazed joints. Label piping to indicate service, inlet, and outlet.
1. Two-way, modulating control valve for chilled-water coil.
 2. Two-way, modulating control valve for heating coil.
 3. Hose Kits: Minimum 400-psig working pressure, and operating temperatures from 33 to 211 deg F. Tag hose kits to equipment designations.
 - a. Length: 36 inches.
 - b. Minimum Diameter: Equal to fan-coil-unit connection size.
 4. Two-Piece Ball Valves: Bronze body with full-port, chrome-plated bronze ball; PTFE or TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.
 5. Calibrated-Orifice Balancing Valves: Bronze body, ball type; 125-psig working pressure, 250-deg F maximum operating temperature; with calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, threaded ends, and equipped with a memory stop to retain set position.
 6. Automatic Flow-Control Valve: Brass or ferrous-metal body; 300-psig working pressure at 250 deg F, with removable, corrosion-resistant, tamperproof, self-cleaning piston

- spring; factory set to maintain constant indicated flow with plus or minus 10 percent over differential pressure range of 2 to 80 psig.
7. Y-Pattern Hydronic Strainers: Cast-iron body (ASTM A 126, Class B); 125-psig working pressure; with threaded connections, bolted cover, perforated stainless-steel basket, and bottom drain connection. Include minimum NPS 1/2 hose-end, full-port, ball-type blowdown valve in drain connection.
 8. Wrought-Copper Unions: ASME B16.22.
 9. Risers: ASTM B 88, Type L copper pipe with hose and ball valve for system flushing.
- K. Control devices and operational sequences are specified in Section 230900 "Instrumentation and Control for HVAC" and Section 230993 "Sequence and Operations for HVAC Controls."
- L. Basic Unit Controls:
1. Control voltage transformer.
 2. Wall-mounting thermostat with the following features:
 - a. Heat-cool-off switch.
 - b. Fan on-auto switch.
 - c. Fan-speed switch.
 - d. Automatic changeover.
 - e. Adjustable deadband.
 - f. Concealed set point.
 - g. Concealed indication.
 - h. Degree F indication.
 3. Unoccupied-period-override push button.
 4. Data entry and access port.
 - a. Input data includes room temperature, and humidity set points and occupied and unoccupied periods.
 - b. Output data includes room temperature and humidity, supply-air temperature, entering-water temperature, operating mode, and status.
- M. BAS Interface Requirements:
1. Interface relay for scheduled operation.
 2. Interface relay to provide indication of fault at the central workstation.
 3. Provide BACnet interface for central BAS workstation for the following functions:
 - a. Adjust set points.
 - b. Fan-coil-unit start, stop, and operating status.
 - c. Data inquiry, including supply- and room-air temperature.
 - d. Occupied and unoccupied schedules.
- N. Electrical Connection: Factory wire motors and controls for a single electrical connection.
- O. Capacities and Characteristics:
1. Refer to mechanical drawings.

2.2 DUCTED FAN-COIL UNITS

- A. Manufacturers:
1. Carrier Corporation.
 2. Engineered Air Ltd.
 3. Environmental Technologies, Inc.
 4. International Environmental Corporation.
 5. McQuay International.
 6. Trane.
 7. YORK International Corporation.
- B. Description: Factory-packaged and -tested units rated according to ARI 440, ASHRAE 33, and UL 1995.
- C. Coil Section Insulation: 1-inch thick foil-faced glass fiber complying with ASTM C 1071 and attached with adhesive complying with ASTM C 916.
1. Fire-Hazard Classification: Insulation and adhesive shall have a combined maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
 2. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Drain Pans: Stainless steel. Fabricate pans and drain connections to comply with ASHRAE 62.1.
- E. Chassis: Galvanized steel where exposed to moisture, with baked-enamel finish and removable access panels.
- F. Cabinets: Steel with baked-enamel finish in manufacturer's standard paint color.
1. Supply-Air Plenum: Sheet metal plenum finished and insulated to match the chassis with mill-finish, aluminum, double-deflection grille.
 2. Return-Air Plenum: Sheet metal plenum finished to match the chassis.
 3. Mixing Plenum: Sheet metal plenum finished and insulated to match the chassis with outdoor- and return-air, formed-steel dampers.
 4. Dampers: Galvanized steel with extruded-vinyl blade seals, flexible-metal jamb seals, and interlocking linkage.
- G. Filters: Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
1. Washable Foam: 70 percent arrestance and 3 MERV.
 2. Glass Fiber Treated with Adhesive: 80 percent arrestance and 5 MERV.
 3. Pleated Cotton-Polyester Media: 90 percent arrestance and 7 MERV.
- H. Hydronic Coils: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch, rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.

- I. Belt-Driven Fans: Double width, forward curved, centrifugal; with permanently lubricated, single-speed motor installed on an adjustable fan base resiliently mounted in the cabinet. Aluminum or painted-steel wheels, and painted-steel or galvanized-steel fan scrolls.
 - 1. Motors: Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."
- J. Factory, Hydronic Piping Package: ASTM B 88, Type L copper tube with wrought-copper fittings and brazed joints. Label piping to indicate service, inlet, and outlet.
 - 1. Two-way, modulating control valve for chilled-water coil.
 - 2. Two-way, modulating control valve for heating coil.
 - 3. Hose Kits: Minimum 400-psig working pressure, and operating temperatures from 33 to 211 deg F. Tag hose kits to equipment designations.
 - a. Length: 36 inches.
 - b. Minimum Diameter: Equal to fan-coil-unit connection size.
 - 4. Two-Piece Ball Valves: Bronze body with full-port, chrome-plated bronze ball; PTFE or TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.
 - 5. Calibrated-Orifice Balancing Valves: Bronze body, ball type; 125-psig working pressure, 250 deg F maximum operating temperature; with calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, threaded ends, and equipped with a memory stop to retain set position.
 - 6. Automatic Flow-Control Valve: Brass or ferrous-metal body; 300-psig working pressure at 250 deg F; with removable, corrosion-resistant, tamperproof, self-cleaning piston spring; factory set to maintain constant indicated flow with plus or minus 10 percent over differential pressure range of 2 to 80 psig.
 - 7. Y-Pattern Hydronic Strainers: Cast-iron body (ASTM A 126, Class B); 125-psig working pressure, with threaded connections, bolted cover, perforated stainless-steel basket, and bottom drain connection. Include minimum NPS 1/2 hose-end, full-port, ball-type blowdown valve in drain connection.
 - 8. Wrought-Copper Unions: ASME B16.22.
 - 9. Energy Efficiency: Equal to or greater than prescribed by ASHRAE/IESNA 90.1, "Energy Standard for Buildings except Low-Rise Residential Buildings."
 - a. Motor: Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - 10. Accessories: Polyethylene mounting base to provide a permanent foundation.
- K. Control devices and operational sequence are specified in Section 230548 "Vibration and Seismic Controls for HVAC."
- L. Basic Unit Controls:
 - 1. Control voltage transformer.
 - 2. Wall-mounting thermostat with the following features.
 - a. Heat-cool-off switch.

- b. Fan on-auto switch.
- c. Fan-speed switch.
- d. Automatic changeover.
- e. Adjustable deadband.
- f. Concealed set point.
- g. Concealed indication.
- h. Degree F indication.

M. BAS Interface Requirements:

- 1. Interface relay for scheduled operation.
- 2. Interface relay to provide indication of fault at the central workstation.
- 3. Provide BACnet interface for central BAS workstation for the following functions:
 - a. Adjust set points.
 - b. Fan-coil-unit start, stop, and operating status.
 - c. Data inquiry including supply- and room-air temperature.
 - d. Occupied and unoccupied schedules.

N. Electrical Connection: Factory wire motors and controls for a single electrical connection.

O. Capacities and Characteristics:

- 1. Refer to mechanical drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in for piping and electrical connections to verify actual locations before fan-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install fan-coil units level and plumb.
- B. Install fan-coil units to comply with NFPA 90A.
- C. Suspend fan-coil units from structure with elastomeric hangers. Vibration isolators are specified in Section 230548 "Vibration and Seismic Controls for HVAC."
- D. Verify locations of thermostats, and other exposed control sensors with Drawings and room details before installation. Install devices 60 inches above finished floor.

- E. Install new filters in each fan-coil unit within two weeks after Substantial Completion.

3.3 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:
 - 1. Install piping adjacent to machine to allow service and maintenance.
 - 2. Connect piping to fan-coil-unit factory hydronic piping package. Install piping package if shipped loose.
 - 3. Connect condensate drain to indirect waste.
 - a. Install condensate trap of adequate depth to seal against the pressure of fan. Install cleanouts in piping at changes of direction.
 - b. Where FCU condensate cannot be routed to indirect drain by gravity, provide Little Giant VCMX-20 condensate pump or equivalent, and route to indirect drain.
- B. Connect supply and return ducts to fan-coil units with flexible duct connectors specified in Section 233300 "Air Duct Accessories." Comply with safety requirements in UL 1995 for duct connections.
- C. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- D. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform the following field tests and inspections and prepare test reports:
 - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 2. Operate electric heating elements through each stage to verify proper operation and electrical connections.
 - 3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.

3.5 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain fan-coil units.

END OF SECTION 238219

SECTION 238236

FINNED-TUBE RADIATION HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes hydronic, baseboard and finned-tube radiation heaters.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings:
 - 1. Include plans, elevations, sections, and details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include details and dimensions of custom-fabricated enclosures.
 - 4. Indicate location and size of each field connection.
 - 5. Indicate location and arrangement of piping valves and specialties.
 - 6. Indicate location and arrangement of integral controls.
 - 7. Include enclosure joints, corner pieces, access doors, and other accessories.
 - 8. Include diagrams for power, signal, and control wiring.
- C. Samples: For each exposed product and for each color and texture specified.
- D. Color Samples for Initial Selection: For finned-tube radiation heaters with factory-applied color finishes.
- E. Color Samples for Verification: For each type of exposed finish.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Structural members, including wall construction, to which finned-tube radiation heaters will be attached.
 - 2. Method of attaching finned-tube radiation heaters to building structure.
 - 3. Penetrations of fire-rated wall and floor assemblies.
- B. Field quality-control reports.

PART 2 - PRODUCTS

2.1 HOT-WATER BASEBOARD RADIATION HEATERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:
 - 1. A.I.M. Radiant Heating.
 - 2. Embassy Industries, Inc.
 - 3. Haydon Corporation, Inc.
 - 4. Hydro-Air Components Inc.
 - 5. Rosemex.
 - 6. Slant/Fin Corporation.
 - 7. Sterling Hydronics; a Mestek company.
 - 8. Vulcan
 - 9. Jaga (basis of design)
- B. Performance Ratings: Rate baseboard radiation heaters according to Hydronics Institute's "I=B=R Testing and Rating Standard for Baseboard Radiation."
- C. Heating Elements: Copper tubing mechanically expanded into flanged collars of evenly spaced aluminum fins resting on polypropylene element glides. One end of tube shall be belled.
 - 1. Capacities: Refer to mechanical drawings.
- D. Enclosures: Minimum 0.0329-inch- thick steel, removable front cover.
 - 1. Refer to schedule sheet for specific model number and requirements
 - 2. Full-height back.
 - 3. Full-length damper.
 - 4. End panel.
 - 5. End caps.
 - 6. Inside and outside corners.
 - 7. Valve access door.
 - 8. Joiner pieces to snap together.

9. Enclosure Height: refer to mechanical drawings .
 10. Enclosure Depth: refer to mechanical drawings .
 11. Finish: Baked-enamel finish in manufacturer's custom color as selected by Commissioner.
 12. Element Brackets: Primed and painted steel to support front panel and element.
- E. Rust-Resistant Enclosures: Minimum 0.040-inch- thick ASTM A 653/A 653M, G60 galvanized-steel, removable front cover.
1. Refer to schedule sheet for specific model number and requirements
 2. Full-height back.
 3. Full-length damper.
 4. End panel.
 5. End caps.
 6. Inside and outside corners.
 7. Valve access door.
 8. Joiner pieces to snap together.
 9. Enclosure Height: refer to mechanical drawings.
 10. Enclosure Depth: refer to mechanical drawings.
 11. Finish: Baked-enamel finish in manufacturer's custom color as selected by Commissioner.
 12. Element Brackets: Primed and painted steel to support front panel and element.

2.2 HOT-WATER FINNED-TUBE RADIATION HEATERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Embassy Industries, Inc.
 2. Engineered Air.
 3. Hydro-Air Components Inc.
 4. Quincy Hydronic Technology Inc.
 5. Rosemex.
 6. Slant/Fin Corporation.
 7. Sterling Hydronics; a Mestek company.
 8. Trane Inc.
 9. Vulcan
 10. Jaga (basis of design)
- B. Performance Ratings: Rate finned-tube radiation heaters according to Hydronics Institute's "I=B=R Testing and Rating Standard for Finned-Tube (Commercial) Radiation."
- C. Heating Elements: Copper tubing mechanically expanded into flanged collars of evenly spaced aluminum fins resting on element supports. One end of tube shall be belled.
1. Refer to mechanical drawings
- D. Element Supports: Ball-bearing cradle type to permit longitudinal movement on enclosure brackets.

- E. Front Panel: Minimum 0.0428-inch- thick steel.
- F. Rust-Resistant Front Panel: Minimum 0.052-inch- thick, ASTM A 653/A 653M, G60 galvanized steel.
- G. Wall-Mounted Back Panel: Minimum 0.0329-inch- thick steel, full height, with full-length channel support for front panel without exposed fasteners.
- H. Floor-Mounted Pedestals: Conceal insulated piping at maximum 36-inch spacing. Pedestal-mounted back panel shall be solid panel matching front panel. Provide stainless-steel escutcheon for floor openings at pedestals.
- I. Support Brackets: Locate at maximum 36-inch spacing to support front panel and element.
- J. Finish: Baked-enamel finish in manufacturer's custom color as selected by Commissioner.
- K. Damper: Knob-operated internal damper at enclosure outlet.
- L. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, minimum size 6 by 7 inches, integral with enclosure.
- M. Enclosure Style: Commissioner to review and approve.
- N. Accessories: Filler sections, corners, relay sections, and splice plates all matching the enclosure and grille finishes.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive finned-tube radiation heaters for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for hydronic-piping connections to verify actual locations before installation of finned-tube radiation heaters.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BASEBOARD RADIATION HEATER INSTALLATION

- A. Install units level and plumb.
- B. Install enclosure continuously around corners, using outside and inside corner fittings.
- C. Join sections with splice plates and filler pieces to provide continuous enclosure.
- D. Install access doors for access to valves.

- E. Install enclosure continuously from wall to wall.
- F. Terminate enclosures with manufacturer's end caps except where enclosures are indicated to extend to adjoining walls.
- G. Install valves within reach of access door provided in enclosure.
- H. Install air-seal gasket between wall and recessed flanges or front cover of fully recessed unit.
- I. Install piping within pedestals for freestanding units.

3.3 FINNED-TUBE RADIATION HEATER INSTALLATION

- A. Install units level and plumb.
- B. Install enclosure continuously around corners, using outside and inside corner fittings.
- C. Join sections with splice plates and filler pieces to provide continuous enclosure.
- D. Install access doors for access to valves.
- E. Install enclosure continuously from wall to wall.
- F. Terminate enclosures with manufacturer's end caps except where enclosures are indicated to extend to adjoining walls.
- G. Install valves within reach of access door provided in enclosure.
- H. Install air-seal gasket between wall and recessed flanges or front cover of fully recessed unit.
- I. Install piping within pedestals for freestanding units.

3.4 CONNECTIONS

- A. Piping installation requirements are specified in Section 232113 "Hydronic Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect hot-water finned-tube radiation heaters and components to piping according to Section 232113 "Hydronic Piping".
 - 1. Install shutoff valves on inlet and outlet, and balancing valve on outlet.
- C. Install control valves as required by Section 230900 "Instrumentation and Control for HVAC."
- D. Install piping adjacent to finned-tube radiation heaters to allow service and maintenance.
- E. Ground electric finned-tube radiation heaters according to Section 260526 "Grounding and Bonding for Electrical Systems."

- F. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.5 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Units will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 238236

SECTION 238239.19

WALL AND CEILING UNIT HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes wall and ceiling heaters with propeller fans and electric-resistance heating coils.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Shop Drawings:
 - 1. Include plans, elevations, sections, and details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include details of anchorages and attachments to structure and to supported equipment.
 - 4. Include equipment schedules to indicate rated capacities, operating characteristics, furnished specialties, and accessories.
 - 5. Wiring Diagrams: Power, signal, and control wiring.
- D. Samples: For each exposed product and for each color and texture specified.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For wall and ceiling unit heaters to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following or approved equal:
1. Berko; Marley Engineered Products.
 2. Chromalox, Inc.
 3. Indeeco.
 4. Markel Products Company; TPI Corporation.
 5. Marley Engineered Products.
 6. Ouellet Canada Inc.
 7. QMark; Marley Engineered Products.
 8. Trane Inc.
 9. Solaronics
 10. Approved equal

2.2 DESCRIPTION

- A. Assembly including chassis, electric heating coil, fan, motor, and controls. Comply with UL 2021.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 CABINET

- A. Front Panel: Extruded-aluminum bar grille, with removable panels fastened with tamperproof fasteners.
- B. Finish: Baked enamel over baked-on primer with manufacturer's standard color selected by Commissioner, applied to factory-assembled and -tested wall and ceiling heaters before shipping.
- C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Surface-Mounted Cabinet Enclosure: Steel with finish to match cabinet.

2.4 COIL

- A. Electric-Resistance Heating Coil: Nickel-chromium heating wire, free from expansion noise and 60-Hz hum, embedded in magnesium oxide refractory and sealed in corrosion-resistant

metallic sheath. Terminate elements in stainless-steel, machine-staked terminals secured with stainless-steel hardware, and limit controls for high-temperature protection. Provide integral circuit breaker for overcurrent protection.

2.5 FAN AND MOTOR

- A. Fan: Aluminum propeller directly connected to motor.
- B. Motor: Permanently lubricated, multispeed. Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."

2.6 CONTROLS

- A. Controls: Unit-mounted thermostat. Low-voltage relay with transformer kit.
- B. Electrical Connection: Factory wire motors and controls for a single field connection with disconnect switch.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive wall and ceiling unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for electrical connections to verify actual locations before unit-heater installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install wall and ceiling unit heaters to comply with NFPA 90A.
- B. Install wall and ceiling unit heaters level and plumb.
- C. Install wall-mounted thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.
- D. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- E. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

END OF SECTION 238239.19

SECTION 238316

RADIANT HEATING HYDRONIC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Thermal radiant floor heating and cooling system.
- B. The work in this section includes, but is not limited to the following:
 - 1. Complete radiant heating and cooling system as shown in the drawings and as specified. This system shall be fully integrated with the construction of the floor slab (completed by others).
 - 2. Coordination with floor slab, insulation, and vapor barrier.
 - 3. Coordination with the selection and installation of circulation pumps and distribution piping.
 - 4. System controls and automation, including sensors within floor slab.
 - 5. Manufacturer supported system startup and commissioning service.
- C. Related Sections:
 - 1. DDC General Conditions

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: Use an installer with demonstrated experience on projects of similar size and complexity and possessing documentation proving successful completion of radiant floor installation training by the PEX-A tubing manufacturer.
- B. References
 - 1. General: Standards listed by reference, including revisions by issuing authority, form a part of this specification section to the extent indicated. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referenced to by issuing authority abbreviation and standard designation.
- C. ASTM International
 - 1. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials

2. ASTM E119 Standard Test Methods for Fire Tests of Building Construction and Materials
 3. ASTM E814 Standard Test Method for Fire Tests of Through-Penetration Fire Stops
 4. ASTM F 876 Standard Specification for Cross-linked Polyethylene (PEX-A) Tubing
 5. ASTM F877 Standard Specification for Cross-linked Polyethylene (PEX-A) Plastic Hot- and Cold-Water Distribution Systems
 6. ASTM F1960 Standard Specification for Cold Expansion Fittings with PEX-A Reinforcing Rings for Use with Cross-linked Polyethylene (PEX-A) Tubing
- D. American National Standards Institute (ANSI)/Underwriters Laboratories, Inc. (UL)
1. ANSI/UL 263 Standard for Safety for Fire Tests of Building Construction and Materials
- E. International Conference of Building Officials (ICBO) Evaluation Services
1. Evaluation Report No. 4407
 2. Evaluation Report No. 514
- F. International Code Council (ICC)
1. International Mechanical Code (IMC)
 2. ICC Evaluation Service (ES) Evaluation Report No. ESR 1099
- G. Plastics Pipe Institute (PPI)
1. Technical Report TR-3 Policies and Procedures for Developing Recommended Hydrostatic Design Stresses for Thermoplastic Pipe Materials
 2. Technical Report TR-4 Recommended Hydrostatic Strengths and design stresses for Thermoplastic Piping and Fitting Compounds
- H. International Association of Plumbing and Mechanical Officials (IAPMO)
1. Uniform Mechanical Code
- I. Certifications: Provide letters of certification as follows
1. Installer is trained by the PEX-A tubing manufacturer to install radiant floor systems.
 2. Installer uses skilled workers holding a trade qualification license or equivalent, or apprentices under the supervision of a licensed tradesperson.
- J. Pre-installation Meetings
1. Verify project requirements, substrate conditions, floor coverings, manufacturer's installation instructions and warranty requirements.
 2. Review project construction timeline to ensure compliance or discuss modifications as required.
 3. Interface with other trade representatives to verify areas of responsibility.
 4. Establish the frequency and construction phase the Commissioner intends for site visits and inspection by the PEX-A tubing manufacturer's representative.

1.4 DEFINITIONS

- A. EPDM: Ethylene-propylene-diene terpolymer rubber.
- B. PEX: Crosslinked polyethylene.

- C. PEX/AL/PEX: Crosslinked polyethylene/aluminum/crosslinked polyethylene.

1.5 SYSTEM DESCRIPTION

A. Design Requirements

1. Standard Grade hydrostatic pressure ratings from Plastics Pipe Institute in accordance with TR-3 as listed in TR-4. The following Three Standard grade ratings are required.
 - a. 200°F at 80 psi
 - b. 180°F at 100 psi
 - c. 73.4°F at 160 psi
2. Certification of flame spread/smoke development rating of 25/50 in accordance with ASTM E84 for the following PEX-A tubing sizes when installed uninsulated at a tube spacing not less than 18 inches apart.
 - a. 3/8 inch
3. Certification of flame spread/smoke development rating of 25/50 in accordance with ASTM E84 for the following PEX-A tubing sizes when encased with 1/2 inch fiberglass insulation at tube spacing not less than 4 inches apart.
 - a. 5/8 inch

- B. Performance Requirements: Provide hydronic radiant floor cooling system that is manufactured, fabricated, and installed to comply with regulatory agencies and authorities with jurisdiction, and maintain performance criteria stated by the PEX-A tubing manufacturer without defects, damage, or failure.

1. Show compliance with ASTM F877.
2. Show compliance with DIN 4726 regarding oxygen diffusion concerns
3. Show compliance with ASTM E119 and ANSI/UL 263 through certification listings through Underwriters Laboratories, Inc. (UL).
 - a. UL Design No. K913 - 2 hour concrete floor/ceiling assemblies.

- C. Radiant thermal floor system manufacturer shall have successfully completed 5 installations of similar type and scope. Manufacturer shall provide from the factory a full-time representative to supervise the complete design, detailing, coordination, installation, and commissioning of the thermal floor system.

- D. The contractor shall furnish all labor, materials, tools, equipment, appliances, and services necessary to deliver and install all radiant floor dimension to the radiant floor manufacturer.

1.6 SUBMITTALS

- A. General: Submit listed submittals in accordance with DDC General Conditions.

- B. Product Data: For each type of radiant heating pipe, fitting, manifold, specialty, and control.

1. For radiant heating piping and manifolds, include pressure and temperature rating, oxygen-barrier performance, fire-performance characteristics, and water flow and pressure drop characteristics.

- C. Shop Drawings: Show piping layout and details drawn to scale, including valves, manifolds, controls, and support assemblies, and their attachments to building structure.
1. Shop Drawing Scale: 1/4 inch = 1 foot.
 2. Submit shop drawings for piping installation in the project. Indicate all valves, pumps and items of equipment that are required to control and operate the radiant floor for both cooling and heating as shown on the drawings and described in the sequence of operations. Submit a valve and pump schedule listing each number, type, size, model and service. Cross reference to supporting product data
 3. Submit manufacturer's detailed drawings showing layouts, fixing details and piping details of all areas where radiant floors are indicated along with product and performance data for each component.
 4. Provide calculations which support the heating and cooling performance requirements of the radiant floor. These calculations should show the flow through the floor for heating and cooling as well as the primary heating and cooling connections to the radiant floor headers and control circuits. System pressure drop calculations are also to be provided.
 5. Submit drawings showing details of manifolds, including all connections and valves. If manifolds are to be installed on a wall then the details should include all fixture details. If the manifolds are to be installed in wall cavities then all fixture and access details are to be provided.
 6. Piping materials and temperature/pressure ratings.
 7. Location of all expansion and penetration sleeves, showing coordination with concrete slab expansion joints. Provide confirmation of concrete slab expansion requirements and the use of any concrete additives.
 8. Piping manifold locations and installation details. On the shop drawings indicating piping manifold locations indicate whether manifold is enclosed within an architecturally-provided cabinet or if a manufacturer-provided cabinet will be used.
 9. Control sequences and control hardware devices. Indicate compliance and coordination with requirements of other specification sections.
 10. Piping sample with certification of properties.
 11. Submit manufacturer's report detailing that the radiant floor have been installed in accordance with this specification and the manufacturer's specified instructions.
 12. Submit report indicating that installation was performed according to the manufacturer's instructions. Include pressure testing documentation as required in related specification sections.
 13. Submit start-up report demonstrating that system meets required capacity is fully functional and has been commissioned to the satisfaction of system manufacturer.

14. Provide installation drawings indicating tubing layout, manifold locations, zoning requirements and manifold schedules with details required for installation of the system. Provide sectional drawing of floor slab demonstrating coordination with other construction trades and showing insulation if required.

D. Quality Assurance/Control Submittals: Submit the following:

1. Test Reports: Upon request, submit test reports from recognized testing laboratories.

E. Documentation: Submit the following:

1. Manufacturer's certificate indicating products comply with specified requirements.
2. Manufacturer's detailed room-by-room heat-loss or gain analysis for the structure.
3. Documentation indicating the installer is trained to install the manufacturer's products.

F. Closeout Submittals: Submit the following.

1. Warranty documents specified herein.
2. Operation and maintenance data.
3. Manufacturer's field reports specified herein.
4. Final as-built tubing layout drawings.

G. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Structural members to which radiant heating piping will be attached.
2. Items penetrating flooring, including the following:
 - a. Masonry screws
 - b. Perimeter moldings.

H. Operation and Maintenance Data: For radiant heating piping valves and equipment to include in operation and maintenance manuals.

1.7 DELIVERY, STORAGE AND HANDLING

A. General: Comply with DDC General Conditions.

B. Comply with manufacturer's ordering instructions and lead-time requirements to avoid construction delays.

C. Delivery: Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.

D. Storage and Protection: Store materials protected from exposure to harmful environmental conditions and at temperature and humidity conditions recommended by the manufacturer.

1. Store PEX-A tubing in cartons or under cover to avoid dirt or foreign material from entering the tubing.
2. Do not expose PEX-A tubing to direct sunlight for more than 30 days. If construction delays are encountered, cover the tubing that is exposed to direct sunlight.

1.8 WARRANTY

- A. Project Warranty: Refer to DDC General Conditions for project warranty provisions.
- B. Manufacturer's Warranty: Submit, for City of New York's acceptance, manufacturer's standard warranty document executed by authorized company official. Manufacturer's warranty is in addition to, and not a limitation of, other rights City of New York may have under contract documents.
 - 1. Warranty Period for PEX-A Tubing: 30-year, non-prorated warranty against failure due to defect in material or workmanship, beginning with date of substantial completion when installed by a factory-trained contractor.
 - 2. Warranty Period for Manifolds and Fittings: 5-year, non-prorated warranty against failure due to defect in material or workmanship, beginning with date of substantial completion when installed by a factory-trained contractor.
 - 3. Warranty Period for Controls and Electrical Components: 2-year, non-prorated warranty against failure due to defect in material or workmanship, beginning with date of substantial completion when installed by a factory-trained contractor.
 - 4. If a factory-trained contractor does not install the system, then the most recent limited warranty published by the PEX-A tubing manufacturer takes precedence.

PART 2 - PRODUCTS

2.1 HYDRONIC RADIANT FLOOR HEATING AND COOLING SYSTEM

- A. Manufacturers:
 - 1. Uponor, Inc
 - 2. REHAU Incorporated
 - 3. Slant/Fin Corporation
 - 4. Viega
 - 5. HeatLink Group Inc
 - 6. Heat Innovations Inc.
 - 7. Wirsbo

2.2 PRODUCT SUBSTITUTIONS

- A. All products, components, etc., specified herein are manufactured by and/or available from the PEX-A tubing manufacturer.
- B. Alternative equipment manufacturers must submit required data for all electrical, mechanical, structural, engineering, etc. revisions for an equivalent system for approval.
- C. Alternative equipment manufacturers must submit completed radiant floor design layout to the Commissioner for approval.
- D. Tubing manufactured utilizing the silane method of cross-linking (PEX-B) is not considered an acceptable alternate.

2.3 HYDRONIC RADIANT FLOOR COOLING SYSTEM EQUIPMENT

A. Tubing

1. Material: Crosslinked polyethylene (PEX-A) manufactured by PEX-A or Engle method
2. Material Standard: Manufactured in accordance with ASTM F876 and ASTM F877 and tested for compliance by an independent third-party agency.
3. Pressure Ratings: Standard Grade hydrostatic design and pressure ratings as issued by the Plastics Pipe Institute (PPI), a division of the Society of the Plastics Industry (SPI).
4. Show compliance with ASTM E119 and ANSI/UL 263 through certification listings through UL.
 - a. UL Design No. L557 — 1 hour wood frame floor/ceiling assemblies
 - b. UL Design No. K913 — 2 hour concrete floor/ceiling assemblies
 - c. UL Design No. U372 -- 1 hour wood stud/gypsum wallboard wall assemblies
 - d. UL Design No. V444 — 1 hour steel stud/gypsum wallboard wall assemblies
5. Minimum Bend Radius (Cold Bending): No less than six times the outside diameter. Use the PEX tubing manufacturer's bend supports if radius is less than stated.
6. Barrier Tubing Type:
 - a. Tubing shall have an oxygen diffusion barrier does not exceed an oxygen diffusion rate of 0.10 grams per cubic meter per day at 104 degrees F (40 degrees C) water-temperature in accordance with German DIN 4726.
 - b. Nominal Inside Diameter: Provide tubing with nominal inside diameter in accordance with ASTM F876, as indicated in the system design.
7. Non-Barrier Tubing Type:
 - a. Tubing does not feature an oxygen diffusion barrier.
 - b. Nominal Inside Diameter: Provide tubing with nominal inside diameter in accordance with ASTM F876, as indicated in the system design.
8. An oxygen diffusion barrier tubing is not required if one of the following design strategies is used.
 - a. Use non-ferrous components within the entire fluid pathway

B. Brass Manifolds

1. For system compatibility, use 1/4-inch brass manifolds offered by the respective PEX tubing manufacturer.
2. Manifold shall be constructed of dezincification resistant brass.
3. Appropriate sized manifold boxes shall be supplied that allow the manifold assemblies to be mounted inside the wall cavity.
4. Use manifold mounting brackets offered by the respective PEX-A tubing manufacturer.
5. Manifolds must be capable of individual flow control for each loop on the manifold through valve actuators available from the manifold supplier.
6. Manifolds must feature manual flow balancing capability within the manifold body for balancing unequal loop lengths across the manifold.
7. Flow setter shall be installed on the return leg from the manifold to provide flow balancing between manifolds.
8. Manifolds support 5/16 inch through 3/4 inch PEX tubing.
9. Each manifold location should have the ability to vent air manually from the system.
10. Each manifold shall be protected by a cabinet or enclosure. Where a manifold enclosure has not been provided by the Commissioner, such as above a ceiling, in a mechanical room, or in a janitor's closet, the mechanical contractor shall install the manifold in a cabinet or enclosure.

C. Fittings

1. For system compatibility, use fittings offered by the PEX-A tubing manufacturer.
2. The fitting assembly consists of a barbed insert, a compression ring and a compression nut. The barbed insert is manufactured with an o-ring to facilitate air pressure testing.
3. Compression Fittings
 - a. Fitting assembly manufactured from UNS C3600 series brass material.
 - b. The fitting assembly consists of a barbed insert, a compression ring and a compression nut. The barbed insert is manufactured with an o-ring to facilitate air pressure testing.
4. Fittings or equivalent
 - a. Fittings manufactured in accordance with ASTM F1960.
 - b. Fitting assembly manufactured from material listed in paragraph 5.1 of ASTM F1960. The fitting assembly consists of a barbed adapter and an applicable sized PEX ring. The barbed insert may include an o-ring to facilitate pressure testing with air.

D. Supply-and-return Piping to the Manifolds (above ground piping)

1. Properly size supply and return distribution piping for the given volume and velocities required at system design.
2. Use suitable distribution piping material for all supply fluid temperatures in systems with ferrous components.
3. Use suitable distribution piping material for systems free of or isolated from ferrous components.
 - a. When using HDPE mains, do not exceed 140 degrees F at 80 psi.
4. Do not expose PEX-A tubing to direct sunlight or install near overhead fluorescent lighting. If PEX-A tubing is exposed, install suitable pipe insulation around the exposed tubing.
5. Use fittings compatible with piping material. Fittings must transition from distribution piping to system manifolds.

E. Controls

1. Coordinate Controls with all other relevant specification sections
2. Radiant Cooling water temperature (Central System) Control (provided by radiant tubing manufacturer).
 - a. This will be controlled by the control system provided by the radiant heating manufacturer.
 - 1) Router Main Control provides connections to the Digital Zone control module and the Network supply water temperature control. Provides a connection to the internet for remote viewing (optional). All connections are RJ45 and use Cat5 wire to communicate to devices. Includes control cabinet mounting screws and power connector.
 - 2) Network supply water temperature control provides connections to the mixing devices and secondary pumps. The Supply Water Temperature Control can control either modulating valves and radiant pumps . All connections are RJ45 and require the use of a Cat5 wire for the supply water temperature control to communicate with the other devices. Includes control cabinet mounting screws and power connector.
 - 3) Climate control network system control cabinet — low profile enclosure that houses all main controllers. Cabinet must be powder coated white and can be mounted in either a right hand or left hand hinged configuration.

3. Zoning control (Zoning system is provided by radiant tubing manufacturer)
 - a. Controlled by a Digital zone control system
 - 1) Climate Control Network Thermostat with slab sensor is polarity — sensitive, flush mounted thermostat which includes an air sensor , humidity sensor (%RH) and option terminals for slab sensing if required.
 - 2) Digital Zone Control Module provides connections to the Network System thermostats and actuators. The DZCM requires 24VAC to power the controller and actuators. Actuators must have a Molex plug to for proper connection. The DZCM provides 3.5VDC to power the thermostats. The DZCM controller is addressed through a rotary switch.
 - 3) Router Main Control contains the communication ports for the DZCM . The router also has an Ethernet port to connect to the internet for remote viewing (optional) or UCT.
 - b. The Digital thermostats will sense operative temperature (radiant surfaces + air temperature) , humidity and slab temperature.
 - c. The Digital thermostats will send inputs of operative temperature , humidity , and slab temperature to the BMS system via open Bacnet protocol.

- F. All equipment used shall be furnished from one radiant floor manufacturer and be fully compatible to work as one integrated system.

- G. Provide flow balancing manifolds to be assembled with manual air vent, drain and refill valves, supply module with built in shut off valve, return module with manual flow regulating and balancing valve

- H. General Contractor to provide high-density rigid board insulation for both base concrete structural slab and topping slab edge insulation where not provided by others. Minimum 2-inch thickness to be confirmed during shop drawing coordination. Insulation to be selected for compressive strength appropriate for this installation.

- I. General Contractor provide control/monitoring devices, hardware equipment and software necessary to provide complete operating radiant floor system, independent of existing base building control system. Coordinate with requirements included in related specification sections.

- J. Floor system shall be provided by manufacturer to achieve the following minimum performance requirements:
 1. Cooling: 15.0 Btu/hr per square foot, uniformly distributed over floor area served.
 2. Heating: 30.0 Btu/hr per square foot, uniformly distributed over floor area served.

- K. Indoor space conditions at this peak cooling load shall be controlled to 55°F, 85% RH through 74°F, 60% RH at occupant level. Direct solar load is also assumed during peak output conditions.

2.4 ACCESSORIES

- A. Use accessories associated with the installation of the radiant floor heating and cooling system as recommended by or available from the PEX tubing manufacturer.

PART 3 - EXECUTION

3.1 MANUFACTURER'S INSTRUCTIONS

- A. Comply with manufacturer's product data, including product technical bulletins, installation instructions and design drawings, including the following:
 - 1. Design Assistance Manuals and Radiant Floor Installation handbooks.

3.2 EXAMINATION

- A. Examine surfaces and substrates to receive radiant heating piping for compliance with requirements for installation tolerances and other conditions affecting performance.
 - 1. Ensure that surfaces and pipes in contact with radiant heating piping are free of burrs and sharp protrusions.
 - 2. Ensure that surfaces and substrates are level and plumb.
 - 3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 APPLICATIONS

- A. Install the following types of radiant heating piping for the applications described:
 - 1. Piping in Level Fill Concrete Floors (Not Reinforced): PEX.

3.4 INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop or Coordination Drawings.
- B. Install radiant heating piping continuous from the manifold through the heated panel and back to the manifold without piping joints in heated panels.
- C. Connect radiant piping to manifold in a reverse-return arrangement.
- D. Do not bend pipes in radii smaller than manufacturer's minimum bend radius dimensions.
- E. Install manifolds in accessible locations as shown on drawings, or install access panels to provide maintenance access as required in Division 8 Section "Access Doors."
- F. Fire- and Smoke-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials according to Division 7 Section "Firestops and Smoke-seals."
- G. Piping in Level Fill Concrete Floors (Not Reinforced):
 - 1. Secure piping in concrete floors by attaching pipes to subfloor using tracks, clamps, or staples.

2. Space tracks, clamps, or staples a maximum of 6" o.c., and at center of turns or bends.
 3. Maintain 3/4-inch minimum cover.
 4. Install a sleeve of 3/8-inch- thick, foam-type insulation or PE pipe around tubing and extending for a minimum of 10 inches on each side of slab joints to protect the tubing passing through expansion or control joints. Anchor sleeve to slab form at control joints to provide maximum clearance for saw cut.
 5. Maintain minimum 40-psig pressure in piping during the concrete pour and continue for 24 hours during curing.
- H. Revise locations and elevations from those indicated as required to suit field conditions and ensure integrity of piping and as approved by Commissioner.
- I. After system balancing has been completed, mark balancing valves to permanently indicate final position.
- J. Perform the following adjustments before operating the system:
1. Open valves to fully open position.
 2. Check operation of automatic valves.
 3. Set temperature controls so all zones call for full flow.
 4. Purge air from piping.
- K. After the concrete or plaster heating panel has cured as recommended by concrete or plaster supplier, operate radiant heating system as follows:
1. Start system heating at a maximum of 10 deg F above the ambient radiant panel temperature, and increase 10 deg F each following day until design temperature is achieved.
- L. Next, operate Radiant Cooling System as follows:
1. Start system cooling at a maximum of 5 deg F below ambient radiant panel temperature, and decrease 5 deg F each following day until design temperature is reached.
- M. Suspended Slab Construction:
1. Fasten the tubing to flat wire mesh or reinforcing bar, or snap into PEX rails in accordance with the PEX-A tubing manufacturer's installation recommendations.
 2. Use closer tubing on-center distances along exterior walls. Increase tubing on-center distances as the installation moves away from the exterior wall.
 - a. Use 6 inches (152mm) on center for exterior section of the design.
 - b. Do not exceed 9 inches (229mm) on center for interior sections of the design.
 - c. Do not install tubing within 6 inches (152mm) of all walls. d. Refer to the submitted radiant floor design layout for actual on center information.
 3. The required insulation resistance value (R-value) is determined by the radiant floor design.
 4. Use edge insulation when the radiant floor directly contacts an exterior wall or beam.
 5. Install tubing at a consistent depth below the surface elevation as determined by the Commissioner. Ensure sufficient clearance to avoid control joint cuts.
 6. Depending on the manufacturer's and Commissioner's recommendation, fibrous expansion joints may tolerate penetration.
 7. For tubing that exits the slab in a 90-degree bend, use metal or PVC bend supports.

- N. Length of loops and piping location/spacing to be determined by the manufacturer and approved by the Commissioner.
- O. Verify high-density rigid board insulation and vapor barrier has been installed.
- P. Insure that a minimum bending radius of 6 times piping diameter or per manufacturer's recommendations (if more stringent) is obtained.
- Q. Piping to have a fully enclosed protective conduit where tubing first penetrates concrete flooring.
- R. Provide a 12-inch (300mm) long protective sleeve where pipe crosses expansion joints.
- S. Insure a minimum of a 1/4-inch (6mm) thick foam or "sill gasket" expansion strip is placed against all inner and outer walls (i.e. where the topping comes in contact with a wall plate).
- T. All piping to be identified with loop numbers marked on pipe wall before connecting to manifold using a permanent tag. 1. Verify actual loop length for each loop on a manifold. 2. Room identification plus loop number is to be printed and placed on each individual module in the manifold tag slot with the identification tags provided. 3. All loops must be identified to allow for future balancing.
- U. Coordinate slab piping layout with other devices (electrical conduits and boxes, telecommunication conduits and boxes, plumbing penetrations, construction and furniture supports) and all other services within or attaching to the slab. Zones designated on the drawings shall be kept clear of all radiant floor piping.
- V. Provide survey documentation of pipe layout on a 10 foot grid after installation of piping and prior to pouring concrete. Notify Commissioner 3 days in advance of concrete pour to allow inspection of installation and survey documentation.
- W. Through-penetration Firestops.
 - 1. Ensure compatibility of one- and two-hour rated through-penetration assemblies in accordance with ASTM E814.
 - 2. Refer to the PEX-A tubing manufacturer for manufacturers that list PEX-A tubing with their firestop systems.

3.5 FIELD QUALITY CONTROL

- A. Prepare radiant heating piping for testing as follows:
 - 1. Open all isolation valves and close bypass valves.
 - 2. Open and verify operation of zone control valves.
 - 3. Flush with clean water, and clean strainers.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Subject piping to hydrostatic test pressure that is not less than 1.5 times the design pressure but not more than 100 psig. Repair leaks and retest until no leaks exist.

2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 3. Test all electrical controls in accordance with respective installation manuals.
- C. Remove and replace malfunctioning radiant heating piping components that do not pass tests, and retest as specified above.
- D. Prepare a written report of testing.

3.6 ADJUSTING

- A. Balancing Across the Manifold
1. Balance all loops across each manifold for equal flow resistance based on actual loop lengths and total manifold flow.
 2. Balancing is unnecessary when all loop lengths across the manifold are within 3 percent of each other in length. Install the supply and return piping to the manifold in a reverse-return configuration to ensure self-balancing.
- B. Balancing between manifolds is accomplished with a flow control device installed on the return piping leg from each manifold.

3.7 CLEANING

- A. Remove temporary coverings and protection of adjacent work areas.
- B. Repair or replace damaged installed products.
- C. Clean installed products in accordance with manufacturer's instructions prior to City of New York's acceptance.
- D. Remove construction debris from project site and legally dispose of debris.

3.8 DEMONSTRATION

- A. Demonstrate operation of hydronic radiant floor heating and cooling system to City of New York's personnel.

3.9 PROTECTION

- A. Protect installed work from damage caused by subsequent construction activity on the site.

END OF SECTION 238316

This Page Intentionally Left Blank

SECTION 260500 – COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. All work under this Section shall comply with the requirements of General Conditions, Supplemental Conditions, Special Conditions and Division 1 - General Requirements, and shall include all Sections of Division 26 and shall apply to all Work specified, indicated in the Drawings, and as required to furnish a complete installation of mechanical systems for the Project. Review all Sections of the Specifications for related work and coordinate the work of this Section with all other Sections.

- B. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes common work results related to all Division 26 Sections.

- B. Furnish all labor, services, materials, tools, equipment, appliances, facilities, transportation and incidental work and appurtenances required to furnish a complete and properly operating system.

- C. The Contractor shall refer to the architectural interior details, floor plans, elevations, and the structural and other Contract Drawings and shall coordinate the work with that of the other trades to avoid interference. The plans are diagrammatic and show the general arrangement of the conduit, panels, transformers and equipment. All dimensions and existing conditions shall be the responsibility the Contractor. Before proceeding with work check and verify all dimensions.

- D. The Contractor shall assume all responsibility for fitting of materials and equipment to other parts of equipment and structure. Make adjustments that may be necessary or as requested, in order to resolve space problems, preserve headroom, and avoid architectural openings, structural members and work of other trades. Where existing pipes, conduits and/or ducts prevent installation of new work as indicated, relocate, or arrange for relocation with the applicable trades, existing pipes, conduits and/or ducts.

- E. Where the project involves interface with existing building and site systems, the Commissioner has used reasonable care to identify existing utilities and services. The Contractor is responsible to thoroughly familiarize themselves with existing conditions and be aware that in some cases information is not available i.e. concealed conditions, which exist in the existing building affected by this work.

- F. Documents do not represent to show or list every item to be provided. When an item not shown or listed, is necessary for proper operation of the system and/or equipment, the Contractor shall provide the item which will allow the system to function properly at no increase in Contract Sum.

- G. Maintain integrity of fire-rated construction where penetrated by electrical work.

- H. Work shall include, but shall not be limited to, the following:
 - 1. Special coordination of chases and plenums.
 - 2. Hoisting and rigging required to complete work of this section.
 - 3. Sleeves, inserts and hangers.
 - 4. Equipment bases and supports.
 - 5. Vibration isolators, and seismic restraints.
 - 6. Motors.
 - 7. Low Voltage Transmission System
 - 8. Interior Lighting System
 - 9. Exterior Lighting System
 - 10. Prime painting.
 - 11. Panelboard and major component identification.
 - 12. Instruction manual and start up instructions.
 - 13. Commissioning.
 - 14. Cleaning.
 - 15. Power wiring to all DDC control panels and controls.

- I. Related work specified elsewhere: The following work, unless otherwise noted is not included in this section shall be performed in other sections:
 - 1. Fire Suppression Equipment. Division 21
 - 2. Mechanical Equipment. See Division 23.
 - 3. Automation and Control See Division 23
 - 4. Electronic Safety and Security. Division 28
 - 5. Provision of circuit breakers testing and connections for DDC control power wiring.
 - 6. Gypsum drywall enclosures of supply and return ductwork on all rooftop air handlers, supply and return shafts, as shown on drawings.
 - 7. Excavation and backfill.
 - 8. Concrete work, including concrete housekeeping pads and other pads and blocks for vibrating and rotating equipment, duct bank envelopes and cast in place manholes and handholes, except as part of an inertia base. See Division 3
 - 9. Cutting and patching of masonry, concrete, tile and other parts of structure, with the exception of drilling for hangers and providing holes and openings in metal deck.
 - 10. Flashing of wall and roof penetrations.
 - 11. Installation of access panels in floors, walls, furred spaces or above ceilings
 - 12. Outdoor air intake and exhaust louvers.
 - 13. Undercutting of doors and door louvers
 - 14. Partitions and Painting (except as specifically indicated) See Division.
 - 15. Structural supports necessary to distribute loading from equipment to roof or floor, except as specified herein.
 - 16. Foundation drainage systems and site drainage structures.
 - 17. Paving
 - 18. Thermal and sound insulation in partitions and ceilings.

1.3 QUALITY ASSURANCE

A. General:

1. All equipment and accessories shall be the product of a manufacturer regularly engaged in its manufacture.
2. All equipment and accessories shall be new and free from defects.
3. Supply all equipment and accessories in compliance with the applicable standards listed in this Section and with all applicable National, State and Local Codes.
4. All items of a given type shall be the product of the same manufacturer.
5. Install work by craftsmen skilled in trade involved and by apprentices as indicated in the general conditions. Rough work will be rejected.
6. The subcontractor must, within the last three years, prior to the bid opening, have successfully completed in a timely fashion at projects similar in scope and type to the required work.

B. Requirement of regulatory agencies:

1. In accordance with requirements of Division 1 and as specified herein.
2. Nothing in the Drawings or Specifications shall be construed to permit Work not conforming to applicable laws, ordinances, rules or regulations.
3. When Drawings or Specifications exceed requirements of applicable laws, ordinances, rules or regulations, Drawings and Specifications take precedence.
4. It is not the intent of Drawings and Specifications to repeat requirements of codes except where necessary for completeness or clarity.
5. If any of the requirements of the above are in conflict with one another, or with the requirements of these specifications, the most stringent requirements shall govern.

C. LEED General Requirements

1. The Project is targeting a specific level of Certification under USGBC's LEED Green Building Rating System for New Construction. The contractor, subcontractor, vendors, material suppliers and manufactures performing work on the Project shall ensure that the requirements related to these goals, as defined in the sections below, are implemented fully.
2. Substitutions, or other changes to the work, proposed by the contractor, subcontractor, vendors, material suppliers and manufacturers performing work on this Project shall not be allowed if such changes to this specification section may compromise the attainment of any points under any credits on the Project's LEED Checklist. Green Building Performance Requirements
3. The Contractor shall implement practices and procedures to meet the Project's GREEN BUILDING requirements. The Contractor shall ensure that the requirements related to these goals, as defined in Section 01 81 13: "Sustainable Design Requirements", and as specified in this Section, are implemented to the fullest extent. Substitutions or other changes to the work shall not be proposed by the Contractor or their sub-contractors if such changes compromise the stated GREEN BUILDING Performance Criteria.

1.4 APPLICABLE REGULATIONS, CODES, PUBLICATION, PERMITS AND FEES

A. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:

1. Local and state building, plumbing, mechanical, electrical, fire and health department codes.

2. American National Standards (ANSI).
 3. American Society of Testing and Materials (ASTM).
 4. Underwriter's Laboratories (UL).
 5. National Electric Code (NEC)
 6. Insulated Cable Engineers Association (ICEA).
 7. Institute of Electrical and Electronic Engineers (IEEE).
 8. National Electrical Manufacturers' Association (NEMA).
 9. National Electrical Testing Association, Inc (NETA).
 10. National Fire Protection Association (NFPA).
 11. Occupational Safety and Health Act (OSHA)
 12. Certified Ballast Manufacturers (CBM).
- B. All materials and equipment shall be listed by Underwriters' Laboratories (UL), and approved by ANSI, ASTM, and NEC for intended service.
- C. Most recent editions of applicable specifications and publications of the following organizations form part of these Contract Documents.
1. American National Standards Institute (ANSI)
 2. American Society of Testing and Materials (ASTM).
 3. Underwriter's Laboratories (UL).
 4. National Electric Code (NEC)
 5. Insulated Cable Engineers Association (ICEA).
 6. Institute of Electrical and Electronic Engineers (IEEE).
 7. National Electrical Manufacturers' Association (NEMA).
 8. National Electrical Testing Association, Inc (NETA).
 9. National Fire Protection Association (NFPA).
 10. Occupational Safety and Health Act (OSHA)
 11. Certified Ballast Manufacturers (CBM)
 12. Illuminating Engineering Society (IES)
- D. Specific reference is made to following NFPA codes which contain an exceptionally high quantity of mechanical, electrical, and fire protection requirements.
1. No. 20 - Installation of centrifugal fire pumps.
 2. No. 70 - National Electric Code
 3. No. 72D - Proprietary Protective Signaling Systems
 4. No. 72E - Automatic Fire Detectors
- E. Conform to all rules, regulations, standards, ordinances and laws of local, state, and Federal governments and other authorities that have legal jurisdiction over the site.
- F. Prior to commencement of work, notify City of New York and applicable authorities as required and submit all of the applicable notifications for construction, operation and demolition. Secure required permits and inspections from any of the authorities having jurisdiction, for this work and pay for all fees required for permits, inspections and review, including special agency construction.
- G. Include all utility and local building department charges for providing temporary and permanent electric services to buildings.
- H. Provide City of New York, Commissioner and Inspectors from any of the authorities / agencies having jurisdiction access to work at all times.

- I. Contractor shall be responsible for all law violations caused by the work under this Division. Notify Contractor in writing when a discrepancy occurs between code requirements and work shown on drawings and resolve matter before proceeding with work.
- J. When requirements cited in this specification conflict with each other or with Contract Documents, most stringent shall govern work. Commissioners may relax this requirement when such relaxation does not violate ruling of authorities that have jurisdiction. Approval for such relaxation shall be obtained in writing.
- K. Make corrections in the work as required by the Commissioner or Inspector to pass local regulations.
- L. Contractor shall deliver to the Commissioner any and all certificates of inspections, permits, and approvals. Contractor shall submit final inspection certificates signed by governing authorities to the City of New York.
- M. Make all necessary submissions to the Department of Environmental Protection, Bureau of Air Resources and Management, and Department of Labor and Industry. Pay all required fees for review, registration and sign off.

1.5 DEFINITIONS

- A. "Above Grade": Not buried in the ground and not embedded in concrete slab on ground.
- B. "Accessible": Ability to perform recommended maintenance without removal of services or equipment and requiring no special platforms.
- C. "Actuating" or "Control" Devices: Automatic sensing and switching devices such as thermostats, pressure, float, electro-pneumatic switches and electrodes controlling operation of equipment.
- D. "Below Grade": Buried in the ground or embedded in concrete slab on ground.
- E. "Concealed": Embedded in masonry or other construction, installed in furred spaces, within double partitions or hung ceilings, in trenches, in crawl spaces, or in enclosures. In general, any item not visible or directly accessible.
- F. "Exposed": Not installed underground or "concealed."
- G. "Piping": Pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation, and related items.
- H. "Rough-In": Provide all indicated services in the necessary arrangement suitable for making final connections to fixture or equipment.
- I. "Wiring": Raceway, fittings, wire, boxes and related items.

- J. Reference by abbreviation may be made in the specifications and the Contract Drawings for Mechanical and Electrical Work in accordance with the following list:
1. HVAC Heating, Ventilating and Air Conditioning
 2. GC Contractor
 3. AWG American Wire Gauge
 4. USS United States Standards
 5. ASTM American Society of Testing Materials
 6. ASA American Standards Association
 7. AC: Alternating Current.
 8. AIC: Ampere Interrupting Capacity.
 9. ADA: Americans with Disabilities Act.
 10. ANSI: American National Standards Institute.
 11. AWG: American Wire Gauge.
 12. CBM: Certified Ballast Manufacturers.
 13. DC: Direct Current.
 14. ETL: Electrical Testing Laboratory.
 15. HID: High Intensity Discharge.
 16. HP:Horsepower.
 17. ICEA: Insulated Cable Engineers Association
 18. IEEE: Institute of Electrical and Electronic Engineers.
 19. NEMA:National Electrical Manufacturers' Association.
 20. NETA: National Electrical Testing Association, Inc.
 21. NFPA: National Fire Protection Association.
 22. OSHA: Occupational Safety and Health Act.
 23. PVC: Polyvinyl chloride.
 24. UBC: Uniform Building Code.
 25. UL:Underwriters' Laboratories,

1.6 SCOPE

- A. Perform work and provide material and equipment as shown on the drawings and/or as specified and/or as indicated in this section of the specifications. Completely coordinate all work of this section with work of other trades and provide a complete and fully functional installation.
- B. Drawings and Specifications form complimentary requirements; provide work specified and not shown, and work shown and not specified as though explicitly require by both. Although work is not specifically shown or specified, provide supplementary or miscellaneous items, appurtenances, devices and materials obviously necessary for sound, secure and complete installation.
- C. Give notices, file plans, obtain permits and licenses, pay fees and back-charges, and obtain necessary approvals from authorities that have jurisdiction as required to perform work in accordance with all legal requirements and with Specifications, Drawings, Addenda and Change Orders, all of which are part of Contract Documents.
- D. Contractor shall be responsible with obtaining all the final inspection as required by Local Code and ordinances.

1.7 CONTRACT DOCUMENTS

- A. Listing of Documents does not limit responsibility of determining full extent of work required by these Contract Documents. Refer to the Commissioner's, Electrical, HVAC, Plumbing and Fire Protection, Structural, Site Utility and all other drawings and other sections that types of and work of other trades with which work of this section must be coordinated.
- B. Except where modified by a specific notation to the contrary; it shall be understood that the indication and/or description of any item, in the drawings or specifications or both, carries with it the instruction to furnish and install the item, regardless of whether or not this instruction is explicitly stated as part of the indication or description.
- C. Items referred to in singular number in Contract Documents shall be provided in quantities necessary to complete work.
- D. Drawings are diagrammatic. They are not intended to be absolutely precise; they are not intended to specify coordinated routings and component. The purpose of the document is to indicate systems concept, the main components of the systems, and the approximate geometric relationships. Based on the systems concept, the main components and the approximate geometrical relationships, the contractor shall provide all other components and materials necessary to make the systems fully complete and operational.
- E. Information and components shown on riser diagrams, but not shown on plans, and vice versa, shall apply and be provided as if expressly required on both.
- F. Data that may be furnished electronically by the Commissioner is diagrammatic. Such electronically furnished information is subject to the same limitation of precision as heretofore described. If furnished, such data is for convenience and generalized reference, and shall not be substitute for Commissioner's sealed or stamped construction documents.

1.8 COORDINATION DRAWINGS

- A. A single set of coordination drawings shall be mutually prepared by all mechanical, electrical, plumbing and fire protection trades.
- B. The initiation of these drawings begins with Sheet Metal Subcontractor.
- C. The Sheet Metal Subcontractor shall prepare a complete set of electronic background drawings at scale not less than 3/8" equals 1'-0", showing structure and other information as needed for coordination. He shall show sheet metal layout thereon. These will be Coordination Drawings.
- D. Each of the mechanical, electrical and other specialty trade shall add its work to these background drawings with appropriate elevations and grid dimensions. Specialty trade information is require for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.
- E. Each specialty trade shall sign and date each coordination drawing. Return drawing to the Sheet Metal Subcontractor, who shall route them sequentially to all specialty trades.

- F. Where conflicts occur with placement of materials of various trades, the Sheet Metal Subcontractor will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by specialty trade. The Sheet Metal Subcontractor shall then final date and sign each drawing. If he cannot resolve conflicts, the decision of the Contractor/Contractor shall be final.
- G. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- H. Sheet Metal Subcontractor shall make prints of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Commissioner/Engineer and have been reviewed and approved.
- I. The review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with the other trades, structural and other work.
- J. After review:
 - 1. After review of coordination drawings, the method used to resolve interferences not previously identified shall be as in "MODIFICATIONS IN LAYOUT" above.
 - 2. All changes to reviewed coordination drawings shall be in writing by the Commissioners/Engineer prior to start of work in affected area.
- K. Distribution of Coordination Drawings - The Sheet Metal Subcontractor shall provide the following distribution of documents:
 - 1. One sepia (reproducible) of each Coordination Drawing to each specialty trade and affected Contractor for their use.
 - 2. One reproducible of each Coordination drawing to City of New York.
 - 3. One sepia (reproducible) of each coordination drawing to the Contractor/Contractor.
 - 4. The above documents can be submitted as electronic media upon agreement of all parties.
- L. ALL FIREWALLS AND SMOKE PARTITIONS SHALL BE HIGHLIGHTED ON COORDINATION DRAWINGS FOR APPROPRIATE COORDINATION.
- M. The main paths of egress and for equipment removal from main mechanical and electrical rooms must be clearly shown on coordination drawings.
- N. Coordination Drawings shall include, but not limited to:
 - 1. Plumbing systems, piping and equipment.
 - 2. HVAC piping, systems and equipment.
 - 3. Control systems.
 - 4. Electrical distribution, systems and equipment.
 - 5. Lighting systems and fixtures.
 - 6. Sheet metal work, components and accessories, costs and boxes in terminals, etc.
 - 7. Fire protection and sprinkler system, piping and heads.
 - 8. Structural.
 - 9. Electrical Equipment Room layouts.
 - 10. Environmental Rooms and associated refrigeration/heating systems.
 - 11. Partition/room layout.
 - 12. Ceiling tile and grid.

13. Access panels.
 14. Smoke and fire dampers.
 15. Roof drain piping.
 16. Major electrical conduit runs, panel-boards, feeder conduit and racks of branch conduit.
 17. Above ceiling miscellaneous metal.
 18. Heat tracing of piping.
 19. Minimum access space requirements for all equipment for both installation and maintenance.
- O. Product Selection for Restricted Space: Drawings indicate maximum allowed dimensions for basis of design electrical equipment, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- P. Digital Assets: The contractor shall hand over all digital data files related to the coordination and shop drawing exercise at the end of the construction process, including all, but not limited to the shop drawings, as built conditions and all native digital file formats, including 3D BIM files, if used.

1.9 MODIFICATION IN LAYOUT

- A. Electrical, HVAC, Plumbing and Fire Protection Drawings are diagrammatic. They indicate general arrangements of mechanical and electrical systems and other work. They do not show all offsets required for coordination nor do they show exact routings and locations needed to coordinate with structure and other trades to meet the Commissioner's requirements
- B. In order to obtain the Commissioner's desired aesthetics in spaces used by building occupants; prior to installation of visible materials, finishes and equipment (including access panels, review Commissioner's Drawings for desired locations and where not definitely indicated, request information from the Commissioner/Commissioner.
- C. Check Contract Drawings, as well as Shop Drawings, of all subcontractors to verify and coordinate spaces in which work of this section will be installed
- D. Maintain maximum headroom at all locations. All conduit, piping, duct and associated components to be as tight to underside of structure as possible.
- E. Make reasonable modifications in layout and components to prevent conflict with work of other trades and to coordinate according to Paragraphs A,B,C,and D above. Systems shall be run in an organized and rectilinear fashion.
- F. Where conflicts or potential conflict exists and engineering guidance is desired, submit sketch of proposed resolution to the Commissioner for review and approval

1.10 MEASUREMENTS

- A. Contractor shall base all his measurements, both horizontal and vertical from established benchmark. All work shall agree with these established lines and levels. He shall verify all measurements at site; and check the correctness of same as related to the work.

1.11 MATERIALS AND WORKMANSHIP

- A. Materials shall be new, meet detailed requirements of the Contract Documents and be identifiable as being specified or substitute products.
- B. Materials which do not conform to the requirements of the Contract Documents, are not equal to approved samples or are unsatisfactory or unsuited to the purpose for which they are intended, will be rejected.
- C. All work shall be performed in the best and most workmanlike manner by tradesmen skilled in their respective trades and properly licensed.
- D. All equipment shall be installed in accordance with the recommendation of the manufacturer.
- E. Defective work, whether the result of poor workmanship, use of defective materials, damage through carelessness, or other cause shall be removed within ten (10) days after written notice is given by the Commissioner and the work shall be re-executed by the Contractor. The fact that the Commissioner may have previously overlooked such defective work shall not constitute total or partial acceptance of it.
- F. In no case shall a Bidder base his bid on a class of material or workmanship less than that required by the contract documents nor the governing codes and ordinances.

1.12 CHECKING AND TESTING EQUIPMENT BY CONTRACTORS AND MANUFACTURER'S REPRESENTATIVE

- A. All equipment shall be installed in strict accordance with manufacturer's instructions. During construction request supervisory assistance from equipment manufacturer's representatives so the equipment will be correctly installed. After installation, request the Commissioner to inspect and see the equipment is in proper working order.
- B. Manufacturer's representative shall review the overall system design relative to the proper application of his equipment in the particular system. He shall note conduit, wiring, control, location, and other relevant relationships, and furnish appurtenances necessary for satisfactory operation.
- C. The Contractor's representative shall submit to the CM a signed statement certifying:
 - 1. The equipment is properly installed and ready for operation
 - 2. The City of New Yorks maintenance representatives have been thoroughly instructed
 - 3. Maintenance and operation manuals issued and accepted by the Commissioner.

1.13 TEMPORARY FACILITIES

- A. Temporary Light and Power:
- B. All temporary facilities shall be removed at completion of project.

1.14 PROJECT COMMUNICATION

- A. Communication and Submittals:
- B. The specification references communication and submittal of information and documents by the Contractor to the Engineers of Record and CM or visa versa. In all cases such communication shall be submitted to the CM who will review it before forwarding to the relevant party for review and response.
- C. If the information provided is not in conformance with the specification the CM shall return it to the relevant Contractor for re-submission.
- D. The time taken for this process shall be factored into all work schedules and submissions.

1.15 HOIST, RIGGING, TRANSPORTATION AND SCAFFOLDING

- A. Provide all scaffolding, staging, cribbing, tackle hoist and rigging necessary for placing all materials and equipment in their proper places in the Project. All temporary work shall be removed from the premises when its use is no longer required.

1.16 GUARANTEE AND 24 HOUR SERVICE

- A. Guarantee the Work of this section for one year following the date of Substantial Completion
- B. The guarantee shall repair or replace defective materials, equipment, workmanship and installation that develop within this period, promptly and to the Commissioner's satisfaction and correct damage caused in making necessary repairs and replacements under guarantee within Contract Price.
- C. In addition to guarantee requirements of Division 1 and of Paragraph A above, obtain written equipment and material warranties offered in manufacturer's published data without exclusion or limitation, in City of New York's name.
- D. Replace material and equipment that require excessive service during guarantee period as defined and as directed by the Commissioner.
- E. Provide 24 hour service beginning on the date of substantial completion and lasting until the termination of guarantee period. Service shall be at no cost to City of New York
- F. Submit copies of equipment and material warranties to Commissioners before final payment.
- G. At end of guarantee period, transfer manufacturer's equipment and warranties still in force to City of New York.
- H. Use of systems provided under this Section for temporary services and facilities shall not constitute Final Acceptance of work nor beneficial use by City of New York, and shall not institute guarantee period.

- I. Provide manufacturer's engineering and technical staff at site to analyze and rectify problems that develop during guarantee period immediately. If problems cannot be rectified immediately to City of New York's satisfaction, advise the Commissioner in writing, describe efforts to rectify situation, and provide analysis of cause of problem. Commissioners will suggest course of action.

1.17 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 1. Ambient Temperature: Not less than minus 22 deg F (minus 30 deg C) and not exceeding 104 deg F (40 deg C).
 2. Altitude: Not exceeding 6600 feet (2010 m).
- B. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
 1. Notify City of New York no fewer than five days in advance of proposed interruption of electric service.
 2. Do not proceed with interruption of electric service without City of New York's written permission.
 3. Comply with NFPA 70E.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Equipment and materials shall be as described in the respective Sections of Division 21, 22,23 and Division 26 and as shown.

2.2 MATERIALS

- A. Equipment specified by manufacturer's number shall include all accessories, controls, etc., listed in catalog as standard with equipment. Furnish optional or additional accessories as specified. And or/as required to provide a fully operational installation.
- B. Equipment, material damaged during transportation, installation, operation is considered as totally damaged. Replace with new. Payment for this equipment shall not be approved. Variance from this permitted only with written acceptance.
- C. All items of materials in each category of equipment shall be of one manufacturer.
- D. Material and Equipment General Requirements:
 1. All equipment and components shall be New.

2. Testing agency labeled or with other identification wherever standards have been established.
3. Commissioner reserves right to reject items not in accordance with Specification either before or after installation.
4. Comprised to render complete and operable systems; provide additional items needed to complete installation to realized design.
5. Compatible with space allocated. Modifications necessary to adjust items to space limitations at Contractor's expense.
6. Installed fully operating and without objectionable noise or vibration.

PART 3 - EXECUTION

3.1 SPECIAL RESPONSIBILITIES:

- A. Cooperate and coordinate with work of other Sections in executing work of this Section.
 1. Perform work such that progress of entire project including work of other Sections shall not be interfered with or delayed.
 2. Provide information as requested on items furnished under this Section which shall be installed under other Sections.
 3. Obtain detailed installation information from manufacturers of equipment provided under this section.
 4. Obtain final roughing dimensions or other information needed for complete installation of items furnished under other Sections or by City of New York.
 5. Keep fully informed as to shape, size and position of openings required for material or equipment to be provided under this and other Sections. Give full information so that openings required by work of this Section may be coordinated with other work and other openings and may be provided for in advance. In case of failure to provide sufficient information on proper time, provide cutting and patching or have same done, at own expense and to full satisfaction of Commissioners.
 6. Provide information as requested as to sizes, number and locations of pads necessary for floor mounted equipment provided under this Section.
 7. Notify Commissioners of location and extent of existing piping, conduit, ductwork and equipment that interferes with new construction. In coordination with and with approval of Commissioners, relocate piping, ductwork and equipment to permit new work to be provided as required by Contract Documents. Remove non-functioning and abandoned piping, ductwork and equipment as directed by Commissioners. Dispose of or store items as requested by Commissioners.
- B. Installation Only Items
 1. Where this contractor is required to install items which it does not purchase, it shall coordinate delivery and be responsible for their unloading from delivery vehicles and for their safe handling and field storage up to time of installation. This trade shall be responsible for:
 2. Any necessary field assembly and internal connections, as well as mounting in place of the items, including the purchase and installation of all dunnage supporting members and fastenings necessary to adapt to Commissioner's and structural conditions.
 3. Their connection to building systems including the purchase and installation of all terminating fittings necessary to adapt and connect them to the building systems.

4. This contractor shall carefully examine such items upon delivery. Claims that any of these items have been received in such condition that their installation will require procedures beyond the reasonable scope of work of this contractor will be considered only if presented in writing within one week of their date of delivery. Unless such claims have been submitted this contractor shall be fully responsible for the complete reconditioning or replacement of the damaged items.
- C. Maintenance of equipment and systems: Maintain equipment and systems until Final Acceptance. Ensure adequate protection of equipment and material during delivery, storage, installation and shutdown and during delays pending final test of systems and equipment because of seasonal conditions.
- D. Use of premises: Use of premises shall be restricted as directed by the Commissioner and as required below:
1. Remove and dispose of dirt and debris, and keep premises clean. During progress of work, remove equipment and unused material. Put building and premises in neat and clean condition, and do cleaning and washing required to provide acceptable appearance and operation of equipment, to satisfaction of the Commissioner.
 2. Store materials in a manner that will maintain an orderly clean appearance. If stored on-site in open or unprotected areas, all equipment and material shall be kept off the ground by means of pallets or racks and covered with tarpaulins.
 3. Do not interfere with function of existing sewers and water and gas mains, electrical or mechanical systems and services. Extreme care shall be observed to prevent debris from entering pipe, ductwork and equipment. Confer with the Commissioner as to the disruption of services or other utilities due to testing, connection of new work to existing. Interruption of services shall be performed at time of day or night deemed by City of New York to provide minimal interference with normal operation. Obtain City of New York's approval of the method proposed for minimizing service interruption.
- E. Surveys and Measurements:
1. Base measurements, both horizontal and vertical, on reference points established by Contractor and be responsible for correct laying out of work.
 2. In event of discrepancy between actual measurements and those indicated, notify the Commissioner in writing and do not proceed with work until written instructions have been issued by the Commissioner.
- F. Fireproofing:
1. Clip, hangers, clamps, supports and other attachments to surfaces to be fireproofed shall be installed, insofar as possible prior to start of spray fiber work.
 2. Conduit and other items which would interfere with proper application of fireproofing shall be installed after completion of spray fiber work.
 3. Patching and repairing of fireproofing due to cutting or damaging to fireproofing during course of work specified under this section shall be performed by installer of fireproofing and paid for by the trade responsible for damage and shall not constitute grounds for an extra to City of New York.
- G. Temporary Utilities:
1. Refer to Division 1 regarding requirements.
 2. Furnish temporary equipment, and wiring, as needed during the construction phase. Remove temporary items after use.

3.2 MATERIAL AND WORKMANSHIP

- A. Work shall be neat and rectilinear. Conduit shall run concealed except in mechanical rooms and areas where no hung ceiling exists. Install material and equipment to comply with manufacturers' Recommended Requirements. Rough Work will be rejected. Work shall be properly and effectively protected, and conduit openings shall be temporarily closed to prevent obstruction and damage before completion.
- B. Except as specified otherwise, material and equipment shall be new. Provide supplies, appliances and connections necessary for complete and operational installation. Provide components required or recommended by OSHA and applicable NFPA documents.
- C. Finish of materials, components and equipment shall be as approved by the Commissioner and shall be resistant to corrosion and weather as necessary.
- D. City of New York will not be responsible for material and equipment before testing, commissioning, and acceptance.

3.3 CONTINUITY OF SERVICES

- A. Do not interrupt existing services without City of New York's approval.
- B. Schedule interruptions in advance, according to City of New York's instructions. Submit, in writing, with request for interruption, methods proposed to minimize length of interruption.
- C. Interruptions shall be scheduled at such times of day and work so that they have minimal impact to City of New York's operations.
- D. Subcontractor shall coordinate any shutdowns of existing systems as follows:
 - 1. Give proper notice to City of New York when making shutdowns; a minimum of fourteen full days are required.
 - 2. Minimize shutdowns of any system.
 - 3. Provide temporary services where required and perform shutdown and tie-ins at a time convenient to City of New York.
 - 4. Subcontractor shall be responsible for completing and filing City of New York's shutdown notice questionnaire.
 - 5. Perform required survey and inspection work required by the notice for shutdown.
- E. Include premium time work associated with interruption of services and/or shutdown as necessary to avoid disruption to City of New York's operations.

3.4 ANCHORS AND INSERTS:

- A. Inserts shall be iron or steel of type to receive machine bolt head or nut after installation. Insert shall permit adjustment of bolt in one horizontal direction and shall develop strength of bolt when installed in properly cured concrete.
- B. Provide anchors as necessary for attachment of equipment support and hangers.

3.5 CORE DRILLING

- A. Core drilling is to be avoided.
- B. Set sleeves prior to installation of structure for passage of conduits, etc.
- C. Where core drilling is unavoidable, or required by renovation projects, locate all required openings prior to coring and submit to the Commissioner for review.
- D. Coordinate openings with Contractor/Contractor and all other trades.
- E. Core drilling is to be provided by the Contractor for General Construction and not by the M/E subcontractors.
- F. Do not disturb existing systems.
- G. Thoroughly investigate existing conditions in vicinity of required opening prior to coring.

3.6 CUTTING AND PATCHING:

- A. Complete cutting and patching in accordance with DDC General Conditions, and as follows.
- B. Provide all sleeves, core drilling, carpentry, cutting and patching required for proper installation of material and equipment specified in this Division.
- C. Do not cut or drill structural members without written approval of Commissioner and structural engineer.
- D. No cutting or patching should be done without first receiving the Commissioner's and Structural Engineer's written approval.
- E. Any damage caused by cutting and patching shall be restored to the original condition as required by the Commissioner.

3.7 VIBRATION CONTROL:

- A. Comply with DDC General Conditions.
- B. Design criteria for all the Work of Division 26 shall be as specified in 260548.

3.8 WATERPROOF CONSTRUCTION:

- A. Maintain waterproof integrity of penetrations of materials intended to be waterproof. Provide flashing at exterior wall and roof penetrations. Caulk watertight penetrations of foundation walls and floors. Provide membrane clamps at penetrations of waterproof membranes.
- B. Provide galvanized sheet metal weather protection canopies, hoods or enclosures over all out-of-doors equipment, the operation or maintenance of which would be impaired by rainwater. This requirement applies to damper operators and bearing, damper motors, controls, and

instruments. See other paragraphs in this Division for application of this requirement to panels, motors, and devices.

3.9 RESTORATION OF DAMAGE:

- A. Repair or replace, as directed by the Commissioner and/or Commissioner, materials and parts of premises which become damaged as result of installation of Work of this Division. Remove replaced parts from premises.

3.10 ROOF OPENINGS AND CURBS

- A. Roof openings where required shall be coordinated with the other affected trades and all flashing and patching shall be as per details indicated on the Commissioner's plans.

3.11 TOOLS AND EQUIPMENT

- A. Furnish all tools and equipment necessary for the proper installation, protection and upkeep of the Work.

3.12 ADJUSTMENTS

- A. Preliminary Operation: Operate any portion of installation for City of New York's convenience if so requested by Contractor. Such operation does not constitute acceptance of Work as complete. Cost of utilities, such as gas and electrical power, will be borne by City of New York if City of New York requests operation.
- B. Start-up Service: Prior to startup, ensure that systems are ready for their intended use.
- C. Start and operate all systems. Provide services of factory trained technicians for startup of major equipment and systems.
- D. Adjusting:
 - 1. Adjust all equipment and system components as shown or as otherwise required to result in intended system operation.
 - 2. Thereafter, as a result of system operation or as directed by Commissioner, make readjustments as necessary to refine performance and to effect complete system "tune-up".
 - 3. After completion of testing and adjustment, operate the different systems and equipment under normal working conditions for 72 hours continuously and show specified performance.
 - 4. If, in the opinion of the Commissioner, performance of equipment or systems is not in accordance with specifications or submitted data, alter or replace equipment at no increase in Contract Sum. The Contractor, at his option, may order tests from an independent approved laboratory to prove compliance. All such tests shall be at no increase in Contract Sum. Repeat process as often as required. If the reason for unsatisfactory operation is design errors all additional cost for corrective measures will be reimbursed to the contractor.

5. At completion of Work, provide written certification that all systems are functioning properly without defects.

E. Noise:

1. Cooperate in reducing any objectionable noise or vibration caused by electrical systems to the extent of adjustments to specified and installed equipment and appurtenances.
2. Cooperate in adjustment of mechanical systems and terminal devices, as directed by Commissioner, to obtain specified acoustic properties.
3. Completely correct noise problems caused by failure to make installation in accordance with Contract Documents, including labor and materials required as a result of such failure, at no increase in Contract Sum. Includes refinish walls, floors etc.

3.13 INSTALLATION

- A. Comply with NECA 1.
- B. Coordinate connection of electrical service with utility provider. Comply with utility provider requirements and local codes and regulations.
- C. Coordinate connection of branch circuits and feeders to equipment furnished under other Divisions.
- D. Assemble equipment required to be field assembled under the direct supervision of the manufacturers' agent. Prior to the final acceptance submit letters from the manufacturers that this has been done.
- E. Avoid interference with structure and with work of other trades, preserving adequate headroom and clearing doors and passageways, to the satisfaction of the Commissioner and in accordance with code requirements. Installation shall permit clearance for access to equipment for repair, servicing and replacement.
- F. Install equipment so as to properly distribute equipment loads on building structural members provided for equipment support under other Sections: Roof mounted equipment shall be installed and supported on structural steel provided under other Sections.
- G. Provide suspended platforms, strap hangers, brackets, shelves, stands or legs as necessary for floor, wall or ceiling mounting of equipment as required.
- H. Provide steel supports and hardware for proper installation of hangers, anchors, guides, etc.
- I. Provide cuts, weights, and other pertinent data required for proper coordination of equipment support provisions and installations.
- J. Structural steel and hardware shall conform to Standard specifications of ASTM; use of steel and hardware shall conform to requirements of Section V of Code of Practice of American Institute of Steel Construction.
- K. Verify site conditions and dimensions of equipment to ensure access for proper installation of equipment without disassembly, which will void warrantee. Report in writing to the

Commissioner, prior to purchase or shipment of equipment involved, on conditions which may prevent proper installation.

- L. Measure indicated mounting heights to center of unit for suspended items and wall-mounted items, unless noted otherwise.
- M. If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.
- N. Sequence for efficient flow of installation and positioning prior to building closing-in. Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Provide for ease of disconnecting of equipment with minimum interference to other installations.
- O. Arrange raceways, cables, wireways, to be clear of obstructions and of the working and access space of other equipment.
- P. Give right of way to piping systems installed at a required slope.
- Q. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.
- R. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed. Refer to Division 08 Section "Access Doors and Frames."
- S. Apply firestopping to penetrations of fire-rated floor and wall assemblies for electrical installations to restore original fire-resistance rating of assembly. Comply with Division 07 Section "Penetration Firestopping."
- T. Comply with DDC General Conditions; restoration of surfaces disturbed by electrical installation.

3.14 PAINTING

- A. Equipment installed shall have shop coat of non-lead paint. Hangers and supports shall have one coat of non-lead primer. Finish painting, including painting of various conduit or wire way systems, shall be done under other Sections.
- B. Paint all outside exposed equipment and equipment supports with two coats of weather resistant enamel.
- C. Properly prepare Work under this Division to be finish painted.
- D. Refer to standard paint colors for all Electrical equipment inside the Building.
- E. Paint finished surfaces damaged during electrical installation, matching color and type of paint. Follow manufacturer's written instructions for surface preparation and application. Apply successive coats required to restore finish equal to the unblemished areas.

3.15 FINAL JOBSITE OBSERVATION

- A. As the work nears completion, the Contractor is to review the requirements of the Contract Documents, inspect the work and inform all parties involved of the work to be corrected or completed before the project can be deemed substantially complete.
- B. The Contractor shall carry out their own final inspection and satisfy the Work.
- C. The Commissioner reserves the right to cancel and reschedule the inspection in the event considerable more work remains to be completed or corrected than indicated in the written request for inspection.
- D. All items not completed or found not complying with drawings or specifications by the Commissioner will be identified in their inspection report.
- E. Correct all items on inspection report. Make the correction and initial and date each item on the report after corrections have been completed.
- F. Include the fee for all local inspections.

3.16 INSTRUCTING THE CITY OF NEW YORK

- A. Adequately instruct the City Of New York in the maintenance, care, and operation of all systems installed under this contract.
- B. Provide verbal and written instructions to the City of New York by Factory Personnel in the care, maintenance, and operation of the equipment and systems.
- C. The City of New York has the option to video tape all instructions. Coordinate schedule of instructions to facilitate this recording.
- D. The instructions shall include:
 - 1. Maintenance of equipment.
 - 2. Start-up procedures for all major equipment.
 - 3. Description of emergency system operation.

END OF SECTION 260500

SECTION 260519

LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Building wires and cables rated 600 V and less.
2. Connectors, splices, and terminations rated 600 V and less.

B. Related Requirements:

1. Section 260523 "Control-Voltage Electrical Power Cables" for control systems communications cables and Classes 1, 2 and 3 control cables.

1.3 DEFINITIONS

- A. VFC: Variable frequency controller.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For testing agency.
- B. Field quality-control reports.

PART 2 - PRODUCTS

2.1 CONDUCTORS AND CABLES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Alcan Products Corporation; Alcan Cable Division.

2. Alpha Wire
 3. Belden Inc.
 4. Encore Wire Corporation.
 5. General Cable Technologies Corporation
 6. Southwire Incorporated.
 7. Tyco Thermal Controls/Pyrotenax System 1850 2-hour fire rated.
- B. Copper Conductors: Comply with NEMA WC 70/ICEA S-95-658.
- C. Conductor Insulation: Comply with NEMA WC 70/ICEA S-95-658 for Type THHN-2-THWN-2 or Type XHHW-2.
- D. Multiconductor Cable: Comply with NEMA WC 70/ICEA S-95-658 for armored cable, Type AC, and metal-clad cable, Type MC, with ground wire.
- E. VFC Cable:
1. Comply with UL 1277, UL 1685, and NFPA 70 for Type TC-ER cable.
 2. Type TC-ER with oversized crosslinked polyethylene insulation, spiral-wrapped foil plus 85 percent coverage braided shields and insulated full-size ground wire, and sunlight- and oil-resistant outer PVC jacket.
 3. Comply with UL requirements for cables in direct burial applications.

2.2 CONNECTORS AND SPLICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AFC Cable Systems, Inc.
 2. Gardner Bender.
 3. Hubbell Power Systems, Inc.
 4. Ideal Industries, Inc.
 5. IlSCO; a branch of Bardes Corporation.
 6. NSi Industries LLC.
 7. O-Z/Gedney; a brand of the EGS Electrical Group.
 8. 3M; Electrical Markets Division.
 9. Tyco Electronics.
- B. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

2.3 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.

PART 3 - EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

- A. Feeders: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.
- B. Branch Circuits: Copper. Solid for No. 14 AWG and smaller; stranded for No. 12 AWG and larger, except VFC cable, which shall be extra flexible stranded.

3.2 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

- A. Service Entrance: Type XHHW-2, single conductors in raceway.
- B. Exterior Feeders and Branch Circuits: Type XHHW-2, single conductors in raceway.
- C. Exposed Feeders: Type THHN-2-THWN-2, single conductors in raceway Type XHHW-2, single conductors in raceway.
- D. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspace: Type THHN-2-THWN-2, single conductors in raceway.
- E. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-2-THWN-2, single conductors in raceway and coordinated with Commissioner.
- F. Feeders Installed below Raised Flooring: Type THHN-2-THWN-2, single conductors in raceway.
- G. Exposed Branch Circuits, Including in Crawlspace: Type THHN-2-THWN-2, single conductors in raceway.
- H. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-2-THWN-2, single conductors in raceway.
- I. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-2-THWN-2, single conductors in raceway and coordinated with Commissioner.
- J. Branch Circuits Installed below Raised Flooring: Type THHN-2-THWN-2, single conductors in raceway.
- K. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.
- L. VFC Output Circuits: Type XHHW-2 in metal conduit Type TC-ER cable with braided shield.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

- A. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.

- B. Complete raceway installation between conductor and cable termination points according to Section 260533 "Raceways and Boxes for Electrical Systems" prior to pulling conductors and cables.
- C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
- D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.
- E. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.
- F. Support cables according to Section 260529 "Hangers and Supports for Electrical Systems."

3.4 CONNECTIONS

- A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
- C. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

3.5 IDENTIFICATION

- A. Identify and color-code conductors and cables according to Section 260553 "Identification for Electrical Systems."
- B. Identify each spare conductor at each end with identity number and location of other end of conductor, and identify as spare conductor.

3.6 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.7 FIRESTOPPING

- A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 078413 Firestops and Smoke seals.

3.8 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each splice in conductors No. 3 AWG and larger. Remove box and equipment covers so splices are accessible to portable scanner. Correct deficiencies determined during the scan.
 - a. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each splice 11 months after date of Substantial Completion.
 - b. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
 - c. Record of Infrared Scanning: Prepare a certified report that identifies splices checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
- C. Test and Inspection Reports: Prepare a written report to record the following:
 - 1. Procedures used.
 - 2. Results that comply with requirements.
 - 3. Results that do not comply with requirements and corrective action taken to achieve compliance with requirements.
- D. Cables will be considered defective if they do not pass tests and inspections.

END OF SECTION 260519

This Page Intentionally Left Blank

SECTION 260523

CONTROL-VOLTAGE ELECTRICAL POWER CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:
 - 1. Multimode optical-fiber cabling.
 - 2. UTP cabling.
 - 3. RS-485 cabling.
 - 4. Low-voltage control cabling.
 - 5. Control-circuit conductors.
 - 6. Identification products.

1.3 DEFINITIONS

- A. EMI: Electromagnetic interference.
- B. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control and signaling power-limited circuits.
- C. Plenum: A space forming part of the air distribution system to which one or more air ducts are connected. An air duct is a passageway, other than a plenum, for transporting air to or from heating, ventilating, or air-conditioning equipment.
- D. RCDD: Registered Communications Distribution Designer.
- E. UTP: Unshielded twisted pair.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.

- B. Source quality-control reports.
- C. Field quality-control reports.

1.6 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Member company of NETA or an NRTL.
 - 1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 PERFORMANCE REQUIREMENTS

- A. Flame Travel and Smoke Density in Plenums: As determined by testing identical products according to NFPA 262 by a qualified testing agency. Identify products for installation in plenums with appropriate markings of applicable testing agency.
 - 1. Flame Travel Distance: 60 inches or less.
 - 2. Peak Optical Smoke Density: 0.5 or less.
 - 3. Average Optical Smoke Density: 0.15 or less.
- B. Flame Travel and Smoke Density for Riser Cables in Non-Plenum Building Spaces: As determined by testing identical products according to UL 1666.
- C. Flame Travel and Smoke Density for Cables in Non-Riser Applications and Non-Plenum Building Spaces: As determined by testing identical products according to UL 1685.

2.3 BACKBOARDS

- A. Description: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches.
- B. Painting: Paint plywood on all sides and edges with flat paint.

2.4 LOW-VOLTAGE CONTROL CABLE

- A. Paired Cable: NFPA 70, Type CMG.
 - 1. Multi-pair, twisted, No. 16 AWG, stranded (19x29) tinned-copper conductors.
 - 2. PVC insulation.

3. Unshielded.
4. PVC jacket.
5. Flame Resistance: Comply with UL 1685.

B. Plenum-Rated, Paired Cable: NFPA 70, Type CMP.

1. Multi-pair, twisted, No. 16 AWG, stranded (19x29) tinned-copper conductors.
2. PVC insulation.
3. Unshielded.
4. PVC jacket.
5. Flame Resistance: Comply with NFPA 262.

2.5 CONTROL-CIRCUIT CONDUCTORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Encore Wire Corporation.
2. General Cable Technologies Corporation.
3. Southwire Company.

B. Class 1 Control Circuits: Stranded copper, Type XHHW-2, in raceway, complying with UL 44.

C. Class 2 Control Circuits: Stranded copper, Type XHHW-2, in raceway, complying with UL 44.

D. Class 3 Remote-Control and Signal Circuits: Stranded copper, Type XHHW-2, in raceway, complying with UL 44.

2.6 SOURCE QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test UTP cables according to TIA-568-C.2.

C. Factory test optical-fiber cables according to TIA-568-C.3.

D. Cable will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 INSTALLATION OF RACEWAYS AND BOXES

A. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems" for raceway selection and installation requirements for boxes, conduits, and wireways as supplemented or modified in this Section.

1. Outlet boxes shall be no smaller than 2 inches wide, 3 inches high, and 2-1/2 inches deep.
 2. Flexible metal conduit shall not be used.
- B. Comply with TIA-569-B for pull-box sizing and length of conduit and number of bends between pull points.
- C. Install manufactured conduit sweeps and long-radius elbows if possible.
- D. Raceway Installation in Equipment Rooms:
1. Position conduit ends adjacent to a corner on backboard if a single piece of plywood is installed, or in the corner of the room if multiple sheets of plywood are installed around perimeter walls of the room.
 2. Install cable trays to route cables if conduits cannot be located in these positions.
 3. Secure conduits to backboard if entering the room from overhead.
 4. Extend conduits 4 inches above finished floor.
 5. Install metal conduits with grounding bushings and connect with grounding conductor to grounding system.
- E. Backboards: Install backboards with 96-inch dimension vertical. Butt adjacent sheets tightly and form smooth gap-free corners and joints.

3.2 INSTALLATION OF CONDUCTORS AND CABLES

- A. Comply with NECA 1 and NFPA 70.
- B. General Requirements for Cabling:
1. Comply with TIA-568-C Series of standards.
 2. Terminate all conductors and optical fibers; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, and cross-connect and patch panels.
 3. Cables may not be spliced.
 4. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
 5. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems" and Ch. 6, "Optical Fiber Structured Cabling Systems." Install lacing bars and distribution spools.
 6. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
 7. Cold-Weather Installation: Bring cable to room temperature before dereeling. Do not use heat lamps for heating.
 8. Pulling Cable: Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems" and Ch. 6, "Optical Fiber Structured Cabling Systems." Monitor cable pull tensions.
 9. Support: Do not allow cables to lay on removable ceiling tiles.
 10. Secure: Fasten securely in place with hardware specifically designed and installed so as to not damage cables.

- C. Installation of Control-Circuit Conductors:
 - 1. Install wiring in raceways. Comply with requirements specified in Section 260533 "Raceways and Boxes for Electrical Systems."

- D. Installation of Cable Routed Exposed under Raised Floors:
 - 1. Install plenum-rated cable only.
 - 2. Install cabling after the flooring system has been installed in raised floor areas.
 - 3. Below each feed point, neatly coil a minimum of 72 inches of cable in a coil not less than 12 inches in diameter.

- E. Separation from EMI Sources:
 - 1. Comply with BICSI TDMM and TIA-569-B recommendations for separating unshielded copper voice and data communications cable from potential EMI sources including electrical power lines and equipment.
 - 2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:
 - a. Electrical Equipment or Circuit Rating Less Than 2 kVA: A minimum of 5 inches.
 - b. Electrical Equipment or Circuit Rating between 2 and 5 kVA: A minimum of 12 inches.
 - c. Electrical Equipment or Circuit Rating More Than 5 kVA: A minimum of 24 inches.
 - 3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:
 - a. Electrical Equipment or Circuit Rating Less Than 2 kVA: A minimum of 2-1/2 inches.
 - b. Electrical Equipment or Circuit Rating between 2 and 5 kVA: A minimum of 6 inches.
 - c. Electrical Equipment or Circuit Rating More Than 5 kVA: A minimum of 12 inches.
 - 4. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
 - a. Electrical Equipment or Circuit Rating Less Than 2 kVA: No requirement.
 - b. Electrical Equipment or Circuit Rating between 2 and 5 kVA: A minimum of 3 inches.
 - c. Electrical Equipment or Circuit Rating More Than 5 kVA: A minimum of 6 inches.
 - 5. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or 5 HP and Larger: A minimum of 48 inches.
 - 6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.3 REMOVAL OF CONDUCTORS AND CABLES

- A. Remove abandoned conductors and cables. Abandoned conductors and cables are those installed that are not terminated at equipment and are not identified for future use with a tag.

3.4 CONTROL-CIRCUIT CONDUCTORS

- A. Minimum Conductor Sizes:
 1. Class 1 remote-control and signal circuits; No 14 AWG.
 2. Class 2 low-energy, remote-control, and signal circuits; No. 16 AWG.
 3. Class 3 low-energy, remote-control, alarm, and signal circuits; No 12 AWG.

3.5 FIRESTOPPING

- A. Comply with requirements in Section 078413 "Penetration Firestopping."
- B. Comply with TIA-569-B, Annex A, "Firestopping."
- C. Comply with BICSI TDMM, "Firestopping" Chapter.

3.6 GROUNDING

- A. For data communication wiring, comply with ANSI-J-STD-607-A and with BICSI TDMM, "Bonding and Grounding (Earthing)" Chapter.
- B. For low-voltage control wiring and cabling, comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.7 IDENTIFICATION

- A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Identify data and communications system components, wiring, and cabling according to TIA-606-A; label printers shall use label stocks, laminating adhesives, and inks complying with UL 969.

3.8 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 1. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

- C. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide, or transfer the data from the instrument to the computer, save as text files, print, and submit.
- D. End-to-end cabling will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

END OF SECTION 260523

SECTION 260526

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes: Grounding systems and equipment.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.4 INFORMATIONAL SUBMITTALS

- A. Informational Submittals: Plans showing dimensioned as-built locations of grounding features specified in "Field Quality Control" Article, including the following:
 - 1. Test wells.
 - 2. Ground rods.
- B. Qualification Data: For qualified testing agency and testing agency's field supervisor.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For grounding to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:
 - 1. Instructions for periodic testing and inspection of grounding features at test wells, grounding connections for separately derived systems based on NFPA 70B.
 - a. Tests shall determine if ground-resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if values do not.
 - b. Include recommended testing intervals.

1.6 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Member company of NETA or an NRTL.
 - 1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with UL 467 for grounding and bonding materials and equipment.

PART 2 - PRODUCTS

2.1 CONDUCTORS

- A. Insulated Conductors: tinned-copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.
- B. Bare Copper Conductors:
 - 1. Solid Conductors: ASTM B 3.
 - 2. Stranded Conductors: ASTM B 8.
 - 3. Tinned Conductors: ASTM B 33.
 - 4. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch in diameter.
 - 5. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
 - 6. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
 - 7. Tinned Bonding Jumper: Tinned-copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
- C. Grounding Bus: Predrilled rectangular bars of annealed copper, 1/4 by 4 inches in cross section, with 9/32-inch holes spaced 1-1/8 inches apart. Stand-off insulators for mounting shall comply with UL 891 for use in switchboards, 600 V. Lexan or PVC, impulse tested at 5000 V.

2.2 CONNECTORS

- A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.
- B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, pressure type with at least two bolts.
 - 1. Pipe Connectors: Clamp type, sized for pipe.
- C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.3 GROUNDING ELECTRODES

- A. Ground Rods: Copper-clad steel, sectional type; 3/4 inch by 10 feet in diameter.
 - 1. Termination: Factory-attached No. 4/0 AWG bare conductor at least 48 inches long.
 - 2. Backfill Material: Electrode manufacturer's recommended material.

PART 3 - EXECUTION

3.1 APPLICATIONS

- A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.
- B. Underground Grounding Conductors: Install bare tinned-copper conductor, No. 2/0 AWG minimum.
 - 1. Bury at least 24 inches below grade.
 - 2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.
- C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.
- D. Grounding Bus: Install in electrical and telephone equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
 - 1. Install bus on insulated spacers 2 inches minimum from wall, 6 inches above finished floor unless otherwise indicated.
 - 2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down to specified height above floor; connect to horizontal bus.
- E. Conductor Terminations and Connections:
 - 1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
 - 2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
 - 3. Connections to Ground Rods at Test Wells: Bolted connectors.
 - 4. Connections to Structural Steel: Welded connectors.

3.2 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

- A. Comply with IEEE C2 grounding requirements.
- B. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches will extend above finished floor. If necessary,

install ground rod before manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, nonshrink grout.

- C. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.
- D. Pad-Mounted Transformers and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches from the foundation.

3.3 EQUIPMENT GROUNDING

- A. Install insulated equipment grounding conductors with all feeders and branch circuits.
- B. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:
 - 1. Feeders and branch circuits.
 - 2. Lighting circuits.
 - 3. Receptacle circuits.
 - 4. Single-phase motor and appliance branch circuits.
 - 5. Three-phase motor and appliance branch circuits.
 - 6. Flexible raceway runs.
 - 7. Armored and metal-clad cable runs.
 - 8. Computer and Rack-Mounted Electronic Equipment Circuits: Install insulated equipment grounding conductor in branch-circuit runs from equipment-area power panels and power-distribution units.
- C. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.
- D. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.
- E. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

- F. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.
- G. Signal and Communication Equipment: In addition to grounding and bonding required by NFPA 70, provide a separate grounding system complying with requirements in TIA/ATIS J-STD-607-A.
 - 1. For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
 - 2. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-4-by-12-inch grounding bus.
 - 3. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.
- H. Metal and Wood Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

3.4 INSTALLATION

- A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.
- B. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.
- C. Ground Rods: Drive rods until tops are 2 inches below finished floor or final grade unless otherwise indicated.
 - 1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
 - 2. For grounding electrode system, install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.
- D. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Section 260543 "Underground Ducts and Raceways for Electrical Systems," and shall be at least 12 inches deep, with cover.

1. Test Wells: Install at least one test well for each service unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.
- E. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.
1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
 2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
 3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.
- F. Grounding and Bonding for Piping:
1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
 2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
 3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.
- G. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned bonding jumper to bond across flexible duct connections to achieve continuity.
- H. Grounding for Steel Building Structure: Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 feet apart.

3.5 LABELING

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for instruction signs. The label or its text shall be green.
- B. Install labels at the telecommunications bonding conductor and grounding equalizer and at the grounding electrode conductor where exposed.
 1. Label Text: "If this connector or cable is loose or if it must be removed for any reason, notify the facility manager."

3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells. Make tests at ground rods before any conductors are connected.
 - a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
 - b. Perform tests by fall-of-potential method according to IEEE 81.
4. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location, and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

C. Grounding system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

E. Report measured ground resistances that exceed the following values:

1. Power and Lighting Equipment or System with Capacity of 500 kVA and Less: 10 ohms.
2. Power and Lighting Equipment or System with Capacity of 500 to 1000 kVA: 5 ohms.
3. Power and Lighting Equipment or System with Capacity More Than 1000 kVA: 3 ohms.
4. Power Distribution Units or Panelboards Serving Electronic Equipment: 1 ohm(s).
5. Substations and Pad-Mounted Equipment: 5 ohms.
6. Manhole Grounds: 10 ohms.

F. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Commissioner promptly and include recommendations to reduce ground resistance.

END OF SECTION 260526

SECTION 260529

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes the following:

- 1. Hangers and supports for electrical equipment and systems.
- 2. Construction requirements for concrete bases.

- B. Related Sections include the following:

- 1. Section 260548 "Vibration and Seismic Controls for Electrical Systems" for products and installation requirements necessary for compliance with seismic criteria.

1.3 DEFINITIONS

- A. EMT: Electrical metallic tubing.
- B. IMC: Intermediate metal conduit.
- C. RMC: Rigid metal conduit.

1.4 PERFORMANCE REQUIREMENTS

- A. Provide supports for multiple raceways capable of supporting combined weight of supported systems and its contents.
- B. Provide equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
- C. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

1.5 ACTION SUBMITTALS

- A. Product Data: For the following:
 - 1. Steel slotted support systems.

1.6 QUALITY ASSURANCE

- A. Comply with NFPA 70.

1.7 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified together with concrete Specifications.
- B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 077200 "Roof Accessories."

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Allied Tube & Conduit.
 - b. Cooper B-Line, Inc.; a division of Cooper Industries.
 - c. ERICO International Corporation.
 - d. GS Metals Corp.
 - e. Thomas & Betts Corporation.
 - f. Unistrut; Tyco International, Ltd.
 - g. Wesanco, Inc.
 - 2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
 - 3. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
 - 4. Channel Dimensions: Selected for applicable load criteria.
- B. Raceway and Cable Supports: As described in NECA 1 and NECA 101.
- C. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

- D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
- E. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
 - 1. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
 - a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) Cooper B-Line, Inc.; a division of Cooper Industries.
 - 2) Empire Tool and Manufacturing Co., Inc.
 - 3) Hilti Inc.
 - 4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
 - 5) MKT Fastening, LLC.
 - 2. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
 - 3. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
 - 4. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
 - 5. Toggle Bolts: All-steel springhead type.
 - 6. Hanger Rods: Threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

- A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.
- B. Materials: Comply with requirements in Section 055000 "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

- A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.
- B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NFPA 70. Minimum rod size shall be 1/4 inch in diameter.
- C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
 - 1. Secure raceways and cables to these supports with single-bolt conduit clamps .
- D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.2 SUPPORT INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this Article.
- B. Raceway Support Methods: In addition to methods described in NECA 1, EMT, IMC, and RMC may be supported by openings through structure members, as permitted in NFPA 70.
- C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.
- D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
 - 1. To Wood: Fasten with lag screws or through bolts.
 - 2. To New Concrete: Bolt to concrete inserts.
 - 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
 - 4. To Existing Concrete: Expansion anchor fasteners.
 - 5. To Steel: Welded threaded studs complying with AWS D1.1/D1.1M, with lock washers and nuts Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69.
 - 6. To Light Steel: Sheet metal screws.
 - 7. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.

- E. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

- A. Comply with installation requirements in Section 055000 "Metal Fabrications" for site-fabricated metal supports.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
- C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE BASES

- A. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.
- B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 033000 "Cast-in-Place Concrete."
- C. Anchor equipment to concrete base.
 - 1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

- A. Touchup: Comply with requirements in for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.
- B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 260529

This Page Intentionally Left Blank

SECTION 260533

RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Metal conduits, tubing, and fittings.
2. Metal wireways and auxiliary gutters.
3. Boxes, enclosures, and cabinets.
4. Handholes and boxes for exterior underground cabling.

B. Related Requirements:

1. Section 260543 "Underground Ducts and Raceways for Electrical Systems" for exterior ductbanks, manholes, and underground utility construction.

1.3 DEFINITIONS

- A. EMT: Electrical Metallic Tubing
- B. ENT: Electrical nonmetallic tubing
- C. EPDM: Ethylene-propylene-diene terpolymer rubber.
- D. FMC: Flexible metal conduit.
- E. IMC: Intermediate metal conduit.
- F. LFMC: Liquidtight flexible metal conduit.
- G. LFNC: Liquidtight flexible nonmetallic conduit.
- H. NBR: Acrylonitrile-butadiene rubber.
- I. RNC: Rigid nonmetallic conduit.
- J. RMC: Rigid metal conduit.

K. RGS: Rigid galvanized steel conduit.

1.4 ACTION SUBMITTALS

- A. Product Data: For surface raceways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.
- B. LEED Submittals:
1. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
 2. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Shop Drawings: For custom enclosures and cabinets. Include plans, elevations, sections, and attachment details.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:
1. Structural members in paths of conduit groups with common supports.
 2. HVAC and plumbing items and architectural features in paths of conduit groups with common supports.
- B. Qualification Data: For professional engineer.
- C. Seismic Qualification Certificates: For enclosures, cabinets, and conduit racks and their mounting provisions, including those for internal components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
 4. Detailed description of conduit support devices and interconnections on which the certification is based and their installation requirements.
- D. Source quality-control reports.

PART 2 - PRODUCTS

2.1 METAL CONDUITS, TUBING, AND FITTINGS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AFC Cable Systems, Inc.
 2. Allied Tube & Conduit; a Tyco International Ltd. Co.
 3. Anamet Electrical, Inc.
 4. Electri-Flex Company.
 5. O-Z/Gedney; a brand of EGS Electrical Group.
 6. Picoma Industries, a subsidiary of Mueller Water Products, Inc.
 7. Republic Conduit.
 8. Robroy Industries.
 9. Southwire Company.
 10. Thomas & Betts Corporation.
 11. Western Tube and Conduit Corporation.
 12. Wheatland Tube Company; a division of John Maneely Company.
- B. Listing and Labeling: Metal conduits, tubing, and fittings shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. ARC: Comply with ANSI C80.5 and UL 6A.
- D. IMC: Comply with ANSI C80.6 and UL 1242.
- E. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit.
1. Comply with NEMA RN 1.
 2. Coating Thickness: 0.040 inch , minimum.
- F. EMT: Comply with ANSI C80.3 and UL 797.
- G. FMC: Comply with UL 1; zinc-coated steel or aluminum.
- H. LFMC: Flexible steel conduit with PVC jacket and complying with UL 360.
- I. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886 and NFPA 70.
 2. Fittings for EMT:
 - a. Material: Steel.
 - b. Type: Setscrew or compression.

3. Expansion Fittings: PVC or steel to match conduit type, complying with UL 651, rated for environmental conditions where installed, and including flexible external bonding jumper.
 4. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch (1 mm), with overlapping sleeves protecting threaded joints.
- J. Joint Compound for IMC, GRC, or ARC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.2 METAL WIREWAYS AND AUXILIARY GUTTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cooper B-Line, Inc.
 2. Hoffman; a Pentair company.
 3. Mono-Systems, Inc.
 4. Square D; a brand of Schneider Electric.
- B. Description: Sheet metal, complying with UL 870 and NEMA 250, Type 1 unless otherwise indicated, and sized according to NFPA 70.
1. Metal wireways installed outdoors shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
- D. Wireway Covers: Hinged type unless otherwise indicated.
- E. Finish: Manufacturer's standard enamel finish.

2.3 BOXES, ENCLOSURES, AND CABINETS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cooper Technologies Company; Cooper Crouse-Hinds.
 2. EGS/Appleton Electric.
 3. Erickson Electrical Equipment Company.
 4. FSR Inc.
 5. Hoffman; a Pentair company.
 6. Hubbell Incorporated; Killark Division.
 7. Kraloy.
 8. Milbank Manufacturing Co.

9. Mono-Systems, Inc.
 10. O-Z/Gedney; a brand of EGS Electrical Group.
 11. RACO; a Hubbell Company.
 12. Robroy Industries.
 13. Spring City Electrical Manufacturing Company.
 14. Stahlin Non-Metallic Enclosures; a division of Robroy Industries.
 15. Thomas & Betts Corporation.
 16. Wiremold / Legrand.
- B. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets installed in wet locations shall be listed for use in wet locations.
- C. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.
- D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy, Type FD, with gasketed cover.
- E. Metal Floor Boxes:
1. Material: Cast metal.
 2. Type: Fully adjustable.
 3. Shape: Rectangular.
 4. Listing and Labeling: Metal floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- F. Luminaire Outlet Boxes: Nonadjustable, designed for attachment of luminaire weighing 50 lb. Outlet boxes designed for attachment of luminaires weighing more than 50 lb shall be listed and marked for the maximum allowable weight.
- G. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
- H. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, galvanized, cast iron with gasketed cover.
- I. Box extensions used to accommodate new building finishes shall be of same material as recessed box.
- J. Device Box Dimensions: 4 inches square by 2-1/8 inches deep.
- K. Modular Gangable boxes are prohibited, use non-modular boxes sized for number of ganged devices.
- L. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1 with continuous-hinge cover with flush latch unless otherwise indicated.
1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
 2. Nonmetallic Enclosures: Plastic.
 3. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

M. Cabinets:

1. NEMA 250, Type 1 galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
2. Hinged door in front cover with flush latch and concealed hinge.
3. Key latch to match panelboards.
4. Metal barriers to separate wiring of different systems and voltage.
5. Accessory feet where required for freestanding equipment.

2.4 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

A. General Requirements for Handholes and Boxes:

1. Boxes and handholes for use in underground systems shall be designed and identified as defined in NFPA 70, for intended location and application.
2. Boxes installed in wet areas shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel, fiberglass, or a combination of the two.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Armorcast Products Company.
 - b. Carson Industries LLC.
 - c. CDR Systems Corporation; Hubbell Power Systems.
 - d. NewBasis.
 - e. Oldcastle Precast, Inc.; Christy Concrete Products.
 - f. Synertech Moulded Products; a division of Oldcastle Precast, Inc.
 - g. Or approved equal
2. Standard: Comply with SCTE 77.
3. Configuration: Designed for flush burial with closed bottom unless otherwise indicated.
4. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
5. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
6. Cover Legend: Molded lettering, "ELECTRIC."
7. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
8. Handholes 12 Inches Wide by 24 Inches Long and Larger: Have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.5 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

1. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
2. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012 and traceable to NIST standards.

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Outdoors: Apply raceway products as specified below unless otherwise indicated:

1. Exposed Conduit: Rigid Steel Conduit.
2. Concealed Conduit, Aboveground: IMC EMT.
3. Underground Conduit: RNC, Type EPC-80-PVC, direct buried.
4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
5. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R.
6. Application of Handholes and Boxes for Underground Wiring:
 - a. Handholes and Pull Boxes in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Polymer concrete, SCTE 77, Tier 15 structural load rating.
 - b. Handholes and Pull Boxes in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Polymer-concrete units Heavy-duty fiberglass units with polymer-concrete frame and cover, SCTE 77, Tier 8 structural load rating.
 - c. Handholes and Pull Boxes Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced polyester resin, structurally tested according to SCTE 77 with 3000-lbf vertical loading.

B. Indoors: Apply raceway products as specified below unless otherwise indicated:

1. Exposed, Not Subject to Physical Damage: EMT.
2. Exposed, Not Subject to Severe Physical Damage: EMT.
3. Exposed and Subject to Severe Physical Damage: Rigid Steel conduit. Raceway locations include the following:
 - a. Loading dock.
 - b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
 - c. Mechanical rooms.
4. Concealed in Ceilings and Interior Walls and Partitions: EMT.
5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
6. Damp or Wet Locations: Rigid steel conduit IMC.

7. Raceways for Optical Fiber or Communications Cable Risers in Vertical Shafts: Riser-type, optical fiber/communications cable raceway EMT.
 8. Raceways for Concealed General Purpose Distribution of Optical Fiber or Communications Cable: General-use, optical fiber/communications cable raceway Riser-type, optical fiber/communications cable raceway Plenum-type, optical fiber/communications cable raceway EMT.
 9. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4 stainless steel in institutional and commercial kitchens and damp or wet locations.
- C. Minimum Raceway Size: 3/4-inch trade size.
- D. Raceway Fittings: Compatible with raceways and suitable for use and location.
1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
 2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
 3. EMT: Use setscrew, steel fittings. Comply with NEMA FB 2.10.
 4. Flexible Conduit: Use only fittings listed for use with flexible conduit. Comply with NEMA FB 2.20.
- E. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth.
- F. Install surface raceways only where indicated on Drawings.
- G. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F (49 deg C).

3.2 INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NECA 102 for aluminum conduits. Comply with NFPA 70 limitations for types of raceways allowed in specific occupancies and number of floors.
- B. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.
- C. Complete raceway installation before starting conductor installation.
- D. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for hangers and supports.
- E. Arrange stub-ups so curved portions of bends are not visible above finished slab.
- F. Install no more than the equivalent of three 90-degree bends in any conduit run except for control wiring conduits, for which fewer bends are allowed. Support within 12 inches of changes in direction.

- G. Conceal conduit and EMT within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
- H. Support conduit within 12 inches of enclosures to which attached.
- I. Raceways Embedded in Slabs:
 - 1. Run conduit larger than 1-inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support. Secure raceways to reinforcement at maximum 10-foot intervals.
 - 2. Arrange raceways to cross building expansion joints at right angles with expansion fittings.
 - 3. Arrange raceways to keep a minimum of 2 inches of concrete cover in all directions.
 - 4. Do not embed threadless fittings in concrete unless specifically approved by Commissioner for each specific location.
- J. Stub-ups to Above Recessed Ceilings:
 - 1. Use EMT for raceways.
 - 2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.
- K. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.
- L. Coat field-cut threads on PVC-coated raceway with a corrosion-preventing conductive compound prior to assembly.
- M. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors including conductors smaller than No. 4 AWG.
- N. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to 1-1/4-inch trade size and insulated throat metal bushings on 1-1/2-inch trade size and larger conduits terminated with locknuts. Install insulated throat metal grounding bushings on service conduits.
- O. Install raceways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus 1/4 turn more.
- P. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.
- Q. Cut conduit perpendicular to the length. For conduits 2-inch trade size and larger, use roll cutter or a guide to make cut straight and perpendicular to the length.
- R. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.

- S. Install raceway sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings according to NFPA 70.

- T. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all raceways at the following points:
 - 1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
 - 2. Where an underground service raceway enters a building or structure.
 - 3. Where otherwise required by NFPA 70.

- U. Comply with manufacturer's written instructions for solvent welding RNC and fittings.

- V. Expansion-Joint Fittings:
 - 1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F and that has straight-run length that exceeds 25 feet . Install in each run of aboveground RMC and EMT conduit that is located where environmental temperature change may exceed 100 deg F and that has straight-run length that exceeds 100 feet.
 - 2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
 - a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F temperature change.
 - b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
 - c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
 - d. Attics: 135 deg F temperature change.
 - 3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F of temperature change for metal conduits.
 - 4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.
 - 5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.

- W. Flexible Conduit Connections: Comply with NEMA RV 3. Use a maximum of 72 inches of flexible conduit for recessed and semirecessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
 - 1. Use LFMC in damp or wet locations subject to severe physical damage.
 - 2. Use LFMC or LFNC in damp or wet locations not subject to severe physical damage.

- X. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
- Y. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box.
- Z. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.
- AA. Locate boxes so that cover or plate will not span different building finishes.
- BB. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.
- CC. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.
- DD. Set metal floor boxes level and flush with finished floor surface.

3.3 INSTALLATION OF UNDERGROUND CONDUIT

A. Direct-Buried Conduit:

1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Section 312000 "Earth Moving" for pipe less than 6 inches in nominal diameter.
2. Install backfill as specified in Section 312000 "Earth Moving."
3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in Section 312000 "Earth Moving."
4. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.
 - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches of concrete for a minimum of 12 inches on each side of the coupling.
 - b. For stub-ups at equipment mounted on outdoor concrete bases and where conduits penetrate building foundations, extend steel conduit horizontally a minimum of 60 inches from edge of foundation or equipment base. Install insulated grounding bushings on terminations at equipment.
5. Warning Planks: Bury warning planks approximately 12 inches above direct-buried conduits but a minimum of 6 inches below grade. Align planks along centerline of conduit.

6. Underground Warning Tape: Comply with requirements in Section 260553 "Identification for Electrical Systems."

3.4 INSTALLATION OF UNDERGROUND HANDHOLES AND BOXES

- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
- C. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch above finished grade.
- D. Install handholes with bottom below frost line, below grade.
- E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables but short enough to preserve adequate working clearances in enclosure.
- F. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

3.5 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.6 FIRESTOPPING

- A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.7 PROTECTION

- A. Protect coatings, finishes, and cabinets from damage and deterioration.
 1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
 2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION 260533

SECTION 260543

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes the following:

- 1. Conduit, ducts, and duct accessories for direct-buried and concrete-encased duct banks, and in single duct runs.

1.3 ACTION SUBMITTALS

- A. Product Data: For the following:

- 1. Duct-bank materials, including separators and miscellaneous components.
- 2. Ducts and conduits and their accessories, including elbows, end bells, bends, fittings, and solvent cement.
- 3. Warning tape.
- 4. Warning planks.

1.4 INFORMATIONAL SUBMITTALS

- A. Duct-Bank Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures.
 - 1. Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.
 - 2. Drawings shall be signed and sealed by a qualified professional engineer.
- B. Product Certificates: For concrete and steel used in precast concrete manholes and handholes, as required by ASTM C 858.
- C. Qualification Data: For professional engineer and testing agency.
- D. Source quality-control test reports.
- E. Field quality-control test reports.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.
- B. Comply with ANSI C2.
- C. Comply with NFPA 70.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver ducts to Project site with ends capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

1.7 COORDINATION

- A. Coordinate layout and installation of ducts with final arrangement of other utilities, site grading, and surface features as determined in the field.
- B. Coordinate elevations of ducts and duct-bank entrances with final locations and profiles of ducts and duct banks as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations from those indicated as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Commissioner.

PART 2 - PRODUCTS

2.1 CONDUIT

- A. Rigid Steel Conduit: Galvanized. Comply with ANSI C80.1.
- B. RNC: NEMA TC 2, Type EPC-80-PVC, UL 651, with matching fittings by same manufacturer as the conduit, complying with NEMA TC 3 and UL 514B.

2.2 SOURCE QUALITY CONTROL

- A. Test and inspect precast concrete utility structures according to ASTM C 1037.
- B. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of manholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
 - 1. Tests of materials shall be performed by a independent testing agency.
 - 2. Strength tests of complete boxes and covers shall be by either an independent testing agency or the manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.

3. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.1 UNDERGROUND DUCT APPLICATION

- A. Ducts for Electrical Feeders 600 V and Less: RNC, NEMA Type EPC-80-PVC, in concrete-encased duct bank, unless otherwise indicated.
- B. Underground Ducts for Telephone, Communications, or Data Utility Service Cables: RNC, NEMA Type EPC-40-PVC, in concrete-encased duct bank, unless otherwise indicated.
- C. Underground Ducts for Telephone, Communications, or Data Circuits: RNC, NEMA Type DB-60-PVC, in direct-buried duct bank, unless otherwise indicated.

3.2 EARTHWORK

- A. Excavation and Backfill: Comply with Section 312000 "Earth Moving," but do not use heavy-duty, hydraulic-operated, compaction equipment.
- B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.
- C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Section 329300 "Plants."
- D. Cut and patch existing pavement in the path of underground ducts and utility structures according to DDC General Conditions.

3.3 DUCT INSTALLATION

- A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.
- B. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches, both horizontally and vertically, at other locations, unless otherwise indicated.
- C. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane.

- D. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10 inches o.c. for 5-inch ducts, and vary proportionately for other duct sizes.
1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell without reducing duct line slope and without forming a trap in the line.
 2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to manhole or handhole.
 3. Grout end bells into structure walls from both sides to provide watertight entrances.
- E. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least 10 feet outside the building wall without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."
- F. Sealing: Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.
- G. Pulling Cord: Install 100-lbf- test nylon cord in ducts, including spares.
- H. Concrete-Encased Ducts: Support ducts on duct separators.
1. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent floating during concreting. Stagger separators approximately 6 inches between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
 2. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
 - a. Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.
 - b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing rod dowels extending 18 inches into concrete on both sides of joint near corners of envelope.
 3. Pouring Concrete: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.
 4. Reinforcement: Reinforce concrete-encased duct banks where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.

5. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
6. Minimum Space between Ducts: 3 inches between ducts and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and signal ducts.
7. Depth: Install top of duct bank at least 24 inches below finished grade in areas not subject to deliberate traffic, and at least 30 inches below finished grade in deliberate traffic paths for vehicles, unless otherwise indicated.
8. Stub-Ups: Use manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.
 - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
 - b. Stub-Ups to Equipment: For equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.
9. Warning Tape: Bury warning tape approximately 12 inches above all concrete-encased ducts and duct banks. Align tape parallel to and within 3 inches of the centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

I. Direct-Buried Duct Banks:

1. Support ducts on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
2. Space separators close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6 inches between tiers.
3. Excavate trench bottom to provide firm and uniform support for duct bank. Prepare trench bottoms as specified in Section 312000 "Earth Moving" for pipes less than 6 inches in nominal diameter.
4. Install backfill as specified in Section 312000 "Earth Moving."
5. After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand-place backfill to 4 inches over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction as specified in Section 312000 "Earth Moving."
6. Install ducts with a minimum of 3 inches between ducts for like services and 6 inches between power and signal ducts.
7. Depth: Install top of duct bank at least 36 inches below finished grade, unless otherwise indicated.
8. Set elevation of bottom of duct bank below the frost line.
9. Install manufactured duct elbows for stub-ups at poles and equipment and at building entrances through the floor, unless otherwise indicated. Encase elbows for stub-up ducts throughout the length of the elbow.

10. Warning Planks: Bury warning planks approximately 12 inches above direct-buried ducts and duct banks, placing them 24 inches o.c. Align planks along the width and along the centerline of duct bank. Provide an additional plank for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional planks 12 inches apart, horizontally.

3.4 GROUNDING

- A. Ground underground ducts and utility structures according to Section 260526 "Grounding and Bonding for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections and prepare test reports:
 1. Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.
 2. Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80 percent fill of duct. If obstructions are indicated, remove obstructions and retest.
 3. Test manhole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Correct deficiencies and retest as specified above to demonstrate compliance.

3.6 CLEANING

- A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.
- B. Clean internal surfaces of manholes, including sump. Remove foreign material.

END OF SECTION 260543

SECTION 260544

SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Sleeves for raceway and cable penetration of non-fire-rated construction walls and floors.
2. Sleeve-seal systems.
3. Sleeve-seal fittings.
4. Grout.
5. Silicone sealants.

B. Related Requirements:

1. Section 078413 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Data for Credit EQ 4.1: For sealants, documentation including printed statement of VOC content.
2. Laboratory Test Reports for Credit EQ 4: For sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

PART 2 - PRODUCTS

2.1 SLEEVES

A. Wall Sleeves:

1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, plain ends.
2. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies: Galvanized-steel sheet; 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

C. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.

D. Molded-PVC Sleeves: With nailing flange for attaching to wooden forms.

E. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

F. Sleeves for Rectangular Openings:

1. Material: Galvanized sheet steel.
2. Minimum Metal Thickness:
 - a. For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16 inches, thickness shall be 0.052 inch.
 - b. For sleeve cross-section rectangle perimeter 50 inches or more and one or more sides larger than 16 inches, thickness shall be 0.138 inch.

2.2 SLEEVE-SEAL SYSTEMS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.

1. Manufacturers: Subject to compliance with requirements, provide products by the following provide products by one of the following:
 - a. Advance Products & Systems, Inc.
 - b. CALPICO, Inc.
 - c. Metraflex Company (The).
 - d. Pipeline Seal and Insulator, Inc.
 - e. Proco Products, Inc.
2. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

3. Pressure Plates: Carbon steel.
4. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, of length required to secure pressure plates to sealing elements.

2.3 GROUT

- A. Description: Nonshrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.
- B. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- C. Design Mix: 5000-psi, 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

2.4 SILICONE SEALANTS

- A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
 1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.
 2. Sealant shall have VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

- A. Comply with NECA 1.
- B. Comply with NEMA VE 2 for cable tray and cable penetrations.
- C. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
 1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
 - a. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 079200 "Joint Sealants."

- b. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect material while curing.
 - 2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
 - 3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed.
 - 4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
 - 5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.
- D. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies:
- 1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
 - 2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.
- E. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- F. Aboveground, Exterior-Wall Penetrations: Seal penetrations using cast-iron pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- G. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

3.2 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.
- B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.3 SLEEVE-SEAL-FITTING INSTALLATION

- A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
- B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

- C. Secure nailing flanges to concrete forms.
- D. Using grout, seal the space around outside of sleeve-seal fittings.

END OF SECTION 260544

This Page Intentionally Left Blank

SECTION 260548

VIBRATION AND SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

B. Work Specified Elsewhere:

1. Division 1 – Definitions and requirements for Acoustically Sensitive Rooms (ASR), Noise Producing Rooms (NPR), Acoustically Isolated Construction (AIC):
 - a. Division 26 – Requirements for resilient penetration detailing:
 - b. Division 7 – Acoustical Sealant
 - c. Division 3 – Housekeeping pads and bases (Cast-in-Place Concrete)
 - d. Division 26 – Installation of Transformers
 - e. Division 26 – Performance Lighting System
 - f. Division 26 – Electric Service

1.2 SUMMARY

- A. For the purposes of this specification, an Isolator is considered to be any equipment used for the resilient support of mechanical, plumbing, and fire-protection systems equipment including bases, roof-curb rails, hangers, and mounts.
- B. This Section includes the following:
1. Vibration isolation concrete inertia bases
 2. Elastomeric and spring isolation for base-mounted support
 3. Elastomeric and spring isolation for hanging supports
 4. Elastomeric isolation for fittings
 5. Isolation pads.
 6. Spring isolators.
 7. Restrained spring isolators.
 8. Channel support systems.
 9. Restraint cables.
 10. Hanger rod stiffeners.
 11. Anchorage bushings and washers.
- C. Related Sections include the following:

1. Section 260529 "Hangers and Supports for Electrical Systems" for commonly used electrical supports and installation requirements.
- D. Vibration isolator sizes and layout shall be determined by the vibration isolator supplier, accounting for the possible non-uniform weight distribution of the equipment. Supplier's selection shall comply with the vibration isolation equipment composition and type, material durometer and/or static deflection as specified herein. Supplier's recommendations for alternate equipment shall be presented in writing to the Commissioner.

1.3 DEFINITIONS

- A. The IBC: International Building Code.
- B. ICC-ES: ICC-Evaluation Service.

1.4 PERFORMANCE REQUIREMENTS

- A. Design vibration isolation mounts and hangers to support equipment and conduit at their full operating loads.
- B. Design seismic restraints to provide sufficient restraint in accordance with all applicable codes and standards.
- C. Design vibration isolation mounts to achieve the minimum static deflection specified in this section.

1.5 ACTION SUBMITTALS

- A. Isolator manufacturer shall furnish with submittal load calculations for selection of isolators, including supplemental bases, based on lowest operating speed of equipment supported.
- B. Submit a vibration isolation system schedule indicating the following:
 1. Manufacturer, type, model number, size
 2. Height when uncompressed and static deflection of each isolation element
 3. The additional deflection to solid under actual loads.
 4. The ratio of spring height under actual load to spring diameter
 5. Spring constant of each isolation element
 6. Estimated imposed load on each isolation element
 7. Spring outer diameter, free operating, and solid heights
- C. Product Data: For the following:
 1. The model number and corresponding specification classification
 2. Dimensions (uncompressed)
 3. Load vs. deflection curves or tables
 4. Rated load capacity and rated deflection and over load capacity

5. For products which are not listed as approved manufacturers and products, submittals shall include the information required above, plus the following information:
6. Samples of all acoustic isolation products. After approval, samples will be returned for installation at the job. All costs associated with submission of samples shall be borne by the Contractor.
7. Corporate information indicating that the manufacturer has been in business for at least three continuous years and has provided acoustic isolation products on projects of similar scope.
8. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic-restraint component used.
 - a. Annotate to indicate application of each product submitted and compliance with requirements.
9. Restrained-Isolation Devices: Include ratings for horizontal, vertical, and combined loads.

1.6 INFORMATIONAL SUBMITTALS

A. Shop Drawings:

1. Signed and sealed by a qualified professional engineer.
2. Submit shop drawings indicating scope of vibration isolation work and locations of units and flexible connections. Include support isolation points for piping and ductwork including risers, air housing and inertia bases. Drawings shall include clear, coordinated reference to the submitted product data.
3. For bases and curbs, drawings shall include:
4. Design calculations for selecting isolation products and sizes and designing bases. Include the total weight and load distribution of the supported equipment.
5. Dimensioned detail drawings of bases including the location of isolators, the method of attachment to structure, and the method of attachment to the supported equipment.
6. For hangers and supports, drawings shall include:
 - a. Layout of isolator hangers, mounts, and other elements shown on an outline of the isolated equipment, including complete details of attachment to load-bearing structure or supplementary framing.
7. For pneumatic vibration isolators: provide certification of equipment load, natural frequency, and damping based on laboratory tests performed by an independent laboratory.
8. Piping isolators shown and identified on piping layout drawings.
9. Provide seismic restraint calculations, certified by a qualified Professional Engineer, as appropriate to project requirements.

B. Field quality-control test reports.

1.7 QUALITY ASSURANCE

- A. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

- B. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval by an agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.
- C. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ace Mountings Co., Inc.
 - 2. Amber/Booth Company, Inc.
 - 3. California Dynamics Corporation.
 - 4. CDM Novitec (CDM), Evanston, IL – www.cdm-novitec.com
 - 5. Isolation Technology, Inc.
 - 6. Kinetics Noise Control.
 - 7. Mason Industries.
 - 8. Vibration Eliminator Co., Inc.
 - 9. Vibration Isolation.
 - 10. Vibration Mountings & Controls, Inc.
- B. Pads : Arrange in single or multiple layers of sufficient stiffness for uniform loading over pad area, molded with a nonslip pattern and galvanized-steel baseplates, and factory cut to sizes that match requirements of supported equipment.
 - 1. Resilient Material: Oil- and water-resistant neoprene.
- C. Isolator Selection:
 - 1. Type of isolator, base, and minimum static deflection shall be as required for each specific equipment application as recommended by isolator or equipment manufacturer but subject to minimum requirements indicated herein and in the schedule on the drawings.
 - 2. Vibration isolator sizes and layout shall be determined by the vibration isolator supplier.
 - 3. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than $\pm 10\%$.
 - 4. Select and locate isolators to produce uniform loading and deflection even when equipment weight is not evenly distributed.

D. Spring Isolators: Freestanding, laterally stable, open-spring isolators.

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 500 psig.
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.
7. Each spring isolator shall be designed and installed so that the ends of the spring remain parallel during and after the spring installation.
8. Spring isolators shall operate in the linear portion of their load versus deflection curve.
9. Springs shall be sized to be non-resonant with equipment forcing frequencies or support structure natural frequencies.

E. Neoprene Isolators:

1. Neoprene isolators shall comply with ASTM D2240 and be oil resistant neoprene.
2. Neoprene Isolators shall have a Shore hardness of 30 to 60 ±5, as specified herein, after minimum aging of 20 days or corresponding over-aging
3. Neoprene Isolators shall have a straight-line deflection curve over a deflection range of not less than 50% above the design deflection.

F. Exterior applications:

1. All isolators protected from the outdoor elements shall utilize neoprene of bridge bearing quality. All isolators exposed to the outdoor elements shall utilize natural rubber with a durometer as specified herein.
2. All isolators that are to be installed outdoors or exposed to the weather shall be hot-dipped galvanized and shall be furnished with neoprene mounting washers and bushings for hold-down bolts to prevent any metal to metal contact.

G. Identification:

1. Provide isolators with visible color identification or other mark to indicate capacity range.
2. All vibration isolators shall have either known undeflected heights or calibration markings so that, after adjustment, the amount of deflection can be verified, thus determining that the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the design.

H. Bases

	Mason	Kinetics	CDM	VMC
Type 1	WFSLFSW Base	SFB Base	CDM-ISO-MACHINE-FLOAT	as approved
Type 2	KSLFSW Base	CIB Base	CDM-ISO-	MPF Base

			MACHINE-FLOAT	
--	--	--	---------------	--

1. Type 1 Base

Type 1 base shall be a structural steel frame with clearance holes located to correspond to the mounting bolt holes of the equipment mounted on the base. A minimum 1 inch clearance shall be provided between the base and the supporting structural slab.

Bases shall have built-in motor slide rails, and shall be reinforced as necessary to withstand belt pull without drive misalignment or base distortion. The bases shall be constructed with deep angle steel sections with a minimum vertical angle leg of 4 inches (100mm) for motors of 7.5 hp (5.6 kW) or less, 5 inches (125mm) for motors between 7.5 hp (5.6 kW) and 20 hp (14.9 kW), and 6 inches (150mm) for motors over 20 hp (14.9 kW).

2. Type 2 Base

a. Type 2 base shall consist of an integral rectangular structural steel form into which concrete is poured. Perimeter members shall be beams of depth equal to 10% of the longest span of the base, but not more than 12 inches (300mm) nor less than 6 inches (150mm) deep. Forms shall include motor slide base and all reinforcing steel. Where anchor bolt locations fall in concrete, the reinforcing steel shall include drilled members with sleeves welded below the steel to accept the anchor bolts. Height saving steel brackets shall be used in all mounting locations. A minimum 1 inch (25mm) clearance shall be provided between the base and the supporting structural slab.

When the concrete base is "T" shaped, isolators shall be located under the projections as well as under the main body in order to prevent cantilever distortion.

Thickness of concrete within inertia base shall be as follows:

Motor Size	Minimum Thickness of Inertia Base
5 to 20 Horsepower	6 inches
25 to 50 Horsepower	8 inches
60 to 100 Horsepower	10 inches
Greater than 100 Horsepower	12 inches

I. Curbs

	Mason	Kinetics	CDM	VMC
Type 1	CMAB Curb	ESR Curb	as approved	AXR Spring-Flex Base
Type 2	RSC Curb	ESSR Curb	as approved	P6200 or P6300 Curb

1. Type 1 Curb

- a. Type 1 curb for roof-mounted equipment shall be a structural steel or aluminum base mounted directly to the structure or roof curb with an isolated upper section supported on steel springs. The upper frame must provide continuous support for the equipment.
- b. Wind resistance shall be provided by resilient snubbers at the corners of the base.

- c. Weatherproofing shall be provided by a continuous flexible seal. All springs shall have removable waterproof covers to allow for adjustment or replacement of the springs.

2. Type 2 Curb

- a. Type 2 curb for roof-mounted equipment shall be a structural steel base mounted directly to the structure with an isolated upper section supported on steel springs. The upper frame must provide continuous support for the equipment. Steel springs shall rest on 1/4" (6mm) min. thickness neoprene pads.
- b. Wind resistance shall be provided by resilient snubbers at the corners of the base. All-directional snubber bushings shall be 1/4" (6mm) minimum thickness neoprene. All hardware must be plated or galvanized to provide a rust-resistant finish.
- c. Weatherproofing shall be provided by a continuous flexible seal. All springs shall have removable waterproof covers to allow for adjustment or replacement of the springs.

J. Mounts

	Mason	Kinetics	CDM	VMC
Type 1	W Pad	NP Pad	CDM-ISO-MACHINE-FIX	SHEAR-FLEX Pad
Type 2	Super W Pad	NGS/NGD Pad	CDM-ISO-MACHINE-FIX	Maxi-Flex Pads
Type 3	ND Mount	RD Mount	CDM-ISO-MACHINE-FIX	RD Mount
Type 4	SLF Mount	FDS Mount	CDM-ISO-MACHINE-FIX	AC or ADC Mount
Type 5	SLR Mount	FLS Mount	CDM-ISO-MACHINE-FIX	AWRS Mount

1. Type 1 Mount

- a. Type 1 mount shall be a minimum 5/16 inch (8mm) thick neoprene pad ribbed or waffled on both sides. The pads shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for strain of 10 to 15% of the pad thickness, but shall not exceed the rated maximum strain of the pad. If the isolated equipment does not load the pad uniformly over its entire area, steel load-spreading plates shall be incorporated between the equipment and the neoprene pad.
- b. Type 1 mounts shall consist of two or more 5/16 inch (8mm) thick ribbed or waffle neoprene pads sandwiching a 16 gauge stainless steel shim plate when greater thickness or multiple layers are indicated on contract documents.
- c. If the isolator is bolted to the structure, a neoprene vibration isolation washer and bushing shall be installed under the bolt head between the steel washer and the base plate.

2. Type 2 Mount

- a. Type 2 mounts shall be pads manufactured of neoprene or encapsulated glass fiber.
- b. Materials:
 - i Neoprene isolation mounts shall be ¾" (19mm) thick neoprene pads waffled on both sides. The pads shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for strain of 10 to 15% pad thickness. Where required, steel load-spreading plates shall be incorporated between the equipment and the Neoprene Isolation Pad.
 - ii Glass fiber isolation mounts shall consist of high density molded glass fiber pads individually coated with a flexible elastomeric membrane. Pads shall be manufactured from annealed glass fibers stabilized by precompression during manufacture. The deflection of the pad while under load shall range from 10 to 15% of the pad thickness, but shall not exceed the rated maximum strain of the pad.
- c. If the isolator is bolted to the structure, a neoprene vibration isolation washer and bushing shall be installed under the bolt head between the steel washer and the base plate.

3. Type 3 Mount

- a. Type 3 mounts shall be laterally stable, double deflecting, molded neoprene isolators. All metal surfaces shall be covered with neoprene. The top and bottom surfaces shall be ribbed and bolt holes shall be provided in the base. The mounts shall have leveling bolts rigidly secured to the equipment.
- b. The isolator shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for strain of 10 to 15% of the pad thickness, but shall not exceed the rated maximum strain of the pad.

4. Type 4 Mount

- a. Type 4 mounts shall have a free-standing and laterally stable steel spring without any housing. Springs shall be designed so that the ratio of the horizontal to vertical spring constant is between one and two.
- b. A minimum 1/4 inch (6mm) thick neoprene pad shall be bonded to the isolator baseplate.
- c. Unless otherwise specified, isolators need not be bolted to the floor for indoor installations. If the base plates are bolted to the structure, a neoprene vibration isolation washer and bushing shall be installed under the bolt head between the steel washer and the base plate.

5. Type 5 Mount

- a. Type 5 mounts shall be a spring and neoprene mount that incorporates a housing which includes vertical limit stops to prevent spring expansion when weight (water or other fluid) is removed from the equipment and limits the movement of equipment when it is subjected to wind loading.

- b. A minimum clearance of 1/2 inch (12 mm) shall be maintained around restraining bolts and between the housing and the spring so as not to interfere with the spring operation. Limit stops shall be out of contact with equipment during normal operation, start up and shut down. A neoprene washer shall be installed beneath the bolt head / washer used to restrain the isolator.
- c. In outdoor rooftop installations isolators must be bolted to the roof or supporting structure with a neoprene mounting sleeve.
- d. Where seismic code requirements dictate the use of a restraining mechanism, Type 5 mounts shall be utilized beneath equipment identified to be mounted on Type 4 mounts.

K. All Directional Captive Mounting

	Mason	Kinetics	CDM	VMC
Captive Mount	BR	RQ	CDM-ISO-MACHINE-FIX	as approved

- 1. Captive Neoprene elements shall be arranged in opposition within a steel or ductile iron housing to provide positive mechanical restraint in all directions. Neoprene elements shall prevent metal-to-metal contact during normal operation. Bonded assemblies without mechanical interlocks are not acceptable.
- 2. Static deflection shall be chosen based on the direction of mounting (tension, compression, or shear) and as specified.

L. Hangers

	Mason	Kinetics	CDM	VMC
Type 1	not used			
Type 2	not used			
Type 3	HD or WHD Hanger	RH Hanger	As approved	RHD Hanger
Type 4	30N or W30N Hanger	Type SRH Hanger	As approved	RSH-30A Hanger

- 1. Type 1 Hanger (not used)
- 2. Type 2 Hanger (not used)
- 3. Type 3 Hanger
 - a. Type 3 hangers shall consist of a molded neoprene or encapsulated glass fiber isolating element in a steel hanger box. A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch (19mm) larger than the diameter of the hanger rod, or an alternative design approach shall be incorporated to permit the hanger rod to swing through a 30 degree arc without defeating the vibration isolation effectiveness of the hanger.

- b. The isolator shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and 10% to 15% strain.

4. Type 4 Hanger

- a. Type 4 hangers shall consist of a steel spring in series with a neoprene or encapsulated glass fiber isolating element. The neoprene element shall have a strain not exceeding 15%.
- b. Spring diameter and hanger box hole size shall be large enough to permit the hanger rod to swing through a 30 degree arc. A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box, or an alternative design approach shall be incorporated, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch (19mm) larger than the diameter of the hanger rod.

M. Neoprene Mounting Washers and Bushings

- 1. Neoprene mounting sleeves for hold-down applications of equipment with vibration isolators shall be:

	Mason	Kinetics	CDM	VMC
Washer	HLW	as approved	as approved	as approved
Bushing	HLB	as approved	as approved	as approved

N. Flexible Piping Connections

	Mason	Kinetics	CDM	VMC
Spherical Rubber	Safeflex Series	Kinflex Series	As approved	VM-series
Braided Metal	BBS or BBF	Kinflex series	as approved	as approved

- 1. Flexible spherical rubber expansion fittings:
 - a. EPDM rubber impregnated liner with solid steel constraining ring.
 - b. Control rods or cables shall not be used to connect across flexible pipe connectors. Pipes shall be supported or hung using isolators specified herein.
- 2. Braided metal hoses
 - a. Corrugated hose body surrounded by metallic braided hose
- 3. Expansion fittings shall be selected by the manufacturer based on movement and pressure rating.

O. Flexible Neoprene Fitting Isolator

	Spring City Electric	OZ/Gedney
Flexible Neoprene Fitting	Type DF	Type DX

1. Flexible Neoprene Fitting isolator shall consist of threaded metal fittings on both ends of a neoprene sleeve to create a resilient fitting for the connection of electrical conduits and allow for acoustic isolation, expansion and deflection.
 2. A flexible grounding strap shall be provided to maintain electrical continuity between isolated conduits.
 3. Neoprene shall be bridge-bearing quality with a maximum durometer of 50.
- P. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.
1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled baseplate bonded to 1/4-inch- thick, neoprene or rubber isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
 2. Restraint: Seismic or limit-stop as required for equipment and authorities having jurisdiction.
 3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
 4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
 5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
 6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.2 FACTORY FINISHES

- A. Finish: Manufacturer's standard prime-coat finish ready for field painting.
- B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.
 1. Powder coating on springs and housings.
 2. All hardware shall be galvanized. Hot-dip galvanize metal components for exterior use.
 3. Baked enamel or powder coat for metal components on isolators for interior use.
 4. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and equipment to receive vibration isolation for compliance with requirements for installation tolerances and other conditions affecting performance.

- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 COORDINATION

- A. Following the installation of isolated conduits, resilient penetrations or other isolated electrical equipment and prior to architectural enclosure of these items, the electrical contractor shall notify the Commissioner of the completion of installation so an inspection of the work can occur prior to architectural enclosure of the work.

3.3 APPLICATIONS

- A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.
- B. Hanger Rod Stiffeners: Install hanger rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.
- C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

3.4 INSTALLATION

- A. Resilient Support Of Wiring and Conduit Connected To Isolated Equipment
 1. All wiring connections to mechanical equipment on isolators shall be made with a minimum 18-inch (45 cm) long flexible conduit in a "U" shaped loop.
 2. In limited spaces where other means of conduit isolation may not fit or where conduit is buried within slabs at the crossing of the Extent of AIC, install a flexible neoprene fitting.
 3. No wiring or conduit shall be supported from other pipes, ducts, or equipment.
 4. Resiliently isolated conduit shall not contact the building construction or other equipment.
 5. Parallel running conduit may be hung together on a trapeze that is isolated from the building. Isolator deflections must be the largest determined by the provisions for conduit isolation. Do not mix isolated and non-isolated conduit on the same trapeze.
 6. Conduit shall be supported on Type 4 isolators under the following conditions:
 - a. Ducts and pipes within the Mechanical Equipment Room that are connected to equipment that is vibration isolated with spring-type isolators.

- b. Ducts and pipes within the Mechanical Equipment Room but still within 30 feet from connection to equipment that is vibration isolated with spring-type isolators.
 - c. This includes ducts, domestic water, heating, compressed air, hydraulic fluid, steam and chilled water pipes etc. The only exclusions are roof and floor drains and sprinkler piping.
 - d. The first isolator both upstream and downstream of equipment on springs shall have a static deflection equal to 1.5 times that of the equipment isolators, up to a maximum of 2 inches. The static deflection of the remaining pipe isolators within the Mechanical Equipment Room or within 30 feet of the equipment or within 50 pipe diameters of the equipment (whichever distance is greater) shall be 1 inch (25mm).
7. Conduit shall be supported on Type 3 isolators under the following conditions:
- a. Ducts and pipes within the Mechanical equipment room that are connected equipment this is vibration isolated with neoprene-type isolators.
 - b. Ducts and pipes beyond the Mechanical Equipment Room but still within 30 feet from connection to equipment that is vibration isolated with neoprene-type isolators.
8. Conduit with Multiple Connections
- a. Where a pipe run connects multiple items of equipment in the mechanical room the pipe mounts or hangers for the entire run shall be chosen to suit the connected equipment of greatest static deflection.
- B. Resilient Support Of Conduit At Special Construction
1. All building services that cross the extent of AIC shall be suspended or mounted on vibration isolators for a distance of 8 feet measured linearly along the penetrating element.
- C. Flexible Connectors
1. All wiring connections to mechanical, electrical, and plumbing equipment supported on vibration isolators shall be made with the following:
- a. For equipment supported on Type 2 or 3 (neoprene-type) isolators, provide a 36 inch (1m) long slack U-shaped flexible conduit or a minimum 36 inch (1m) long flexible conduit in a 360 degree loop. Flexible conduit and cable shall be capable of and recommended for a greater curvature than what is installed.
 - b. For equipment supported on a Type 4 or 5 (spring-type) isolators, provide a minimum 36 inch (1m) long flexible conduit in a 360 degree loop. Flexible conduit and cable shall be capable of and recommended for a greater curvature than what is installed.
2. A neoprene flexible hose shall be installed to connect a conduit on mounts or hangers to a piece of equipment on mounts or hangers of less static deflection than the pipe.
- a. Install expansion joints of neoprene or EPDM as connections to equipment that is supported from vibration isolation.
 - b. Where neoprene rubber or EPDM mounts are not approved, provide two metal bellows or flexible metal hoses at 90-degree orientation to each other.

3. In limited spaces where other means of conduit isolation may not fit or where conduit is buried within slabs at the crossing of the Extent of AIC, install a flexible neoprene fitting.

D. Resilient Support of Electrical Equipment

1. The table below summarizes the vibration isolation requirements for all equipment.
2. All equipment located in Mechanical Rooms with floating floors can be installed without any additional floor isolation. All requirements for ceiling-supported equipment, resilient connections, and penetrations still apply.

Equipment Type	On Grade			Above Grade		
	Base ¹	Isolator	Defl.	Base ¹	Isolator	Defl.
Transformers						
45KVA or less	1	3	0.3"	1	3	0.3"
45KVA to 750KVA	1	3	0.3"	1	4	1"
750KVA or greater	2	3	1"	2	4	1"
Emergency Generators	--	3	0.3"	--	5	2"
Motor Control Centers	1	1 or 3	0.3"	1	1 or 3	0.3"
Enclosures containing relays, transformers, ballasts, or choke coils	1	3 or Captive Neoprene Mounting	0.3"	1	3 or Captive Neoprene Mounting	0.3"

3. If equipment can be supported by point loads, base type 1 may not be required. Coordinate with equipment manufacturer to confirm the need for a base.
4. Dimmer racks shall be located a minimum of three inches from adjacent walls.

3.5 Demonstration

- A. The vibration isolation manufacturer shall inspect and approve the installation of the vibration isolators, and shall submit a report to the Commissioner which verifies that all of the isolators for electrical equipment has been properly installed and that the installation is in full conformance with the specification. The report shall contain the type and measured static deflection of any spring isolators provided.
- B. Upon completing installation and adjustment for suitable operation of all work specified under this section, the Contractor shall notify in writing the Commissioner, who will schedule an inspection by the Commissioner. The letter shall certify that all work specified under this section is complete, operational and adjusted in every respect, and that all work is ready for the completion checkout. Defective equipment and installation shall be repaired at the cost of the Contractor, and another inspection shall be scheduled.
- C. For each inspection, workmen shall be furnished to perform such functions as are necessary for inspection of the equipment.

3.6 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 - 1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
 - 2. Schedule test with City of New York, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
 - 3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.
 - 4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
 - 5. Test to 90 percent of rated proof load of device.
 - 6. Measure isolator restraint clearance.
 - 7. Measure isolator deflection.
 - 8. Verify snubber minimum clearances.
 - 9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.
- C. Remove and replace malfunctioning units and retest as specified above.
- D. Prepare test and inspection reports.

3.7 ADJUSTING

- A. Adjust isolators after isolated equipment is at operating weight.
- B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
- C. Adjust active height of spring isolators.
- D. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION 260548

This Page Intentionally Left Blank

SECTION 260553

IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:
 - 1. Identification for raceways.
 - 2. Identification of power and control cables.
 - 3. Identification for conductors.
 - 4. Underground-line warning tape.
 - 5. Warning labels and signs.
 - 6. Instruction signs.
 - 7. Equipment identification labels.
 - 8. Miscellaneous identification products.

1.3 ACTION SUBMITTALS

- A. Product Data: For each electrical identification product indicated.
- B. Identification Schedule: An index of nomenclature of electrical equipment and system components used in identification signs and labels.

1.4 QUALITY ASSURANCE

- A. Comply with ANSI A13.1.
- B. Comply with NFPA 70.
- C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.
- D. Comply with ANSI Z535.4 for safety signs and labels.
- E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

1.5 COORDINATION

- A. Coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual; and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.
- B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- C. Coordinate installation of identifying devices with location of access panels and doors.
- D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 POWER AND CONTROL RACEWAY IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway size.
- B. Colors for Raceways Carrying Circuits at 600 V or Less:
 - 1. Legend: Indicate voltage and system or service type.
- C. Vinyl Labels for Raceways Carrying Circuits at 600 V or Less: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing ends of legend label.

2.2 ARMORED AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each cable size.
- B. Colors for Cables Carrying Circuits at 600 V and Less:
 - 1. Legend: Indicate voltage and system or service type.
- C. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches wide; compounded for outdoor use.

2.3 CONDUCTOR IDENTIFICATION MATERIALS

- A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inches wide.

2.4 FLOOR MARKING TAPE

- A. 2-inch- wide, 5-mil pressure-sensitive vinyl tape, with yellow and black stripes and clear vinyl overlay.

2.5 WARNING LABELS AND SIGNS

- A. Comply with NFPA 70 and 29 CFR 1910.145.
- B. Baked-Enamel Warning Signs:
 - 1. Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application.
 - 2. 1/4-inch grommets in corners for mounting.
 - 3. Nominal size, 7 by 10 inches.
- C. Warning label and sign shall include, but are not limited to, the following legends:
 - 1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
 - 2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."

2.6 INSTRUCTION SIGNS

- A. Engraved, laminated acrylic or melamine plastic, minimum 1/16 inch thick for signs up to 20 sq. inches and 1/8 inch thick for larger sizes.
 - 1. Engraved legend with black letters on white face.
 - 2. Punched or drilled for mechanical fasteners.
 - 3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.7 EQUIPMENT IDENTIFICATION LABELS

- A. Engraved, Laminated Acrylic or Melamine Label: Punched or drilled for screw mounting. White letters on a dark-gray background. Minimum letter height shall be 3/8 inch.
- B. Stenciled Legend: In nonfading, waterproof, black ink or paint. Minimum letter height shall be 1 inch.

2.8 CABLE TIES

- A. General-Purpose Cable Ties: Fungus inert, self extinguishing, one piece, self locking, Type 6/6 nylon.
 - 1. Minimum Width: 3/16 inch.

2. Tensile Strength at 73 deg F, According to ASTM D 638: 12,000 psi.
 3. Temperature Range: Minus 40 to plus 185 deg F.
 4. Color: Black except where used for color-coding.
- B. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self extinguishing, one piece, self locking, Type 6/6 nylon.
1. Minimum Width: 3/16 inch.
 2. Tensile Strength at 73 deg F, According to ASTM D 638: 12,000 psi.
 3. Temperature Range: Minus 40 to plus 185 deg F.
 4. Color: Black.
- C. Plenum-Rated Cable Ties: Self extinguishing, UV stabilized, one piece, self locking.
1. Minimum Width: 3/16 inch.
 2. Tensile Strength at 73 deg F, According to ASTM D 638: 7000 psi.
 3. UL 94 Flame Rating: 94V-0.
 4. Temperature Range: Minus 50 to plus 284 deg F.
 5. Color: Black.

2.9 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Verify identity of each item before installing identification products.
- B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.
- C. Apply identification devices to surfaces that require finish after completing finish work.
- D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.
- E. Attach signs and plastic labels that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.
- F. Aluminum Wraparound Marker Labels and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.
- G. Cable Ties: For attaching tags. Use general-purpose type, except as listed below:
1. Outdoors: UV-stabilized nylon.

2. In Spaces Handling Environmental Air: Plenum rated.

H. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench exceeds 16 inches overall.

3.2 IDENTIFICATION SCHEDULE

A. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 30 A, and 120 V to ground: Identify with self-adhesive vinyl label. Install labels at 10-foot maximum intervals.

B. Accessible Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive vinyl labels with the wiring system legend and system voltage. System legends shall be as follows:

1. Emergency Power.
2. Power.
3. UPS.

C. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use color-coding conductor tape to identify the phase.

1. Color-Coding for Phase Identification, 600 V or Less: Use colors listed below.

a. Colors for 208/120-V Circuits:

- 1) Phase A: Black.
- 2) Phase B: Red.
- 3) Phase C: Blue.
- 4) Neutral: White
- 5) Ground: Green

b. Colors for 480/277-V Circuits:

- 1) Phase A: Brown.
- 2) Phase B: Orange.
- 3) Phase C: Yellow.
- 4) Neutral: Grey
- 5) Ground: Green

D. Power-Circuit Conductor Identification, More than 600 V: For conductors in vaults, pull and junction boxes, manholes, and handholes, use nonmetallic plastic tag holder with adhesive-backed phase tags, and a separate tag with the circuit designation.

E. Install instructional sign including the color-code for grounded and ungrounded conductors using adhesive-film-type labels.

- F. Control-Circuit Conductor Identification: For conductors and cables in pull and junction boxes, manholes, and handholes, use self-adhesive, self-laminating polyester labels with the conductor or cable designation, origin, and destination.
- G. Control-Circuit Conductor Termination Identification: For identification at terminations provide self-adhesive, self-laminating polyester labels with the conductor designation.
- H. Conductors to Be Extended in the Future: Attach marker tape to conductors and list source.
- I. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.
 - 1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
 - 2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
 - 3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual.
- J. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.
 - 1. Limit use of underground-line warning tape to direct-buried cables.
 - 2. Install underground-line warning tape for both direct-buried cables and cables in raceway.
- K. Workspace Indication: Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.
- L. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Baked-enamel warning signs.
 - 1. Comply with 29 CFR 1910.145.
 - 2. Identify system voltage with black letters on an orange background.
 - 3. Apply to exterior of door, cover, or other access.
 - 4. For equipment with multiple power or control sources, apply to door or cover of equipment including, but not limited to, the following:
 - a. Power transfer switches.
 - b. Controls with external control power connections.
- M. Operating Instruction Signs: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.

- N. Emergency Operating Instruction Signs: Install instruction signs with white legend on a red background with minimum 3/8-inch- high letters for emergency instructions at equipment used for power transfer and load shedding.
- O. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and the Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.
 - 1. Labeling Instructions:
 - a. Indoor Equipment: Self-adhesive, engraved, laminated acrylic or melamine label. Unless otherwise indicated, provide a single line of text with 1/2-inch- high letters on 1-1/2-inch- high label; where two lines of text are required, use labels 2 inches high.
 - b. Outdoor Equipment: Engraved, laminated acrylic or melamine label.
 - c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
 - d. Unless provided with self-adhesive means of attachment, fasten labels with appropriate mechanical fasteners that do not change the NEMA or NRTL rating of the enclosure.
 - 2. Equipment to Be Labeled:
 - a. Panelboards: Typewritten directory of circuits in the location provided by panelboard manufacturer. Panelboard identification shall be engraved, laminated acrylic or melamine label.
 - b. Enclosures and electrical cabinets.
 - c. Access doors and panels for concealed electrical items.
 - d. Switchgear.
 - e. Switchboards.
 - f. Transformers: Label that includes tag designation shown on Drawings for the transformer, feeder, and panelboards or equipment supplied by the secondary.
 - g. Substations.
 - h. Emergency system boxes and enclosures.
 - i. Motor-control centers.
 - j. Enclosed switches.
 - k. Enclosed circuit breakers.
 - l. Enclosed controllers.
 - m. Variable-speed controllers.
 - n. Push-button stations.
 - o. Power transfer equipment.
 - p. Contactors.
 - q. Remote-controlled switches, dimmer modules, and control devices.
 - r. Battery-inverter units.
 - s. Battery racks.
 - t. Power-generating units.
 - u. Monitoring and control equipment.

v. UPS equipment.

SECTION 260573

OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes computer-based, fault-current and overcurrent protective device coordination studies. Protective devices shall be set based on results of the protective device coordination study.

1.3 ACTION SUBMITTALS

- A. Product Data: For computer software program to be used for studies.
- B. Other Action Submittals: The following submittals shall be made after the approval process for system protective devices has been completed. Submittals may be in digital form.
 - 1. Coordination-study input data, including completed computer program input data sheets.
 - 2. Study and Equipment Evaluation Reports.
 - 3. Coordination-Study Report.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For coordination-study specialist.
- B. Product Certificates: For coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 399.

1.5 QUALITY ASSURANCE

- A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.
- B. Coordination-Study Specialist Qualifications: An entity experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

1. Professional engineer, licensed in the state where Project is located, shall be responsible for the study. All elements of the study shall be performed under the direct supervision and control of engineer.
- C. Comply with IEEE 242 for short-circuit currents and coordination time intervals.
- D. Comply with IEEE 399 for general study procedures.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

- A. Available Computer Software Developers: Subject to compliance with requirements, companies offering computer software programs that may be used in the Work include, but are not limited to, the following or approved equal:
 1. SKM Systems Analysis, Inc.
 2. ETAP Star
 3. Basler

2.2 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

- A. Comply with IEEE 399.
- B. Analytical features of fault-current-study computer software program shall include "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- C. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.
 1. Optional Features:
 - a. Arcing faults.
 - b. Simultaneous faults.
 - c. Explicit negative sequence.
 - d. Mutual coupling in zero sequence.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.

1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 POWER SYSTEM DATA

A. Gather and tabulate the following input data to support coordination study:

1. Product Data for overcurrent protective devices specified in other electrical Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Impedance of utility service entrance.
3. Electrical Distribution System Diagram: In hard-copy and electronic-copy formats, showing the following:
 - a. Circuit-breaker and fuse-current ratings and types.
 - b. Relays and associated power and current transformer ratings and ratios.
 - c. Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios.
 - d. Generator kilovolt amperes, size, voltage, and source impedance.
 - e. Cables: Indicate conduit material, sizes of conductors, conductor material, insulation, and length.
 - f. Busway ampacity and impedance.
 - g. Motor horsepower and code letter designation according to NEMA MG 1.
4. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:
 - a. Special load considerations, including starting inrush currents and frequent starting and stopping.
 - b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
 - c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
 - d. Generator thermal-damage curve.
 - e. Ratings, types, and settings of utility company's overcurrent protective devices.
 - f. Special overcurrent protective device settings or types stipulated by utility company.
 - g. Time-current-characteristic curves of devices indicated to be coordinated.
 - h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
 - i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
 - j. Panelboards, switchboards, motor-control center ampacity, and interrupting rating in amperes rms symmetrical.

3.3 FAULT-CURRENT STUDY

- A. Calculate the maximum available short-circuit current in amperes rms symmetrical at circuit-breaker positions of the electrical power distribution system. The calculation shall be for a current immediately after initiation and for a three-phase bolted short circuit at each of the following:
 - 1. Switchgear and switchboard bus.
 - 2. Motor-control center.
 - 3. Distribution panelboard.
 - 4. Branch circuit panelboard.

- B. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Include studies of system-switching configurations and alternate operations that could result in maximum fault conditions.

- C. Calculate momentary and interrupting duties on the basis of maximum available fault current.

- D. Calculations to verify interrupting ratings of overcurrent protective devices shall comply with IEEE 241 and IEEE 242.
 - 1. Transformers:
 - a. ANSI C57.12.10.
 - b. ANSI C57.12.22.
 - c. ANSI C57.12.40.
 - d. IEEE C57.12.00.
 - e. IEEE C57.96.
 - 2. Medium-Voltage Circuit Breakers: IEEE C37.010.
 - 3. Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.20.1.
 - 4. Low-Voltage Fuses: IEEE C37.46.

- E. Study Report:
 - 1. Show calculated X/R ratios and equipment interrupting rating (1/2-cycle) fault currents on electrical distribution system diagram.

- F. Equipment Evaluation Report:
 - 1. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
 - 2. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
 - 3. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

3.4 COORDINATION STUDY

- A. Perform coordination study using approved computer software program. Prepare a written report using results of fault-current study. Comply with IEEE 399.
 - 1. Calculate the maximum and minimum 1/2-cycle short-circuit currents.
- B. Comply with IEEE 241 IEEE 242 recommendations for fault currents and time intervals.
- C. Transformer Primary Overcurrent Protective Devices:
 - 1. Device shall not operate in response to the following:
 - a. Inrush current when first energized.
 - b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
 - c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
 - 2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.
- D. Motors served by voltages more than 600 V shall be protected according to IEEE 620.
- E. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.
- F. Coordination-Study Report: Prepare a written report indicating the following results of coordination study:
 - 1. Tabular Format of Settings Selected for Overcurrent Protective Devices:
 - a. Device tag.
 - b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values.
 - c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.
 - d. Fuse-current rating and type.
 - e. Ground-fault relay-pickup and time-delay settings.
 - 2. Coordination Curves: Prepared to determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:

- a. Device tag.
- b. Voltage and current ratio for curves.
- c. Three-phase and single-phase damage points for each transformer.
- d. No damage, melting, and clearing curves for fuses.
- e. Cable damage curves.
- f. Transformer inrush points.
- g. Maximum fault-current cutoff point.

G. Completed data sheets for setting of overcurrent protective devices.

END OF SECTION 260573

SECTION 260923

LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Time switches.
2. Photoelectric switches.
3. Indoor occupancy sensors.
4. Lighting contactors.

B. Related Requirements:

1. Section 262726 "Wiring Devices" for wall-box dimmers, wall-switch occupancy sensors, and manual light switches.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Show installation details for occupancy and light-level sensors.

1. Interconnection diagrams showing field-installed wiring.
2. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For each type of lighting control device to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.1 TIME SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cooper Industries, Inc.
 2. Leviton Mfg. Company Inc.
 3. NSi Industries LLC; TORK Products.
- B. Electronic Time Switches: Solid state, programmable, with alphanumeric display; complying with UL 917.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Contact Rating: 20-A ballast load, 120-/240-V ac.
 3. Programs: 10 channels; each channel is individually programmable with eight on-off set points on a 24-hour schedule.
 4. Astronomic Time: Selected channels.
 5. Automatic daylight savings time changeover.
 6. Battery Backup: Not less than seven days reserve, to maintain schedules and time clock.

2.2 OUTDOOR PHOTOELECTRIC SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cooper Industries, Inc.
 2. Intermatic, Inc.
 3. NSi Industries LLC; TORK Products.
- B. Description: Solid state, with SPST DPST dry contacts rated for 1800-VA tungsten or 1000-VA inductive, to operate connected relay, contactor coils, or microprocessor input; complying with UL 773A.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Light-Level Monitoring Range: 1.5 to 10 fc(to be verified by Lighting Designer) , with an adjustment for turn-on and turn-off levels within that range.
 3. Time Delay: Fifteen second minimum, to prevent false operation.
 4. Surge Protection: Metal-oxide varistor.
 5. Mounting: Twist lock complies with NEMA C136.10, with base-and-stem mounting or stem-and-swivel mounting accessories as required to direct sensor to the north sky exposure.

2.3 INDOOR OCCUPANCY SENSORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Lutron Electronics Co., Inc.
 2. Sensor Switch, Inc.
 3. Watt Stopper.
- B. General Requirements for Sensors: Wall- or ceiling-mounted, solid-state indoor occupancy sensors with a separate power pack.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Operation: Unless otherwise indicated, turn lights on when coverage area is occupied, and turn them off when unoccupied; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
 3. Sensor Output: Contacts rated to operate the connected relay, complying with UL 773A. Sensor is powered from the power pack.
 4. Power Pack: Dry contacts rated for 20-A ballast load at 120- and 277-V ac, for 13-A tungsten at 120-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc, 150-mA, Class 2 power source, as defined by NFPA 70.
 5. Mounting:
 - a. Sensor: Suitable for mounting in any position on a standard outlet box.
 - b. Relay: Externally mounted through a 1/2-inch knockout in a standard electrical enclosure.
 - c. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
 6. Indicator: Digital display, to show when motion is detected during testing and normal operation of sensor.
 7. Bypass Switch: Override the "on" function in case of sensor failure.
 8. Automatic Light-Level Sensor: Adjustable from 2 to 200 fc; turn lights off when selected lighting level is present.
- C. PIR Type: Ceiling mounted; detect occupants in coverage area by their heat and movement.
1. Detector Sensitivity: Detect occurrences of 6-inch- minimum movement of any portion of a human body that presents a target of not less than 36 sq. in..
 2. Detection Coverage (Room): Detect occupancy anywhere in a circular area of 1000 sq. ft. when mounted on a 96-inch- high ceiling.
 3. Detection Coverage (Corridor): Detect occupancy within 90 feet when mounted on a 10-foot- high ceiling.
- D. Ultrasonic Type: Ceiling mounted; detect occupants in coverage area through pattern changes of reflected ultrasonic energy .
1. Detector Sensitivity: Detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.

2. Detection Coverage (Small Room): Detect occupancy anywhere within a circular area of 600 sq. ft. when mounted on a 96-inch- high ceiling.
 3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sq. ft. when mounted on a 96-inch- high ceiling.
 4. Detection Coverage (Large Room): Detect occupancy anywhere within a circular area of 2000 sq. ft. when mounted on a 96-inch- high ceiling.
 5. Detection Coverage (Corridor): Detect occupancy anywhere within 90 feet when mounted on a 10-foot- high ceiling in a corridor not wider than 14 feet.
- E. Dual-Technology Type: Ceiling mounted; detect occupants in coverage area using PIR and ultrasonic detection methods. The particular technology or combination of technologies that control on-off functions is selectable in the field by operating controls on unit.
1. Sensitivity Adjustment: Separate for each sensing technology.
 2. Detector Sensitivity: Detect occurrences of 6-inch- minimum movement of any portion of a human body that presents a target of not less than 36 sq. in., and detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.
 3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sq. ft. when mounted on a 96-inch- high ceiling.

2.4 SWITCHBOX-MOUNTED OCCUPANCY SENSORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Lutron Electronics Co., Inc.
 2. Sensor Switch, Inc.
 3. Watt Stopper.
- B. General Requirements for Sensors: Automatic-wall-switch occupancy sensor, suitable for mounting in a single gang switchbox.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Operating Ambient Conditions: Dry interior conditions, 32 to 120 deg F.
 3. Switch Rating: Not less than 800-VA fluorescent at 120 V, 1200-VA fluorescent at 277 V, and 800-W incandescent.

2.5 LIGHTING CONTACTORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Allen-Bradley/Rockwell Automation.
 2. ASCO Power Technologies, LP; a division of Emerson Electric Co.
 3. Eaton Corporation.

4. General Electric Company; GE Consumer & Industrial - Electrical Distribution; Total Lighting Control.
 5. Square D; a brand of Schneider Electric.
- B. Description: Electrically operated and mechanically held, combination-type lighting contactors with fusible switch, complying with NEMA ICS 2 and UL 508.
1. Current Rating for Switching: Listing or rating consistent with type of load served, including tungsten filament, inductive, and high-inrush ballast (ballast with 15 percent or less total harmonic distortion of normal load current).
 2. Fault Current Withstand Rating: Equal to or exceeding the available fault current at the point of installation.
 3. Enclosure: Comply with NEMA 250.
 4. Provide with control and pilot devices as indicated on Drawings, matching the NEMA type specified for the enclosure.
- C. BAS Interface: Provide hardware interface to enable the BAS to monitor and control lighting contactors.
1. Monitoring: On-off status,.
 2. Control: On-off operation,.

2.6 CONDUCTORS AND CABLES

- A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- B. Classes 2 and 3 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- C. Class 1 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 14 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.1 SENSOR INSTALLATION

- A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression systems, and partition assemblies.
- B. Install and aim sensors in locations to achieve not less than 90 percent coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.

- C. Install and aim sensors so that they are not triggered by movement in adjacent spaces.

3.2 CONTACTOR INSTALLATION

- A. Mount electrically held lighting contactors with elastomeric isolator pads to eliminate structure-borne vibration, unless contactors are installed in an enclosure with factory-installed vibration isolators.

3.3 WIRING INSTALLATION

- A. Wiring Method: Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size is 1/2 inch.
- B. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.
- C. Size conductors according to lighting control device manufacturer's written instructions unless otherwise indicated.
- D. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.4 IDENTIFICATION

- A. Identify components and power and control wiring according to Section 260553 "Identification for Electrical Systems."
 - 1. Identify controlled circuits in lighting contactors.
 - 2. Identify circuits or luminaires controlled by photoelectric and occupancy sensors at each sensor.
- B. Label time switches and contactors with a unique designation.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to evaluate lighting control devices and perform tests and inspections.
- B. Lighting control devices will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

3.6 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting sensors to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.
 - 1. For occupancy and motion sensors, verify operation at outer limits of detector range. Set time delay to suit City of New York's operations.
 - 2. For daylighting controls, adjust set points and deadband controls to suit City of New York's operations.
 - 3. Align high-bay occupancy sensors using manufacturer's laser aiming tool.

3.7 DEMONSTRATION

- A. Coordinate demonstration of products specified in this Section with demonstration requirements for low-voltage, programmable lighting control systems specified in Section 260943.23 "Relay-Based Lighting Controls."
- B. Instruct City of New York's maintenance personnel to adjust, operate, and maintain lighting control devices.

END OF SECTION 260923

This Page Intentionally Left Blank

SECTION 260943.23

RELAY-BASED LIGHTING CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes: Lighting control panels using mechanically held relays for switching.
- B. Section Includes: Networked lighting control panels using control-voltage relays for switching and that are interoperable with BAS.

1.3 DEFINITIONS

- A. BAS: Building automation system.
- B. IP: Internet protocol.
- C. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.
- D. PC: Personal computer; sometimes plural as "PCs."
- E. RS-485: A serial network protocol, similar to RS-232, complying with TIA-485-A.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for control modules, power distribution components, relays, manual switches and plates, and conductors and cables.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For each relay panel and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
2. Detail enclosure types and details for types other than NEMA 250, Type 1.
3. Detail wiring partition configuration, current, and voltage ratings.
4. Short-circuit current rating of relays.
5. Include diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Submit evidence that lighting controls are compatible with connected monitoring and control devices and systems specified in other Sections.
 1. Show interconnecting signal and control wiring, and interface devices that prove compatibility of inputs and outputs.
 2. For networked controls, list network protocols and provide statements from manufacturers that input and output devices comply with interoperability requirements of the network protocol.
- B. Qualification Data: For testing agency.
- C. Software licenses and upgrades required by and installed for operation and programming of digital and analog devices.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For lighting controls to include in emergency, operation, and maintenance manuals.
- B. Software and Firmware Operational Documentation:
 1. Software operating and upgrade manuals.
 2. Program Software Backup: On magnetic media or compact disk, complete with data files.
 3. Device address list.
 4. Printout of software application and graphic screens.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Lighting Control Relays: Equal to 20 percent of amount installed for each size indicated.

1.8 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Handle and prepare panels for installation according to NECA 407.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Input signal from field-mounted manual switches, or digital signal sources, shall open or close one or more lighting control relays in the lighting control panels. Any combination of inputs shall be programmable to any number of control relays.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with 47 CFR, Subparts A and B, for Class A digital devices.
- D. Comply with UL 916.

2.2 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Lighting control panels shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified."
- B. BAS Interface: Provide hardware and software to enable the BAS to monitor, control, display, and record data for use in processing reports.
 1. Hardwired Points:
 - a. Monitoring: On-off status.
 - b. Control: On-off operation.
 2. Communication Interface: Comply with ASHRAE 135. The communication interface shall enable the BAS operator to remotely control and monitor lighting from a BAS operator workstation. Control features and monitoring points displayed locally at lighting panel shall be available through the BAS.

2.3 LIGHTING CONTROL RELAY PANELS

- A. Products: Subject to compliance with requirements, provide one of the following:

1. Acuity Brands, Inc., Lighting Control & Design, Inc.; GR2400.
 2. Leviton Mfg. Company Inc.; Z-Max Plus.
 3. WattStopper, a Legrand Group brand; Lighting Integrator.
- B. Description: Standalone lighting control panel using mechanically latched relays to control lighting and appliances.
- C. Lighting Control Panel:
1. A single enclosure with incoming lighting branch circuits, control circuits, switching relays, and on-board timing and control unit.
 2. A vertical barrier separating branch circuits from control wiring.
- D. Control Unit: Contain the power supply and electronic control for operating and monitoring individual relays.
1. Timing Unit:
 - a. 365-day calendar, astronomical clock, and automatic adjustments for daylight savings and leap year.
 - b. Clock configurable for 12-hour (A.M./P.M.) or 24-hour format.
 - c. Four independent schedules, each having 24 time periods.
 - d. Schedule periods settable to the minute.
 - e. Day-of-week, day-of-month, day-of-year with one-time or repeating capability.
 - f. 10 special date periods.
 2. Sequencing Control with Override:
 - a. Automatic sequenced on and off switching of selected relays at times set at the timing unit, allowing timed overrides from external switches.
 - b. Sequencing control shall operate relays one at a time, completing the operation of all connected relays in not more than 10 seconds.
 - c. Override control shall allow any relay connected to it to be switched on or off by a field-deployed manual switch or by an automatic switch, such as an occupancy sensor.
 - d. Override control "blink warning" shall warn occupants approximately five minutes before actuating the off sequence.
 3. Nonvolatile memory shall retain all setup configurations. After a power failure, the controller shall automatically reboot and return to normal system operation, including accurate time of day and date.
- E. Relays: Electrically operated, mechanically held single-pole switch, rated at 20 A at 277 V. Short-circuit current rating shall be not less than 5 kA. Control shall be three-wire, 24-V ac.
- F. Relays: Electrically operated, mechanically held single-pole switch, rated at 20 A at 120-V tungsten, 30 A at 277-V ballast, 1.5 hp at 120 V, and 3 hp at 277 V. Short-circuit current rating shall be not less than 14 kA. Control shall be three-wire, 24-V ac.

- G. Power Supply: NFPA 70, Class 2, sized for connected equipment, plus 20 percent spare capacity. Powered from a dedicated branch circuit of the panelboard that supplies power to the line side of the relays, sized to provide control power for the local panel-mounted relays, bus system, low-voltage inputs, field-installed occupancy sensors, and photo sensors.
- H. Operator Interface:
 - 1. Integral alphanumeric keypad and digital display, and intuitive drop-down menus to assist in programming.
 - 2. Log and display relay on-time.
 - 3. Connect relays to one or more time and sequencing schemes.

2.4 NETWORKED LIGHTING CONTROL PANELS

- A. Products: Subject to compliance with requirements, provide one of the following:
 - 1. Acuity Brands, Inc., Lighting Control & Design, Inc.; GR2400.
 - 2. Leviton Mfg. Company Inc.; Z-Max Plus.
 - 3. WattStopper, a Legrand Group brand; Lighting Integrator.
- B. Description: Lighting control panels using mechanically latched relays to control lighting and appliances. The panels shall be capable of being interconnected with digital communications to appear to the operator as a single lighting control system.
- C. Lighting Control Panels:
 - 1. A single enclosure with incoming lighting branch circuits, control circuits, switching relays, and on-board timing and control unit.
 - 2. A vertical barrier separating branch circuits from control wiring.
- D. Main Control Unit: Installed in the main lighting control panel only; powered from the branch circuit of the standard control unit.
 - 1. Ethernet Communications: Comply with MS Windows TCP/IP protocol. The main control unit shall provide for programming of all control functions of the main and all networked slave lighting control panels including timing, sequencing, and overriding.
 - 2. Compliance with ASHRAE 135: Controllers shall support serial MS/TP and Ethernet IP communications, and shall be able to communicate directly via BAS RS-485 serial networks and Ethernet 10Base-T networks as a native device.
 - 3. Web Server: Display information listed below over a standard Web-enabled server for displaying information over a standard browser.
 - a. A secure, password-protected login screen for modifying operational parameters, accessible to authorized users via Web page interface.
 - b. Panel summary showing the master and slave panels connected to the controller.
 - c. Controller diagnostic information.
 - d. Show front panel mimic screens for setting up controller parameters, input types, zones, and operating schedules. These mimic screens shall also allow direct breaker control and zone overrides.

4. Timing Unit:
 - a. 365-day calendar, astronomical clock, and automatic adjustments for daylight savings and leap year.
 - b. Clock configurable for 12-hour (A.M./P.M.) or 24-hour format.
 - c. Four independent schedules, each having 24 time periods.
 - d. Schedule periods settable to the minute.
 - e. Day-of-week, day-of-month, day-of-year with one-time or repeating capability.
 - f. 16 special date periods.
 5. Time Synchronization: The timing unit shall be updated not less than every 12 hour(s) with the network time server.
 6. Sequencing Control with Override:
 - a. Automatic sequenced on and off switching of selected relays at times set at the timing unit, allowing timed overrides from external switches.
 - b. Sequencing control shall operate relays one at a time, completing the operation of all connected relays in not more than 10 seconds.
 - c. Override control shall allow any relay connected to it to be switched on or off by a field-deployed manual switch or by an automatic switch, such as an occupancy sensor.
 - d. Override control "blinking warning" shall warn occupants approximately five minutes before actuating the off sequence.
 - e. Activity log, storing previous relay operation, including the time and cause of the change of status.
 - f. Download firmware to the latest version offered by manufacturer.
- E. Standard Control Unit, Installed in All Lighting Control Panels: Contain electronic controls for programming the operation of the relays in the control panel, contain the status of relays, and contain communications link to enable the digital functions of the main control unit. Comply with UL 916.
1. Electronic control for operating and monitoring individual relays, and display relay on-time.
 2. Nonvolatile memory shall retain all setup configurations. After a power failure, the controller shall automatically reboot and return to normal system operation.
 3. Integral keypad and digital-display front panel for local setup, including the following:
 - a. Blink notice, time adjustable from software.
 - b. Ability to log and display relay on-time.
 - c. Capability for accepting downloadable firmware so that the latest production features may be added in the future without replacing the module.
- F. Relays: Electrically operated, mechanically held single-pole switch, rated at 20 A at 277 V. Short-circuit current rating shall be not less than 5 kA. Control shall be three-wire, 24-V ac.
- G. Power Supply: NFPA 70, Class 2, UL listed, sized for connected equipment, plus not less than 20 percent spare capacity. Powered from a dedicated branch circuit of the panelboard that supplies power to the line side of the relays, sized to provide control power for the local panel-

mounted relays, bus system, low-voltage inputs, field-installed occupancy sensors, and low-voltage photo sensors.

- H. Operator Interface: At the main control unit, provide interface for a tethered connection of a portable PC running MS Windows for configuring all networked lighting control panels using setup software designed for the specified operating system. Include one portable device for initial programming of the system and instruction of City of New York's personnel. That device shall remain the property of City of New York.
- I. Software:
 - 1. Menu-driven data entry.
 - 2. Online and offline programming and editing.
 - 3. Provide for entry of the room or space designation for the load side of each relay.
 - 4. Monitor and control all relays, showing actual relay state and the name of the automatic actuating control, if any.
 - 5. Size the software appropriate to the system.

2.5 MANUAL SWITCHES AND PLATES

- A. Push-Button Switches: Modular, momentary contact, three wire, for operating one or more relays and to override automatic controls.
 - 1. Match color and style specified in Section 262726 "Wiring Devices."
 - 2. Integral green LED pilot light to indicate when circuit is on.
 - 3. Internal white LED locator light to illuminate when circuit is off.
- B. Wall Plates: Single and multigang plates as specified in Section 262726 "Wiring Devices."
- C. Legend: Engraved or permanently silk-screened on wall plate where indicated. Use designations indicated on Drawings.

2.6 FIELD-MOUNTED SIGNAL SOURCES

- A. Indoor Occupancy Sensors: Comply with Section 260923 "Lighting Control Devices." Control power may be taken from the lighting control panel, and signal shall be compatible with the relays.
- B. Outdoor/Indoor Photoelectric Switches

2.7 CONDUCTORS AND CABLES

- A. Power Wiring to Supply Side of Class 2 Power Source: Not smaller than No. 12 AWG, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

- B. Classes 2 and 3 Control Cables: Multiconductor cable with copper conductors not smaller than No. 18 AWG, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- C. Class 1 Control Cables: Multiconductor cable with copper conductors not smaller than No. 14 AWG, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- D. Digital and Multiplexed Signal Cables: Unshielded, twisted-pair cable with copper conductors, complying with TIA/EIA-568-B.2, Category 6 for horizontal copper cable.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store panels according to NECA 407.
- B. Examine panels before installation. Reject panels that are damaged or rusted or have been subjected to water saturation.
- C. Examine elements and surfaces to receive panels for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 WIRING INSTALLATION

- A. Comply with NECA 1.
- B. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Conceal raceway and cables except in unfinished spaces.
 - 1. Install plenum cable in environmental air spaces, including plenum ceilings.
 - 2. Comply with requirements for raceways and boxes specified in Section 260533 "Raceways and Boxes for Electrical Systems."
- C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.3 PANEL INSTALLATION

- A. Comply with NECA 1.
- B. Install panels and accessories according to NECA 407.

- C. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- D. Mount top of trim 90 inches above finished floor unless otherwise indicated.
- E. Mount panel cabinet plumb and rigid without distortion of box.
- F. Install filler plates in unused spaces.

3.4 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Section 260553 "Identification for Electrical Systems."
- C. Create a directory to indicate loads served by each relay; incorporate City of New York's final room designations. Obtain approval before installing. Use a PC or typewriter to create directory; handwritten directories are unacceptable.
- D. Lighting Control Panel Nameplates: Label each panel with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- C. Acceptance Testing Preparation:
 - 1. Test continuity of each circuit.
- D. Lighting control panel will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies lighting control panels and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.6 STARTUP SERVICE

- A. Perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Confirm correct communications wiring, initiate communications between panels, and program the lighting control system according to approved configuration schedules, time-of-day schedules, and input override assignments.

3.7 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.8 SOFTWARE SERVICE AGREEMENT

- A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for one year.
- B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within one year from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
 - 1. Upgrade Notice: At least 30 days to allow City of New York to schedule and access the system and to upgrade computer equipment if necessary.

3.9 DEMONSTRATION

- A. Instruct City of New York's maintenance personnel to adjust, operate, and maintain the control unit and operator interface.

END OF SECTION 260943.23

SECTION 262200

LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:
 - 1. Distribution transformers.

1.3 ACTION SUBMITTALS

- A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Wiring Diagrams: Power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

- A. Manufacturer Seismic Qualification Certification: Submit certification that transformers, accessories, and components will withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Source quality-control test reports.

C. Field quality-control test reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain each transformer type through one source from a single manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.8 COORDINATION

A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Eaton Electrical Inc.; Cutler-Hammer Products.
2. General Electric Company.
3. Square D; Schneider Electric.

2.2 GENERAL TRANSFORMER REQUIREMENTS

- A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
- B. Cores: Grain-oriented, non-aging silicon steel.
- C. Coils: Continuous windings without splices except for taps.
 1. Internal Coil Connections: Brazed or pressure type.
 2. Coil Material: Aluminum.

2.3 DISTRIBUTION TRANSFORMERS

- A. Comply with NEMA ST 20, and list and label as complying with UL 1561.
- B. Provide transformers that are constructed to withstand seismic forces specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- C. Cores: One leg per phase.
- D. Enclosure: Ventilated, NEMA 250, Type 2.
 1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.
- E. Enclosure: Ventilated, NEMA 250, Type 3R.
 1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.
- F. Transformer Enclosure Finish: Comply with NEMA 250.
 1. Finish Color: Gray.
- G. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.
- H. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.
- I. Insulation Class: 220 deg C, UL-component-recognized insulation system with a maximum of 150 deg C rise above 40 deg C ambient temperature.
- J. Energy Efficiency for Transformers Rated 15 kVA and Larger:
 1. Complying with NEMA TP 1, Class 1 efficiency levels.
 2. Tested according to NEMA TP 2.

- K. K-Factor Rating: Transformers indicated to be K-factor rated shall comply with UL 1561 requirements for nonsinusoidal load current-handling capability to the degree defined by designated K-factor.
 - 1. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor.
 - 2. Indicate value of K-factor on transformer nameplate.
- L. Wall Brackets: Manufacturer's standard brackets.
- M. Low-Sound-Level Requirements: Minimum of 3 dBA less than NEMA ST 20 standard sound levels when factory tested according to IEEE C57.12.91.

2.4 IDENTIFICATION DEVICES

- A. Nameplates: Engraved, laminated-plastic or metal nameplate for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Section 260553 "Identification for Electrical Systems."

2.5 SOURCE QUALITY CONTROL

- A. Test and inspect transformers according to IEEE C57.12.91.
- B. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.
- B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.
- C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
- D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.
 - 1. Brace wall-mounting transformers as specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions, seismic codes applicable to Project, and requirements in Section 260529 "Hangers and Supports for Electrical Systems."

3.3 CONNECTIONS

- A. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
- C. Remove and replace units that do not pass tests or inspections and retest as specified above.
- D. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.
 - 1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
 - 2. Perform 2 follow-up infrared scans of transformers, one at 4 months and the other at 11 months after Substantial Completion.
 - 3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.
- E. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

- A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.
- B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.
- C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

- A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION 262200

SECTION 262413

SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Service and distribution switchboards rated 600 V and less.
2. Transient voltage suppression devices.
3. Disconnecting and overcurrent protective devices.
4. Instrumentation.
5. Control power.
6. Accessory components and features.
7. Identification.

1.3 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Switchboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.
1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of switchboard, overcurrent protective device, transient voltage suppression device, ground-fault protector, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
- B. Shop Drawings: For each switchboard and related equipment.
1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
 2. Detail enclosure types for types other than NEMA 250, Type 1.
 3. Detail bus configuration, current, and voltage ratings.

4. Detail short-circuit current rating of switchboards and overcurrent protective devices.
5. Include descriptive documentation of optional barriers specified for electrical insulation and isolation.
6. Detail utility company's metering provisions with indication of approval by utility company.
7. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

1.5 INFORMATIONAL SUBMITTALS

- A. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems." Include the following:
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:
 1. Routine maintenance requirements for switchboards and all installed components.
 2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 3. Time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.
- B. Source quality-control test reports.
- C. Field quality-control test reports.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Fuses and Fusible Devices for Fused Circuit Breakers: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
4. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
5. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
6. Indicating Lights: Equal to 10 percent of quantity installed for each size and type, but no fewer than one of each size and type.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.
- B. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. Comply with NEMA PB 2.
- F. Comply with NFPA 70.
- G. Comply with UL 891.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.
- B. Remove loose packing and flammable materials from inside switchboards and install temporary electric heating (250 W per section) to prevent condensation.
- C. Handle and prepare switchboards for installation according to NEMA PB 2.1.

1.10 PROJECT CONDITIONS

- A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.
- B. Environmental Limitations:

1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - a. Ambient Temperature: Not exceeding 104 deg F.
 - b. Altitude: Not exceeding 6600 feet.

1.11 COORDINATION

- A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.12 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURED UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Square D; a brand of Schneider Electric.
- B. Front-Connected, Front-Accessible Switchboards:
 1. Main Devices: Panel mounted.
 2. Branch Devices: Panel mounted.

3. Sections front and rear aligned.
- C. Nominal System Voltage: as indicated on drawings.
 - D. Main-Bus Continuous: as indicated on drawings.
 - E. Seismic Requirements: Fabricate and test switchboards according to IEEE 344 to withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
 - F. Indoor Enclosures: Steel, NEMA 250, Type 1.
 - G. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
 - H. Barriers: Between adjacent switchboard sections.
 - I. Insulation and isolation for main bus of main section and main and vertical buses of feeder sections.
 - J. Utility Metering Compartment: Fabricated, barrier compartment and section complying with utility company's requirements; hinged sealed door; buses provisioned for mounting utility company's current transformers and potential transformers or potential taps as required by utility company. If separate vertical section is required for utility metering, match and align with basic switchboard. Provide service entrance label and necessary applicable service entrance features.
 - K. Customer Metering Compartment: A separate customer metering compartment and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks. Include potential transformers having primary and secondary fuses with disconnecting means and secondary wiring terminated on terminal blocks.
 - L. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
 - M. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
 - N. Buses and Connections: Three phase, four wire unless otherwise indicated.
 1. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity, silver-plated, with tin-plated aluminum or copper feeder circuit-breaker line connections.
 2. Load Terminals: Insulated, rigidly braced, runback bus extensions, of same material as through buses, equipped with mechanical connectors for outgoing circuit conductors. Provide load terminals for future circuit-breaker positions at full-ampere rating of circuit-breaker position.
 3. Ground Bus: Minimum-size required by UL 891, hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.

4. Main Phase Buses and Equipment Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
 5. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with mechanical compression connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
 6. Isolation Barrier Access Provisions: Permit checking of bus-bolt tightness.
- O. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.

2.2 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time pickup levels.
 - c. Long- and short-time time adjustments.
 - d. Ground-fault pickup level, time delay, and I^2t response.
 4. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor material.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
 - f. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
- B. Insulated-Case Circuit Breaker (ICCB): 100 percent rated, sealed, insulated-case power circuit breaker with interrupting capacity rating to meet available fault current.
1. Fixed circuit-breaker mounting.
 2. Two-step, stored-energy closing.

3. Standard-function, microprocessor-based trip units with interchangeable rating plug, trip indicators, and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time time adjustments.
 - c. Ground-fault pickup level, time delay, and I^2t response.
- C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.
- D. Fuses are specified in Section 262813 "Fuses."

2.3 INSTRUMENTATION

- A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
 1. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; type; secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
 2. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
 3. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.
- B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
 1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
 - a. Phase Currents, Each Phase: Plus or minus 1 percent.
 - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
 - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
 - d. Megawatts: Plus or minus 2 percent.
 - e. Megavars: Plus or minus 2 percent.
 - f. Power Factor: Plus or minus 2 percent.
 - g. Frequency: Plus or minus 0.5 percent.
 - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
 - i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
 - j. Contact devices to operate remote impulse-totalizing demand meter.
 2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.
- C. Impulse-Totalizing Demand Meter:
 1. Comply with ANSI C12.1.

2. Suitable for use with switchboard watt-hour meter, including two-circuit totalizing relay.
3. Cyclometer.
4. Four-dial, totalizing kilowatt-hour register.
5. Positive chart drive mechanism.
6. Capillary pen holding a minimum of one month's ink supply.
7. Roll chart with minimum 31-day capacity; appropriate multiplier tag.
8. Capable of indicating and recording 30 minute integrated demand of totalized system.

2.4 CONTROL POWER

- A. Control Circuits: supplied from switchboard.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.
- B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
- C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install switchboards and accessories according to NEMA PB 2.1.
- B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 4. Install anchor bolts to elevations required for proper attachment to switchboards.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.

- D. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- E. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.
- F. Install filler plates in unused spaces of panel-mounted sections.
- G. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.
 - 1. Set field-adjustable switches and circuit-breaker trip ranges based on coordination study.
- H. Install spare-fuse cabinet.
- I. Comply with NECA 1.

3.3 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
 - c. Instruments and Equipment:
 - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

D. Switchboard will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as indicated.

3.6 PROTECTION

- A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer's written instructions, until switchboard is ready to be energized and placed into service.

3.7 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and service switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram microprocessor-based trip, monitoring, and communication units.

END OF SECTION 262413

This Page Intentionally Left Blank

SECTION 262416

PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:
 - 1. Distribution panelboards.
 - 2. Lighting and appliance branch-circuit panelboards.

1.3 DEFINITIONS

- A. SVR: Suppressed voltage rating.
- B. TVSS: Transient voltage surge suppressor.

1.4 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.
- B. Shop Drawings: For each panelboard and related equipment.
 - 1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
 - 2. Detail enclosure types and details for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings.
4. Short-circuit current rating of panelboards and overcurrent protective devices.
5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
6. Include wiring diagrams for power, signal, and control wiring.
7. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graph paper; include selectable ranges for each type of overcurrent protective device.

1.6 INFORMATIONAL SUBMITTALS

- A. Seismic Qualification Certificates: Submit certification that panelboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems." Include the following:
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- B. Field Quality-Control Reports:
 1. Test procedures used.
 2. Test results that comply with requirements.
 3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- C. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:
 1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.8 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Keys: Two spares for each type of panelboard cabinet lock.
2. Circuit Breakers Including GFCI and Ground Fault Equipment Protection (GFEP) Types: Two spares for each panelboard.
3. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
4. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

1.9 QUALITY ASSURANCE

- A. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NEMA PB 1.
- E. Comply with NFPA 70.

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Remove loose packing and flammable materials from inside panelboards; install temporary electric heating (250 W per panelboard) to prevent condensation.
- B. Handle and prepare panelboards for installation according to NEMA PB 1.

1.11 PROJECT CONDITIONS

- A. Environmental Limitations:
 1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - a. Ambient Temperature: Not exceeding 23 deg F to plus 104 deg F.
 - b. Altitude: Not exceeding 6600 feet.
- B. Service Conditions: NEMA PB 1, usual service conditions, as follows:

1. Ambient temperatures within limits specified.
2. Altitude not exceeding 6600 feet.

1.12 COORDINATION

- A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.13 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PANELBOARDS

- A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- B. Enclosures: Surface-mounted cabinets.
 1. Rated for environmental conditions at installed location.
 - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
 - b. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
 2. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.
 3. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.
 4. Finishes:
 - a. Panels and Trim: Steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
 - b. Back Boxes: Galvanized steel.

5. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover.
- C. Incoming Mains Location: Top or Bottom as required.
- D. Phase, Neutral, and Ground Buses:
1. Material: Hard-drawn copper, 98 percent conductivity.
 2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
 3. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box.
 4. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads.
 5. Split Bus: Vertical buses divided into individual vertical sections.
- E. Conductor Connectors: Suitable for use with conductor material and sizes.
1. Material: Hard-drawn copper, 98 percent conductivity.
 2. Main and Neutral Lugs: Compression type.
 3. Ground Lugs and Bus-Configured Terminators: Compression type.
 4. Feed-Through Lugs: Compression type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
 5. Subfeed (Double) Lugs: Compression type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
 6. Gutter-Tap Lugs: Compression type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
- F. Service Equipment Label: NRTL labeled for use as service equipment for panelboards or load centers with one or more main service disconnecting and overcurrent protective devices.
- G. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
- H. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

2.2 DISTRIBUTION PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Square D; a brand of Schneider Electric.

- B. Panelboards: NEMA PB 1, power and feeder distribution type.
- C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
 - 1. For doors more than 36 inches high, provide two latches, keyed alike.
- D. Mains: As shown on drawings.
- E. Branch Overcurrent Protective Devices: Bolt-on circuit breakers.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Square D; a brand of Schneider Electric.
- B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.
- C. Mains: Circuit breaker.
- D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
- E. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

2.4 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Square D; a brand of Schneider Electric.
- B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
 - 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 - 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
 - 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:

- a. Instantaneous trip.
 - b. Long- and short-time pickup levels.
 - c. Long- and short-time time adjustments.
 - d. Ground-fault pickup level, time delay, and I^2t response.
4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
 5. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
 6. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
 7. Arc-Fault Circuit Interrupter (AFCI) Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.
 8. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - e. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 260913 "Electrical Power Monitoring and Control."
 - f. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.
 - g. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

2.5 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Portable Test Set: For testing functions of solid-state trip devices without removing from panelboard. Include relay and meter test plugs suitable for testing panelboard meters and switchboard class relays.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

- B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.
- C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install panelboards and accessories according to NEMA PB 1.1.
- B. Equipment Mounting: Install panelboards on concrete bases, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
 - 2. For panelboards, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 4. Install anchor bolts to elevations required for proper attachment to panelboards.
 - 5. Attach panelboard to the vertical finished or structural surface behind the panelboard.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.
- D. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- E. Mount top of trim 90 inches above finished floor unless otherwise indicated.
- F. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
- G. Install overcurrent protective devices and controllers not already factory installed.
 - 1. Set field-adjustable, circuit-breaker trip ranges per coordination study.
- H. Install filler plates in unused spaces.
- I. Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.
- J. Arrange conductors in gutters into groups and bundle and wrap with wire ties after completing load balancing.

- K. Comply with NECA 1.

3.3 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Section 260553 "Identification for Electrical Systems."
- B. Create a directory to indicate installed circuit loads after balancing panelboard loads; incorporate City of New York's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
 - c. Instruments and Equipment:

- 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
- D. Panelboards will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

- A. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as indicated on drawings.
- C. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes.
1. Measure as directed during period of normal system loading.
 2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility and at time directed. Avoid disrupting critical 24-hour services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
 3. After circuit changes, recheck loads during normal load period. Record all load readings before and after changes and submit test records.
 4. Tolerance: Difference exceeding 20 percent between phase loads, within a panelboard, is not acceptable. Rebalance and recheck as necessary to meet this minimum requirement.

3.6 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION 262416

SECTION 262726

WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Receptacles, receptacles with integral GFCI, and associated device plates.
2. Weather-resistant receptacles.
3. Toggle Switches
4. Solid-state fan speed controls.
5. Wall-switch and exterior occupancy sensors.
6. Communications outlets.
7. Floor service outlets, poke-through assemblies, service poles, and multioutlet assemblies.

1.3 DEFINITIONS

- A. EMI: Electromagnetic interference.
- B. GFCI: Ground-fault circuit interrupter.
- C. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
- D. RFI: Radio-frequency interference.
- E. TVSS: Transient voltage surge suppressor.
- F. UTP: Unshielded twisted pair.

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Receptacles for Building Owner/City of New York-Furnished Equipment: Match plug configurations.
2. Cord and Plug Sets: Match equipment requirements.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.
- C. Samples:
 - 1. One for each type of device and wall plate specified, in each color specified.
 - 2. Receptacle tester for each type of device NEMA configuration specified.

1.6 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing-label warnings and instruction manuals that include labeling conditions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:
 - 1. Cooper Wiring Devices; Division of Cooper Industries, Inc. (Cooper).
 - 2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
 - 3. Leviton Mfg. Company Inc. (Leviton).
 - 4. Pass & Seymour/Legrand (Pass & Seymour).
- B. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 GENERAL WIRING-DEVICE REQUIREMENTS

- A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.
- C. Decorator-Style Devices: Unless noted otherwise or unavailable for an option, provide wiring devices with rectilinear, decorator-style faces.

- D. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:
 - 1. Connectors shall comply with UL 2459 and shall be made with stranding building wire.
 - 2. Devices shall comply with the requirements in this Section.

2.3 STRAIGHT-BLADE RECEPTACLES

- A. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; 5351 (single), CR5362 (duplex).
 - b. Hubbell; HBL5351 (single), HBL5352 (duplex).
 - c. Leviton; 5891 (single), 5352 (duplex).
 - d. Pass & Seymour; 5361 (single), 5362 (duplex).
 - 2. Tamper-Resistant: Integral dual mechanical shutter system to help prevent insertion of foreign objects.
- B. Isolated-Ground, Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; IG5362RN.
 - b. Hubbell; IG5362.
 - c. Leviton; 5362-IG.
 - d. Pass & Seymour; IG5362.
 - 2. Description: Straight blade; equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.
 - 3. Tamper-Resistant: Integral dual mechanical shutter system to help prevent insertion of foreign objects.

2.4 GFCI RECEPTACLES

- A. General Description:
 - 1. Straight blade, non-feed-through type.
 - 2. Comply with NEMA WD 1, NEMA WD 6, UL 498, UL 943 Class A, and FS W-C-596.
 - 3. Include indicator light that shows when the GFCI has malfunctioned and no longer provides proper GFCI protection.

4. Tamper-Resistant: Integral dual mechanical shutter system to help prevent insertion of foreign objects.

B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; VGF20.
 - b. Hubbell; GFR5352L.
 - c. Pass & Seymour; 2095.
 - d. Leviton; 7590.

2.5 TOGGLE SWITCHES

A. Comply with NEMA WD 1, UL 20, and FS W-S-896.

B. Switches, 120/277 V, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:
 - 1) Single Pole:
 - a) Cooper; AH1221.
 - b) Hubbell; HBL1221.
 - c) Leviton; 1221-2.
 - d) Pass & Seymour; CSB20AC1.
 - 2) Two Pole:
 - a) Cooper; AH1222.
 - b) Hubbell; HBL1222.
 - c) Leviton; 1222-2.
 - d) Pass & Seymour; CSB20AC2.
 - 3) Three Way:
 - a) Cooper; AH1223.
 - b) Hubbell; HBL1223.
 - c) Leviton; 1223-2.
 - d) Pass & Seymour; CSB20AC3.
 - 4) Four Way:
 - a) Cooper; AH1224.
 - b) Hubbell; HBL1224.
 - c) Leviton; 1224-2.
 - d) Pass & Seymour; CSB20AC4.

C. Pilot-Light Switches, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; AH1221PL for 120 and 277 V.
 - b. Hubbell; HBL1201PL for 120 and 277 V.
 - c. Leviton; 1221-LH1.
 - d. Pass & Seymour; PS20AC1RPL for 120 V, PS20AC1RPL7 for 277 V.
 - 2. Description: Single pole, with neon-lighted handle, illuminated when switch is "off."
- D. Key-Operated Switches, 120/277 V, 20 A:
- 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; AH1221L.
 - b. Hubbell; HBL1221L.
 - c. Leviton; 1221-2L.
 - d. Pass & Seymour; PS20AC1-L.
 - 2. Description: Single pole, with factory-supplied key in lieu of switch handle.
- E. Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors.
- 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; 1995.
 - b. Hubbell; HBL1557.
 - c. Leviton; 1257.
 - d. Pass & Seymour; 1251.
- F. Key-Operated, Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.
- 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Cooper; 1995L.
 - b. Hubbell; HBL1557L.
 - c. Leviton; 1257L.
 - d. Pass & Seymour; 1251L.

2.6 WALL-BOX DIMMERS

- A. Dimmer Switches: Modular, full-wave, solid-state units with integral, quiet on-off switches, with audible frequency and EMI/RFI suppression filters.
- B. Control: Continuously adjustable slider; with single-pole or three-way switching. Comply with UL 1472.

- C. Incandescent Lamp Dimmers: 120 V; control shall follow square-law dimming curve. On-off switch positions shall bypass dimmer module.
 - 1. 600 W; dimmers shall require no derating when ganged with other devices.
- D. Fluorescent Lamp Dimmer Switches: Modular; compatible with dimmer ballasts; trim potentiometer to adjust low-end dimming; dimmer-ballast combination capable of consistent dimming with low end not greater than 20 percent of full brightness.

2.7 WALL PLATES

- A. Single and combination types shall match corresponding wiring devices.
 - 1. Plate-Securing Screws: Metal with head color to match plate finish.
 - 2. Material for Finished Spaces: 0.035-inch- thick, satin-finished, Type 302 stainless steel.
 - 3. Material for Unfinished Spaces: Galvanized steel Smooth, high-impact thermoplastic.
 - 4. Material for Damp Locations: Thermoplastic with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.
- B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum with lockable cover.

2.8 FLOOR SERVICE FITTINGS

- A. Type: Modular, flush-type, dual-service units suitable for wiring method used.
- B. Compartments: Barrier separates power from voice and data communication cabling.
- C. Service Plate: Rectangular, with satin finish.
- D. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.

2.9 FINISHES

- A. Device Color:
 - 1. Wiring Devices Connected to Normal Power System: As selected by Architect unless otherwise indicated or required by NFPA 70 or device listing.
 - 2. Wiring Devices Connected to Emergency Power System: Red.
 - 3. TVSS Devices: Blue.
 - 4. Isolated-Ground Receptacles: Orange.
- B. Wall Plate Color: For plastic covers, match device color.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.
- B. Coordination with Other Trades:
 - 1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
 - 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
 - 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
 - 4. Install wiring devices after all wall preparation, including painting, is complete.
- C. Conductors:
 - 1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
 - 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
 - 3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
 - 4. Existing Conductors:
 - a. Cut back and pigtail, or replace all damaged conductors.
 - b. Straighten conductors that remain and remove corrosion and foreign matter.
 - c. Pigtailing existing conductors is permitted, provided the outlet box is large enough.
- D. Device Installation:
 - 1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
 - 2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
 - 3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
 - 4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
 - 5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
 - 6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
 - 7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
 - 8. Tighten unused terminal screws on the device.

9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

E. Receptacle Orientation:

1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.
2. Install hospital-grade receptacles in patient-care areas with the ground pin or neutral blade at the top.

F. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

G. Dimmers:

1. Install dimmers within terms of their listing.
2. Verify that dimmers used for fan speed control are listed for that application.
3. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' device listing conditions in the written instructions.

H. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

I. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

3.2 GFCI RECEPTACLES

- A. Install non-feed-through-type GFCI receptacles where protection of downstream receptacles is not required.

3.3 IDENTIFICATION

- A. Comply with Section 260553 "Identification for Electrical Systems."
- B. Identify each receptacle with panelboard identification and circuit number. Use hot, stamped, or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

3.4 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 1. Test Instruments: Use instruments that comply with UL 1436.
 2. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

- B. Tests for Convenience Receptacles:
1. Line Voltage: Acceptable range is 105 to 132 V.
 2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
 3. Ground Impedance: Values of up to 2 ohms are acceptable.
 4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
 5. Using the test plug, verify that the device and its outlet box are securely mounted.
 6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.
- C. Wiring device will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

SECTION 262813

FUSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:

- 1. Cartridge fuses rated 600-V ac and less.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material, dimensions, descriptions of individual components, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:

- 1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.
 - a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
 - b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.
- 2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
- 3. Current-limitation curves for fuses with current-limiting characteristics.
- 4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.
- 5. Coordination charts and tables and related data.
- 6. Fuse sizes for elevator feeders and elevator disconnect switches.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:

- 1. Ambient temperature adjustment information.

2. Current-limitation curves for fuses with current-limiting characteristics.
3. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.
4. Coordination charts and tables and related data.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

1.6 QUALITY ASSURANCE

- A. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.
- D. Comply with NFPA 70.
- E. Comply with UL 248-11 for plug fuses.

1.7 COORDINATION

- A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Cooper Bussmann, Inc.
 2. Edison Fuse, Inc.
 3. Ferraz Shawmut, Inc.
 4. Littelfuse, Inc.

2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
 - 1. 601 Ampere or larger: Class L, fast acting.
 - 2. 600 Ampere or smaller: Class J, time delay.
 - 3. Fuses protecting Control Circuits: Class CC, time delay.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- B. Install plug-fuse adapters in Edison-base fuseholders and sockets. Ensure that adapters are irremovable once installed.
- C. Install spare-fuse cabinet(s).

3.3 IDENTIFICATION

- A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems" and indicating fuse replacement information on inside door of each fused switch and adjacent to each fuse block, socket, and holder.

SECTION 262816

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:
 - 1. Fusible switches.
 - 2. Nonfusible switches.
 - 3. Receptacle switches.
 - 4. Shunt trip switches.
 - 5. Molded-case circuit breakers (MCCBs).
 - 6. Molded-case switches.
 - 7. Enclosures.

1.3 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, double throw.

1.4 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.
2. Current and voltage ratings.
3. Short-circuit current ratings (interrupting and withstand, as appropriate).
4. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
5. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.

B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

1. Wiring Diagrams: For power, signal, and control wiring.

1.6 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For enclosed switches and circuit breakers, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Field quality-control reports.

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

C. Manufacturer's field service report.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:

1. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.
2. Time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.

1.8 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 2. Fuse Pullers: Two for each size and type.

1.9 QUALITY ASSURANCE

- A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.
- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NFPA 70.

1.10 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - 1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
 - 2. Altitude: Not exceeding 6600 feet.

1.11 COORDINATION

- A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.

2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Square D; a brand of Schneider Electric.
- B. Type GD, General Duty, Single Throw, 240-V ac, 800 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with cartridge fuse interiors to accommodate indicated fuses, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
 - C. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
 - D. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
 - E. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
 - F. Accessories:
 1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 3. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.
 4. Lugs: Compression type, suitable for number, size, and conductor material.

2.2 NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Square D; a brand of Schneider Electric.
- B. Type GD, General Duty, Single Throw, 600 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

- D. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- E. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- F. Accessories:
 - 1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 - 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 - 3. Lugs: Compression type, suitable for number, size, and conductor material.

2.3 MOLDED-CASE CIRCUIT BREAKERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Square D; a brand of Schneider Electric.
- B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.
- C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- D. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- E. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
 - 1. Instantaneous trip.
 - 2. Long- and short-time pickup levels.
 - 3. Long- and short-time time adjustments.
 - 4. Ground-fault pickup level, time delay, and I^2t response.
- F. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.
- G. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.

- H. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
- I. Ground-Fault, Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).
- J. Features and Accessories:
 - 1. Standard frame sizes, trip ratings, and number of poles.
 - 2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.
 - 3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits..
 - 4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
 - 5. Communication Capability: Din-rail-mounted communication module with functions and features compatible with power monitoring and control system, specified in Section 260913 "Electrical Power Monitoring and Control."
 - 6. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
 - 7. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
 - 8. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.

2.4 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
 - 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
 - 2. Outdoor Locations: NEMA 250, Type 3R.
 - 3. Kitchen Areas: NEMA 250, Type 4X,.
 - 4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- B. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Install fuses in fusible devices.
- E. Comply with NECA 1.

3.3 IDENTIFICATION

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.

- b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.
 - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

END OF SECTION 262816

SECTION 262913

ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes the following enclosed controllers rated 600 V and less:
 - 1. Fractional horsepower manual controllers.
 - 2. Combination controllers with starters and overcurrent protection.
- B. Related Section:
 - 1. Section 262923 "Variable-Frequency Motor Controllers" for general-purpose, ac, adjustable-frequency, pulse-width-modulated controllers for use on variable torque loads in ranges up to 200 hp.

1.3 DEFINITIONS

- A. CPT: Control power transformer.
- B. MCCB: Molded-case circuit breaker.
- C. MCP: Motor circuit protector.
- D. N.C.: Normally closed.
- E. N.O.: Normally open.
- F. OCPD: Overcurrent protective device.
- G. SCR: Silicon-controlled rectifier.

1.4 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Enclosed controllers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed controller. Include manufacturer's technical data on features, performance, electrical characteristics, ratings, and enclosure types and finishes.
- B. Shop Drawings: For each enclosed controller. Include dimensioned plans, elevations, sections, details, and required clearances and service spaces around controller enclosures.
 1. Show tabulations of the following:
 - a. Each installed unit's type and details.
 - b. Factory-installed devices.
 - c. Nameplate legends.
 - d. Short-circuit current rating of integrated unit.
 - e. Listed and labeled for integrated short-circuit current (withstand) rating of OCPDs in combination controllers by an NRTL acceptable to authorities having jurisdiction.
 - f. Features, characteristics, ratings, and factory settings of individual OCPDs in combination controllers.
 2. Wiring Diagrams: For power, signal, and control wiring.

1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified testing agency.
- B. Seismic Qualification Certificates: For enclosed controllers, accessories, and components, from manufacturer.
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control reports.
- D. Load-Current and Overload-Relay Heater List: Compile after motors have been installed, and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.
- E. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed, and arrange to demonstrate that switch settings for motor running overload protection suit actual motors to be protected.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For enclosed controllers to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:
 - 1. Routine maintenance requirements for enclosed controllers and installed components.
 - 2. Manufacturer's written instructions for testing and adjusting circuit breaker and MCP trip settings.
 - 3. Manufacturer's written instructions for setting field-adjustable overload relays.
 - 4. Manufacturer's written instructions for testing, adjusting, and reprogramming reduced-voltage solid-state controllers.

1.8 MATERIALS MAINTENANCE SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
 - 3. Indicating Lights: Two of each type and color installed.
 - 4. Auxiliary Contacts: Furnish one spare(s) for each size and type of magnetic controller installed.
 - 5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.9 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.
- C. IEEE Compliance: Fabricate and test enclosed controllers according to IEEE 344 to withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems."

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Store enclosed controllers indoors in clean, dry space with uniform temperature to prevent condensation. Protect enclosed controllers from exposure to dirt, fumes, water, corrosive substances, and physical damage.
- B. If stored in areas subject to weather, cover enclosed controllers to protect them from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside controllers; install temporary electric heating, with at least 250 W per controller.

1.11 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
2. Altitude: Not exceeding 6600 feet.

1.12 COORDINATION

- A. Coordinate layout and installation of enclosed controllers with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
- C. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

PART 2 - PRODUCTS

2.1 FULL-VOLTAGE CONTROLLERS

- A. General Requirements for Full-Voltage Controllers: Comply with NEMA ICS 2, general purpose, Class A.
- B. Motor-Starting Switches: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off or on.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - c. Rockwell Automation, Inc.; Allen-Bradley brand.
 - d. Square D; a brand of Schneider Electric.
 2. Configuration: Nonreversing.
 3. Surface mounting.
 4. Red pilot light.
- C. Fractional Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - c. Rockwell Automation, Inc.; Allen-Bradley brand.
 - d. Square D; a brand of Schneider Electric.
2. Configuration: Nonreversing.
 3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button ; melting alloy type.
 4. Surface mounting.
 5. Red pilot light.
- D. Integral Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - c. Rockwell Automation, Inc.; Allen-Bradley brand.
 - d. Square D; a brand of Schneider Electric.
 2. Configuration: Nonreversing.
 3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters and sensors in each phase, matched to nameplate full-load current of actual protected motor and having appropriate adjustment for duty cycle; external reset push button ; melting alloy type.
 4. Surface mounting.
 5. Red pilot light.
- E. Combination Magnetic Controller: Factory-assembled combination of magnetic controller, OCPD, and disconnecting means.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - c. Rockwell Automation, Inc.; Allen-Bradley brand.
 - d. Square D; a brand of Schneider Electric.
 2. Fusible Disconnecting Means:
 - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J Class R fuses.
 - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

3. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
4. Nonfusible Disconnecting Means:
 - a. NEMA KS 1, heavy-duty, horsepower-rated, nonfusible switch.
 - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
 - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
5. MCP Disconnecting Means:
 - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
 - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
 - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
 - d. N.C. or N.O. alarm contact that operates only when MCP has tripped.
 - e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
6. MCCB Disconnecting Means:
 - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
 - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
 - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
 - e. N.C. alarm contact that operates only when MCCB has tripped.

2.2 ENCLOSURES

- A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.
 1. Dry and Clean Indoor Locations: Type 1.
 2. Outdoor Locations: Type 3R.
 3. Other Wet or Damp Indoor Locations: Type 4.

2.3 ACCESSORIES

- A. General Requirements for Control Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.
 1. Push Buttons, Pilot Lights, and Selector Switches: Heavy-duty, type.

- a. Push Buttons: Recessed types; momentary as indicated.
 - b. Pilot Lights: LED types; colors as indicated; push to test.
 - c. Selector Switches: Rotary type.
- B. Reversible N.C./N.O. auxiliary contact(s).
 - C. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.
 - D. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and surfaces to receive enclosed controllers, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
- B. Examine enclosed controllers before installation. Reject enclosed controllers that are wet, moisture damaged, or mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Section 260529 "Hangers and Supports for Electrical Systems."
- B. Seismic Bracing: Comply with requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Install fuses in each fusible-switch enclosed controller.
- E. Install fuses in control circuits if not factory installed. Comply with requirements in Section 262813 "Fuses."
- F. Install heaters in thermal overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- G. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.

- H. Comply with NECA 1.

3.3 IDENTIFICATION

- A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each enclosure with engraved nameplate.
 - 3. Label each enclosure-mounted control and pilot device.

3.4 CONTROL WIRING INSTALLATION

- A. Install wiring between enclosed controllers and remote devices. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."
- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic-control selection devices where applicable.
 - 1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switch is in manual-control position.
 - 2. Connect selector switches with enclosed-controller circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Inspect controllers, wiring, components, connections, and equipment installation.
 - 2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
 - 3. Test continuity of each circuit.

4. Verify that voltages at controller locations are within plus or minus 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Construction Manager before starting the motor(s).
5. Test each motor for proper phase rotation.
6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
8. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each multi-pole enclosed controller. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each multi-pole enclosed controller 11 months after date of Substantial Completion.
 - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

D. Enclosed controllers will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

- A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
- B. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Construction Manager before increasing settings.
- C. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

3.7 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.
- B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.8 DEMONSTRATION

- A. Instruct City of New York's maintenance personnel to adjust, operate, and maintain enclosed controllers.

END OF SECTION 262913

SECTION 262923

VARIABLE-FREQUENCY MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section includes separately enclosed, pre-assembled, combination VFCs, rated 600 V and less, for speed control of three-phase, squirrel-cage induction motors.

1.3 DEFINITIONS

- A. BAS: Building automation system.
- B. CE: Conformance Europeene (European Compliance).
- C. CPT: Control power transformer.
- D. EMI: Electromagnetic interference.
- E. IGBT: Insulated-gate bipolar transistor.
- F. LAN: Local area network.
- G. LED: Light-emitting diode.
- H. MCP: Motor-circuit protector.
- I. NC: Normally closed.
- J. NO: Normally open.
- K. OCPD: Overcurrent protective device.
- L. PCC: Point of common coupling.
- M. PID: Control action, proportional plus integral plus derivative.
- N. PWM: Pulse-width modulated.
- O. RFI: Radio-frequency interference.

- P. TDD: Total demand (harmonic current) distortion.
- Q. THD(V): Total harmonic voltage demand.
- R. VFC: Variable-frequency motor controller.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type and rating of VFC indicated. Include features, performance, electrical ratings, operating characteristics, shipping and operating weights, and furnished specialties and accessories.
- B. LEED Submittals:
 - 1. Product Data for Credit EA 5: For continuous metering equipment for energy consumption.
- C. Shop Drawings: For each VFC indicated. Include dimensioned plans, elevations, and sections; and conduit entry locations and sizes, mounting arrangements, and details, including required clearances and service space around equipment.
 - 1. Show tabulations of installed devices, equipment features, and ratings. Include the following:
 - a. Each installed unit's type and details.
 - b. Factory-installed devices.
 - c. Enclosure types and details.
 - d. Nameplate legends.
 - e. Short-circuit current (withstand) rating of enclosed unit.
 - f. Features, characteristics, ratings, and factory settings of each VFC and installed devices.
 - g. Specified modifications.
 - 2. Schematic and Connection Wiring Diagrams: For power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout, required working clearances, and required area above and around VFCs. Show VFC layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.
- B. Qualification Data: For qualified testing agency.
- C. Seismic Qualification Certificates: For VFCs, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based, and their installation requirements.
- D. Product Certificates: For each VFC, from manufacturer.
- E. Harmonic Analysis Study and Report: Provide Project-specific calculations and manufacturer's statement of compliance with IEEE 519.
- F. Source quality-control reports.
- G. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For VFCs to include in emergency, operation, and maintenance manuals. In addition to items specified elsewhere, include the following:
1. Manufacturer's written instructions for testing and adjusting thermal-magnetic circuit breaker and MCP trip settings.
 2. Manufacturer's written instructions for setting field-adjustable overload relays.
 3. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor control modules.
 4. Manufacturer's written instructions for setting field-adjustable timers, controls, and status and alarm points.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Auxiliary Contacts: Furnish one spare(s) for each size and type of magnetic controller installed.
 2. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.8 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Member company of NETA or an NRTL.
1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NFPA 70.

- D. IEEE Compliance: Fabricate and test VFC according to IEEE 344 to withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems."

1.9 DELIVERY, STORAGE, AND HANDLING

- A. If stored in space that is not permanently enclosed and air conditioned, remove loose packing and flammable materials from inside controllers and install temporary electric heating, with at least 250 W per controller.

1.10 COORDINATION

- A. Coordinate features of motors, load characteristics, installed units, and accessory devices to be compatible with the following:
 - 1. Torque, speed, and horsepower requirements of the load.
 - 2. Ratings and characteristics of supply circuit and required control sequence.
 - 3. Ambient and environmental conditions of installation location.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.
- C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.11 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace VFCs that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURED UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. ABB.
 - 2. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 3. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 4. Rockwell Automation, Inc.; Allen-Bradley Brand.
 - 5. Siemens Energy & Automation, Inc.
 - 6. Square D; a brand of Schneider Electric.
 - 7. Toshiba International Corporation.

- B. General Requirements for VFCs: Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 508C.
- C. Application: Constant torque and variable torque.
- D. VFC Description: Variable-frequency power converter (rectifier, dc bus, and IGBT, PWM inverter) factory packaged in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.
 - 1. Units suitable for operation of NEMA MG 1, Design A and Design B motors as defined by NEMA MG 1, Section IV, Part 30, "Application Considerations for Constant Speed Motors Used on a Sinusoidal Bus with Harmonic Content and General Purpose Motors Used with Adjustable-Voltage or Adjustable-Frequency Controls or Both."
 - 2. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
 - 3. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to authorities having jurisdiction.
- E. Design and Rating: Match load type, such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- F. Output Rating: Three-phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.
- G. Unit Operating Requirements:
 - 1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFC input voltage rating.
 - 2. Input Frequency Tolerance: Plus or minus 3 percent of VFC frequency rating.
 - 3. Minimum Efficiency: 96 percent at 60 Hz, full load.
 - 4. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
 - 5. Minimum Short-Circuit Current (Withstand) Rating: As required.
 - 6. Ambient Temperature Rating: Not less than 14 deg F and not exceeding 104 deg F.
 - 7. Ambient Storage Temperature Rating: Not less than minus 4 deg F and not exceeding 140 deg F
 - 8. Humidity Rating: Less than 95 percent (noncondensing).
 - 9. Altitude Rating: Not exceeding 3300 feet.
 - 10. Vibration Withstand: Comply with IEC 60068-2-6.
 - 11. Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
 - 12. Starting Torque: Minimum 100 percent of rated torque from 3 to 60 Hz.
 - 13. Speed Regulation: Plus or minus 5 percent.
 - 14. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.
 - 15. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.
- H. Inverter Logic: Microprocessor based, 32 bit, isolated from all power circuits.
- I. Isolated Control Interface: Allows VFCs to follow remote-control signal over a minimum 40:1 speed range.

1. Signal: Electrical.
2. Signal: Pneumatic.

J. Internal Adjustability Capabilities:

1. Minimum Speed.
2. Maximum Speed.
3. Acceleration.
4. Deceleration.
5. Current Limit.

K. Self-Protection and Reliability Features:

1. Input transient protection by means of surge suppressors to provide three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
2. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
3. Under- and overvoltage trips.
4. Inverter overcurrent trips.
5. VFC and Motor Overload/Overtemperature Protection: Microprocessor-based thermal protection system for monitoring VFCs and motor thermal characteristics, and for providing VFC overtemperature and motor overload alarm and trip; settings selectable via the keypad; NRTL approved.
6. Critical frequency rejection, with three selectable, adjustable deadbands.
7. Instantaneous line-to-line and line-to-ground overcurrent trips.
8. Loss-of-phase protection.
9. Reverse-phase protection.
10. Short-circuit protection.
11. Motor overtemperature fault.

L. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.

M. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped, unless "Bidirectional Autospeed Search" feature is available and engaged.

N. Bidirectional Autospeed Search: Capable of starting VFC into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.

O. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.

P. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.

- Q. Integral Input Disconnecting Means and OCPD: with pad-lockable, door-mounted handle mechanism.
1. Disconnect Rating: Not less than 115 percent of VFC input current rating.
 2. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFC input current rating, whichever is larger.
 3. Auxiliary Contacts: NO/NC, arranged to activate before switch blades open.
 4. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.

2.2 CONTROLS AND INDICATION

- A. Status Lights: Door-mounted LED indicators displaying the following conditions:
1. Power on.
 2. Run.
 3. Overvoltage.
 4. Line fault.
 5. Overcurrent.
 6. External fault.
- B. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.
1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
 2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
 - a. Control Authority: Supports at least four conditions: Off, local manual control at VFC, local automatic control at VFC, and automatic control through a remote source.
- C. Historical Logging Information and Displays:
1. Real-time clock with current time and date.
 2. Running log of total power versus time.
 3. Total run time.
 4. Fault log, maintaining last four faults with time and date stamp for each.
- D. Indicating Devices: Digital display mounted flush in VFC door and connected to display VFC parameters including, but not limited to:
1. Output frequency (Hz).
 2. Motor speed (rpm).
 3. Motor status (running, stop, fault).
 4. Motor current (amperes).
 5. Motor torque (percent).

6. Fault or alarming status (code).
7. PID feedback signal (percent).
8. DC-link voltage (V dc).
9. Set point frequency (Hz).
10. Motor output voltage (V ac).

E. Control Signal Interfaces:

1. Electric Input Signal Interface:
 - a. A minimum of two programmable analog inputs: 0- to 10-V dc 4- to 20-mA dc.
 - b. A minimum of six multifunction programmable digital inputs.
2. Pneumatic Input Signal Interface: 3 to 15 psig.
3. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BAS or other control systems:
 - a. 0- to 10-V dc.
 - b. 4- to 20-mA dc.
 - c. Potentiometer using up/down digital inputs.
 - d. Fixed frequencies using digital inputs.
4. Output Signal Interface: A minimum of one programmable analog output signal(s) (0- to 10-V dc 4- to 20-mA dc), which can be configured for any of the following:
 - a. Output frequency (Hz).
 - b. Output current (load).
 - c. DC-link voltage (V dc).
 - d. Motor torque (percent).
 - e. Motor speed (rpm).
 - f. Set point frequency (Hz).
5. Remote Indication Interface: A minimum of two programmable dry-circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
 - a. Motor running.
 - b. Set point speed reached.
 - c. Fault and warning indication (overtemperature or overcurrent).
 - d. PID high- or low-speed limits reached.

F. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display VFC status and alarms. Allows VFC to be used with an external system within a multidrop LAN configuration; settings retained within VFC's nonvolatile memory.

1. Network Communications Ports: Ethernet and RS-422/485.
2. Embedded BAS Protocols for Network Communications: ASHRAE 135 BACnet Echelon LonWorks Johnson Metasys N2 Modbus/Memobus Siemens System 600 APOGEE; protocols accessible via the communications ports.

2.3 LINE CONDITIONING AND FILTERING

- A. Input Line Conditioning: Based on the harmonic analysis study and report, provide input filtering, as required, to limit TDD and THD(V) at the defined PCC per IEEE 519.
- B. Output Filtering: Load filters for motors that do not meet the requirements in NEMA MG1.
- C. EMI/RFI Filtering: CE marked; certify compliance with IEC 61800-3 for Category C2.

2.4 BYPASS SYSTEMS

- A. Bypass Operation: Safely transfers motor between power converter output and bypass circuit, manually, automatically, or both. Selector switches set modes and indicator lights indicate mode selected. Unit is capable of stable operation (starting, stopping, and running) with motor completely disconnected from power converter.
- B. Bypass Mode: Field-selectable automatic or manual, allows local and remote transfer between power converter and bypass contactor and retransfer, either via manual operator interface or automatic control system feedback.
- C. Bypass Controller: Two-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter and permit safe troubleshooting and testing, both energized and de-energized, while motor is operating in bypass mode.
 - 1. Bypass Contactor: Load-break, NEMA-rated contactor.
 - 2. Output Isolating Contactor: Non-load-break, NEMA-rated contactor.
 - 3. Isolating Switch: Non-load-break switch arranged to isolate power converter and permit safe troubleshooting and testing of the power converter, both energized and de-energized, while motor is operating in bypass mode; pad-lockable, door-mounted handle mechanism.
- D. Bypass Contactor Configuration: Full-voltage (across-the-line) type.
 - 1. NORMAL/BYPASS selector switch.
 - 2. HAND/OFF/AUTO selector switch.
 - 3. NORMAL/TEST Selector Switch: Allows testing and adjusting of VFC while the motor is running in the bypass mode.
 - 4. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.
 - a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
 - b. Power Contacts: Totally enclosed, double break, and silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.

2.5 OPTIONAL FEATURES

- A. Sleep Function: Senses a minimal deviation of a feedback signal and stops the motor. On an increase in speed-command signal deviation, VFC resumes normal operation.
- B. Motor Preheat Function: Preheats motor when idle to prevent moisture accumulation in the motor.
- C. Firefighter's Override (Smoke Purge) Input: On a remote contact closure from the firefighter's control station, this password-protected input:
 - 1. Overrides all other local and external inputs (analog/digital, serial communication, and all keypad commands).
 - 2. Forces VFC to operate motor, without any other run or speed command, at a field-adjustable, preset speed.
 - 3. Forces VFC to transfer to Bypass Mode and operate motor at full speed.
 - 4. Causes display of Override Mode on the VFC display.
 - 5. Reset VFC to normal operation on removal of override signal automatically.
- D. Remote Indicating Circuit Terminals: Mode selection, controller status, and controller fault.
- E. Remote digital operator kit.
- F. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.

2.6 ENCLOSURES

- A. VFC Enclosures: NEMA 250, to comply with environmental conditions at installed location.
 - 1. Dry and Clean Indoor Locations: Type 1.
- B. Plenum Rating: UL 1995; NRTL certification label on enclosure, clearly identifying VFC as "Plenum Rated."

2.7 ACCESSORIES

- A. General Requirements for Control-Circuit and Pilot Devices: NEMA ICS 5; factory installed in VFC enclosure cover unless otherwise indicated.
 - 1. Push Buttons, Pilot Lights, and Selector Switches: Heavy-duty, type.
 - a. Push Buttons: Shielded types;.
 - b. Pilot Lights: LED types;.
 - c. Selector Switches: Rotary type.
- B. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.

1. Current Transformers: Continuous current rating, basic impulse insulating level (BIL) rating, burden, and accuracy class suitable for connected circuitry. Comply with IEEE C57.13.
- C. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.

2.8 SOURCE QUALITY CONTROL

- A. Testing: Test and inspect VFCs according to requirements in NEMA ICS 61800-2.
 1. Test each VFC while connected to its specified motor.
 2. Verification of Performance: Rate VFCs according to operation of functions and features specified.
- B. VFCs will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, surfaces, and substrates to receive VFCs, with Installer present, for compliance with requirements for installation tolerances, and other conditions affecting performance.
- B. Examine VFC before installation. Reject VFCs that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFC installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 HARMONIC ANALYSIS STUDY

- A. Perform a harmonic analysis study to identify the effects of nonlinear loads and their associated harmonic contributions on the voltages and currents throughout the electrical system. Analyze designated operating scenarios, including recommendations for VFC input filtering to limit TDD and THD(V) at each VFC to specified levels.
- B. Prepare a harmonic analysis study and report complying with IEEE 399 and NETA Acceptance Testing Specification.

3.3 INSTALLATION

- A. Coordinate layout and installation of VFCs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Wall-Mounting Controllers: Install VFCs on walls with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished floor unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not on walls, provide freestanding racks complying with Section 260529 "Hangers and Supports for Electrical Systems."
- C. Seismic Bracing: Comply with requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in each fusible-switch VFC.
- F. Install fuses in control circuits if not factory installed. Comply with requirements in Section 262813 "Fuses."
- G. Install heaters in thermal-overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- H. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- I. Comply with NECA 1.

3.4 IDENTIFICATION

- A. Identify VFCs, components, and control wiring. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each VFC with engraved nameplate.
 - 3. Label each enclosure-mounted control and pilot device.
- B. Operating Instructions: Frame printed operating instructions for VFCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFC units.

3.5 CONTROL WIRING INSTALLATION

- A. Install wiring between VFCs and remote devices and facility's central-control system. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."

- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic control devices where applicable.
 - 1. Connect selector switches to bypass only those manual- and automatic control devices that have no safety functions when switches are in manual-control position.
 - 2. Connect selector switches with control circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each VFC element, bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- D. Tests and Inspections:
 - 1. Inspect VFC, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
 - 2. Test insulation resistance for each VFC element, component, connecting motor supply, feeder, and control circuits.
 - 3. Test continuity of each circuit.
 - 4. Verify that voltages at VFC locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Architect Construction Manager before starting the motor(s).
 - 5. Test each motor for proper phase rotation.
 - 6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 8. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each VFC. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each VFC 11 months after date of Substantial Completion.

- c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
- 9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- E. VFCs will be considered defective if they do not pass tests and inspections.
- F. Prepare test and inspection reports, including a certified report that identifies the VFC and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.7 STARTUP SERVICE

- A. Perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.

3.8 ADJUSTING

- A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.
- B. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
- C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable, instantaneous trip elements. Initially adjust to six times the motor nameplate full-load amperes and attempt to start motors several times, allowing for motor cool-down between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Construction Manager before increasing settings.
- D. Set the taps on reduced-voltage autotransformer controllers.
- E. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."
- F. Set field-adjustable pressure switches.

3.9 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until controllers are ready to be energized and placed into service.

- B. Replace VFCs whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.10 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's maintenance personnel to adjust, operate, reprogram, and maintain VFCs.

END OF SECTION 262923

This Page Intentionally Left Blank

SECTION 263323

CENTRAL BATTERY EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. This Section includes fast-transfer central battery inverters.

1.3 DEFINITIONS

- A. LCD: Liquid-crystal display.
- B. LED: Light-emitting diode.
- C. THD: Total harmonic distortion.
- D. UPS: Uninterruptible power supply.

1.4 ACTION SUBMITTALS

- A. Product Data: For the following:
 - 1. Electrical ratings, including the following:
 - a. Capacity to provide power during failure of normal ac.
 - b. Inverter voltage regulation and THD of output current.
 - c. Rectifier data.
 - d. Transfer time of transfer switch.
 - e. Data for specified optional features.
 - 2. Transfer switch.
 - 3. Inverter.
 - 4. Battery charger.
 - 5. Batteries.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, components, and location and identification of each field connection. Show access, workspace, and clearance requirements; details of control panels; and battery arrangement.

1. Wiring Diagrams: Detail internal and interconnecting wiring; and power, signal, and control wiring.
2. Elevation and details of control and indication displays.

1.5 INFORMATIONAL SUBMITTALS

- A. Manufacturer Seismic Qualification Certification: Submit certification that central battery inverter equipment will withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems." Include the following:
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- B. Source quality-control test reports.
- C. Field quality-control test reports.
- D. Warranty: Special warranty specified in this Section.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For central battery inverter equipment to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Central Battery Inverter System: UL 924 listed.
- C. Comply with NFPA 70 and NFPA 101.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in fully enclosed vehicles.
- B. Store equipment in spaces having environments controlled within manufacturers' written instructions for ambient temperature and humidity conditions for non-operating equipment.

1.9 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace batteries that fail in materials or workmanship within specified warranty period. Special warranty, applying to batteries only, applies to materials only, on a prorated basis, for period specified.
 - 1. Warranty Period: Include the following warranty periods, from date of Substantial Completion:
 - a. Lead-Calcium, Wet-Cell Batteries:
 - 1) Full Warranty: One year.
 - 2) Pro Rata: Nine years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Chloride Systems.
 - 2. Cooper Industries, Inc.; Sure-Lites Division.
 - 3. Dual-Lite.
 - 4. Lithonia Lighting; Emergency Lighting Systems.

2.2 INVERTER PERFORMANCE REQUIREMENTS

- A. Fast-Transfer Central Battery Inverters: Automatically sense loss of normal ac supply and use a solid-state switch to transfer loads. Transfer in 0.002 second or less from normal supply to battery-inverter supply.
 - 1. Operation: Unit supplies power to output circuits from a single, external, normal supply source. Unit automatically transfers load from normal source to internal battery/inverter source. Retransfer to normal is automatic when normal power is restored.

2.3 SERVICE CONDITIONS

- A. Environmental Conditions: Inverter system shall be capable of operating continuously in the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
 - 1. Ambient Temperature for Electronic Components: 68 to 85 deg F.
 - 2. Relative Humidity: 0 to 95 percent, noncondensing.
 - 3. Altitude: Sea level to 100 feet .

2.4 INVERTERS

- A. Description: Solid-state type, with the following operational features:
1. Automatically regulate output voltage to within plus or minus 5 percent.
 2. Automatically regulate output frequency to within plus or minus 1 Hz, from no load to full load at unit power factor over the operating range of battery voltage.
 3. Output Voltage Waveform of Unit: Sine wave with maximum 10 percent THD throughout battery operating-voltage range, from no load to full load.
 - a. THD may not exceed 5 percent when serving a resistive load of 100 percent of unit rating.
 4. Output Protection: Current-limiting and short-circuit protection.
 5. Overload Capability: 125 percent for 10 minutes; 150 percent surge.

2.5 BATTERY CHARGER

- A. Description: Solid-state, automatically maintaining batteries in fully charged condition when normal power is available. With LED indicators for "float" and "high-charge" modes.

2.6 BATTERIES

- A. Description: Maintenance-free, sealed, lead-calcium, wet-cell batteries, capable of sustaining full-capacity output of inverter unit for minimum of 90 minutes.

2.7 ENCLOSURES

- A. NEMA 250, Type 1 steel cabinets with access to components through hinged doors with flush tumbler lock and latch.
- B. Finish: Manufacturer's standard baked-enamel finish over corrosion-resistant prime treatment.

2.8 SEISMIC REQUIREMENTS

- A. Central battery inverter assemblies, subassemblies, components, fastenings, supports, and mounting and anchorage devices shall be designed and fabricated to withstand seismic forces. The term "withstand" is defined in the "Manufacturer Seismic Qualification Certification" Paragraph in Part 1 "Informational Submittals" Article.

2.9 CONTROL AND INDICATION

- A. Description: Group displays, indications, and basic system controls on common control panel on front of central battery inverter enclosure.

- B. Minimum displays, indicating devices, and controls shall include those in lists below. Provide sensors, transducers, terminals, relays, and wiring required to support listed items. Alarms shall include an audible signal and a visual display.
- C. Indications: Labeled LED and plain-language messages on a digital LCD or LED.
1. Quantitative Indications:
 - a. Input voltage, each phase, line to line.
 - b. Input current, each phase, line to line.
 - c. System output voltage, each phase, line to line.
 - d. System output current, each phase.
 - e. System output frequency.
 - f. DC bus voltage.
 - g. Battery current and direction (charge/discharge).
 - h. Elapsed time-discharging battery.
 2. Basic Status Condition Indications:
 - a. Normal operation.
 - b. Load-on bypass.
 - c. Load-on battery.
 - d. Inverter off.
 - e. Alarm condition exists.
 3. Alarm Indications:
 - a. Battery system alarm.
 - b. Control power failure.
 - c. Fan failure.
 - d. Overload.
 - e. Battery-charging control faulty.
 - f. Input overvoltage or undervoltage.
 - g. Approaching end of battery operation.
 - h. Battery undervoltage shutdown.
 - i. Inverter fuse blown.
 - j. Inverter transformer overtemperature.
 - k. Inverter overtemperature.
 - l. Static bypass transfer switch overtemperature.
 - m. Inverter power supply fault.
 - n. Inverter output overvoltage or undervoltage.
 - o. System overload shutdown.
 - p. Inverter output contactor open.
 - q. Inverter current limit.
 4. Controls:
 - a. Inverter on-off.
 - b. Start.
 - c. Battery test.
 - d. Alarm silence/reset.

- e. Output-voltage adjustment.
- D. Enclosure: Steel, with hinged lockable doors, suitable for wall mounting. Manufacturer's standard corrosion-resistant finish.

2.10 OPTIONAL FEATURES

- A. Emergency-Only Circuits: Automatically energize only when normal supply has failed. Disconnect emergency-only circuits when normal power is restored.
- B. Maintenance Bypass/Isolation Switch: Switch is interlocked so it cannot be operated unless static bypass transfer switch is in bypass mode. Switch provides manual selection among the following three conditions without interrupting supply to the load during switching:
 - 1. Full Isolation: Load is supplied, bypassing central battery inverter system. Normal ac input circuit, static bypass transfer switch, and central battery inverter load terminals are completely disconnected from external circuits.
 - 2. Maintenance Bypass: Load is supplied, bypassing central battery inverter system. Central battery inverter ac supply terminals are energized to permit operational checking, but system load terminals are isolated from the load.
 - 3. Normal: Normal central battery inverter ac supply terminals are energized and the load is supplied either through static bypass transfer switch and central battery inverter rectifier-charger and inverter or through battery and inverter.

2.11 SOURCE QUALITY CONTROL

- A. Factory test complete inverter system, including battery, before shipment. Include the following:
 - 1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.
 - 2. Full-load test.
 - 3. Transient-load response test.
 - 4. Overload test.
 - 5. Power failure test.
- B. Observation of Test: Give 14 days' advance notice of tests and provide access for City of New York's representative to observe tests at City of New York's option.
- C. Report test results. Include the following data:
 - 1. Description of input source and output loads used. Describe actions required to simulate source load variation and various operating conditions and malfunctions.
 - 2. List of indications, parameter values, and system responses considered satisfactory for each test action. Include tabulation of actual observations during test.
 - 3. List of instruments and equipment used in factory tests.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance.
 - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment will be installed, before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install system components on wall per manufacturer's written instructions.
 - 1. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Section 260548 "Vibration and Seismic Controls for Electrical Systems" for seismic-restraint requirements.
- B. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and NFPA 70.

3.3 CONNECTIONS

- A. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams, unless otherwise indicated.
- B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
 - 1. Separately Derived Systems: Make grounding connections to grounding electrodes and bonding connections to metallic piping systems as indicated; comply with NFPA 70.
- C. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 IDENTIFICATION

- A. Identify equipment and components according to Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Inspect interiors of enclosures for integrity of mechanical and electrical connections, component type and labeling verification, and ratings of installed components.
 - 2. Test manual and automatic operational features and system protective and alarm functions.
 - 3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specifications. Certify compliance with test parameters.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.

3.6 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Verify that central battery inverter is installed and connected according to the Contract Documents.
- C. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements.
- D. Complete installation and startup checks according to manufacturer's written instructions.

3.7 ADJUSTING AND CLEANING

- A. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- B. Install new filters in each equipment cabinet within 14 days from date of Substantial Completion.

3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain central battery inverters. Refer to DDC General Conditions.

END OF SECTION 263323

SECTION 265100

LIGHTING FIXTURES AND DEVICES

PART 1 GENERAL

1.01 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.02 SECTION INCLUDES

- A. All work shall be in accordance with the requirements of the General Specification 265100 – Lighting Fixtures and Devices except as modified herein. The following paragraphs modify and supplement the correspondingly numbered paragraphs of General Specification 265100 - Lighting Fixtures and Devices.

1.03 RELATED SPECIFICATIONS

- A. DDC General Conditions - LEED Performance Requirements
- B. DDC General Conditions - Low Emitting Indoor Materials
- C. DDC General Conditions - Construction Waste Management
- D. DDC General Conditions - Start Up and Commissioning Testing

1.04 SUBMITTALS

- A. Product Data: For each type of lighting fixture, arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:
 - 1. Physical description of lighting fixture including dimensions.
 - 2. Emergency lighting units including battery and charger.
 - 3. Ballast.
 - 4. Energy-efficiency data.
 - 5. Life, output, and energy-efficiency data for lamps.

6. Photometric data, in IESNA format, based on laboratory tests of each lighting fixture type, outfitted with lamps, ballasts, and accessories identical to those indicated for the lighting fixture as applied in this Project.
 - a. For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by the manufacturer.
- B. Shop Drawings: Show details of nonstandard or custom lighting fixtures. Indicate dimensions, weights, methods of field assembly, components, features, and accessories.
 1. Wiring Diagrams: Power and control wiring.
- C. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 1. Lighting fixtures.
 2. Suspended ceiling components.
 3. Structural members to which suspension systems for lighting fixtures will be attached.
 4. Other items in finished ceiling including the following:
 - a. Air outlets and inlets.
 - b. Speakers.
 - c. Sprinklers.
 - d. smoke and fire detectors.
 - e. Occupancy sensors.
 - f. Access panels.
 - g. Perimeter moldings.
- D. Samples for Verification: Interior lighting fixtures designated for sample submission in Interior Lighting Fixture Schedule. Each sample shall include the following:
 1. Lamps: Specified units installed.
 2. Accessories: Cords and plugs.
- E. Product Certificates: For each type of ballast for bi-level and dimmer-controlled fixtures, signed by product manufacturer.
- F. Qualification Data: For agencies providing photometric data for lighting fixtures.
- G. Field quality-control test reports.

- H. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.
- I. Warranties: Special warranties specified in this Section.
- J. LEED Submittal Requirements:
 - 1. For all field-applied adhesives, sealants, paints and coatings relating to work of this section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 01301 LEED Certification Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs./gallon.
 - 2. Provide back-up documentation to validate information provided on the VOC REPORTING forms. For each material listed on the Forms, provide documentation to certify each of the material VOC content.
 - 3. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
 - 4. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies

1.05 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
- B. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with NFPA 70.
- E. FMG Compliance: Lighting fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard by FMG.
- F. Mockups: Provide interior lighting fixtures for room or module mockups, complete with power and control connections.
 - 1. Obtain Architect's approval of fixtures for mockups before starting installations.

2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
3. Approved fixtures in mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.06 SPARE PARTS

- G. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Lamps: 10 for every 100 of each type and rating installed for HID and fluorescent lamps. 200 for every 100 of each type and rating for incandescent lamps. Furnish at least two of each type.
 2. Plastic Diffusers and Lenses: 1 for every 100 of each type and rating installed. Furnish at least one of each type.
 3. Battery and Charger Data: One for each emergency lighting unit.
 4. Ballasts: 5 for every 100 of each type and rating installed. Furnish at least two of each type.
 5. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

1.07 WARRANTY

- A. Special Warranty for Emergency Lighting Batteries: Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.
- B. Special Warranty for Ballasts: Manufacturer's standard form in which ballast manufacturer agrees to repair or replace ballasts that fail in materials or workmanship within specified warranty period.
1. Warranty Period for Electronic Ballasts: Five years from date of Substantial Completion.
 2. Warranty Period for Electromagnetic Ballasts: Three years from date of Substantial Completion.

1.08 SUMMARY

- A. This Section includes the following:
1. Interior lighting fixtures, lamps, and ballasts.
 2. Emergency lighting units.
 3. Exit Signs.
- B. Related Sections include the following:

1. 260923 - Lighting Control Devices for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
2. 260943.23 - Relay Based Lighting Controls for manual or programmable control systems with low-voltage control wiring or data communication circuits.
3. 262726 - Wiring Devices for manual wall-box dimmers for incandescent lamps.

1.09 DEFINITIONS

- A. BF: Ballast factor.
- B. CRI: Color-rendering index.
- C. CU: Coefficient of utilization.
- D. HID: High-intensity discharge.
- E. LER: Luminaire efficacy rating.
- F. Luminaire: Complete lighting fixture, including ballast housing if provided.
- G. RCR: Room cavity ratio.

1.10 LEED PERFORMANCE REQUIREMENTS

- H. All field-applied adhesives, sealants, paints and coatings relating to work of this section that are used on the interior of the building (defined as inside of the waterproofing system) shall meet the requirements DDC General Conditions.

PART 2 PRODUCTS

2.01 LIGHT FIXTURES

- A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.
- B. Incandescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5A.
- C. Fluorescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5 and NEMA LE 5A as applicable.
- D. HID Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5B.
- E. Metal Parts: Free of burrs and sharp corners and edges.
- F. Sheet Metal Components: Steel, unless otherwise indicated. Form and support to prevent warping and sagging.

- G. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- H. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:
 - 1. White Surfaces: 85 percent.
 - 2. Specular Surfaces: 83 percent.
 - 3. Diffusing Specular Surfaces: 75 percent.
 - 4. Laminated Silver Metallized Film: 90 percent.
- I. Plastic Diffusers, Covers, and Globes:
 - 1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 - a. Lens Thickness: At least 0.125 inch minimum unless different thickness is indicated.
 - b. UV stabilized.
 - 2. Glass: Annealed crystal glass, unless otherwise indicated.
- J. Electromagnetic-Interference Filters: Factory installed to suppress conducted electromagnetic-interference as required by MIL-STD-461E. Fabricate lighting fixtures with one filter on each ballast indicated to require a filter.
- K. Air-Handling Fluorescent Fixtures: For use with plenum ceiling for air return and heat extraction and for attaching an air-diffuser-boot assembly specified in Section "Diffusers, Registers, and Grilles."
 - 1. Air Supply Units: Slots in one or both side trims join with air-diffuser-boot assemblies.
 - 2. Heat Removal Units: Air path leads through lamp cavity.
 - 3. Combination Heat Removal and Air Supply Unit: Heat is removed through lamp cavity at both ends of the fixture door with air supply same as for air supply units.
 - 4. Dampers: Operable from outside fixture for control of return-air volume.
 - 5. Static Fixture: Air supply slots are blanked off, and fixture appearance matches active units.

2.02 LAMPS

- A. Lamps shall be by General Electric Company, Sylvania Company, Philips or approved equal.
- B. Low-Mercury Fluorescent Lamps: Comply with EPA's toxicity characteristic leaching procedure test; shall yield less than 0.2 mg of mercury per liter when tested according to NEMA LL 1.
- C. T8 rapid-start low-mercury fluorescent lamps, rated 32 W maximum, nominal length of 48 inches (1220 mm), 2800 initial lumens (minimum), CRI 75 (minimum), color temperature 3500 K, and average rated life 20,000 hours, unless otherwise indicated.

- D. T8 rapid-start low-mercury fluorescent lamps, rated 17 W maximum, nominal length of 24 inches (610 mm), 1300 initial lumens (minimum), CRI 75 (minimum), color temperature 3500 K, and average rated life of 20,000 hours, unless otherwise indicated.
- E. T5 rapid-start low-mercury lamps, rated 28 W maximum, nominal length of 45.2 inches (1150 mm), 2900 initial lumens (minimum), CRI 85 (minimum), color temperature 3500 K and average rated life of 20,000 hours, unless otherwise indicated.
- F. T5HO rapid-start, high-output low-mercury fluorescent lamps, rated 54 W maximum, nominal length of 45.2 inches (1150 mm), 5000 initial lumens (minimum), CRI 85 (minimum), color temperature 4100 K, and average rated life of 20,000 hours, unless otherwise indicated.
- G. Compact Fluorescent Lamps: 4-Pin, low mercury, CRI 80 (minimum), color temperature 3500 K, average rated life of 10,000 hours at 3 hours operation per start, and suitable for use with dimming ballasts, unless otherwise indicated.
 - 1. 13 W: T4, double or triple tube, rated 900 initial lumens (minimum).
 - 2. 18 W: T4, double or triple tube, rated 1200 initial lumens (minimum).
 - 3. 26 W: T4, double or triple tube, rated 1800 initial lumens (minimum).
 - 4. 32 W: T4, triple tube, rated 2400 initial lumens (minimum).
 - 5. 42 W: T4, triple tube, rated 3200 initial lumens (minimum).
 - 6. 55 W: T4, triple tube, rated 4300 initial lumens (minimum).
- H. Metal-Halide HID Lamps: ANSI C78.1372, with a minimum CRI 70, and color temperature 4000 K.
- I. Pulse-Start, Metal-Halide HID Lamps: Minimum CRI 70, and color temperature 4000 K.
- J. Ceramic, Pulse-Start, Metal-Halide HID Lamps: Minimum CRI 80, and color temperature 4000 K.

2.03 BALLASTS

- A. Fluorescent Ballasts:
 - 1. Electronic Ballasts: Comply with ANSI C82.11; programmed-start type, unless otherwise indicated, and designed for type and quantity of lamps served. Ballasts shall be designed for full light output unless dimmer or bi-level control is indicated.
 - 2. Sound Rating: A, except B for T12/HO and T12/Slimline lamp ballasts.
 - a. Total Harmonic Distortion Rating: Less than 10 percent.
 - b. Transient Voltage Protection: IEEE C62.41, Category A or better.
 - d. -Operating Frequency: 20 kHz or higher.
 - e. Lamp Current Crest Factor: 1.7 or less.
 - f. BF: 0.85 or higher.
 - g. Power Factor: 0.95 or higher.
 - h. Parallel Lamp Circuits: Multiple lamp ballasts shall comply with ANSI C 82.11 and shall be connected to maintain full light output on surviving lamps if one or more lamps fail.

3. Electronic Programmed-Start Ballasts for T5 and T5HO Lamps: Comply with ANSI C82.11 and the following:
 - a. Lamp end-of-life detection and shutdown circuit for T5 diameter lamps.
 - b. Automatic lamp starting after lamp replacement.
 - c. Sound Rating: A.
 - d. Total Harmonic Distortion Rating: Less than 20 percent.
 - e. Transient Voltage Protection: IEEE C62.41, Category A or better.
 - f. Operating Frequency: 20 kHz or higher.
 - g. Lamp Current Crest Factor: 1.7 or less.
 - h. BF: 0.95 or higher, unless otherwise indicated.
 - i. Power Factor: 0.95 or higher.
4. Electromagnetic Ballasts: Comply with ANSI C82.1; energy saving, high-power factor, Class P, and having automatic-reset thermal protection.
 - a. Ballast Manufacturer Certification: Indicated by label.
5. Ballasts for Low-Temperature Environments:
 - a. Temperatures 0 Deg F (Minus 17 Deg C) and Higher: Electronic or electromagnetic type rated for 0 deg F (minus 17 deg C) starting and operating temperature with indicated lamp types.
 - b. Temperatures Minus 20 Deg F (Minus 29 Deg C) and Higher: Electromagnetic type designed for use with indicated lamp types.
6. Ballasts for Low Electromagnetic-Interference Environments: Comply with 47 CFR, Chapter 1, Part 18, Subpart C, for limitations on electromagnetic and radio-frequency interference for consumer equipment.
7. Ballasts for Dimmer-Controlled Lighting Fixtures: Electronic type.
 - a. Dimming Range: 100 to 10 percent of rated lamp lumens.
 - b. Ballast Input Watts: Can be reduced to 20 percent of normal.
8. Ballasts for Bi-Level Controlled Lighting Fixtures: Electronic type.
 - a. Operating Modes: Ballast circuit and leads provide for remote control of the light output of the associated lamp between high- and low-level and off.
 - b. High-Level Operation: 100 percent of rated lamp lumens.
 - c. Low-Level Operation: 30 percent of rated lamp lumens.
 - d. Ballast shall provide equal current to each lamp in each operating mode.
 - e. Compatibility: Certified by manufacturer for use with specific bi-level control system and lamp type indicated.

B. High Intensity Discharge Ballasts:

1. Electromagnetic Ballast for Metal-Halide Lamps: Comply with ANSI C82.4 and UL 1029. Include the following features, unless otherwise indicated:

- a. Ballast Circuit: Constant-wattage autotransformer or regulating high-power-factor type.
 - b. Minimum Starting Temperature: Minus 22 deg F (Minus 30 deg C) for single-lamp ballasts.
 - c. Normal Ambient Operating Temperature: 104 deg F (40 deg C).
 - d. Open-circuit operation that will not reduce average life.
 - e. Low-Noise Ballasts: Manufacturers' standard epoxy-encapsulated models designed to minimize audible fixture noise.
2. Electronic Ballast for Metal-Halide Lamps: Include the following features unless otherwise indicated:
- a. Lamp end-of-life detection and shutdown circuit.
 - b. Sound Rating: A.
 - c. Total Harmonic Distortion Rating: Less than 15 percent.
 - d. Transient Voltage Protection: IEEE C62.41, Category A or better.
 - e. Lamp Current Crest Factor: 1.5 or less.
 - f. Power Factor: .90 or higher.
 - g. Interference: Comply with 47 CFR, Chapter 1, Part 18, Subpart C, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
 - h. Protection: Class P thermal cutout.
 - i. Retain subparagraph and associated subparagraphs below for bi-level ballasts.
 - j. Bi-Level Dimming Ballast: Ballast circuit and leads provide for remote control of the light output of the associated fixture between high- and low-level and off.
 - 1. High-Level Operation: 100 percent of rated lamp lumens.
 - 2. Low-Level Operation: 35 percent of rated lamp lumens.
 - 3. Compatibility: Certified by ballast manufacturer for use with specific bi-level control system and lamp type indicated. Certified by lamp manufacturer that ballast operating modes are free from negative effect on lamp life and color-rendering capability.
3. Auxiliary Instant-On Quartz System: Factory-installed feature automatically switches quartz lamp on when fixture is initially energized and when power outages occur. System automatically turns quartz lamp off when HID lamp reaches approximately 60 percent light output.
4. High-Pressure Sodium Ballasts: Electromagnetic type, with solid-state igniter/starter. Igniter-starter shall have an average life in pulsing mode of 10,000 hours at an igniter/starter-case temperature of 90 deg C.
- a. Instant-Restrike Device: Integral with ballast, or solid-state potted module, factory installed within fixture and compatible with lamps, ballasts, and mogul sockets up to 150 W.
 - 1. Restrike Range: 105- to 130-V ac.
 - 2. Maximum Voltage: 250-V peak or 150-V ac RMS.
 - b. Minimum Starting Temperature: Minus 40 deg F (Minus 40 deg C).
 - c. Open-circuit operation shall not reduce average lamp life.

5. Ballasts for Compact Fluorescent Lamps
6. Description: Electronic programmed rapid-start type, complying with ANSI C 82.11, designed for type and quantity of lamps indicated. Ballast shall be designed for full light output unless dimmer or bi-level control is indicated:
 - a. Lamp end-of-life detection and shutdown circuit.
 - b. Automatic lamp starting after lamp replacement.
 - c. Sound Rating: A.
 - d. Total Harmonic Distortion Rating: Less than 20 percent.
 - e. Transient Voltage Protection: IEEE C62.41, Category A or better.
 - f. Operating Frequency: 20 kHz or higher.
 - g. Lamp Current Crest Factor: 1.7 or less.
 - h. BF: 0.95 or higher, unless otherwise indicated.
 - i. Power Factor: 0.95 or higher.
 - j. Interference: Comply with 47 CFR, Chapter 1, Part 18, Subpart C, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
 - k. Ballast Case Temperature: 75 deg C, maximum.
7. Ballasts for Dimmer-Controlled Lighting Fixtures: Electronic type.
 - a. Dimming Range: 100 to 10 percent of rated lamp lumens.
 - b. Ballast Input Watts: Can be reduced to 20 percent of normal.
 - c. Compatibility: Certified by manufacturer for use with specific dimming control system and lamp type indicated.

2.04 EMERGENCY FLUORESCENT POWER UNIT

- A. Internal Type: Self-contained, modular, battery-inverter unit, factory mounted within lighting fixture body and compatible with ballast. Comply with UL 924.
 1. Emergency Connection: Operate 1 fluorescent lamp(s) continuously at an output of 1100 lumens each. Connect unswitched circuit to battery-inverter unit and switched circuit to fixture ballast.
 2. Night-Light Connection: Operate one fluorescent lamp continuously.
 3. Test Push Button and Indicator Light: Visible and accessible without opening fixture or entering ceiling space.
 - a. Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - b. Indicator Light: LED indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 4. Battery: Sealed, maintenance-free, nickel-cadmium type.
 5. Charger: Fully automatic, solid-state, constant-current type with sealed power transfer relay.
 6. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.

7. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.
- B. External Type: Self-contained, modular, battery-inverter unit, suitable for powering one or more fluorescent lamps, remote mounted from lighting fixture. Comply with UL 924.
1. Emergency Connection: Operate one fluorescent lamp continuously. Connect unswitched circuit to battery-inverter unit and switched circuit to fixture ballast.
 2. Battery: Sealed, maintenance-free, nickel-cadmium type.
 3. Charger: Fully automatic, solid-state, constant-current type.
 4. Housing: NEMA 250, Type 1 enclosure.
 5. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 6. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 7. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 8. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.

2.05 LED LUMINAIRES & LIGHT SOURCES

A. FINAL SELECTION OF LED LIGHT SOURCES

1. To account for the continual development of LED light source efficacy all luminaires equipped with LED are specified noting the lumen output required. The final selection of LED light source used within the specified fixture shall be made during the submittal phase of the project to ensure the project benefits from increases in efficiency that will occur between specification and submittal. For all LED products specified the Contractor shall submit the fixture specified with the current LED technology available within the specified fixture range at the time of submittal, ensuring that the required lumen output is achieved. If the specified fixture has been updated the revised fixture shall achieve a minimum light output ratio equal to the luminaire specified.

B. COLOR TOLERANCE

1. Unless otherwise specified, all LED light sources shall achieve a minimum color tolerance of at least 3-step ellipse, measured for both initial and at 25% of rated life. Colour tolerance beyond this is unacceptable.

C. COLOR RENDERING

1. Color rendering index (CRI) of all LED light sources shall achieve the minimum CRI specified initially and at 25% of rated life. No variation in CRI between initial and 25% rated life is acceptable.

D. LIFE

1. Lifetime testing of LED light sources shall be carried out in accordance with LM-80-08. All LED light sources shall achieve a minimum performance of L70, where rated life of the LED light source is defined as the time taken to reach 70% of the initial lumen output.

E. All LED light sources shall achieve a minimum lifetime of 50,000 hours at L70.

F. All LED light sources shall not exceed a failure fraction of 10% (F10) at rated life (L70).

G. LUMEN DEPRECIATION

Unless otherwise specified, all LED light sources shall provide a maximum lumen depreciation of 30% over the rated life of the product.

H. POWER FACTOR

LED drivers shall achieve a minimum power factor of 0.9.

I. LUMINAIRE TESTING

1. General. The following tests shall be undertaken for all LED products specified, including those identified as custom products. Confirmation that these tests have been carried out and passed is required during submittal.
2. Temperature cycling shock test. The non-energised LED luminaire shall be stored firstly at (minus) -20°C for 1 hour. The luminaire shall then be immediately moved into a cabinet having a temperature of (plus) +35 °C and stored for 1 hour. Five such cycles shall be carried out. At the end of the test the LED luminaire shall operate and remain alight for 15 min.
3. Supply voltage switching test. At test voltage the luminaire shall be switched on and off for 30 seconds. The cycling shall be repeated for a number equal to half the rated luminaire life in hours (example: 10K cycles if rated luminaire life is 20 000 hours). At the end of the test the LED luminaire shall operate and remain alight for 15 min.
4. Thermal endurance test. The LED luminaire shall be operated at nominal voltage and at an ambient temperature of (plus) +35°C for outdoor luminaires, (plus) +25°C for indoor luminaires and (plus) +35°C for recessed luminaires until a test period equal to 25 % of the rated luminaire life (with a maximum of 6 000 hours) has passed. At the end of this time, and after cooling down to room temperature, the luminaire shall remain alight for at least 15 min.

J. LED LIGHT SOURCE AND LUMINAIRE DATA

1. The following data for LED light sources shall be submitted for approval with all luminaires equipped with LED light sources:

K. Initial Luminaire Lumen Output at 1,000 hours (L1000).

L. Ra14 color rendering data, in addition to the general color rendering index Ra. Provide initial and data at 25% of rated life.

- M. Color tolerance data, initial and at 25% of rated life, including the chromaticity coordinates of the bin.
- N. Rated power of the luminaire including driver.
- O. Power factor of the luminaire including driver, initial and at 25% of rated life.
- P. Absolute photometry report in accordance with LM-79-08.
- Q. LED light source test reports in accordance with LM-80-08.

2.06 RECEPTACLES AND SWITCHES

- A. Switches:
 - 1. Switches shall be by Hubbel Incorporated, Arrow-Hart Incorporated or approved equal. Hazardous located receptacles shall be by Crouse-Hinds Company, Appleton Electric Company, Lutron, Crestron or approved equal.
- B. Plates and Covers:
 - 1. Plates shall be by Hubbel Incorporated, Arrow-Hart Incorporated or approved equal. Covers shall be by Crouse-Hinds Company, Appleton Electric Company, Lutron, Crestron or approved equal.

2.07 MANUFACTURERS

- A. In Interior Lighting Fixture Schedule where titles below are column or row headings that introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 - 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
 - 3. Basis-of-Design Product: The design for each lighting fixture is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified.

2.08 EXIT SIGNS

- A. Description: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Signs:
 - 1. Lamps for AC Operation: LEDs, 70,000 hours minimum rated lamp life.
 - 2. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.
 - a. Battery: Sealed, maintenance-free, nickel-cadmium type.

- b. Charger: Fully automatic, solid-state type with sealed transfer relay.
- c. Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
- d. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
- e. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
- f. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
- g. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.

C. Master/Remote Sign Configurations:

- 1. Master Unit: Comply with requirements above for self-powered exit signs, and provide additional capacity in LED power supply for power connection to remote unit.
- 2. Remote Unit: Comply with requirements above for self-powered exit signs, except omit power supply, battery and test features. Arrange to receive full power requirements from master unit. Connect for testing concurrently with master unit as a unified system.

2.09 EMERGENCY LIGHTING UNITS

A. Description: Self-contained units complying with UL 924.

- 1. Battery: Sealed, maintenance-free, lead-acid type.
- 2. Charger: Fully automatic, solid-state type with sealed transfer relay.
- 3. Operation: Relay automatically turns lamp on when power supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
- 4. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
- 5. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
- 6. Integral Time-Delay Relay: Holds unit on for fixed interval of 15 minutes when power is restored after an outage.
- 7. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
- 8. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.

2.10 REQUIREMENTS FOR INDIVIDUAL LIGHTING FIXTURES

- A. Fixture Type: See Architectural Drawings.

PART 3 EXECUTION

3.01 INSTALLATION OF LUMINAIRES

- A. Lighting fixtures: Set level, plumb, and square with ceilings and walls. Install lamps in each fixture.
- B. Support for Lighting Fixtures in or on Grid-Type Suspended Ceilings: Use grid as a support element.
 - 1. Install a minimum of four ceiling support system rods or wires for each fixture. Locate not more than 6 inches (150 mm) from lighting fixture corners.
 - 2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
 - 3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch (20-mm) metal channels spanning and secured to ceiling tees.
- C. Suspended Lighting Fixture Support:
 - 1. Pendants and Rods: Where longer than 48 inches (1200 mm), brace to limit swinging.
 - 2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
 - 3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
- D. Air-Handling Lighting Fixtures: Install with dampers closed and ready for adjustment.
- E. Adjust aimable lighting fixtures to provide required light intensities.
- F. Connect wiring according to Section "Low-Voltage Electrical Power Conductors and Cables."

3.02 FIELD QUALITY CONTROL

- A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.
- B. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

END OF SECTION 265100

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 283111

DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

A. Section Includes:

1. Fire-alarm control unit.
2. Manual fire-alarm boxes.
3. System smoke detectors.
4. Nonsystem smoke detectors.
5. Heat detectors.
6. Notification appliances.
7. Firefighters' two-way telephone communication service.
8. Magnetic door holders.
9. Remote annunciator.
10. Addressable interface device.
11. Data Gathering Panel
12. Digital alarm communicator transmitter.
13. Radio alarm transmitter.
14. System printer.

1.3 DEFINITIONS

- A. AHJ: Authorities having jurisdiction
- B. EMT: Electrical Metallic Tubing
- C. FACP: Fire Alarm Control Panel
- D. DGP: Data Gathering Panel
- E. HLI: High Level Interface
- F. LED: Light-emitting diode.
- G. NICET: National Institute for Certification in Engineering Technologies.

1.4 SYSTEM DESCRIPTION

- A. Noncoded, UL-certified addressable system, with multiplexed signal transmission, dedicated to fire-alarm service only.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For fire-alarm system. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Comply with recommendations in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA 72.
 - 2. Include voltage drop calculations for notification appliance circuits.
 - 3. Include battery-size calculations.
 - 4. Include performance parameters and installation details for each detector, verifying that each detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.
 - 5. Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale and coordinating installation of duct smoke detectors and access to them. Show critical dimensions that relate to placement and support of sampling tubes, detector housing, and remote status and alarm indicators. Locate detectors according to manufacturer's written recommendations.
 - 6. Include voice/alarm signaling-service equipment rack or console layout, grounding schematic, amplifier power calculation, and single-line connection diagram.
 - 7. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits.
- C. General Submittal Requirements:
 - 1. Submittals shall be approved by authorities having jurisdiction prior to submitting them to Commissioner.
 - 2. Shop Drawings shall be prepared by persons with the following qualifications:
 - a. Trained and certified by manufacturer in fire-alarm system design.
 - b. NICET-certified fire-alarm technician, Level IV minimum.
 - c. Licensed or certified by authorities having jurisdiction.
- D. Engineering Services Submittal: For smoke and heat detectors indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 1. Drawings showing the location of each smoke and heat detector, ratings of each, and installation details as needed to comply with listing conditions of the detector.
 - 2. Design Calculations: Calculate requirements for selecting the spacing and sensitivity of detection, complying with NFPA 72. Provide additional detector as required per design intent for coverage.

1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Seismic Qualification Certificates: For fire-alarm control unit, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control reports.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals.
 - 1. Comply with the "Records" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
 - 2. Provide "Record of Completion Documents" according to NFPA 72 article "Permanent Records" in the "Records" Section of the "Inspection, Testing and Maintenance" Chapter.
 - 3. Record copy of site-specific software.
 - 4. Provide "Maintenance, Inspection and Testing Records" according to NFPA 72 article of the same name and include the following:
 - a. Frequency of testing of installed components.
 - b. Frequency of inspection of installed components.
 - c. Requirements and recommendations related to results of maintenance.
 - d. Manufacturer's user training manuals.
 - 5. Manufacturer's required maintenance related to system warranty requirements.
 - 6. Abbreviated operating instructions for mounting at fire-alarm control unit.
- B. Software and Firmware Operational Documentation:
 - 1. Software operating and upgrade manuals.
 - 2. Program Software Backup: On magnetic media or compact disk, complete with data files.
 - 3. Device address list.
 - 4. Printout of software application and graphic screens.

1.8 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Lamps for Remote Indicating Lamp Units: Quantity equal to 10 percent of amount installed, but no fewer than 1 unit.
 - 2. Lamps for Strobe Units: Quantity equal to 10 percent of amount installed, but no fewer than 1 unit.
 - 3. Smoke Detectors, Fire Detectors: Quantity equal to 10 percent of amount of each type installed, but no fewer than 1 unit of each type.
 - 4. Detector Bases: Quantity equal to 2 percent of amount of each type installed, but no fewer than 1 unit of each type.
 - 5. Keys and Tools: One extra set for access to locked and tamperproofed components.
 - 6. Audible and Visual Notification Appliances: One of each type installed.
 - 7. Fuses: Two of each type installed in the system.

1.9 QUALITY ASSURANCE

- A. Installer Qualifications: Personnel shall be trained by manufacturer for installation of units required for this Project.
- B. Installer Qualifications: Installation shall be by personnel certified by NICET as fire-alarm technician.
- C. Source Limitations for Fire-Alarm System and Components: Obtain fire-alarm system from single source from single manufacturer. Components shall be compatible with, and operate as, an extension of existing system.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. NFPA Certification: Obtain certification according to NFPA 72 by an NRTL.
- F. NFPA Certification: Obtain certification according to NFPA 72 by a UL-listed alarm company.
- G. NFPA Certification: Obtain certification according to NFPA 72 in the form of a placard by an FMG-approved alarm company.
- H. NFPA Certification: Obtain certification according to NFPA 72 by.

1.10 PROJECT CONDITIONS

- A. Interruption of Existing Fire-Alarm Service: Do not interrupt fire-alarm service to facilities occupied by City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary guard service according to requirements indicated:

1. Notify Commissioner Construction Manager City of New York no fewer than two days in advance of proposed interruption of fire-alarm service.
2. Do not proceed with interruption of fire-alarm service without Construction Manager's City of New York's written permission.

1.11 SEQUENCING AND SCHEDULING

- A. Existing Fire-Alarm Equipment: Maintain existing equipment fully operational until new equipment has been tested and accepted. As new equipment is installed, label it "NOT IN SERVICE" until it is accepted. Remove labels from new equipment when put into service and label existing fire-alarm equipment "NOT IN SERVICE" until removed from the building.
- B. Equipment Removal: After acceptance of new fire-alarm system, remove existing disconnected fire-alarm equipment and wiring.

1.12 SOFTWARE SERVICE AGREEMENT

- A. Comply with UL 864.
- B. Technical Support: Beginning with Substantial Completion, provide software support for one year.
- C. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.
 1. Provide 30 days' notice to City of New York to allow scheduling and access to system and to allow City of New York to upgrade computer equipment if necessary.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Faraday; Siemens Building Technologies, Inc.
 2. Fire Control Instruments, Inc.; a Honeywell company.
 3. Fire Lite Alarms; a Honeywell company.
 4. GAMEWELL; a Honeywell company.
 5. GE Infrastructure; a unit of General Electric Company.
 6. Gentex Corporation.
 7. Harrington Signal, Inc.
 8. NOTIFIER; a Honeywell company.
 9. Siemens Building Technologies, Inc.; Fire Safety Division.
 10. Silent Knight; a Honeywell company.

11. SimplexGrinnell LP; a Tyco International company.

2.2 SYSTEMS OPERATIONAL DESCRIPTION

A. Fire-alarm signal initiation shall be by one or more of the following devices:

1. Manual stations.
2. Heat detectors.
3. Smoke detectors.
4. Duct smoke detectors.
5. Verified automatic alarm operation of smoke detectors.
6. Automatic sprinkler system water flow.
7. Heat detectors in elevator shaft and pit.
8. Fire-extinguishing system operation.
9. Fire standpipe system.
10. Fire Pump running.

B. Fire-alarm signal shall initiate the following actions:

1. Continuously operate alarm notification appliances.
2. Identify alarm at fire-alarm control unit and remote annunciators.
3. Transmit an alarm signal to the remote alarm receiving station.
4. Unlock electric door locks in designated egress paths.
5. Release fire and smoke doors held open by magnetic door holders.
6. Activate voice/alarm communication system.
7. Switch heating, ventilating, and air-conditioning equipment controls to fire-alarm mode.
8. Activate smoke-control system (smoke management) at firefighter smoke-control system panel.
9. Activate stairwell and elevator-shaft pressurization systems.
10. Close smoke dampers in air ducts of designated air-conditioning duct systems.
11. Recall elevators to primary or alternate recall floors.
12. Activate emergency lighting control.
13. Activate emergency shutoffs for gas and fuel supplies.
14. Record events in the system memory.
15. Record events by the system printer.

C. Supervisory signal initiation shall be by one or more of the following devices and actions:

1. Valve supervisory switch.
2. Low-air-pressure switch of a dry-pipe sprinkler system.
3. Elevator shunt-trip supervision.

D. System trouble signal initiation shall be by one or more of the following devices and actions:

1. Open circuits, shorts, and grounds in designated circuits.
2. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
3. Loss of primary power at fire-alarm control unit.
4. Ground or a single break in fire-alarm control unit internal circuits.

5. Abnormal ac voltage at fire-alarm control unit.
6. Break in standby battery circuitry.
7. Failure of battery charging.
8. Abnormal position of any switch at fire-alarm control unit or annunciator.
9. Fire-pump power failure, including a dead-phase or phase-reversal condition.
10. Low-air-pressure switch operation on a dry-pipe or preaction sprinkler system.

E. System Trouble and Supervisory Signal Actions: Initiate notification appliance and annunciate at fire-alarm control unit and remote annunciators. Record the event on system printer.

2.3 FIRE-ALARM CONTROL UNIT

A. General Requirements for Fire-Alarm Control Unit:

1. Field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864 and listed and labeled by an NRTL.
 - a. System software and programs shall be held in flash electrically erasable programmable read-only memory (EEPROM), retaining the information through failure of primary and secondary power supplies.
 - b. Include a real-time clock for time annotation of events on the event recorder and printer.
2. Addressable initiation devices that communicate device identity and status.
 - a. Smoke sensors shall additionally communicate sensitivity setting and allow for adjustment of sensitivity at fire-alarm control unit.
 - b. Temperature sensors shall additionally test for and communicate the sensitivity range of the device.
3. Addressable control circuits for operation of mechanical equipment.

B. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire-alarm control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.

1. Annunciator and Display: Liquid-crystal type, 3 line(s) of 80 characters, minimum.
2. Keypad: Arranged to permit entry and execution of programming, display, and control commands and to indicate control commands to be entered into the system for control of smoke-detector sensitivity and other parameters.

C. Circuits:

1. Initiating Device, Notification Appliance, and Signaling Line Circuits: NFPA 72, Class B.
 - a. Initiating Device Circuits: Style B.
 - b. Notification Appliance Circuits: Style Z.

- c. Signaling Line Circuits: Style 4.
 - d. Install no more than 50 addressable devices on each signaling line circuit.
 2. Serial Interfaces: Two RS-232 ports for printers.
- D. Smoke-Alarm Verification:
 1. Initiate audible and visible indication of an "alarm-verification" signal at fire-alarm control unit.
 2. Activate an NRTL-listed and -approved "alarm-verification" sequence at fire-alarm control unit and detector.
 3. Record events by the system printer.
 4. Sound general alarm if the alarm is verified.
 5. Cancel fire-alarm control unit indication and system reset if the alarm is not verified.
- E. Notification Appliance Circuit: Operation shall sound in a temporal 3 pattern.
- F. Elevator Recall:
 1. Smoke detectors at the following locations shall initiate automatic elevator recall. Alarm-initiating devices, except those listed, shall not start elevator recall.
 - a. Elevator lobby detectors except the lobby detector on the designated floor.
 - b. Smoke detector in elevator machine room.
 - c. Smoke detectors in elevator hoistway.
 2. Elevator lobby detectors located on the designated recall floors shall be programmed to move the cars to the alternate recall floor.
 3. Water-flow alarm connected to sprinkler in an elevator shaft and elevator machine room shall shut down elevators associated with the location without time delay.
 - a. Water-flow switch associated with the sprinkler in the elevator pit may have a delay to allow elevators to move to the designated floor.
- G. Remote Smoke-Detector Sensitivity Adjustment: Controls shall select specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and change those settings. Allow controls to be used to program repetitive, time-scheduled, and automated changes in sensitivity of specific detector groups. Record sensitivity adjustments and sensitivity-adjustment schedule changes in system memory, and print out the final adjusted values on system printer.
- H. Transmission to Remote Alarm Receiving Station: Automatically transmit alarm, supervisory, and trouble signals to a remote alarm station.
- I. Printout of Events: On receipt of signal, print alarm, supervisory, and trouble events. Identify zone, device, and function. Include type of signal (alarm, supervisory, or trouble) and date and time of occurrence. Differentiate alarm signals from all other printed indications. Also print system reset event, including same information for device, location, date, and time. Commands initiate the printing of a list of existing alarm, supervisory, and trouble conditions in the system and a historical log of events.

- J. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory signals supervisory and digital alarm communicator transmitters shall be powered by 24-V dc source.
 - 1. Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.
- K. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.
 - 1. Batteries: Sealed, valve-regulated, recombinant lead acid.
- L. Instructions: Computer printout or typewritten instruction card mounted behind a plastic or glass cover in a stainless-steel or aluminum frame. Include interpretation and describe appropriate response for displays and signals. Briefly describe the functional operation of the system under normal, alarm, and trouble conditions.

2.4 DATA GATHERING PANELS

- A. DGP: Transponder with field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864 and listed and labeled by an NRTL. Networked communication with FACP with ability to function as stand-alone panel upon loss of communication. Transmits and receives alarm, supervisory, and trouble signals to and from the FACP.
- B. Initiating Device Circuit: Functions for monitoring of addressable initiation devices equal to that of FACP.
- C. Notification Appliance Circuit: Functions for notification appliances, control relays, etc. equal to that of FACP.
- D. Printer: Includes printer port and capable to generate printout for all incident on entire fire alarm system, equal to that of FACP.
- E. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory signals shall be powered by 24-V dc source. Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.
- F. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.

2.5 MANUAL FIRE-ALARM BOXES

- A. General Requirements for Manual Fire-Alarm Boxes: Comply with UL 38. Boxes shall be finished in red with molded, raised-letter operating instructions in contrasting color; shall show visible indication of operation; and shall be mounted on recessed outlet box. If indicated as surface mounted, provide manufacturer's surface back box.

1. Single-action mechanism, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.
2. Double-action mechanism requiring two actions to initiate an alarm, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.
3. Station Reset: Key- or wrench-operated switch.
4. Indoor Protective Shield: Factory-fabricated clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm. Lifting the cover actuates an integral battery-powered audible horn intended to discourage false-alarm operation.
5. Weatherproof Protective Shield: Factory-fabricated clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm.

2.6 SYSTEM SMOKE DETECTORS

A. General Requirements for System Smoke Detectors:

1. Comply with UL 268; operating at 24-V dc, nominal.
2. Detectors shall be two-wire type.
3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
4. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
6. Integral Visual-Indicating Light: LED type indicating detector has operated and power-on status.
7. Remote Control: Unless otherwise indicated, detectors shall be analog-addressable type, individually monitored at fire-alarm control unit for calibration, sensitivity, and alarm condition and individually adjustable for sensitivity by fire-alarm control unit.
 - a. Rate-of-rise temperature characteristic shall be selectable at fire-alarm control unit for 15 or 20 deg F per minute.
 - b. Fixed-temperature sensing shall be independent of rate-of-rise sensing and shall be settable at fire-alarm control unit to operate at 135 or 155 deg F.
 - c. Provide multiple levels of detection sensitivity for each sensor.

B. Photoelectric Smoke Detectors:

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).

C. Ionization Smoke Detector:

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).

D. Duct Smoke Detectors: Photoelectric type complying with UL 268A.

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).
3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector.
4. Each sensor shall have multiple levels of detection sensitivity.
5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
6. Relay Fan Shutdown: Rated to interrupt fan motor-control circuit.

2.7 NOTIFICATION APPLIANCES

- A. General Requirements for Notification Appliances: Individually addressed, connected to a signaling line circuit, equipped for mounting as indicated and with screw terminals for system connections.
- B. General Requirements for Notification Appliances: Connected to notification appliance signal circuits, zoned as indicated, equipped for mounting as indicated and with screw terminals for system connections.
 1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated and with screw terminals for system connections.
- C. Chimes, Low-Level Output: Vibrating type, 75-dBA minimum rated output.

- D. Chimes, High-Level Output: Vibrating type, 81-dBA minimum rated output.
- E. Horns: Electric-vibrating-polarized type, 24-V dc; with provision for housing the operating mechanism behind a grille. Comply with UL 464. Horns shall produce a sound-pressure level of 90 dBA, measured 10 feet from the horn, using the coded signal prescribed in UL 464 test protocol.
- F. Visible Notification Appliances: Xenon strobe lights comply with UL 1971, with clear or nominal white polycarbonate lens mounted on an aluminum faceplate. The word "FIRE" is engraved in minimum 1-inch- high letters on the lens.
 - 1. Rated Light Output:
 - a. 15/30/75/110 cd, selectable in the field.
 - 2. Mounting: Wall mounted unless otherwise indicated.
 - 3. For units with guards to prevent physical damage, light output ratings shall be determined with guards in place.
 - 4. Flashing shall be in a temporal pattern, synchronized with other units.
 - 5. Strobe Leads: Factory connected to screw terminals.
 - 6. Mounting Faceplate: Factory finished, white.
- G. Voice/Tone Notification Appliances:
 - 1. Appliances shall comply with UL 1480 and shall be listed and labeled by an NRTL.
 - 2. High-Range Units: Rated 2 to 15 W.
 - 3. Low-Range Units: Rated 1 to 2 W.
 - 4. Mounting: Flush.
 - 5. Matching Transformers: Tap range matched to acoustical environment of speaker location.

2.8 MAGNETIC DOOR HOLDERS

- A. Description: Units are equipped for wall or floor mounting as indicated and are complete with matching doorplate.
 - 1. Electromagnet: Requires no more than 3 W to develop 25-lbf holding force.
 - 2. Wall-Mounted Units: Flush mounted unless otherwise indicated.
 - 3. Rating: 24-V ac or dc.
 - 4. Rating: 120-V ac.
- B. Material and Finish: Match door hardware.

2.9 REMOTE ANNUNCIATOR

- A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit, including acknowledging, silencing, resetting, and testing.

1. Mounting: Flush cabinet, NEMA 250, Type 1.
- B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

2.10 ADDRESSABLE INTERFACE DEVICE

- A. Description: Microelectronic monitor module, NRTL listed for use in providing a system address for alarm-initiating devices for wired applications with normally open contacts.
- B. Integral Relay: Capable of providing signals for fire safety functions..

2.11 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632 and be listed and labeled by an NRTL.
- B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture two telephone line(s) and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on either line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.
- C. Local functions and display at the digital alarm communicator transmitter shall include the following:
 1. Verification that both telephone lines are available.
 2. Programming device.
 3. LED display.
 4. Manual test report function and manual transmission clear indication.
 5. Communications failure with the central station or fire-alarm control unit.
- D. Digital data transmission shall include the following:
 1. Address of the alarm-initiating device.
 2. Zone of the supervisory signal.
 3. Zone of the trouble-initiating device.
 4. Loss of ac supply or loss of power.
 5. Low battery.
 6. Abnormal test signal.
 7. Communication bus failure.
- E. Secondary Power: Integral rechargeable battery and automatic charger.

- F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

2.12 SYSTEM PRINTER

- A. Printer shall be listed and labeled by an NRTL as an integral part of fire-alarm system.

2.13 DEVICE GUARDS

- A. Description: Welded wire mesh of size and shape for the manual station, smoke detector, gong, or other device requiring protection.
 1. Factory fabricated and furnished by manufacturer of device.
 2. Finish: Paint of color to match the protected device.

PART 3 - EXECUTION

3.1 EQUIPMENT INSTALLATION

- A. Comply with NFPA 72 for installation of fire-alarm equipment.
- B. Equipment Mounting: Install fire-alarm control unit on concrete base with tops of cabinets not more than 72 inches above the finished floor.
 1. Install seismic bracing. Comply with requirements in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
 2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 5. Install anchor bolts to elevations required for proper attachment to supported equipment.
- C. Equipment Mounting: Install fire-alarm control unit on finished floor with tops of cabinets not more than 72 inches above the finished floor.
 1. Comply with requirements for seismic-restraint devices specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- D. Install wall-mounted equipment, with tops of cabinets not more than 72 inches above the finished floor.
 1. Comply with requirements for seismic-restraint devices specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- E. Smoke- or Heat-Detector Spacing:

1. Comply with NFPA 72, "Smoke-Sensing Fire Detectors" Section in the "Initiating Devices" Chapter, for smoke-detector spacing.
 2. Comply with NFPA 72, "Heat-Sensing Fire Detectors" Section in the "Initiating Devices" Chapter, for heat-detector spacing.
 3. Smooth ceiling spacing shall not exceed 30 feet.
 4. Spacing of detectors for irregular areas, for irregular ceiling construction, and for high ceiling areas shall be determined according to Appendix A or Appendix B in NFPA 72.
 5. HVAC: Locate detectors not closer than 5 feet from air-supply diffuser or return-air opening.
 6. Lighting Fixtures: Locate detectors not closer than 12 inches from any part of a lighting fixture.
- F. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct.
- G. Heat Detectors in Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location.
- H. Single-Station Smoke Detectors: Where more than one smoke alarm is installed within a dwelling or suite, they shall be connected so that the operation of any smoke alarm causes the alarm in all smoke alarms to sound.
- I. Remote Status and Alarm Indicators: Install near each smoke detector and each sprinkler water-flow switch and valve-tamper switch that is not readily visible from normal viewing position.
- J. Audible Alarm-Indicating Devices: Install not less than 6 inches below the ceiling. Install bells and horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille.
- K. Visible Alarm-Indicating Devices: Install adjacent to each alarm bell or alarm horn and at least 6 inches below the ceiling.
- L. Device Location-Indicating Lights: Locate in public space near the device they monitor.
- M. Fire-Alarm Control Unit: Surface mounted, with tops of cabinets not more than 72 inches above the finished floor.
- N. Annunciator: Install with top of panel not more than 72 inches above the finished floor.

3.2 CONNECTIONS

- A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Section 087100 "Door Hardware." Connect hardware and devices to fire-alarm system.
1. Verify that hardware and devices are NRTL listed for use with fire-alarm system in this Section before making connections.

- B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 3 feet from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.
 - 1. Alarm-initiating connection to smoke-control system (smoke management) at firefighter smoke-control system panel.
 - 2. Alarm-initiating connection to stairwell and elevator-shaft pressurization systems.
 - 3. Smoke dampers in air ducts of designated air-conditioning duct systems.
 - 4. Alarm-initiating connection to elevator recall system and components.
 - 5. Alarm-initiating connection to activate emergency lighting control.
 - 6. Alarm-initiating connection to activate emergency shutoffs for gas and fuel supplies.
 - 7. Supervisory connections at valve supervisory switches.
 - 8. Supervisory connections at low-air-pressure switch of each dry-pipe sprinkler system.
 - 9. Supervisory connections at elevator shunt trip breaker.
 - 10. Supervisory connections at fire-pump power failure including a dead-phase or phase-reversal condition.
 - 11. Supervisory connections at fire-pump engine control panel.

3.3 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Install framed instructions in a location visible from fire-alarm control unit.

3.4 GROUNDING

- A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.

3.5 FIELD QUALITY CONTROL

- A. Field tests shall be witnessed by authorities having jurisdiction.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Tests and Inspections:
 - 1. Visual Inspection: Conduct visual inspection prior to testing.
 - a. Inspection shall be based on completed Record Drawings and system documentation that is required by NFPA 72 in its "Completion Documents,

Preparation" Table in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter.

- b. Comply with "Visual Inspection Frequencies" Table in the "Inspection" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.
2. System Testing: Comply with "Test Methods" Table in the "Testing" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
 3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
 4. Test audible appliances for the private operating mode according to manufacturer's written instructions.
 5. Test visible appliances for the public operating mode according to manufacturer's written instructions.
 6. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
- D. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
- E. Fire-alarm system will be considered defective if it does not pass tests and inspections.
- F. Prepare test and inspection reports.
- G. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.
- H. Annual Test and Inspection: One year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct City of New York's maintenance personnel to adjust, operate, and maintain fire-alarm system.

END OF SECTION 283111

This Page Intentionally Left Blank

SECTION 311000

SITE CLEARING

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. The Removal of Designated Trees.
 - 2. The Protection and Trimming of Existing Trees to Remain.
 - 3. The Pruning and Removal of Dead Wood from Existing Trees to Remain.

1.3 RELATED SECTIONS

- A. Sustainability Requirements – Section 013010
- B. Exterior Plantings – Section 329300
- C. Plantings for Wetland Areas – Section 327200
- D. Soil Mixes for Wetland Areas – Section 327500
- E. Planting Soil Mixes - Section 329113

1.4 REFERENCES

- A. ISA-International Society of Arboriculture
- B. ANSI A300 (Part 1), “Tree, Shrub, and Other Woody Plant Maintenance—Standard Practices (Pruning).”

1.5 DEFINITIONS

- A. Clearing: Clearing is the removal from the ground surface and disposal, within the designated areas, of trees, brush, shrubs, down timber, decayed wood, other vegetation, rubbish, trash, scrap, metal, debris and miscellaneous other structures not covered under other Sections as shown on the Contract Drawings, specified or otherwise required to permit construction of the new Work.

- B. Grubbing: Grubbing is the removal and disposal of all stumps, buried logs, roots larger than 2 inches, matted roots and organic materials.
- C. Tree Protection Zone: Area surrounding individual trees or groups of trees to remain during construction, and defined by the drip line of individual trees or the perimeter drip line of groups of trees, unless otherwise indicated.

1.6 QUALITY ASSURANCE

- A. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- B. Codes and Standards: State and local laws and code requirements shall govern the hauling and disposal of trees, shrubs, stumps, roots, rubbish, debris and other matter.
- C. Tree Service Firm Qualifications: An experience tree service firm that has successfully completed tree removal work, tree protection and trimming work similar to that required for this Project and that will assign an experienced, qualified arborist to the Project site during execution of the designated tree removal, tree protection and trimming work.
- D. Arborist Qualifications: An arborist certified by ISA or licensed in the jurisdiction where Project is located.
- E. Tree Pruning Standard: Comply with ANSI A300 (Part 1), "Tree, Shrub, and Other Woody Plant Maintenance—Standard Practices (Pruning)."
 - 1. Before tree protection and trimming operations begin, meet with representatives of authorities having jurisdiction, the Commissioner, the Construction Manager, and other concerned entities to review tree protection and trimming procedures and responsibilities.

1.7 SUBMITTALS

- A. Tree Pruning Schedule: Written schedule from arborist detailing scope and extent of pruning of trees to remain that interfere with or are affected by construction.
- B. Qualification Data: For tree service firm and arborist.
- C. Certification: From arborist, certifying that trees indicated to remain have been protected during construction according to recognized standards and that trees were promptly and properly treated and repaired when damaged.
- D. Maintenance Recommendations: From arborist, for care and protection of trees affected by construction during and after completing Work.
- E. LEED Submittals Requirements

1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post –industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as a basis for rejecting the submitted products or assemblies.

1.8 PROJECT/SITE CONDITIONS

- A. Street, roads, adjacent property and other works and structures shall be protected throught the entire project. Contractor shall return to original condition, satisfactory to the Commissioner, facilities damaged by the Contractor's operations.

1.9 GUARANTEE

- A. The Contractor shall guarantee that work performed under this Section will not permanently damage trees, shrubs, turf or plants designated to remain, or other adjacent work or facilities. If damage resulting from Contractor's operations appears during the period up to 12 months after completion of the project, the Contractor shall replace damaged items at no expense to the City.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 TREES AND SHRUBS TO BE SAVED

- A. Protection: The Contractor shall protect from defacement, injury and destruction all trees and shrubs within the construction site that are so delineated or are marked in the field to be saved. Trees, shrubs and grassed areas which are to remain shall be protected by fences, barricades, wrapping or other methods as shown on the Contract Drawings, specified or approved by the City of New York and the Commissioner.
1. Within the limits of the tree drip line, work shall be performed with extreme care using either hand tools or equipment that will not cause damage to the trees.
 - a. Do not disturb or cut roots unnecessarily. Do not cut roots 2 inches and larger unless approved by the Arborist and/or the Commissioner.
 - b. Immediately backfill around tree roots after completion of construction in the vicinity of trees.
 - c. Do not operate any wheeled or tracked equipment within drip line.
 2. Vegetation shall be protected from damage caused by emissions from engine-powered equipment.
 3. During working operations, the trunk, foliage and root system of all trees to be saved shall be protected with boards or other guards placed as shown on the Contract Drawings and as required to prevent damage, injury and defacement.
 - a. Excavated materials shall not be piled within the drip line or adjacent to the trunks of the trees. Equipment, stockpiles, and etc., shall not be permitted within the drip line.
 - b. Do not allow runoff to accumulate around trunks of trees.
 - c. Ropes, cable, or guy wires shall not be fastened or attached to trees without permission. When such permission is granted, protect the tree before making fastening or attachments by providing burlap wrapping and softwood cleats.
 - d. The use of axes or climbing spurs for trimming will not be permitted.
 - e. Provide climbing ropes during trimming.
 4. Shrubs to be saved shall be removed by taking a sufficient earth ball with roots to maintain the shrub.

- a. Temporarily replant, if required, and replace at the completion of construction in a condition equaling that which existing prior to removal.
 - b. Replace in kind if the transplant fails. Provide transplanting, planting, and watering and guarantee as specified in Specification Section 329200 Exterior Plantings.
5. Any tree and shrub repair shall be performed by a tree surgeon and/or arborist properly licensed by the State of New York and within 24 hours after damage occurred. Treat damaged trunks, limbs, and roots according to the tree surgeon and/or arborist's written instructions.
 6. Trees and shrubs intended to remain which are removed, die or damaged beyond repair and are determined by the Commissioner as incapable of restoring to normal growth pattern, shall be replaced by the Contractor.

3.2 TREES AND SHRUBS TO BE REMOVED

A. Tree Removal within Property Limits:

1. Trees and shrubs shall only be removed at the direction of the City of New York. Roots, stumps, and other items to be removed shall become the property of the Contractor and removed from the Site.
2. All designated trees, including the root to a depth of three (3) feet below the surface, and shrubs within the construction limit lines shall be removed unless otherwise indicated.
3. The Contractor shall carefully protect against damage all existing trees, shrubs, plants and other features to remain. He shall be liable for any damage to such trees, shrubs, plants, park features and other property caused by tree removal operations and all damaged property shall be replaced or restored to its original condition to the satisfaction of the Commissioner.
4. Do not cut or damage trees or shrubs outside of the Contract limit lines. Damage outside the Contract limit lines caused by the Contractor's operations shall be corrected at the Contractor's expense.

B. The stumps and roots of these trees shall be removed to a depth of three (3) feet below the ground surface except in areas of fill greater than three (3) feet, where such trees may be cut flush with the ground surface. All voids and excavations left after removal of the tree and roots shall be backfilled to grade with clean earth fill. The fill shall be placed and compacted by acceptable methods to the satisfaction of the Commissioner. Chips generated by root removal operations shall be removed prior to backfilling.

C. Cutting of trees shall be done by competent workmen only and in a workmanlike manner. All trees shall be "topped" and "limbed" previous to felling unless otherwise directed by the Commissioner. All branches, limbs, trunks, stumps, roots and other

debris shall be removed from the site or otherwise disposed of to the satisfaction of the Commissioner.

- D. No trees are to be removed except as designated by the Commissioner.
- E. Tree Removal outside Property Limits: The Contractor shall not cut or damage trees outside the property limits unless shown on the Contract Drawings to be removed or unless written permission before removal operations commence. Damage outside the property limits caused by the Contractor's operations shall be corrected at the Contractor's expense.
- F. If, when removing the stumps, existing walks or curbs are disturbed, the Contractor shall restore and/or reset these walks and curbs, at no additional cost, to the satisfaction of the Engineer. The Contractor is responsible for locating and protecting underground utilities from damage during excavation and/or grinding of stumps.

3.3 CLEARANCE AND GRUBBING

- A. Clearing: The Contractor shall clear all items specified to the Contract limit lines shown on the Contract Drawings and shall remove cleared and grubbed materials from the site to an authorized disposal site.
 - 1. Do not start earthwork operations in areas where clearing and grubbing is not complete, except that stumps and large roots may be removed concurrent with excavation.
- B. Grubbing: The Contractor shall clear and grub areas to be excavated, areas receiving less than 3 feet of fill and areas upon which structures are to be constructed.
 - 1. Stumps and root mats in these areas shall be removed to depth of not less than 1 foot below the subgrade of sloped surfaces.
- C. The stumps and roots shall be removed to a depth of three (3) feet below the ground surface except in areas of fill greater than three (3) feet, where such plant material may be cut flush with the ground surface. All voids and excavations left after removal of the plants and roots shall be backfilled to grade with clean earth fill. The fill shall be placed and compacted by acceptable methods to the satisfaction of the Commissioner. Chips generated by root removal operations shall be removed prior to backfilling.
- D. Burning:
 - 1. Burning of cleared and grubbed material is not allowed within the property limits.
 - 2. All burning off-site shall be in complete accordance with rules and regulations of local authorities having jurisdiction.
- E. Explosives shall not be used.

- F. No cleared or grubbed material may be used in backfills or structural embankments.
- G. Cleared and grubbed items shall become property of the Contractor and shall be removed from the site and satisfactorily disposed of as specified in General Conditions Specification section 017419 Construction Waste Management and Disposal.
- H. Cutting of trees shall be done by competent workmen only and a in workmanlike manner. All trees shall be “topped” and “limbed” previous to felling unless otherwise directed by the Commissioner. All branches, limbs, trunks, stumps, roots and other debris shall be removed from the site or otherwise disposed of to the satisfaction of the the Commissioner.
- I. No trees are to be removed except as designated by the Commissioner.
- J. Air pollution caused by dust and dirt shall be controlled, complying with governing regulations.

3.4 PREPARATION

- A. Site Walk Through: The Contractor will inspect the Project Site with the the Commissioner. Trees designated for removal by the Commissioner will be tagged or clearly marked by the Contractor for removal.
- B. Temporary Fencing: Install temporary barrier around tree protection zones to protect remaining trees and vegetation from construction damage. Maintain temporary fence and remove when construction is complete.
- C. Protect tree root systems from damage caused by runoff or spillage of noxious materials while mixing, placing, or storing construction materials. Protect root systems from ponding, eroding, excessive wetting caused by dewatering operations.
- D. Maintain tree protection zones free of weeds and trash.
- E. Do not allow fires within tree protection zone.

3.5 EXCAVATION

- A. Do not excavate within tree protection zones, unless otherwise indicated.
- B. Where excavation for new construction is required within tree protection zones, hand clear and excavate to minimize damage to root systems. Use narrow-time spading forks and comb soil to expose roots.
 - 1. Redirect roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and redirect them without breaking. If encountered immediately adjacent to location of new construction and redirection is not practical, cut roots approximately 3 inches back from new construction.

2. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.
- C. Where utility trenches are required within the tree protection zones, tunnel under or around roots by drilling, auger boring, pipe jacking, or digging by hand.
1. Root Pruning: Do not cut main lateral roots or taproots; cut only smaller roots that interfere with installation of utilities. But roots with sharp pruning instruments; do not break or chop.

3.6 REGRADING

- A. Maintain existing grades within tree protection zones and with trees and shrubs to be saved.
- B. Minor Fill: Where existing grade is 6 inches or less below the elevation of finish grade, fill with topsoil. Place topsoil in a single uncompacted layer and hand grade to required finish elevations and approved by the Commissioner.

3.7 TREE PRUNING

- A. Prune trees to remain that are affected by temporary and permanent construction.
- B. Prune trees to remain to compensate for root loss caused by damaging or cutting root system. Provide subsequent maintenance during Contract period as recommended by the Arborist.
- C. Pruning Standards: Prune trees according to ANSI A300.
1. Type of Pruning: Remove dead wood, or broken or structurally unsound limbs from existing trees to remain.
- D. Cut branches with sharp pruning instruments; do not break or chop.
- E. Chip removed tree branches and stockpile in areas approved by the Commissioner dispose of off-site.

END OF SECTION

SECTION 312000

EARTHWORK

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Geotechnical Design Report prepared for The Croton Water Treatment Plant at Mosholu Golf Course, Van Cortlandt Park, Borough of Bronx, City of New York, prepared by Metcalf & Eddy of New York, Inc & Hazen and Sawyer, P.C., dated November 2000, including the associated drawings, data report and appendices.

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, and paving, as necessary to construct the improvements as shown on the Contract Drawings or as directed by the Commissioner, which include but not limited to:
 - 1. Prepare subgrades for wetland cells and stormwater management basins, underground detention.
 - 2. Prepare subgrades for turf, grasses and plants.
 - 3. Excavating and backfilling for buildings and structures.
 - 4. Subbase course for concrete walks and pavement.
 - 5. Subbase course and base course for asphalt paving.
 - 6. Subsurface drainage backfill for walls and trenches.
 - 7. Excavating and backfilling trenches for utilities and pits for buried utility structures.

1.3 RELATED SECTIONS

- A. Section 311000 - Site Clearing
- B. Section 312316 - Rock Removal
- C. Section 312319 - Dewatering
- D. Section 312500 - Erosion and Sediment Controls
- E. Section 315000 - Excavation Support and Protection
- F. Section 329300 - Exterior Plantings
- G. Section 329113 - Planting Soil Mixes

- H. Section 033000 - Cast-in-Place Concrete
- I. Section 334600 - Subdrainage
- J. Section 334610 - Stormwater Underground Detention

1.4 DEFINITIONS

- A. Backfill: Soil material or controlled suitable material used to fill an excavation.
- B. Base Course: Aggregate layer placed between the subbase course and hot-mix asphalt paving.
- C. Pipe Bedding: Aggregate layer placed over the excavated subgrade in a trench before laying pipe.
- D. Borrow Soil: Satisfactory soil imported from off-site for use as fill or backfill.
- E. Drainage Bedding: Aggregate layer supporting the slab-on-grade that also minimizes upward capillary flow of pore water.
- F. Excavation: Removal of material encountered above subgrade elevations and to lines and dimensions indicated.
- G. Authorized Additional Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions as directed by Commissioner.
- H. Unauthorized Excavation: Excavation below subgrade elevations or beyond indicated lines and dimension without direction by Commissioner. Un-authorized excavation, as well as remedial work directed by Commissioner, shall be without additional compensation.
- I. Fill: Soil materials used to raise existing grades.
- J. Rock: Rock material in beds, ledges, unstratified masses, conglomerate deposits, and boulders of rock material 3/4 cu. yd. or more in volume that exceed a standard penetration resistance of 100 blows/2 inches when tested by a geotechnical testing agency, according to ASTM D 1586.
- K. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man-made stationary features constructed above or below the ground surface.
- L. Subbase Course: Aggregate layer placed between the subgrade and base course for hot-mix asphalt pavement, or aggregate layer placed between the subgrade and a cement concrete pavement or a cement concrete or hot-mix asphalt walk.
- M. Subgrade: Uppermost surface of an excavation or the top surface of a fill or backfill immediately below subbase, drainage fill, drainage course, or topsoil materials.
- N. Utilities: On-site underground pipes, conduits, ducts, and cables, as well as underground services within buildings.

- O. Rough Grading: Initial grading for the preparation of the finished subgrade prior to placement of Planting Soils, Structural Soils, and Paving. Refer to the Contract Drawings for the depth of finished subgrade below the finished grade. The rough grade of the subgrade shall be smooth, uniform, and parallel to the finished grade.
- P. Finished Grading: Fine grading of the soil to achieve the forms and contours as per the Contract Drawings.
- Q. Contaminated Soil: As defined by the analysis entitled 'Limited Phase II Environmental Site Investigation (ESI)' dated June 6, 2016.

1.5 PROJECT CONDITIONS

- A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during earth moving operations.
- B. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Commissioner and authorities having jurisdiction.
- C. Provide alternate routes around closed or obstructed traffic ways if required by Commissioner or authorities having jurisdiction.
- D. Utility Locator Service: Notify "One Call" for area where Project is located before beginning earth moving operations.
- E. Do not commence earth moving operations until temporary erosion and sediment control measures, specified in Section 312500 "Erosion and Sediment Control" are in place.
- F. The following practices are prohibited within protection zones:
 - 1. Storage of construction materials, debris, or excavated material.
 - 2. Parking vehicles or equipment.
 - 3. Foot traffic.
 - 4. Erection of sheds or structures.
 - 5. Impoundment of water.
 - 6. Excavation or other digging unless otherwise indicated.
 - 7. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.
- G. Do not direct vehicle or equipment exhaust towards protection zones.
- H. Prohibit heat sources, flames, ignition sources, and smoking within or near protection zones.

1.6 QUALITY CONTROL

- A. Contractor qualifications for the grading operations: Engage an experience Contractor who has completed rough and fine grading work similar in material, on-structure conditions, design and extent to that indicated for this Project and with a record of successful landscape establishment.
1. Submit the name, contract information and qualifications of the grading contractor for approval by the Commissioner. Submittal shall include the names and contract information that best represent the firm's qualifications. All representative work shall have been completed within the previous three years.
 2. Installer Field Supervision: Require installer to maintain full-time supervisor during times rough and fine grading work is in progress.
 3. Submit the name and qualifications of the Installer Field Supervisor for approval by the Commissioner.

1.7 SUBMITTALS

A. LEED SUBMITTALS REQUIREMENTS

1. For all installed products and materials of this Section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).

4. Provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
5. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.
- B. As defined by the Limited Phase II Environmental Site Investigation (ESI)' dated June 6, 2016, a Materials Handling Plan (MHP) and an HASP shall be submitted by the contractor prior to performing and excavation on site.

PART 2 PRODUCTS

2.1 SOIL MATERIALS

- A. General: Provide borrow soil materials when sufficient satisfactory soil materials are not available from excavations.
- B. Satisfactory Soils: Soil Classification - Groups GW, GP, GM, SW, SP, and SM according to ASTM D 2487 or Groups A-1, A-2-4, A-2-5, and A-3 according to AASHTO M 145, or a combination of these groups; free of rock or gravel larger than 3 inches 75 mm in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.
 - 1. Liquid Limit: 32
 - 2. Plasticity Index: 17
- C. Unsatisfactory Soils: Soil Classification Groups A-2-6, A-2-7, A-4, A-5, A-6, and A-7 according to AASHTO M 145, or a combination of these groups. Unsatisfactory soils also include satisfactory soils not maintained within 2 percent of optimum moisture content at time of compaction.
- D. Subbase Material: Naturally or artificially graded mixture of natural crushed gravel or crushed stone; ASTM D 2940; with at least 90 percent passing a 3/4-inch sieve and not more than 12 percent passing a No. 200 sieve.
- E. Base Course: Naturally or artificially graded mixture of natural or crushed gravel or crushed stone; ASTM D 2940; with at least 80 percent passing a 1-inch sieve and not more than 10 percent passing a No. 200 sieve.
- F. Engineered Fill: Well-graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; with at least 90 percent passing a 1-1/2-inch sieve and not more than 12 percent passing a No. 200 sieve.

- G. Pipe Bedding and Drainage Bedding: Narrowly graded mixture of washed crushed stone, or crushed or uncrushed gravel; ASTM D 448; coarse-aggregate grading Size 57; with 100 percent passing a 1-1/2-inch sieve and 0 to 5 percent passing a No. 8 sieve.
- H. Filter Material: Sand and gravel with less than 15% silt.
- I. Sand: ASTM C 33; fine aggregate.
- J. Impervious Fill: Clayey gravel and sand mixture capable of compacting to a dense state.

2.2 GEOTEXTILES

- A. Reference Specification Section 313219 - Geosynthetic Soil Stabilization and Layer Separation for more information.

2.3 ACCESSORIES

- A. Detectable Warning Tape: Acid- and alkali-resistant, polyethylene film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches 150 mm wide and 4 mils 0.1 mm thick, continuously inscribed with a description of the utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches 750 mm deep; colored as follows or as required by the local utility companies:
 - 1. Yellow: Gas, oil, steam, and dangerous materials.
 - 2. Orange: Telephone and other communications.
 - 3. Blue: Water systems.
 - 4. Green: Sewer systems.

PART 3 EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earth moving operations.
- B. Protect and maintain erosion and sedimentation controls during earth moving operations.
- C. Protect subgrades and foundation soils from freezing temperatures and frost. Remove temporary protection before placing subsequent materials.
- D. Backfill all excavations to the original surface of the ground or to such other grades as may be shown or required. For areas to be covered by exterior plantings, or lawn/meadow mix, leave or stop backfill 12 inches below the finished grade or as otherwise required to provide adequate depth of exterior plantings, or lawn/meadow mix to satisfy the requirements of Section 329300 - Exterior Plantings.

- E. Obtain approval for the time elapsing before backfilling against recently constructed masonry structures. Remove from all backfill, and from the space being backfilled, any compressible, putrescible, or destructible rubbish and refuse and all lumber and braces before backfilling is started.
- F. Leave sheeting and bracing in place or remove as the work progresses.

3.2 DEWATERING

- A. Prevent surface water and ground water from entering excavations, from ponding on prepared subgrades, and from flooding Project site and surrounding area.
- B. Reroute surface water runoff away from excavated areas. Do not allow water to accumulate in excavations. Do not use excavated trenches as temporary drainage ditches.
- C. Protect subgrades from softening, undermining, washout, and damage by rain or water accumulation.
- D. Refer to Section 312319 – Dewatering.

3.3 EXCAVATION OF CONTAMINATED SOILS

- A. Characterization, management, handling and disposal of contaminated materials shall be performed in conformance with the recommendations of the Limited Phase II Environmental Site Investigation (ESI) dated June 6, 2016 and all applicable regulations.

3.4 EXCAVATION, GENERAL

- A. Unclassified Excavation: Excavate to subgrade elevations regardless of the character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions. No changes in the Contract Sum or the Contract Time will be authorized for rock excavation or removal of obstructions.
 - 1. If excavated materials intended for fill and backfill include unsatisfactory soil materials and rock, replace with satisfactory soil materials.
 - 2. Remove rock to lines and grades indicated to permit installation of permanent construction without exceeding the following dimensions:
 - a. Measurements in subparagraphs below are examples only; revise to suit Project conditions and office standards.
 - b. 24 inches outside of concrete forms other than at footings.
 - c. 12 inches outside of concrete forms at footings.
 - d. 6 inches outside of minimum required dimensions of concrete cast against grade.
 - e. Outside dimensions of concrete walls indicated to be cast against rock without forms or exterior waterproofing treatments.
 - f. 6 inches beneath bottom of concrete slabs-on-grade.

- g. 6 inches beneath pipe in trenches, and the greater of 24 inches wider than pipe or 42 inches wide.

3.5 EXCAVATION FOR STRUCTURES

- A. Excavate to indicated elevations and dimensions within a tolerance of plus or minus 1 inch. If applicable, extend excavations a sufficient distance from structures for placing and removing concrete formwork, for installing services and other construction, and for inspections.
- B. Excavations for Footings and Foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.
- C. Excavation for Underground Tanks, Basins, and Mechanical or Electrical Utility Structures: Excavate to elevations and dimensions indicated within a tolerance of plus or minus 1 inch. Do not disturb bottom of excavations intended as bearing surfaces.

3.6 EXCAVATIONS AT EDGES OF TREE- AND PLANT-PROTECTION ZONES:

- A. Excavate by hand to indicated lines, cross sections, elevations, and subgrades. Use narrow-tine spading forks to comb soil and expose roots. Do not break, tear, or chop exposed roots. Do not use mechanical equipment that rips, tears, or pulls roots.
- B. Do not cut main lateral roots or taproots; cut only smaller roots that interfere with installation of utilities.

3.7 EXCAVATION FOR WALKS AND PAVEMENTS

- A. Excavate surfaces under walks and pavements to indicated lines, cross sections, elevations, and subgrades.

3.8 EXCAVATION FOR UTILITY TRENCHES

- A. Excavate trenches to indicated gradients, lines, depths, and elevations.
- B. Beyond building perimeter, excavate trenches to allow installation of top of pipe below frost line.
- C. Excavate trenches to uniform widths to provide the following clearance on each side of pipe or conduit. Excavate trench walls vertically from trench bottom to 12 inches higher than top of pipe or conduit unless otherwise indicated.
- D. Clearance: 12 inches each side of pipe or conduit.
- E. Trench Bottoms: Excavate trenches 6 inches deeper than bottom of pipe and conduit elevations to allow for pipe bedding course. Hand-excavate deeper for bells of pipe.
- F. Excavate trenches 6 inches deeper than elevation required in rock or other unyielding bearing material to allow for bedding course.

3.9 SUBGRADE INSPECTION

- A. Notify the Commissioner when excavations have reached required subgrade.
- B. If the Commissioner determines that unsatisfactory soil is present, continue excavation and replace with compacted backfill consist of sand and gravel with less than 15% silt. A 2-inch maximum size, well graded crush stone or structural fill subbase must be provided over the subgrade and/or fill as means of sub-pavement support and drainage layer.
- C. Proof-roll subgrade below the building slabs and pavement with a pneumatic-tired and loaded 10-wheel, tandem-axle dump truck weighing not less than 15 tons to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.
- D. Completely proof-roll subgrade in one direction, repeating proof-rolling in direction perpendicular to first direction. Limit vehicle speed to 3 mph.
- E. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Commissioner, and replace with compacted backfill or fill as directed.

3.10 UNAUTHORIZED EXCAVATION

- A. Fill unauthorized excavation under foundations or wall footings by extending bottom elevation of concrete foundation or footing to excavation bottom, without altering top elevation. Lean concrete fill, with 28-day compressive strength of 2500 psi, may be used when approved by Commissioner.
- B. Fill unauthorized excavations under other construction, pipe, or conduit as directed by Commissioner.

3.11 STORAGE OF SOIL MATERIALS

- A. Stockpile borrow soil materials and excavated satisfactory soil materials without intermixing. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
- B. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.

3.12 BACKFILL

- A. Place and compact backfill in excavations promptly, but not before completing the following:
 - 1. Construction below finish grade including, where applicable, subdrainage, dampproofing, and waterproofing.
 - 2. Surveying locations of underground utilities for Record Documents.
 - 3. Testing and inspecting underground utilities.
 - 4. Removing concrete formwork.
 - 5. Removing trash and debris.

6. Removing temporary shoring and bracing, and sheeting.
7. Installing permanent or temporary horizontal bracing on horizontally supported walls.

B. Place backfill on subgrades free of mud, frost, snow, or ice.

3.13 UTILITY TRENCH BACKFILL

A. Place backfill on subgrades free of mud, frost, snow, or ice.

B. Place and compact pipe bedding course on trench bottoms and where indicated. Shape bedding course to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits.

C. Trenches under Footings: Backfill trenches excavated under footings and within 18 inches of bottom of footings with satisfactory soil; fill with concrete to elevation of bottom of footings. Concrete is specified in Section 033000 "Cast-in-Place Concrete"

D. Trenches under Roadways: Provide 4-inch- thick, concrete-base slab support for piping or conduit less than 30 inches below surface of roadways. After installing and testing, completely encase piping or conduit in a minimum of 6" concrete before backfilling or placing roadway subbase course. Concrete is specified in Section 033000 "Cast-in-Place Concrete"

E. Backfill voids with satisfactory soil while removing shoring and bracing.

F. Place and compact initial backfill of subbase material, free of particles larger than 2 inch in any dimension, to a height of 12 inches over the pipe or conduit.

G. Carefully compact initial backfill under pipe haunches and compact evenly up on both sides and along the full length of piping or conduit to avoid damage or displacement of piping or conduit. Coordinate backfilling with utilities testing.

H. Place and compact final backfill of satisfactory soil to final subgrade elevation.

3.14 SOIL FILL

A. Plow, scarify, bench, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so fill material will bond with existing material.

B. Place and compact fill material in layers to required elevations as follows:

1. Under grass and planted areas, use satisfactory soil material.
2. Under walks and pavements, use satisfactory soil material.
3. Under steps and ramps, use engineered fill.
4. Under building slabs, use engineered fill.
5. Under footings and foundations, use engineered fill.

3.15 SOIL MOISTURE CONTROL

- A. Uniformly moisten or aerate subgrade and each subsequent fill or backfill soil layer before compaction to within 2 percent of optimum moisture content.
- B. Do not place backfill or fill soil material on surfaces that are muddy, frozen, or contain frost or ice.
- C. Remove and replace, or scarify and air dry, otherwise satisfactory soil material that exceeds optimum moisture content by 2 percent and is too wet to compact to specified dry unit weight.

3.16 COMPACTION OF SOIL BACKFILLS AND FILLS

- A. Place backfill and fill soil materials in layers not more than 12 inches in loose depth for material compacted by heavy compaction equipment, and not more than 6 inches in loose depth for material compacted by hand-operated tampers.
- B. Place backfill and fill soil materials evenly on all sides of structures to required elevations, and uniformly along the full length of each structure.
- C. Compact soil materials to not less than the following percentages of maximum dry unit weight according to ASTM D 1557:
 - 1. Under structures, building slabs, steps, and pavements, scarify and re-compact top 12 inches of existing subgrade and each layer of backfill or fill soil material at 98 percent.
 - 2. Under walkways, scarify and re-compact top 6 inches below subgrade and compact each layer of backfill or fill soil material at 98 percent.
 - 3. Under turf or unpaved areas, scarify and re-compact top 6 inches below subgrade and compact each layer of backfill or fill soil material at 95 percent.
 - 4. For utility trenches, compact each layer of initial and final backfill soil material at 98 percent.

3.17 GRADING

- A. General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.
 - 1. Provide a smooth transition between adjacent existing grades and new grades.
 - 2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.
- B. Site Rough Grading: Slope grades to direct water away from buildings and to prevent ponding. Finish subgrades to required elevations within the following tolerances:
 - 1. Turf or Unpaved Areas: Plus or minus 1 inch.

2. Walks: Plus or minus 1 inch.
 3. Pavements: Plus or minus 1/2 inch.
- C. Grading inside Building Lines: Finish subgrade to a tolerance of 1/2 inch when tested with a 10-foot straightedge.
- D. Final Contours: Perform finish grading in accordance with the completed contour elevations and grades shown on the Contract Drawings and blend into conformation with remaining natural ground surfaces.
1. For rough grading, leave all grading surfaces smooth, uniform and firm to drain. Areas shall be finished to the degree obtainable by either blade or scraper operations and suitable for application of topsoil or paving section.
 2. Bring finish grades to elevations within plus or minus 0.10 foot of elevations or contours shown.
 3. Areas which are anticipated to be undisturbed for a period of more than 30 days shall receive temporary seeding of rye grass at a rate of three bushels per acre, weather and season permitting, or as directed by the Commissioner. This seeding shall be repeated as necessary to maintain a continuing ground cover.
 4. Refer to Detail Specification 329113 – Planting Soil Mixes for additional requirements for finish and fine grading operations.
 5. Surface Drainage: Grade outside of building or structure lines in a manner to prevent accumulation of water within the area. Where necessary or where shown, extend finish grading to ensure that water will be carried to drainage ditches, and the site area left smooth and free from depressions holding water as directed by the Commissioner.

3.18 SUBSURFACE DRAINAGE

- A. Subdrainage Pipe: See Section 334600 - Subdrainage.
- B. Subsurface Drain: Place subsurface drainage geotextile around perimeter of subdrainage trench. Place a 6-inch course of filter material on subsurface drainage geotextile to support subdrainage pipe. Encase subdrainage pipe in a minimum of 12 inches of filter material, placed in compacted layers 6 inches thick, and wrap in subsurface drainage geotextile, overlapping sides and ends at least 6 inches.
- C. Compact each filter material layer to 95 percent of maximum dry unit weight according to ASTM D 698.

3.19 SUBBASE AND BASE COURSES UNDER PAVEMENTS AND WALKS

- A. Place subbase course and base course on subgrades free of mud, frost, snow, or ice.
- B. On prepared subgrade, place subbase course and base course under pavements and walks as follows:

1. Install separation geotextile on prepared subgrade according to manufacturer's written instructions, overlapping sides and ends.
2. Place base course material over subbase course under hot-mix asphalt pavement.
3. Shape subbase course and base course to required crown elevations and cross-slope grades.
4. Place subbase course and base course 6 inches or less in compacted thickness in a single layer.
5. Place subbase course and base course that exceeds 6 inches in compacted thickness in layers of equal thickness, with no compacted layer more than 6 inches thick or less than 3 inches thick.
6. Compact subbase course and base course at optimum moisture content to required grades, lines, cross sections, and thickness to not less than 98 percent of maximum dry unit weight according to ASTM D698 or ASTM D 1557.

3.20 FIELD QUALITY CONTROL

- A. Inspections: The City of New York will engage a qualified special inspector to perform the inspections.
 1. Determine prior to placement of fill that site has been prepared in compliance with requirements.
 2. Determine that fill material and maximum lift thickness comply with requirements.
 3. Determine, at the required frequency, that in-place density of compacted fill complies with requirements.
- B. Testing: The City of New York will engage a qualified geotechnical engineering testing agency to perform tests and inspections.
 1. Allow testing agency to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.
 2. Footing Subgrade: At footing subgrades, at least one test of each soil stratum will be performed to verify design bearing capacities. Subsequent verification and approval of other footing subgrades may be based on a visual comparison of subgrade with tested subgrade when approved by Commissioner.
- C. Testing agency will test compaction of soils in place according to ASTM D 1556, ASTM D 2167, ASTM D 2922, and ASTM D 2937, as applicable. Tests will be performed at the following locations and frequencies:
 1. Paved and Building Slab Areas: At subgrade and at each compacted fill and backfill layer, at least one test for every 2000 sq. ft. or less of paved area or building slab, but in no case fewer than three tests.

2. Foundation Wall Backfill: At each compacted backfill layer, at least one test for every 100 feet or less of wall length, but no fewer than two tests.
3. Trench Backfill: At each compacted initial and final backfill layer, at least one test for every 150 feet or less of trench length, but no fewer than two tests.

3.21 PROTECTION

- A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
- B. Repair and reestablish grades to the specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.
- C. Scarify or remove and replace soil material to depth as directed by Commissioner; reshape and re-compact.
- D. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.
- E. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.22 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Transport surplus satisfactory soil to designated storage areas on The City of New York's property. Stockpile or spread soil as directed by Commissioner.
- B. Remove waste materials, including unsatisfactory soil, trash, and debris, and legally dispose of them off The City of New York property.

3.23 CORRECTION OF WORK

- A. Correction of Work: Correct any areas of unsatisfactory compaction or landforms in the Contract Drawings by removal and replacement, or by scarifying, aerating or sprinkling as needed and recompaction in place prior to placement of a new lift. The Contractor shall, if necessary, increase his compactive effort by increasing the number of passes, using heavier or more suitable compaction equipment, or by reducing the lift thickness. The Contractor shall adjust the moisture content of the soil to bring it to the optimum range by drying or adding water, as required.
- B. Responsibility for after settlement: Correct any depression which may develop from settlement in backfilled areas or landforms as per the Contract Drawings within one year after the work is fully completed. Provide, as needed, backfill material, soil mix, pavement base replacement, permanent pavement, sidewalk, curb and driveway repair or replacement, and exterior plantings, and/or lawn/meadow mix replacement, and perform the necessary reconditioning and restoration work to bring such depressed areas to proper grade as approved. Transport surplus satisfactory soil to designated storage areas on The City of New York's property. Stockpile or spread soil as directed by Commissioner.

SECTION 312316

ROCK REMOVAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to construct the improvements as shown on the Contract Drawings or as directed by the Commissioner, which include but not limited to:
 - 1. Excavation, removal and disposal of excavated rock materials when encountered and necessary to construct the Project as proposed.
 - 2. On-site rock crushing and reuse is permitted, refer to Commissioner for specific information for pavement subbase, structural fill subbase, pipe bedding, rip rap specifications.
 - 3. Due to the proximity of existing structures and streets, the use of explosive is not allowed.

1.3 DEFINITION OF TERMS

- A. Earth Excavation: Removal of material to lines, elevations, and dimensions shown on drawings and disposition of materials encountered in grading and excavation work except that classified as rock.
- B. Rock Excavation: Removal of materials classified as rock and disposal of excavated material as specified herein and in conformity with lines, grades, and dimensions shown on drawings. To be classified as rock, material must be boulders of one-half cubic yard or more in volume, solid or ledge rock, or other hard material in place that cannot be excavated by heavy construction equipment, such as a Caterpillar 215C power excavator equipped with a short-tip radius rock bucket or a Caterpillar D9 bulldozer equipped with a single tooth hydraulic ripper or comparable. In addition, the material must exceed a value of 3 on Mohs' hardness scale. Material classified as rock shall be removed by drilling and feathering, bull point wedging, Ho-rams, power shovels, or chemical demolition agents.

1.4 EXCAVATION

- A. Carry excavation through whatever materials are encountered to depths shown on drawings. Remove all existing fill, debris, unsuitable materials (unclassified materials) and rock within limits of excavation as indicated on the drawings.
- B. Remove excavated material not required or not suitable for backfill from site. Dispose of excavated material off-site to disposal areas approved by the Commissioner.
- C. When excavations are carried below ground water elevations, such excavations shall be dewatered by lowering and maintaining the ground water level at twelve (12) inches minimum below such excavations during all construction, including subgrade excavation, placing of reinforcing steel or pipe, placing of concrete, plastering of masonry, and shall be maintained in a dry condition until all concrete has been placed and allowed to harden for at least twelve (12) hours as specified above.

1.5 REFERENCES

- A. For construction noise, the Contractor shall refer to the following standards:
 - 1. New York City Noise Code, Chapter 28 "Citywide Construction Noise Mitigation"
 - 2. Federal Highway Administration Noise Prediction Model b
 - 3. OSHA Standard, Title 29, Code of Federal Regulations, Part 1926, Section 650 (Subpart p - Excavations)

1.6 RELATED SECTIONS

- A. Section 311000 - Site Clearing
- B. Section 312000 - Earthwork
- C. Section 312500 - Erosion and Sedimentation Control

1.7 INFORMATION SUBMITALS

- A. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).

- c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

PART 2 - PRODUCTS

2.1 NON-EXPLOSIVE DEMOLITION OF ROCK

- A. Materials - The Contractor may use Soundless Chemical Demolition Agents (SCDAs) as a substitute for the use of explosives.

1. FRACT-AG, distributed by Daigh Company Inc., Cumming, GA.
2. Dexpan, as manufactured by Archer Company USA, Santa Teresa, NM.
3. Bustar, distributed by Demolition Technologies Incorporated, Greenville, AL.

B. Equipment

1. Use drilling equipment as indicated by the chemical demolition agent manufacturer or distributor.

2.2 ROCK MEASUREMENT:

- A. Volume of rock actually removed, measured in original position, but not to exceed the following. Unit prices for rock excavation include replacement with approved materials.
1. 24 inches outside of concrete forms other than at footings.
 2. 12 inches outside of concrete forms at footings.
 3. 6 inches outside of minimum required dimensions of concrete cast against grade.
 4. Outside dimensions of concrete walls indicated to be cast against rock without forms or exterior waterproofing treatments.
 5. 6 inches beneath bottom of concrete slabs-on-grade.
 6. 6 inches beneath pipe in trenches, and the greater of 24 inches wider than pipe or 42 inches wide.

PART 3 - EXECUTION

3.1 NON-EXPLOSIVE DEMOLITION

- A. Follow the manufacturer's instructions on how to drill the holes in rock and use the chemical demolition cartridges in the holes.
- B. Design and execute a demolition pattern of holes at distances and depths recommended by the manufacturer.
- C. Scale and remove the cracked rock immediately after the chemical agent has produced cracking. It may need several steps using chemical demolition agents to achieve the removal of rock to the required final elevation.

3.2 ROCK EXCAVATION BY HEAVY EQUIPMENT AND TOOLS

- A. Noise will be a major factor in using heavy equipment in rock excavation/demolition. The Contractor shall use the quietest equipment; retrofit equipment with damping materials; use enclosures; erect barriers as necessary to mitigate the noise.

- B. Portable acoustic barriers immediately surrounding drill rigs and heavy equipment and hydraulic hammers shall be provided by the Contractor.
- C. For dust abatement, drill rigs or any machine causing dust shall be fitted with dust collectors and sprays to suppress dust.
- D. Excavation shall not undermine existing building/structure foundation.

END OF SECTION 312316

This Page Intentionally Left Blank

SECTION 312319

DEWATERING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

B. Geotechnical Design Report prepared for The Croton Water Treatment Plant at Mosholu Golf Course, Van Cortlandt Park, Borough of Bronx, City of New York, prepared by Metcalf & Eddy of New York, Inc & Hazen and Sawyer, P.C., dated November 2000.

1.2 SUMMARY

A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform dewatering during construction as necessary to construct and maintain the improvements as shown on the Contract Drawings or as directed by the Engineer.

1.3 RELATED SECTIONS:

- A. Section 312000 - Earthwork
- B. Section 312500 - Erosion and Sediment Control
- C. Section 315000 – Excavation Support and Protection
- D. Section 334600 – Subdrainage

1.4 PRE-INSTALLATION MEETINGS

- A. Pre-installation Conference: Conduct conference at Project site.
 - 1. Verify availability of Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - 2. Review condition of site to be dewatered including coordination with temporary erosion-control measures and temporary controls and protections.
 - 3. Review geotechnical report.
 - 4. Review proposed site clearing and excavations.
 - 5. Review existing utilities and subsurface conditions.
 - 6. Review observation and monitoring of dewatering system.
 - 7. Discharge the construction dewatering flow to the nearby temporary sediment basins where possible.
 - 8. Secure the necessary permit to discharge to the nearby sewer system.

- B. Dewatering: For dewatering system, prepared by or under the supervision of a qualified professional engineer.
- C. Include written plan for dewatering operations including sequence of well and well-point placement coordinated with excavation shoring and bracing and control procedures to be adopted if dewatering problems arise.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.
- B. Existing Conditions: Using photographs, show existing conditions of adjacent construction and site improvements that might be misconstrued as damage caused by dewatering operations. Submit before Work begins.
- C. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 - 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
 - 3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 - 4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
 - 5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

6. LEED Performance Requirements

- a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
- b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
- c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer that has specialized in design of dewatering systems and dewatering work.

1.7 FIELD CONDITIONS

- A. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of a geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by a geotechnical engineer. Owner is not responsible for interpretations or conclusions drawn from this data.
- B. The latest Geotechnical Report prepared for this Project.
- C. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.

1.8 REFERENCES

- A. State of New York Department of Environmental Conservation (NYSDEC) General Discharge Permit
- B. International and New York City Building Code
- C. ASTM standards applicable to piping, equipment and other items required for a complete dewatering system.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Dewatering Performance: Design, furnish, install, test, operate, monitor, and maintain dewatering system of sufficient scope, size, and capacity to control hydrostatic pressures and to lower, control, remove, and dispose of ground water and permit excavation and construction to proceed on dry, stable subgrades.
- B. Provide dewatering system, including comprehensive engineering analysis by a qualified professional engineer.
- C. Continuously monitor and maintain dewatering operations to ensure erosion control, stability of excavations and constructed slopes, prevention of flooding in excavation, and prevention of damage to subgrades and permanent structures.
- D. Prevent surface water from entering excavations by grading, dikes, or other means.
- E. Accomplish dewatering without damaging existing buildings, structures, and site improvements adjacent to excavation.
- F. Remove dewatering system when no longer required for construction.
- G. Regulatory Requirements: Comply with governing EPA notification regulations before beginning dewatering. Comply with water- and debris-disposal regulations of authorities having jurisdiction.

PART 3 EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by dewatering operations.
- B. Prevent surface water and subsurface or ground water from entering excavations, from ponding on prepared subgrades, and from flooding site or surrounding area.
- C. Protect subgrades and foundation soils from softening and damage by rain or water accumulation.
- D. Install dewatering system to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.
- E. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
- F. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- G. Provide temporary grading to facilitate dewatering and control of surface water.

- H. Protect and maintain temporary erosion and sedimentation controls, which are specified in Section 311000 "Site Clearing," during dewatering operations.

3.2 INSTALLATION

- A. Install dewatering system utilizing wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.
- B. Space well points or wells at intervals required to provide sufficient dewatering.
- C. Use filters or other means to prevent pumping of fine sands or silts from the subsurface.
- D. Place dewatering system into operation to lower water to specified levels before excavating below ground-water level.
- E. Provide sumps, sedimentation tanks, and other flow-control devices as required by authorities having jurisdiction.
- F. Provide standby equipment on-site, installed and available for immediate operation, to maintain dewatering on continuous basis if any part of system becomes inadequate or fails.

3.3 OPERATION

- A. Operate system continuously until drains, sewers, and structures have been constructed and fill materials have been placed or until dewatering is no longer required.
- B. Operate system to lower and control ground water to permit excavation, construction of structures, and placement of fill materials on dry subgrades. Drain water-bearing strata above and below bottom of foundations, drains, sewers, and other excavations.
- C. Do not permit open-sump pumping that leads to loss of fines, soil piping, subgrade softening, and slope instability.
- D. Reduce hydrostatic head in water-bearing strata below subgrade elevations of foundations, drains, sewers, and other excavations.
- E. Maintain piezometric water level a minimum of 24 inches below bottom of excavation.
- F. Dispose of water removed by dewatering in a manner that avoids endangering public health, property, and portions of work under construction or completed. Dispose of water and sediment in a manner that avoids inconvenience to others.
- G. Remove dewatering system from Project site on completion of dewatering. Plug or fill well holes with sand or cut off and cap wells a minimum of 36 inches below overlying construction.

3.4 FIELD QUALITY CONTROL

- A. Observation Wells: Provide observation wells or piezometers, take measurements, and maintain at least the minimum number indicated; additional observation wells may be required by authorities having jurisdiction.

- B. Observe and record daily elevation of ground water and piezometric water levels in observation wells.
- C. Repair or replace, within 24 hours, observation wells that become inactive, damaged, or destroyed. In areas where observation wells are not functioning properly, suspend construction activities until reliable observations can be made. Add or remove water from observation-well risers to demonstrate that observation wells are functioning properly.
- D. Fill observation wells, remove piezometers, and fill holes when dewatering is completed.
- E. Survey-Work Benchmarks: Resurvey benchmarks monthly during dewatering and maintain an accurate log of surveyed elevations for comparison with original elevations. Promptly notify the Commissioner if changes in elevations occur or if cracks, sags, or other damage is evident in adjacent construction.
- F. Provide continual observation to ensure that subsurface soils are not being removed by the dewatering operation.
- G. Provide periodic testing of Radon level in groundwater and air during construction or as directed by the Commissioner.
- H. Prepare reports of observations.

3.5 PROTECTION

- A. Protect and maintain dewatering system during dewatering operations.
- B. Promptly repair damages to adjacent facilities caused by dewatering.

END OF SECTION 312319

SECTION 312500

EROSION AND SEDIMENT CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The Work specified in this Section consists of the labor, equipment, tools, materials and services needed to manage stormwater and provide and maintain temporary and permanent erosion control measures prior to and throughout construction as described herein, shown on the Contract Drawings or as directed by the Commissioner. Work in this Section includes, but is not limited to:
 - 1. A Trained Contractor to prepare and/or renew the Stormwater Pollution Prevention Plan (SWPPP) for this project.
 - 2. Comply with the conditions and requirements set forth in the General Permit for Stormwater Discharges from Construction Activity Permit GP-0-10-001 approved for this Project.
 - 3. Submit Notice of Intent (NOI).
 - 4. Coordination with the Commissioner regarding NYCDEP and NYSDEC requests pertaining to erosion and sedimentation control.
 - 5. Installation and maintenance of temporary and permanent sedimentation and erosion control measures.
 - 6. Maintain existing sediment basins and construct new sediment basins during construction.
 - 7. Construct temporary drainage swale to convey stormwater to sediment basins.
 - 8. Control of erosion from stockpiles.
 - 9. Perform weekly Inspections by a Qualified Inspector of erosion control measures during and after rainfall and prepare reports.
 - 10. Repair of failed sedimentation and erosion control measures.
 - 11. Removal and disposal of sediment deposits in a manner that does not result in additional erosion or pollution.
 - 12. Removal of temporary erosion control measures once construction and permanent stabilization is complete.
 - 13. Update the SWPPP when necessary.

14. Maintain and make available for public viewing the SWPPP report, site inspection report, NOI certificates and the GP-0-10-001 permit.

1.3 PERMITTING

- A. The Contractor shall renew the SPDES General Permit for Stormwater Discharges During Construction Activity as in accordance with the requirements for GP-0-10-001 permit.

1.4 STORMWATER POLLUTION PREVENTION PLAN (SWPPP)

- A. The SWPPP shall be amended to identify any new Contractor or Subcontractor that will implement any measures of the SWPPP which shall be updated as required.
- B. The Prime Contractor and the Subcontractor implementing any measures of the SWPPP will be required to sign a certification statement in the SWPPP and the Erosion and Sediment Control Plan (ESC) must sign the "Contractor/Subcontractor SPDES Certification" before commencing any construction activity at the site.

1.5 RELATED SECTIONS

- A. Section 311000 – Site Clearing
- B. Section 312000 – Earthwork
- C. Section 312316 – Rock Removal
- D. Section 312319 – Dewatering
- E. Section 315000 – Excavation Support & Protection
- F. Section 329301 – Tree Protection

1.6 RELATED REQUIREMENTS

- A. ASTM D 3786 - Hydraulic Bursting Strength of Knitted Goods and Nonwoven Fabrics - Diaphragm Bursting Strength Tester Method
- B. ASTM D 4354 - Sampling of Geosynthetics for Testing
- C. ASTM D 4355 - Deterioration of Geotextiles from Exposure to Ultraviolet Light and Water (Xenon-Arc Type Apparatus)
- D. ASTM D 4439 - Standard Terminology for Geotextiles
- E. ASTM D 4491 - Water Permeability of Geotextiles by Permittivity
- F. ASTM D 4533 - Trapezoid Tearing Strength of Geotextiles
- G. ASTM D 4632 - Test Method for Grab Breaking Load and Elongation of Geotextiles
- H. ASTM D 4751 - Method for Determining Apparent Opening Size of a Geotextile

- I. ASTM D 4759 - Method for Determining the Specification Conformance of Geosynthetics
- J. ASTM D 4873 - Method for Identification, Storage, and Handling of Geotextiles
- K. ASTM D 1556 - Density and Unit Weight of Soil in Place by the Sand-Cone Method
- L. ASTM D 1557 - Test Methods for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-lb Hammer and 18-in. Drop
- M. ASTM D 2922 - Test Methods for Density of Soil and Soil Aggregate in Place by Nuclear Methods (Shallow Depth)
- N. AISC Specifications for the Design, Fabrication, and Erection of Structural Steel for Buildings
- O. OSHA Standard, Title 29, Code of Federal Regulations, Part 1926, Section 650 (Subpart p - Excavations)

1.7 PERFORMANCE REQUIREMENTS

- A. Contractor shall comply with all applicable Federal, State, and Local codes, ordinances, regulations, statutes and standards.
- B. Conform to all erosion and sedimentation control requirements per New York Standards and Specifications for Erosion and Sediment Controls by NYS Department of Environmental Conservation (NYS DEC).
- C. Install temporary erosion and sediment control measures as one of the first steps of site preparation, before any clearing and grubbing or earthwork occurs. Temporary erosion and sediment control measures shall be maintained throughout the construction, and shall not be removed until permanent cover is completely established and stabilized, with no visible unstable rills or erosion, subject to the approval of the Commissioner.
- D. The Contractor shall install, inspect, maintain, and modify control measures as required by changing remedial construction needs over time.
- E. The Contractor shall plan and execute the Work to minimize routing of storm or flood water over disturbed areas in order to minimize erosion and sedimentation to the extent practicable. Similarly, the control measures shall minimize, to the extent practicable, the flow of stormwater over ground such that rills or unplanned ditches are not formed.

1.8 EROSION CONTROL MEASURES

- A. Temporary and permanent soil erosion and sediment control measures including but not limited to:
 - 1. Temporary Seeding and Stabilization
 - 2. Dust Control
 - 3. Rip Rap Slope Protection
 - 4. Straw Bales
 - 5. Silt Fence

6. Temporary Swale
7. Storm Drain Inlet Protection
8. Stone Check Dams
9. Temporary Sediment Basin
10. Stabilized Construction Entrance
11. Rip Rap Outlet Protection
12. Construction Entrance Stabilization
13. Inlet Protection
14. Lined Waterway
15. Land Grading
16. Runoff Diversion
17. Dewatering
18. Temporary Sediment Trap

1.9 SUBMITTALS

A. Stormwater Pollution Prevention Plan (SWPPP)

1. The Contractor shall comply with the Storm Water Pollution Prevention Plan (SWPPP) prepared pursuant to New York State Department of Environmental Conservation (NYSDEC) and New York City Department of Environmental Protection (NYCDEP) requirements, and in compliance with the SPDES General Permit.
2. A SWPPP shall be developed and submitted to the Commissioner for approval prior to the initiation of construction activities. The SWPPP shall include the following at a minimum:
3. Provide background information about the scope of the project, including the location, type and size of project.
4. Provide a site map for the project, including a general location map. The site map should show the total site area; all improvements; areas of disturbance; areas that will not be disturbed; existing vegetation; adjacent off-site surface water(s), wetlands and drainage patterns that could be affected by the construction activity; existing and final slopes; locations of off-site material, waste, borrow or equipment storage areas; and location (s) of the stormwater discharge(s).
5. Provide a description of the soil(s) present at the site.
6. Provide a construction phasing plan describing the intended sequence of construction activities, including clearing and grubbing, excavation and grading, utility and infrastructure installation and any other activity at the site that results in soil disturbance. Consistent with the New York Guidelines for Urban Erosion and Sediment Control, there shall not be more than five (5) acres of disturbed soil at any one time without prior written approval from NYSDEC.

7. Provide a description of the pollution prevention measures that will be used to control litter, construction chemicals and construction debris from becoming a pollutant source in the storm water discharges.
8. Provide a description of construction and waste materials expected to be stored on-site with updates as appropriate, and a description of controls to reduce pollutants from these materials including storage practices to minimize exposure of the materials to storm water, and spill prevention response.
9. Describe the temporary and permanent structural and vegetative measures to be used for soil stabilization, runoff control and sediment control for each stage of the project from initial land clearing and grubbing to project close-out.
10. Identify and show on a site map the specific location(s), size(s), and length(s) of each erosion and sediment control practice.
11. Provide the dimensions, material specifications, and installation details for all erosion and sediment control practices, including the siting and sizing of any temporary sediment basins.
12. Identify temporary practices that will be converted to permanent control measures;
13. Provide an implementation schedule for staging temporary erosion and sediment control practices, including the timing of initial placement and the duration that each practice should remain in place.
14. Provide a maintenance schedule to ensure continuous and effective operation of the erosion and sediment control practices.
15. Provide the name(s) of the receiving water(s).
16. Provide a delineation of SWPPP implementation responsibilities for each part of the site.
17. Provide a description of structural practices to divert flows from exposed soils, store flows, or otherwise limit runoff and the discharge of pollutants from exposed areas of the site to the degree attainable.
18. Provide any existing data that describes the stormwater runoff characteristics at the site.
19. Enforcement of documentation and repair activities as noted in the SWPPP shall be by the Signatory of the SWPPP, who shall be a designated representative of the Contractor.
20. The SWPPP shall be updated monthly to reflect changed site conditions or when directed by the Commissioner. The SWPPP and all inspection reports shall be maintained in a log book at the site. A monthly summary of the site inspection activities shall be provided to the Commissioner and added to the SWPPP.

B. Weekly SPDES Stormwater Inspection Reports

1. Following commencement of construction, site inspections shall be conducted by a Qualified Inspector the at least every seven (7) calendar days. During each inspection the qualified professional shall record the following information:
2. Date and time of inspection

3. Name and title of person(s) performing the inspection.
4. Weather description, soil conditions at time of the inspection.
5. On a site map, indicate the extent of all disturbed site areas and drainage pathways during the inspection. Indicate site areas that are expected to undergo initial disturbance or significant site work within the next 14-day period;
6. A description of natural surface water bodies located within or immediately adjacent to the property boundaries of the construction site which receive runoff from disturbed areas.
7. Indicate on a site map all areas of the site that have undergone temporary or permanent stabilization;
8. A description of the condition of the runoff at all points of discharge from the construction site.
9. Indicate all disturbed site areas that have not undergone active site work during the previous 14-day period;
10. Inspect all sediment control practices and record the approximate degree of sediment accumulation as a percentage of the sediment storage volume (for example, 10 percent, 20 percent, or 50 percent). All sediment removed from control practices shall be disposed of in accordance with all applicable regulations and in such a manner as transport of sediments does not re-occur.
11. Inspect all erosion and sediment control practices and record all maintenance requirements such as verifying the integrity of barrier or diversion systems (earthen berms or silt fencing) and containment systems (sediment basins and sediment traps). Identify any evidence of rill or gully erosion occurring on slopes and any loss of stabilizing vegetation or seeding/mulching. Document any excessive deposition of sediment or ponding water along barrier or diversion systems. Record the depth of sediment within containment structures, any erosion near outlet and overflow structures, and verify the ability of rock filters around perforated riser pipes to pass water; and
12. Identify all erosion and sediment control practice that need repair, maintenance, or not install property, or are not functioning as designed, or in need to be reinstalled, replaced or redesigned.
13. Include digital color photographs (with date stamp) in each weekly report of all practices that are in need of corrective actions, and showing the practices after corrective actions have been completed.
14. All inspection reports must be signed by the Qualified Inspector.

C. INSPECTION NOTIFICATION

1. Within one (1) business day of the inspection, the Qualified Inspector shall notify the Commissioner and Contractor of any corrective action that need to be taken. The Contractor shall begin implementing the corrective actions writing one (1) business day of the notification and complete them in a reasonable time frame.

D. ON-SITE RECORDS

1. The Notice of Intent (NOI), Stormwater Pollution Prevention Plan (SWPPP) and the weekly inspection reports required for this Project site are public documents, that the Commissioner or operator must make available on-site for review and copying by any person within five (5) business days of the Commissioner or operator receiving a written request by any such person to review the NOI, SWPPP or inspection reports. Copying of documents will be done at the requester's expense.

E. LEED SUBMITTAL REQUIREMENTS

1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs./gallon.
 - a. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 - b. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 - c. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
 - d. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
3. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.

- b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
- c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.10 PROJECT AND SITE CONDITIONS

- A. The Contractor shall carefully examine the site to determine the full extent, nature, and location of work required to conform to the Contract Drawings and Specifications. The Contractor shall bring any inaccuracies or discrepancies between the Contract Drawings and Specifications to the Commissioner's attention in order to clarify the exact nature of the Work to be performed.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Straw Bales:

- 1. Straw for straw bales shall meet the requirements of NYSDOT 713-19 – Straw. The use of hay is not permitted.
- 2. Stakes for straw bale use shall be re-bar, steel pickets or 2 inch by 2 inch hardwood.

B. Silt Fences:

- 1. Meet the requirements of NYSDOT 209-2.06 Silt Fence-Temporary and Table 737-01G.
- 2. Fence posts shall be 5 ft minimum length and be of wood or steel. Softwood posts shall be at least 1-1/2 inch by 3-1/2 inch; hardwood posts shall be at least 1-1/4 inch by 1-1/4 inch; steel posts shall be of T or U cross-section, with a minimum weight of 1.3lb/ft.
- 3. Fasteners shall be heavy duty staples, hog rings, tie wires or other fasteners compatible with the fence post material.
- 4. Silt Fence geotextile shall have a minimum permittivity of 0.05 sec-1 and a maximum Apparent Opening Size of 0.0236 inch or sieve designation of #30. The filter cloth shall be either Filter X, Mirafi 100X, Stablinka T140N, or approved equivalent.

C. Temporary Check Dams:

- 1. The primary purpose of a check dam is to reduce flow velocity in a channel, thereby reducing erosion in the channel. A check dam will capture sediment that falls out of

suspension behind it due to decreased velocity. A check dam is not intended to and generally does not filter sediment from turbid water.

2. The maximum drainage area for any temporary check dam shall be 2 acres.

D. Inlet Protection:

1. Inlet protection sack is a temporary sediment control device for catch basins. It is made of woven polypropylene geotextile using a high strength nylon thread to create a filtering sack to prevent silt and sediment from entering the drainage system.
2. Inlet protection sack Styles:
 - a. High Flow: ASTM D-4884, flow rate 150 gal/min./ft²
 - b. Low Flow: ASTM D-4884, flow rate 40 gal/min./ft²
3. Inlet protection sack Types:
 - a. Type A for inlet without curb piece.
 - b. Type B for inlet with curb piece.
 - c. Type C for adjustable frame size.
4. Contractor to provide all high flow silk sacks and the appropriate type to best fit the drainage inlets and catch basins.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

- A. The Contractor shall provide all means, methods, services, facilities, power, equipment, tools, material, consumables, incidentals, labor and supervision necessary to manage stormwater and implement and maintain erosion and sedimentation control measures to effectively minimize erosion and sedimentation.
- B. Construction, including but not limited to clearing, grubbing, earthwork and excavations shall be conducted in such a manner as to minimize erosion and sedimentation.
- C. Install erosion and sedimentation control products in accordance with manufacturers' recommendations prior to any major soil disturbances, or in their proper sequence and maintained until permanent protection is established.
- D. Erosion and sedimentation control measures shall be inspected by the Contractor daily. Repairs shall be made as soon as practical.
- E. Cover staged soil piles with temporary liners when precipitation is expected in order to minimize soil erosion.
- F. Employ, construct, inspect, maintain and document all temporary erosion and sediment control measures in accordance with the New York State Standards and Specifications for Erosion and Sediment Control, (Latest Version).

- G. If the planned measures do not result in effective control of erosion and sediment runoff, the Contractor shall immediately adjust the program and/or institute additional measures in order to eliminate excessive erosion and sediment runoff.
- H. Conduit Outlet Protection must be installed at all required outfalls prior to the drainage system becoming operational.
- I. Contractor is responsible for keeping all adjacent roads clean during life of construction project.

3.2 TEMPORARY AND PERMANENT SEEDING AND STABILIZATION

- A. Any disturbed areas that will be left exposed more than 30 days and not subject to construction traffic, shall immediately receive a temporary seeding. If the season prevents the establishment of a temporary cover, the disturbed areas shall be mulched with straw or equivalent material, at a rate of two (2) tons per acre, according to NYS DEC standards.
- B. Permanent Vegetation shall be seeded or sodded on all exposed areas within ten (10) days after final grading. Mulch will be used for protection until seeding is established
- C. A sub-base course will be applied immediately following rough grading and installation of improvements in order to stabilize streets, roads, driveways and parking areas. In areas where no utilities are present, the sub-base shall be installed within 15 days or preliminary grading.
- D. Immediately following initial disturbance or rough grading all critical areas subject to erosion (i.e.: steep slopes, roadway embankments) will receive a temporary seeding in combination with straw mulch or a suitable equivalent, at a rate of two (2) tons per acre, or as in accordance with the NYS DEC requirements.
- E. Any slopes greater than 3:1 which receive pipeline installation will be backfilled and stabilized daily.
- F. Install stabilized construction entrance with a minimum 50 feet long x 24 feet wide x 6" thick pad of 1" to 4" stones, immediately after initial site disturbance.
- G. At the time when the site preparation for permanent vegetative stabilization is going to be accomplished, any soil that will not provide a suitable environment to support adequate vegetative ground cover, shall be removed or treated in such a way that will permanently adjust the soil conditions and render it suitable for vegetative ground cover. If the removal or treatment of the soil will not provide suitable conditions, non-vegetative means of permanent ground stabilization will have to be employed.

3.3 DUST CONTROL

- A. Dust control measures shall be implemented as needed, including, but not limited to, those items when visible dust is generated during the clearing, demolition, earthwork and construction vehicle cleaning.
- B. Provide air monitoring during earthwork operations (mass excavation, backfilling, and grading operations), as per local regulatory requirements.

3.4 RIP RAP

- A. The Contractor shall place rip rap as shown, noted, and detailed on the Contract Drawings. Individual rock fragments shall be dense, sound and free from cracks, seams and other defects conducive to accelerated weathering. The rock fragments shall be angular in shape. The least dimension of an individual rock shall be not less than one-third the greatest dimension of that fragment. The stone shall be of such quality that it will not disintegrate on exposure to water or weathering, be chemically stable, and shall be suitable in all other respects for the purpose intended. The bulk specific gravity (saturated surface-dry basis) of the individual stones shall be at least 2.65.

3.5 STRAW BALES

- A. Straw bale sediment barriers are only to be used when:
 - 1. No other practice is feasible.
 - 2. Erosion would occur in the form of sheet erosion.
 - 3. The length of slope above the bales does not exceed the following limits for a one-inch rainfall event:
 - a. 2:1 slope 25 ft slope length
 - b. 3:1 slope 50 ft slope length
 - c. 4:1 slope 75 ft slope length
- B. Bales shall be placed at the toe of a slope or along a contour with each vertical end tightly abutting the adjacent bale. Loose straw shall be wedged between bales as required.
- C. Each bale shall be embedded a minimum of 4 inches and placed so bindings are horizontal.
- D. Two stakes shall securely anchor each bale in place. Stakes must be driven a minimum of 18 inches into the ground and driven flush with the top of the bale. The first stake in each bale shall be driven at an angle toward the previously laid bale, in order to force the bales together.

3.6 SILT FENCE

- A. Silt fences shall be placed within 2 ft of the area under consideration, but at least 10 ft from the toe of a slope to allow for maintenance and roll down of larger materials from the slope.
- B. The geotextile shall be embedded to a minimum of 6 inches with native material tamped in place so that no flow can pass under the fence.
- C. The geotextile shall be placed on the upslope side of the fence posts.
- D. Where ends of the geotextile join each other, they shall be overlapped by a minimum of 6 inches, folded and stapled or sewn.
- E. Geotextile shall be securely fastened to reinforced support with ties spaces every 24 inches at the top and mid-section.
- F. The fence post shall be driven a minimum of 2 ft into the ground. Maximum center to center fence post spacing shall be 4 ft. Reinforced support shall be a minimum 30 inches high and tied to fence posts.

3.7 TEMPORARY SWALES

- A. Contractor to construct temporary swales and stone check dams to divert surface water runoff to the sediment basin and minimize construction water washout the sediment to outside of the construction limits or to the adjacent streets.
1. The drainage area for a temporary dike/swale shall be less than 2 acres.
 2. The evenly divided minimum height from the bottom of the swale to the top of dike shall be 24 inches.
 3. The top width of the swale shall be a minimum of 2 feet. The bottom of the swale shall have a minimum slope of 0.5% and a maximum slope of 5%. The side of the swale shall be maximum 3H:1V slope. The entire bottom of the swale should lined with erosion control blanket SC150B, made by North American Green or equivalent.
 4. The bottom width of the dike shall be a minimum of 2 feet,
 5. The perimeter dike/swale shall have positive drainage to an adequate stabilized outlet with a maximum allowable grade of 8 percent.
 6. Erosion control products shall be installed within the ditches to minimize soil erosion.
 7. Diverted runoff from a disturbed area shall convey to a sediment trapping device or an area protected by a sediment trapping device.
 8. Periodic inspection and maintenance must be carried out following any rain event at a minimum.

3.8 TEMPORARY CHECK DAMS

- A. Contractor to construct temporary check dams where needed to control the runoff velocity in the swale and reduce erosion.
1. Materials
 - a. Stone fill core material shall meet the gradation requirements for drainage course per Section 312000 - Earthwork.
 - b. Aggregate facing material shall meet the gradation requirements for Size Designation #1 or #2 from NYSDOT Table 703-4.
 - c. Check dams shall be keyed into the channel by a cutoff trench 20" wide and 8" deep.
 - d. Sand/gravel bags may be substituted for stone. Bags must be filled with clean sand/gravel to prevent receiving waters from becoming turbid.
 - e. If sand/gravel bags are used, they must be individually tied, double bagged and inversely inserted. Bags shall lap the joints between the bags in the layer below.
 - f. If stone check dams are constructed, the stone shall be placed on a geotextile to prevent soil migration.
 2. Maintenance Requirements:

- a. Inspect channel every 7 days, after each rainfall event of minimum 0.5 inches over a 24 hour period, or daily during prolonged rainfall. Clean and repair as required.
- b. If significant erosion occurs between check dam structures, a stone liner or Rolled Erosion Control Product (RECP) should be installed in that portion of the channel.
- c. Remove sediment when accumulation reached half of the channel height. Removed sediment shall be managed such that it does not create erosion and sediment issues. If it is considered to be a contaminated material, then it shall be disposed of as per Section 022423 – Chemical Sampling and Analysis of Soils.
- d. Replace stones, sand/gravel bags as required to maintain the design cross-section of the check dams.

3.9 RIP RAP APRON OUTLET PROTECTION

- A. Install rip rap apron outlet protection at the outlet pipes to reduce erosion and scouring, and to reduce velocity and energy of discharge at a receiving reach.
- B. Outlets protection shall be installed as per the latest version of the New York State Standards and Specifications for Erosion and Sediment Control.

3.10 CONSTRUCTION ROAD STABILIZATION

- A. A 6 inch layer of Structural Fill as per Section 312000 – Earthwork, shall be placed evenly over the full width of the temporary construction route.
- B. Surface drainage will be provided and excess runoff shall be diverted to stabilized areas. Roadside ditch capacity shall be the 10 yr. peak runoff where required.
- C. Construction Roads shall be top-dressed with new gravel as required.

3.11 STABILIZED CONSTRUCTION ENTRANCE

- A. The length of the stabilized construction entrance shall be a minimum of 50 feet.
- B. The width shall be 12 foot minimum, but not less than the full width where ingress or egress occurs. For a single site entrance, this shall be a minimum of 24 feet.
- C. A stabilization geotextile or filter fabric, as per Section 313219 – Geosynthetic Soil Stabilization & Layer Separation, shall be placed over the entire area before gravel placement. This will also serve as a suitable separation fabric.
- D. A minimum of 6 inches of 2” to 3” coarse aggregate gravel shall be placed over the geotextile.
- E. The entrance shall be maintained in a condition which will prevent tracking of sediment onto public streets, including top-dressing as required.

3.12 INLET PROTECTION

- A. To install Inlet protection sediment trap in the catch basin, remove the grate and place the sack in the opening. Hold approximately six inches of the sack outside the frame. This is the area of the lifting straps. Replace the grate to hold the sack in place.

- B. When the restraint cord is no longer visible, Inlet protection sack is full and should be emptied.
- C. To remove Inlet protection sack, take two pieces of 1" diameter rebar and place through the lifting loops on each side of the sack to facilitate the lifting of Inlet protection sack. To empty Inlet protection sack, place unit where the contents will be collected. Place the rebar through the lift straps (connected to the bottom of the sack) and lift. This will lift Inlet protection sack from the bottom and empty the contents. Clean out and rinse. Return Inlet protection sack to its original shape and place back in the basin.
- D. Inlet protection sack is reusable. Once the construction cycle is complete, remove Inlet protection sack from the basin and clean, stored out of sunlight until next use.

END OF SECTION 312500

SECTION 313219

GEOSYNTHETIC SOIL STABILIZATION AND LAYER SEPARATION

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. The Contractor shall furnish and install Geotextile Fabric, including all necessary and incidental items required to complete the installation in accordance with the Drawings and as specified herein.
- B. For the location of each type of Geotextile Fabric, see the Drawings.

1.3 RELATED SPECIFICATIONS

- A. Section 312000 - Earthwork
- B. Section 312500 – Erosion and Sedimentation Control
- C. Section 334600 – Subdrainage

1.4 REFERENCES

- A. ASTM D5261 – Mass Per Unit Area
- B. ASTM D5199 – Thickness
- C. ASTM D4632 – Grab Tensile Strength
- D. ASTM D3786 – Burst Strength
- E. ASTM D4833 – Puncture Resistance
- F. ASTM D4355 – UV Resistance
- G. ASTM D4491 – Permittivity
- H. ASTM D4751 – Apparent Opening Size

1.5 SYSTEM DESCRIPTION

- A. Geotextile Fabric shall be placed to the lines and grades shown on the Drawings for use as a filter, cushion, or separator between differing construction materials as called out on the Drawings or as specified herein.

1. Filter Geotextile shall produce an equilibrium geotextile-to-soil system that allows for adequate liquid flow with limited soil loss through the geotextile.
2. Cushion Geotextile shall provide a cushion from the installation of one construction material above another construction material, with the purpose of protecting the lower and/or upper material from damage.
3. Separator Geotextile shall act as a flexible, porous textile placed between dissimilar materials such that the integrity and functioning of both materials shall remain intact or be improved.

1.6 SUBMITTALS

- A. Prior to shipping to the site, the Contractor shall submit to the Commissioner two copies of mill certificates or affidavits signed by a legally authorized official of the manufacturer for each type of Geotextile fabric. The Contractor shall also submit three geotextile fabric samples of each product, 1 yard square each, seamed and un-seamed as appropriate, with the mill certificate for each geotextile fabric type supplied. The mill certificate or affidavit shall attest that the geotextile fabric meets the chemical, physical and manufacturing requirements stated in this Detailed Specification. The samples shall be labeled with the manufacturer's lot number, machine direction, date of sampling, project number, specifications, manufacturer and product name.
- B. The Commissioner shall be furnished copies of the delivery tickets or other acceptable receipts as evidence for materials received that will be incorporated into the work.
- C. The Contractor shall be responsible for timely submittals of all confirmation test data for Geotextile Fabrics prior to approval for use in the Work.
- D. LEED submittal requirements
 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each

product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.

3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.7 QUALITY ASSURANCE AND QUALIFICATIONS

- A. At the option of the Commissioner, representative samples of Geotextile Fabrics shall be obtained and tested by the Commissioner to assure that the material properties conform to this Detailed Specification.
- B. Conformance testing shall be completed at a minimum frequency of one sample per 100,000 square feet of Geotextile Fabric delivered to the project site. Sampling and testing shall be as directed by the Commissioner.
- C. Conformance testing of the Geotextile Fabrics shall include but not be limited the properties noted in this Detailed Specification.
- D. The Commissioner may add to, remove or revise the test methods used for determination of conformance properties to allow for use of improved or more technically applicable methods.
- E. All Geotextile Fabric conformance test data shall meet or exceed requirements outlined in Table 1 at the end of this Specification for the particular type of Geotextile Fabric

prior to installation. Any materials that do not conform to these requirements shall be retested or rejected at the direction of the Commissioner.

- F. Each roll of Geotextile Fabric will be visually inspected by the Commissioner. The Commissioner reserves the right to sample, test and reject, if necessary, Geotextile Fabric based on visual inspection or verification tests.
- G. A Geotextile Fabric that is rejected shall be removed immediately from the project site and replaced at the Contractor's expense. Sampling and conformance testing of the Geotextile Fabric supplied as replacement for rejected material shall be performed by the Commissioner at Contractor's expense.

1.8 DELIVERY STORAGE AND HANDLING

- A. During all periods of shipment and storage, Geotextile Fabrics shall be protected from direct sunlight, temperature greater than 140 °F water, mud, dirt, dust, and debris.
- B. To the extent possible, the Geotextile Fabric shall be maintained wrapped in heavy-duty protective covering until use. Geotextile Fabric delivered to the project site without protective covering shall be rejected. After the protective covering has been removed, the Geotextile Fabric shall not be left uncovered for longer than 3 days, under any circumstances.
- C. The Commissioner shall approve the shipping and delivery schedule prior to shipment. The Commissioner shall designate the on-site storage area for the Geotextile Fabric. Unloading and proper storage of Geotextile Fabrics shall be the responsibility of the Contractor.
- D. Geotextile Fabrics that are damaged during shipping or storage shall be rejected and replaced at Contractors expense.

PART 2 PRODUCTS

2.1 FILTER GEOTEXTILE FABRIC

- A. Filter Geotextile shall be a minimum 8-ounce per square yard nonwoven needle-punched synthetic fabric consisting of staple or continuous filament polyester or polypropylene. The Filter Geotextile shall be inert and unaffected by long-term exposure to chemicals or liquids with a pH range from 3 to 10. The Filter Geotextile shall have a minimum threshold water head of 0.25-inches in the "as received" condition.
- B. Filter Geotextile shall be one of the following products or "as equal" as approved by the Commissioner:
 - 1. Mirafi S800 manufactured by Mirafi Construction Products,
 - 2. SKAPS GE-170 manufactured by Engineered Synthetic Products, Inc.
 - 3. Propex 4508 manufactured by Amoco Fabrics and Fibers, Inc.
 - 4. For planting and soil installation, Mirafi 140NL manufactured by Mirafi Construction Products

2.2 CUSHION GEOTEXTILE FABRIC

- A. Cushion Geotextile shall be a minimum 16-ounce per square yard nonwoven needle-punched synthetic fabric consisting of continuous filament or staple polyester or polypropylene. Cushion Geotextile shall be inert and unaffected by long-term exposure to chemicals or liquids with a pH range from 3 to 10.
- B. Cushion Geotextile shall be one of the following products or “as equal” as approved by the Commissioner:
 - 1. Mirafi S1600 manufactured by Mirafi Construction Products,
 - 2. SKAPS GT-116 manufactured by Engineered Synthetic Products, Inc.
 - 3. Propex 4516 manufactured by Amoco Fabrics and Fibers, Inc.

2.3 SEPARATOR GEOTEXTILE FABRIC

- A. Separator Geotextile shall be a woven slit film or monofilament synthetic fabric consisting of polyester or polypropylene.
- B. Separator Geotextile shall be one of the following products or “as equal” as approved by the Commissioner:
 - 1. GTF 400E manufactured by LINQ Industrial Fabrics, Inc.,
 - 2. Geotex 104F manufactured by Synthetic Industries, Inc.,
 - 3. Propex 1199 manufactured by Amoco Fabrics and Fibers, Inc.

PART 3 EXECUTION

3.1 INSTALLATION

- A. Geotextile Fabrics shall be placed to the lines and grades shown on the Drawings. At the time of installation, the Geotextile Fabric may be rejected by the Commissioner if it has defects, rips, holes, flaws, evidence of deterioration, or other damage.
- B. The Geotextile Fabrics shall be placed smooth and free of wrinkles determined to be excessive by the Commissioner.
- C. When the Geotextile Fabrics are placed on slopes, the upslope fabric portion shall be lapped such that it is the upper or exposed Geotextile Fabric.
- D. Geotextile Fabrics shall be temporarily secured in a manner acceptable to the Commissioner prior to placement of overlying materials. The Contractor shall be responsible for repair or replacement of any Geotextile damaged due to the effects of wind, water or sediment during construction.
- E. Filter or Separator Geotextile fouled by sediment during construction shall be removed and replaced by the Contractor if, in the opinion of the Commissioner, filter or separation function of the Geotextile is compromised.
- F. The minimum overlap of adjacent rolls of Geotextile Fabric shall be as follows:

GEOTEXTILE TYPE/ APPLICATION	OVERLAP OF ADJACENT ROLLS ⁽¹⁾ (INCHES)	TRANSVERSE END OVERLAP (INCHES)
Filter Geotextile	6 min	12 min
Cushion Geotextile	12 min	12 min
Separator-Roadway Applications ⁽²⁾	12 min	24 min
Separator-Slope Protection ⁽²⁾	18 min	24 min
Special Applications	(2)	(2)

(1) Overlaps may be reduced if adjacent panels are sewn or heat bonded where approved by the Commissioner.

(2) Special applications may require additional overlap, sewing or other mechanical connection. Special applications are shown on the Drawings.

G. Geotextile shall be off limits to vehicle or construction traffic. Any damage due to vehicle traffic shall be repaired by the Contractor at no cost to the City of New York.

H. Any Geotextile Fabric that is torn or punctured shall be repaired or replaced as directed by the Commissioner at no additional cost to the City of New York. The repair shall consist of a patch of the same type of Geotextile Fabric placed over the failed areas and shall overlap the existing Geotextile Fabric a minimum of 12-inches from any point of the rupture.

I. The Contractor shall not cause damage to Geotextiles during placement or compaction of overlying materials. During placement of aggregate over any Geotextile, drop height shall be limited to 3-feet for aggregate less than 4-inches in diameter and to less than 1-foot for rip-rap or any aggregate greater than 4-inches in diameter. Construction materials or methods may have to be modified to prevent damage to Geotextiles.

(See Table 1 on the next page)

TABLE 1 - MINIMUM REQUIRED GEOTEXTILE PROPERTIES*

GEOTEXTILE FABRIC PROPERTY	FILTER GEOTEXTILE	CUSHION GEOTEXTILE	SEPARATOR GEOTEXTILE
Geotextile Construction	Nonwoven Needle punched	Nonwoven Needle punched	Woven
Mass per Unit Area (Unit Weight), ASTM D5261 (oz/yd ²)	7.5	15.7	5.6
Ultraviolet Resistance, (500 hrs.) ASTM D4355, Average % Strength Retention	70	70	90
Grab Tensile Strength (lbs.), ASTM D4632	200	340	370 ⁽¹⁾ X 250 ⁽²⁾
Grab Tensile elongation (%) ASTM D4632	50	50	20 Max
Burst Strength, ASTM D3786, Diaphragm Method (psi)	380	500	450
Apparent Opening Size (AOS), (mm), ASTM D4751	0.21	N/A	0.21
Permittivity at 50 mm constant head (sec ⁻¹), ASTM D4491	1.3	N/A	N/A
Puncture Resistance, ASTM D4833 (lb)	120	200	120

This Page Intentionally Left Blank

SECTION 315000

EXCAVATION SUPPORT AND PROTECTION

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Geotechnical Report prepared for The Croton Water Treatment Plant at Mosholu Golf Course, Van Cortlandt Park, Borough of Bronx, City of New York, prepared by Metcalf & Eddy of New York, Inc & Hazen and Sawyer, P.C., dated November 2000.

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, and paving, as necessary to construct temporary excavation support and protection systems necessary for the improvements as shown on the Contract Drawings or as directed by the Commissioner.
- B. Related Sections:
 - 1. Section 312000 - Earthwork
 - 2. Section 312319 – Dewatering
 - 3. Section 334610 – Stormwater Underground Detention
- C. Related References:
 - 1. ASTM D1557 - Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³)
 - 2. Geotechnical Report

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Include construction details, material descriptions, performance properties, and dimensions of individual components and profiles, and calculations for excavation support and protection system.
- C. Shop Drawings: For excavation support and protection system, prepared by or under the supervision of a qualified professional engineer.
- D. Include plans, elevations, sections, and details.

- E. Show arrangement, locations, and details of soldier piles, piling, lagging, tiebacks, bracing, and other components of excavation support and protection system according to engineering design.
- F. Indicate type and location of waterproofing.
- G. Include a written plan for excavation support and protection, including sequence of construction of support and protection coordinated with progress of excavation.

1.4 INFORMATIONAL SUBMITTALS

- A. Contractor Calculations: For excavation support and protection system. Include analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- B. Existing Conditions: Using photographs, show existing conditions of adjacent construction and site improvements that might be misconstrued as damage caused by inadequate performance of excavation support and protection systems. Submit before Work begins.
- C. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 - 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
 - 3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 - 4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.

5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.5 FIELD CONDITIONS

- A. Notify Construction Manager no fewer than two days in advance of proposed interruption of utility. Do not proceed with interruption of utility without Commissioner's written permission.
- B. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of a geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by a geotechnical engineer. Commissioner is not responsible for interpretations or conclusions drawn from the data.
- C. Make additional test borings and conduct other exploratory operations necessary for excavation support and protection according to the performance requirements. Review the project Geotechnical Report.
- D. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Provide, design, monitor, and maintain excavation support and protection system capable of supporting excavation sidewalls and of resisting earth and hydrostatic pressures and superimposed and construction loads.

- B. Engineering Services: Engineer excavation support and protection system, including comprehensive engineering analysis by a qualified professional engineer. Prevent surface water from entering excavations by grading, dikes, or other means. Install excavation support and protection systems without damaging existing buildings, structures, and site improvements adjacent to excavation. Continuously monitor vibrations, settlements, and movements to ensure stability of excavations and constructed slopes and to ensure that damage to permanent structures is prevented.

2.2 MATERIALS

- A. General: Provide materials that are either new or in serviceable condition.
- B. Structural Steel: ASTM A 36/A 36M, ASTM A 690/A 690M, or ASTM A 992/A 992M.
- C. Wood Lagging: Lumber, mixed hardwood, nominal rough thickness of 4 inches.
- D. Cast-in-Place Concrete: ACI 301, of compressive strength required for application.
- E. Reinforcing Bars: ASTM A 615/A 615M, Grade 60Grade 420, deformed.
- F. Tiebacks: Steel bars, ASTM A 722/A 722M.

PART 3 EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards that could develop during excavation support and protection system operations.
- B. Shore, support, and protect utilities encountered.
- C. Install excavation support and protection systems to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.
- D. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Commissioner and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- E. Locate excavation support and protection systems clear of permanent construction so that construction and finishing of other work is not impeded.

3.2 SOLDIER PILES AND LAGGING

- A. Install steel soldier piles before starting excavation. Extend soldier piles below excavation grade level to depths adequate to prevent lateral movement. Space soldier piles at regular intervals not to exceed allowable flexural strength of wood lagging. Accurately align exposed faces of flanges to vary not more than 2 inches (50 mm) from a horizontal line and not more than 1:120 out of vertical alignment.
- B. Install wood lagging within flanges of soldier piles as excavation proceeds. Trim excavation as required to install lagging. Fill voids behind lagging with soil, and compact.

- C. Install wales horizontally at locations indicated on Drawings and secure to soldier piles.

3.3 TIEBACKS

- A. Drill, install, grout, and tension tiebacks.
- B. Test load-carrying capacity of each tieback and replace and retest deficient tiebacks.
- C. Have test loading observed by a qualified professional engineer responsible for design of excavation support and protection system.
- D. Maintain tiebacks in place until permanent construction is able to withstand lateral earth and hydrostatic pressures.

3.4 FIELD QUALITY CONTROL

- A. Survey-Work Benchmarks: Resurvey benchmarks regularly during installation of excavation support and protection systems, excavation progress, and for as long as excavation remains open. Maintain an accurate log of surveyed elevations and positions for comparison with original elevations and positions. Promptly notify Architect if changes in elevations or positions occur or if cracks, sags, or other damage is evident in adjacent construction.
- B. Promptly correct detected bulges, breakage, or other evidence of movement to ensure that excavation support and protection system remains stable.
- C. Promptly repair damages to adjacent facilities caused by installation or faulty performance of excavation support and protection systems.

3.5 REMOVAL AND REPAIRS

- A. Remove excavation support and protection systems when construction has progressed sufficiently to support excavation and earth and hydrostatic pressures. Remove in stages to avoid disturbing underlying soils and rock or damaging structures, pavements, facilities, and utilities.
- B. Remove excavation support and protection systems to a minimum depth of 48 inches below overlying construction and abandon remainder.
- C. Fill voids immediately with approved backfill compacted to density specified in Section 312000 "Earthwork".
- D. Repair or replace, as approved by Commissioner, adjacent work damaged or displaced by removing excavation support and protection systems.

END OF SECTION 315000

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 320516

AGGREGATE PAVING

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Peastone Paving.
 - 2. Rounded Gravel in the Wetland Cells

1.3 RELATED SECTIONS

- A. Sustainability Requirements – Section 013010
- B. Geosynthetic Soil Stabilization And Layer Separation – Section 313219
- C. Earthwork – Section 312000
- D. Planting Soil Mixes – Section 329113
- E. Soil Mixes for Wetland Areas – Section 327500
- F. Exterior Plantings – Section 329300
- G. Plantings for Wetland Areas – Section 327200
- H. Vegetated Roofing System – Section 073360

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed Gravel and Peastone with edging installations similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- B. Source Limitation: Obtain each type of aggregate paving from one source with resources to provide materials and products of consistent quality in appearance and physical properties.

- C. Installer's Field Supervision: Require installer to maintain an experienced full-time supervisor on the Project site during times the installation is in progress.
- D. Mockups: Before installing Gravel and Peastone, build mockups for each type and application required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work, including same base construction, specified edging, and contiguous Work as indicated:
 - 1. Build mockups in the location and of the size indicated or, if not indicated, as directed by the Construction Manager and the Landscape Architect. Unless otherwise specified the mockup shall be a minimum size of 6' x 6' x full depth for each time and application.
 - 2. Notify Construction Manager and Landscape Architect seven days in advance of dates and times when mockups will be constructed.
 - 3. Demonstrated the proposed range of aesthetic effects and workmanship.
 - 4. Obtain the Construction Manager and the Landscape Architect's approval of mockups before starting installation of work.
 - 5. Maintain mockup during construction in an undisturbed condition as a standard for judging the completed Work.
 - 6. Demolish and remove mockups when directed.
 - 7. Approved mock ups may not become part of the completed Work unless authorized by Landscape Architect.

1.5 PERFORMANCE REQUIREMENTS

- A. The following standards and definitions are applicable to the work of this Section to the extent referenced herein:
 - 1. Standard Specifications: The City of New York Department of Transportation Highway Department, Standard Specification, latest edition.
 - 2. ASTM: American Society for Testing and Materials.
 - 3. AASHTO: American Association of State Highway and Transportation Officials.

1.6 LEED PERFORMANCE REQUIREMENTS

- A. Aggregate Paving shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Specification section 013010 Project Specific Sustainability Requirements.

- B. Aggregate Paving materials fabricated within and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with the Specification section 013010 Project Specific Sustainability Requirements.

1.7 SUBMITTALS

A. Product Data:

- 1. Product Data: For each type of product indicated
- 2. Sieve analysis of aggregate for each type of product indicated

B. Samples for Verification:

- 1. 12-inch baggies of each type of aggregate indicated; in sets for each color, texture, and pattern specified, showing the full range of variations. Clearly label each bag of each paving type.

C. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

D. LEED Submittal Requirements

- 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentage (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of the exact distance (in miles) from the location of where the products(s) have been extracted, harvested or recovered, and manufactured.
- 2. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g. recycled content, VOC content).
- 3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.

4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.8 DELIVERY, STORAGE, AND PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.
- C. Deliver, store and handle as directed by Construction Manager.

1.9 PROJECT CONDITIONS

- A. Stockpiling: Aggregates materials, stored on Project Site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All stockpiled materials shall be placed on tarpaulin, heavy polyethylene sheeting or other suitable barrier to protect park surfaces from soiling by stockpiled materials. All temporary storage means and methods shall be approved by the City of New York, Construction Manager and Commissioner.

1.10 WARRANTY

- A. Warranty: The special warranty specified in this Section shall not deprive the City of New York may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Submit to Construction Manager a written warranty executed by the installer agreeing to repair or replace components of Gravel, Peastone, and edging that fail in materials or workmanship within the one year period. Failures include, but are not limited to, the following:
 1. Premature wear and tear, provide the material is maintained in accordance with manufacturer's written maintenance instructions.
 2. Failure of system to meet performance requirements.
- C. Contractor shall provide, for a period of one year of service and repairs as required.

PART 2 PRODUCTS

2.1 PEASTONE PAVING (AT SECURITY CABLE MAINTENANCE ZONE)

- A. Peastone Paving shall be rounded stone from granite or other hard durable stone.

1. Type: Delaware Blend
2. Size: 1" dia.
 - a. Naturally rounded cross-bedded sandstone and quartzite made up of multi-colored grays, tans, and rusts
3. Source:

PART 3 EXECUTION

3.1 INSPECTION

- A. Examine areas indicated to receive Gravel or Peastone with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Verification of sub-grade: Verify that sub-grade has been properly compacted and graded to correct elevations.
- C. Utilities and Structures: Verify that the locations of utility structures, appurtenances and other surface features have been clearly marked or are visible.
- D. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Remove foreign substances, from substrates, that could impair installation and performance of Screenings, Peastone, and Riverstone.
- B. Make any corrections necessary to sub grade or base furnished and installed to bring compacted gravel base to the elevations shown on the drawing.
- C. Place filter fabric or edge restraints or headers if specified.

3.3 INSTALLATION GENERAL

- A. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.
- B. Placement / Compaction
 - 1. Place the aggregate on a prepared subgrade, and rake smooth to desired grade and cross section and required depth allowing extra material depth so that the post-compacted depth is as specified.

3.4 INSPECTION

- A. Finish surface shall be uniform, to specified grade. Compacted surface shall be firm to full depth with no soft areas.

3.5 PROTECTION

- A. Protect paving from damage due to related construction operations, by other contractors, trades and trespassers. Treat, repair or replace damaged work as directed by Construction Manager.

3.6 GUARANTEE SERVICE

- A. Remove debris, such as paper, grass clippings, leaves or other organic material by mechanically blowing or hand raking the surface as needed.

3.7 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Remove surplus aggregate or other waste material, including unsuitable soil, trash, and debris, and legally dispose of it off of the City of New York's property.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 321216

BITUMINOUS PAVEMENT

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. Work of this Section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:

- 1. Asphaltic Concrete Pavement Roads and Walks.

1.3 RELATED SECTIONS

- A. Sustainability Requirements - Section 013010
- B. Geosynthetic Soil Stabilization and Layer Separation - Section 313219
- C. Earthwork - Section 312000
- D. Concrete Paving - Section 321313
- E. Planting Soil Mixes - Section 329113

1.4 SUBMITTALS

- A. Contractor shall furnish all working drawings and specifications in accordance with Division 01 DDC Standard General Conditions and Section 013010 Project Specific Sustainability Requirements. The following shall be submitted as a minimum.

- 1. Qualifications: Manufacturer and Installer
- 2. The bituminous mix design for both the binder course and the wearing course, which shall include the sources of all ingredient materials, the penetration of the asphaltic cement and the percentages by weight and the number of pounds of each of the materials making up one batch.
- 3. The laboratory analysis of the bituminous mix and the laboratory compacted density.

- B. LEED Submittals Requirement

- 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section

018113 – Sustainable Design Requirements). Information to be supplied for this Form shall include:

- a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post –industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. Provide back-up documentation to validate information provided on MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributed (e.g., recycled content, VOC content).
 3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
 4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.5 QUALITY ASSURANCE

- A. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- B. Manufacturer Qualification: Manufacturer shall be ISO 9002 certified. Provide proof of certification or demonstrate that the standards and experience required for certification are possessed, all to the satisfaction of the Engineer.

1.6 LEED PERFORMANCE REQUIREMENTS

- A. Bituminous pavement shall contain not less than 30% recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.

- B. Bituminous pavement materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Specification Section 013010 Project Specific Sustainability Requirements.

1.7 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.

PART 2 PRODUCTS

2.1 MATERIALS

- A. Roads and Walks: Provide asphaltic concrete pavement for roadways conforming to the requirements specified in this section and to the following standards:
 - 1. Bottom Course: Broken stone, NYCDOT, Bureau of Highway Operations Standard Specifications, Section 2.02, Aggregate-Coarse, Type 1, Grade B, Sizes No. 1, No. 2 and No. 4. Provide bottom course consisting of a uniform mixture of broken stone, Size Nos. 1 and 2, and add No. 4 as a filler after the coarser mixture has been rolled and compacted.
 - a. As of January 1, 2015, asphaltic concrete shall contain not less than 30 percent reclaimed asphalt pavement by weight (LL71 of 2011).
Alternate Material for Bottom Course: Recycled Aggregate shall meet NYCDOT, Bureau of Highway Operations Standard Specifications, Section 2.02, Aggregate-Coarse, Type 1, Grade B, Sizes No. 1, No. 2 and No. 4. Provide bottom course consisting of a uniform mixture of broken stone, Size Nos. 1 and 2, and add No. 4 as a filler after the coarser mixture has been rolled and compacted.
 - 2. Tack Coat: Asphalt emulsion, NYSDOT Standard Specifications, material designation 702-90.
 - 3. Binder Course: Binder mixture, NYSDOT Standard Specifications, Subsections 401-2.01 through 401.2.05, Table 401-1, Type 3.
 - 4. Wearing Course: NYSDOT Standard Specifications, Subsections 401-2.01 through 401-2.05, Table 401-1, Type 6F.

PART 3 EXECUTION

3.1 INSPECTION

- A. Examine the areas and conditions where miscellaneous specialties are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the work.
- B. Coordinate as required with other trades to ensure proper and adequate provision in the work of those trades for interface with the work of this Section.
- C. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.

3.2 ROADS

- A. General: Asphaltic concrete pavement roads shall consist of
 1. A bottom course of broken stone.
 2. A tack coat of asphalt emulsion.
 3. An intermediate course of asphaltic concrete (close binder type).
 4. A tack coat of asphalt emulsion, and
 5. A wearing course of fine surface mix asphaltic concrete (top mix).
- B. Preparation of Subgrade:
 1. Remove to a depth of 24 inches, top soil, boulders, muck, soft clay, spongy material and any other objectionable material and replace them with broken stone, sand and gravel or other approved fill to promote positive drainage.
 2. On sites where it appears that there may be some areas containing objectionable materials, proof roll to locate the unsuitable materials.
 3. Exercise care during stripping operations to prevent excessive disturbance to subgrade. Use lightweight dozers or grade-alls for low strength, saturated, noncohesive and low cohesive soils.
 4. For extremely soft ground such as peat bog areas, do not over excavate surface materials to take advantage of root mat strength.
 5. If vegetation is present, cut at ground surface and place sawdust or sand over stumps and roots extending above ground surface.
 6. Scrape and fill subgrades, as necessary, and thoroughly consolidate them to the required lines and grades. Consolidate subgrades for pavements by means of a

smooth steel-wheel roller having a nominal gross weight of not less than 10 tons, and exerting a minimum force of not less than 300 pounds per inch of width on the compression roll faces, or approved equivalent.

7. Compact subgrade to not less than 75 percent relative density as determined by ASTM D2049, or not less than 95 percent of the maximum dry density as determined by ASTM D1557, as applicable.
8. In places where the use of a roller is impractical, compact subgrades with hand tampers weighing not less than 40 pounds and having a face not exceeding 80 square inches in area.
9. Subgrade shall be prepared not less than 100 feet in advance of the pavement to be immediately constructed.
10. End-dump base aggregate on previously placed aggregate.
 - a. For subgrades with CBR less than or equal to 1, limit pile heights to prevent possible subgrade failure.
 - b. Maximum placement thickness for subgrades with CBR less than or equal to 1 shall not exceed design thickness of road.
11. Spread and grade first lift of aggregate to 300 mm (12 in) or to design thickness if less than 300 mm (12 in) prior to compaction. Do not allow traffic on soft roadway with less than 200 mm (8 in) of aggregate over geotextile, except 150 mm (6 in) for CBR greater than or equal to 3.
12. Compact the bottom course as specified in Paragraph C.2. Vibratory compaction shall not be used on the initial lift over the geotextile.
13. Perform construction parallel to road alignment.
14. Fill ruts formed during construction to maintain adequate cover over geotextile. Do not blade ruts down.
15. Place remaining base aggregate in lifts not exceeding 250 mm (10 in) in loose thickness and compact to specified density.
16. Equipment may operate on roadway without aggregate for geotextile installation under permeable bases if subgrade is of sufficient strength.
 - a. For soils with CBR less than or equal to 0.5, use lightweight construction vehicles for access on first lift.
 - b. Limit construction vehicles in size and weight to limit rutting in initial lift to 75mm (3 in).
 - c. If rut depths exceed 75 mm (3in), decrease construction vehicle size or weight or increase lift thickness.

17. Turning will not be permitted on first lift of base aggregate. Construct turn-outs at roadway edge to facilitate construction.

C. Bottom Course:

1. Spreading

- a. Spread the mixture of No. 1 and No. 2 broken stone uniformly with shovels from piles along the side of the roadway or from dumping boards or by means of vehicles of approved design constructed especially for this purpose, but in no case dump the material directly on the geotextile.
- b. The loose lift thickness shall be a minimum of 1.5 times the maximum particle size. The Contractor shall control the lift thickness, provided that the thickness shall not exceed the thickness limitations specified in Paragraph C, above, for installation of aggregate, and shall not exceed the maximum allowed according to the equipment classifications in Subparagraph B of Subsection 203-3.12, Compaction, of New York State Department of Transportation Standard Specifications, and the equipment meets all specified class criteria of that Standard.
- c. Spread broken stone in sufficient quantity to provide the required thickness after rolling. The depth of stone shall be gauged by the use of cubical concrete blocks of the required thickness, or other approved means.
- d. Remove all segregated fine or coarse stone and replace it with well graded stone.
- e. Do not place broken stone over wet geotextile.
- f. Do not place broken stone adjacent to manhole heads or other structures until such structures have been set to the required lines and grades.

2. Rolling and Filling

- a. After the No. 1 and No. 2 stone mixture has been laid loose, thoroughly roll it with an approved smooth steel-wheel roller having a nominal gross weight of not less than 10 tons and exerting a minimum force of 300 pounds per inch of width on the compression roll faces.
- b. Start rolling longitudinally at the sides and proceed toward the center, overlapping on successive trips by at least one half the width of a rear wheel. A minimum of 8 passes shall be applied over each lift with the roller operating at a speed not exceeding 6 feet per second. Rolling shall be continued until there is no movement of the stone ahead of the roller.

- c. After the bottom course is thoroughly compacted, as measured by the method described in Paragraph f, below, uniformly spread No. 4 stone over the compacted area from piles along the side of the roadway or from dumping boards. Broom the filler in and roll it dry until no more filler can be forced into the voids. Remove excess filler.
- d. Do not lay over 500 lineal feet of the bottom course without it being rolled and thoroughly filled.
- e. The maximum layer thickness prior to compaction shall be 300 mm (12 in.) as specified in Paragraph 3.01C, and the final compacted thickness shall be as shown on the Contract Drawings. In confined areas as defined by the Engineer the maximum compacted layer thickness shall be 6 inches.
- f. Do not allow the surface of the completed bottom course to deviate more than one-quarter inch in five feet from the nearest point of contact nor more than 3/8-inch in eighteen feet when tested by means of an eighteen foot straight-edge placed parallel to the centerline of the roadway.
- g. If any irregularities develop in the surface during or after rolling of the bottom course, remedy them by loosening the surface and removing or adding broken stone as may be required, and follow by rolling the entire area, including the surrounding surface, applying filler and continuing rolling until the course is compacted satisfactorily to a uniform surface.

D. Tack Coat:

- 1. Before spreading the binder course, spray the bottom course with an asphalt emulsion tack coat in the amount of 0.25 gallon per square yard. Allow the tack coat to cure until sticky or tacky. Renew and repair or replace damaged coating.
- 2. Tack coat shall be applied evenly by means of a truck having appropriate spray nozzles. All nozzles shall be kept free of clogs.
- 3. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with the tack coat material.
- 4. Tack coat shall not be applied on a wet pavement surface or when the temperature is below 45°F.

E. Binder Course:

- 1. Preparation: Clean the bottom course of all dirt and loose material, thoroughly dry it and obtain the Engineer's approval before laying the binder course.
- 2. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

3. Forms: When side forms are required, accurately set them to line and grade and securely stake and brace them in place sufficiently to withstand all construction operations. Thoroughly clean and oil forms before use.
4. Spreading:
 - a. Dump the binder course into the hopper of the spreader. Spread and screed it immediately to the full width required for the pavement and to such a depth that, when rolled, the required thickness is obtained. The maximum allowable compacted thickness shall be 4 inches.
 - b. When the mixture is to be spread by hand, dump it on approved steel dump sheets outside of the area on which it is to be spread and immediately distribute it into place and spread it in a uniformly loose layer.
 - c. Remove material from areas which show an excess or lack of bituminous material or an inconsistent mix and fill with new material. Respread or otherwise rectify areas which show segregation to obtain a uniform mixture in the course.
 - d. Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250°F when spread.
 - e. Do not lay over 500 lineal feet of binder material without it being rolled and properly compacted.
5. Compacting:
 - a. Rake the mixture after spreading and immediately compress it thoroughly and uniformly by either of the following methods:
 - 1). Option A – Three roller Compaction Train: Under this option, the binder course shall be initially rolled with an approved steel wheel roller. The roller shall overlap the previous roller pass by one-half the width of the roller.
 - (a). Immediately following the initial rolling, the course shall be rolled with an approved pneumatic rubber-tired roller. A minimum of three passes of the rubber-tired roller shall be made. One pass is defined as one movement of the roller over any point of the pavement in either direction.
 - (b). Immediately following the intermediate rolling, the course shall be finish rolled with a steel-wheel tandem roller. This final rolling shall be both longitudinal and diagonal as directed by the Engineer and shall remove all shallow ruts and ridges and other irregularities from the surface. Rolling shall be continued until all roller marks are eliminated.

- (c). Under this option, the course shall not be compacted to a thickness in excess of 4 inches. No rollers shall move at speeds in excess of 3 miles per hour unless otherwise approved.
- 2). Option B – Vibratory Compaction: Under this option, the Contractor shall use vibratory compaction equipment appearing on the current Approved List - Bituminous Concrete Vibratory Compaction Equipment in the NYSDOT Standard Specifications. The Contractor may substitute one vibratory roller in lieu of the initial roller and the pneumatic roller in the conventional three-roller compaction train stipulated under Option A. Under this option, the course shall be finish rolled with a steel-wheel tandem roller having a minimum weight of 8 tons. This finish roller shall add a minimum of two passes closely following the vibratory roller or as directed by the Engineer.
- (a). One vibratory roller and one steel-wheel tandem roller shall be provided for each nominal 12-foot width of paving. Dual vibrating drum rollers meeting the requirements of a steel-wheel tandem roller and operating in the static mode may be used as the finish roller. However, this single vibratory roller shall not be used as both the initial roller and the finish roller.
 - b. To prevent adhesion of the mixture to the roller, keep the drum properly moistened with water. Drums must have working water spray nozzles to keep drums moistened.
 - c. Compact material thoroughly with hot irons or damp vibratory tampers along curbs, headers, manholes and similar structures and at all places not accessible to the roller.
 - d. Remedy depressions which develop before the completion of the rolling by loosening the laid mixture and adding new mixture to bring such depressions to a true surface. Should any depressions remain after the final compaction has been obtained, remove the full depth of the mixture, replace it with new mixture, and reroll it to form a true and even surface. Correct all high spots, waves, bunches and honeycombing, to the satisfaction of the Engineer.
 - e. Remove and replace with new material areas that are unbonded after rolling, areas containing drippings, areas that are fat or lean, and areas evidencing defective construction of any description.
 - f. Do not allow the surface of the completed binder course to deviate more than 1/16 inch per foot from the nearest point of contact nor more than 1/4 inch

maximum when tested longitudinally with an 18-foot straight edge placed parallel to the centerline of the roadway.

- g. After final compression, the finished course shall at no point have a density less than 95 percent, as measured by a nuclear density meter, of the laboratory compacted density.

F. Wearing Course:

1. Preparation:

- a. Thoroughly clean the binder course of all loose and foreign material before the top mixture is delivered.
- b. Apply a tack coat at a rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.
- c. Do not lay mixture until the Engineer approves the binder course and determines in all cases whether the weather conditions are suitable to permit laying.

2. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

3. Forms: If at the time of laying the mixture, permanent side supports such as curbs, edgings or gutters have not been constructed, firmly fasten in place suitable side forms of wood or steel, true to line and grade. In all cases adequately support the sides of roadways until final compaction has been obtained and the mixture has hardened by cooling.

4. Spreading and Compacting:

- a. Spread and compact the wearing course until it meets the compaction and surface requirements specified above for the binder course.
- b. The Contractor shall have the same options for achieving the required compaction as given for the compaction of the binder course.
- c. Do not lay over 500 lineal feet of wearing course material without it being rolled and properly compacted.
- d. Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250°F when spread.

5. Joints: Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:
 - a. Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.
 - b. Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.
6. Shoulders: If temporary forms are used, protect the edges of the finished roadway by placing and thoroughly compacting approved material to form shoulders along the roadway as shown on the Contract Drawings. Construct finished shoulders 1/4 inch above the elevation of the finished roadway edges:
7. If weather conditions necessitate delaying the installation of the wearing course for more than two days, the tack coat shall be reapplied to the binder course at the rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

3.3 WALKS

- A. General: Asphaltic concrete pavement walks shall consist of:
 1. A bottom course of broken stone.
 2. A tack coat of asphalt emulsion.
 3. An intermediate course of asphaltic concrete (close binder type).
 4. A tack coat of asphalt emulsion, and
 5. A wearing course of fine surface mix asphaltic concrete (top mix).
- B. Subgrade
 1. Refer to Paragraph 3.2.B for Subgrade Requirements.
 2. Before the bottom course is laid, compact the subgrade thoroughly, so that the bottom course, after compaction, will be found satisfactory when tested by the method given in Paragraph 4, below, and clean it of all loose and foreign material, dry it, and obtain the Engineer's approval.
- C. Bottom Course:
 1. Refer to Paragraph 3.2.C for Bottom Course Requirements.
- D. Tack Coat:
 1. Refer to Paragraph 3.2.D for Tack Course Requirements.

2. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with an asphalt emulsion tack coat at the rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

E. Binder Course:

1. Refer to Paragraph 3.2.E for Tack Course Requirements.
2. Set forms, spread and compact the bottom course as specified above for the binder course for roads.
3. Provide a bottom course surface free from depressions exceeding 3/8-inch when tested with a 10-foot straight edge placed parallel with the center line of the walk.

F. Wearing Course:

1. Refer to Paragraph 3.2.F for Wearing Course Requirements.
2. Clean the bottom course of all loose and foreign material before the wearing course mixture is delivered. Do not lay mixture until the Engineer approves the bottom course and determines in all cases whether the weather conditions are suitable to permit laying.
3. If at the time of laying the mixture, permanent side supports such as curbs, edging or gutters have not been constructed, fasten in place suitable side forms of wood or steel, true to line and grade. In all cases, adequately support the sides of walks until final compaction is obtained and until the mixture hardens.
4. Spread and compact the wearing course as specified for the bottom course.
5. Provide a walk surface free from depression exceeding 1/8-inch when measured with a 10-foot straight edge placed parallel with the centerline of the walk.
6. Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:
 - a. Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.
 - b. Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.
7. Paving procedure, including compaction requirements, shall be the same as specified above for the wearing course for roads.

3.4 PAVEMENT SAMPLES

- A. When required by the Engineer, furnish 4-inch diameter test samples cored from the binder course and from the completed pavement. The Engineer will choose the number of cores and the locations at which the cores shall be taken. Sample cores, when required, shall be taken for every 10,000 square feet of pavement and patch. Density test shall show that the sample is within 90 percent of the laboratory specimen. Replace with new mixture and refinish the areas of pavement so removed without additional compensation.

3.5 PATCHING

- A. As directed by Engineer, remove and replace defective areas. Cut such areas and replace with fresh asphaltic concrete and compact to required density.

3.6 CLEANING AND PROTECTION

- A. After paving, clear surfaces of excess asphaltic concrete and all foreign matter.
- B. Protect new pavement until fully hardened.
- C. Cover openings of drainage structures until permanent covers are placed.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 321217

AGGREGATE OVERLAY OVER ASPHALT PAVING

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Aggregate Overlay over Asphalt Paving
 - 2. Traffic Striping over Aggregate Overlay

1.3 RELATED SECTIONS

- A. Sustainability Requirements - Section 013010
- B. Geosynthetic Soil Stabilization and Layer Separation - Section 313219
- C. Earthwork - Section 312000
- D. Bituminous Pavement - Section 321216
- E. Concrete Paving - Section 321313
- F. Planting Soil Mixes - Section 329113

1.4 SUBMITTALS

- A. Contractor shall furnish all working drawings and specifications in accordance with the DDC Standard General Conditions and Specification Section 013010 Sustainability Requirements. The following shall be submitted:
 - 1. Qualifications: Installer as specified in "Quality Assurance". Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
 - 2. Material Properties:
 - a. Aggregate
 - 1). Description
 - 2). Material Properties

- b. Epoxy Overlay –
 - 1). Manufacturer’s Data
 - 2). Independent Test Lab Report: Test results certified and verified by a nationally recognized independent testing laboratory verifying properties of the cured system as per Table 1 herein shall be submitted to the engineer for approval prior to application. This certification shall be provided on each batch number to be used on the project.
- c. Traffic Striping over Aggregate Overlay:
 - 1). Manufacturer’s data
- 3. Samples
 - a. Aggregate - 1 lb minimum bag of aggregate representative of the full range of color and texture.
 - b. Epoxy Overlay System:
 - 1). (Quantity 3) 12” x 12” samples of the epoxy overlay with aggregate. Samples shall include a representative 4” x 12” wide traffic stripe as per the requirements herein.
- 4. Timetable

At the start of construction, within 60 days after the notice to proceed, Contractor to formally submit anticipated timetable of the asphalt paving and the subsequent anticipated timetable for the Aggregate Overlay over Asphalt Paving installation.

B. LEED Submittals Requirement

- 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor’s work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post –industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
- 2. Provide back-up documentation to validate information provided on MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the

Forms, provide documentation to certify each of the material attributed (e.g., recycled content, VOC content).

3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.5 QUALITY ASSURANCE

- A. Contractor shall follow timing requirements for the time required between asphalt paving and aggregate overlay, as per paragraph 3.1 Advance Preparation herein.
- B. Installer Qualifications:
 1. the contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work. Single Source: Obtain each type of product or material from a single source in order to provide materials of consistent quality in appearance and physical properties.
- C. The overlay shall be applied on all areas using metering, mixing and distribution machinery appropriate for epoxy overlay installation.
 1. The application machine shall feature positive displacement volumetric metering pumps controlled by a hydraulic power unit. Components A and B shall be stored in reservoirs which are independently temperature controlled and capable of maintaining $100^{\circ}\text{F} \pm 10^{\circ}\text{F}$ to insure optimal mixing. Ratio check verification at the pump outlets as well as cycle counting capabilities to monitor output will be standard features. In line mixing shall be motionless so as to not overly shear the material or entrap air in the mix. The machine shall also make maximum use of the working time of the material, to insure proper "wetting" of the system, by mixing immediately prior to dispensing onto the substrate.
 2. Hand mixing of material is not permitted.
- D. Mock-Ups
 1. Contractor shall provide a 20'x20' mockup of Aggregate Overlay over Asphalt Paving for Landscape Architect's approval. Mockup to include the boundary concrete curb to show the edge condition and 4" x 18' minimum mockup of the traffic striping.
- E. Guarantee:

Installer to provide 1 year guarantee period after installation. At the end of 1 year, Installer will return to correct any delamination or defect of the aggregate overlay and/or pavement striping as directed by the Commissioner without additional cost to the City of New York.

F. Performance Acceptance

1. Friction Acceptance Testing: Within 60 days after installation of the Aggregate Overlay, the Installer shall measure the friction characteristics in accordance with ASTM E274. The minimum acceptable friction number (FN40R) is 60. Remove and replace Aggregate Overlay areas not meeting this requirement unless approved to remain in place by the project engineer.
2. Acceptance of the materials will be based on the certified test report received during the approval process, a certification of compliance from the manufacturer, and results of any acceptance tests ordered or performed by the engineer during construction.

1.6 LEED PERFORMANCE REQUIREMENTS

- A. Aggregate Overlay over Asphalt Paving shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.
- B. Aggregate Overlay over Asphalt Paving materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with the Specification Section 013010 Project Specific Sustainability Requirements.
- C. Aggregate Overlay shall have a minimum Solar Reflective Index (SRI) value of 29.

1.7 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.
- C. Liquid Material: All material shall be transported and stored in their original containers inside a dry, temperature controlled facility and maintained at a minimum temperature of 60°F and not to exceed 120°F.
- D. Job Site Storage: The materials shall be stored on the jobsite in a dry, weather protected facility away from moisture and within the temperature range of 60°F to 90°F whenever possible. Outdoor storage is only permitted with manufacturer and Commissioner's approval.

- E. Store resin materials in their original containers in a dry area. Store and handle materials according to the manufacturers recommendations.
 - a. Packing Requirement: All materials must be packaged in strong, substantial containers. The containers shall be identified as Part A and Part B and shall be plainly marked with the name and address of the manufacturer, name of the product, mixing proportions and instructions, lot and batch numbers, date of manufacture, and quantity contained therein.
- 2. Aggregate: All aggregate shall be stored in a dry, moisture-free atmosphere. The aggregate shall be fully protected from any contaminants on the jobsite and shall be stored so as not to be exposed to rain or other moisture sources.
- F. Handling of Liquid Materials on the Job: Protective gloves, clothing, and goggles, and any additional PPE shall be available to workers and inspectors directly exposed to the material if desired. Material Safety Data Sheets (MSDS) shall be provided to all workers and inspectors as obtained from the manufacturer.

PART 2 PRODUCTS

2.1 MATERIALS

A. Asphalt Paving:

- 1. As per the 321216 Bituminous Pavement specification for Vehicular Asphalt Paving

B. Epoxy:

- 1. The modified epoxy resin and hardener shall be composed of a two-part, 100% solids, thermosetting, moisture insensitive, flexible compound meeting the requirements set forth in Table 1. The two-part modified epoxy system shall be formulated to provide simple volumetric mixing ratio of two components such as one to one by volume.

2. Type:

Per the following table:

Product Trade Name	Supplier	Telephone
E-Bond 526 Lo-Mod	Transpo Industries	800.321.7870
Pro-poxy Type III DOT	Dayton Superior	800-745-3700
174 Polymer Road System	PolyCarb, Inc	800-441-5369
Or Approved Equal		

3. Material Requirements

Table 1--PHYSICAL PROPERTIES OF THE EPOXY SYSTEM	
Property	Value
Compressive Strength, min. psi (at 3 hrs)	1,000
Compressive Strength, min. psi (at 24 hrs)	5,000
Tensile Strength, min. psi (at 7 days)	2,000 - 5000
Tensile Elongation, percent	30 - 80%
Water Absorption, percent by wt. Max.	1.0%
Shore D Hardness, 77°F	60 - 70
Gel Time, minutes	15 - 45 (100 gms)
Viscosity (Poise)	7 - 25
Adhesion to Concrete	100% failure in concrete
Percent Solids	100%

4. Method of testing

Tests shall be conducted in accordance with the following methods:

- a. Compressive Strength: ASTM C109, *Compressive Strength of Hydraulic Cement Mortars*. The two components of the resin are to be thoroughly mixed in their appropriate ratios. Two volumes of graded silica sand in accordance with ASTM C778 shall be added to one volume of mixed resin. The samples shall then be prepared according to the requirements of ASTM C109 and allowed to cure for 7 days at $23 \pm 2^{\circ}\text{C}$.
- b. Tensile Strength and Elongation: ASTM D638, *Tensile Properties of Plastics*, Specimen Type I or Type II. Samples shall be cured at $23 \pm 2^{\circ}\text{C}$ ($73.4 \pm 3.6^{\circ}\text{F}$) and $50 \pm 5\%$ relative humidity. Speed of testing shall be at 0.5 in./min.
- c. Water Absorption: ASTM D570, *Water Absorption of Plastics*, Sample specimens shall be prepared according to section 4.1 and allowed to cure at $23 \pm 2^{\circ}\text{C}$ ($73.4 \pm 3.6^{\circ}\text{F}$) and $50 \pm 5\%$ relative humidity. Tests are then to be carried out as per section 6.1.
- d. Shore D Hardness: ASTM D2240, *Rubber Property - Durometer Hardness*. Specimen shall be prepared as per ASTM D570 section 4.1 and allowed to cure at $23 \pm 2^{\circ}\text{C}$ ($73.4 \pm 3.6^{\circ}\text{F}$).
- e. Gel Time: The following procedure shall be used to determine gel time. Measure 4 oz. of Part A and 2 oz. of Part B each at 25°C (77°F), into an unwaxed paper cup and record the time and mix immediately. 100 gms of this mixture shall be poured into a 6 oz. unwaxed paper cup and placed on a wooden bench top. Starting twenty minutes from the time recorded above, the mixture shall be probed every two minutes with a small stick until a small ball forms in the center of the container. The total time, including mixing, required for the ball to form shall be regarded as the gel time. The

test shall be performed in a room or enclosed area maintained at $25 \pm 2^{\circ}\text{C}$ ($77 \pm 3.6^{\circ}\text{F}$) and $50 \pm 5\%$ relative humidity.

- f. Abrasion Resistance: ASTM C501, *Test Method for Relative Resistance to Wear of Unglazed Ceramic Tile by the Taber Abrader*. Tests shall be done using a CS-17 wheel and a 1,000 gram load for 1,000 cycles.
- g. Adhesion to Concrete: ACI-503-R; Pull Out Test.

C. Specialty Aggregate for Aggregate Overlay

- 1. Aggregate to be used shall be non-friable, non-polishing, clean and free from surface moisture. It shall be durable and sound and have a proven record of performance in applications of this type. The aggregate shall be 100 percent fractured, thoroughly washed and kiln dried to a maximum moisture content of 0.2 percent by weight, measured in accordance with ASTM C566. The fracture requirements shall be at least one mechanically fractured face and will apply to materials retained on U.S. No. 10 sieve.
 - a. Size: 3/32" – 3/16"
 - b. Type: Granite Aggregate – white color with black specks - Mt. Airy or approved equal.
 - c. Supplier:
Aggregate:-3/32" – 3/16" (#1) Mt. Airy granite aggregate or approved equal
The North Carolina Granite Corp.
151 Granite Quarry Trail Mount Airy, NC 27030,
<http://www.ncgranite.com/>
Contact: Richard Zinsmeister, Tel: 336 719 2624
Or Approved Equal
- 2. Aggregate shall have a minimum Mohs scale hardness of 6.5.
- 3. The gradation of the aggregate shall conform to the requirements of Table 2 or jointly approved by the manufacturer and project engineer.

TABLE 2	
AGGREGATE GRADATION	
Sieve Size	Percent Passing
No. 3 – 1/2	100
No. 5	25-100
No. 10	< 3

D. Traffic Striping over Aggregate Overlay:

- 1. Material:

- a. Methyl-Methacrylate Beaded Two-Component Traffic Marking Paint
 - 1). Two component liquid pavement marking materials that consist of a pigmented MMA resin and a catalyst, capable of full cure in a wide range of temperatures without requiring external heat sources. The two components are mixed as they are applied. The application requires specialized equipment.
Potential products include:
 - (a). Color Safe resin, as supplied by Transpo Industries, 20 Jones Street, New Rochelle, NY, 914-636-1000 or approved equal
 - 2). Reflective Beads
 - (a). Post applied glass beads shall be Type 3 beads coated for use with MMA materials
 - (b). Application rate: 12 lbs/100 sf
 - (c). The striping target retroreflectivity shall be 450 mcd/lux/sq m for white stripe
 - (d). The bead's Refractive Index: minimum 1.5 RI
- 2. Installation tolerance
 - a. All lines to be straight, with 1/4" tolerance along an 18' length.
- 3. Color:
 - a. Parking lane, parking symbol and stop bar striping: White
- 4. Thickness: 90 mils, or as required for satisfactory installation.
- 5. Slip resistant
- 6. Meet the following technical criteria:

a. Bond Strength ACI 503	over 500 psi
b. Abrasion Resistance ASTM C 501:	Wear Index 85 mg or less
c. Pencil hardness ASTM D-2240	Greater than 8H
d. Flexibility D522	No cracking, flaking, peeling
e. Yellowness Index ASTM D 1925:	30 or less (on asphalt surface)
f. Minimum Retro-reflectivity:	125 millicandelas.
- 7. Conform to Federal Specification TT-P-1952E

PART 3 EXECUTION

3.1 ADVANCE PREPARATION

- A. Contractor may NOT apply the Aggregate Overlay on asphalt that is newer than 90 days old – contractor must ensure that asphalt is installed a minimum of 90 days before installation of the aggregate overlay. See Paragraph 3.3A below for surface preparation.
- B. The temperature must be above 50 degrees and the weather clear in order to install the aggregate overlay. For the purposes of advance scheduling, the rough 'season' for

installation is roughly from March 15th – October 15th, although it is completely weather and temperature dependent.

3.2 INSPECTION

- A. General: Conduct a pre-installation conference with the Commissioner prior to construction. Furnish the Engineer a copy of the recommended procedures and apply the overlay system according to the manufacturer's instructions.
- B. Examine the areas and conditions where miscellaneous specialties are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the work.
- C. Coordinate as required with other trades to ensure proper and adequate provision in the work of those trades for interface with the work of this Section.
- D. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.

3.3 PREPARATION

- A. For Older Asphalt Surfaces (>90 Days Old), the surface shall be broomed and air blown. If the surface is excessively dirty as determined by the Commissioner, the surface should be power-washed and completely dried prior to installation. (Asphalt must be installed a minimum of 90 days prior to overlay application).
- B. The overlay application equipment is allowed to drive on the surface during application provided precautions have been taken to insure that the surface will not become contaminated, as approved by manufacturer's representative on site.
- C. All surfaces to be treated shall be dry at the time of application. Immediately before the application of any liquids, all prepared surfaces shall be cleaned with compressed air to remove dust and debris.
 - 1. The Commissioner may consider alternate surface preparation methods per the overlay system manufacturer's recommendations. The Commissioner will approve the final surface profile and bituminous pavement cleanliness prior to the Contractor placing the epoxy overlay.
- D. Installer to protect all joints, castings, curb faces, and adjacent surfaces prior to aggregate overlay installation. All joints and edge lines shall be taped to ensure a crisp straight line, as recommended by manufacturer. Curbs must be taped ¼" above finished grade at bottom of curb to provide a straight surface.

3.4 EXECUTION

- A. Application of the Epoxy Overlay

1. Perform the handling and mixing of the epoxy resin and hardening agent in a safe manner to achieve the desired results according to the manufacturer's instructions. Do not apply the overlay system if one of more of the following occurs:
 - a. If it has rained within 24 hours before application or if rain is forecast (greater than 40%) within eight hours of application
 - b. Ambient air temperature is below 50° F
 - c. Moisture content in the deck exceeds 4.5% measured in accordance with ASTM D4263 or other approved method
 - d. Materials component temperatures below 50° F
2. Application of Liquid: After mixing of the components via the mechanical application equipment, the liquid shall be evenly distributed on the clean, dry surface at the rate recommended by the manufacturer.
3. The number of layers (a minimum of one) and the application rates of the liquid in the various layers shall be as recommended by the manufacturer in order to achieve an average thickness of 60 mls (0.060 inches) (cured) on the surface.
4. After the application of the liquid, the maximum time allowed before broadcasting of the aggregate is as follows:

Above 90°F	10 minutes
80°F to 90°F	15 minutes
70°F to 80°F	20 minutes
60°F to 70°F	25 minutes
50°F to 60°F	35 minutes

5. No vehicle shall be allowed on the overlay during the curing period.
6. Broadcasting into the material shall be by truck-mounted equipment capable of variable width dispensing of the aggregate onto the roadway in a uniform manner as directed or otherwise approved by the manufacturer of the epoxy overlay.
7. The aggregate shall be broadcast in such a manner as to completely cover the substrate so that no wet spots appear, before the polymer begins to gel. The aggregate must be dropped vertically in such a manner that the level of the liquid is not disturbed.
8. Removal of Excess Aggregate: After the overlay has hardened, remove all loose and excess aggregate with a power vacuum, or other manufacturer approved method, shall be made prior to striping and opening to traffic.
9. Provide at least eight hours of curing or the minimum cure as prescribed by the manufacturer prior to opening that section of public or construction traffic. Do not allow traffic on the treated area until recommended by the manufacturer and directed by the Engineer.

3.5 CLEANING AND PROTECTION

- A. After paving, clear surfaces of excess asphaltic concrete and all foreign matter.
- B. Protect new pavement until fully hardened.
- C. Cover openings of drainage structures until permanent covers are placed.

3.6 PAVEMENT STRIPING

- A. Do not apply when air or surface temperatures are below 50 degrees F.
- B. Use appropriate equipment to ensure straight lines, including but not limited to: High pressure pumping system.
- C. Clean with power and hand brooms. Remove all excess aggregate and clean all dirt and debris from surface.
- D. Embed glass beads as per manufacturer's instructions. Beads must be dropped mechanically by appropriate equipment or carefully dropped by hand in a vertical direction. (Throwing the beads in a horizontal direction reduces or eliminates the required reflectivity.)
- E. Mark edges straight and uniform. Comply with manufacturer's recommendations.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 321313

CONCRETE PAVING

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 RELATED SPECIFICATIONS

- A. Sustainability Requirements – Section 013010
- B. Earthwork – Section 312000
- C. Cast in Place Pervious Concrete Paving – Section 321314
- D. Cast in Place Concrete – Section 033000
- E. Ornamental Metals – Section 057000

1.3 REFERENCES

- A. Standard specification-New York City, Department Of Transportation (NYCDOT), Bureau Of Highway Operations.
- B. American Concrete Institute (ACI):
 - 1. Sp66-(88) - ACI Detailing Manual.
- C. American Society For Testing And Materials (ASTM)
 - 1. A185 - Standard Specification For Steel Welded Wire, Fabric, Plain For Concrete Reinforcement.
 - 2. C31 - Standard Methods Of Making And Curing Concrete Test Specimens In The Field.
 - 3. C33 - Standard Specification For Concrete Aggregates.
 - 4. C78 - Standard Test Method For Flexural Strength Of Concrete (Using Simple Beam With Third-Point Loading).
 - 5. C94 - Standard Specification For Ready-Mixed Concrete.
 - 6. C150 - Standard Specification For Portland Cement.
 - 7. C173 - Standard Test Method For Air Content Of Freshly Mixed Concrete By The Volumetric Method.
 - 8. C494 - Standard Specification For Chemical Admixtures For Concrete.

D. Concrete Reinforcing Steel Institute (Crsi)

1. MSP - Manual Of Standard Practice.

1.4 SUBMITTALS

A. Submittals shall include, but not be limited to:

1. Qualification Data for Installer, manufacturer and testing agency
2. Welding certificates
3. Material certificates: submit at least 15 days prior to installation of materials, material data and certificates signed by manufacturer and contractor, certifying that materials comply with, or exceed, specified requirements.
 - a. Cementitious materials.
 - b. Admixtures.
 - c. Steel reinforcement and accessories.
 - d. Fiber reinforcement.
 - e. Curing compounds.
 - f. Joint filler material & backer rod
 - g. Sealant
4. Material Test Reports: For the following, from a qualified testing agency, indicating compliance with requirements:
 - a. Aggregates.
5. Concrete mix reports: submit at least 15 days before placing concrete, reports for each concrete mix type that contains the information specified herein.
6. Laboratory reports: submit results of tests performed within one working day after tests are performed.
7. Concrete repairs: submit repair procedures, including materials and methods to the engineer for approval.
8. Shop Drawings: submit shop drawings showing concrete paving, including fabrication, placement, and support of concrete reinforcement, and location of proposed construction joints, control joints (sawed), isolation and expansion joints. Shop drawings will show all locations of proposed concrete paving and concrete plank paving with pervious joints in relation to other built and proposed work, including but not limited to: buildings, walls, curbs, utilities, signage, hydrants, bike racks, etc, as measured on site. Comply with CRSI Manual Of Standard Practice and ACI Sp66.
9. Submit actual samples of the sealant for color selection by the Commissioner.
10. Submit samples as follows for concrete paving and concrete plank pavement for approval by the Commissioner.

- a. (quantity 3) 12 inch x 12 inch x minimum 2inch slab of approved design mix with light, medium, and heavy exposed aggregate finishes.
- b. Use specified form material, concrete mix, aggregate and color admixture, as specified herein.
- c. Finish with finish treatments specified herein.

B. LEED submittal requirements

1. For all installed products and materials of this section, complete the materials reporting form (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: the contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
- B. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."

- C. Testing Agency Qualifications: An independent agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
- D. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from single source, and obtain admixtures from single source from single manufacturer.
- E. Welding Qualifications: Qualify procedures and personnel according to AWS D1.4/D 1.4M, "Structural Welding Code - Reinforcing Steel."
- F. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 - 1. ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
- G. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.
- H. The contractor shall conform to the requirements of Specification 033000 – Cast-In-Place Concrete.
- I. Contractor to perform Field Tests as per paragraph 3.4 Field Test Specimens herein.
- J. Mock up for concrete plank paving for approval by the Commissioner: An approved mockup may be incorporated into the work: An unapproved mockup will require additional mockups until acceptance by the Commissioner.
 - 1. Minimum (quantity 3) 3' – 2-1/2" x 11 – 6" x 6" thick plank slabs on grade with specified finish. Place three plank sections in typical configuration shown in drawings.
 - 2. This mock-up is to include the 6" wide cast in place pervious concrete joint, which is located between the planks. Refer to the cast in place pervious concrete specification section for concrete mix, color and finish.
 - 3. This mockup is to include one 'small trench drain'. See Specification 057000 Ornamental Metals.

1.6 LEED PERFORMANCE REQUIREMENTS

- A. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the structural engineer. Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.
- B. Structural steel (i.e. reinforcement bar, wire mesh, ladders) used in this section shall contain a minimum of 75% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials).

Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.

- C. Concrete paving shall have a minimum Solar Reflective Index (SRI) value of 29.

PART 2 PRODUCTS

2.1 REINFORCING MATERIALS

- A. Welded wire, fabric: ASTM A185, sheet type only. Ensure that sheets are free from loose flaky rust, loose scale, oil, grease, mud, or other coatings that might reduce the bond with concrete.
- B. Dowels: furnish epoxy coated steel bars conforming to ASTM A615, Grade 60. Fabricate dowels or cut to length at the shop or mill prior to delivery to the site. Ensure that dowels are free of loose flaky rust and scale, clean and straight. Before delivery, paint a minimum of two thirds the length of each dowel with one coat of epoxy paint. Shear dowels to length provided that the deformation from true shape caused by shearing does not exceed 0.04 inch on the diameter of the dowel and does not extend more than 0.04 inch from the end of the dowel.
- C. Support for reinforcement: conform to recommendations by CRSI: Manual Of Standard Practice.

2.2 CONCRETE MATERIALS

- A. Portland cement: White Cement - Lehigh Portland/Type I/II ASTM C150. Do not use air entraining cement.
- B. Aggregates: ASTM C33 and the requirements specified herein.
 - 1. Granite Aggregate for Exposed Aggregate Surfaces shall be 3/8" Blend #1 Coarse Aggregate Mount Airy from The North Carolina Granite Corporation. Contact: Richard Zinmeister, Tel: 336 719 2624 or William Swift, Tel: 336 719 2653
Or approved equal.
- C. Admixtures
 - 1. Color Pigment:
 - a. Pigment must be certified to be compatible with the cement, aggregates, and all other constituent materials.
 - b. Pigment shall be manufactured from one production run, shall have integral dispersal agents, and shall be packaged in dissolvable bags for the treatment of one yard. Color shall be as selected and approved by the Commissioner.
 - 1). Pigment shall be white cement + color admixture:
Color: 3611 - Oyster White, Solar Reflective Index: 68
 - (a). L.M. Scofield Company
 - (b). Davis Colors
 - (c). Solomon Colors, Inc

Or Approved Equal

2. Curing Materials: Wet cotton mats
3. Retarders: Retarding admixtures meeting the requirements established in ASTM C494, Type B or D. Use retarders only with prior written approval of the Engineer.
4. Exposed Retarder for Concrete Surfaces: Retarder shall be "Rugasol-S" as manufactured by Sika Corporation: 'Surface Retarder-S' by Euclid Chemical Corp or approved equal. Type and amount of material, to treat the surface with the specified exposure, shall be as recommended by the manufacturer.
5. Protective Coating
 - a. Exposed aggregate flatwork sealer shall be a penetrating compound and shall have a VOC content of less than 250 grams per liter and be approved by color additive manufacturer for use with colored concrete.
 - 1). Product: Sealer shall be Scofield Repello as manufactured by the L.M. Scofield Company, Douglasville, Georgia, or approved equal.
 - 2). Available from:
 - (a). Raw, 2800 College Point Ave, College Point NY 718 461 2200
 - (b). Extech, 41-39 Avenue K, Newark NJ, 973 274 3340
 - (c). Legge/Colonial Concrete, 81 Clay St, Newark NJ, 201 280 2170

D. Joints

1. Sawed Control Joints, as per the drawings and this specification, see Execution herein.
2. Expansion and Isolation Joints –
Pre-molded bituminous fiber joint filler system, with a bond breaker and sealant
 - a. Expansion and Isolation Joint Filler Strips: ASTM D 1752, Closed cell flexible foam expansion joint filler, compatible with sealants, shall be installed as recommended by manufacturer.
 - b. Bond Breaker: Joint bond breaker, polyethylene tape or expanded closed cell polyethylene foam backer rod, shall be installed as recommended by manufacturer.
 - c. Sealant: Prepared expansion and Isolation joints shall be coated with a primer followed by installation of a bond breaker and a self-leveling two-component polyurethane-based elastomeric sealant. Color of sealant shall match color of adjacent paving, as approved by the Commissioner.

- E. Water: fresh and free from injurious amounts of oil, acid, salt, alkali, organic matter, or other deleterious substances.

2.3 COMPACTED AGGREGATE SUBBASE

- A. Compacted aggregate subbase: Broken stone, NYCDOT, Bureau of Highway Operations Standard Specifications, Section 2.02, Aggregate-Coarse, Type 1, Grade B, Sizes No. 1, No. 2 and No. 4. Provide bottom course consisting of a uniform mixture of broken stone, Size Nos. 1 and 2, and add No. 4 as a filler after the coarser mixture has been rolled and compacted.

2.4 PROPORTIONING AND DESIGN OF MIXES

- A. Mix design criteria:
 - 1. Mix shall include a Medium Range Water Reducing admixture with a final slump of 5" +/- 1/2".
 - 2. Air Entraining Admixture: shall be in all concrete exposed to weather conditions in the finished work.
 - 3. Air Content: 6% +/- 1% at point of delivery for 3/8" nominal maximum aggregate size.
 - 4. Coarse aggregate shall be 3/8" Blend #1 Mount Airy Granite graded for concrete.
 - 5. Compressive Strength (28 days): 4000 PSI strength minimum

2.5 CONCRETE MIXING

- A. Refer to Specification Section 033000, Cast in Place Concrete.

2.6 EQUIPMENT, APPROVAL AND MAINTENANCE

- A. Furnish dependable equipment appropriate and adequate to meet approved plan and schedule of work. Assemble equipment sufficiently early before start of paving to permit thorough inspection, calibration of weighing and measuring devices, and adjustment of parts. Equipment shall be subject to the approval of the Engineer. Maintain equipment in good working condition at all times.
- B. Furnish and maintain at the jobsite, in good condition, one 12-foot straightedge for each paving spread in testing hardened Portland cement concrete surfaces. Straightedges constructed of aluminum or magnesium alloy must have blades of box or box-girder cross section with flat bottom, adequately reinforced to ensure rigidity and accuracy. The straightedges must have handles for operation on the pavement.

PART 3 EXECUTION

3.1 GRADE CONTROL

- A. Establish and maintain lines and grades shown, by means of line and grade stakes placed at the jobsite.

3.2 PREPARATION

- A. Proof-roll prepared subbase surface to check for unstable areas and to verify need for additional compaction. Proceed with pavement work only after non-complying conditions have been corrected and subgrade is ready to receive pavement.
- B. Protect adjacent construction from discoloration and spillage during application of color hardeners, release agents, curing compounds, and sealers.

3.3 FORMWORK

- A. Design, erect, shore, brace, and maintain formwork, according to ACI 301, to support vertical, lateral, static, and dynamic loads, and construction loads that might be applied, until structure can support such loads.
- B. Construct formwork so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of ACI 117.
- C. Construct forms tight enough to prevent loss of concrete mortar.
- D. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.
 - 1. Install keyways, reglets, recesses, and the like, for easy removal.
 - 2. Do not use rust-stained steel form-facing material.
- E. Set edge forms, bulkheads, and intermediate screed strips for slabs to achieve required elevations and slopes in finished concrete surfaces. Provide and secure units to support screed strips; use strike-off templates or compacting-type screeds.
- F. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
- G. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
- H. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

3.4 FIELD TEST SPECIMENS

- A. General: Prepare concrete samples in the field to determine slump, air content, and strength of concrete. Make test specimens to determine conformance with strength requirements and, when required, to determine the time at which pavements may be placed in service. Determine air content in conformance with ASTM C173. Mold test specimens and cure in conformance with ASTM C31. Furnish materials, labor, and facilities required for molding, curing, and protecting test specimens at the site and under the supervision of the Engineer. Curing facilities for test specimens include furnishing and operating water tanks equipped with temperature-control devices that automatically maintain the temperature of the water at 73 degrees F plus or minus 5

degrees F. Also, furnish and maintain at site, boxes or other facilities suitable for storing specimens while in mold at temperature of 73 degrees F plus or minus 10 degrees F. Perform tests of fresh concrete and of hardened concrete specimens.

- B. Specimens for Strength Tests: Make a group of test specimens for every 400 square yards of pavement placed. As a minimum, however, make a set of test specimens each shift that concrete is placed. Mold each group of test specimens from the same batch of concrete. A group of specimen consist of four (4) beams to be tested as follows: One specimen at 7 days of age, two at 28 days, and one as a spare. Perform strength tests in accordance with ASTM C78, flexural tests from concrete beams.

3.5 JOINTS

- A. General: Construct joints and tool edges true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated on the drawings.
- B. Construction Joints: Set construction joints at side and end terminous of pavement and at locations where pavement operations are stopped for more than one-half hour, unless pavement terminates at a planned joint. When concrete placement cannot be continued, install the transverse construction joint within the slab unit but not less than 10 feet from a planned transverse joint. Dowel transverse construction joints as shown. When the construction joint is located at planned transverse joints, plant $\frac{1}{2}$ of each dowel and oil to permit movement at the joint. Edge joints and saw to obtain a groove at the top conforming to the details and dimensions indicated. When concrete placing is resumed, use planned joint spacing beginning with the first regularly scheduled transverse joint.
 - 1. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of strip pavements, unless otherwise indicted.
 - 2. Install dowels, keys or keys with tie bars in the longitudinal construction joints as specified herein.
- C. Isolation and Expansion Joints:
 - 1. Form isolation joints of preformed joint filler strips abutting concrete curbs, catch basins, manholes, inlets, walks, other fixed objects, and where indicated.
 - 2. Locate expansion joints at intervals of 20 feet unless otherwise indicated.
 - 3. Extend filler joints full width and depth of joint, terminating flush with finished concrete surface, unless otherwise indicated.
 - 4. Furnish joint fillers in one-piece lengths for full width being placed where possible. Where more than one length is required, lace or clip joint-filler sections together.
 - 5. Protect top edge of joint filler during concrete placement with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

6. Install Bond Breaker, expanded closed cell polyethylene foam backer rod or polyethylene tape, as recommended by manufacturer.
 7. Install approved Sealant as recommended by the manufacturer. Sealant shall be applied cleanly without deviating more than 1/8" from the joint or from the terminations. Any sealant on adjacent paving shall be removed carefully without damaging the adjacent surface.
- D. Contraction Joints: Sawed transverse and longitudinal contraction joints shall be of the weakened-plane or dummy-groove type. Construct transverse contraction joint, as specified herein.
1. Construct sawed joints by sawing a groove in the hardened concrete with a 1/8 inch thick blade to the full depth as indicated on the drawings and specified herein.
 - a. After expiration of curing period, widen upper portion of groove by sawing to width and depth indicate on the drawings.
 - b. Vary time of sawing depending on existing and anticipated weather conditions, so as to prevent uncontrolled cracking of pavement.
 - c. Commence sawing of joints as soon as concrete has hardened sufficiently to permit cutting concrete without chipping, spalling, or tearing.
 - d. Inspect sawed faces of joints for undercutting or washing of the concrete due to early sawing.
 - e. Delay sawing if undercutting or washing is sufficiently deep to cause structural weakness or excessive roughness in the joint.
 - f. Saw joints at required spacing consecutively in sequence of concrete placement. Use a chalk line or other suitable guide to mark alignment of joint.
 - g. The saw cut shall not vary more than 1/2 inch from the true joint alignment.
 - h. Before sawing a joint, examine concrete closely for cracks.
 - i. Saw joint if a crack has occurred near the joint location.
 - j. Discontinue sawing when a crack develops ahead of the saw cut.
 - k. Workmen and inspectors must wear clean, rubber-soled footwear.
 - l. Limit number of persons walking on the pavement to those actually performing the sawing operation. Immediately after joint is sawed, thoroughly flush saw cut and adjacent concrete surface with water until all waste from sawing is removed from the joint.
 - m. Respray membrane-cured surface damaged during the sawing operations as soon as surface become dry.

E. Dowels and Tie Bars - Fixed Form Installation

1. Use bonded-in-place method.
2. Place tie bars and dowels across joints where indicated on the drawings.
3. Correctly align and securely hold in proper horizontal and vertical position during placing and finishing operations.
4. Install tie bar in front of paver along longitudinal contraction joints, by insertion into the unconsolidated concrete.
5. Do not install by removing and replacing dowels in preformed holes.

6. Hold dowel assemblies securely in proper location by means of suitable pins or anchors.
7. Furnish an approved template for checking the position of dowels.
8. Paint the portion of each dowel intended to move within the concrete or expansion cap with one coat of red-lead or blue-lead paint.
9. Wipe clean the painted portion and coat with a thin even film of lubricating oil before concrete is placed.

3.6 PLACING

- A. General: Do not place steel or concrete until tests on underlying courses are completed and the courses approved by the Engineer.
- B. Placing Welded Wire Fabric: Furnish and install the wire fabric shown on the drawings. Position wire fabric on suitable metal chairs prior to concrete placement. Lap one spacing of wire fabric pattern with transverse reinforcing members touching and wire together.
- C. Placing Concrete
 1. Deposit concrete as close as possible to its final position in pavement cross section.
 2. Place concrete continuously and at a uniform rate without unscheduled stops except for equipment failure or other emergencies.
 3. Do not drop concrete freely more than 3 feet.
 4. Do not allow workmen with foreign material on their footwear or construction equipment that might deposit foreign material to walk or operate in or on the concrete during placement and finishing operations.
 5. Do not use re-tempered concrete or concrete which is non-plastic and unworkable, or does not meet the specified mix properties, or which is contaminated by foreign materials.
- D. Vibration
 1. Consolidate concrete with mechanical vibrating equipment during spreading.
 2. Supplement consolidation by hand-spading, rodding, or tamping to maintain concrete members free of honeycomb, rock pockets and voids.
 3. Do not insert vibrators into lower layers of concrete that have begun to set.
 4. Do not allow vibrators to touch forms, tie bars, dowels, or other embedded items.
 5. Bring pavement surfaces to correct elevation and strike off.
 6. Use bull float, darby or highway straightedge to level surface free of lumps or hollows.
- E. Placing During Cold Weather
 1. Discontinue concrete placement when air temperature reaches 40 degrees F and is falling.
 2. Do not resume until air temperature reaches 35 degrees F and is rising.

3. Furnish and install covers for maintaining concrete at a temperature of at least 50 degrees F for not less than 72 hours after placing.
- F. Placing During Warm Weather: During periods of warm weather when the maximum daily air temperature is likely to exceed 85° F.
1. Sprinkle forms and/or underlying material with water immediately before concrete is placed.
 2. Place concrete at coolest temperature practicable, but in no case will the temperature of concrete when placed exceed 90° F.
 3. Cool aggregates and/or mix with water as necessary.
 4. Chipped ice in mixing water may be required to cool concrete, subject to approval of the Engineer.
 5. Place concrete continuously and rapidly at a rate of not less than 100 feet of paving lane per hour.
 6. Alternately, place concrete as individual slabs in checkerboard pattern.
 7. Keep finished surface of newly laid pavement damp by applying a water fog or mist with approved spraying equipment.

3.7 FINISHING OPERATIONS

- A. Machine or Hand Finish: The sequence of operations is as follows: finishing, floating, straight-edging, texturing, and edging of joints.
- B. Finishing and Floating
1. As soon as placed and vibrated, strike-off concrete and screed to crown and cross section and to such elevation above grade that, when consolidated and finished, surface of pavement will be at the required elevation.
 2. Tamp surface until required compaction and reduction of internal and surface voids are accomplished.
 3. Immediately following final tamping of surface, float pavement longitudinally from bridges resting on side forms and spanning but not touching concrete.
 4. If necessary, place and screed additional concrete, and then float until a satisfactory surface is produced.
 5. Advance floating operation not more than half the length of float, and continue floating over new and previously floated surfaces.
- C. Surface Correction and Testing
1. After finishing and floating, but while concrete is still plastic, eliminate minor irregularities and score marks in pavement surface by means of straightedges.
 2. Operate straightedges from sides of pavement or from bridges.
 3. Test surface for trueness with a 12-foot straightedge held in successive positions parallel and at right angles to centerline of pavement.
 4. Cover whole area as necessary to detect variations.
 5. Advance straightedge along pavement in successive stages of not more than one-half the length of the straightedge.

6. Fill depressions with freshly mixed concrete, strike off, consolidate, and refinish.
7. Strike-off projections above required elevations and refinish.
8. Continue straightedge testing and finishing, until entire surface of the concrete is free from observable departure and conforms to surface requirements specified herein.

D. Finish:

1. Cast concrete with approved mix as specified herein:
 2. Apply retardant application. Type and amount of material to treat the surface shall be as recommended by the manufacturer to achieve the exposure. Aggregate exposure of the coarse aggregate shall be as approved by the Commissioner per the approved samples.
 3. After the concrete has set, but is still pliable, wash the retarded material from the surface to expose the aggregate. Aggregate exposure to match the approved sample.
- E. Edging: After texturing, carefully finish edge of pavement along forms and at joints, where indicated or directed by the Engineer, with an edging tool to form a smooth rounded surface of the required radius. Eliminate tool marks and smooth edges true to line.

3.8 CURING AND PROTECTION

- A. General: Protect concrete against loss of moisture and rapid temperature changes for at least seven (7) days from the beginning of curing operation. Protect unhardened concrete from rain, flowing water and wind. Furnish and install covers as necessary to prevent cracking of the pavement due to temperature changes. If any selected method of curing does not afford the proper curing and protection against concrete cracking and pavement is damaged, remove and replace damaged pavement and employ another method of curing as directed by the Engineer.
- B. Curing Methods: Cure concrete for at least seven days by one or more of the following methods:
1. Keep concrete surface continuously wet by covering with water.
 2. Cover concrete surface with specified mat, saturated and continuously wet. Ensure that mat covers concrete surfaces and edges, with 6-inches lap over adjacent mat.
 3. Apply water-fog spray continuously to concrete surface.

3.9 PLAN GRADE AND SURFACE-SMOOTHNESS REQUIREMENTS

- A. Ensure that finished surfaces of pavements, when tested as specified herein, conform to grade line and elevations shown and surface-smoothness requirements specified herein.
- B. Plan Grade: Ensure that finished surfaces of pavements do not vary more than ½ inch above or below plan grade line or elevation established and approved at jobsite. Finished surfaces of new abutting pavements will coincide at their juncture.

- C. Surface Smoothness: Ensure that finished surfaces of pavements have no abrupt change of $\frac{1}{8}$ inch or more and do not deviate from the testing edge of an approved 12-foot straightedge more than $\frac{1}{4}$ inch.

3.10 SURFACE TEST, DEFICIENCIES AND CORRECTIONS

- A. Test finished surface for conformance with plan grade and surface smoothness requirements.
- B. Grade Conformance Tests: Check pavement for conformance with plan grade requirements. Test finished surface of each approved pavement area by running lines of levels at intervals of 25 feet or less longitudinally and transversely to determine elevation of completed pavement. Furnish level surveys to Engineer as surveys are completed. Within 30 days after receipt of level surveys the Engineer will inform this Contractor in writing of areas defective in plan-grade requirements.
- C. Surface-Smoothness Determinations: After concrete has hardened sufficiently to permit walking thereon, but not later than 36 hours after placement, test surface of pavement with a straightedge 12-foot. Test across longitudinal construction joints within 48 hours after the end of the curing period of the concrete placed in the adjacent lane. Inform Engineer when straightedge testing is planned. Operate straightedge in such manner as to reveal surface irregularities exceeding tolerances specified herein. Test entire area of pavement in both longitudinal and transverse direction on parallel lines 10 feet or less apart. Hold straightedge in contact with surface and move ahead one-half the length of the straightedge for each successive measurement. Carry lines of straightedging continuously across joints.

3.11 PAVEMENT TOLERANCES

- A. Comply with the following tolerances:
 - 1. Elevation: $\frac{1}{8}$ inch.
 - 2. Horizontal Perpendicular Alignments: $\frac{1}{8}$ inch
 - 3. Thickness: Plus $\frac{3}{8}$ inch, minus $\frac{1}{8}$ inch.
 - 4. Surface: Gap below 10 foot-long, unlevelled straightedge not to exceed $\frac{1}{8}$ inch.
 - 5. Lateral Alignment and Space of Dowels: 1 inch.
 - 6. Vertical Alignment of Dowels: $\frac{1}{4}$ inch.
 - 7. Alignment of Dowel-Bar End Relative to Line Perpendicular to Pavement Edge: Length of dowel $\frac{1}{4}$ inch per 12 inches.
 - 8. Joint Spacing: 1 inch
 - 9. Contraction Joint Depth: Plus $\frac{1}{4}$ inch, no minus.
 - 10. Joint Width: Plus $\frac{1}{8}$ inch, no minus.
 - 11. No honeycombs at finish surface concrete will be accepted.

3.12 REMOVAL AND REPLACEMENT OF DEFECTIVE PAVEMENT AREAS

- A. Remove defective pavement areas and replace as specified herein with pavements of thickness and quality required by these specifications.
- B. In no case will the removal and replacement of concrete result in a slab less than the full paving width or a joint less than 10 feet from a regularly scheduled transverse joint.
- C. Remove defective pavement carefully so that adjacent pavement is not damaged and existing keys or dowels at the joint are left intact.
- D. When a portion of an un-fractured slab is replaced, make a saw cut 2 inches deep transversely across the slab in the required location.
- E. Remove concrete and provide an essentially vertical face in the remaining portion of the slab.
- F. Prior to placement of fresh concrete, clean face of slab of debris and loose concrete, and then thoroughly coat with a thixotropic epoxy-resin grout manufactured specifically for bonding fresh Portland cement concrete to existing hardened concrete.
- G. Apply epoxy resin coating approximately 1/16 inch thick, by scrubbing a thin coat of epoxy grout into the surface with a stiff-bristle brush followed by a second application.
- H. Place strips of polyethylene sheeting on vertical joint faces of adjacent slabs at juncture with slab to be patched as a bond-breaking medium.
- I. Place fresh dry packed Portland cement concrete while the epoxy resin is still tacky and in such a manner that grout coating will not be removed.
- J. Construct longitudinal and transverse joints of the replaced slab or portion thereof as indicated on the drawings.
- K. No payment will be made for the defective pavements removed and replaced nor for the cost of removing the defective pavements.

3.13 PAVEMENT PROTECTION

- A. Protect pavement against damage prior to final acceptance by the Engineer. Repair any damage to pavement before final acceptance at no cost to the City. Do not permit construction traffic on concrete pavement. Protect against spillage of any deleterious materials.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 321314

CAST IN PLACE PERVIOUS CONCRETE PAVING

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Subgrade preparation
 - 2. Cast-In-Place Pervious Concrete paving with Integral Pigment.
 - 3. Furnishing or installing curing materials, reinforcing bars or carbon fiber fabric, concrete joints, keyways, thickened edges of concrete at joints, joint material, joint sealant, or sawcutting joints, used in construction of Portland cement pervious pavement.

1.3 RELATED SECTIONS

- A. Sustainability Requirements - Section 013010
- B. Geosynthetic Soil Stabilization and Layer Separation - Section 313219
- C. Earthwork - Section 312000
- D. Concrete Paving - Section 321313
- E. Planting Soil Mixes - Section 329113

1.4 REFERENCES

1.5 SUBMITTALS

- A. Qualification Data for installer, manufacturer and testing agency.
- B. Product Data
 - 1. Product Data: For each type of manufactured material and product indicated.
 - 2. Manufacturer's specifications and other data needed to prove compliance with the specified requirements.
 - 3. Design Mixes: For each concrete pavement mix. Include alternate mix designs when characteristics of materials, project conditions, weather, test results, or other circumstances warrant adjustments.
 - 4. Material Certificates: Signed by manufacturers certifying that each of the following materials complies with requirements:
 - a. Cementitious materials and aggregates
 - b. Steel reinforcement and reinforcement accessories
 - c. Fiber reinforcement
 - d. Admixtures
 - e. Applied Finish Materials
 - f. Curing Compounds

- C. Samples: Samples of pigmented pervious concrete paving.
 - a. Provide one sample (3' x 3' x 12" as required in ACI522.1-08 for visual inspection.)
 - b. Provide one sample (3' x 3' x 12" as required in ACI522.1-08 for core sampling requirements.)

- D. LEED Submittal Requirements
 - 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and materials-only cost.
 - b. The percentages (by weight) of post-consumer and /or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 - 2. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g. recycled content, VOC content).
 - 3. For products and materials in LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed on the project.
 - 4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.6 QUALITY ASSURANCE

- A. Perform work of this section in accordance with ACI 522.1-13.
- B. Follow recommendations of ACI 306R when concreting during cold weather.
- C. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work in this section.
- D. Contractor Qualifications
 - 1. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.

2. If the placing contractor and concrete producer have insufficient experience with Portland Cement pervious concrete pavement, the placing contractor shall retain an experienced consultant or NRMCA Certified Pervious Craftsman to monitor production, handling, and placement operations at the contractor's expense.
- E. Testing Agency Qualifications: An independent agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
 - F. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from single source, and obtain admixtures from single source from single manufacturer.
 - G. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 1. ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
 - H. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.
 - I. Test Panels:
 1. Regardless of qualification, Contractor is to place, joint and cure two test panels, each to be a minimum of 225 sq. ft. at the required project thickness to demonstrate to the Commissioner's satisfaction that in-place unit weights can be achieved and a satisfactory pavement can be installed at the site location.
 2. Test panels must be placed outside of the specified Portland Cement pervious locations on the project or at another test site. Test panels are too large to be used as part of the actual work.
 3. Test panels shall be tested for thickness in accordance with ASTM C 1688 Density and Void Content of Freshly Mixed Pervious Concrete and for core unit weight in accordance with ASTM C 1754.
 4. Satisfactory performance of the test panels will be determined by:
 - a. Compacted thickness within a 1/4" tolerance of specified thickness.
 - b. Void Structure: 17% minimum; 23% maximum.
 - c. Unit weight plus or minus 5 pcf of the design unit weight.
 - d. If measured void structure falls below 13% or if measured thickness is greater than 1/4" less than the specified thickness or if measured weight falls less than 5 pcf below unit weight, the test panel shall be removed at the contractor's expense and disposed of in an approved landfill.
 - J. Mock-ups – Contractor to provide the pervious paving mockup for Commissioner's approval as per Specification 321313 Concrete Paving.

1.7 PERFORMANCE REQUIREMENTS

- A. Abrasion Resistance:

1. ADA Requirements: Minimum value of 0.6 Coefficient of Friction for ADA accessible level surfaces (0-5%) and 0.8 Coefficient of Friction for ADA ramp conditions (5%+).

1.8 LEED PERFORMANCE REQUIREMENTS

- A. Concrete mix used in this section shall contain a minimum of 20% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the structural engineer. Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.
- B. Structural steel (i.e. reinforcement bar, wire mesh, ladders) used in this section shall contain a minimum of 75% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Specification Section 013010 Project Specific Sustainability Requirements.

1.9 PROJECT CONDITIONS

A. Protection of Existing Improvements

1. Protect adjacent work from splashing of paving materials. Remove all stains from exposed surfaces of paving, structures, and grounds. Remove all waste and spillage.
2. Do not damage or disturb existing improvements or vegetation. Provide suitable protection where required before starting work and maintain protection throughout the course of the work.
3. Restore damaged improvements, including existing paving on or adjacent to the site that has been damaged as a result of construction work, to their original condition or repair as directed to the satisfaction of the Owner, and authority having jurisdiction at no additional cost.

B. Safety and Traffic Control

1. Notify and cooperate with local authorities and other organizations having jurisdiction when construction work will interfere with existing roads and traffic.
2. Provide temporary barriers, signs, warning lights, flagmen, and other protections
3. As required to assure the safety of persons and vehicles around the construction area and to organize the smooth flow of traffic.

C. Weather Limitations

1. Do not place Portland cement pervious concrete pavement mixtures when the ambient temperature is 40 degrees Fahrenheit or lower, unless otherwise permitted in writing by the Engineer.

1.10 PRE PAVING CONFERENCE

- A. A pre-paving conference with the engineer shall be held two (2) days prior to beginning placing the pervious concrete. The contractor shall have the pervious concrete consultant, ready mix supplier, the foreman and the entire concrete crew that will form and place the concrete in attendance at this meeting. A pre-paving conference with the engineer shall be held two (2) days prior to beginning placing the pervious concrete. The contractor shall have the pervious concrete consultant, ready mix supplier, the foreman and the entire concrete crew that will form and place the concrete in attendance at this meeting.

PART 2 - PRODUCTS

2.1 CONCRETE MIX DESIGN

- A. Contractor shall furnish a proposed mix design with proportions of materials prior to commencement of work. The data shall include unit weights determined in accordance with ASTM C 1688.

2.2 PORTLAND CEMENT PERVIOUS CONCRETE

A. Cement:

Portland Cement Type I or II conforming to ASTM C 150 or Portland Cement Type IP or IS conforming to ASTM C 595. Slag or Flyash may be used as part of the total cementitious content.

B. Aggregate:

Use #9 (1/4") Washed, crushed coarse aggregate with a minimum void content per ASTM C29 of 40%. If other gradation of aggregate are to be used, submit data on proposed material to the City of New York for approval.

C. Admixtures:

1. The following admixtures may be used as needed:

- a. Type A/F Water Reducing – ASTM C 494.
- b. Air Entraining Agent – ASTM C 260.
May be used to improve resistance to freeze/thaw cycles.
- c. A viscosity modifier.
Used to reduce paste drain down caused by using a dirty aggregate
- d. Buckeye Cellulose fibers
Dosed at the rate of 3lbs per cubic yard

2. The following admixtures shall be used:

- a. A hydration stabilizer that also meets the requirements of ASTM C 494 Type B Retarding or Type D Water Reducing/Retarding admixtures. This stabilizer suspends cement hydration by forming a protective barrier around the cementitious particles, which delays the particles initial set.
- b. Internal Curing Admixutre - reduces the amount of cementitious material needed as well as the need for a viscosity modifier.

- 1). Product: HydroMax Internal Curing Admixture
- 2). Rate: Dosed at the rate of 1.5 oz/cwt of total cementitious material.
- 3). Available from:
 - (a). Concrete Management Solutions, 5449 Montville Drive, Medina, OH 44256, 216-373-6927, www.concretemanagementsolutions.com
 - (b). Murray Decorative Concrete Supply, 8329 Monticello Road, Shawnee Mission, KS 66227, 913.422.4443, www.murraydecorative.com
 - (c). ProContractor Supply, P.O. Box 87, Oakwood, GA 30566, 800.604.0088, www.procontractorsupplyinc.com

D. Integral Color Admixture:

1. Color Pigment:

- a. Pigment must be certified to be compatible with the cement, aggregates, and all other constituent materials.
- b. Pigment shall be manufactured from one production run, shall have integral dispersal agents, and shall be packaged in dissolvable bags for the treatment of one yard. Color shall be as selected and approved by the Commissioner.
- c. Color: C-14 French Gray or approved equal
- d. Manufacturers
 - 1). LM. Scofield Company
 - 2). Davis Colors
 - 3). Solomon Colors, Inc.

E. Water: Potable water shall be used.

F. Proportions:

1. Cement Content: For pavements subjected to vehicular traffic loading, the total cementitious material shall not be less than 480 lbs. per cu. yd. For other pavement areas not subject to vehicular traffic loading, the total cementitious material shall not be less than 450 lbs. per cu. yd.
2. Aggregate Content: the volume of aggregate per cu. yd. shall be equal to 27 cu. ft. when calculated as a function of the unit weight determined in accordance with ASTM C 1688.
 - a. An aggregate/cement ratio range of 4:1 to 4.5:1.
 - b. A unit weight range of 105 lbs/cu. ft. to 140 lbs/cu. ft. per ASTM C 1688.
 - c. Voids of 17% to 23%.
3. Admixtures: Shall be used in accordance with the manufacturer's instructions and recommendations.
4. Mix Water: Mix water shall be such that the cement paste displays a wet metallic sheen without causing the paste to flow from the aggregate. (Mix water yielding a cement paste with a dull-dry appearance has insufficient water for hydration).
 - a. Water cement ratios can range from 0.30 to 0.38.

- b. Insufficient water results in inconsistency in the mix and poor bond strength. High water content results in the paste sealing the void system primarily at the bottom and poor surface bond.

2.3 COMPACTED AGGREGATE SUBBASE

- A. Compacted Aggregate Subbase: Broken stone, NYCDOT, Bureau of Highway Operations Standard Specifications, Section 2.02, Aggregate-Coarse, Type 1, Grade B, Sizes No. 1, No. 2 and No. 4. Provide bottom course consisting of a uniform mixture of broken stone, Size Nos. 1 and 2, and add No. 4 as a filler after the coarser mixture has been rolled and compacted.
- B. Filter fabric
- C. Propex PERC Pervious Concrete Infiltration Fabric or approved equal.

2.4 IMPERVIOUS LINER

- A. Permalon, PLY-X 150, or approved equal.

PART 3 – EXECUTION

The City of New York shall be notified at least 24 hours prior to all aggregate subbase installation and pervious paving work

3.1 INSTALLATION

A. Subgrade preparation

1. Existing subgrade under bed areas shall NOT be compacted or subject to excessive construction equipment traffic prior to stone bed placement.
2. Where erosion of subgrade has caused accumulation of fine materials and/or surface ponding, this material shall be removed with light equipment and the underlying soils scarified to a minimum depth of 6 inches with a York rake or equivalent and light tractor.
3. Bring subgrade of stone recharge bed to line, grade, and elevations required.
4. Fill and lightly regrade any areas damaged by erosion, ponding, or traffic compaction before the placing of stone.

B. Aggregate Subbase Installation

1. Upon completion of subgrade work, the Commissioner shall be notified and shall inspect at his discretion before proceeding with recharge bed installation.
2. Filter fabric, pipe, and aggregate subbase shall be placed immediately after approval of subgrade preparation. Any accumulation of debris or sediment which has taken place after approval of subgrade shall be removed prior to installation of filter fabric at no extra cost to the City of New York.

3. Place filter fabric in accordance with manufacturer's standards and recommendations. Adjacent strips of filter fabric shall overlap a minimum of sixteen inches (16"). Secure fabric at least two feet (2') outside of bed and take steps necessary to prevent any runoff or sediment from entering the storage bed. Place impervious liner over geo-textile extending six feet (6') beyond toe of slope face at building face, secure as recommended by manufacturer.
4. Install coarse aggregate in 6 inch maximum lifts. Lightly compact each layer with equipment, keeping equipment movement over storage bed subgrades to a minimum. Install aggregate to grades required on the drawings.
5. Following placement of bed aggregate, the filter fabric shall be folded back along all bed edges to protect from sediment washout along bed edges. At least a two foot (2") strip shall be used to protect beds from adjacent bare soil. This edge strip shall remain in place until all bare soils contiguous to beds are stabilized and vegetated. In addition, hay bales shall be placed at the toe of slopes which may be adjacent to beds to further prevent sediment from washing into beds during site development. As the site is fully stabilized, excess filter fabric along the bed edges can be cut back to gravel edge.

3.2 PORTLAND CEMENT PERVIOUS PAVEMENT CONCRETE MIXING, HAULING AND PLACING:

- A. Mix Time: Central mixed concrete shall be mixed for a minimum of one minute after introduction of all materials into mixer. Truck mixers shall be operated at the speed designated as mixing speed by the manufacturer for 75 to 100 revolutions of the drum.
 1. If a central mixed batch plant is used, the mixer must be rinsed out prior to loading pervious materials if a normal concrete mix was previously batched.
- B. Transportation: The Portland Cement aggregate mixture may be transported by ready mix trucks or dump trucks or mixed on site and should be used within one (1) hour of the introduction of mix water, unless otherwise approved by an engineer. This time can be increased to 180 minutes when utilizing the hydration stabilizer specified above at the proper dosage rate, unless otherwise approved by an engineer.
- C. Each truck should not haul more than two (2) loads before being cycled to another type concrete, unless delivered by dump truck or if a stabilizing hydration agent is used in the pervious concrete mix design or if field experience proves that there is no significant concrete buildup in concrete mixer after delivery.
- D. Prior to placing concrete, the subbase shall be soaked and in a wet condition (no ponding of water) at time of placement. Failure to provide a moist subbase will result in a reduction in strength of the pavement.
- E. Discharge shall be a continuous operation and shall be completed as quickly as possible.
 1. If consolidation occurs during concrete discharge, placement shall be halted and wet concrete removed (this may happen towards the end of some loads).

- F. Concrete shall be deposited as close to its final position as practicable and such that fresh concrete enters the mass of previously placed concrete. The practice of discharging onto subgrade and pulling or shoveling to final placement is not allowed.
- G. Placing and Finishing Equipment: Unless otherwise approved by the City of New York or Commissioner in writing, the Contractor shall provide mechanical equipment of either slipform or form riding with a following compactive unit that will provide a minimum of 10 psi vertical force.
- H. The pervious concrete pavement will be placed to the required cross section and shall not deviate more than +/- 3/8 inch in 10 feet from profile grade.
- I. If placing equipment does not provide the minimum specified vertical force, a full width roller or other full width compaction device that provides sufficient compactive effort shall be used immediately following the strike-off operation.
- J. Strike off the pervious concrete 1/2" to 3/4" above the final grade prior to compaction, if needed, by using either slip-form, form riding vibrating screed, form riding aluminum roller screed or laser screed. Strike off may be done by hand for sidewalks. Care must be taken to avoid filling voids in the concrete.
- K. If vibration, internal or surface applied, is used, it shall be shut off immediately when forward progress is halted for any reason.
- L. The Contractor will be restricted to pavement placement widths of a maximum of fifteen (15') feet unless the Contractor can demonstrate competence to provide pavement placement widths greater than the maximum specified to the satisfaction of the City of New York.

3.3 CURING

- A. Curing procedures shall begin immediately following all finishing operations if PerviousShield (or approved equal) liquid spray on curing compound/densifier is used.
- B. Curing procedures shall be complete within 20 minutes after the final placement operations if polyethylene sheeting is used.
 - 1. The pavement surface shall be covered with a minimum .31 mil thick polyethylene sheet (painters plastic) or other approved covering material prior to final cross rolling of the surface and then covered with a layer of four to six (4 – 6) mil thick polyethylene sheeting. Prior to covering, an evaporative reducer shall be sprayed above the surface when required due to ambient conditions (high temperature, high wind, and low humidity). The cover shall overlap all exposed edges and shall be secured (without using dirt or stone) to prevent dislocation due to winds or adjacent traffic conditions.
- C. Cure Time: Portland Cement Type I, II, or IS – 7 days minimum.
- D. No truck traffic shall be allowed for 10 days (no passenger car/light trucks for 7 days and no pedestrian traffic for 24 hours).

3.4 Jointing

- A. Control (contraction) joints shall be installed as indicated by plans. They shall be installed at a depth of the 1/3 to 1/4 the thickness of the pavement.
- B. These joints can be installed in the plastic concrete or saw cut.
 - 1. If saw cut, the procedure should begin as soon as the pavement has hardened sufficiently to prevent raveling and uncontrolled cracking (normally after curing), minimum of 24 hours after placement.
 - 2. Possible complications from saw cutting include:
 - a. Removal of plastic to perform saw cutting will cause pervious concrete to hydrate too quickly (Not a concern if PerviousShield is used). If plastic is removed to accommodate saw cutting, re-hydrating of pervious concrete is required.
 - b. Walking on pervious concrete too early can damage concrete surface
- C. Transverse construction joints shall be installed whenever placing is suspended a sufficient length of time that concrete may begin to harden.
- D. Isolation (expansion) joints should be used in structure widths exceeding thirty (30) feet or at seventy five (75) feet on sidewalks or when pavement is abutting slabs or other adjoining structures.
- E. Expansion joint material shall be K-form screed rail or approved equal.
- F. To reduce raveling, if transverse or isolation joints are used, or where pervious concrete meets impervious pavement, extra compaction may be necessary.
- G. Additional installation specifications for the pervious concrete provided by the material source and engineer shall be followed strictly.

3.5 PORTLAND CEMENT PERVIOUS PAVEMENT CONCRETE TESTING, INSPECTION, AND ACCEPTANCE

- A. The City of New York will retain an independent testing laboratory.
- B. The testing laboratory shall conform to the applicable requirements of ASTM E 329 "Standard Recommended Practice for Inspection and Testing Agencies for Concrete, Steel, and Bituminous Materials as Used in Construction" and ASTM C 1077 "Standard Practice for Testing Concrete and Concrete Aggregates for use in Construction, and Criteria for Laboratory Evaluation" and shall be inspected and accredited by the Construction Materials Engineering Council, Inc. or by an equivalent recognized national authority.
- C. The Agent of the testing laboratory performing field sampling and testing of concrete shall be certified by the American Concrete Institute as a Concrete Field Testing Technician Grade I, or by a recognized state or national authority for an equivalent level of competence.
- D. Testing and Acceptance:
 - 1. A minimum of 1 gradation test of the subgrade is required every 5000 square feet to determine percent passing the No. 200 sieve per ASTM C 117.

2. A minimum of one test for each load of pervious concrete in accordance with ASTM C 1688 to verify unit weight shall be conducted. Delivered unit weights are to be determined in accordance with ASTM C 1688 using a 0.25 cubic foot cylindrical metal measure. The measure is to be filled and compacted in accordance with ASTM C 1688. The unit weight of the delivered concrete shall be +/- 2.5 pcf of the accepted design unit weight.
 3. It is highly recommended that unit weight testing per ASTM C 1688 be performed on every load of concrete to assure uniformity through the project.
 4. Test panels shall have two cores taken from each panel in accordance to ASTM C 42 at a minimum of seven (7) days after placement of the pervious concrete. The cores shall be measured for thickness, void content and unit weight in accordance with ASTM C1754. Range of satisfactory unit weight values are +/- 5 pcf of the design unit weight.
 5. After a minimum of seven (7) days following each placement, three cores shall be taken in accordance with ASTM C 42. The cores shall be measured for thickness, void content and unit weight determined as described above for test panels. Core holes shall be filled with concrete meeting the pervious design or other concrete material as permitted by the City of New York.
- E. Service: There shall be a service plan submitted to the City of New York to prevent the clogging of the pervious concrete pavement which shall include periodic testing for flowability by the pervious concrete installer prior to the pervious concrete being opened to service, with flow rates reported in writing to the City of New York and again at six (6), twelve (12), eighteen (18) and twenty-four (24) months and again report the results in writing to the City of New York. It is the Contractor's responsibility to help the City of New York to develop a service plan. The City of New York must have a plan and methods to restore flowability if the flow rate drops below 75% of the original rate. Acceptable methods to restore levels of flowability are either to vacuum or powerwash the pervious concrete sections.

END OF SECTION

SECTION 321400

UNIT PAVERS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. The contractor shall furnish, install, complete, test, make ready for operation and maintain concrete unit paver pavement as shown on the Contract Drawings and as specified herein. This section covers:
 - 1. Linear Roof Pavers
 - 2. Detectable Warning Pavers
 - 3. Edge Restraints
 - a. Edging at the Clubhouse Roof
 - 1). Edging at Linear Roof Pavers at Clubhouse Roof
 - 2). Gravel Edging at Clubhouse Roof
 - b. Steel Landscape Edging

1.3 RELATED SPECIFICATIONS

- A. Sustainability Requirements - Section 013010
- B. Geosynthetic Soil Stabilization and Layer Separation - Section 313219
- C. Earthwork - Section 312000

1.4 REFERENCES

- A. Where the language in any of the documents referred to herein is in the form of a recommendation or suggestion, such recommendation or suggestion shall be deemed to be mandatory under this Contract.
- B. Except as modified by governing codes and by the Contract Documents, comply with the applicable provisions and recommendations for the following:
- C. American Society of Testing and Materials (ASTM) (latest edition):
 - 1. C 33 Specification for Concrete Aggregates.
 - 2. C 136 Method for Sieve Analysis for Fine and Coarse Aggregate.
 - 3. C 140 Sampling and Testing Concrete Masonry Units.
 - 4. C 144 Standard Specifications for Aggregate for Masonry Mortar.
 - 5. C 936 Specifications for Solid Interlocking Concrete Paving Units.
 - 6. C 979 Specification for Pigments for Integrally Colored Concrete.

7. D 698 Test Methods for Moisture Density Relations of Soil and Soil Aggregate Mixtures Using a 5.5 lb (24.4 N) Rammer and 12 in. (305 mm) drop.
8. D 1557 Test Methods for Moisture Density Relations of Soil and Soil Aggregate Mixtures Using a 10-lb (44.5 N) Rammer and 18 in. (457 mm) drop.
9. D 2940 Graded Aggregate Material for Bases or Subbases for Highways or Airports.

1.5 PERFORMANCE REQUIREMENTS

- A. Provide materials that meet ASTM C241 Stone Abrasion Resistance for outdoor usage.

1.6 SUBMITTALS

A. Product Data:

1. Product Data: For each type of product indicated.
2. Color charts: For each type of sealant

B. Shop Drawings:

1. Provide shop drawings showing the proposed layouts of pavers, adjacent edgings and their relationships to nearby fixtures and utilities for Commissioner approval.

C. Samples:

1. Full-size units of each type of unit paver indicated; in sets for each color, texture, and pattern specified, showing the full range of variations expected in these characteristics.
2. Sealants: provide actual caulk and mortar samples showing color.
3. Full size edging samples for each type specified.

D. Testing:

1. Sieve analyses for grading of bedding and joint sand
2. Test results shall be submitted from an independent testing laboratory for compliance of paving unit requirements to ASTM C 936 or other applicable requirements.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified

F. LEED submittal requirements

1. For all installed products and materials of this section, complete the materials reporting form (blank copy attached at end of Section 018113 – Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.

- b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 3. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
 4. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.7 LEED PERFORMANCE REQUIREMENTS

- A. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the structural engineer. Certification and submittal of recycled content shall be in accordance with the DDC General Conditions.
- B. Structural steel (i.e. reinforcement bar, wire mesh, ladders) used in this section shall contain a minimum of 75% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with the DDC General Conditions.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed unit paver installations similar in material, design, and extent to that indicated for this project in the last 3 years and whose work has resulted in successful construction installations.
- B. Source Limitations: Obtain each type of unit paver, joint material, and setting material from one source with resources to provide materials and products of consistent quality in appearance and physical properties.
- C. Installer's Field Supervision: Require installer to maintain an experienced full-time supervisor on the Project site during times unit paving installation is in progress.
- D. Mockups: Before installing unit pavers, build mockups for each form and pattern of unit pavers required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed

Work, including same base construction, special features for expansion joints, edging and contiguous work as indicated:

1. A 7 ft. x 7 ft. paver area shall be installed for approval by Commissioner.
2. This area will be used to determine the amount that the pavers settle into bedding sand after compaction, joint sizes, lines, laying pattern(s), color(s), and texture of the project.
3. This area shall be the standard from which the work will be judged.
4. Notify Construction Manager and Commissioner seven days in advance of dates and times when mockups will be constructed.
5. Demonstrate the proposed range of aesthetic effects and workmanship.
6. Obtain Construction Manager and Commissioner's approval of mockups before starting unit paver installation.
7. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Protect unit pavers and aggregates during storage and construction against soiling or contamination from earth and other materials. Maintain manufacturer's containers in unopened and undamaged condition with labels intact and legible.
 1. Cover pavers with plastic or use other packaging materials that will prevent rust marks from steel strapping.
- B. Bedding and joint sand shall be covered with a secure waterproofing covering to prevent exposure to rainfall or removal by wind.
- C. Delivery and paving schedules shall be coordinated in order to minimize interference with normal use of building adjacent to paving.

1.10 PROJECT CONDITIONS

- A. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen subgrade or setting beds. Remove and replace unit paver work damaged by frost or freezing.
- B. Do not install sand or pavers during heavy rain or snowfall.
- C. Do not install frozen sand.

1.11 WARRANTY

- A. Warranty: The special warranty specified in this Section shall not deprive the Owner of other rights the Owner or may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Submit to Construction Manager a written warranty executed by the installer agreeing to repair or replace components of stabilized surfacing that fail in materials or workmanship within the specified warranty period. Failures include, but are not limited to, the following:

1. Premature wear and tear, provide the material is maintained in accordance with manufacturer's written maintenance instructions.
 2. Failure of system to meet performance requirements.
- C. Warranty Period: Contractor shall provide warranty for performance of product. Contractor shall warranty installation of product for the time of one year from completion.
- D. Contractor shall provide, for a period of sixty days, service and repairs as required

PART 2 PRODUCTS

2.1 CONCRETE UNIT PAVERS

- A. Varieties and Sources: Subject to compliance with requirements, provide the unit pavers specified for each type in 2.2 "Concrete Unit Paver Types":
- B. Match Commissioner's samples for variety, color and finish, and other unit paver characteristics retaining to aesthetic effects.
- C. Provide unit pavers that are free of cracks, seams and starts impairing structural integrity or function.
- D. All unit pavers to be gauged for thickness.

2.2 CONCRETE UNIT PAVER TYPES

A. Linear Roof Pavers

1. Product name: Promenade Pavers
2. Product shape: 4" x 16" x 3.94" (10cm)
3. Product color: Sandstone
4. Finish: Premiere face mix finish (top 1/4" to 3/8" shall be a smooth sand/cement mix integrally cast as part of the manufacturing process.)
5. Edge: Pavers shall have a "micro bevel" edge.
6. Manufacturer: Unilock NY, 51 International Blvd, Brewster, NY 10509, Rep: Sean O'Leary, 845-406-8294 Territory Manager Chris Wilkens 516-369-6877, Or approved equal.
7. Available via spec book from:
 - a. Bayside Building Supply, 200-09 47th Ave, Bayside, NY 11361 (718) 428-4000
 - b. Sammarco Stone and Supply, 173 Oak St, New Rochelle, NY 10801, (914) 636-6563
 - c. County Line Mason Supplies, 167 Depot Road, Huntington Station, New York 11746, (631) 271-6679
8. Performance criteria:

- a. Pavers shall be produced in strict accordance with ASTM C-936 standards. Manufacturer shall have a minimum of 3-years experience producing the specified shape style and finish outlined herein.
- b. Pavers shall meet the minimum material and physical properties set forth in ASTM C 936, Standard Specification for Interlocking Concrete Paving Units.
- c. Average compressive strength 8000 psi (55MPa) with no individual unit under 7,200 psi (50 MPa).
- d. Average absorption of 5% with no unit greater than 7% when tested according to ASTM C 140.
- e. Resistance to 50 freeze-thaw cycles, when tested according to ASTM C 67, with no breakage greater than 1.0% loss in dry weight of any individual unit. This test method shall be conducted not more than 12 months prior to delivery of units.
- f. Pigment in concrete pavers shall conform to ASTM C 979. ACI Report No. 212.3R provides guidance on the use of pigments.

B. Detectable Warning Paver

1. Nominal 2' x 3' x 3" thick
2. Color: Charcoal Gray
3. Finish: Natural / unblasted
4. Available from:
 - a. Hanover

Product:	Prest Paver Detectable Warning Paver
Actual Size:	23 1/2" x 35 3/8" x 3" thick
Color:	Charcoal
Finish	Natural
Manufacturer:	Hanover Architectural Products, 240 Bender Road, Hanover PA 17331
Contact:	Lee Fuhman, 717-637-0500
 - b. Wausau

Product:	ADA 2 Detectable Warning Paver
Actual Size:	23-13/16" x 35 13/16" x 2-3/4" thick
Color:	A-90
Finish	Unblasted (Natural)
Manufacturer:	Wausau Tile, 9001 Bus. Hwy 51, Rothschild, WI 54474
Contact:	Michael Conboy 631-650-0991

Or approved equal

2.3 EDGING AT THE CLUBHOUSE ROOF

A. Edging at Linear Roof Pavers at Clubhouse Roof:

1. Product: Permaloc GeoEdge
2. Size: 4.5" width x 4.5" height (or as shown in the drawings).

The height of the edging to be 1" less than finished grade at the pavers; the edging shall not be visible. The length of each edging section shall be 8' long, to be connected with (2) 2.75" sliding aluminum connectors.

3. Material: Extruded Aluminum – 6063 alloy containing Silicon and Magnesium
4. Finish: Mill finish (natural aluminum)
5. Hardware: Geoedge Capture Plate: Aluminum 3"x10"
6. Manufacturer: Permaloc Corporation, 13505 Barry Street, Holland, MI 49424, 1.800.356.9660
7. Available from:
 - a. Terre Company, 206 Delawanna Ave, Clifton, NJ 07014 973-473-3393
 - b. John Deere Landscape, 4-29 Banta Place, Fairlawn, NJ, 201-797-6350
 - c. Fusco Brothers Supply, 55 River Road, Chatham, NJ, 973-635-6282Or approved equal

B. Gravel Edging at Clubhouse Roof

- Product: Permaloc Geo Edge: linear along the parapets and prefabricated at the drains / utilities.
- Size: 6.5" width x 5.5" height (or as shown on the drawings.) The height of the edging shall be flush with finished grade.
1. Material: Extruded Aluminum - 6063 alloy containing Silicon and Magnesium
 2. Finish: Mill finish (natural aluminum)
 3. Manufacturer: Permaloc Corporation, 13505 Barry Street, Holland, MI 49424, 1.800.356.9660
 4. Available from:
 - a. Terre Company, 206 Delawanna Ave, Clifton, NJ 07014 973-473-3393
 - b. John Deere Landscape, 4-29 Banta Place, Fairlawn, NJ, 201-797-6350
 - c. Fusco Brothers Supply, 55 River Road, Chatham, NJ, 973-635-6282Or approved equal

C. Geogrid

1. Syntec SBX11, as manufactured by Syntec, 4800 Pulaski Highway, Baltimore, MD 21224, 1-800-USGRIDS
2. Tensar Triax TX140, as manufactured by Tensar, 2500 Northwinds Parkway, Suite 500, Alpharetta, GA 30009, 770-344-2090
3. Stratagrid 200, as manufactured by Strata, 380 Dahlonge Rd Suite 200, Cumming, GA 30040, 770-888-6688

Or approved equal

2.4 STEEL LANDSCAPE EDGING

A. Steel Landscape Edging (on grade):

Comply with ASTM A 569, hot-rolled, standard flexible carbon steel landscape edging, fabricated in sections with stake pockets stamped, punched, or welded to face of

sections approximately 30" apart to receive stakes. Steel landscape edging shall be double staked at overlap joints, and designed to receive tapered steel stakes.

1. Size: 1/4" thick, 4 5/8" wide, by 16' length, with 6 stakes (actual coverage 15'-4")
2. Finish: Hot-Dipped Galvanized finish to be applied after steel landscape edging is cut to length and stake pockets are stamped, punched or welded. Galvanization shall comply with ASTM A123/A123M-97A. Zinc coverage shall be to a standard thickness of 3/16" x 4" wide, by 16' length – 3.0 mil (1.7 oz/ft²).
3. Product: "DURAEDGE",
As supplied by The J D Russell Company,
Tucson, AZ,
800-888-7425

Or Approved Equal

B. Steel Landscape Edging Stakes:

Steel, tapered and finished to match specified steel landscape edging. Stakes designed specifically to anchor steel landscape edging in place, and shall be made by the manufacturer of the steel landscape edging for which they will be used.

1. Size: 3/16" thick x 16" minimum length
2. Finish: To match Steel Landscape Edging

C. Steel Landscape Edging Accessories

1. Standard start/end sections, 90° corners, splicers as required, sectional and one-piece circles.

2.5 BEDDING AND JOINT SAND

- A. The bedding and joint sand shall be clean, non-plastic, and free from deleterious or foreign matter. It can be natural or manufactured from crushed rock. Do not use limestone screenings or stone dust that do not conform to the grading requirements in Table 3. When concrete pavers are subject to vehicular traffic, the sands shall be as hard as practically available.
- B. The bedding sand shall conform to the grading requirements of ASTM C 33 as shown in Table 3.

**TABLE 3
BEDDING SAND
GRADING REQUIREMENTS**

Sieve Size	Percent Passing
3/8 in. (9.5 mm)	100
No. 4 (4.75 mm)	95 to 100
No. 8 (2.36 mm)	85 to 100

No. 16 (1.18 mm)	50 to 85
No. 30 (600 µm)	25 to 60
No. 50 (300 µm)	10 to 30
No. 100 (150 µm)	2 to 10

- C. The joint sand shall conform to the grading requirements of ASTM C 144 as shown in Table 4 below:

TABLE 4
JOINT SAND
GRADING REQUIREMENTS

	Natural Sand	Manufactured Sand
Sieve Size	Percent Passing	Percent Passing
No. 4 (4.75 mm)	100	100
No. 8 (2.36 mm)	95 - 100	95 to 100
No. 16 (1.18 mm)	70 - 100	70 to 100
No. 30 (600 µm)	40 - 75	40 to 75
No. 50 (300 µm)	10 - 35	20 to 40
No. 100 (150 µm)	2 - 15	10 to 25
No. 200 (75 µm)	0	0 to 10

2.6 CONCRETE SUBSLAB FOR UNIT PAVERS

- A. 3200 PSI concrete reinforced with WWF 6x6 10/10, with expansion joints as indicated or 20 feet on center or every 400 SF.
- B. Aggregate Base for Concrete Subslab: Sound crushed stone or gravel complying with DOT standards.

2.7 MORTAR SETTING BED MATERIALS

- A. Portland Cement: ASTM C 150, Type I or Type II.
- B. Hydrated Lime: ASTM C 207, Type S.
- C. Sand: ASTM C 144.
- D. Latex Additive: acrylic resin, water emulsion, serving as replacement for part or all of gaging water, of type specifically recommended by latex-additive manufacturer for use with field-mixed portland cement and aggregate mortar bed, and not containing a retarder.
- E. Water: Potable.

- F. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062 inch in diameter; comply with ASTM A 185/A 185M and ASTM A 82/A 82M except for minimum wire size.
- G. Color additive: Mortar color is to be as approved by the Commissioner.

2.8 SEALANT

- A. Product: See specification 079200 Joint Sealers
- B. Color: To match adjacent paving, as approved by the Commissioner prior to installation.

PART 3 EXECUTION

3.1 GRADE CONTROL

- A. Establish and maintain lines and grades shown, by means of line and grade stakes placed at the jobsite.

3.2 EXAMINATION

- A. Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Verify that subgrade preparation, compacted density and elevations conform to the specifications and drawings.
- C. Utilities and Structures: Verify that the locations of utility structures, appurtenances and other surface features have been clearly marked or are visible
- D. Verify that geotextiles, if applicable, have been placed according to specifications and drawings.
- E. Verify that aggregate base materials, thickness, compaction, surface tolerances and elevations conform to the specifications & drawings.
- F. Local aggregate base materials typical to those used for flexible pavements are recommended, or those conforming to ASTM D 2940. Compaction to not less than 95% Proctor Density in accordance with ASTM D 698 is recommended for pedestrian areas. Compaction to not less than 98% Modified Proctor Density according to ASTM D 1557 is recommended for vehicular areas.
- G. Verify the proper installation of the concrete curbing, in terms of location, elevation, and adherence to the specifications.
- H. Verify that the base is dry, uniform, even and ready to support sand, pavers and imposed loads.

3.3 PREPARATION

- A. Sweep or vacuum clean concrete substrates to remove dirt, dust, debris, and loose particles.

- B. Remove substances from concrete substrates that could impair asphalt bond, including curing and sealing compounds, form oil and laitance

3.4 EDGING INSTALLATION

A. Typical Edging Installation

1. Install straight sections true to the alignments as indicated, free of waves or bends, using strings as guides. Install curved sections true to the alignments as indicated, free of waves or bends, following marked alignments approved in the field by the Commissioner. Notify the Commissioner (1) one week in advance to approve the layout.
2. Install vertical alignment plumb. Edging shall be flush to grade unless otherwise indicated with no trip hazard (less than 1/8" difference between the edging and the adjacent grade).
3. Maximum tolerance is 1/16" maximum offset from vertical alignment, and 1/8" maximum offset from horizontal within a 10' run. Maximum tolerances shall not be cumulative.

B. Steel Landscape Edging:

1. Install Steel Landscape Edging where indicated on contract drawings, according to manufacturer's recommendations. Anchor with steel stakes approximately 30" on center, driven below top elevation of edging, or at every stake pocket location in landscape edging (header) sections designed and manufactured to receive stakes. Stakes shall be located in solid undisturbed soil, or in soil set at 85% relative compaction. Field weld all butt joints and at joints that change in orientation.
2. Replace edging sections damaged by construction operations.

C. Edging at Linear Roof Pavers at Clubhouse Roof:

The 'Edging at Linear Roof Pavers' is intended to hold the paver, but be held an inch below the paver finished grade.

1. Verify conditions are appropriate for edging installation.
2. Place geogrid as described on the drawings. Place first side of edging, ensuring straight clean lines. Radial curves to be bent in the shop or to be sourced as bent from the manufacturer. Edges to be clean bends as per the manufacturer's instructions – under no condition shall an edging end at a corner.
3. Attach geogrid to edging with capture plate as per the manufacturer's instructions.
4. Set pavers, as per paver installation herein. If pavers do not set in a clean line as per the drawings, the edging shall be reinstalled to allow the pavers to be properly laid. The Commissioner will make the final determination as to whether the pavers have been properly installed.

D. Gravel Edging at Clubhouse Roof

The 'Gravel Edging at Clubhouse Roof' is intended as a clean separation between the gravel and the adjacent planting. The top of the edging shall be flush to grade.

1. Shop fabricate all corners.
2. Verify conditions are appropriate for edging installation.
3. Use the longest lengths possible. Connect sections together using the 2-3/4" sliding connector as per manufacturer's directions.

3.5 PAVER INSTALLATION GENERAL

- A. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be visible or cause staining on finished work.
- B. In areas with a single paver type; mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
- C. Field cutting is to be minimized, only as approved by Commissioner. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, un-chipped edges. Cut units to provide pattern indicated to fit adjoining work neatly. Use full units with cutting where possible. Hammer cutting is not acceptable. Cut pavers to provide pattern indicated to fit adjoining work neatly or to fit cleanly around manholes, utility covers, appurtenances and other utility features. Sharp edges or corners created by cutting or splitting shall be worked smooth to produce a consistent quality with un-cut or un-split edges.
- D. Tolerances:
 1. Do not exceed 1/32-inch unit-to-unit offset from flush (lippage) nor 1/8-inch in 10-feet from level, or indicated slope, for finished surface of paving.
 2. Paver joints shall not exceed 1/16-inch spacing.
 3. Pavers shall align horizontally with adjacent pavers within a 1/32" tolerance.
 4. Pavers laid out in radial rows shall follow the overall curve smoothly without wobbling, with the centerline of each paver located within a 1/16" tolerance of the overall radius.
- E. Joint Pattern shall be as indicated on drawings and approved by the Commissioner.
- F. Expansion and Control Joints: Provide sealant-filled joints at locations and of widths indicated. Provide joint filler as backing for sealant-filled joints where indicated. Install joint filler before setting joints. Sealant to match adjacent paving and to be approved by the Commissioner.
- G. Install edge restraints or headers as indicated, and as detailed in drawings.

3.6 SAND SETTING BED APPLICATION

- A. Spread the bedding sand evenly over the base course and screed to a nominal 1 in. (25 mm) thickness, not exceeding 1 1/2 in. (40 mm) thickness. The screeded sand should not be disturbed. Sufficient sand shall be placed in order to stay ahead of the laid pavers. Do not use the bedding sand to fill depressions in the base surface.

- B. The spread sand shall be carefully maintained in a loose condition, and protected against incidental compaction, both prior to and following screeding. Any incidentally compacted sand or screeded sand left overnight, shall be loosened before further paving units are placed. Sand shall be lightly screeded in a loose condition to the predetermined depth, only slightly ahead of the paving units. Under no circumstances shall the sand be screeded in advance of the laying face to an extent to which paving will not be complete on that day.
- C. Screed sand shall be fully protected against incidental compaction, including compaction by rain. Any screeded sand which is incidentally compacted prior to laying of the paving unit, shall be removed and brought back to profile in a loose condition. Neither pedestrian nor vehicular traffic shall be permitted on the screeded sand.
- D. The Contractor shall screed the bedding sand using either an approved mechanical spreader (e.g.: an asphalt paver) or by the use of screed rails and boards.
- E. Pavers shall be free of foreign material before installation.
- F. Pavers shall be inspected for color distribution and all chipped, damaged or discolored pavers shall be replaced.
- G. The pavers shall be laid in the pattern(s) as shown on the drawings. String lines or chalk lines on bedding sand should be used to hold all pattern lines true.
- H. Pavers to be placed along the edge shall be cut with a double blade paver splitter or masonry saw.
- I. Upon completion of cutting, the area must be swept clean of all debris to facilitate inspection and to ensure pavers are not damaged during compaction. (Debris or sand particles left on pavers which are being compacted can cause point loading which may chip, scrape or break the paver.)
- J. After sweeping and prior to compaction, the paved area must be inspected by the Commissioner to ensure satisfactory color blending. Pavers can be moved easily at this time to achieve good color distribution.
- K. Low amplitude, high frequency plate compactor shall be used to compact the pavers into the sand. The compactor shall transmit an effective force not less than 75 kN per square metre (1600 Lb/ft²) of plate area. The frequency of vibration shall be within the range of 75 to 100 Hz. Use Table 5 below to select size of compaction equipment:

TABLE 5
PAVER THICKNESS AND REQUIRED MINIMUM
COMPACTION FORCE

Paver Thickness	Compaction Force
2 3/8 in. (60 mm)	3000 lbs [13 kN]
2 3/4 in. (70 mm) & 3 1/8 in. (80 mm)	5000 lbs [22 kN]

Note: Use of a urethane plate compactor pad is recommended to minimize any scuffing of

- the paving stone surface.
- L. The pavers shall be compacted to achieve consolidation of the sand bedding and brought to level and profile by not less than three passes. Initial compaction should proceed as closely as possible following the installation of the paving units and prior to the acceptance of any traffic or application of sweeping sand.
 - M. Any units that are structurally damaged during compaction shall be immediately removed and replaced.
 - N. Dry joint sand shall be swept into the joints until the joints are full. This will require at least two or three passes with the compactor. Do not compact within 3 ft. (1 m) of the unrestrained edges of the paving units.
 - O. All work to within 3 ft. (1 m) of the laying face must be left fully compacted with sand-filled joints at the completion of each day.

3.7 MORTAR SETTING BED APPLICATION

- A. General: Comply with referenced standards and with manufacturers' written instructions for mix proportions, mixing equipment, mixer speeds, mixing containers, mixing times, and other procedures needed to produce setting-bed and joint materials of uniform quality and with optimum performance characteristics.
- B. Latex-Modified Mortar: Proportion and mix mortar and latex additive for setting bed to comply with written instructions of latex-additive manufacturer and as necessary to produce stiff mixture with a moist surface when bed is ready to receive pavers.
- C. Saturate concrete subbase with clean water several hours before placing setting bed. Remove surface water about one hour before placing setting bed.
- D. Apply mortar-bed bond coat over surface of concrete subbase about 15 minutes before placing mortar bed. Limit area of bond coat to avoid its drying out before placing setting bed. Do not exceed 1/16-inch thickness for bond coat.
- E. Apply mortar bed over bond coat; spread and screed mortar bed to uniform thickness at subgrade elevations required for accurate setting of pavers to finished grades indicated.
- F. Spread and screed mortar bed to uniform thickness at subgrade elevations required for accurate setting of pavers to finished grades indicated.
- G. Mix and place only that amount of mortar bed that can be covered with pavers before initial set. Before placing pavers, cut back, bevel edge, and remove and discard setting-bed material that has reached initial set.
- H. Wet pavers before laying if the initial rate of absorption exceeds 30 g/30 sq. in. per minute when tested according to ASTM C 67. Allow units to absorb water so they are damp but not wet at time of laying.
- I. Place pavers before initial set of cement occurs. Immediately before placing pavers on mortar bed, apply uniform 1/16-inch-thick bond coat to mortar bed or to back of each paver with a flat trowel.
- J. Tamp or beat pavers with a wooden block or rubber mallet to obtain full contact with setting bed and to bring finished surfaces within indicated tolerances. Set each paver

in a single operation before initial set of mortar; do not return to areas already set or disturb pavers for purposes of realigning finished surfaces or adjusting joints.

- K. Spaced Joint Widths: Provide a hand-tight joint not to exceed 1/16" joint width.
- L. Cure grout by maintaining in a damp condition for seven days unless otherwise recommended by grout or liquid-latex manufacturer. recommended by grout or liquid-latex.

3.8 REPAIRING, AND CLEANING

- A. Cleaning: Remove excess grout from exposed paver surfaces; wash and scrub clean.
 - 1. Remove temporary protective coating as recommended by coating manufacturer and as acceptable to paver and grout manufacturers.
 - 2. Do not allow protective coating to enter drains.
- B. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units as intended. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.
- C. Protect paving from damage due to related construction operations, by other contractors, trades and trespassers. Treat, repair or replace damaged work as directed.

3.9 FIELD QUALITY CONTROL

- A. Final elevations shall be checked for conformance to the drawings after removal of excess joint sand.
- B. All surface and pavement structures shall be true to the lines and levels, grades, thickness and cross sections shown on the drawings. All pavements shall be finished to lines and levels to ensure positive drainage at all drainage outlets and channels. In no case shall the cross-fall of any portion of pavement be less than 1 percent. The final surface elevations shall not deviate more than 3/8 in. under a 10 ft. long straight edge.
- C. The surface elevation of the pavers shall be 1/8" to 1/4" above adjacent drainage inlets, concrete collars or channels.

3.10 PAVEMENT PROTECTION

- A. Protect pavement against damage prior to final acceptance by the Commissioner. Repair any damage to pavement at no cost to the City. Keep pavement carrying traffic or equipment clean. Protect against spillage of any deleterious materials.

3.11 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Remove surplus pavers, and waste material, include excess setting bed materials, unsuitable soil, trash, and debris, and legally dispose of it off the City of New York's property.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 321613

CONCRETE CURBS AND SIDEWALKS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Examine all drawings and other sections of the specifications for requirements therein affecting the work of this trade.

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, facilities needed to perform excavation, backfill, trenching, forming as necessary to construct the on-site and off-site concrete curb, gutters and sidewalks as shown on the Contract Drawings or as directed by the Commissioner.

1.3 RELATED SECTIONS

- A. Section 321216 - Bituminous Pavement
- B. Section 321217 - Aggregate Overlay Over Asphalt
- C. Section 321313 - Cast-in-Place Concrete Paving
- D. Section 321314 - Cast-in-Place Concrete Paving – Pervious

1.4 DESIGN REQUIREMENTS

- A. Concrete curbs and sidewalks which are under jurisdiction of New York City DOT, even though constructed as part of this contract, shall be constructed in accordance with the Rules and Regulations, Standard Details and Standard Specifications of NYC DOT Standard Specifications section 4.08, 3.05, as further defined in the Contract Drawings and Specifications.
- B. Concrete for curbs and sidewalks which are inside the property line of the site and not under the jurisdiction of other City agencies shall be concrete, proportioned, mixed, placed, cured and protected.
- C. Concrete for curbs and sidewalks shall be:
 - 1. Class A, have a minimum 28-day compressive strength of 4,000 psi.
 - 2. Slump values: 2 inch minimum to 4 inch maximum.
 - 3. Air content 5 to 7%

4. Minimum cement content (94 lb sacks per cy): 6.0
5. Maximum water-cement ratio by weight: 0.48

1.5 SUBMITTALS

- A. The Contractor shall furnish all working drawings and material specifications for the approval of the Construction Manager in accordance with the requirements of the General Conditions.
- B. The Contractor shall submit marked-up drawings and shop drawings including shop and field test reports of concrete samples tested in an approved laboratory.
- C. The Contractor shall submit test results of the concrete testing and sampling in writing to the Commissioner on the same day tests are completed.
- D. The Contractor shall submit manufacturer's product data including reinforcement and related materials.
- E. The Contractor shall submit two copies of laboratory test or evaluation reports for concrete materials and mix designs at least 5 days prior to start of work. Do not begin concrete production until mixes have been reviewed and are acceptable to Commissioner.
- F. LEED submittal requirements
 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
 3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material

listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).

4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Concrete:

1. Portland Cement: ASTC C150, Type 1
2. Coarse aggregate: ASTM C33, maximum aggregate size shall be 3/4 inch.
3. Water: Clean, drinkable
4. Air-entraining mixture: ASTC C260
5. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 - General Requirements.

B. Reinforcing:

1. Welded Wire Fabric: ASTM A185, #6 gauge, 6x6
2. Structural steel: ASTM A36.

C. Crushed Stone or Gravel: Washed, size 1/4" to 3/4"

- D. Membrane-forming curing compound: ASTM C309, Type I.
- E. Preformed expansion joint filler: Type IV as described in Section 2.15 of the Standard Specifications of the New York City Department of Transportation, Bureau of Highway Operations.
- F. Joint sealing compound for horizontal joints shall be asphaltic blown joint filler as described in Section 2.16 of the Standard Specifications of the New York City Department of Transportation.
- G. Form materials: with sufficient stability to withstand pressure of placed concrete without bow or deflection.

2.2 SOURCE QUALITY CONTROL

- A. Concrete shall be tested and evaluated for strength and acceptance in accordance with:
 1. Sampling: ASTM C172
 2. Slump: ASTC C143 one test per each load at point of discharge
 3. Air Content: ASTM C173
 4. Compressive Strength: ASTC C39. One specimen tested at 7 days, one specimen tested at 28 days, and one retained for later testing if necessary.
 5. Measuring, mixing, transporting and placing concrete: ACI 304
 6. Concrete curbs and sidewalks shall have a Solar Reflective Index (SRI) equal to or greater than 29 when tested in accordance with ASTM E 1980”

PART 3 - EXECUTION

3.1 SIDEWALK INSTALLATION

- A. Concrete sidewalk shall be of the width shown or otherwise specified and shall be laid on 6 inches thick compacted broken stone base, unless otherwise specified or shown on the Contract Drawings.
- B. Sidewalk shall consist of a single course of concrete 4 inches thick, unless otherwise shown on the Contract Drawings.
- C. Concrete shall be pigmented when required by the detailed specifications.
- D. Excavation and subgrade preparation shall be in accordance with the requirements of Specification 312000 “Earthwork”. All existing material within the required 6 inches of foundation shall be removed in its entirety. Additional depth of foundation material for special conditions shall be placed as required by the Construction Manager.
- E. Materials: Foundation material shall be placed on the prepared subgrade and thoroughly compacted into a course not less than 6 inches thick. The top surface shall be parallel to the finished grade and at a distance below the grade equal to the specified thickness of concrete.

- F. Slabs: Concrete sidewalk shall be built in approximately 20-foot lengths between expansion joints. The sidewalk shall be separated from adjoining structures by expansion joints. Expansion joints in sidewalk shall coincide with expansion joints in curb. Tooled control joints not less than 1/2 inch in depth shall be provided where at four foot intervals unless otherwise shown on the Contract Drawings.
- G. Reinforcement: Position, support and secure reinforcement against displacement. Welded wire fabric shall be 2" from bottom of slab. Install welded wire fabric in as long length as practical, lapping at least one mesh.
- H. Expansion Joints: Transverse expansion joints shall be 1/2 inch in width and shall be filled with material approved by the Construction Manager.
- I. The foundation material shall be wetted immediately before concrete is placed. The concrete shall be placed within the forms and thoroughly tamped until the surface is at the finished grade.
- J. When specified in the detailed specifications, the concrete sidewalk shall be pigmented with a minimum of 2 pounds of dispersed carbon black per bag of cement to produce a bluestone color. The coloring pigment shall either be treated so as not to cause an increase or decrease of the entrained air content in cement mortar or in the concrete of more than 10 percent, or the amount of air-entrainment agent added to the concrete shall be adjusted to meet the specified requirements. All cement used for concrete work specified herein shall be of uniform color. Match the color of the existing concrete where new concrete will meet the existing curb and sidewalk in the street.
- K. Each rectangular slab shall have all edges neatly rounded with proper tools and be bounded on all sides by a troweled border about 1 inch in width. Surface texture of pedestrian ramps shall be transverse grooves, 1/2 inch wide by 1/4 inch deep on 2-inch centers.
- L. Backfilling shall follow the removal of forms as soon as practicable and, unless otherwise permitted, shall be of clean earth, satisfactorily compacted.
- M. Forming and Placing Concrete: Use drum-type batch machine mixer, mixing not less than 1-1/2 mm for 1 cubic yard or smaller capacity. Increase mixing time at least 15 second for each additional cubic yard or fraction thereof.

3.2 CURB INSTALLATION

- A. Concrete and steel face curbs shall be constructed in accordance with the applicable provisions of Sections 4.08 and 4.09, Standard Specifications of the New York City Department of Transportation, Bureau of Highway Operations. Match the color of existing curb within the public right-of-way.
- B. Expansion joints of 1/2" cellulose or similar material shall be placed at 10-ft intervals. Curbs shall be installed at 10-ft sections.
- C. Depressed curb and handicap ramps shall be provided where specified or shown on the Contract Drawings.

END OF SECTION 321613

This Page Intentionally Left Blank

SECTION 327200

PLANTINGS FOR WETLAND AREAS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work included: This work includes but is not limited to the following:
 - 1. Furnishing and installing new shrubs and all other plant materials.
 - 2. Furnishing and installing coir fiber blanket.
 - 3. Furnishing and installing waterfowl exclusion barrier.
 - 4. Protection and service of all plant materials until Substantial Completion.
 - 5. Guarantee of all new plant materials for a period of 24 months.
 - 6. Service of plantings during the 24 month guarantee period.

1.3 RELATED SECTIONS

- A. Excavation and Fill - Section 312300
- B. Erosion and Sedimentation Controls – Section 312500
- C. Coir Fiber Blanket – Section 327300
- D. Waterfowl Exclusion Barrier – Section 327400
- E. Soil Mixes for Wetland areas – Section 327500
- F. LEED Certification Requirements – Section 013010
- G. Construction Waste Management – Section 017330

1.4 REFERENCES

- A. AAN – American Association of Nurserymen
- B. ASNS – “American Standard for Nursery Stock,” ANSI Z60.1 latest edition, published by the American Associate of Nurserymen, (AAN)

1.5 QUALITY ASSURANCE

- A. The Contractor or Subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.

1.6 SUBMITTALS

A. Product Data

- 1. Submit certified analysis for each treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged material. Manufacturer's specifications and other data needed to prove compliance with the specified requirements.

- B. Documentaion: The Contractor shall submit written documentation at least 30 days prior to scheduled start of planting that all plant material has been ordered.

- C. Service Program: Submit written schedule of service operations proposed for the guarantee period. Schedule shall be in the form of a list of each service operation, with dates showing when each service task will be performed, and the frequency of occurrence.

D. LEED Submittals Requirements:

- 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 013010 LEED Certification Requirements). Information for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractors or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post – industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.

1.7 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Packaged Materials

1. Deliver packaged materials in unopened bags or containers, each clearly bearing the name of the producer, the material composition, manufacturers' certified analysis, and the weight of the material.
2. All packaged products shall be stored, handled and applied in strict accordance with manufacturers instructions.

B. Dig and handle all plant material to prevent injury to trunks, branches and roots.

1. Do not prune prior to delivery.
2. Do not bend or bind-tie trees in such manner as to damage bark, break branches or destroy natural shape.

C. Pack and ship all plant material to ensure arrival at site in good condition. Provide protective covering during delivery.

D. If planting is delayed more than 24 hours after delivery, Contractor shall provide adequate means of protection from freezing and from the drying effects of wind and sun.

1. Rootballs shall be protected with soil, wet mulch, or other acceptable material.
2. Provide shade structures or other covering as required to protect branches and leaves.
3. Water as necessary until planted. Do not allow plant material to wilt or show signs of stress from lack of water. Provide all water and equipment for water distribution at no additional cost to the City.

E. Immediately remove rejected or damaged plant material from the site and replace with plants approved by Commissioner. All replacement plants shall be subject to the same requirements as the original material.

1.8 COORDINATION

A. The Contractor shall coordinate his work with that of other Contractors. Such coordination shall include, but not be limited to:

1. Location of all underground utility lines and structures
2. Scheduling of planting operations
3. Scheduling of service operations

1.9 MOCK UP – CELL 1

A. Cell 1 shall be planted in full and hydrated to weir level before commencing any planting in Cells 2-5. The Commissioner will assess soil moisture in each planting

zone over the span of three weeks and shall verify that soil moisture levels are adequate for plant survival in each planting zone prior to construction of Cells 2-5.

1.10 PLANT SELECTION AND INSPECTION

- A. Contractor shall locate all plant materials and provide documentation to verify source of all plant material at least 6 months prior to proposed delivery.
- B. Inspection at Nursery: All plants will be inspected and selected by the Contractor at the nursery for conformity to specification requirements.
- C. Inspection at Delivery - On Site: Notify the Commissioner at least five (5) working days in advance of delivery of plants to the site.
 - 1. The Commissioner may inspect all plants upon delivery to site.
 - 2. Contractor shall schedule a time for on-site inspection prior to planting, and shall arrange for adequate labor and equipment on-site at the time of inspection to unload, open, and handle plants during inspection.
 - 3. The Commissioner may reject any plant material prior to or upon delivery to the site.
 - a. All plant material that is dead, dying or appears unhealthy will be rejected.
 - b. All plant material that has been improperly maintained, transported or handled in such a way as to impair its appearance or health will be rejected.
 - c. All plant material that is underdeveloped, immature will be rejected. Minimum above ground heights for each specified size are: 2 inch diameter plug (Herbaceous Floodplain, Wet Meadow and Riparian Herbaceous) > 6 inches, 2 inch diameter plug (Shallow Marsh) > 12 inches, bare root > 6 inches, #1 cont.(Riparian Herbaceous) > 6 inches, #1 cont.(Shrubs) > 14 inches, #2 cont.(Shrubs) > 18 inches.
- D. The Commissioner will be the sole judge of the condition of the plants.
 - 1. All material which is rejected on-site shall be removed immediately from site, and replaced with new material selected by the Commissioner, at no additional cost to the City.

1.11 INITIAL LAYOUT

- A. Contractor shall submit a written request to the Commissioner, for a formal inspection of the planting work for Initial Layout.
- B. At the time of inspection the locations of all planting zones shown on plans must be laid out with stakes and lines.

1. Revisions to planting zones shall be made as necessary in the opinion of the Commissioner.

1.12 SUBSTANTIAL COMPLETION

- A. Contractor shall submit a written request to the Commissioner, for a formal inspection of the planting work for Substantial Completion.
- B. At the time of inspection all plant material must be alive, healthy, and installed as specified to be accepted.
 1. If plants are dead, dying, unhealthy, or not serving their visual function in the landscape scheme in the opinion of the Commissioner, or if workmanship is unacceptable, written notice will be given to the Contractor in the form of a punch list which itemizes all remedial work required for Substantial Completion.
 2. This work may include plant replacement or service and must be carried out prior to issuance of the Certificate of Substantial Completion.

1.13 GUARANTEES

- A. All new plant material shall be guaranteed for a period of 24 months after the date of Substantial Completion.
- B. Service
 1. Contractor shall submit a written service program and schedule to the Commissioner for approval.
 2. Service program shall be revised and resubmitted as required until approved by Commissioner.
 3. During the guarantee period, the Contractor shall maintain all plant materials as specified herein, and as noted in the approved service schedule, and shall replace, at no additional cost to the City, any and all plant material that has died or, in the opinion of the Commissioner, is in unhealthy or unsightly condition.
- C. Replacements
 1. There will be no limit to the number of times replacements are made of individual plants, unless conditions causing the failure can be proved to be beyond the control of the Contractor.
 2. All replacements shall be in accordance with original Specification.
 3. Cost of all replacements shall be included in the Contract price. No additional payment will be made therefore.
 4. Replace unacceptable plant material no later than the next succeeding planting season.

5. Replace unacceptable plant material no later than the next succeeding planting season.
6. All areas damaged or soiled by replacement planting operations are to be fully restored to their original condition at no additional cost to the City.

D. Site Inspection

1. Approximately one month prior to the expiration of the guarantee period, the Contractor shall arrange a site inspection by the Commissioner.
2. The Commissioner will prepare a list of all remedial work required, including plant replacement or service.
3. This work shall be carried out before the end of the guarantee period, unless weather conditions cause delays, in which case such work shall be carried out as soon as is practical.

E. Final Acceptance

1. Following the completion of all remedial work and replacement plantings, the Contractor shall request the Commissioner in writing for a formal inspection of the landscape work for Final Acceptance.
2. If replacement plantings are required, Final Acceptance will be provisional upon a final inspection at the end of the guarantee period for the plant replacements.

- F. All of the materials and labor required for service and replacements during the guarantee period shall be included in the Contractor's bid price. No additional payments will be made therefor.

1.14 LEED PERFORMANCE REQUIRMENTS

- A. Plants grown within 500 miles of the project site shall be documented in accordance with Section 013010.

1.15 QUALIFICATIONS

- A. Submit a Statement of Qualifications for the Landscape Contractor. Qualifications shall show experience in the installation of wetland landscapes of a similar type and scale to this project within the last three years.
- B. Statement of Qualifications shall consist of the following information:
1. Company name and address
 2. Number of years in business under this name
 3. Number of current full-time, part-time, and seasonal employees
 4. Estimated number of employees intended for this project

1.16 REGULATORY REQUIREMENTS

- A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to the City

PART 2 PRODUCTS

2.1 PLANT MATERIAL

- A. Provide plant material to meet or exceed applicable AAN standards in all ways in addition to other standards specified. Plants shall be true to species and cultivar specified. Plants shall be typical of their species or variety with normal habits of growth, in accordance with ASNS: Sound, healthy and vigorous, well-branched and densely foliated when in leaf, free from disease, insect pests, eggs or larvae with healthy well developed root systems.
- B. All plants shall be species native to the Eastern United States. Plants that have escaped cultivation, or have accidentally been introduced into native habitats, shall not be considered native to the Eastern United States.
 - 1. All plants shall be nursery grown.
 - 2. No plant material shall be collected or harvested from non-nursery areas.
 - 3. All trees shall be freshly dug for this project.
- C. Sources: Nursery sources of supply shall have been investigated by the Contractor prior to submitting bid to confirm that size, variety, and quantity of plant material specified on Plant List can be supplied. Failure to take this precaution will not relieve the Contractor from the responsibility for furnishing and installing all plant material in strict accordance with the Contract requirements and without additional expense to the City. The following are recommended sources of plant material:
 - 1. Greenbelt Native Plant Center, 3808 Victory Blvd, Staten Island, NY 10314. (718) 370-9044
 - 2. Pinelands Nursery, 323 Island Rd, Columbus, NJ 08022. (609) 291-9486
 - 3. Southern Tier Consulting and Nursery, 2701-A Rte 305, West Clarksville, NY 14786. (585) 968-3120
- D. Quality: All plant material shall be nursery grown in accordance with good horticultural practice, for at least two years under climatic conditions and soils similar to those at project site. All plants shall be of specimen quality. All trees are to be uniform and matched. All trees shall have straight trunks with leader intact, undamaged and uncut. Trees with a damaged or crooked leaders, bark or abrasions, sun-scald, disfiguring knots, insect damaged will not be accepted.
- E. Size

1. All plants shall meet specified minimum size requirements.
2. Plants that meet measurements but do not possess a normal balance between height and spread shall be rejected.
3. Plants larger than specified may be used only if approved by Commissioner. Use of such plants shall not increase the contract price. If larger plants are approved, the root ball shall be increased in proportion to the size of the plant. Contractor shall verify that size of root ball will fit in prepared planting pits.

2.2 WATER

- A. The Contractor shall be responsible for supplying all required water to the site at no additional cost to the City.
 1. All work injured or damaged due to the lack of water, or the use of too much water, or contaminated water shall be the Contractor's responsibility to correct.
 2. Water shall be free from impurities injurious to vegetation.
- B. The hydrology of wetland Cells 1-5 will be tested during construction
 1. Water shall flow freely over weirs during hydrology test, dewatering may be required for Cell 7.
 2. Hydrology shall be tested in Mock up – Cell 1 prior to Cells 2-5, water shall flow freely over Cell 1 Weir during evaluation period and temporary runoff shall be routed to sedimentation pond.
- C. Water shall flow freely over weirs in Cells 1-5 before planting and throughout the service and guarantee period. Contractor shall be responsible for artificially maintaining water levels at weir level if water flow is disrupted at any point during guarantee period.

PART 3 EXECUTION

3.1 INSPECTION

- A. Contractor shall inspect the site before bidding to determine the characteristics of the site.
- B. The Contractor shall be liable for all damage to surrounding areas caused by planting operations and shall be required to restore or replace the damaged areas to their original condition.

3.2 UTILITIES

- A. Contractor is responsible for determining the location of all utilities, by contacting the appropriate utility company prior to any planting activities..

- B. Verify that underground utilities and irrigation systems in landscape areas are in place, at proper location, tested (except final irrigation testing) and ready for use.
 - 1. Take proper precautions so as not to disturb or damage sub-surface elements.
 - 2. Coordinate with other trades.
- C. Contractor is liable for any damage to such utilities during the course of construction, and is responsible for making necessary repairs to damaged utilities at his own expense.

3.3 PLANTING DATES

- A. Plant only within the following dates, weather permitting. Do not plant in times of high wind, rain, sleet or snow, or when the ground is frozen or the soil is otherwise in an unsatisfactory condition for planting. Planting at times other than those specified will be at the Contractor's own risk, and will not invalidate any Guarantees.
 - 1. Container-grown perennials, vines, ground cover plants, and wetland plugs:
 - a. Spring: April 15 to May 15

3.4 PREPARATION FOR PLANTING

- A. Planting Soil Mixes materials and installation shall be as specified in Section 327500 – Soil Mixes for Wetland Areas.
- B. Install Coir Fiber Blanket on top of soil in areas shown on drawings.
 - 1. See Section 327300 – Coir Fiber Blanket
- C. Exercise extreme caution during excavation to avoid damaging or interrupting existing underground utilities. Use appropriate detection equipment to locate utilities during excavation for planting.
- D. Erect barricades, warning signs, or other protective devices as may be required by local, state, or federal laws and regulations to protect open excavations.

3.5 PLANT INSTALLATION

- A. Do not plant until plant material has been approved by the Commissioner at site.
- B. Placement of Plants
 - 1. Plants shall be set in the center of pits, plumb and straight, in accordance with the planting details, and faced to give best appearance and relationship to adjacent plants and structures.
 - 2. Plant to such depth that the finished grade level of plant, after settlement, will be the same as that at which the plant was grown.
- C. Planting perennials, vines and container grown shrubs
 - 1. Excavate plant holes to depth of container and twice the container diameter.

2. Carefully remove plant from container using gentle handling to avoid damage to any part of plant.
3. If roots are loose, spread roots out evenly over a mound of soil mix. If roots are tight and compact, loosen by pulling gently apart. If plant roots will not separate, use a sharp tool to make vertical slits in the root ball, approximately 1/2-inch deep at three or four locations around root mass.
4. Set plants on a bed of compacted soil mix, so that the root ball is level with the surface of the soil.
5. Backfilling: Fill plant pit with soil mix by hand, pushing the mix around and just over the surface of the root ball. Add soil mix in layers not more than four inches (4") deep, and with each layer thoroughly settled by hand tamping and with water, and free of all voids before next layer is put in place.

D. Saucering

1. After backfilling is completed, a saucer shall be made for the retention of water around each plant, unless impracticable due to placement of tree gratings or other paving material over planted area.
2. The saucer shall be of the same diameter as that of the hole dug.
3. The lip shall be level all around and shall be at least 4 inches high for trees, and 2 inches high at shrubs.

E. Planting wetland plugs in aquatic areas

1. Follow specific species planting instructions called out below as applicable. Otherwise follow procedure described below:
2. Excavate plant holes to depth of plug and twice the plug diameter. Tear small hole in Coir Fiber Blanket and move aside to create space for plug. Do not tear fiber blanket excessively.
3. Carefully remove plant from container using gentle handling to avoid damage to any part of plant.
4. If roots are loose, spread roots out evenly over a mound of soil mix. If roots are tight and compact, loosen by pulling gently apart. If plant roots will not separate, use a sharp tool to make vertical slits in the root ball, approximately 1/2-inch deep at three or four locations around root mass.
5. Set plants upright in excavated hole so that the root ball is level with the surface of the soil.
6. Backfilling: Fill plant pit with soil mix by hand, pushing the mix around and just over the surface of the root ball. Add soil mix in layers not more than four inches (4") deep, and with each layer thoroughly settled by hand tamping and with water,

and free of all voids before next layer is put in place. Smooth disturbed Coir Fiber Blanket back into place adjacent to plug.

7. If plugs float to water surface immediately after planting, sod staples may be used to secure plugs.
8. Floating plants spotted around the water's edge more than 24 hours after planting indicate unsuccessful planting.

3.6 WATERING

- A. Water areas immediately after planting is complete.
 1. Apply water slowly so as to penetrate the entire root system.
 2. Watering shall continue throughout the service and guarantee period, as frequently as seasonal conditions require, until final acceptance of the work.
 - a. Watering is only required for planting areas above standing water elevation.
 3. Contractor shall be responsible for adequate water both before and after installation of irrigation system.

3.7 WATERFOWL EXCLUSION

- A. Waterfowl exclusion fencing shall be installed around wetland areas immediately after planting is complete.
 1. See Section 327400 – Waterfowl Exclusion Barrier

3.8 PRUNING

- A. Perform compensatory pruning of shrubs following planting.
 1. Excessive pruning at the time of transplanting must be avoided. The extent of top pruning should be based upon the ability of the plant roots to function.
 2. All deadwood, suckers, broken or badly bruised branches shall be removed.
 3. Pruning shall be done with clean, sharp tools.
 4. No leaders shall be cut. Each cut shall be made carefully, at the correct location, leaving a smooth surface with no jagged edges or torn bark. The correct anatomical location is just beyond the branch collar.
 5. Large or heavy limbs should be removed using three (3) cuts. The first cut undercuts the limb one or two feet from the parent branch or trunk. The second cut is top cut which is made slightly further out on the limb than the undercut. The third cut is to remove the stub.

3.9 ANTIDESICCANT SPRAYING

- A. Use antidesiccant only as approved by Commissioner. Approval is required for each condition of use.

3.10 PLANT PROTECTION

- A. The Contractor shall provide at his own expense all protection he deems necessary for all plants and lawn areas against damage prior to Final Acceptance of the work.
- B. Removal of Temporary Protection Measures: All temporary protection measures employed during the construction period shall be removed prior to Substantial Completion unless otherwise directed by the Commissioner. All guys, arbor tie or stakes used for temporary bracing of trees or any tree trunk wrapping shall be removed and disposed of by the Contractor off site at his own expense at the end of the guarantee period, or earlier at the direction of the Commissioner.

3.11 PLANT SERVICE

- A. Service of all plant material shall begin immediately after planting, and continue until the end of the guarantee period, unless otherwise noted.
- B. Defective work shall be corrected as soon as possible after it becomes apparent and weather season permits. The Commissioner shall be the sole judge of the condition of the plants.
- C. Service shall include:
 - 1. Watering, re-planting, repair of ruts and erosion, repair of protection devices, weeding, and fertilizing.
 - 2. The removal of all dead, dying or unhealthy plant material, and replacement of such material with new plants to meet all specifications of the original plantings.
 - 3. The repeating of any or all phases of planting as specified herein, or which may be required to obtain healthy, densely vegetated wetland areas.
- D. Service Program
 - 1. Contractor shall arrange a meeting with the Commissioner, and with City's designated service personnel to review together the submitted service program and any modifications required for the duration of the guarantee period.
 - 2. The Contractor shall make periodic inspections, at no extra cost, during the guarantee period to determine what changes, if any, should be made in the service program.
 - 3. Any recommended changes shall be submitted in writing to the Commissioner
 - 4. Additional remedial work not included in the service program shall be carried out by the Contractor as deficiencies are identified and reported by the Commissioner or designated service personnel.

5. The Contractor shall replace, at no additional cost to the City, as soon as weather conditions permit, and within a specified planting period, all plants determined dead and/or dying by City's designated service personnel during and at the end of the guarantee period.
 6. Plants shall be free of dead or dying branches and shall bear foliage of normal density, size, and color.
 7. Replacements shall match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this specification. Labor and all materials needed for installation of replacements shall be included in the guarantee.
 8. The guarantee of all replacement plants shall extend for an additional period of 24 months from the date of their acceptance after replacement.
- E. Service Tasks: Service shall include, but not be limited to the following:

1. Watering: Water planted areas as required. Do not permit plant material to wilt or to show signs of stress from lack of water. Contractor shall supply and distribute water to plantings during the full time of their establishment at the site and provide all equipment for water distribution and water at no additional cost to the City. Plants shall be inspected by the Contractor for watering needs at least once each week, and watered as necessary to promote plant growth and vitality.
2. Fertilizers: Fertilizers, pesticides and fungicides may only be used with approval from Commissioner.
3. Rodents: Protect against and exterminate rodents, and repair of any damage caused by rodent activities.
4. Weeding: Weed to keep all planted areas weed-free throughout the guarantee period.
5. Resetting: Reset plant material which has settled, to proper grade and position.
6. Irrigation: Coordinate with irrigation system installer for all adjustments to irrigation as required.
7. Instruct City's service personnel in all service procedures.

3.12 CLEAN UP

- A. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials. Store materials and equipment where directed.
- B. Immediately following the completion of planting operations, the Contractor shall remove all excess materials, stock piles, waste material, tools and equipment, and leave the site in a clear and clean condition.

- C. Immediately remove all rejected materials from the site. All rejected materials and other waste or debris shall become the property of the Contractor, who shall legally dispose of same off-site.

END OF SECTION

SECTION 327300

COIR FIBER BLANKETS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. The Contractor shall provide all equipment, labor, materials and incidental items necessary to furnish and install erosion control Coir Fiber Blanket as indicated on the Contract Drawings and as specified herein.
- B. Installation of Coir Fiber Blanket includes, but is not limited to:
 - 1. Coverage of wetland soil surface in Wetland Cells 1, 2, 3 and 4.
- C. The Contractor shall be responsible for any damage due to his work and for any corrective action or repairs needed to restore any damaged structure or facility to its condition prior to the start of work.

1.3 RELATED SECTIONS

- A. Plantings For Wetland Areas – Section 327200
- B. LEED Certification Requirements – Section 013010
- C. Erosion, and Sedimentation Controls – Section 312500
- D. Construction Waste Management – Section 017330

1.4 QUALITY ASSURANCE

- A. The Contractor shall use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

1.5 SUBMITTALS

- A. Contractor shall submit one (1) 2' x 2' sample of proposed Coir Fiber Blanket product.
- B. LEED Submittals Requirements

1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 013010 LEED Certification Requirements). Information for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractors or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post – industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. Provide back-up documentation to validate information provided on LEED MATERIALS REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, regional content).
3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required.

1.6 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.

1.7 MOCK UP – CELL 1

- A. Coir Fiber Blanket shall be included in Cell 1.

1.8 LEED PERFORMANCE REQUIRMENTS

- A. Coir Fiber Blanket shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division I LEED Requirements Section.

- B. Coir Fiber Blanket materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 LEED Requirements Section.
- C. All field-applied adhesives, sealants, paints and coatings relating to work of this section that are used on the interior of the building (defined as inside of the waterproofing system) shall meet the requirements of Section 013010, Part 2, where applicable.

1.9 QUALIFICATIONS

- A. The installation of Coir Fiber Blanket shall be performed by the Contractor or a specialty subcontractor specializing in and/or having experience installing erosion control measures in wetlands.

PART 2 PRODUCTS

2.1 MATERIALS

- A. Coir Fiber Blanket: Coir Fiber Blanket shall be 100% biodegradable woven matting of coir made from high strength coconut fiber. Coir Fiber Blanket shall be open weave erosion control webbing with non-shifting square mesh consisting of one hundred (100) percent coir fiber yarns in both the warp and the weft, with a minimum weight of twenty ounces (20 oz.) per square yard. Mat shall have 50% open space. Coir Fiber Blanket shall be Coir Mat 700, at least six (6) feet in width or an alternate width approved by the Commissioner or approved equal. The following are recommended sources of coir fiber blankets:
 - 1. Pinelands Nursery, 323 Island Rd, Columbus, NJ 08022. (609) 291-9486
 - 2. East Coast Erosion Control, 443 Bricker Rd, Bernville, PA. (610) 488-8496
 - 3. Hanes Geo Components, 104 Sunfield Ave, Edison NJ 08837. (732) 343-7740
- B. Sod Staples: Sod Staples shall be less than 6" long, 11 gauge galvanized wire.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Coir Fiber Blanket shall be installed and stapled at the direction of the Commissioner, in accordance with the manufacturer's recommendations and staple pattern guide.

3.2 PREPARATION

- A. Prior to installation operations, the Contractor shall confirm that the area of work has been graded to the proper lines and grades as indicated in the plans and specifications, and to the satisfaction of the Commissioner.

3.3 INSTALLATION

- A. Coir Fiber Blanket shall be laid along the wetland soil surface prior to planting, in accordance with the plans and specifications. Rows of fabric shall be joined by overlapping of adjacent sections of fabric, the sections shall be overlapped a minimum of 4 inches with the upstream Coir Fiber Blanket end over-lapping the downstream end. Coir Fiber Blanket shall be placed tightly and in full contact with the soil.
- B. Coir Fiber Blanket shall unroll to its full width and length and be anchored at ends as well as twice per square yard. Coir Fiber Blanket shall be anchored with sod staples. Excess Coir Fiber Blanket shall be cut away and the top edge trenched and buried to a depth of six (6) inches and anchored with staples.
- C. Installation of the Coir Fiber Blanket shall occur prior to the installation of Planting, where applicable and in accordance with the plans, specifications, and directions of the Commissioner.

END OF SECTION

SECTION 327400

WATERFOWL EXCLUSION BARRIER

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. The Contractor shall provide all equipment, labor, materials and incidental items necessary to fabricate, install, and maintain Waterfowl Exclusion Barrier as indicated on the Contract Drawings and as specified herein.
- B. Installation of Waterfowl Exclusion Barrier includes, but is not limited to:
 - 1. Protection of planted Wetland planting area through establishment.
- C. The Contractor shall be responsible for any damage due to his work and for any corrective action or repairs needed to restore any damaged structure or facility to its condition prior to the start of work.

1.3 RELATED SECTIONS

- A. Planting For Wetland Areas – Section 327200
- B. LEED Sustainability
- C. Dust, Soil Erosion, and Sedimentation Control – Section 312500
- D. DDC General Conditions

1.4 QUALITY ASSURANCE

- A. The contractor shall use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

1.5 SUBMITTALS

- A. LEED Submittals Requirements

1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 013010 LEED Certification Requirements). Information for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractors or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post – industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. Provide back-up documentation to validate information provided on LEED MATERIALS REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, regional content).
3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required.

1.6 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.

1.7 QUALIFICATIONS

- A. The installation of Waterfowl Exclusion Barrier shall be performed by the Contractor or a specialty subcontractor specializing in and/or having experience installing waterfowl control measures.

1.8 MOCK UP – CELL 1

- A. Waterfowl Exclusion Barrier shall be included in Cell 1, in conjunction with planting.

1.9 LEED PERFORMANCE REQUIREMENTS

- A. Waterfowl Exclusion Barrier shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 LEED Requirements Section.
- B. Waterfowl Exclusion Barrier materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 LEED Requirements Section.
- C. All field-applied adhesives, sealants, paints and coatings relating to work of this section that are used on the interior of the building (defined as inside of the waterproofing system) shall meet the requirements of Section 013010, Part 2, where applicable.
- D. All wood materials to be FSC certified.

PART 2 PRODUCTS

2.1 MATERIALS

- A. Fence Posts: 2" x 2" x 8' stakes of pointed tipped, untreated FSC-certified hardwood timber.
- B. Nylon Monofilament Line: Nylon mason's line, eighty - one hundred pound test minimum, of sufficient flexibility to wrap tightly around posts.
- C. Surveyor's Ribbon: White or brightly colored surveyor's ribbon.
- D. Fencing: Black polypropylene goose exclusion fencing, with horizontal and vertical lines and an aperture size of 0.75" to 1"; or approved equal.
- E. Nails: Two-inch hot dipped galvanized roofing nails.

PART 3 EXECUTION

3.1 GENERAL REQUIRMENTS

- A. The waterfowl barrier fence shall be installed before or immediately after planting of the wetland areas.

3.2 INSTALLATION

- A. The timber posts shall be spaced six to eight feet apart and pounded into the substrate to a minimum depth of two feet. No posts shall be installed in areas covered by wetland liner. The fencing material shall be taut and stapled with no space between the ground and bottom edge of fencing. If necessary, fencing can be partially buried in substrate. Nylon mason's line shall be strung between posts, beginning not more than eight inches above the fencing material.

- B. Nylon mason's line shall be attached to each post by wrapping the line a minimum of four times around a two-inch nail that extends into the post by a minimum of 1.25 inches. The topmost line shall be attached to nails hammered down into the top of the post, and additional horizontal nylon lines shall be spaced no more than eight inches apart. The fence shall extend around the perimeter of the planting area except locations where site wall or gabion, at least 4 feet high, is present. The outer fence shall be installed a minimum of 18 inches away from the first row of plants.
- C. Pieces of surveyor's ribbon shall be tied to the monofilament line at three-foot intervals. Ribbon must be wrapped twice around line before knotting to prevent slippage.
- D. Additional monofilament lines shall be tied to the tops of each stake, crossing horizontally over the cell to an opposite stake, creating an eight-foot weave above the planting zone. These cross-lines must also be tied with surveyor's ribbon at the same three-foot interval to prevent entry by birds from the air.
- E. There shall be absolutely no unused strands of nylon line, fencing, packaging materials, or any other construction debris left on site after fence installation.
- F. During the establishment period of the planted areas, the fence posts, line, and ribbons will need to be routinely inspected every week and all damaged areas repaired immediately as necessary. In particular, the fencing shall be maintained such that geese cannot trample the fence or walk into the planting area beneath the fence. At the conclusion of the establishment period, the temporary fence and any associated debris must be completely removed.

END OF SECTION

SECTION 327500

SOIL MIXES FOR WETLAND AREAS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work Included: This work includes but is not limited to the following:
 - 1. Supply of component materials and soil amendments for Wetland Soil Mix as specified.
 - 2. Preparation and blending of Soil Mix, as to meet specified requirements herein.
 - 3. Installation, placement, spreading, and fine grading of Soil Mix, as specified herein.
 - 4. Testing of all soil component materials, soil amendment materials, and Soil Mix, as specified herein.

1.3 RELATED SECTIONS

- A. Excavation and Fill – Section 312300
- B. Trenching and Backfilling – Section 312333
- C. Erosion and Sedimentation Controls – Section 312500
- D. Wetland Liners – Section 334713
- E. Sustainability Requirements – Section 013010
- F. DDC General Conditions

1.4 QUALITY ASSURANCE

- A. The contractor shall use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

1.5 SUBMITTALS

- A. All submittals, including the following, shall be as specified in the General Conditions.

- B. Product Data: Submit manufacturer's technical information, including application instructions where relevant, for the following items:
 - 1. Fertilizers
- C. Samples - Soil Mix Components: Each 1 lb. packaged.
 - 1. Topsoil
 - 2. Compost
- D. Samples - Blended Soil Mix: Each 1 lb. packaged.
 - 1. Aquatic Soil Mix
- E. Test Results - Soil Mix Components: Submit written reports, as specified herein, for each bulk component:
 - 1. Topsoil
 - 2. Sand
 - 3. Compost
- F. Test Results - Blended Soil Mix: Submit written reports, as specified herein, for each blended soil mix:
 - 1. Aquatic Soil Mix
- G. LEED Submittals Requirements
 - 1. For all installed products and materials of this Section, complete the MATERIALS REPORTING FORM (blank copy attached at end of Section 013010 LEED Certification Requirements). Information to be supplied for this Form shall include:
 - a. Cost breakdowns for the materials included in the Contractors or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post – industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 - 2. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material

listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).

3. For products and materials in the LEED boundary, provide cut sheets with the Contractor's or subcontractors stamp, confirming that the submitted products are the products installed in the project.
4. The LEED Submittal Information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) Submittals may be used as the basis for rejecting the submitted products or assemblies.

1.6 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.

1.7 TESTING

- A. Contractor shall submit written test reports.
 1. Testing shall be carried out by an independent testing laboratory.
 2. Testing laboratory shall be approved by Engineer.
 3. All testing required by this Section, or additionally required by Engineer, shall be furnished and paid for by Contractor.
 4. Contractor shall be responsible for timely submittal of samples to the testing laboratory.
- B. Each test shall be carried out using the categories and sieve sizes as specified herein. Failure to include any of the required criteria will be sufficient cause for rejection of the test.
- C. Each test report shall include the following information:
 1. Project Title
 2. Name of Contractor
 3. Name of material supplier
 4. Testing Laboratory name, address and telephone number
 5. Type of test
 6. Date of Test
 7. Test results, including identification of deviations from acceptable ranges.

- D. Each sample shall be tested for the following (for additives Peat Moss and Composted Bark see E):
1. Mechanical analysis (soil texture analysis): Sieve method, using sieve sizes specified.
 2. pH
 3. Organic matter content: Percentage of oven-dry weight of soil, determined by loss on ignition of moisture-free sample, dried in accordance with the methods of the Association of Official Agricultural Chemists.
 4. Analysis of soluble salts: Sodium, calcium, magnesium, sulfates, chlorides and bicarbonates, in milimhos per centimeter.
 5. Analysis of minerals: Nitrogen, phosphorus, and potassium, in parts per million.
 6. Analysis of heavy metals: In parts per million.
 7. Corrective recommendations for nutrients and pH.
- E. Each sample of Peat Moss shall be tested for the following:
1. pH
 2. Organic matter content: Percentage of oven-dry weight, determined by loss on ignition of moisture-free sample, dried in accordance with the methods of the Association of Official Agricultural Chemists.
 3. Ash content: Percentage of oven-dry weight.
 4. Moisture absorption capacity: Percentage of oven-dry weight.
- F. Each sample of Composted Bark shall be tested for the following:
1. Particle size distribution.
 2. Wood content.
 3. pH
 4. Methyl bromide or other additives.
- G. The Engineer may take and analyze at any time, such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested at no additional cost to the City.
- H. No component bulk material for Soil Mix shall be used or blended into a mix, until test reports have been received and approved by the Engineer. As necessary, make any and all soil mix amendments and resubmit test reports indicating amendments, until approved.

1.8 REGULATORY REQUIREMENTS

- A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to the City.
- B. Procure and pay for all permits and licenses required for the Work of this Section.

1.9 DELIVERY AND STORAGE

- A. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.
- B. Packaged Materials: Deliver packaged materials to the location where planting Soil Mixes are to be blended, in unopened bags or containers, each bearing the name and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the material.
 - 1. All bags shall be protected from water and contamination with other materials.
 - 2. Retain packages for inspection by Engineer.
 - 3. All packaged materials shall be stored, handled and applied in strict accordance with manufacturer's instructions.
- C. Stockpiles
 - 1. Stockpiles of on-site or off-site bulk materials and Soil Mixes shall not exceed 50 cubic yards, and shall be no more than 6 feet in height to prevent anaerobic conditions within the piles.
 - 2. All stock piled materials shall be adequately covered with tarpaulins or otherwise protected to prevent excessive water absorption and blowing by winds, until time of actual use.

1.10 MOCK UP – CELL 1

- A. Cell 1 shall be constructed ahead of Cells 2-5 using the Aquatic Soil Mix.

1.11 LEED PERFORMANCE REQUIREMENTS

- A. Soil materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 LEED Requirements Section.

PART 2 PRODUCTS

2.1 GENERAL

- A. All Soil Mix components shall be tested and approved prior to incorporation into blended Soil Mixes.

- B. Provide adequate quantities of all Soil Mix materials to attain, after compaction and natural settlement, all design finished grades.

2.2 SOIL AMENDMENT MATERIALS

- A. The following materials may be used as amendments to achieve Aquatic soil mix:
- B. Fertilizer: Use of fertilizer must be approved by Commissioner.
- C. Limestone: Shall be granular limestone, produced from Dolomitic limestone specifically for use in planting, with a minimum of 88% of calcium and magnesium carbonates, conforming to the following requirements:

Sieve Size	Percent Passing
# 10	100
# 20	90 minimum
# 100	60 minimum

- D. Sulfur: Lower pH if required, by use of elemental sulfur product.
 - 1. Peat moss or copper sulfate may not be used to lower pH.
- E. Compost: Shall be used to increase organic matter content of soil.
 - 1. Shall conform to the following requirements:
 - a. Material shall be capable of sustaining the growth of vegetation, with no admixture of refuse or material toxic to plant growth.
 - b. Material shall be derived from organic wastes such as food and agriculture residues, composted cow or other animal manures, sewage sludge or other materials that meet the specified requirements.
 - c. Compost shall be screened, and shall be free of any stones, branches, roots or wood chips, and all debris such as plastic fragments, glass, and metal fragments.
 - d. Material shall be composted for a minimum of one year (12 months).
 - e. Acceptable manufacturers include:
 - 1). Allgro, Inc., Liberty Lane, Hampton, NH 03842, 1-800-662- 2440
 - 2). Milorganite
 - 3). Sustane

- f. Compost shall show conformance with the following requirements:
- 1). Organic content: 50% minimum
 - 2). pH: 6.0 to 7.5
 - 3). Carbon/nitrogen ratio: 25:1 to 35:1
 - 4). Passing 1/2" screen: 100%
- g. Heavy metal content shall not to exceed the following indicated amounts:

Allowed Concentration in parts per million	
Arsenic	1
Boron	300
Cadmium	2
Chromium	100
Copper	100
Lead	150
Mercury	0.50
Molybdenum	10
Nickel	50
Selenium	25
Zinc	400

2.3 AQUATIC SOIL MIX (SOIL MIX #3)

- A. Aquatic Soil Mix shall conform to the following requirements:
1. Organic Matter: 4%-12% maximum (May use compost to achieve)
 2. pH: 5.2 - 7.0
 3. Soluble salts: Less than 2 milimhos per centimeter
 4. Soil Textural Analysis: Wetland Soil Mix shall consist of the following percentages of sand, silt and clay to achieve a soil texture of loamy sand to sandy loam.
 - a. Sand (0.05 to 2 mm) 80% to 85%

- b. Silt (0.002 to 0.05 mm) 0% to 20%
 - c. Clay (<0.002 mm) 0% to 20%
5. Minerals:
- a. Nitrogen: Less than 12 ppm
 - b. Phosphorus: More than 7 ppm
 - c. Potassium: More than 150 ppm

2.4 HEAVY METALS

- A. Each soil mix shall be tested for heavy metal content. The total heavy metal content shall not to exceed the following indicated amounts:

Element	Allowed Concentration in parts per million
Arsenic	1
Boron	300
Cadmium	2
Chromium	100
Copper	100
Lead	150
Mercury	0.50
Molybdenum	10
Nickel	50
Selenium	25
Zinc	400

PART 3 EXECUTION

3.1 INSPECTION AND COORDINATION

- A. Contractor shall inspect the site before bidding to determine the characteristics of the site and the existing soil in areas to be planted.
- 1. Prior to construction and soil mix placement operations, the Contractor shall ascertain the location of all existing and proposed electric cables, conduits,

irrigation, under-drainage systems and all other underground or at grade utilities, by contacting the appropriate utility company.

2. Contractor shall take proper precautions so as not to disturb or damage any sub-surface elements.
 3. Contractor shall be liable for and all damage to such utilities during the course of construction, and shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.
- B. Contractor shall be liable for any and all damage to surrounding areas caused by planting operations and shall be required to restore or replace damage areas to original conditions, to the satisfaction of the Engineer.
- C. Coordination: The Landscape Contractor shall coordinate, adjust, and relate together, work of this Section with other work of the Project and with work of other Contractors. Such coordination shall include but not be limited to:
1. Location of all underground utility lines and structures
 2. Scheduling of planting operations
 3. Scheduling of maintenance operations
- D. Verify that all work requiring access through or adjacent to areas where soil mixes are to be placed has been completed and no further access (other than Landscape installation) will be required. In the event that access will be required, this must be coordinated with the Engineer.

3.2 WEATHER LIMITATIONS

- A. Perform both blending and site soil work only during suitable weather conditions. Do not handle, haul, place, work, disc or rototill soil when frozen, excessively wet, or in otherwise unsatisfactory condition.

3.3 PREPARATION OF SOIL MIXES

- A. Uniformly blend all ingredients required to achieve requirements for Wetland Soil Mix, by wind rowing and/or tilling on a hard surfaced area.
1. The components of all soil mixes shall be blended so that ingredients are thoroughly incorporated into the mixture to assure uniform distribution.
 2. Do not over-mix, mix shall remain friable and well aerated.
 3. Organic matter shall be maintained moist, not wet, during blending.
 4. Delay mixing of fertilizers if planting will not follow within a few days.

3.4 PREPARATION OF SUB-GRADE

- A. Verify as-constructed or existing sub-grade elevation and perform additional grading operations as necessary to bring the sub-grade to a true, smooth, slope parallel to the finished grade, at all areas to receive soil mixes.
- B. Any sub-grades or soils polluted by gasoline, oil, plaster, construction debris, unacceptable soils, or other substances which would render material unsuitable for plant growth, shall be removed from the premises whether or not such pollution occurred or existed prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes shall be reviewed and approved by the Engineer.
- C. Clean sub-grade and dispose of all debris prior to placement of soil mixes.
 - 1. Remove all large clods, lumps, brush, roots, stumps, litter, trash, and other foreign material and stones one-half inch in diameter or larger.
 - 2. Dispose of removed material legally off-site.
- D. Spray all vegetation on sub-grade with a pre-emergent weed killer at the rate of application recommended by the manufacturer.
- E. Wetland Liner must be installed on existing sub-grade prior to installation of Wetland Soil Mix where applicable.
- F. Protect adjacent pavements, walls, utilities and other construction from damage or staining by any soil mix placement operations.

3.5 PLACEMENT OF PLANTING SOIL MIXES

- A. Do not place any muddy or wet Soil Mixes.
- B. Place and spread Soil Mix over Wetland Liner or sub-grade as shown on plan, to a depth sufficiently greater than the depth required for planting areas so that after settlement the completed work will conform to the lines, grades, and elevations shown or otherwise indicated.
- C. Place and spread Soil Mix over the approved Wetland Liner or sub-grade, in 6- inch lifts, or as directed by Engineer or and settle to eliminate air pockets and minimize settlement. Lightly scarify previously placed surfaces prior to placing subsequent lifts.
- D. Compact to not less than 90% Modified Proctor.
 - 1. Provide compaction testing to conform compliance to specified compaction density.
 - 2. Fills shall not be so compacted as to restrict the flow of air or water through the soil.

- E. After completion of compaction operations, protect the installation from contamination by toxic materials or trash, and from water containing cement, clay, silt or any other materials.

3.6 GRADING OF SOIL MIXES

- A. After settlement has occurred, add soil to maintain finished grades. If for any reason soil is left exposed for a long duration prior to planting, add soil and regrade as required.
- B. Protect placed Soil Mix against construction activity with snow fencing or by other acceptable methods.
 - 1. Protect from the eroding effects of wind and rain with filter fabric, as necessary.

3.7 CLEAN UP

- A. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials.
- B. Immediately following the completion of soil mix installation operations, the Contractor shall remove all excess materials, stock piles, waste material, tools and equipment, and leave the site in a clear and clean condition.
- C. All waste materials shall become the property of the Contractor, who shall legally dispose of same off-site.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 328000

IRRIGATION SYSTEM

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Automatic irrigation system with electric/manual control including piping, fittings and accessories.
 - 2. Temporary city water supply, backflow preventer, booster pump and all controls
 - 3. Temporary Irrigation for Cells and North Woodland
 - 4. High Density Polyethylene pipe (HDPE).
 - 5. Rain Sensor with related wiring.
 - 6. Controller (green roof) with related 24V wiring and conduit, electrical wiring.
 - 7. Weather Station
 - 8. Air release valve assemblies
 - 9. Testing and instruction.
 - 10. Excavating and backfilling for irrigation system work.
 - 11. GPS As-Built drawings.
 - 12. M&O Training and Demonstration.
 - 13. Operation Maintenance Manual.
 - 14. Warranty
- B. Water for the irrigation system to be supplied from the cell structure (installed as work of other section(s)). The irrigation Contractor to install the irrigation system from this point of connection (P.O.C.) as shown on the drawings.
- C. Irrigation system requirements: 750 gpm at 120 psi (dynamic) at the irrigation system point of connection.
- D. The extent of the irrigation system is shown on the Drawings.

1.3 RELATED SECTIONS

- A. ELECTRICAL Division 26
- B. PLUMBING Division 22

- C. IRRIGATION PUMP STATION Section 328001
- D. MANUAL IRRIGATION SCHEDULE Section 328002

1.4 REFERENCES

A. Standards and Codes that apply to the Work of this Section:

1. RE NEC — National Electric Code, current edition.
2. UPC — Uniform Plumbing Code, current edition.
3. ASTM — ASTM International:
 - a. B 3 — Specification for Soft or Annealed Copper Wire.
 - b. D 698 — Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort.
 - c. D 1557 — Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.
 - d. D 1784 — Specification for Rigid PVC Compounds and CPVC Compounds.
 - e. D 1785 — Specification for PVC Plastic Pipe, Schedules 40.
 - f. D 2287 — Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds.
 - g. D 2241 — Specification for PVC Pressure-Rated Pipe (SDR Series).
 - h. D 2464 — Specification for Threaded PVC Plastic Pipe Fittings, Schedule 80.
 - i. D 2466 — Specification for PVC Plastic Pipe Fittings, Schedule 40.
 - j. D 2564 — Specification for Solvent Cements for PVC Plastic Piping Systems.
 - k. D 2672 — F 690 — Practice for Underground Installation of Thermoplastic Pressure Piping Irrigation Systems.
4. ANSI — American National Standards Institute: NSF 14— Plastics Piping Components and Related Materials.

1.5 DEFINITIONS

A. The following are industry abbreviations for irrigation materials.

1. Excessive Compaction: Planting area soil or soil mix compaction greater than 75 percent of maximum dry density as determined by ASTM D 1557.
2. PVC: Polyvinyl Chloride.
3. HDPE: High Density Polyethylene
4. SDR: Standard Dimensional Ratio.
5. AWG: American Wire Gauge.

1.6 TEMPORARY IRRIGATION EQUIPMENT

- ##### A. During construction a temporary water supply and control system will be required to meet the requirements of the project. The Irrigation system will be controlled

independently from the DEP (North Area), Driving Range and the Golf Course. Provide a temporary city water connection, backflow preventer, booster pump, electrical, piping and irrigation control systems in order to irrigate the site.

1.7 SUBMITTALS

- A. Shop Drawings: Shop drawings showing all piping, conduit, and irrigation equipment (ie. flow sensor, master valve, controller) for point of connection for submitted irrigation control system.
 - 1. Include shop drawing for temporary irrigation system in Cells and North Woodland Area.
- B. Product Data: Manufacturer or suppliers descriptive literature including installation instructions, for each specified product.
- C. Qualifications: Experienced Contractors are required who are thoroughly trained and experienced in the skills required to install site irrigation, and who will have a qualified superintendent present, at all times, during the installation. Contractors' experience in the installation of site irrigation as outline in Submittals Section 1.7, E and F must be regularly engaged in and which maintains a regular work force in the installation of site irrigation.
- D. Materials, equipment, and methods of installation will comply with the applicable requirements of the authorities having jurisdiction including the following codes and standards:
 - 1. City of New York/State of New York Building Codes
 - 2. National Fire Protection Association, (NFPA): National Electrical Code.
 - 3. American Society for Testing and Materials, (ASTM).
 - 4. National Sanitation Foundation, (NSF).
 - 5. American Society of Agricultural Engineers, (ASAE).
- E. Credentials: Name and qualifications of the irrigation contractor including comparable projects of similar work and scope that the Contractor has completed within the last three (3) years.
- F. Certifications: Written certification from each product manufacturer or supplier stating that their product conforms to the specified requirements and that all products do not contain hazardous materials.
- G. Samples: When requested by the City of New York submit each irrigation system component and other item(s) related to the work to confirm product characteristics.
- H. Operation & Maintenance Manual: The Contractor shall furnish four (4) copies of the O & M Manual (Operation & Maintenance Manual) for the irrigation system and the associated mechanical system. The manual shall include a checklist for trouble shooting and corrective measures in addition to operation and maintenance instructions.

- I. Guarantee: provide one year installer's guarantee.
- J. GPS Construction Record (As-Built) Drawing:
 1. Prepare "Construction Record Drawings" for irrigation system using GPS collected data and AutoCAD, release 2010 software and drawn at a scale of 1"=20'-0". Legibly mark drawings to record actual construction.
 2. GPS Construction Record Drawings to consist of the following:
 - a. Controller.
 - b. Spray Heads.
 - c. Quick Coupling Valves.
 - d. Isolation Valves.
 - e. Automatic Valve Assemblies with decoder number.
 - f. Irrigation system mainline and lateral pipe. Routing to have size indicated.
 - g. Irrigation system 2-wire path routing.
 3. Maintain GPS Data of the irrigation system during the duration of the installation keeping the same current on a daily basis. GPS Data will be updated as irrigation work proceeds indicating the exact field location of all sprinkler heads, piping, valves, wire and miscellaneous equipment for the entire irrigation system. The GPS Data to be kept on-site and be available for review by the Commissioner and City of New York.
 4. Submit a CD-ROM disk with digital AutoCAD drawing file(s), one (1) set of PDF files suitable for reproduction of the "Construction Record Drawings" showing actual construction.
 5. Submit "Construction Record Drawings" prior to final review and acceptance.
- K. Controller Drawings.
 1. Controller drawings to be a reproduction of the construction record drawing reduced and printed on 8 1/2" x 11" 24lb bond paper. Drawings are to be legible. If necessary use multiple sheets of 8 1/2" x 11" paper and place drawings back to back.
 2. Drawings are to show all irrigation zones highlighted in a different color solid hatch pattern with the designated valve schedule.
 3. Seal controller drawings in 10 mil plastic laminate. When multiple drawings are required punch a hole in the upper left hand corner of the laminate and connect with round key chain loop.
 4. Submit two (2) drawings for each controller.
- L. Irrigation Schedule.
 1. Using data obtained from the water audit the Certified Landscape Irrigation Auditor shall create a typewritten schedule on 8 1/2" x 11" white paper listing each

valve number, type of sprinkler (rotor, spray), description of that zone, days to water and daily runtimes for each irrigation month. Irrigation run times based on historical evapotranspiration and rainfall data.

2. Example:

Zone	Type	Days	Description	April	May	June	Jul	Aug	Sept	Oct
1	Rotor	MWF	Front Bed	15:00	17:00	25:00	25:00	30:00	18:00	8:00
2	Spray	MWF	Rear Lawn	5:00	6:00	8:00	12:00	13:00	9:00	6:00

3. Schedule to include the following note: Irrigation runtimes are based on Historical data and should be used only as a guide. All irrigation runtimes should be adjusted accordingly based on actual climatic conditions.

4. Seal irrigation schedule in 10 mil plastic laminate.

5. Submit two (2) irrigation schedules for each controller.

6. Submit all product warranties to City of New York.

1.8 COORDINATION

A. Thoroughly coordinate and schedule the work of this Section with all trades involved to prevent interferences, and in order to allow adequate time at the proper stage of construction to properly perform all work of this Section.

B. Before any work is started, a site conference shall be held between the Contractor, the Irrigation Sub/Contractor and Commissioner concerning the work to be performed under this Section. The Landscape Plans shall be reviewed at this conference and siting, layout, hand and/or pneumatic excavation shall be discussed. Contractor shall schedule conference at the convenience of the City of NY.

C. Subcontractor to coordinate location of all piping and sleeves to be installed under walkways and driveway pavements with the Contractor.

1.9 QUALITY ASSURANCE

A. It is the intent of these Specifications and the Contract Drawings to provide for a complete installation. Therefore, any items not specifically noted but, reasonably necessary for a complete installation, to be furnished. The system is to efficiently and uniformly irrigate all areas and perform as required by the Contract Documents. The irrigation system is to be fully automatic with an electric/manual control.

B. The Contractor shall obtain all necessary permits and pay all required fees, at no additional cost to the City, to any governmental agency having jurisdiction over the work. The contractor as required shall arrange inspections required by local ordinances during the course of construction.

C. Licenses:

1. A Licensed Plumber shall make all plumbing connections. A Licensed Electrician shall perform connections to 120V power supplies.

D. Rejection:

1. The Commissioner reserves the right to reject any proposed design layout, material, or work, which does not conform to the Contract Documents. Rejected work shall be removed or corrected at the Contractor's expense immediately upon notification by the City of NY.

1.10 FINAL REVIEW AND ACCEPTANCE

- A. When all irrigation work is completed and the "Construction Record Drawing" has been submitted a final review of the irrigation system will be made by the City of New York, upon written notice requesting such a review. Submit the written notice at least ten (10) days prior to the anticipated review.
- B. Upon final review and acceptance, the City of New York will notify the Contractor, in writing, as to final acceptance of the irrigation system. Date of the final acceptance by the City of New York is the date beginning the warranty period.
- C. Any irrigation equipment item required under this contract that is malfunctioning or in need of repair is to be removed and replaced. All replacements are to be of equipment and/or material originally specified. The cost of replacement is to be borne by the Contractor.
- D. Upon acceptance of the entire system, instruct the City of New York's personnel in the complete operation of the entire system.

1.11 GUARANTEE

- A. Guarantee the entire irrigation system and all related equipment and accessories for a period of one (1) year from the date of substantial completion.
- B. The guarantee period will commence upon substantial completion for a complete system and/or any portion thereof has been put into operation and acceptable to the City of New York.

1.12 GUARANTEE SERVICE

- A. Irrigation system shall be guaranteed for a period of 12 months after the date of Substantial Completion. During the 12 month guarantee period, the Contractor shall maintain the irrigation system
- B. During the warranty period, maintain the irrigation system to ensure complete operation of the entire system. Adjust and repair all settled piping, trenches and sprinkler heads. Correct all defective or damaged work as soon as possible.

- C. Return to the site during the subsequent fall season(s) (before October 30th) and winterize the entire system. Drain all water from the system via compressed air and demonstrate to the City of New York the proper procedures for the system winterization.
- D. Return to the site during the subsequent spring season(s) (before April 15th) and start-up the system. Demonstrate to the City of New York the proper procedures for the system start-up, operation, and maintenance.
- E. System maintenance to begin immediately upon substantial completion. Provide continuing maintenance of the irrigation system, as necessary, throughout the installation of the irrigation system.

1.13 DELIVERY, STORAGE, AND HANDLING

- A. Deliver the irrigation system components in the manufacturer's original undamaged and unopened containers with labels intact and legible.
- B. Deliver plastic piping in bundles, packaged to provide adequate protection of pipe ends, both threaded or plain.
- C. Handle materials to prevent damage.
- D. Store materials to protect from sunlight, temperature variation and weather.
- E. Provide secure, locked storage for valves, sprinkler heads, and similar components that can not be immediately replaced, to prevent installation delays.

PART 2 - PRODUCTS

2.1 IRRIGATION MANUFACTURERS

- A. Toro Company, Riverside, California

2.2 MATERIALS

- A. All irrigation equipment is to be provided by an authorized distributor.
- B. All material and equipment furnished by the Contractor to be new, of the kind and type specified, of good quality, and to be delivered to the site in good condition. All materials to be protected by the Contractor until incorporated in the work and finally accepted by the City of New York.
- C. Temporary irrigation equipment
 - 1. Backflow Preventer:

- a. Backflow preventer to be 6" model 825YD as manufactured by Wilkins, Watts, Febco or approved equal.

D. Controller

1. The Control System shall consist of 200 Station 2-wire controller, model DEC-SA-200 as manufactured by The Toro Company.
2. The Control System shall include a maintenance remote radio system, model TMR-1-KIT as manufactured by The Toro Company.
3. Include at no additional cost to the City of New York a site survey for the controller which shall be performed (PRIOR TO ORDERING CONTROLLER) by the Authorized Representative of the controller manufacturer to confirm radio reception.
4. Include at no additional cost to the City of New York provide account set-up and communication activation for the irrigation controller.
5. Include at no additional cost to the City of New York (3) three instructional meetings with the City of New York and Department of Parks and Recreation designated personnel and the Authorized Representative of Manufacturer. These meetings are to occur upon completion of the irrigation system installation.

E. Weather Station:

1. Weather station to be model T Weather 106 as manufactured by The Toro Company.

F. Line Decoders:

1. Line decoder shall be a fully programmable, direct bury decoder that provides an interface between the Toro controller and automatic valve. Approved line decoders shall be DEC-ISP-1 DEC-ISP-2 or DEC-ISP-4 as manufactured by The Toro Company.

G. Flow Sensor:

1. Flow Sensor shall be a 1" nylon impeller style sensor module in a brass fitting that provides current flow status. Approved Flow Sensor model shall be Rain Master FSB-100, Rain Bird model FS-100B, Badger IR250B-1.0, or approved equal.

H. 2-Wire Decoder Wire:

1. 2-Wire decoder wire to be double jacketed two (2) conductor #14 awg cable specially designed for use with the 2-wire control systems, suitable for direct burial. The conductors to be 12 -18 gauge, tin coated, soft drawn, annealed, solid copper conforming to ASTM 33 with 4/64" thick PVC (polyvinyl chloride) insulation, conforming to UL Standard #493 for thermoplastic-insulated style UF (Underground Feeder), rated at 60 degree C. Wire to be manufactured by Paige Electric, Baron or Regency Wire or approved equal.

I. Pump Communication Wire:

1. Pump Communication Wire to be shielded and armored with double jacketed two (2) conductor #16 awg cable specially designed to transmit and receive signals between irrigation satellites, central computers, weather stations, and sensors, suitable for direct burial. The conductors to be 16 gauge, tin coated, soft drawn, annealed, solid copper conforming to ASTM B-3 and B-8 with 4/64" thick PVC (polyvinyl chloride) insulation, conforming to UL Standard #493 for thermo-plastic-insulated style UF (Underground Feeder), rated at 60 degree C. The cable utilizes stranded insulated conductors, aluminum shield and drain wire to minimize electrical, magnetic, and radio frequency interference. The cable also features stainless steel tape armor for protection against rodents and for shielding of lightning and power surges. Wire to be manufactured by Paige Electric, Baron or Regency Wire or approved equal.

J. 24V Electrical Equipment:

1. Low voltage (24 VAC) wire-splice kits to be UL listed 3M DBY-6, Paige DBM or Connector Kings Dryconn or approved equal.
2. Wire connectors to be Insulated Connector (Y, R, G, B), or approved equal - size in accordance to wire AWG used.
3. Conduit for 2-wire path to be rigid 1" Non-Metallic conduit and fittings conforming to NEMA TC-2, Federal specification WC1094A and UL 651 specifications. Fittings are manufactured to NEMA TC-3, Federal specification WC1094A and UL514B.

K. Grounding:

1. Ground rods to be 5/8" by 8' copper clad steel rods.
2. Grounding plates for grounding controllers to be 4" x 8" x 0.0625" (101.6 mm x 2.44 m x 1.6 mm). A 25-foot (7.62 m) continuous length of 6 AWG, green insulated, with extruded yellow stripe, solid bare copper wire is welded to the plate. Grounding plate to be Paige Electric model #182199IC, Regency, Baron or approved equal.
3. Grounding plates for grounding decoders and 2-Wire/2-Core circuits to be 4" x 3" x 0.0625" (101.6 mm x 2.44 m x 0.9 mm). A 10-foot (3.05 m) continuous length of 10 AWG, green insulated, with extruded yellow stripe, solid bare copper wire is welded to the plate. Grounding plate to be Paige Electric model #1822011C, Regency, Baron or approved equal..
4. Earth grounding wire to be 6/1 AWG, green insulated, solid bare copper wire. Paige Electric model #150854, Regency, Baron or approved equal.
5. All grounding connectors to be of the Cadweld "One Shot" fuse type – Model GR1161GPLUS (Paige Electric model #1820037P) and Model GT1161GPLUS (Paige Electric model #1820039P). Connections to be made utilizing the Cadweld Battery Control Unit, Paige Electric model # PLUSCU, Regency, Baron or approved equal. .

6. Earth contact material for each grounding plate to be two (2) 50lb bags of "PowerSet" for loose soils, Paige Electric model #1820058 or "PowerFill" for clay soils, Paige Electric model #1820059 Regency, Baron, or approved equal..
- L. Sleeves:
1. Sleeves to house pipe and wire conduit under pavement or walkways to be Sch. 40 PVC pipe w/solvent weld coupling as manufactured by JM Eagle, Ipex or Diamond Pipe or approved equal.
- M. Pipe:
1. Provide pipe continuously and permanently marked with manufacturer's name or trademark, size schedule and type of pipe, working pressure at 73 degrees F. and National Sanitation Foundation (NSF) approval.
 2. All mainline and lateral piping shall be homogenous throughout and free from visible cracks, holes, foreign materials, blisters, wrinkles, and dents.
 3. Main line piping to be SDR-11 160 PSI (Butt Fusion) High Density Polyethylene (HDPE). The pipe shall be PE3408/PE3608 high density, high molecular weight resin. The pipe shall be in compliance with ASTM F714 dimension and pressure ratings. Primary properties- Cell classification shall be in accordance with ASTM D 3350-84 and 345434C/E. Pipe to be manufactured by JM Eagle, Phillips Driscopipe Inc. or ISCO Industries or approved equal.
 4. Lateral piping (1 1/2" and smaller) to be POLY (polyethylene) PE 3408/3608 SDR-15 - 100 psi NSF pipe conforming to ASTM-2239. Pipe to be as manufactured by Oil Creek Plastics, Inc., Centennial Plastics or Charter Plastics or approved equal.
- N. Pipe Fittings:
1. HDPE main line BUTT Fusion pipe fittings to be SDR-11 200 PSI (Butt Fusion) High Density Polyethylene (HDPE) Driscopipe 8600 extruded from Marlex M-8000. The fittings shall be PE 4710 high density, high molecular weight. The fittings shall be in compliance with ASTM F714 dimension and pressure ratings. Primary properties- Cell classification shall be in accordance with ASTM D 3350-84 and 345434C. Fabricated fittings are to be manufactured using Data Logger to record temperature, fusion pressure, and a graphic representation of the fusion cycle shall be of the Quality Control records. Fittings to be manufactured by JM Eagle, Phillips Driscopipe Inc. or ISCO Industries or approved equal. .
 2. Electrofusion Fittings for HDPE pipe – Fittings shall be made from resin or pipe meeting ASTM D 3350 with a minimum cell classification of 345434C/E. Electrofusion Fittings shall meet the manufacturing standard of ASTM F714. Fittings shall have the same pressure rating as the pipe or higher unless otherwise specified on the plans.

3. Mainline Flanged and Mechanical Joint Adapters – Flanged and Mechanical Joint Adapters shall be made from materials containing resin that meets ASTM D 3350 with a minimum cell classification of 345434C/E
 4. Fittings to be used with polyethylene pipe in the landscape areas to be PVC insert fittings as manufactured by Spears, Lasco, Colonial Engineering or approved equal. Clamps to be stainless steel, worm gear hose clamps with stainless steel screws, series 6800 as manufactured by Ideal or stainless steel “ear” type clamps, series 210 as manufactured by Oetiker, SAE type “J” as manufactured by Murray Corporation or series 61 as manufactured by Ideal or approved equal.
 5. PVC fittings, where required on lateral pipe, to be PVC Schedule 40. Male adapters to be PVC Schedule 80. All PVC nipples to be Schedule 80 with molded threads. Close nipples to not be allowed. Fittings and nipples to be as manufactured by Spears Manufacturing, Dura or Lasco or approved equal..
- O. Dielectric Fittings:
1. ASTM F 441/F 441M, Schedule 80, CPVC threaded pipe nipples, 4 inch length.
- P. Spray Heads:
1. 6” pop-up spray head to be Toro 570Z-6P-PR-COM, Rain Bird model 1806-SAM-PRS or Hunter model PRS40-06-CV or approved equal.
 2. Plastic rotary nozzles to be Precision Rotary Series by Toro, MP Rotator series 1000, 2000 and 3000 as manufactured by Hunter Industries, RN Series by Rain Bird or approved equal.
- Q. Swing Joints:
1. Swing joint used for pop-up spray heads to be made from Toro Funny Pipe model 850-25 and Funny Pipe elbows models 850-31 (1/2”) and 850-32 (3/4”) or model SJ-512 (1/2”), SJ-712 (3/4”) as manufactured by Hunter Industries, Rainbird models SA-125050 (1/2”), SA-125575 (3/4”) or approved equal.
 2. Swing joint used for quick coupling valves to be PVC snap-loc with brass MIPT, model G13S-212 as manufactured by Lasco, Dura or Fittings, Inc. or approved equal.
- R. Valves:
1. Valves on the pressure side of the automatic valves to be bronze body manual ball valves with stainless steel plastic covered handle (150 p.s.i. rated) with NPT connections. Size to be the same as the automatic valve it serves. Valves to be as manufactured by Apollo Ball Valve, Nibco or Watts or approved equal.
 2. All main line gate valves to be resilient wedge type conforming to the requirements of AWWA Spec. C509. They are to have flanged connections, turn counter-clockwise to open, to be designed for 200 psi working pressure and have a 2” operating nut. Valves to be Clow Valve Company, Kennedy or Waterous or approved equal. Supply two (2) - 5 ft. main line valve keys.

3. Quick-coupling valves to be two piece bronze bodies, double slot, 1" IPS with lock top. Supply four (4) keys. Valves to be model #100-2SLVLC as manufactured by The Toro Company, model #44LRC as manufactured by Rain Bird or model #HQ-44LRC as manufactured by Hunter or approved equal. Coupler to be model #100-SLK as manufactured by The Toro Company, model #44-K as manufactured by Rain Bird or model HK-44 as manufactured by Hunter or approved equal. Supply six (6) couplers and keys. Brass hose swivels to be 1" X 3/4" model #075-MHS as manufactured by The Toro Company, model #SH-1 as manufactured by Rain Bird or model HS1 as manufactured by Hunter or approved equal. Supply six (6) swivels.
 4. Automatic valves to be plastic globe type, normally closed, electric solenoid-actuated and diaphragm-operated with flow stem. Solenoid to be epoxy impregnated 24 VAC-60 Hz (18 to 30 VAC), 5.8 VA and to be suitable for direct burial. Valves to be capable of manual operation by means of an internal bleed. Sizes to be as noted on the drawings. Valves to be Toro P220 series valves, Rain Bird PEB series or Hunter ICV series valves or approved equal.
 5. Master valve to be brass globe type, normally open, electric solenoid-actuated and diaphragm-operated with flow stem. Solenoid to be epoxy impregnated 24 VAC-60Hz (18 to 30 VAC), 5.8 VA and to be suitable for direct burial. Valves to be capable of manual operation by means of an internal bleed. Valve to be series 3100 as manufactured by SuperiorBuckner Controls Company, 400 series Bermad Inc, 2000 series Griswold or approved equal.
 6. Flush hydrant to be model Aquarius #108-2". Supply one (1) 2-1/2" x 50' fire hose with proper connections and Sch. 80 PVC riser, see detail drawings. Depth of flush valve will determine length of 2" riser pipe. Flush hydrant to be as manufactured by Gil Industries, Inc., Tru-Flow, Zurn, or approved equal.
 7. Pressure Reducing Valve to be 3" model N223F super capacity water pressure reducing valve as manufactured by Watts, Wilkins or Febco or approved equal. .
 8. Valve identification tags to be standard size, model ID-STD-Y1. The identification tag shall be stamped with the following designation L1, L2 etc. for lawn areas, P1, P2 etc. for planter areas and T1, T2 etc. for tree pit areas to match number of valves per controller. The identification tags to be manufactured by T. Christy Enterprises, Seton, BradyID or approved equal.
- S. Valve Boxes:
1. Valve boxes used with automatic valve assemblies (other than drip irrigation) to be 12" x 17" x 12" deep valve boxes; black in color. Valve boxes to be model #1419-12" with L-Bolt down option Black T-cover as manufactured by Carson Industries LLC, model #174541 as manufactured by Pentek or VB-STD-H as manufactured by Rainbird or approved equal.
 2. Valve boxes used with 1" drip irrigation valve assemblies to be 15" x 21" x 12" deep valve boxes; Black in color. Valve boxes to be model #1220-12" with L-Bolt down option BLACK T-cover as manufactured by Carson Industries LLC,

model #190156 box with #194006 cover with snap locks as manufactured by Pentek or model VB-JMB-H as manufactured by Rainbird or approved equal.

3. Valve boxes for drip irrigation flush valves, ground rods and quick coupling valves to be 6" round valve box. BLACK in color. Valve boxes to be model #L-0708 as manufactured by Carson Industries, model #182103 with snap down BLACK cover as manufactured by Armor Access Boxes, VB-7RNDK as manufactured by Rainbird or approved equal.
4. Valve box extensions, as required, to be of the same size, color and manufacturer as the box on which it is used.

T. Rain Sensor:

1. Wireless rain sensor to be model 53770 as manufactured by The Toro Company, WR2-RS as manufactured by Rain Bird or model WR-CLIK as manufactured by Hunter Industries or approved equal.

U. Pressure Gauges:

1. Pressure gauges to be (0-200 PSI) 2" x 1/4"-NPT, model 1005S stainless steel as manufactured by Ashcroft, Cole-Parmer, Omega or approved equal.

2.3 ACCESSORY MATERIALS

A. Drainage Stone for Valve Boxes:

1. One-half inch (1/2") to three-quarter (3/4") size, washed, graded crushed stone.

B. Fabric:

1. Soil separation fabric at valve boxes shall be Mirafi 140N, StrataTex ST142, US Fabrics US 120NW, non-woven, spun bound, polyester geotextile fabric or approved equal.

C. Brick:

1. Common, grade SW, per ASTM C42.

D. Reinforcing Rods:

1. Steel, galvanized.

E. Bedding for Piping Material:

1. Coarse, mason sand conforming to ASTM C-33.

F. Trench Backfill in Lawn and Planting Areas:

1. Refer to Section 312000, Earthwork.

G. Suitable excavated materials removed to accommodate the irrigation system work are to be used as fill materials provided it conforms to the requirements of fill as noted above.

1. Soils on site are to consist of sub grade materials and planting soil mix. Materials placed at different levels and thicknesses depending upon planting types and locations. Separation of materials to be maintained.
- H. PVC Cement/Primer
1. PVC cement to be IPS - #721, #725 Wet "R" Dry, Recto-Seal Gold or approved equal. PVC primer to be IPS - #P-70 (purple), Oatey Industrial Grade (Purple), Spears Primer-70 (Purple) or approved equal. PVC cement for Schedule 80 nipples to be IPS #711, #725 Wet "R" Dry, Recto-Seal Gold or approved equal.
- I. Thread Sealant:
1. Assemble brass to brass threaded fitting connections with non-hardening thread sealant- Lasco Blue Pipe Thread Sealant, Permatex #80045, Rectorseal Tru-Blue sealant or approved equal.

2.4 Extra Materials:

- A. The following materials to be left with the City of New York, prior to completion of the work to be utilized in repair and maintenance.
1. 300' - 1 ½" Poly PE #2306 100 psi pipe
 2. 500' - 1" Poly PE #2306 100 psi pipe
 3. 400' - Blank drip tubing
 4. 100 - Stakes
 5. 6 - 6" pop up sprinklers with swing joints
 6. 2 - 1" automatic valves
 7. 6 - 1" quick coupling valves
 8. 8 - Standard valve boxes w/cover
 9. 4 - 24 - 24 VAC wire splice kits
 10. 6 - Single decoders

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine the areas and conditions where Site Irrigation is to be installed. Notify the City of New York, in writing, of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the City of New York.

3.2 PREPARATION AND LAYOUT

- A. The location of sprinkler heads, valves and piping, noted on the drawings, are generally diagrammatic to the extent that swing joints, off sets and all pipe fittings are not shown; exact locations of piping, sprinkler heads, valves, and other components are to be approved by the City of New York in the field prior to the time of installation.

- B. Pipe routing is to be in accordance with the drawings, however, the City of New York shall have the right to change the route and/or depth of the pipe from that shown in cases where rock or other obstacles may interfere with the intended path or depth of the piping.
- C. Stake all proposed pipe and wire routes, sprinkler, valve and controller locations in accordance with the locations noted on the drawings; provide staking prior to the commencement of work in any area of installation; furnish all supplies, equipment and personnel necessary for the staking of the work.
- D. Notify the Commissioner a minimum of five (5) days prior to the scheduled staking.
- E. Coordinate the irrigation work with planting and lawn work as to have irrigation available at time of the turf and plant material establishment.
- F. Coordinate irrigation work with plumbing, electrical and sleeve work.
- G. Final system layout to be acceptable to the City of New York.
- H. Contractor to install temporary water connection at South 8" double check meter pit for Package 4 area establishment irrigation systems. Contractor to coordinate temporary irrigation piping, and is responsible for all temporary system components listed and not limited to the following:
 - 1. Temporary Controller and 2-wire path installed at permanent South 8" double check meter pit with associated grounding and electrical connections.
 - 2. Temporary Pump at permanent South 8" double check meter pit and associated electrical connections.
 - 3. Irrigation line connecting to Package 4 irrigation system.
- I. Contractor is responsible for coordinating transitional preparations and execution. Contractor to coordinate transition with the Commissioner.
 - 1. At completion of the maintenance and guarantee period of DEP (North Area) and Final Approval of Commissioner, the main water lines within DEP (North Area) shall be decommissioned.
 - 2. After decommissioning the main water lines, the contractor shall relocate and install temporary controller and 2-wire path in coordination with DPR representative at Moshulu Golf Course Pump Station at Maintenance Shed and connect the controller to DEP-DPR driving range irrigation system to form an operational system.

3.3 CUTTING AND PATCHING

- A. Methods and materials used for cutting and patching to be acceptable to the Commissioner.

- B. Materials and finishes for all patching to match existing cut surface materials and finish.
- C. Cut through concrete and masonry with core drills. Jack hammers not permitted.
- D. Seal all openings in exterior walls water tight with link seals.

3.4 CONDUIT:

- A. Install all electrical conduits for 24V control wiring.
- B. Backfill and thoroughly compact around all conduit.
- C. All conduits to have a minimum cover of twenty four inches (24").

3.5 SLEEVES:

- A. Coordinate installation of sleeves for all piping and conduit/24V control wire passing under concrete curbing, concrete or masonry walls and pathways while the same are under construction.
- B. Install all sleeves for all piping and conduit passing under planter walls, curbing, concrete or masonry walls and pathways while the same are under construction.
- C. Install ends of sleeves six to twelve inches (6"-12") beyond the edge of all pavement and curbs.
- D. Backfill and thoroughly compact around all sleeves.
- E. All sleeves to have a minimum cover of twenty four inches (24").
- F. All sleeve locations to be staked or permanently marked.

3.6 INSTALLATION

- A. Temporary Irrigation Equipment
 - 1. Install water connection, backflow preventer, booster pump (125 gpm at 75 psi boost) with power supply (3ph 208V) on concrete pad including, but not limited to all piping, fittings, excavation, thrustblocking, backfilling, manpower required.
- B. Winterization Assembly:
 - 1. Install winterization assemblies as detailed on the drawings.
- C. Main Line Isolation Valve(s):
 - 1. Install main line Isolation valves as detailed on the drawings.

- D. Master Valve:
1. Install master valve on mainline and connect to the master valve terminal of the irrigation controller. See detail drawings.
- E. Flow Sensor:
1. Install flow sensor on mainline and connect to the sensor terminal of the irrigation controller. See detail drawings.
- F. Excavating and Backfilling:
1. Provide all excavation, backfilling and compaction required for the proper installation of all piping.
 2. All piping is to be trenched. Pipe pulling method is not to be used.
 3. Excavation is to include all materials encountered.
 4. Minimum trench width is to be three inches (3") on each side of the main line pipe and one and one half inches (1½") on each side of lateral pipe to allow for proper compaction of backfill material.
 5. Minimum depth of cover:
 - a. Main line piping: - 24" of cover.
 - b. Lateral piping: - 14" of cover.
 - c. Control wire: - 24" of cover.
 - d. Control wire and pipe under pavement: - 24" of cover.
 6. Excavate to the depths required to allow a four inch (4") depth of sand bedding material for piping where pipe settles on rock, shale or where the pipe cannot be fully supported along its entire length.
 7. Install a four inch (4") depth of sand bedding material where pipe settles on rock, shale or where the pipe cannot be fully supported along its entire length.
 8. The trench bottom should be smooth and free of rocks greater than 1 1/2" diameter, large dirt clods or any frozen material. Excavation at bells (bell holes) should be provided to allow pipe to be fully supported along its length.
 9. Bed pipe to provide uniform longitudinal support under the pipe to prevent low spots.
 10. Backfill material to be free from rock, large stones, large dirt clods or other unsuitable substances to prevent damage to pipe during backfilling operations.
 11. Initial backfill to be properly compacted continuously above the bedding and around the pipe as well as between the pipe and undisturbed trench walls. Initial backfill is to be done by hand.

12. Backfill trenches to match adjacent grade elevations with approved trench back-fill material. Place and compact fill in layers not greater than six inch (6") depth to ninety-five percent (95%) maximum dry density at optimum moisture content under all paving areas and 85% maximum under lawn and planting areas.
13. Excavate trenches; install piping and backfill during the same working day. Do not leave open trenches or partially filled trenches overnight.

G. Pipe Fusion:

1. Sections of polyethylene pipe should be joined into continuous lengths on the jobsite above ground. The joining method shall be the butt fusion method and shall be performed in strict accordance with the pipe supplier's recommendations. The butt fusion equipment used in the joining procedures should be capable of meeting all conditions recommended by the pipe supplier. The butt fusion joining will produce a joint with weld strength equal to or greater than the tensile strength of the pipe itself. All field welds shall be made with fusion equipment equipped with a Data Logger. Temperature, fusion pressure and a graphic representation of the fusion cycle shall be part of the Quality Control records.
2. Mechanical joining will be used where the butt fusion method cannot be used. Mechanical joining will be accomplished by either using a HDPE flange adapter with a ductile iron back-up ring.
3. Hot gas fusion, threading, solvents, and epoxies will not be used to join HDPE pipe.

H. Pipe Laying:

1. Inspect the pipe for defects before installation and fusion. Defective, damaged or unsound pipe will be rejected.
2. Pipe to be installed in accordance with ANSI/ASAE Standard #S376.1 and the printed instructions of the manufacturer, including leveling of trench bottoms and bedding of pipe in bottom trench.
3. Allow joints to set at least 24 hours before pressure is applied to the system.
4. Maintain pipe interiors free of dirt and debris. Close open ends of pipe by acceptable methods when pipe installation is not in progress.
5. Join HDPE pipe using butt-fusion technique as per the written instructions of the manufacturer. Join HDPE pipe to dissimilar pipe material using HDPE (butt-fusion) x flange adapter with ductile iron back-up ring.
6. Cement all solvent weld fittings in strict accordance with cement manufacturer's printed instructions. Color primer to be used.
7. Install all wall penetrations through planter walls where required to make plumbing and/or electrical wiring connections. All penetrations to be watertight. Penetrations and seals to be acceptable to the Commissioner.

8. All insert type fittings on laterals 1 1/2" or larger to be double clamped. Insert fittings used on 1 1/4" or smaller poly pipe to be single clamped.
- I. Clearances:
 1. Minimum horizontal clearances between pipes: 4 inches for 2 inch pipe and less; 12 inches for 2 inch pipe and more.
 2. Minimum vertical clearances between pipes: Two inches.
 - J. Dielectric Fittings:
 1. Provide dielectric fittings between copper and ferrous metal piping.
 - K. Spray Heads, Quick Coupling Valves, Fittings, and Accessories:
 1. Spray heads and quick coupling valves to be connected to the piping system by installing factory assembled PVC swing joints. Swing joint size to be the same size as that of the IPS inlet of the sprinkler, or as otherwise shown. The long nipple of the swing joint to be set between 20 and 60 degrees from the horizontal. Install quick coupling valve in 6" econo box and set within 1" of the bottom of the box cover. See detail drawings.
 2. All sprinklers and quick-coupling valves are to be set flush to finish grade.
 3. Locate quick coupling valves along main line piping in a location approved by the Commissioner.
 4. Install fittings, valves, sprinkler heads, risers and accessories in accordance with manufacturer's printed instructions, except as otherwise indicated or as detailed on the drawings.
 5. Install all pop-up spray heads with flex pipe swing joints as shown on the drawings.
 6. Obtain Commissioner's review and acceptance of height for risers, spray heads, sprinklers and quick coupling valves.
 - L. Valve Boxes and Valve Assemblies:
 1. All valve box locations are to be staked prior to installation and approved by the Commissioner prior to starting construction.
 2. Valve boxes to be installed as shown on drawings with adequate space for operation, service and removal of the equipment in the box. Refer to Details Sheet.
 3. Do not group more than two irrigation valve boxes together in one location. When grouping two valve boxes together allow 12" of space between boxes.

4. Where necessary to properly fit the pipe, boxes to be neatly cut so as to provide a firm fit to the pipe. Soil or gravel not to be allowed to enter the box through these cut-outs.
5. All boxes to be mounted plum and flush to finish grade - extensions to be used as required for proper installation and setting. Surrounding grade to be established with the use of a leveling board not less than 4' in length. Box to be set to the underside of this board.
6. Do not install more than one valve assemblies per valve access box.
7. Install all valve boxes in planting beds in a location approved by the City of New York. Do not install valve boxes in lawn areas.
8. Seal threaded connections on pressure side of control valves with teflon tape.
9. Automatic valve assemblies to be as per drawings using standard brass nipples, Heavy Duty brass fittings and PVC Schedule 80 nipples.
10. Ball valves to be installed in the "closed" position and to not be opened until the main line piping system has been pressurized and flushing has been completed through the blow-out valve assemblies.
11. Assemble brass to brass threaded fitting connections with non-hardening thread sealant - Lasco Blue Pipe Thread Sealant, Permatex #80045, or approved equal.
12. Assemble threaded PVC to PVC, or brass to PVC, with the use of two (2) wraps of Teflon tape.
13. Assemble threaded connections so that thread sealant or Teflon tape does not enter the pipe or fitting.
14. Automatic valve manual bleeds to not be used for continual operation. For extended use without 24 VAC, the manual bleed to be left in the open position and the flow to the zone controlled (on-off) by the manual ball valve.
15. Install valve identification tag on each valve assembly as shown on the drawings.

M. Controller:

1. Controller to be wall mounted in the mechanical room in a location approved by the Commissioner. Install the controller in accordance with manufacturer's printed instructions and connected so as to form an operational system. Diagrammatic location shown on the drawings.
2. Valve control wires to be numbered with waterproof labels corresponding to their valve number (A1, A2 etc).

N. Controller Power Supply:

1. Controller to have one circuit with full time 120VAC GFCI outlet and 120VAC to the controller with on/off switch.
2. Power to the controller to be supplied from a dedicated circuit and brought to the controller location (Installed as part of work of other section(s) and contract).
3. The irrigation Contractor to be responsible for all wiring and associated equipment to connect power supply from dedicated circuit to the controller.
4. All 120V wiring is to be done by a licensed professional.
5. All wiring is to be in accordance with all state and local codes. Refer to and comply with Electrical work requirements specified in Division 26.

O. Weather Station:

1. Weather station to be installed in a location approved by the Commissioner.
2. Install weather station on concrete pad as per the manufacturer's written instructions.

P. Grounding/Surge Protection:

1. All surge protection and grounding to be installed in strict compliance with the manufacturer's printed instructions and in accordance with local, State and Federal codes and requirements.
2. Place ground rod in a location approved by the City of New York.
3. Drive 8' ground rod to its entire length.
4. Connect 6/1 solid copper wire to the ground rod with Cadwell type weld connector. Ground wires to be installed as straight as possible from point of connection to ground rod and from rod to rod. No sharp bends or turns to be allowed.
5. Connect 6/1 solid copper wire to the surge suppression device in accordance with the manufacturer's printed instructions.
6. The ground plates are to be installed to a minimum depth of 30" (76 cm), or below the frost line if it is lower than 30".
7. Two 50-pound bags of "Earth Contact Material" must be spread so that it surrounds and the 8-foot copper plate evenly along its length within a 6" (152 mm) wide trench. Use one bag only for the installation of 3-foot ground plates. Salts, fertilizers, bentonite clay, cement, coke, carbon, and other chemicals are not to be used to improve soil conductivity because these materials are corrosive and will cause the copper electrodes to erode and become less effective with time. It is important that the Earth Contact Material completely surrounds the ground plate

and 6" (152 mm) of the insulation of the green wire, as shown in the detail, in order to minimize corrosion.

8. Connect 6/1 AWG earth grounding, green insulated, solid bare copper wire to the ground rod and grounding plate with Cadweld connector. Install all grounding circuit components in straight lines and simple geometry. No sharp bends or turns to be allowed. When necessary to bend wires, make sweeping turns as detailed. All grounding and bonding wires of electronic equipment must be fed through a dedicated 1.5" (38.1 mm) plastic sweep ell. "Sweep bends" must follow the guidelines shown here. The 6/1 AWG bare copper wires are to be installed in as straight a line as possible, and if it is necessary to make a turn or a bend it shall be done in a sweeping curve with a minimum radius of 8" (203.2 mm) and a minimum included angle of 90°. This type of installation, which utilizes a multi-position bus bar, allows for rapid connecting and disconnecting of desired wires in order to periodically take earth resistance readings of the individual grounding electrodes.
9. The earth-to-ground resistance is to be measured at the time of installation using a "Megger", or other similar instrument, and the reading is to be no more than 10 Ohms. If the resistance is more than 10 ohms, additional ground plates and "Earth Contact Material" are to be installed using the 100-2002 (www.asic.org, "Design Guides".) It is required that the soil surrounding copper electrodes, within the Sphere of Influence, be kept at a minimum moisture level of 15% (by weight) at all times as dry soil does not conduct electricity. **ALL GROUNDING COMPONENTS MUST BE CONNECTED TO THE EQUIPMENT BEFORE ANY OTHER CONNECTION IS MADE.**
10. Surge suppression device to be installed at every line termination point. Install first surge suppression device within 100 feet of central control system. Additional installation of surge suppression devices are needed per 600 feet of wire cable, located at the nearest line decoder. The surge suppression device ground wires to be connected to a single grounding rod as detailed.

Q. Measuring Resistance

1. Earth resistance shall be measured and recorded after the installation of the grounding grid(s), and every three months thereafter for the first year. This data should be used to determine the most critical times of the year, based on soil moisture content and lightning frequency. The resistance shall be tested and recorded every six months thereafter, at these most critical dates, to ensure that proper contact with the soil is maintained at all times. Resistance measurement shall be made using commercially available instruments, in accordance with the latest requirements of NFPA 780. Follow instrument manufacturer's specific operating instructions.
2. Readings of 5 to 10 ohms are desirable. The effectiveness of the circuit is a function of its impedance, which cannot be measured in the field in a practical manner. Sound practices and proper installation are more important in assuring quality results than this reading.
3. The minimum requirements of the NEC shall be met, which are:

- a. A resistance reading of no more than 25 ohms.
 4. In installations with multiple equipment locations, the resistance readings of like grounding circuits should be compared for consistency. Large variances in readings point to different soil conditions, or soils with varying degrees of moisture content, or improper installation.
- R. Rain Sensor:
1. Install rain sensor in a location approved by the Commissioner. Install all wire inside rigid metallic conduit.
- S. Line Decoders:
1. Install on each automatic valve assembly a line decoder in accordance with manufacturer's printed instructions. See detail drawings.
 2. The contractor is to be responsible for accurately recording on the as-built drawings, as each decoder is being installed, the address number of the decoder at that location. It is also necessary that it be indicated which remote controls valves controlled by each specified decoder.
- T. 2-Wire Path Cable:
1. Install 2-wire path in conduit and locate in pipe trenches. Place conduit in trench adjacent to pipe. Install wire with slack to allow of thermal expansion and contraction.
 2. Install control wire under pavements in PVC sleeves. Coordinate location of wiring and sleeve locations.
 3. Install a thirty-six inch (36") long wire loop with expansion joint at remote control valves in control boxes to allow raising the valve bonnet to the surface without disconnecting the wires when repair is required. At all splice and valve assemblies make 5-6 turns of the wire around a piece of ½" PVC pipe to allow for thermal expansion and contraction.
 4. Connect each remote control value to one line decoder and connect to two-wire path.
 5. Make all two wire connections to automatic valves completely waterproof using UL listed splice kit. Install in strict accordance with the manufacturer's printed instructions.
- U. Air Release Valve Assemblies:
1. Install air release valve assemblies as detailed at the highest elevation points along the main line piping of the irrigation system in a location approved by the City of New York.
 2. Test air release assemblies for operation prior to acceptance of the system.

V. Flush Valve Assemblies:

1. Install flush valve assemblies as detailed on the drawings in a location approved by the Commissioner.
2. Install flush valve so that flushing water can be discharged into an area designated by the Commissioner. Flush valve assemblies to be used to flush the main line piping system during original start up and during subsequent flushing that may be required due to pipe breakage or leaks.

3.7 PRESSURE TESTING

- A. Use Hydrostatic pressure test **ONLY**. Pressure test using air or compressed gas is not acceptable.
- B. Approximate amount of gallons of water required to fill 100' for test of mainline pipe are noted below:

1 1/2"	13 gallons
2"	20 gallons
2 1/2"	29 gallons
3"	43 gallons
4"	70 gallons

- C. Testing should be performed at the lowest elevation along the pipe to be tested.
- D. Pressure testing shall be conducted in accordance with the ASTM F 2164, Field Leak Testing of Polyethylene Pressure Piping Systems Using Hydrostatic Pressure. The HDPE pipe shall be filled with water, raised to test pressure and allowed to stabilize. The test pressure shall be 1.5 times the operating pressure at the lowest point in the system. In accordance with section 9.8, the pipe shall pass if the final pressure is with 5% of the test pressure for 1 hour. For safety reasons, hydrostatic testing only will be used.
- E. When main line pipe is installed in phases and/or segments pressure test each main line segment and/or phase.
- F. All lateral piping to be tested under working conditions and visual inspection made for leaks.
- G. All leaks to be repaired and the lines retested until approved by the City of New York.

- H. Notify the Commissioner and the City of New York seventy-two (72) hours prior to testing.

3.8 FLUSHING AND ADJUSTMENT

- A. After piping is installed and before sprinklers and spray heads are installed, open control valves and flush out the system with full head of water until pipe is free of all foreign materials.
- B. Adjustment of the sprinkler equipment will be done upon completion of the installation, to provide optimum performance and to assure that all sprinklers are properly set to grade.
- C. Adjust all automatic valves by means of the flow control stem and verify sprinkler discharge pressure on each lateral zone, with a pitot tube and gauge, to obtain optimum sprinkler performance in accordance with manufacturer's printed instructions.
- D. After the system has been installed, test the entire system and demonstrate that the entire system meets coverage requirements and automatic controls function properly.

3.9 CLEAN UP AND PROTECTION

- A. Upon completion of all work of this Section, remove and legally dispose of all excess materials resulting from the work operations of this Section.
- B. Accumulation of materials for disposal is not permitted. Disposal is to be made as fast as materials accumulate.
- C. Adequately protect all paving, surfacing, lawn areas and plant material and restore to original condition all damages resulting from work operations of this Section.
- D. Contractor shall be responsible for removal of temporary equipment, not limited to temporary pump and electrical connection at South Check meter pit. Reference paragraph 3.02 for additional provision.

3.10 Maintenance & Operations Staff Instruction and Demonstration

- A. After testing is completed and approved by the Commissioner, a instruction and demonstration session shall be held for the M&O staff. The installed irrigation system shall be demonstrated for one day (maximum 6 hours) for the district M & O Staff. The demonstrations shall include manual and automatic operation including pumping. The demonstration shall also include identification and operation of each component, trouble shooting for each component, winterizing the system, removal and replacement of defective components, general and specific requirements for the system maintenance, and a check list for frequent attention of components. Highlights of the demonstration, including identification of components shall be videotaped for future M&O instruction.

3.11 Operations and Maintenance Manual

- A. The Contractor shall furnish four (4) copies of the O & M Manual (Operation & Maintenance Manual) for the irrigation system and the associated mechanical system. The manual shall include a checklist for trouble shooting and corrective measures in addition to operation and maintenance instructions.

END OF SECTION 328000

SECTION 328001

IRRIGATION PUMP STATION

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to provide a single source responsibility for the manufacture of the complete system including pumps, warranty, service and operation of a prefabricated, skid mounted fully automatic variable speed pumping system (systems). The pumping system shall automatically maintain a constant discharge pressure regardless of varying flow demands within the station rating. Pumping system shall conform to the following specifications in all respects. This specification covers the minimum requirements; however, it should not be construed as all inclusive. It is the successful manufacturer's responsibility to include all necessary components to provide for a complete, automatic, smooth operating, and reliable pumping system.

1.3 RELATED SECTIONS

- A. Electrical Division 26
- B. Plumbing Division 22
- C. Irrigation System Section 328000

1.4 REFERENCES

- A. Standards and Codes that apply to the Work of this Section:
 - 1. RE NEC — National Electric Code, current edition.
 - 2. UPC — Uniform Plumbing Code, current edition.

1.5 SUBMITTALS

- A. The pump manufacturer shall provide the following:
 - 1. A complete set of general arrangement drawings, including all dimensions.
 - 2. Electrical power schematics, and control schematics
 - 3. UL Listed as a Packaged Pumping System.

- B. Materials, equipment, and methods of installation will comply with the applicable requirements of the authorities having jurisdiction including the following codes and standards:
 - 1. City of New York/State of New York Building Codes
 - 2. National Fire Protection Association, (NFPA): National Electrical Code.
 - 3. American Society for Testing and Materials, (ASTM).
 - 4. National Sanitation Foundation, (NSF).
 - 5. American Society of Agricultural Engineers, (ASAE).

- C. Manufacturer Guarantee: The pump manufacturer shall warrant the pumping station to be free of defects and product malfunctions for a period of one year from date of start up or fifteen months after shipment, whichever occurs first. Failures caused by, lighting strikes, power surges, vandalism, flooding, operator abuse, or acts of God are excluded from warranty coverage. All warranties implied or otherwise shall not exceed those warranties extended by major or sub-component suppliers.

- D. Manufacturer Service Network
 - 1. The pump manufacturer shall maintain a Factory Trained and Managed Service Network to execute all warranty claims.
 - 2. All service entities must maintain as their primary core business the maintenance, service and repair of pump systems.
 - 3. Authorized Service Technicians must be Factory Trained and maintain a minimum of 25 hours per year of on going in-factory training.
 - 4. The manufacturer shall provide 24/7 technical phone support to the end user during and after the warranty period.

1.6 COORDINATION

- A. Thoroughly coordinate and schedule the work of this Section with all trades involved to prevent interferences, and in order to allow adequate time at the proper stage of construction to properly perform all work of this Section.

1.7 QUALITY ASSURANCE

- A. The Contractor shall obtain all necessary permits and pay all required fees, at no additional cost to the City, to any governmental agency having jurisdiction over the work. The contractor as required shall arrange inspections required by local ordinances during the course of construction.

- B. Licenses:
 - 1. A Licensed Plumber shall make all plumbing connections.
 - 2. A Licensed Electrician shall perform connections to power supplies.

1.8 FINAL REVIEW AND ACCEPTANCE

- A. When all pumping work is completed a final review of the pumping system will be made by the City of New York, upon written notice requesting such a review. Submit the written notice at least ten (10) days prior to the anticipated review.
- B. Upon final review and acceptance, the City of New York will notify the Contractor, in writing, as to final acceptance of the pumping system. Date of the final acceptance by the City of New York is the date beginning the warranty period.
- C. Upon acceptance of the entire system, instruct the City of New York's and Department of Parks and Recreation designated personnel in the complete operation of the entire system.

1.9 GUARANTEE

- A. Warranty the entire pump system and all related equipment and accessories for a period of one (1) year from the date of substantial completion against all defects in workmanship and material.

1.10 GUARANTEE SERVICE

- A. Irrigation system shall be guaranteed for a period of 12 months after the date of Substantial Completion. During the 12 month guarantee period, the Contractor shall maintain the irrigation system
- B. During the warranty period, maintain the pumping system to ensure complete operation of the entire system.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. The prefabricated pump station shall have a capacity of 750 GPM and a discharge pressure of 120 PSI at skid edge as described in the technical specifications. The overall pump length shall extend to within twelve inches of the bottom of the wet well. The main pumps shall operate at no more than 1800 RPM.
 - 1. In addition, the pump station discharge shall provide a 60 gpm tap to connect to the greywater system.
 - 2. In addition, the pump station discharge shall provide a 30 gpm tap to connect to the green roof irrigation system.
 - 3. In addition, the pump station shall include a fertigation system.

- B. The pump station controls shall communicate with Toro Lynx central and allow for the following features.
1. The pump station will provide constant pressure, flow and alarms to the Toro Lynx central on the menu bar in the Toro Lynx screen.
 2. The pump station will continuously provide status information to the Toro Lynx system to allow for fault indication of any pump and provide the ability to recalculate flows based upon available pumping capacities.
 3. The pump system shall be equipped with APS (automatic power saver) to allow the user to reduce the set point pressure during non irrigating hours. If selected the Toro Lynx system shall instruct the pump system to go into APS mode to a set point pressure set by the end user.
 4. Prior to irrigation program cycle the pump station shall automatically start and come up to set point pressure. If the station is equipped with filtration the filters will be pre-flushed prior to the irrigation cycle.
- C. The station shall be completely wired, piped, hydraulically, electrically, and flow tested to full station capacity at factory prior to shipment to job site. Documentation of dynamic test shall be verified by owner prior to pump station shipment.
- D. Construction shall include a fabricated steel plate and skid assembly to support all components during shipping and to serve as the installation mounting base.
- E. The discharge manifold from the pump station shall terminate at or near the pump station skid edge and be provided by the pump station manufacturer.
- F. The pumping system shall be model VWTP-750-4-120 (3 pumps) as manufactured by Flowtronex PSI Inc. or approved equal. Total Design Flow 750 GPM @ 120 PSI Station Discharge.
- G. The station shall be the capacity as shown in the technical data listed below:

2.2 Mechanical

- A. Scope. Pump station shall be a completely skid mounted vertical turbine VFD pump station built by a single manufacturer. All equipment including but not limited to pumps, motors, piping, filters, valves, instrumentation and controls (unless otherwise noted in the technical specifications or drawings) shall be mounted on a common structural base to form a complete operating pumping station.
- B. Paint Structural steel, attached piping, and supports shall be grit-blasted with #50 steel grit per SSPC-10 to a near white metal condition. The cleaned steel surface shall be immediately coated with an aliphatic polyurethane coating to a thickness of no less than 5 mils and applied through an electrostatic method to ensure proper adhesion. The aliphatic coating shall meet or exceed the following testing criteria:
1. Direct impact resistance of 140 in/lbs (per ASTM D 2794)
 2. Taber abrasion loss no greater than 60.2 mg (per ASTM 4060)
 3. Adhesion to substrate of 1500 PSI (per ASTM D 4541)
 4. Salt fog resistance at 1400 hours (per ASTM B117-85)
 5. Rust rating of 10 (per D 610)
 6. Corrosion rating of 4 (per D 1654)
 7. Blistering rating of 10 (D 714)

Manufacturer shall provide a touch up kit for site use.

- C. Hardware. All bolts and nuts used in the assembly of the pumping system shall be zinc plated to retard Corrosion. Anti-corrosion washers to be used on each side of fastener.

2.3 Pumps

- A. Scope. Pump station manufacturer shall strictly adhere to the following pump specifications. All pumps shall be manufactured and supplied by the pump system manufacturer.

- B. Vertical Turbine Pumps. The main irrigation pump(s) shall be of the vertical turbine type with flow and head defined in the attached technical specifications.
1. The vertical turbine pumps shall be manufactured according to the standards of the Hydraulic Institute and to ANSI specification No. B58.1.
 2. The bowl assemblies, column pipe, line-shaft, head shaft, and discharge head shall be of U.S. manufacture.
- C. The pumping systems manufacturer shall have a network of service centers, which shall have available spare parts and trained pump technicians to handle service, repair and warranty procedures.
- D. Pump Discharge Head. The pump discharge head shall strictly adhere to the following pump head specification.
1. The discharge head shall be of the fabricated steel type with a minimum 60,000 PSI tensile strength.
 2. The discharge head shall have a working pressure of not less than 275 PSI and incorporate a 150 ANSI discharge flange.
 3. The discharge head shall incorporate an integral air separation chamber, allowing air to be discharged through an air release line mounted on top of head.
 4. Complete discharge head shall be hydrostatically tested to a minimum of 413 PSI.
 5. A product lubricated high-pressure stuffing box containing at least six rings of packing and two lantern rings shall be provided. Packing shall be compressed around the shaft by an adjustable two-piece gland. Dual bypass tubing shall be included for proper packing lubrication and cooling. The discharge head stuffing box area shall also include a drain, which will be piped back to the wet well. Discharge head to be designed to include leakless configuration. Stuffing box bushing shall be SAE 660 Cast Iron.
 6. The head shaft shall be of the two piece type, 416 stainless steel and shall be turned and ground. The pump manufacturer shall include a method for adjusting the impeller running clearance at the top of the head shaft. Adequate space shall exist to couple the head shaft and the line shaft above the stuffing box. Coupling shall be extra heavy duty AISI 416 SS with a minimum service factor of 2 to 1.
- E. Pump Column Pipe. Column pipe shall be A53, Grade B schedule 40 material, in inter-changeable sections not more than 5 feet in length. Pump line shaft shall be AISI 416 SS. The size of the shaft shall be no less than determined by ANSI specification B58.1, Section 4.2, Table 4. Bearing retainers shall be bronze with rubber bearings.
- F. Pump Wet End. The pump bowls shall be ASTM A48 Class 30 cast iron free of detrimental defects. All bowls larger than 8" should be of the flanged type construction. All pump bowls shall have porcelain enamel lined water passageways for high efficiencies.
1. The impellers shall be C83800 bronze and of the enclosed type design.
 2. Pump shaft shall be AISI 416 SS turned and ground.
 3. The shaft shall be supported by bronze bearings above and below each impeller.
 4. The suction bell bearing shall be extra long and permanently greased packed and sealed with a bronze sand collar.

5. A stainless steel clip on type inlet strainer shall be mounted on the bottom of each pump.
6. Inlet area shall not be less than 4 times the suction bell inlet area.
7. Pump bowl assemblies shall be as manufactured by Goulds or approved equal.

2.4 Motor

- A. Scope. All motors shall be of the same manufacturer. Pump station manufacturer shall strictly adhere to the following specifications.
- B. Vertical Hollow Shaft Motor. Motor(s) for irrigation pump(s) shall be of the vertical Hollow shaft high thrust design.
 1. Motor shall have a WP-I enclosure, 1.15 service factor, and class F insulation.
 2. Motors shall be wound for the starting configuration as called out in the technical data sheet.
 3. Design pump brake horsepower shall not exceed 98% of motor horsepower exclusive of service factor. Maximum pump run out horsepower shall not be greater than 8% higher than motor rating exclusive of service factor.
 4. Motor shall be rated for continuous duty and be designed to carry the maximum thrust load of the pump and will have B10 bearing life of no less than 5 years.
 5. Motors shall be rated and tagged for VFD service, proper ambient temperature and proper altitude per motor manufacturer recommendations.
 6. Motors shall be as manufactured by U.S. Motors or approved equal.
- C. Motor Space Heater. The pump station manufacturer shall provide on each pump motor a 120volt, single phase space heater of ample size to prevent condensation from occurring within the motor during non operating periods. The space heater shall be de-energized when the motor is running.

2.5 Valves and Gauges

- A. Scope. Pump station manufacturer shall strictly adhere to the following specifications.
- B. Pump Check Valve. Silent check valve shall be installed on the discharge of each pump between the pump discharge head and the pump isolation valve.
 1. The check valve shall be of the silent operating type that begins to close as the forward flow diminishes and is fully closed at zero velocity preventing flow reversal and resultant water hammer or shock.
 2. The valve design shall incorporate a center guided spring loaded disc, guided at opposite ends and having a short linear stroke that generates a flow area equal to the pipe size.
 3. Valves shall be sized to permit full pump capacity to discharge through them without exceeding a pressure drop of 2.5 PSI.
 4. All component parts shall be field replaceable without the need of special tools.

5. A replaceable guide bushing shall be provided and held in position by the spring. The spring shall be designed to withstand 100,000 cycles without failure and provide cracking pressure of 0.5 PSI and to fully open at a flow velocity of 4 ft/sec.
 6. The valve disc shall be concave to the flow direction providing for disc stabilization, maximum strength, and a minimum flow velocity to open the valve.
 7. The valve disc and seat shall have a seating surface finish of 32 micro-inch or better to ensure positive seating at all pressures.
 8. The leakage rate shall not exceed one-half of the allowable rates for metal seated valves allowed by AWWA Standard C508 or 0.5 oz per hour per inch of valve diameter
 9. The valve body shall be constructed of ASTM A126 Class B cast iron for class 125 and Class 250 valves.
 10. The seat and disc shall be ASTM B584 Alloy C83600 cast bronze or ASTM B148 aluminum bronze covered in Buna-N to provide resilient sealing.
 11. The compression spring shall be ASTM A313 Type 302 stainless steel with ground ends.
 12. Valves 4" and smaller to be pressure rated for 250 PSI, 6" to 10" to be pressure rated to 150 PSI. Valves 12" and larger check valves to be globe style with 150 PSI rating.
 13. Dual disc style check valves are not acceptable.
- C. Pump Discharge Isolation Valve. Pump isolation valves shall be of the butterfly type with grooved ends to provide for expansion and vibration dampening and a lever operator.
1. Valve body shall be constructed of ductile iron with a polyphenylene sulfide coating.
 2. Valve disc is rubber coated ductile iron.
 3. Valve shall be rated to 200 PSI.
 4. The pump isolation valve shall be sized as shown in the technical data sheet.
 5. Isolation valve shall be as manufactured by Victaulic Or Grinnell Company or approved equal.
 6. Lug style isolation valves are not acceptable.
- D. Pressure Gauge. A pressure gauge shall be mounted on the discharge header with a 1/2" isolation ball valve.
1. All gauges shall be glycerin silicon filled to reduce wear due to vibration.
 2. Accuracy shall be within 2%. Gauge diameter shall be 4" - 3 1/2" minimum.
 3. Range shall be at least 50% higher than the highest pressure attainable from the pumps at shutoff head conditions.
 4. The gauge shall incorporate a stainless steel back & bronze internal.
 5. Pressure gauge shall be as manufactured by Wika or approved equal.

2.6 Electrical

- A. Scope. To provide safe and reliable power and protection to all motors, control equipment and electrical devices. All electrical controls shall be U.L. Listed as an Industrial Control Device.
- B. Codes. All wiring and controls shall comply with NEMA, N.E.C., and U.L. standards. The pump station including electrical components and enclosure shall be labeled as a complete U.L. listed assembly with manufacturer's U.L. label applied to the pump station. All equipment and wiring within the enclosure shall be labeled for proper identification. A complete wiring circuit and legend with all terminals, components, and wiring identification shall be provided
- C. Surge Suppression. Electrical equipment shall be protected by a U.L. Listed Category C and Category B surge arrestor. The device shall adhere to IEEE C62.41 as a transient voltage surge suppressor. The suppressor shall withstand an impulse of 10,000 volts at 10,000 amps and a ringwave of 6000 volts at 500 amps. The pass voltage to a 480-volt device shall not exceed 1500V-1800V when subjected to an 8-millisecond by 20-millisecond waveform and shall meet or exceed the following performance criteria: 3720 joules minimum with a power dissipation of 82,500,000VA at 1800 volts maximum pass voltage to the protected equipment. Response time shall not exceed five nanoseconds.
- D. Control Enclosure. Controls shall be housed in a NEMA 4 enclosure with integral latches. The control enclosure should be constructed of 12 gauge steel and the back plate assembly shall be constructed of 12 gauge steel. Enclosures 60 inches wide and larger shall use a back plate assembly 10 gauge steel or thicker. The enclosure shall be Powder coat painted or as specified in the paint specification listed under Section 2.0 Mechanical. Enclosure cutouts shall be laser cut for proper fit, sealing and coating retention. All indicating lights, reset buttons, speed potentiometer, selector switches and the operator interface device shall be mounted on enclosure door and be rated NEMA 4. All internal components shall be mounted and secured to the removable back plate assembly. A closed type cooling system shall be included to cool the enclosure and reject heat from the VFD and other source. Open type cooling systems allowing outside ambient air to enter the panel are not acceptable. No water line connections shall be permitted inside of the control enclosure. VFD status and internal parameters must be viewable without the opening of the enclosure door. Entire control panel shall provide minimum of 65KA short circuit protection. Control enclosure shall be lockable.
- E. Main Disconnect. A fusible main disconnect shall be provided to completely isolate all controls and motor starting equipment from incoming power. Main disconnect shall possess a through the door operator, and shall be sized as shown in the technical data sheet including horsepower rating. Disconnect shall be as manufactured by ABB or Allen-Bradley or approved equal. Disconnect shall not be rated as a service disconnect. Fuses shall be sized to protect equipment in the enclosure sufficiently to permit a minimum 65KA Short Circuit Current Rating (SCCR).
- F. Motor Starting Equipment—all motor starters for the pumping station shall be mounted in a NEMA (National Electrical Manufacturers Association) Type 4 Enclosure (or an IEC equivalent specification) as specified in Section 3.10. Motor starters shall meet IEC standards and shall be rated for a minimum of 1,250,000 operations. Each main irrigation motor shall have dual contactors that are both electrically and mechanically

interlocked to allow the VFD (Variable Frequency Drive) to operate on any of the motors, as specified in the technical data sheet. Motor overload relays shall be IEC Class 10 Rated with bimetal ambient compensated overload relays. Fuses shall supply short-circuit protection for each motor and shall be rated for a minimum 200,000 amperes interrupt capacity. Note: Motor overloads shall be manual reset only: auto-reset of motor overloads shall not be permitted.

- G. Control Power. Power for the controls shall be provided by a control power transformer which will provide low voltage, single phase power for the pumping system control operation. Control power transformer shall not be used for any other external load. The control power transformer shall be protected on the primary side by current limiting fuses of adequate size and voltage rating. All control components will be protected by time delay circuit breakers of adequate size. The control power transformer shall be as manufactured by Sola or approved equal.

2.7 Station Controls

- A. Scope. To provide complete instrumentation and controls to automatically start, stop and modulate pump speed(s) to smoothly, efficiently and reliably pump variable flow rates at a constant discharge pressure. Full alarms and safety features needed to protect the equipment and irrigation piping system. All electrical controls shall be U.L. Listed as an Industrial Control Device.
- B. Motor Starting Equipment. All motor starters for the pumping station shall be mounted on a single back panel in a single NEMA 4 enclosure as specified in section 3.10. Motor starters shall meet I.E.C. standards and shall be rated for a minimum of 1,250,000 operations. Each main irrigation motor shall have dual contactors, which are both electrically and mechanically interlocked to allow the VFD to operate on any of the motors as called out in the technical data sheet. Motor overload relays shall be I.E.C. rated class 10 ambient compensated. Fuses shall supply short circuit protection to each motor and shall be rated for a minimum 200,000 amp interrupting capacity. Motor starters shall be as manufactured by Allen Bradley or approved equal. Motor overloads shall be manual reset only. Auto-reset of motor overloads shall not be permitted.
- C. Variable Frequency Drive. The variable speed drive shall be a digital, pulse width modulation (PWM) variable frequency drive (VFD) with IGBT transistors. The VFD shall include a 3% input line reactor to protect against voltage transients. The VFD shall have a minimum wire to wire efficiency of 98.5%, and shall be rated up to 550 volt operation in order to eliminate nuisance tripping at marginally high voltage conditions. Incoming power end shall be protected by fast acting semiconductor fuses. Any VFD error messages shall be displayed on a 80 character LCD readout in English or any one of 11 other languages. The following fault protection circuits shall be included: Overcurrent (240%), Overvoltage (130%), Undervoltage (65%), Overtemperature (70 Deg. C), Ground fault, and motor overload. The VFD shall be capable of starting into a rotating load and accelerate or decelerate to setpoint without safety tripping. The VFD shall have an automatic extended power loss ride through circuit which will utilize the inertia of the pump to keep the drive powered. Minimum power loss ride-through shall

be one cycle based on full load and no inertia. The VFD shall be optimized for a 3 kHz carrier frequency to reduce motor noise. The VFD shall employ three current limit circuits to provide "tripless" operation. The following operating information shall be displayed on the VFD LCD: KWH, elapsed time, output frequency (Hz), motor speed (RPM), motor current (amps), and voltage. Line reactor will be installed on input of VFD to protect against voltage transients. The VFD LCD display shall continuously scroll through all operating information and shutdown faults while the drive is running and while stopped. The information shall be viewable through a water tight plexiglass window on the control panel door as specified in Section H. VFD shall be as manufactured by ABB or approved equal.

- D. Instrumentation. Instrumentation and sensory devices shall monitor pressure, flow and other necessary system criterion. All instrumentation shall be installed in adherence to UL and manufacturer specifications. Analog isolation shall be utilized on all analog signals originating off the skid and whenever necessary.
- E. Pressure Transducer. Pressure transducer shall provide analog pressure signals for the control logic. Pressure transducer shall be a solid-state bonded strain gage type with an accuracy of plus/minus 0.20% and constructed of 316L stainless steel. Transducer shall be rated for station discharge pressure as shown on technical data sheet, and shall provide gauge pressure output, rather than an absolute. Pressure transducer constructed of plastic is not acceptable. Threshold transducers are not acceptable. Pressure transducer shall be as manufactured by GEMS or approved equal.
- F. Magnetic Flowmeter. The pump station shall have a flow sensor installed, which shall be utilized for control and to display the pump station flow rate, and to display total flow through the pump station controller operator interface device (OID). Flow meter shall be electro magnetic flow meter comprised of two major components, a primary head and a signal converter. Flow meter signal converter shall produce two separate signals, pulse and 4-20mA, in linear proportion to flow rate. Flow meter shall read flows from 0-40 fps, with a worst case inaccuracy of 0.5% of indicated value (not a percentage of full scale) at 1.3 fps or greater. Flows under 1.3 fps shall have a lower accuracy with accuracy applying to indicated value (not full scale). Flow meter shall be sized so that maximum system flow lies between 16 and 24 fps through the meter. Meter shall be installed according to manufacturers recommendations. Manufacturer shall have a US based manufacturing and assembly center. Flow meter shall be as manufactured by Krohne or approved equal.
- G. Programmable Logic Controller (PLC). One or more industrial grade programmable logic controllers shall handle all control logic. The PLC(s) shall provide demand controlled sequential pump start-up, shutdown and safety features through pressure sensing, flow sensing and voltage sensing devices. An LED visual status light is provided for each I/O point to indicate on/off status. PLC shall be provided with a built in non-volatile EEPROM chip. Industrial grade programmable logic controllers shall handle all logic for system control, timing, and control of VFD speed.. All PLCs shall have a built in clock calendar and shall communicate via the internal-100megabit Ethernet network. PLC shall possess a minimum of 1.5 megabytes of total memory and shall meet the following use-specific memory requirements: 256k for inputs, 256k for outputs, 512k available for programming and 256k used as data space. The PLC shall be as manufactured by WAGO or approved equal.

- H. Human Machine Interface Device (HMI). The pump station shall include a NEMA 4, 320 x 240 resolution, 64K color touch screen display mounted on the control panel door. This device shall allow the operator to view and selectively modify all registers in the PLC. The unit shall store its messages in non-volatile memory. The human machine interface device shall incorporate password protection for protecting data integrity. The device shall allow display and modification of all timers, set points, lockout times, etc. The device shall communicate with the PLC through the internal Ethernet network.
- I. Operation and Control. Control software shall be parameter driven, fully documented, and allow user to easily change ALL operational parameters. Standard control features and equipment which need to be included as a minimum are as follows:
1. Panel face switches and lights: Controls shall be designed so operator can discretely start and stop all pumps in all modes of operation including manual mode, operator interface failure, VFD bypass and PLC bypass modes with enclosure doors closed and disconnect switch fully engaged. Enclosure shall include the following switches/ or indicator lights:
 - a. Individual pump run lights
 - b. Individual pump Hand / Off / Automatic switches
 - c. System Test / Off / Automatic switch
 - d. Mode select switch – allows automatic bypass mode of operation which can be used in the event of VFD failure
 - e. VFD selector switch – in manual mode, the lead pump will run on the VFD and each lag pump will start across the line
 - f. Reset – Acknowledges pump station alarms
 - g. Speed potentiometer – in test mode allows user to adjust VFD pump speed
 - h. Low discharge pressure override switch – disables low discharge pressure alarm Individual pump run lights
 2. The Station shall possess the following Alarms as a minimum, and may employ addition job specific alarms, safeties, and shutdown faults as needed. All alarms will be indicated by a red general alarm light. Alarm conditions along with procedures for correction will be displayed in English on the human machine interface device (HMI). Three unsuccessful restarts in 60 minute period will give hard shutdown.
 - a. Low discharge pressure
 - b. High discharge pressure (Attempts restart)*
 - c. Low water level (Attempts restart)*
 - d. Phase loss (Attempts restart)*
 - e. Low voltage (Attempts restart)*
 - f. Phase unbalance (Attempts restart)*
 - g. Phase reversal (Attempts restart)*
 - h. Individual motor overload/phase loss (indicates which individual motor was shut down) Manual reset only. Automatic reset is not acceptable.
 - i. VFD fault (shutdown VFD pump only and attempts restart)*

3. Fifteen distinct set point pressures (normal, lockouts 1 & 2, and 3 high elevation). The lockout feature gives the user the flexibility to lower the set point pressure automatically at days and times, and "locking out" the operation of one or more of main pumps if local power authority imposes penalties for operating these pumps during such times. It also allows user to set a maximum RPM for the VFD pump during these lockout times so that user can limit amperage draw during penalty periods. The high elevation set point can be tied into a computerized irrigation system, or directly linked to high elevation satellites. When high elevation satellites are operating, control software will automatically and gradually elevate the pressure to the new desired set point. When finished, the high set point will be lowered back to normal. The high elevation set point will only be used if called out on the technical data sheet.
4. Software will be included to automatically and gradually ramp up irrigation system pressure to the desired operating pressure (i.e., 1 PSI every 4 seconds) without overshooting design pressure. This feature operates whenever pressure drops below set point pressure. This ramp up time is fully adjustable by the operator. This control feature is based on an increase in pressure over a pre-defined time period. The acceleration control on the VFD is NOT an acceptable means of adjusting pressure ramp up speed.
5. Software will be included for optionally maintaining a lower irrigation system pressure when not irrigating. Reduced pressure values will be shown in the technical data sheet. Controls will cycle the PM pump at these reduced pressures during non irrigation times and pressure will gradually increase to design pressure when the irrigation periods begin.
6. Neither flow meter nor VFD output frequency shall be used for shutting down last VFD driven pump. Controls and software shall incorporate a method to eliminate excessive cycling of VFD pump at very low flow conditions, yet not run the pump excessively at no flow conditions.
7. Automatic alternation of VFD driven pumps. This shall be accomplished by incorporating dual mechanically and electrically interlocked contactors allowing alternation of the VFD between pumps. The controls shall alternate pumps based on individual run time allowing each pump to acquire equal operation.
8. Real time clock calendar allows PLC to internally provide all date, time and day of week functions used above.
9. Two separately adjustable PID control loops for both low flow and high flow pressure stability.
10. User shall be able to field select either of two modes of VFD operation. Auto switch VFD option allows VFD to sequentially start each pump. The standard mode of operation starts the first main pump on the VFD and the remaining pumps start across the line as required.
11. Shutoff algorithm for fixed speed pumps to minimize pump cycling while also remaining responsive to sudden flow reductions. Minimum run timers alone for minimizing fixed speed pump cycling is not acceptable. Discharging through relief valve during pump transitions is not acceptable.
12. Full manual operation capability with panel face mounted speed potentiometer for manually adjusting VFD speed.
13. Light test sequence: Activating the lamp test sequence on the HMI illuminates all lights for 5 seconds.

14. All pump station shutdowns shall be of the controlled type that sequentially retires pumps at user selectable intervals to reduce water hammer within the irrigation system. Phase fault shut-down shall have accelerated rate to minimize motor damage. All pump system shut downs shall be of a controlled type that sequentially retire pumps at intervals appropriate to the specific individual alarms.
 15. The pump station software program shall be user friendly enough to enable the set point pressure from being raised or lowered by the end user at the pump station or through the remote monitoring software package if provided. The pump station software ladder logic shall be written in such a way that no other value would require changing if the set point pressure had to be adjusted. Pressure maintenance pump and main irrigation pump start pressures, the pressure maintenance pump stop pressure, low discharge shutdown and high discharge shutdown shall not be at a specific value but a differential pressure off of set point (i.e. pressure maintenance pump (PMP) to start 5 psi below set point and stop 5 psi above setpoint).
- J. Sequence of Operation. During non irrigation times, the pressure maintenance pump (PM) will cycle on and off as required to maintain irrigation system pressure. The start and stop pressures shall be a differential off of set point. The cycling pressures can be user selected and can be set substantially below normal set point pressure, if desired. If the PM pump cannot maintain the desired pressure, then the VFD will start the first pump and will gradually ramp the pressure up to desired irrigation pressure. The start pressure of the VFD pump shall be a differential below the set point. The pump speed will be modulated to hold a constant discharge pressure regardless of flow. As the flow rate increases and the VFD pump can no longer maintain pressure while at maximum speed, the next sequential pump will be started and the VFD driven pump will accordingly reduce its speed and modulate. An algorithm shall be included for accurately reducing the VFD pump speed as the next sequential pump is started so that no pressure surges are generated during the transition (even with across the line starting). If the user prefers to switch the VFD from pump to pump for sequential starting, he can select this option with the HMI. As the flow continues to increase, pumps will sequentially be started until all pumps are running. As the flow begins to decrease, pumps will be sequentially turned off until only a single VFD driven pump is operating. When a no flow condition occurs, PLC must check and verify pump curve position prior to station shutdown.
- K. PLC Automation Program. The pump station software program shall be user friendly and intuitive. enough to enable the set point pressure from being raised or lowered by the end user at the pump station or through the remote monitoring software package if provided. The pump station software ladder logic shall be written in such a way that no other value would require changing if the set point pressure had to be adjusted. Pressure maintenance pump and main irrigation pump start pressures, the pressure maintenance pump stop pressure, low discharge shutdown and high discharge shutdown shall not be at a specific value but a differential pressure off of set point (i.e. pressure maintenance pump (PMP) to start 5 psi below set point and stop 5 psi above setpoint).

- L. HMI Automation Program. The following information and control screens shall be provided as a minimum to give the user detailed, accurate, and easily understandable operational information. The following screens will enable the user to make real-time changes to the station's control software. This information shall also be accessible through the internet if the station has internet access.
1. Pressure, Flow and System Status: The current pressure, flow, VFD RPM and a system status overview shall be displayed. Codes or Fault's ID numbers shall not be adequate.
 2. Current Condition of all Alarms: The input state and alarm state, for all active alarms shall be shown.
 3. Pump Runtime and Starts: Runtime and number of starts for each pump shall be readily. The starts and runtime must be verified by electrical pump feedback. The OID will include a grand total and since reset value for each pump.
 4. Alarm History: The last nine alarms shall be stored in PLC Memory with detailed information about time, pressure and flow at the time of occurrence. The log will also include diagnostic and recommendations for correction of condition.
 5. Total Flow Output: This total shall include a grand total since commission and a total since reset.
 6. Stations Events: The last 255 events shall be stored in PLC memory. This will include all alarms, individual pump starts and stops, and change in system status.
- M. Networking and Communication. Station shall utilize Ethernet communications as defined in IEEE 802.3. An industrial grade 8-port Ethernet switch shall be provided for star topology connection between PLC(s), HMI, and wireless communication devices if present. An unintelligent Ethernet hub shall not be acceptable. The router shall also provide a field service point of connection without disconnecting any devices from the Ethernet network. All Ethernet communication cable shall be category 5 multiple twisted pair wire terminated by RJ45 connectors. An RJ45 terminal shall be installed in the enclosure door to provide network connectivity without opening the enclosure.
- N. The pump system manufacture shall provide radio's for communication to the maintenance facility or internet accessible location. The radios shall be license free 900 MHz supporting TCP. The radios shall adhere to the following specification.
1. Input voltage 6-30 Volt DC
 2. Low current draw <140mA full time receive and ,550 mA transmit current
 3. 154 Kbbs over-the-air throughput
 4. Point-to-point range of 60 miles with clear line of site.
 5. Point-to-multipoint range of 60 miles with clear line of site.
 6. Error free communications with 32 bit CRC with automatic retransmission
 7. RF performance from -40°C to +75°C
- O. Transmitter
1. Frequency Range - 902-928 MHz (FHSS)
 2. Output power - 5 mW to 1 W

3. Modulation – 2 level GFSK
4. Occupied bandwidth – 230.4 kHz
5. Hopping patterns – 15 per Band, 105 total (user selectable)
6. Hopping channels – 112
7. Hopping bands – 7 (user selectable)
8. Frequency zones – 16 zones, 7-8 Channels per zone
9. RF Connector – TNC

P. Receiver

1. Sensitivity - -110dBm for BER 1x10⁴ at 153.6 kbs
2. Selectivity – 20dBat fc ±230 kHz
3. System gain – 140 dB

Q. Data Transmission

1. Error Detection – 32 bit CRC, retransmit on error
2. Data Encryption – AES 128 bit encryption and proprietary spread spectrum technology
3. Authentication – Radius
4. Data Interface – Ethernet
5. Protocol – Ethernet: IEEE 802.3 TCP/IP, DHCP, ICMP, ARP multicast TFTP
6. Data Connector – Ethernet 10/100 Base T Auto-crossover and 2x serial DB9

R. Toro Lynx Interface.

1. The pump station controls shall communicate with Toro Lynx central and allow for the following features.
 - a. The pump station will provide constant pressure, flow and alarms to the Toro Lynx central on the menu bar in the Toro Lynx screen.
 - b. The pump station will continuously provide status information to the Toro Lynx system to allow for fault indication of any pump and provide the ability to recalculate flows based upon available pumping capacities.
 - c. The pump system shall be equipped with APS (automatic power saver) to allow the user to reduce the set point pressure during non irrigating hours. If selected the Toro Lynx system shall instruct the pump system to go into APS mode to a set point pressure set by the end user.
 - d. Prior to irrigation program cycle the pump station shall automatically start and come up to set point pressure. If the station is equipped with filtration the filters will be pre-flushed prior to the irrigation cycle.
 - e. The pump system shall be equipped with individual motor CT's to provide power usage back to the Toro Lynx central. The user through the Toro Lynx Power Guard system shall be able to limit the amount of power consumed by the pump system during any hour of the day. The Toro Lynx system shall automatically re-calculate the water window based on the power reduction.

2.8 Valve and Filter.

A. The pump station manufacturer shall furnish a V-Series automatic self-cleaning screen filter(s). The filter(s) shall provide uninterrupted filtration as detailed in the technical specifications.

B. Operation

1. Water shall flow into the 316 stainless steel filter body and through the 316 stainless steel weave-wire filtering screen from the inside out allowing blocked contaminants to accumulate on the inside surface of the filtering screen.
2. Differential pressure across the filtering screen shall be continuously monitored as the filter cake builds on the inside of the filtering screen. When the differential pressure reaches an adjustable threshold, a flush cycle shall be initiated by the opening of a flush valve. The opening of the flush valve drops the pressure inside the drive chamber allowing flow to reverse through the suction scanner nozzles. The suction scanner nozzles transfer this reduced pressure at the nozzle location onto the inside of the filtering screen surface. This reduced pressure on the inside of the filtering screen creates a reversed flow through the filtering screen, pulling the contaminants off the screen, back through the suction scanner nozzles and out the flush valve. Once the nozzles have traversed and cleaned the entire screen surface, the flush valve shall close stopping the flush cycle. The filtering process shall remain uninterrupted during the flush cycle.

C. Cleaning Mechanism

1. The filter cleaning mechanism shall provide a controlled spiral path for the suction scanner nozzles across the inside surface of the filtering screen. The opening of a 1 inch NPT flush valve shall create suction forces at each of the 2 suction scanner nozzles creating a reversed flow back through the filtering screen. The reversed flow back through the filtering screen shall force the contaminants from the filtering screen, back through the suction scanner nozzles and out the flush valve.
2. The surface area of each suction scanner nozzle shall not exceed 0.20 square inches to provide minimal flush waste.
3. The optimum distance of the suction scanner nozzle to the screen shall be fixed by the manufacturer and shall not be adjustable to prevent the reduction of manufacturer's designed cleaning performance.
4. The flush flow shall not exceed 30 gpm at 35 psi.
5. Each cleaning cycle shall be completed in less than 15 seconds to further minimize flush waste.
6. The minimum pressure required shall be 35 psi to assure high cleaning efficiency.
7. The cleaning mechanism assembly shall be constructed of 316 stainless steel.
8. The suction scanner nozzle assembly shall be constructed of CPVC.

D. Drive Mechanism

1. The simplicity and cleaning efficiency of any self-cleaning screen filter is in the mechanical system that drives the cleaning process.
2. For simplicity, the drive mechanism shall not consist of electric motors, limit switches and/or actuated pistons that return the drive mechanism to its start position.
3. For cleaning efficiency, the drive mechanism shall allow the suction scanner nozzles to traverse across the screen and return to their start position, and if required, to continue this cycle indefinitely without interrupting the flush flow.
4. Drive systems that do not continuously clean as the suction scanner nozzles return to their start position will not be accepted.
5. The suction scanner shall be driven by a hydraulic motor directly attached to the suction scanner. The hydraulic motor shall utilize the flush waste flow during the flush process to provide forces that rotate the suction scanner. The suction scanner shall rotate on a double axial spline that allows the suction scanner nozzles to traverse across the screen and return to their start position without interrupting the flush process and without the aid of return mechanisms such as electric motors, limit switches and/or actuated pistons. Each suction scanner nozzle's rotation shall overlap with its prior rotation by no less than 10%.
6. The drive mechanism shall include a pressure balance line. This pressure balance line shall balance forces on each end of the suction scanner to reduce forces on the drive mechanism, thereby minimizing mechanical wear and flush waste.

E. Filtering Element

1. The filtering screen element shall be 316 stainless steel weave-wire with 200-micron openings.
2. The filtering element shall consist of 3 layers constructed of 316 stainless steel, and shall be fabricated to allow for maximum open area and strength.
3. The filtering element layers shall be the 1) filtering screen, 2) dispersion screen and 3) the structural screen.
4. The fine filtering layer shall have no other layers between it and the suction scanner nozzles to assure contaminants are not trapped between layers during the flush cycle.

F. Filter Housing Construction

1. The filter housing and cover shall be manufactured from 316 stainless steel and shall be manufactured to ASME code.
2. Filter housing and internal assembly seals shall be constructed of EPDM.
3. Internal pressure shall not exceed 150 psi and operating temperature shall not exceed 176o F.
4. The filter body assembly shall be capable of accepting interchangeable filtering screen elements down to 10 micron.
5. Filter flanges shall conform to AWWA Class D. Filter body coatings shall not be required.

G. Filter Controller

1. The filter(s) control system shall control all aspects of each filter's operation. The filter(s) control system and/or control logic shall be provided by the filter manufacturer.

PART 3 - EXECUTION

3.1 GENERAL

- A. The Contractor shall be responsible for providing all materials, equipment, and labor necessary to install all items associated with the pump station.

3.2 ON-SITE PUMP STATION OFF LOADING & SETTING

- A. Off-loading & setting of the pump station is the responsibility of the contractor, unless specifically called out elsewhere in the specification. Crane to off-load and set the pump station on the concrete slab is to be provided by contractor.

3.3 ON-SITE PUMP STATION START UP

- A. Technical start up shall be furnished by the pump station manufacturer or a qualified, certified service agency. Location and mounting details shall be furnished by the pump station manufacturer. Electrical connection, by Contractor, shall consist of a single conduit from City of NY disconnect to the pump station main disconnect. Additional Contractor responsibility shall include confirming correct motor rotation and securing local inspection/approval.
- B. Technical start up procedures by the pump station technician shall include the following:
 1. A minimum one-week notice shall be given to manufacturer prior to scheduled start up date.
 2. During start up, the complete pumping system shall be given a running test of normal start and stop, and fully loaded operating conditions.
 3. During this test, each pump shall demonstrate its ability to operate without undue vibration, or overheating and shall demonstrate its general fitness for service.
 4. All defects shall be corrected and adjustments made at the expense of the pump station manufacturer. Test shall be repeated until satisfactory results are obtained.
 5. Start up assistance will be provided but will be limited to one 8-hour day unless otherwise specified.
 6. After the station startup has been completed, but before leaving the job site, an instruction session will be given. The instruction session will be given to the City of NY to familiarize them with the pumping system operation, maintenance and adjustments.

3.4 M & O Instruction and Demonstration

- A. After testing is completed and approved by the Commissioner, a instruction and demonstration session shall be held for the M&O staff. The installed pump station shall be demonstrated for one day (maximum 6 hours) for the district M & O Staff. The demonstrations shall include manual and automatic operation of the pump station. The demonstration shall also include identification and operation of each component, trouble shooting for each component, winterizing the system, removal and replacement of defective components, general and specific requirements for the system maintenance, and a check list for frequent attention of components. Highlights of the demonstration, including identification of components shall be videotaped for future M&O instruction.

3.5 O & M Manual

- A. The Contractor shall furnish four (4) copies of the O & M Manual (Operation & Maintenance Manual) for the pump station and the associated mechanical systems. Operation and maintenance manuals shall be furnished at time of start up and initial training. The manual shall include a checklist for trouble shooting and corrective measures in addition to operation and maintenance instructions.

END OF SECTION 328001

SECTION 328002

MANUAL IRRIGATION SCHEDULING

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 GENERAL REQUIREMENTS

A. Work Plan

1. Submit a detailed work plan within 120 days for the irrigation of the plant material for the entire grow-in and maintenance period. List who is responsible for each task, and when the tasks will be completed.

B. Irrigation Products

Water efficiently to conserve water, tree bags, hoses should have adjustable nozzles. The use of water saving technologies is such as drip irrigation, automatic controllers, efficient sprinkler heads is encouraged.

C. Irrigation Map Drawings:

1. Irrigation schedule map drawings shall be a reproduction of the planting plan identifying areas of low, medium and high water use. Drawings shall be reduced and printed on 11" x 17" 24lb bond paper. Drawings shall be legible and created using AutoCAD. If necessary, use multiple sheets of paper and place drawings back to back.
2. Irrigation map drawings shall show areas of low, high and medium water use highlighted in a different color hatch pattern with the designated landscape area numbered: Lawn 1, Planter 1, Tree 1 etc.
3. Seal drawings in 10 mil plastic laminate. When multiple drawings are required punch a hole in the upper left had corner of the laminate and connect with a key chain loop.

D. Irrigation Schedule:

1. Create a typewritten monthly schedule on 8 1/2" x 11" white paper listing each area of the irrigation map drawing. Include a description of each zone (ie Lanwn 1, Planter 2 etc), days to water per week and daily watering times for each irrigation month. Irrigation run times are to be based the chart "A" below using historical evapotranspiration and rainfall data for the location.
2. Example of Irrigation Schedule:

Zone	Days	Description	April	May	June	Jul	Aug	Sept	Oct
1	MWF	Planter 21	15:00	17:00	25:00	25:00	30:00	18:00	8:00
2	TTH	Lawn 1	15:00	17:00	25:00	25:00	30:00	18:00	8:00
3	TTH	Planter 15	5:00	6:00	8:00	12:00	13:00	9:00	6:00
4	TTH	Planter 21	5:00	6:00	8:00	12:00	13:00	9:00	6:00

3. Seal irrigation schedule in 10 mil plastic laminate.
4. All irrigation equipment must have their gpm determined to properly determine the watering rates. If irrigating with a hose you must determine the gpm by filling a 5 gallon bucket and timing it. Discharge rates of all nozzles should be known.
5. Install a rain gauge to help determine if irrigation is required.
6. CHART "A":

ITEM	SOURCE		VALUE	UNIT or FUNCTION
I. PLANT WATER REQUIREMENT				
A. PLANT MATERIAL	Planting Plan			classification
B. REFERENCE PERIOD	Monthly			days
C. REFERENCE ET (ET _o)	Various sources			inches of water
D. LANDSCAPE COEFFICIENT (K _L)	K _s x K _d x K _{mc}			plant specific multiplier
(Optional) ALLOWABLE STRESS	K _L ____ x K _{as} ____			site specific multiplier
E. PLANT WATER REQUIREMENT (ET)	ET _o x K _L	C x D		inches
II. IRRIGATION WATER REQUIREMENT				
F. PRECIPITATION RATE (PR)	Calculation			inches per hour
G. DISTRIBUTION UNIFORMITY (DU)	Estimate			efficiency adjustment
H. IRRIGATION WATER REQUIREMENT	ET requirement	E/G		inches
I. TOTAL RUN TIME per PERIOD	Irrig. water requirement/PR	(H/F)x 60		minutes
III. SCHEDULING REQUIREMENTS				
J. ROOT ZONE SOIL TYPE	Audit or Estimate			classification
K. AVAILABLE WATER (AW)	Table			inches per inch of soil
L. ACTIVE ROOT ZONE DEPTH	Audit or Estimate			inches
M. PLANT AVAILABLE WATER (PAW)	AW x active root zone	K x L		inches
N. ALLOWABLE DEPLETION (AD)	PAW x MAD (see Table)			budget multiplier
O. IRRIGATION DAYS PER PERIOD	Plant ET/AD	E/N		days in a period
P. TOTAL RUN TIME per DAY	Total run-period/irrigation days per period	I/O		minutes
Q. RUN TIME per CYCLE	Calculation (IR/PR x 60) or Visual observation			minutes
R. CYCLES per DAY	Total run-day/run time-cycle	P/Q		repeats to avoid runoff

END OF SECTION 328002

SECTION 329113

PLANTING SOIL MIXES

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Ammended Existing Topsoil
 - 2. Ammended Imported Topsoil

1.3 RELATED SECTIONS

- A. Project Specific Sustainability Requirements - Section 013010
- B. Exterior Plantings – Section 329300
- C. Plantings for Wetland Areas – Section 327200
- D. Soil Mixes for Wetland Areas – Section 327500
- E. Vegetated Roofing System – Section 073360

1.4 REFERENCES

- A. Except as modified by governing codes and by the Contract Documents:
 - 1. Association of Official Agricultural Chemists
 - 2. American Society for Testing and Materials (ASTM) using test criteria as specified or required by other references
 - 3. Soil Science Society of America, Methods of Soil Analysis
 - 4. US Composting Council, Test Methods for the Examination of Composting and Compost (TMECC).
 - 5. Environmental Protection Agency (EPA).

1.5 SUBMITTALS

- A. General:
 - 1. All submittals shall be marked with the following information:
 - a. Date issued
 - b. Project Title and names of Contractor and material supplier.

- c. Name of material and reference number from Part 2 of the specifications.
 - d. Date, place, and time of sampling.
 - e. Location of material source.
2. No base component material for plant mix shall be used until certified test reports and component samples have been received and approved by the Commissioner.
 3. Commissioner may request additional testing by Contractor for confirmation of mix quality and / or soil mix amendments at any time until completion.
- B. Product Data: Submit to Commissioner technical data for each manufactured or packaged product of this section. Include manufacturer's product testing and analysis, and installation instructions for manufactured or processed items or materials. Provide submittal twelve weeks before the installation of the Topsoil Mix.
- C. Material Source Location: Submit locations of soil material sources. The Landscape Architect shall have the right to reject any material source. Provide submittal twelve weeks before the installation of the Topsoil Mix.
- a. Submit the name, address and telephone number of the source contact, and the location of the soil source including directions to the specific field location on the property.
- D. Material Certificates:
1. Submit to Commissioner certified analysis for each planting soil, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged material. Provide submittal twelve weeks before the installation of Topsoil Mix.
 2. Submit the manufacturers certificate for all sand to the Commissioner for approval, the manufacturer's pH, and particle size analysis.
Provide the following particle size distribution (percent passing):
Sieve
3/8" (9.5mm)
No 4. (4.75mm)
No 8. (2.36mm)
No 16 (1.18mm)
No 30 (.60mm)
No 50 (.30mm)
No 100 (.15mm)
 3. Submit the manufacturers certificate including the manufacturer's Fines Modulus Index, for all sand to the Commissioner's approval.
 4. Prior to job acceptance, submit to the Commissioner written certificates for the following total quantities by weight as used on the Project Site for Project materials:

- a. Quantity and type of topsoil, commercial fertilizer, organic fertilizer, or organic amendment.
- E. Testing: Submit soil test analysis report for each sample of Topsoil from an approved soil-testing laboratory.

1. For all Topsoil provide a particle size analysis (% dry weight) including the following gradient of mineral content:

USDA Designation	Size in mm
Gravel	+2mm
Very Coarse Sand	1-2mm
Coarse Sand	0.5-1mm
Fine Sand	0.1-0.25mm
Very Fine Sand	0.05-0.1mm
Silt	0.002-0.05mm
Clay	Minus 0.002mm

2. For all Topsoil provide a particle size analysis (% dry weight) including the following gradient of mineral content:

USDA Designation	Size in mm
Gravel	+2mm
Sand	0.05-2.0mm
Silt	0.002-0.05mm
Clay	Minus 0.002mm

3. For all Topsoil provide a chemical analysis including the following:
- a. pH and Buffer pH
 - b. Percent organic content by oven dried weight
 - c. Nutrient levels by parts per million including: nitrate, phosphorus, potassium magnesium, manganese, iron, zinc, and calcium. Nutrient test shall include the testing laboratory recommendations for supplemental additions to the Topsoil Mix.
 - d. Soluble salt by electrical conductivity of a 1:2 soil water sample measured in Milliohm per cm.
 - e. Cation Exchange Capacity (CEC).
4. Provide a physical analysis of each Topsoil to include the following test results:
- a. Water permeability with the sample compacted to 80% and 85% maximum proctor density utilizing proctor test (ASTM D 698-12e1).

- F. Samples: Submit samples of each product and material where required by the specification to the Commissioner for approval. Submit all samples in re-sealable plastic bags. Samples will be reviewed for appearance only. Compliance with all other requirements is the exclusive responsibility of the contractor. Delivered materials shall closely match the color, texture and consistency of the samples.

1. Submit two-gallon samples of all topsoil, sand, compost, and Topsoil Mixes, and soil additive products in this section. The number of samples shall be as required for each material.
 - a. Samples of all topsoil, sand, compost and Topsoil Mixes shall be submitted at the same time as the particle size and physical analysis of that material.
 - b. Topsoil Mixes shall be labeled as to the percentage of each component in the mix.
 - c. Samples of all products and Topsoil Mix components shall be submitted twelve weeks before the installation of Topsoil. Topsoil Mixes shall be submitted no more than two weeks after the approval of the mix component.
- G. Soil Mixing Procedures: The Contractor shall submit a detailed soil mixing operations plan. This plan shall include types of equipment, descriptions of procedures, stockpiling plan and shipping methods.
- H. Soil Planting and Grading Procedures: The Contractor shall submit a detailed soil placement, blending and grading operations plan. To the degree possible, soils shall be amended in place
- I. Submittal Summary

Item/Product	Section	Test/Submittal Summary. Referred to sections for specific requirements.
Soil Survey	3.2	Particle size analysis see 1.6E for required test Chemical analysis see 1.6E for required test
Topsoil	2.2	3 lb. sample from each source, samples shall represent the range of material to be provided. Separate samples from screened and unscreened topsoil stockpiles
	1.6E 2.2	Particle size analysis see 1.6E for required test
	1.6E 2.2	Chemical analysis see 1.6E for required test
Composted Organic Matter	2.3	2 gallon sample
	2.3	Manufacturers certificates of compliance showing:

		pH, particle size analysis, certificate of length of composting period, and certificate that the compost meets the requirements of the US Composting Council.
Composted Pine Fines	2.4	3 lb. sample
	2.4	Manufacturer's certificate of compliance showing: pH, particle size analysis, certificate of length of composting period, and certificate that the compost meets the requirements of the US Composting Council.

1.6 QUALITY ASSURANCE

- A. Soil Installer Qualifications: All soil work shall be performed by an experienced contractor who has completed soil work similar in material, design, and extent to that indicated for this Project and with a record of successful landscape establishment.
- B. Installer Field Supervision: Require installer to maintain full-time supervisor during times soil work is in progress.
 - 1. Installation and maintenance foreman on the job shall be competent supervisor experienced in supervising soil installation. A single Installer Field supervisor shall be assigned to the project for its duration. In the event that the designated supervisor cannot be on the site, a replacement supervisor shall be approved by the Commissioner.
- C. Soil Mix and Soil Component Testing
 - 1. Agency Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and specializes in types of tests to be performed, or a member of the Council on Soil Testing and Plant Analysis and has staff members with extensive agricultural research experience as demonstrated with peer reviewed publications. The lab shall be accredited by the A2LA (American Association for Laboratory Accreditation). The soil testing laboratory shall be approved by the Commissioner in advance and have a minimum of 3 years experience with the test protocols of the United States Golf Association – Green Section.
 - 2. Testing of soils and Planting soils shall be performed by either:
 Turf & Soil Diagnostics
 35 King Street

Trumansburg, New York 14886
Tel: (607) 387-5694

Rutgers Soil Testing Laboratory
Rutgers, The State University of NJ
57 US Highway 1
New Brunswick, NJ 08901
Tel:(848) 932-9295

LCL Labs
325 Venture Drive
Westerville, Ohio 43081
Tel: (614) 888-1663

Woods End Research Laboratory
P.O. Box 297
Mt. Vernon, ME 04352
Tel: (800) 451-0337

Or approved equal

3. Laboratory comments or recommendations regarding amendment requirements or procedure shall not be interpreted to prescribe or dictate procedures or quantities of soil materials for the work of this Contract. Final approval of soil amendment procedures shall be approved by the Commissioner.

D. Soil Supplier:

1. Planting Soil Mix supplier shall have a minimum of five years experience in supplying custom planting mixes. Pre-approved soil suppliers are:

Island Topsoil, Syosset, New York

Long Island Compost, Yaphank, New York

Natures Choice , Jersey City, New Jersey

New York Recycling and Materials, Inwood, New York

Or Approved Equal

2. Submit supplier name, address, telephone, fax numbers, email address, and contract name for approval by the Commissioner.
3. Submit certification that the accepted supplier is able to provide required quantities of materials and mixes for the entire project.

- E. Pre-Installation Conference: Contractor to conduct a conference at the Project. Person(s) responsible for soil preparation and installation of soil required by this Section shall attend to review soil placement and grading procedures and methods. The Installers field supervisor shall attend all soil pre-installation conferences.

- F. Review of Work by the Commissioner: The Contractor shall comply with the requirements of the plans and specifications regardless of review or lack of review by the Commissioner.
 - 1. Failure of the Commissioner to reject unsatisfactory workmanship or to notify the Contractor of their responsibility to repair and/or replace unsatisfactory work shall not constitute acceptance of the work.
 - 2. The Commissioner reserves the right to take and analyze, at any time, such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform any additional testing requested.
- 1.7 SEQUENCING AND SCHEDULING
- A. General: Prior to the start of Work, prepare a detailed schedule of the work for coordination with other trades.
 - B. Schedule the installation of Topsoil Mixes after the area is no longer required for use by other trades and work. Schedule work to avoid compaction by later work and other trades.
 - C. Schedule all utility installations prior to beginning work in this section.
- 1.8 DELIVERY, STORAGE, AND HANDLING
- A. Approvals: Do not mix or deliver Topsoil to the site until all products testing samples have been approved by the Commissioner.
 - B. Weather: Do not mix, deliver or place or grade soils in frozen, wet, muddy or overly dry conditions.
 - C. Packaged Materials: Deliver packaged materials to the location where soils are to be mixed, in unopened bags or containers, each clearly bearing the name, guarantee, and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the material. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, injury and theft. Retain empty packages for inspection.
 - D. Stockpiling: Topsoil, or amendment materials, stored on site temporarily in stockpiles prior to placement shall be protected from contaminants and erosion. Soil materials shall be covered with a pervious, needle-punched, geotextile tarpaulin until time of actual use. All stockpiled materials shall be placed on tarpaulin, heavy polyethylene sheeting or other suitable barrier to protect paving surfaces from staining or soiling by stockpiled materials.
 - 1. Topsoil should be handled only when the moisture content is more than the point where the soil within the soil stockpile appears dry and soil peds become hard.
 - E. Soil mixing must take place offsite by an experienced soil-blending supplier.
 - F. Bulk Material: Coordinate delivery and storage with the City of New York and confine materials to neat piles in areas acceptable to the City of New York.

1.9 PROJECT CONDITIONS

- A. **Surface and Subsurface Conditions:** It is the responsibility of the Contractor to be aware of all surface and sub-surface conditions, and to report any circumstances that will negatively impact soil drainage, soil settlement or other installation requirements. Do not proceed with work until unsatisfactory conditions have been corrected.
- B. **Platforms and Structures:** Perform work in a manner, which will avoid damage to marine structures, sea walls, platforms, decks, and other substructures.
- C. **Waterproofing:** Perform work in a manner, which will avoid damage to planter waterproofing membrane, protection board or other structural sealing materials.
- D. **Construction Sequencing:** Install all soils at the point in the project sequencing that the soil can be adequately protected from other work at the site.
- E. **Coordination:** Coordinate work with that of other trade affecting or affected by work of this Section and cooperate to assure the steady progress of work.
- F. **Environmental Requirements:**
 - 1. Perform both off-site and on-site soil work only during suitable weather conditions. Do not work soil or subsoil when frozen, excessively wet, excessively dry, or in otherwise unsatisfactory condition. Do not work soil when moisture is so great that soil will "pump" under compacting force, nor when it is so dry that dust will form in the air or that clods or peds will not break readily.
 - 2. Apply water, if necessary, to bring soil to an optimum moisture content for tilling and placement.
 - 3. Do not apply chemicals if wind conditions will cause hazardous drift to people or property.
 - 4. **Hazardous Materials-** Do not provide or utilize materials that contain asbestos, PBC or other hazardous materials.
- G. **Safety:** The Contractor shall be responsible for pedestrian and vehicular safety and control all movement within and around the work site. Provide the necessary barriers, warning devices and ground personnel needed to give safety, warning and protection to persons and vehicular traffic within the area of work including the contractor's equipment and temporary storage within the public right of way.
- H. **Damage:** During site preparation, soil installation and protection, the Contractor shall be responsible for all damage to existing features above and below ground incurred as a result of work operations. Repairs and/or replacements shall be made to the satisfaction of the Commissioner.
- I. **Protection of Work:** Protect all installed material for compaction, contamination and erosion. Install fences; utilize mulch, mats and geofabrics over the surface of the soil as required. In the event that any soil becomes compacted, contaminated or eroded, repair the damage using procedures required by the Commissioner.

1.10 WORKING AROUND UTILITIES

- A. Carefully examine the civil, record, and survey drawings to become familiar with the existing underground conditions before digging.
- B. Determine location of underground utilities and perform work in a manner that will avoid possible damage. Hand excavate, as required. Maintain grade stakes set by others until parties concerned mutually agree upon removal.

PART 2 PRODUCTS

2.1 AMMENDED EXISTING TOPSOIL

- A. Base Soil Material shall be Harvested Soil from the site either in situ or stockpiled. If insufficient quantities of approved Base Soil Material exist on the Project Site, Base Soil material shall be Imported Harvested Soil from an off-site local source as approved the Commissioner. Base Soil Material from off-site shall follow the same testing procedures for acceptance as on-site material.

1. Soil acceptance criteria for soil harvesting:

- a. General: Harvested soil shall be free of roots, clods, stones larger than 1-inch in the greatest dimension, pockets of coarse sand, noxious weeds, sticks, lumber, hazardous material, brush and other litter. It shall not be infested with nematodes or other undesirable disease-causing organisms such as insects and plant pathogens.
- b. Topsoil shall be friable and have sufficient structure in order to give good tilth and aeration to the soil. Soil shall have a field capacity of at least 15 percent on a dry weight basis.
- c. Gradation limits: soil shall be a sandy loam or loam. The definition of soil texture shall be the USDA classification scheme. Gravel over 1/2-inch in diameter shall be less than 10% by weight.
- d. Permeability Rate: Hydraulic conductivity rate shall be not less than one inch per hour nor more than 20 inches per hour when tested in accordance with the USDA Handbook Number 60, method 34b or other approved methods.
- e. Fertility: The range of the essential elemental concentration in soil shall be as follows:

Ammonium Bicarbonate/DTPA Extraction
parts per million (mg/kilogram) dry weight basis

phosphorus	2 - 40
potassium	40 - 220
iron	2 - 35
manganese	0.3 - 6
zinc	0.6 - 8
copper	0.1 - 5
boron	0.2 - 1
magnesium	50 - 150

sodium	0 - 100
sulfur	25 - 500
molybdenum	0.1 - 30

- f. Harvested soil may need to be amended and conditioned to optimize plant growth.
- g. Acidity: The soil pH range measured in the saturation extract (Method 21a, USDA Handbook Number 60) shall be 6.0 - 7.9.
- h. Salinity: The salinity range measured in the saturation extract (Method 3a, USDA Handbook Number 60) shall be 0.5 - 2.5 millimho/cm.
- i. Chloride: The maximum concentration of soluble chloride in the saturation extract (Method 3a, USDA Handbook Number 60) shall be 150 mg/l (parts per million).
- j. Boron: The maximum concentration of soluble boron in the saturation extract (Method 3a, USDA Handbook Number 60) shall be 1 mg/l (parts per million).
- k. Sodium Adsorption Ratio (SAR): The maximum SAR shall be 3 measured per Method 20b, USDA Handbook Number 60.
- l. Aluminum: Available aluminum measured with the Ammonium Bicarbonate/DTPA Extraction shall be less than 5 parts per million.
- m. Soil Organic Matter Content: Sufficient soil organic matter shall be present to impart good physical soil properties but not be excessive to cause toxicity or cause excessive reduction in the volume of soil due to decomposition of organic matter.
- n. Heavy Metals: The maximum permissible elemental concentration in the soil shall not exceed the following concentrations.

Ammonium Bicarbonate/DTPA Extraction
parts per million (mg/kilogram) dry weight basis

arsenic	1
cadmium	1
chromium	10
cobalt	2
lead	30
mercury	1
nickel	5
selenium	3
Silver	0.5
vanadium	3

- o. If the soil pH is between 6 and 7, the maximum permissible elemental concentration shall be reduced 50%. If the soil pH is less than 6.0, the maximum permissible elemental concentration shall be reduced 75%. No more than three metals shall be present at 50% or more of the above values.

- p. Phytotoxic constituent, herbicides, hydrocarbons etc.: Germination and growth of monocots and dicots shall not be restricted more than 10%. Total petroleum hydrocarbons shall not exceed 50 mg/kg dry soil measured per the modified EPA Method No. 8015. Total aromatic volatile organic hydrocarbons (benzene, toluene, xylene and ethylbenzene) shall not exceed 0.5 mg/kg dry soil measured per EPA Methods No. 8020.
2. Soil acceptance criteria for amended soil:
- a. The amended soil will be accepted if it complies with the following requirements. The soil will need to be leached if the concentration of boron exceeds 1 part per million, if the alkalinity is substantially over 8.0 or if the salinity exceeds 2.5 millimho/cm.
 - b. Fertility: The range of the essential elemental concentration of amended soil shall be as follows.

Ammonium Bicarbonate/DTPA Extraction
parts per million (mg/kilogram) dry weight basis

phosphorus	10 - 40
potassium	100 - 220
iron	5 - 35
manganese	0.6 - 6
zinc	1 - 8
copper	0.3 - 5
boron	0.2 - 1
magnesium	50 - 150
sodium	0 - 100
sulfur	25 - 500
molybdenum	0.1 - 30

- a. Soil Organic Matter Content: About 3% to 5% - sufficient soil organic matter shall be present to impart good physical soil properties but not be excessive to cause toxicity or cause excessive reduction in the volume of soil due to decomposition of organic matter.

2.2 IMPORTED TOPSOIL

- A. Fertile, friable, loamy soil, containing 1.4 to 5 percent by weight organic matter; less than 10% total volume of any combination of subsoil, refuse, roots larger than 1" in diameter, heavy or stiff clay, stones larger than 2 inch in diameter, sticks, brush, or litter. Topsoil shall not contain any substances deleterious to plant growth. Topsoil shall be suitable for the germination of seeds and the support of vegetative growth. Topsoil shall not contain weed seeds in quantities that cause noticeable weed infestations in the final planting beds.
- B. The pH value shall be between 6.0 and 7.0.
- C. Topsoil shall be a harvested soil from fields or development sites. The organic content and particle size distribution shall be the result of natural soil formation. Soils where

sand, composted organic matter or chemical additives has been added to the soil to meet the requirements of this specification section shall not be acceptable.

- D. Soil Texture: USDA textural designation loam or sandy loam, with clay content between 15% and 25%. And a combined clay/silt content of between 45% and 65%.
- E. Topsoil shall NOT have been screened through any screen smaller than 2" and shall retain soil peds or clods larger than 2 inches in diameter throughout the stockpile.
- F. Provide two-gallon sample from each topsoil source with soil testing results. The sample shall be a mixture of the random samples taken around the source stockpile or field. The soil shall be delivered with soil peds intact that represent the size and quantity of expected peds in the soil

2.3 COMPOSTED ORGANIC MATTER

- A. Organic blended material composted for a minimum of 9 months and sufficiently to break down all woody fibers, seeds and leaf structures, free of toxic and non-organic matter. Source material shall be primarily branches and other yard waste designed to produce compost high in fungal material. Organic Matter shall be commercially prepared compost and meet US Compost Council STA/TMECC criteria or equal for stable, Composted Organic Matter intended for Planting Soil amendment Compost made from primarily green leaf yard waste shall not be acceptable.
- B. Product Parameters:
 - 1. pH 5.5 – 7.5
 - 2. Soluable Salt Concentration (electrical conductivity) Maximum 10dS/m (mmhos/cm)
 - 3. Moisture Content %, wet weight basis 30 – 60
 - 4. Organic Matter Content %, dry weight basis 30 – 65
 - 5. Particle Size % passing a select mesh size, dry weight basis 98% pass through 3/4" screen or smaller
 - 6. Stability Carbon Dioxide Evolution Rate mg CO₂-C per g OM per day < 8
 - 7. Physical Contaminants (inerts) %, dry weight basis <1
 - 8. Chemical Contaminants mg/kg (ppm) Meet or exceed US EPA Class A standard, 40CFR § 503.13, Tables 1 and 3 levels
 - 9. Biological Contaminants Select Pathogens Fecal Coliform Bacteria, or Salmonella, Meet or exceed US EPA Class A standard, 40 CFR § 503.32(a) levels
- C. Provide a 3 lb sample with manufacturer's literature and material certification that the product meets the requirements.

2.4 COMPOSTED PINE FINES

- A. Organic blended material composted for a minimum of 9 months and sufficiently to break down all woody fibers, seeds and leaf structures, free of toxic and non-organic matter. Source material shall be primarily pine bark. Composte shall be commercially prepared compost and meet US Compost Council STA/TMECC criteria or equal for

stable, Composted Organic Matter intended for Planting Soil amendment. Compost made from primarily green yard waste shall not be acceptable.

B. Product Parameters:

1. pH 5.5 – 7.0
2. Soluble Salt Concentration (electrical conductivity) Maximum 10dS/m (mmhos/cm)
3. Moisture Content %, dry weight basis 30 – 60
4. Organic Matter Content %, dry weight basis 30 – 65
5. Particle Size % passing a selected mesh size, dry weight basis 98% through ¾" screen or smaller
6. Stability Contaminants (inert) %, dry weight basis < 1
7. Physical Contaminants (inerts) %, dry weight basis <1
8. Chemical Contaminants mg/kg (ppm) Meet or exceed US EPA Class A standard, 40CFR § 503.13, Tables 1 and 3 levels.
9. Biological Contaminants Select Pathogens Fecal Coliform Bacteria, or Salmonella, Meet or exceed US EPA Class A standard, 40 CFR § 503.32(a) levels

C. Provide a 3 lb sample with manufacturer's literature and material certification that the product meets the requirements.

2.5 COARSE SAND

A. Coarse concrete sand, ASTM C-33 Fine Aggregate, with a Fines Modulus Index of 2.8 and 3.2.

1. Sand shall be clean, sharp, natural sands free of limestone, shale and slate particles. Sand PH shall be lower than 7.0.
2. Provide the following particle size distribution:

Sieve	Percent Passing
3/8" (9.5mm)	100
No 4 (4.75mm)	95-100
No 8 (2.36mm)	80-100
No 16(1.18mm)	50-85
No30 (.60mm)	25-60
No50 (.30mm)	10-30
No100 (.15mm)	2-10

B. Provide a 3 lb sample with manufacturer's literature and material certification that the product meets the requirements.

2.6 CHEMICAL ADDITIVES

A. Chemicals materials designed to increase soil fertility. All material shall be delivered to the site in unopened containers and stored in a dry enclosed space suitable for the

material and meeting all environmental regulations. All products shall be freshly manufactured and dated for the season in which the products are to be used.

1. Fertilizer for planting shall be organic fertilizer. Fertilizer selections shall be based on the recommendations of the soil test. Submit manufacturers' product literature for approval.

PART 3 EXECUTION

3.1 SITE EXAMINATION

- A. Examine the surface grades and soil conditions for any circumstances that might be detrimental to soil drainage, such as uneven sub grades and waterproofing that may hold or pond water, deposits of construction-related waste or soil contamination, storage of material or equipment, soil compaction or poor drainage. Confirm that all utility work and installation of planter drainage has been completed and tested. Examine the grading, verify all elevations. Confirm that all other work in the area of Topsoil Mix installation is completed. Notify the City of New York in writing of any unsatisfactory conditions.
- B. Using survey instruments, the Contractor shall verify that subgrade has been prepared according to specification with regard to compaction, grade tolerances and is free of debris prior to beginning work.
- C. The Contractor shall be responsible for all construction surveying required for the proper location of all work covered hereunder

3.2 SOIL SURVEY

- A. Contractor shall pothole one hole per acre. Contractor shall take individual soil samples from the top 2 feet, between 2 and 4 feet and between 4 feet and the depth of the excavation at each pothole. Contractor shall mark each sample by location and depth. Contractor shall send one pound of each sample by zone and depth to the laboratory for testing and evaluation. Contractor shall take Soil Samples from locations identified by the Commissioner and Soil Scientist. Soil Samples shall be taken at least 30 days in advance of commencing earth moving and grading operations. Contractor shall allow sufficient time for performance of Soil Testing and Test Results which will identify areas of suitable soil for Soil Harvesting, Stockpiling and Reuse as Planting Topsoil.

3.3 SOIL HARVESTING

- A. Harvest suitable soil as determined by the soil survey results. Soil harvesting needs to be selective and limited to the better soil. The target soil is darker in color, is less dusty, is more friable and has lower compaction, probably contains roots, contains less rock and gravel, contains less debris, etc. Preliminary identification of Suitable Soil for Soil Harvesting will be made based on Soil Survey results.
- B. Contractor shall Stockpile the apparently suitable soil based on evaluation by Soil Scientist of Initial soil testing. Place unsuitable soil in a separate location. Mark the apparently suitable soil and warn other trades to not place trash on the stockpile.

- C. Generally, the stockpiles should not be higher than 6 feet. The stockpiles should be worked from the side – equipment should not be operated on the amended soil surface, especially after amending. Moist soils are more sensitive to damage than dry soil. Dry soil can be stockpiled higher, particularly if they are low in soil organic matter.
- D. Take one sample per 100 cubic yard with a minimum of 10 samples from the suitable stockpile for additional soil testing by Soil Scientist to determine its properties and recommendations for amendments.

3.4 SOIL AMENDING

- A. Coordinate as required with other trades to ensure proper and adequate provision in the work of those trades for interface with the work of this Section.
- B. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.

3.5 SOIL AMENDING DEPTHS

- A. Unless otherwise specified in the drawings or directed by the Commissioner and Soil Scientist the depth of amended soil shall be as follows:
 - 1. Shrub and Herbaceous Plantings: Amend to 18-inches depth for an area equal to future mature shrub drip line or for shared or mass planting areas amend entire planting area.
 - 2. Turf Grass and Meadow Areas: Amend to 9-inches entire planting area.
 - 3. Trees: Amend to depth of the rootballs for trees but not less than 30 inches to an area 35 inches beyond the rootball edge.

3.6 ENHANCED SOIL DRAINAGE

- A. General Site Areas
 - 1. Before amended soils are placed, rip the base soil 6 inches deep to avoid a sharp soil interface.

3.7 COORDINATION WITH PROJECT WORK

- A. The Contractor shall coordinate with all other work that may impact the completion of the soil work.
- B. Protect installed Topsoil Mix from compaction by other trades.
- C. Assure that all sediment control required by the project documents is in place during the installation of Topsoil. Provide additional sediment control to retain Topsoil within the project limits as needed to keep sediment from migrating on to finished paving and wall surfaces.
- D. Irrigation and site utility coordination: Site utility and electrical conduits, irrigation lines and heads encountered during the Topsoil installation process shall be noted and flagged. Protect these lines from damage during the installation of Topsoil.
 - 1. Where feasible install site utility including site lighting and irrigation below the subgrade of the Planting Soil prior to the installation of Topsoil.

2. Assure that all conduits and risers are outside the limit of all tree and large shrub root balls.
3. When required to have utilities, electric or irrigation lines installed within the Topsoil, coordinate with the subcontractors to avoid compacting the Topsoil. All utility trenches shall be hand dug through the Topsoil. Trenches shall be backfilled with the specified Topsoil at the compaction levels specified in Section Soil Preparation.
4. When conflicts between any conduits and soil installation or plant installation are unavoidable, Utility, electrical and irrigation lines shall be traced to their nearest connection and their alignment relocated to avoid the conflict. The open end of the irrigation line shall be capped to prevent clogging. The site of a disconnected irrigation line shall be flagged after excavated soil has been backfilled.

3.8 GRADE AND ELEVATION CONTROL

- A. Provide grade and elevation control during installation of Planting Soil. Utilize grade stakes, surveying equipments and other means and methods to assure that grades and contours conform to the grades indicated on the plans.
- B. Maintain grade stakes until the grades have been viewed by the Commissioner.

3.9 TOPSOIL DESIGN

- A. Prepare a minimum of (3) 2-gallon sample mixes for each soil type using topsoil taken from different areas of the approved topsoil source, to determine the ratio of mix components to be added to the Topsoil Soil. Submit samples for approval.
- B. This specification is based on the assumption that the soil products to be provided are natural and will vary in quality from location to location and within each soil source, and that mixing of soil will result in variety within the mix. The contractor is expected to provide samples that represent the range of product quality to be provided.
- C. The contractor shall submit mix designs with test results for evaluation. Multiple rounds of testing and evaluations may be required before an approved Topsoil can be determined. For each test mix, submit both representative samples of the material along with the test results to the Commissioner.
- D. Given the variability of the natural products in these Topsoils, the contractor is advised to work with the Commissioner when evaluating products and mix ratios. Significant amounts of time and soil testing cost can be saved if product specific issues and approaches to developing soil blending mixes are discussed prior to and during the testing process.
- E. Schedule the Topsoil testing phase such that all testing and mix design is completed a minimum of six weeks prior to the installation of Topsoil.

3.10 SITE PREPARATION

- A. In areas not above structure, excavate to the proposed sub grade. Maintain all required angles of repose of the adjacent materials as shown on the drawings. Do not over excavate compacted sub grades of adjacent pavement or structures. Maintain a supporting 1:1 side slope of compacted subgrade material along the edges of all paving

and structures with the bottom of the paving or structure above the elevation of the excavated planting area.

- B. In areas above concrete slabs or structures, assure that all drainage material, foam and geotextiles are installed and drains operational. Check foam fill elevations to assure that they are at the proper elevation to permit the specified Topsoil depths and finished grades.
- C. Remove all construction debris and material including any temporary construction roads.
- D. Confirm that the sub grade is at the proper elevation and compacted as required. Sub grade elevations shall slope approximately parallel to the finished grade and/or toward the subsurface drain lines as shown on the drawings.
- E. Do not proceed with the installation of Topsoil, until all utility work in the area has been installed.
- F. Do not begin Topsoil installation until all subsurface drainage, drain boards, filter cloth, irrigation main lines, lateral lines, and irrigation risers shown on the drawings are viewed and approved by the Commissioner.
- G. Protect adjacent walls, walks and utilities from damage or staining by the soil. Use 1/2" plywood and or plastic sheeting as directed to cover existing concrete, metal and masonry work and other items as directed during the progress of the work.
 - 1. At the end of each working day, clean up any soil or dirt spilled on any paved surface.
 - 2. Any damage to the paving or architectural work shall be repaired at the contractor's expense.

3.11 PLACEMENT OF STOCKPILED OR IMPORTED PLANTING TOPSOIL MIXES

- A. All equipment utilized to install Topsoil shall be wide track machines rated with a ground pressure of 4 PSI or less. All grading and soil delivery equipment shall have buckets equipped with teeth to scarify any soil that becomes compacted.
- B. In areas of soil installation above existing subsoils, loosen the subgrade material prior to installing Topsoil.
 - 1. Scarify and loosen the subsoil of the sub grade to a depth of 3-6" with the teeth of the loader bucket or other suitable device.
 - 2. Immediately install the Topsoil. Protect the loosened area from traffic. DO NOT allow the loosened sub grade to become compacted.
 - 3. In the event that the loosened area becomes overly compacted, loosen the area again prior to installing the Topsoil.
- C. In soil areas above structural surfaces and waterproofed conditions, carefully install the initial layer of Topsoil not to exceed 12-18 inches in depth. Do not disturb foam fill, geotextile overlaps, secure and brace drainage risers, brace and protect electric lines and irrigation lines and other conduits installed above the Drainage layer. Assure that no conduits are in conflict with the locations of root ball areas of trees.

- D. Install the remaining Topsoil in 12-18" lifts to the required depths.
 - 1. Where two different types of planting soil are intended to be layered on top of one another, scarify the surface of the lower soil prior to adding the upper soil. Scarification is intended to create an uneven surface with small ridges and valleys created by the teeth of a loader bucket to break the soil interface between the two soils and increase drainage rates between the two soil types.
- E. Phase work such that equipment to deliver or grade soil or deliver or install large trees does not have to operate over previously installed Planting Soil. Where possible, place large trees first and fill Topsoil around the root ball.
- F. Where travel over installed soil is unavoidable. Limit the paths of traffic to reduce the impact of compaction in the soil. Each time equipment passes over the installed soil it shall reverse out of the area along the same path with the teeth of the bucket dropped to scarify the soil. Comply with the paragraph "Compaction Reduction" in the event that soil becomes over compacted.
- G. The depths and grades shown on the drawings are the final grades after settlement and shrinkage of the organic material. The contractor shall install the Topsoil at a higher level to anticipate this reduction of Topsoil volume. A minimum settlement of approximately 10% of the soil depth is in lawn areas shall be installed 1" higher than the design grades. All grade increases are assumed to be as measured to be prior to the addition of any surface compost till layer or mulch.

3.12 TOPSOIL SOIL COMPACTION

- A. Compact the Topsoil to the compaction rates indicated and using the methods approved for the soil mock up.
 - 1. Achieve a soil density of between 75 and 82% of maximum dry density standard proctor.
 - 2. Topsoil compaction shall be tested at each lift using a cone penetrometer calibrated to the mock up soil and its moisture level. The same penetrometer and moisture meter used for the testing of the mock up shall be used to test installed soil throughout the work.
 - 3. Maintain at the site a cone penetrometer with pressure dial and a soil moisture meter on the site at all times to measure the compaction rates relative to the mock up soil compaction. The Commissioner may utilize this equipment to verify compaction rates.
- B. Maintain moisture conditions within the Topsoil during installation to allow for satisfactory compaction. Suspend installation operations if the Topsoil becomes wet. Apply water if the soil is overly dry. Do not place Topsoil on wet or frozen sub grade.
- C. Provide adequate equipment to achieve consistent and uniform compaction of the Topsoil. Use the smallest equipment that can reasonably perform the task of spreading and compaction.

3.13 COMPACTION REDUCTION

- A. Any soil that becomes compacted to a density greater than the specified density or the density in the approved mock up shall be dug up and reinstalled.
- B. Surface roto tilling shall not be considered adequate to reduce over compaction at levels 6" or greater below finished grade. This requirement includes compaction caused by other subcontractors after the Topsoil is installed and approved.

3.14 INSTALLATION OF CHEMICAL ADDITIVES

- A. Following the installation of each soil type, apply chemical additives as recommended by the soil test, and appropriate to the soil type and specific plants to be installed.
- B. Types, application rates and methods of application shall be approved by the Commissioner prior to any applications. Chemicals are to be installed under Composted Organic Matter and tilled into the soil. In turf areas Planting Soil Mix #2B, till fertilizers into the soil prior to fine grading.
- C. Approximately one month after any application of chemical additives, re-sample the soil and apply additional applications if the soil tests indicate further chemical applications would be beneficial. Make sufficient test to analyze each soil type and each plant association within that soil type.

3.15 FINE GRADING

- A. The Commissioner shall view all rough grading prior to the installation of Composted Organic Matter, fine grading, planting, and mulching. The Contractor shall set grade stakes for all landscape features for checking the finish grades.
- B. Grade the finish surface of all planted areas to meet the grades shown on the drawings after the twelve-month settling period.
- C. Utilize equipment with rakes or buckets with teeth for fine grading to keep surface rough. Do not use the bottom of a loader bucket such that the finished grade is smooth and slightly compressed. Equipment operating over the installed soil shall be the smallest equipment possible to reasonably complete the work. Obtain approval for any motorized equipment larger than a 30 HP garden tractor.
- D. Adjust the finish grades to meet field conditions as directed.
- E. Provide for positive drainage from all areas toward the existing inlets, drainage structures and or the edges of planting beds. Adjust grades as directed to reflect actual constructed field conditions of paving, wall and inlet elevations. Notify the Commissioner in the event that conditions make it impossible to achieve positive drainage.
- F. Provide smooth transitions between slopes of different gradients and direction. Modify the grade so that the finish grade is flush with all paving surfaces or as directed by the drawings.
- G. Fill all dips and remove any bumps in the over all plane of the slope.
 - 1. The tolerance for dips and bumps in shrub and ground cover planting areas shall be a 1" deviation from the plane in 10'.

H. Restore all grades after the installation of plants.

3.16 PLACEMENT OF MULCH

A. Place mulch as indicated on the Drawings.

3.17 ACCEPTANCE OF STANDARDS

A. The Commissioner will inspect the work upon the request of the Contractor. Request for inspection shall be received by the Construction Manager and Commissioner at least 10 days before the anticipated date of inspection.

3.18 CLEAN UP

- A. During installation, keep pavements clean and work area in an orderly condition.
- B. Keep the site free of garbage at all times. Immediately dispose of wrappings or waste materials associated with products necessary for the completion of the work.
- C. All garbage shall be kept in a central collection container. Do not bury garbage in backfill.
- D. Once installation is complete, remove any excess soil from pavements or other site structures.

3.19 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil. Trash, and debris, and legally dispose of it off of the City of New York's property.

3.20 PROTECTION

- A. The Contractor shall protect installed Topsoil from damage due to other soil installation, planting operations, operations by other Contractors or trespassers including contamination and over compaction of Planting Soil. Maintain protection during installation until acceptance. Utilize fencing and matting as required or directed. Treat, repair or replace damaged Topsoil immediately.
- B. Loosen compacted Topsoil and replace Topsoil that has become contaminated as determined by the Commissioner. Planting Topsoil shall be loosened or replaced at no expense to the City of New York.

3.21 REPAIR OF SETTLED TOPSOIL

- A. At the end twelve months after the date of substantial completion of the Topsoil installation work, inspect the site and restore any areas where the grades have settled beyond the elevations shown on the drawings by an amount greater than 5% of the soil depth.
 - 1. In shrub planting areas where the settlement is 3" or less, remove the mulch, top dress the area with the specified Topsoil and re-mulch.
 - 2. In all ground cover areas and shrub planting areas where the settlement is greater than 3" remove mulch and plants, add the specified Topsoil, re-plant and re-mulch.

END OF SECTION

SECTION 329300

EXTERIOR PLANTINGS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:

1. Furnishing and installing new trees, shrubs, and all other plant materials.
2. Furnishing and installing new seeded turf grass areas.
3. Site preparation, furnishing and installing seeded meadow areas.
4. Staking and guying of trees.
5. Furnishing and installing mulch.
6. Protection and Guarantee Service of all plant materials until Substantial Completion.
7. Guarantee period for all new plant materials for a period of 24 months.
8. Guarantee Service of plantings for 24 months after substantial completion.

B. Definitions:

1. Finish Grade: Elevation of finish surface of planting soil.
2. Planting Soil: Native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with soil amendments.
3. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill immediately beneath planting soil.
4. PLS (pure live seed) is the measure of germination and purity to rate the seed quality. The percentage is obtained by multiplying the germination by the percentage of purity and dividing by 100. This percentage is used to estimate the amount of seed in a given lot that will germinate.

1.3 RELATED SECTIONS

- A. Project Specific Sustainability Requirements - Section 013010
B. Geosynthetic Soil Stabilization and Layer Separation - Section 313219

- C. Earthwork – Section 312000
- D. Planting Soil Mixes – Section 329113
- E. Soil Mixes for Wetland Areas – Section 327500
- F. Plantings for Wetland Areas – Section 327200
- G. Vegetated Roofing System – Section 073360

1.4 REFERENCES

- A. AAN – American Association of Nurserymen
- B. ASNS – “American Standard for Nursery Stock,” ANSI Z60.1 latest edition, published by the American Associate of Nurserymen, (AAN)
- C. ISA – International Society of Arboriculture, Tree and Shrubs Transplanting Manual, Latest Edition
- D. NNA – National Arborist Association, Standards
- E. SPN – “Standardized Plant Names,” latest edition, by the American Joint Committee on Horticultural Nomenclature
- F. Where the language in any of the documents referred to herein is in the form of a recommendation or suggestion, such recommendation or suggestion shall be deemed to be mandatory under this Contract.

1.5 SUBMITTALS

- A. General: Submit each item in this Article according to DDC General Conditions.
- B. Qualifications: Installer, Contract Grow Nursery
- C. Procurement Documentation: submit written documentation for plant procurement a maximum of 60 days after the Notice to Proceed.
 - 1. Identify specifically by name and quantity the plant material that is available in the required quantities, and the plant material that will require to be contract grown.
 - 2. Plants grown by contract shall require a one year period prior to the estimated planting date. Submit the dates expected for planting and the proposed date for the beginning of the procurement process when the deposit will be given to the nursery. The schedule shall account for the time required for the plants to grow to the required sizes, in addition to the time the nursery needs to acquire planter liners or other tools required to ensure plant availability.
 - 3. Provide written documentation from nursery for the time that they estimate is required for the plants to grow enough to meet our required plant sizes. The nursery shall also provide any other time requirements (to acquire liners, etc.) in the plant procurement process.

4. The Commissioner to approve the contract-grow nursery and expected timetable for plant procurement and planting.

D. Product Data

1. Literature & certificates or photographs for each type of product indicated.
2. Label data substantiation that planting materials comply with specified requirements.
3. Submit certified analysis for each treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged material.
4. Plant Photographs: Prior to tree tagging, provide nursery sources and photographs of actual plants to be used on the project, for review and approval by the Commissioner. Photographs shall be legible and clearly depict the plant specimen.
 - a. Each image shall include a height reference, such as a measuring rod, clearly marked in six inch increments, indicating height and width of the plant, plant quality and growth habit.
 - b. Each Image shall be: either 8" x 10" high quality color prints or color digital photos at minimum 300 dpi.
 - c. Trees: if 12 trees or less are to be planted, two photographs of each tree, prior to tagging at the nursery source. If 13 or more trees to be planted, at least four representative photographs typical of each species.
 - d. The approval of the submitted photograph by the Commissioner does not preclude the Commissioner's right to reject material while at the nursery or on site.

- E. Tree staking request, in writing, not less than 30 days before trees are to be installed.

- F. Submittal Schedule: indicating anticipated dates and locations for each type of planting. This schedule shall be submitted within 15 calendar days after Contract Notice to Proceed. Include in this schedule anticipated dates -from commencement and sequencing of planting operations, including but not limited to contract grow period, selections and tagging, layouts and layout approval, placement of trees, shrubs and commencement of Guarantee Service period.

Sample Submission Schedule

Planting Area	Product/Plant	Contract grown	Procured	Man'f or Nursery	Photograph or Sample	Tagged or Approved	Site Delivery	Installation date
Name	Name		Date	Name	Yes/No	Date	Date	Date
NE Bed	Acer rubrum	yes	1/5/2012	Halka	Jpg file	3/1/12	3/15/12	3/15/12
NE Bed	Mulch	N/A	2/1/12	LI Compost	Sample 2/15/12	2/28/12	3/16/12	3/17/12

G. Samples: for approval by Commissioner.

1. Mulch: Submittal of 3 pound bag of material, provider product data.

H. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture stating the botanical and common name and percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.

1. Certification of each seed mixture for Meadow Mixes, and Turf Mixes identifying source, including name and telephone number of supplier.

I. Guarantee Service: Prior to Substantial Completion, Contractor to provide written schedule of proposed guarantee service operations. Schedule shall be in the form of a list of each guarantee service operation including dates indicating when each guarantee service task will be performed and the frequency of occurrence.

1.6 QUALITY ASSURANCE

A. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

B. Submit a Statement of Qualifications for the Landscape Contractor. Qualifications shall show experience in the installation of landscape work of a similar type, design, scale, and with a record of successful landscape establishment to this project within the last three years.

C. Installer's Field Supervision: Require installer to maintain an experienced full-time supervisor on the Project Site during times landscaping is in progress.

D. Contract Grow Nursery: Nursery will have a record of providing large quantities of plants at the sizes required ready within an appropriate planting season.

- E. Nursery Stock Standards: Provide quality, size, genus, species, and variety of trees indicated, complying with applicable requirements of ANSI Z60.1 “American Standard for Nursery Stock”.
 - 1. Selection of plant material will be made by Commissioner (at Commissioner’s discretion), who will tag plants at their place of growth before they are prepared for transplanting.
- F. Measurements: Measure trees according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches above ground for trees up to 4 –inch caliper size, and 12 inches above ground for larger sizes. Measure main body of tree for height and spread; do not measure branches or roots tip to tip.
- G. Applicable Laws: Meet requirements of applicable laws codes, and regulations required by authorities having jurisdiction over the Work.
- H. The Contractor is liable for any property damages cause by planting operations. All areas and construction shall be returned to the City of New York, at the satisfaction of the City of New York, at no additional cost to the City of New York.
- I. Plant Selection and Inspection
 - 1. All plant material shall be subject to inspection and approval by the Commissioner at the place of growth and again upon delivery and prior to planting for conformity to specification requirements as to quality, size and variety. Such approval shall not impair the right of rejection due to damage suffered in handling, transportation and/or planting during delivery and installation.
 - 2. Contract grow material will be procured with enough time previous to the installation date that the plant material is the size required.
 - 3. Written requests for inspection of plant material, at the place of growth, shall be submitted to the Commissioner, not less than six weeks prior to scheduled dig date.
 - 4. The Contractor shall coordinate all inspection, selection and tagging arrangements with the nursery, ensuring the Commissioner is allowed maximum time for viewing, inspection, selection and tagging. A minimum of six weeks, prior to the time that the plant materials are to be dug, shall be allowed for inspection, selection and tagging.
 - 5. The Commissioner may refuse inspection if in his/her judgment a sufficient quantity of plants is not available for inspection.
 - 6. The Contractor shall, at his own expense, supply the Commissioner with such labor and assistance as may be necessary in the handling of material for proper inspection.

7. The Commissioner may choose to tag each plant, or a representative sample, with their own tags. The Contractor is responsible for paying any upcharge for the Commissioner to attach his/her tag to the selected plant material.
 - a. Field tags to be attached to the north side of the tree in the nursery, by the Commissioner.

8. Tagging of trees shall be as follows: for every - 10 trees planted, 1 additional tree shall be tagged assuring appropriate replacement for (a) trees damaged prior to transplanting, and (b) trees requiring replacement under terms of the guarantee. These additional trees shall be root pruned. The Contractor shall be responsible for coordinating the terms with the nursery.
 - a. All trees are to be dug prior to leafing out in the spring or when plants have gone dormant in the fall. The following Fall hazard species are to be spring dug only:

<ul style="list-style-type: none"> Alnus varieties Betula varieties Carpinus varieties Celtis varieties Cercidiphyllum varieites Cornus varieties Crataegus varieties Fagus varieties Halesia varieties Ilex opaca varieties Koelreuteria paniculata Larix varieties Liquidambar varieties Liriodendron varieties Malus-in leaf 	<ul style="list-style-type: none"> Nyssa sylvatica Ostrya virginiana Populus varieties Prunus – all stone fruit Pyrus varieties Quercus – all oaks except Quercus palustris Salix – weeping varieties Syringa reticulata Taxodium distichum Tilia tomentosa varieties Ulmus species Viburnum lentago Zelkova species
--	---

9. Notify the Commissioner in writing at least five (5) working days in advance of delivery of plants to the site.
 - a. The Commissioner reserves the right to inspect and or reject plant materials upon delivery to the site.
 - b. Rejected plants shall be removed immediately from the site. All replacement plants shall be subject to the same requirements as the original material.
 - c. Any plant that has the following characteristics shall be cause for rejection:
 - 1). TREES:
 - (a). Has a canopy with 25% or more dead limbs.

- (b). Has dead limbs, that when removed, will result in the loss of 25% or more of the structure and form of the canopy of the tree.
- (c). If the species that has a characteristic dominant central leader, and if the lead is dead, when removed the tree will not have a form consistent with the species.
- (d). Any tree that has open wounds (not completely healed over) that penetrates the bark to the wood on the trunks or major limbs, where the removal would result in the loss of 30% or more of the structure and form of the tree.
- (e). Trees will be rejected if they show signs of damage, crooked or multiple leaders, tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark") crossing trunks, cut-off limbs more than 3/4" in diameter, or with stem girdling roots, unless otherwise noted.
- (f). Plants with cracked or broken rootballs will not be accepted.
- (g). Only natural burlap fabric shall be acceptable for balling. Plastic and other non-biodegradable fabrics will not be accepted.

2). SHRUBS

- (a). Have 25% or more dead branches.
- (b). Any dead limbs or portions, that when removed, will result in the loss of 25% or more of the structure and form of the shrub.
- (c). If any dead or diseased branches, when removed the shrub will not have a form consistent with the species.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.
- C. Packaged Materials: Deliver packaged materials in containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery and storage at the site.
 - 1. All packaged products shall be stored, handled and applied in strict accordance with manufacturer's instructions.

D. Stockpiling: Soil, mulch, or amendment materials, stored on site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All stockpiled materials shall be placed on tarpaulin, heavy polyethylene sheeting or other suitable barrier to protect paving surfaces from staining or soiling by stockpiled materials. No materials shall be stockpiled under the dripline of any existing or new tree. Coordinate with soil specifications and other Work.

E. Trees and Shrubs

1. Deliver freshly dug trees and shrubs. All trees shall be balled and burlapped stock (B&B), with a compact natural ball of earth, firmly wrapped and tied in burlap fabric. Rootball and or containers shall correspond to AAN standards for the appropriate tree caliper or shrub height/spread. All shrubs shall be well branched to the ground. Trees shall have well branched top and fibrous root systems. Do not prune trees before installation, except as approved by Commissioner. Protect bark, branches, and root systems from sun-scald, drying, sweating, whipping, and other handling and tying damage. Do not bend trees in such a manner as to destroy natural shape. Provide protective covering during delivery.
 - a. If deciduous trees are moved and delivered when in full-leaf, spray with an approved anti-desiccant per manufacturer's recommendations at the nursery no sooner than 48 hours prior to digging and again two (2) weeks after transplanting. Spraying should take place in the early morning hours with foliage. It is the responsibility of the Contractor to decide if anti-desiccant shall be applied to the tree before delivery.
 - b. Do not drop trees or shrubs during delivery. Evidence of a damaged rootball or container shall be cause for rejection.
2. Deliver trees and shrubs after preparations for planting have been completed and install immediately. If planting is delayed for more than 6 hours after delivery, set planting materials in shade, protect from weather and damage, and keep roots moist. Do not deliver more trees than can be planted in one day. It is not permissible to retain unplanted trees on-site overnight.
3. Water as often as necessary to maintain root systems in a moist condition. Do not allow trees or shrubs to wilt or show signs of stress from lack of water. Contractor shall use a moisture meter to verify adequate watering.

1.8 PRODUCT CONDITIONS

- A. Field Measurements: Verify grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.
- B. Immediately notify the Commissioner & the City of New York, in writing, if field conditions vary from the plans or drawings.
- C. Utilities: Determine location of utilities including lighting, irrigation and drainage. Perform work in a manner which will avoid damage. Hand excavate, as required. Maintain grade stakes by others until removal is mutually agreed upon by the Construction Manager and the Contractor.

1. Interruption of Existing Services or Utilities: Do not interrupt services or utilities to facilities occupied by the City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary services or utilities according to requirements indicated:
 - a. Notify the Construction Manager no fewer than 5 days in advance of proposed interruption of each service or utility.
 - b. Do not proceed with interruption of services or utilities without the Construction Manager's written permission.
- D. Waterproofing and Sub Structures: Perform work in a manner, which will avoid damage to planter waterproofing membrane, adjacent waterproof membrane, protection board or other structural sealing materials.
- E. Mechanical Lifting: The Contractor shall be responsible for lifting plant material, planting soils and other required material to planter areas for planting through exterior means or lifts as approved by the City of New York and the Commissioner.
- F. Safety: The Construction Manager and Contractor shall be responsible for pedestrian and vehicular safety and control within the work site. The Contractor shall provide the necessary warning devices and ground personnel needed to provide safety, warning and protection to persons and vehicular traffic within the area.

1.9 SEQUENCING AND SCHEDULING

- A. Preparation: The meadow planting has extensive site preparation to eliminate the weed population. See paragraph 3.7 herein for more information.
- B. Planting Schedule and Environmental Requirements: Plant only within the following dates, weather permitting. Do not plant when the ground is frozen, excessively wet, or the soil is otherwise in an unsatisfactory condition for planting:
 1. The spring planting season for trees and shrubs shall be:
Deciduous materials from March 1st through May 1st.
Evergreen materials from April 1st to May 15th.
Or as approved by Commissioner
 2. The fall planting season for trees and shrubs shall be:
Deciduous materials from October 15th through December 15th.
Evergreen materials from September 1st through October 15th.
Or as approved by Commissioner
 3. Turf seeding shall be carried out only during the following dates:
Spring: April 1-June 1
Fall: Sept 1-Oct 15
 4. Meadow seeding shall be carried out only during the following dates:
Preferred Season For Meadow Seeding: Spring April 1-June 1
Alternative Season For Meadow Seeding: Fall Sept 1-Oct 15

Seeding shall be in moderately dry to moist soil, at such times when wind does not exceed five miles per hour.

In the event that seeding cannot proceed during the specified periods, areas shall be temporarily seeded with Annual Rye Grass to prevent erosion.

5. There will be no exceptions to the planting seasons, except for extreme weather conditions or as directed by the Commissioner.
 6. Prior to leafing out in spring, fall hazard species shall be dug during the spring season only. (Refer to Section – Quality Assurance)
- C. Notify the Commissioner at least seven (7) days in advance of all planting installation activities.

1.10 SUBSTANTIAL COMPLETION

- A. Contractor shall submit a written request to the Commissioner for a formal inspection of the planting work for Substantial Completion.
- B. At the time of inspection all plant material must be alive, healthy, installed as specified, and show positive signs of strong vigorous growth to be accepted.
- C. All plant material shall be free of disease and pests. All plant material shall be free of broken or damaged limbs & branches.
- D. If plants are dead, dying, unhealthy, not located as per the Contract Documents or approved location of the Commissioner, or if workmanship is unacceptable, written notice will be given to the Contractor in the form of a punch list which itemizes all remedial work required to obtain Substantial Completion.
- E. This work may include plant replacement or guarantee service and must be carried out prior to issuance of the Certificate of Substantial Completion.
- F. Coordinate Substantial Completion with irrigation work.

1.11 GUARANTEE

- A. Warrant all planting materials, for the guarantee period indicated in Part 1, Section 1.2 herein, against defects including death and unsatisfactory growth, except for defects resulting from incidents that are beyond Contractor's control.
 1. At the end of the guarantee period, plant materials shall be healthy, vigorous, and free of pests and disease. Plant materials shall be free of dead and dying branches and branch tips and shall bear foliage of normal density, size, and color for the species.
 2. During the guarantee period, the contractor will maintain all plant materials as specified herein, and as noted in the approved guarantee service schedule, and will replace, at no additional cost to the City of New York, any and all plant material which has died or which is, in the opinion of the Commissioner, in unhealthy or unsightly condition. The meadow will be replaced, including re-doing the initial site preparation, if it has been overtaken with weeds.

3. There will be no limit to the number of of times replacements are made of individual plants.
4. Guarantee all replaced material for a period of 24 months after the date of replacement.
5. Approximately one month prior to the expiration of the guarantee period, the Contractor shall arrange a site inspection by the Commissioner.
 - a. At this time the Contractor will prepare a list of all remedial work required, including plant replacement or guarantee service, to be approved by Commissioner.
 - b. This work shall be carried out before the end of the guarantee period, unless weather conditions cause delays, in which case such work shall be carried out as soon as is practical.
6. If replacement plantings are required, there will be a final inspection at the end of the guarantee period for the plant replacements, to be coordinated with Commissioner.
7. Prior to end of Guarantee period, the Contractor shall include the following remedial actions as a minimum:
 - a. Remove all tree staking and support.
 - b. Rake out any plant saucers, unless directed by Commissioner.
 - c. All trees that are leaning shall be straightened.
 - d. Remove and replace dead planting materials immediately unless required to plant in the succeeding planting season due to weather.
 - e. Replace planting materials that are more than 25% dead or in an unhealthy condition at the end of the guarantee period.
 - f. Replace trees having lost their central leader or exhibit crown dieback at the end of the guarantee period.
 - g. Replace plants with previously tagged specimens.
 - h. Replacement plant materials shall closely match adjacent specimens of the same species and subject to the all requirements in this Specification. All areas damaged or soiled by replacement planting operations are to be fully restored to their original condition at no additional cost to the City of New York.
 - i. There shall be no limit of replacement of each plant material, in the case of failure during the guarantee period.
 - j. If settlement has occurred, reset the grades in the planting areas to the final grades shown on the grading plans of the Contract Documents
8. At the end of the guarantee period the Contactor shall remove all tree wraps, ties, stakes, and guying wires from the trees and the site. Tree wraps should not be on the tree trunks during the active growing season. The guarantee shall expire only when all requirements of the section have been met.
9. All of the materials and labor required for guarantee service and replacements during the guarantee period shall be included in the Contractor's bid price.

1.12 PLANT SERVICE

- A. Guarantee service of all plant material shall begin immediately after plant installation, and shall continue for 24 months after the date of Substantial Completion.
- B. Guarantee service shall include, but not limited to the following:
 - 1. Maintain all plant material by pruning, cultivating, mulching, regular watering, removal of dead material, furnishing and applying such sprays as are necessary to keep plantings free of insects and disease, weeding, fertilizing, tightening and repairing stakes and guy supports, and resetting to proper grades or vertical position, as required to establish healthy, viable plantings. Restore or replace damaged tree wrappings. Planting areas shall be kept free of weeds, grass, and other undesirable vegetative growth.
 - 2. Coordinate with irrigation system installer for all adjustments to irrigation as required.
 - 3. Defective work shall be corrected as soon as possible after it becomes apparent and the weather season permits. The Commissioner shall be the sole judge of the condition of the plants.

1.13 FINAL ACCEPTANCE

- A. Following the completion of all remedial work and replacement plantings, the Contractor shall request the Commissioner in writing for a formal inspection of the landscape work for Final Acceptance. The request shall be received 10 calendar days before the anticipated date for final inspection.
 - 1. If replacement plantings are required, Final Acceptance will be provisional upon a final inspection at the end of the Guarantee period for the plant replacements.

PART 2 PRODUCTS

2.1 PLANT MATERIALS

- A. General: Furnish nursery-grown plant materials, including, but not limited to, trees, shrubs, vines, herbaceous plants, ornamental grasses, bulbs, corms, tubers & rhizomes, and groundcover plants, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully-branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasion, and disfigurement.
 - 1. Grade: Provide plant material of sizes and grades conforming to ANSI Z60.1 for type of plants required. Plant materials of a larger size may be used if acceptable to the Commissioner, with proportionate increase in size of root-ball or container.
 - a. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise noted.

2. Species: All plant materials shall be true to species and cultivar specified. Certification of cultivars by supplying nursery must be supplied in writing to Commissioner.
3. Labels: Label at least 1 plant of each species, variety and size with a securely attached, waterproof tag bearing legible designation of botanical and common name. Field Tags by the Commissioner shall not be removed until so directed by the Commissioner.
4. Branching Height: For Single-stem trees branching height shall be 7'-0" and not more than 1/2 tree height. Limbing up shall not deform natural form of the tree.
5. Multiple-Stem Trees: Multiple-stem trees with multiple basal or low branched stems, and well-balanced crown, of height and caliper indicated, conforming to ANSI Z60.1 for type of trees required. Unless specified otherwise multiple-stem trees shall have 3 to 5 stems minimum.
6. Depth of Planting: The depth of planting must be checked for all trees being tagged at the nursery. If the root/trunk flare is not visible, the root/trunk (the intersection of the trunk and the buttress roots) must be located. Any tree with significant adventitious root growth or evidence of girdling roots shall be subject to rejection by the Commissioner on a case by case basis. Any soil above the root/trunk flare shall be removed prior to digging. After the removal of any excess soil above the root/trunk flare, the tree shall be hand dug and drum laced.
7. Container Grown Material: Container grown vines and groundcover plants shall be nursery grown, conforming to ANSI Z60.1. Container stock shall have well developed fibrous roots, so that the root mass will retain its shape and hold together when removed from the container. Container plants shall not be root bound.
8. Sources: Unless otherwise specified all plant materials shall be from a well-established Northeast region grower or nursery from the following sources:

Atlantic Nurseries
Dix Hills, NY
(631) 586-6242

Halka Nursery
Millstone Township, NJ
(732) 462-8450

Bissett Nurseries
Holtsville, NY
(631) 289-3500

Hardscrabble Nursery
North Salem, NY
(914) 669-5633

Or approved equal

B. Plant Materials: See Planting Schedule on Contract Drawings, unless otherwise specified.

1. Plants larger than specified may be used only if approved by the Commissioner. Use of such plants shall not increase the contract price. If larger plants are approved, the root ball shall be increased in proportion to the size of the plant. Contractor shall verify that size of root ball will fit in prepared planting pits.

2.2 SEED MIXES

A. SEED: TURF AREAS

1. Turf Type 1 – Low Rough Turf –clipped to 2” height
Seed purity to be 98% with 85% germination, and maximum 0.25% weed seed (No noxious weeds)
30% Tall Fescue Grande 4
30% Tall Fescue SR8650
30% Tall Fescue Trophy XRE
10% Ryegrass – Champion GQ Seed Blend
Seeding rate: 250 pounds per acre

2. Turf Type 2 – Rough Turf – mowed seasonally, 4” height max
Seed purity to be 98% with 85% germination, and maximum 0.25% weed seed (No noxious weeds)
60% Reliant Hard Fescue
20% Little Blue Stem
10% Jamestown II Chewings Fescue
10% Red Fescue
Seeding Rate 200 pounds per acre

B. SEED: MEADOW AREAS

1. TALL MEADOW SUN SEED MIX
Seed to be fresh recleaned seed of the latest crop.
Seed purity to be 98% with 95% germination, and no weed seed.
Seed weight to be based upon Pure Live Seed (100% pure germinable seed)
15% Agrostis perennas Autumn Bentgrass’ Albany Pine Bush
4% Asclepias tuberosa Butterfly Milkweed
10% Chamaecrista fasciculata Partridge Pea
10% Elymus virginicus Virginia Wild Rye
1% Eupatorium purpureum Purple Node Joe-Pye Weed
2% Monarda punctata Spotted Bee Balm
10% Panicum clandestinum Deer Tongue ‘Tioga’
15% Panicum virgatum Shelter Switch Grass ‘Shawnee’
8% Rudbeckia hirta Black-Eyed Susan
15% Schizachyrium scoparium Little Bluestem ‘Camper’
5% Sorghastrum nutans Indian Grass
5% Tridens flavus Purple Top
Seeding rate: 15 lbs per acre

2. TALL MEADOW SHADE SEED MIX

Seed to be fresh recleaned seed of the latest crop.

Seed purity to be 98% with 95% germination, and no weed seed.

Seed weight to be based upon Pure Live Seed (100% pure germinable seed)

2%	<i>Agrostis perennans</i> 'apb'	Autumn Bentgrass' Albany Pine Bush
2%	<i>Anemone virginiana</i>	Thimbleweed
3%	<i>Aster macrophyllus</i>	Big Leaf Aster
7%	<i>Chaemocrista fasciculata</i>	Partridge Pea
25%	<i>Elymus hystrix</i>	Bottlebrush Grass
25%	<i>Elymus virginicus</i>	Virginia Wild Rye
3%	<i>Monarda fistulosa</i>	Wild Bergamot
20%	<i>Panicum clandestinum</i> 'tioga'	Deer Tongue 'Tioga'
6%	<i>Penstemon digitalis</i>	Tall White Beard Tongue
3%	<i>Solidago bicolor</i>	Stiff White Goldenrod
1%	<i>Vernonia noveboracensis</i>	New York ironweed
3%	<i>Zizia aurea</i>	Golden Alexanders

Seeding rate: 15 lbs per acre

3. WILDFLOWER OVERSEED MIX

Seed to be fresh recleaned seed of the latest crop.

Seed purity to be 98% with 95% germination, and no weed seed.

Seed weight to be based upon Pure Live Seed (100% pure germinable seed)

50%	<i>Coreopsis lanceolata</i>	Lanceleaf Coreopsis
50%	<i>Leucanthemum vulgare</i>	Oxeye Daisy

4. LOW SUN/SHADE MEADOW

Seed to be fresh recleaned seed of the latest crop.

Seed purity to be 98% with 95% germination, and no weed seed.

Seed weight to be based upon Pure Live Seed (100% pure germinable seed)

1%	<i>Aster novae-angliae</i> , PA Ecotype	New England Aster
15%	<i>Bouteloua curtipendula</i>	Side Oats
1%	<i>Coreopsis tripteris</i> , PA Ecotype	Tall Coreopsis

 721 Main Street
 Farmingdale, NY 11735
 Tel. 516 903 4642
 Contact: John Seib, Jr

Or

4. Approved Equal

D. SEED: TEMPORARY EROSION CONTROL

1. Annual Rye Grass. In the event the use of Annual Rye Grass is required to meet the seasonal planting limitation of these specifications or as described in the drawings, the Contractor shall supply clean fresh Annual Rye Grass seed from an approved supplier. Seed shall be warranted to germinate in 14 days or less and to be 98% pure. Seeding rate shall be 50 lbs per acre, or as recommended by supplier.

2.3 HYDROSEEDING / HYDROMULCHING

- A. Seed: Grass seed mix for hydroseeding or hydromulching shall be fresh recleaned seed of the latest crop.
- B. Hydromulch; shall be a wood fiber product colored with a non-toxic water-soluble green dye. It shall contain no germination or growth inhibiting factors. Hydromulch shall be of such consistency as to allow the fiber to be evenly dispersed and suspended when agitated in water. Hydromulch shall be equal to that which is manufactured by Conwed Fibers, Buffalo Grove, IL and Weyerhaeuser Co., Tacoma, WA, or approved equal. The rate of application shall be one thousand five hundred and thirty pounds (1530 lbs.) per acre, including the seed at the specified rate per acre.

1 Wood Fiber Mulch Binder: Shall be semiporous film material capable of binding wood fiber mulch and see to the soil. Wood fiber mulch binder shall be equal to that which is manufactured by Grass Grower, Plainfield, NJ, Trade Name: Terra Jack, or approved equal. The rate of application shall be seventy (70) gallons per acre (for two step application).

- C. Fertilizer: Organic low nitrogen fertilizer (5-10-10). The manufacturer shall be responsible to certify that the fertilizer shall not lower the soil pH
- D. Dye: Use a biodegradable nontoxic coloring agent free from copper, mercury and arsenic.

2.4 MULCH

- A. Provide organic 12 month old aged fine-shredded hardwood mulch, of uniform size and free from deleterious materials or any material detrimental to plant growth, and suitable as top dressing to trees.
- B. Shredded Bark Mulch shall be a natural forest product composed of shredded bark or wood not exceeding three inches (3") in length and one inch (1") in width. Mulch shall be derived from tree material, not from wood waste or by-products like sawdust, shredded palettes, or other debris. Mulch shall be natural in color and not dyed. It shall be of a uniform grade with no additives or any other treatment. Mulch with leaves, twigs, and/or debris shall not be acceptable. The pH factor should range from 5.8 to 6.20

- C. Shredded bark mulch shall be applied to the surface of the beds and tree pit areas, as shown on the plans or Standard Details and as directed by the Commissioner. Mulch shall be applied to a uniform depth 2", and as indicated in drawings and shall be so distributed to create a smooth level cover over the exposed soil. Plants shall not be covered.

2.5 DRAINAGE MAT

- A. Drainage mat is three-dimensional material which will direct water runoff beneath a substrate toward a drainage structure.
- B. A composite drainage system of a three-dimensional "dimple" type polyethylene core and a woven filter fabric. The filter fabric is bonded to the top surface of the core, preventing intrusion of the fabric into the flow channels during backfilling. (Horizontal and vertical applications) Drainage mat & filter fabric shall be inert to biological degradation and resist naturally-encountered chemicals, alkalis, and acids.

- C. Products: Install according to manufacture's recommendation:

1. Product: Hydrodrain 700 (can be used horizontally & vertically)
Manufacturer: American Hydrotech, Inc.
303 E. Ohio Street
Chicago, IL
Tel: (800) 877-6125
Website: www.hydrotechusa.com
2. Product: Drain Away 50
Manufacturer: Drainage Products, Inc.
383 South Main Street
Windsor Locks, CT 06096
Tel: (860) 668-5108
Website: www.drainaway.com

Or approved equal

2.6 MYCHORRIZA FUNGI INNOCULANT

- A. Mychorrizal fungi inoculant is a supplemental
- B. Mychorrizal fungi inoculant shall be added to the top six to eight inches (6-8") of backfill soil in each planting pit and thoroughly mixed to distribute the inoculant.
- C. Shall be applied by means of a three ounce (3 oz.) premeasured dry formulation packet.
- D. Packets shall contain, as a minimum:
 1. One thousand (1,000) live spores of:
 - a. Vesicular-Arbuscular fungi, including:
Entrophosphora columbiana

Glomus clarum
 Glomus etunicatum
 Glomus sp.

2. Seventeen million five hundred thousand (17,500,000) live spore of:
 - a. Ectomycorrhizal fungi (*Pisolithus tinctorius*)
3. Biostimulant ingredients including *Yucca schidigera* extract.
4. Soluble sea kelp extract derived from *Ascophylum nodosum*.
5. Humic acids.
6. Acrylamide copolymer gel as a water absorbent medium.

E. The material shall be applied according to the following chart:

Container Size	Ounces per plant
1 gal	1
2 gal	2
3 gal	3
5 gal	3
7 gal	3
10 gal	3
15 gal	3

Rootball Diameter	Ounces per plant
20" B&B	6
24" B&B	9
30" B&B	9
36" B&B	12
40" B&B	12

F. Products: Install as according to manufacturer's recommendation or as directed by the Commissioner.

1. Product: Mycor Tree Saver Transplant
 Manufacturer: Plant Health Care, Inc.
 Pittsburgh, PA
 Website: www.planthealthcare.com
2. Product: Rhizanova Tree Transplant

Manufacturer: Becker Underwood, Inc.
Ames, IA
Website: www.beckerunderwood.com/en/home

Or approved equal.

2.7 PESTICIDES / HERBICIDES

A. General:

1. Pesticide registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.
2. Approval required by the Commissioner if the pesticide/herbicide is not on the following approved list. Contractor shall prioritize using an alternative treatment prior to conventional pesticides / herbicides.
 - a. Pre-emergent Herbicides –
Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer. Apply in accordance with manufacturer's written recommendations. Do not apply to seeded areas.
Acceptable to use:
 - 1). Oxidiazon (pre-emergent)
 - 2). Benefin (pre-emergent)
 - 3). Trifluralin
 - 4). Alternatives: Corn gluten Meal, or products with 2-phenethyl propionate, Clove Oil, Rosemary Oil
 - b. Broadleaf Herbicides
Acceptable to use:
 - 1). Mecoprop, for spot treatments only. Submit specific product information for final approval.
 - 2). Alternatives: Iron Hedta for broadleaf weeds, or Fenoxaprop Ethyl for annual and perennial grass weeds.
 - c. Growth Regulating Herbicides
Acceptable to use:
 - 1). Paclobutrazol
 - d. Non-Selective Herbicides
Acceptable to use:
 - 1). Glyphosate, use Rodeo or equal registered for aquatic use. Submit for the Commissioner approval.

- e. Fungicides
Acceptable to use (spot applications only):
 - 1). Azoxystrobin
 - 2). Propiconazole
 - 3). Alternatives: Trichoderma Harzianum

- f. Insecticides
Acceptable to use:
 - 1). Deltamethrin
Alternatives: Steinernema Carpocapsae, Lambda-Cyhalothrin, Heterorhabditis, Bacteriophora, Cyfluthrin, Bacilllys Popilliae, Spinosad
- g. Or Approved Equal

2.8 TREE BRACING

- A. Upright and Guy Stakes:
 - 1. 3" diameter cedar stakes, rough-hewn, sound, new, free of knots, holes, cross grain, and other defects.

- B. Tree Guying:
 - 1. Product: Arbor Tie
flat woven polypropylene material,
3/4" wide
900 lb break strength
 - Color: Green
 - Manufacturer: DeepRoot Green Infrastructure, LLC
San Francisco, CA 94111
 - Tel: (415) 781-9700
 - Tel: (800) 458-7668
 - Email: info@deeproot.com

 - Or approved equal.

- C. See Sections herein for more information: Paragraph 3.3.H for appropriate reasons to have tree staking and guying, as well as installation instructions and Guarantee paragraph 1.11.7A for removal information.

2.9 PLANTING SOIL

- A. Refer to Specification Section 329113-Soil Mixes

2.10 WATER

- A. The Contractor shall be responsible for supplying all required water to the site at no additional cost to the City of New York. Clean fresh potable water suitable for human consumption, free of chemicals and impurities injurious to vegetation.
 - 1. All work injured or damaged due to the lack of water, or the use of too much water, or contaminated water shall be the Contractor's responsibility to correct.
- B. Source:
 - 1. The Contractor must secure his own source of potable water if not available on site.
 - 2. The Contractor shall use water trucks if necessary to import water to the site for regular watering of all plant materials.
 - 3. The Contractor may obtain a hydrant permit from the Department of Environmental Protection, Bureau of Consumer Service, (718-595-6699). Permits are issued for a 30 day period, and the Contractor is responsible for keeping the permit current. The permits are available from each borough office.
- C. Refer to Section –Irrigation

2.11 ACCESSORIES

A. Moisture Meter

- 1. Product: Precision Digital Soil Moisture Meter with Probe Model DSMM500
Manufacturer: General Tools & Instruments
New York, New York
Tel: (212) 431-6499
- 2. Product: Digital Plus Moisture Meter
Manufacturer: Ferry-Morse Seed Company
Fulton, KY
Tel: 1 (800)-626-3392

Or approved equal

2.12 LANDSCAPE STEEL EDGING

- A. Product: Steel Edging with Stakes
1025-5 : 10' x 1/4" x 5"
Finish: Hot Dipped Galvanized
Manufacturer: Col-Met
Tel: (800)-829-8225
Website: www.colmet.com

- B. Product: Sure-Loc Steel Edging
16' x 1/4" x 5" with 15" long stakes
Finish: Hot Dipped Galvanized
Manufacturer: Sure-Loc Edging Corporation
Tel: (800) 787-3562
Website: www.surelocedging.com
- C. Or Approved Equal

PART 3 EXECUTION

3.1 EXAMINATION

- A. Examine the areas and conditions where miscellaneous specialties are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the work.
- B. Examine areas to receive plantings for compliance with requirements and for conditions affecting performance of work in this Section.
1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine tar, roofing compound, or acid has been deposited in soil within a planting area.
 2. Immediately notify the City of New York and the Commissioner in writing, of potential unsafe or hazardous soils.
 3. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
 4. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
 5. Uniformly moisten excessively dry soil that is not workable and which is too dusty.
 6. Verify planting soils are properly compacted. Remove and re-compact any soils which do not meet specification, until compaction rates are as specified.
- C. Utilities and Structures.
1. The Contractor is responsible for determining the location of all utilities, by contacting the appropriate utility company prior to any planting activities.
 2. Verify that the locations of lighting, drainage and irrigation utilities, structures and other underground items have been clearly marked and are in place, at the proper location, tested (excepted for final irrigation testing) and ready for use.
 - a. Take proper precaution so as not to disturb or damage sub-surface elements.

- b. Coordinate with other trades.
- D. Examine the grading and verify that all elevations conform to the Contract Documents. Notify the City of New York and the Commissioner in writing of any discrepancies in the field.
 - 1. Obtain written certification from the Construction Manager that the final rough grade has been set to plus or minus 0.10 inch prior to commencing tree pit excavation.
 - 2. The Commissioner reserves the right to make grading adjustments in the field.
- E. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by the Commissioner and replace with new planting soil.

3.2 PREPARATION

- A. Site preparation for meadow seeding
 - 1. Preparation for seeding must be carried out during the growing season to ensure that weeds are killed before wildflower seeding.
 - 2. Place planting soil and perform grading of soils. Plant a cover crop of annual rye.
 - 3. Weed removal

Preferred Method 1 – using cultivation

- a. At the beginning of the planting season, when the soil is dry and workable, begin a regiment of lightly roto-tilling the soil to a depth of 3-4" every 2 weeks. Do not roto-till under the drip lines of existing trees, but instead remove all vegetation under the trees by hand every 2 weeks. This preparation must happen every 2 weeks for one full growing season in order to prevent weeds from recovering and regrowing.
- b. If mugwort or phragmites are located on site, eradicate all mugwort and phragmites by a method approved by the Commissioner.

Alternate Method 2 – with herbicides

- a. Apply "Roundup" (glyphosphate herbicide) three times throughout the growing season at 6-8 week intervals when plants are green and actively growing. (mid-spring, mid-summer, early fall). Apply Roundup in accordance with manufacturers' instructions, being very careful to avoid any overspray onto trees, shrubs or other plant materials. Do not apply when weather conditions are unsuitable (wind, impending rain etc.).
- b. If perennial weeds are still present on the site after a full year of herbiciding, do not seed. Leave the soil undisturbed over winter, and apply one more herbicide treatment in late spring of the following year to kill any remaining weeds.

- B. Prior to beginning Work under this Section, examine previously installed work and verify that such work is complete and to the point where planting installation may commence properly.
- C. Protect structures, utilities, waterproofing, drainage structures, planter structures, pavements, and other facilities, and existing trees to remain from damage caused by planting operations.
- D. Do not remove, sever or impact root structures of existing trees to remain in the preparation of sub-grade tree pit conditions. Conflicts with existing tree roots shall be brought to the attention of the Commissioner who may alter the required configuration to preserve or protect tree roots as they exist.
- E. Do not alter the planting soils and soil horizon transitions between specified soil mixes already in place. If altered through planting operations return planting soil conditions to that indicated on Drawings.
- F. Test drainage structures and verify working condition. Verify acceptable condition for protection boards and other waterproofing components. Immediately notify the City of New York and the Commissioner of any damage or other inoperable condition.
- G. Verify planting soils are properly compacted. Remove and re-compact any soils which do not meet specification, until compaction rates are as specified.
- H. Prior to planting, tree pits shall be dug to correct depth and width of root-ball, prior to installation, as per contract drawings.
- I. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.3 TREE AND SHRUB PLANTING

- A. Layout individual tree and shrub locations and areas for multiple plantings. Trees shall be staked prior to planting vines and groundcover plants in order to establish the planting structure of the site. Stake plant locations, adjust locations as necessary, when requested by the Commissioner. Secure the Commissioner approval prior to the start of planting work.
 - 1. Notify the Commissioner one (1) week prior to the layout of the plants for the Commissioner's approval. The layout shall be organized to maximize the Commissioner's viewing time. Layout all individual trees and shrubs prior to the arranged viewing time. Locate the plants, still in its container or B&B, in the proposed planting location or place a labeled stake at the planting location. Secure the approval of the Commissioner prior to digging and installation. Make adjustments as required by the Commissioner.
- B. Excavate pits, beds, and trenches with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root-ball and to assist in drainage away from the center. Do not further disturb the base.
- C. Scarify area around the perimeter of the undisturbed tree ball pedestal and on the top 12" of undisturbed soil to create a transition layer.

- D. The compacted setting beds under the tree root-ball shall be placed in six-inch lifts and hand tamped at each lift for stability in placement of root-ball and tree. Tree root-ball shall be firmly placed on compacted setting bed and established at correct location, elevation and in plumb upright condition. Partial soil settlement should be taken into consideration. Use temporary guy wires to secure tree in place as required during planting soil placement, to maintain proper setting location. Tree root-ball must be set at finish grade so that the original root/trunk flair is at the proper relationship to finished planting soil grade.
 - 1. Before planting, verify that root flare is visible at the top of the root-ball according to ANSI Z60.1. If the root flare is not visible, remove the soil in a level manner from the root-ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that the root-ball still meets size requirements.
 - 2. Unless otherwise specified or determined by the Commissioner, on site. Trees shall be oriented so their north side, as marked in the nursery, faces north.
- E. All ropes and strings must be cut and removed. Non-biodegradable material must be removed, except for wire baskets. Burlap wrapping must be cut & folded back from the top one-quarter of the rootball. Do not remove burlap from lower sides or under rootball. Do not use planting stock if rootball is cracked or broken before or during planting operation.
 - 1. The top twelve (12) inches of the wire baskets shall be cut vertically and folded down into the soil at the time of planting.
 - 2. All twine and other materials to be entirely removed from the tree trunk.
- F. Backfilling with planting soil may occur only when placement of trees and shrubs have been approved by the Commissioner. Do not make saucer indentations with soil, unless otherwise directed the Commissioner.
- G. Backfill planting soils shall be placed in uniform six to eight inch lifts. Soil must be firmed at each lift interval by hand tamping as required to settle back fill and eliminate voids and air pockets. When pit is approximately 1/3 back-filled, water until soil is thoroughly settled. Repeat watering until no more is absorbed. Water again after placing second 1/3 level and again after placing final layer of backfill.
- H. Staking and Guying:
 - 1. Staking of trees, shall only be permitted in the event that site conditions or tree conditions are such that the tree is anticipated to be unstable. The Contractor shall submit, in writing, for approval of the Commissioner, a request to stabilize any tree. The submission shall include; the type and location of each tree, the reason why stabilization is requested and the stabilization method to be employed.
 - 2. Provide staking per Drawings, or as approved by the Commissioner.
 - 3. Contractor shall remove tree stakes & other supports at the end of the guarantee period.

3.4 MULCH PLACEMENT

- A. Mulch top of rootballs and groundcover beds covering the entire planting area. Depth of mulch shall be as indicated in the Contract Documents, unless otherwise specified. Top of mulch shall be level.
- B. Mulch shall not come in contact with any part of the trunk or root flare.
- C. Do not over mulch. Excess mulch shall be removed from the site.

3.5 INITIAL PRUNING

- A. Contractor shall prune trees as directed by the Commissioner and according to the Documents.
- B. All pruning of limbs and roots must be performed by a qualified ISA-certified arborist as approved by the City of New York and the Commissioner.
- C. Prune, thin and shape trees according to standard horticultural practice. Prune trees to retain required height and spread. Unless otherwise directed by the Commissioner, do not cut tree leaders; remove only injured or dead branches.
- D. Pruning shall be done with sharp and clean tools. Cuts shall be made flush, leaving no stubs as per ANSI A300-1995.
- E. No tree paint or sealant shall be permitted.

3.6 INSTALLATION OF MEADOW SEEDING

- A. The preferred season for meadow seeding is Spring.
 - 1. Hand broadcast, distribute with a billion seeder or a drop spreader and hydromulch. If Hydromulch is used, mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application. Use tackifier in slurry mix where slopes are greater than or equal to 3:1. All areas to be hydroseeded shall be thoroughly loosened to a depth of 6 inches and graded to true lines free from all unsightly variations, bumps, ridges or depressions. All sticks, stones, roots or other objectionable material shall be removed.
 - a. Wash canister in which seed is mixed and distributed three times prior to adding seed to prevent contaminating desired seed mix and in between changing seed mix types.

3.7 HYDROSEEDING

- A. Lawn seed shall be sown in the fall during the months of September or October or as directed by the Commissioner. Prior to seeding, the area to be seeded shall be disced to loosen top four inches (4") of soil. The disced area shall be fine tilled to open the soil and render it free of rocks, roots, topgrowth, or debris over two inches (2") in any direction. The chain method or another suitable and preapproved method of cultivation shall be employed to loosen, rough grade, and prepare the seedbed.

- B. All seeding shall be performed in moderately dry to moist soil conditions at a time when the wind velocity does not exceed five miles per hour (5 mph). The application of seed, hydromulch, wood fiber binder, and fertilizer shall be by an approved Hydromulcher or Hydroseeder machine with an adequate capacity expediently and the ability to uniformly mix, pump and spray a uniform slurry of the hydroseeding ingredients.
- C. All mixtures shall be constantly agitated from the time they are mixed until they are applied to the seedbed. All seed mixtures in aqueous agitation shall be applied with eight (8) hours after mixing, except for leguminous seed, which shall be applied within one hour after mixing. Seed mixtures not applied within these limits shall be discarded and the Contractor shall receive no payment for the materials. The application shall be a two (2) part procedure:
 - 1. Apply seed, and twenty-five percent (25%) of the hydromulch.
 - 2. Apply seventy-five percent (75%) of the hydromulch and wood fiber mulch binder, or an alternate method approved by the Commissioner.
- D. The seed shall be applied uniformly on a firm, moist seedbed. The seed and fertilizer shall be mixed on site and the seeding shall be performed immediately and without interruption. The mixture shall be applied by means of a high pressure spray which shall be always directed upward so the suspended mixture shall fall like rain in a uniform spray. Nozzles or sprays shall never be directed toward the ground in any way that might produce erosion or runoff.
- E. Particular care shall be exercised to ensure that the application is made uniformly and at the prescribed rate, guarding against missed areas and overlaps. The rate of application may be checked by observing the degree of wetting of the ground or by distributing test sheets of paper or collecting containers over the area at intervals and observing the quality of material deposited. The spray method shall not be used during periods of high winds, which prohibit satisfactory spray patterns.
- F. Staged Seeding Operations: In order to minimize erosion of areas where grading is complete, the Contractor shall stage the application of groundcover hydromulching to coincide with completed construction work. Inspection and acceptance shall be provided for areas in which approved growth is achieved

3.8 WATERING OF PLANTED AREAS

- A. The Contractor shall provide all labor and arrange for all watering necessary to establish acceptable plant materials.
 - 1. Begin watering immediately following installation. Closely monitor plant water intake and insure adequate water is provided to them at all times.
 - 2. Watering shall continue throughout the contract period until the end of defined Guarantee Service Period.

3. During the first two weeks after planting, in the absence of adequate rainfall, watering shall be performed up to 3 times daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least two inches.
4. After the first two weeks, the Contractor shall water the plant bed to maintain adequate moisture in the upper two inches (2") of soil, necessary for the promotion of deep root growth.
5. Watering shall be done in a manner which will provide uniform coverage, prevent erosion due to application of excessive quantities over small areas, and prevent damage to the finished surface by the watering equipment. The Contractor shall furnish sufficient watering equipment to apply one (1) complete coverage to all planted areas in an eight (8) hour period.
6. Minimize excess watering/irrigation. Adjust irrigation controller or hand watering, as required, to provide the ideal amount of water to all plant materials.

3.9 CLEAN-UP AND PROTECTION

- A. Keep pavements clean and adjacent work areas in an orderly condition, free of construction debris, tools, extra soil, mulch and accessories.
- B. Do not stockpile or store equipment or material within plant beds, or within drip-lines of new or existing trees.
- C. Protect landscaping from damage due to landscape operations, operations by other Contractors and trades and trespassers. Maintain protection during installation and Guarantee Service periods. Utilize temporary barriers as necessary and approved by the Commissioner.
- D. Treat, repair or replace damaged work as directed.

3.10 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris. Legally dispose of waste materials off the City of New York's property.
- B. Do not bury waste or garbage in the back-fill or planting areas.

END OF SECTION 329300

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 329301

TREE PROTECTION

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SECTION INCLUDES

- A. Work of this Section includes all labor, materials, equipment and services necessary to complete the miscellaneous specialties as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
 - 1. Under these items, before commencing any work on the site, the Contractor shall erect 'Temporary Tree Protection: Single Tree', 'Temporary Tree Protection: Single High Quality Specimen Tree' and/or 'Temporary Tree Protection: Groups of Trees' around existing trees in accordance with the plans, specifications and directions of the Engineer. Also, the branches of the existing trees shall be tied up, when directed, to prevent injury during work on the site.
 - 2. Under these items, the Contractor shall protect existing tree roots with wood chips – 6" depth in accordance with the plans, specifications, and directions of the Commissioner.
 - 3. Under these items, the Contractor shall protect existing tree roots with plywood or mats in accordance with the plans, specifications, and the direction of the Commissioner. Plywood sheets or ground surface protection mats shall be installed as a temporary protection for tree roots during construction operations and shall be removed from the site at the Contractors expense when work is complete.

- E. Soil Mixes for Wetland Areas - Section 327500
- F. Exterior Plantings - Section 329300
- G. Plantings for Wetland Areas - Section 327200

H. Vegetated Roofing System

– Section 073360

1.4 QUALITY ASSURANCE

- A. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

1.5 PRODUCT HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the installed work and materials of all other trades.
- B. Replacements: In the event of damage, immediately make all repairs and replacements necessary.

PART 2 PRODUCTS

2.1 TEMPORARY TREE PROTECTION: SINGLE TREE

- A. Tree Guard: Lumber shall be Yellow Pine, Douglas Fir or Spruce. Nails shall be galvanized. No paint will be required. All work shall be done in a neat and workmanlike manner to the satisfaction of the Commissioner.
- B. Tree Wrap: Tree wrap shall be snow fencing composed of commercially woven wood slats and wire.
- C. Line Post/Stake: Line Post/Stake shall be 'Heavy Vinyl Guard Post', 'U' shaped, 13 gauge, rustproofed steel, three (3' – 0") foot height, manufactured by Boundary Fence and Rail Systems, Richmond Hill, NY or approved equal. Color to be Black.

2.2 TEMPORARY TREE PROTECTION: SINGLE HIGH QUALITY SPECIMEN TREE;
TEMPORARY TREE PROTECTION: GROUP OF TREES

- A. Snow fence shall be 4'-0" in height, constructed of either wood or plastic, as described below.
1. Fabric: Shall be commercially woven wood slats and wire or **high-density polyethylene. Color to be bright orange.
 2. Line Posts: Shall be two and one-half (2 ½) inch diameter steel stakes.
 3. Tie Wire: For wood fence shall be aluminum or steel ties. For plastic shall be general-purpose heavy plastic ties.

2.3 PROTECTION OF EXISTING TREE ROOTS WITH WOOD CHIPS-6"DEPTH

- A. Wood Chips: shall be clean chips free of any deleterious material such as ash or insecticide. Chips may be of any wood except wood waste generated from an Asian Longhorned beetle infestation or an Emerald Ash borer infestation. Wood chips produced on the site through authorized pruning and tree removal may also be used for

this work. Chips shall be derived from tree material, not from wood waste or by-products like sawdust, shredded palettes, or other debris.

1. Asian Longhorned Beetle Quarantine Zone Regulations: Due to current Federal, State, and New York City Department of Parks and Recreation policy, any wood waste that is transported must be performed by a Sub/Contractor certified by the New York State Department of Agriculture and Markets to perform tree work within the Quarantine Zone. For additional information regarding NYC Department of Parks and Recreation procedures, see the NYC Department of Parks and Recreation specifications, General Conditions, Special Provisions, Section C, Article 14 "Tree Work."

2.4 PROTECTION OF EXISTING TREE ROOTS WITH PLYWOOD OR MATS

- A. Plywood: shall be new or gently used four (4) foot by eight (8) foot sheets with a minimum thickness of one-half (1/2") inch. CCA treated lumber is not acceptable for the Work. Hardware to fasten plywood sheets shall be corrosion resistant steel.

or

- B. Ground Surface Protection Mats: shall be manufactured from high-density polyethylene (HPDE), one-half (1/2") inch thick minimum, measure approximately four (4) foot by eight (8) foot, be equipped with a lip on two sides that creates an overlapping joint with an adjoining mat to allow for effective load distribution between mats, have an interlocking mechanism consisting of multiple connection points uniformly spaced along the full length of the overlapping lips of adjacent mats with fixed locking pins, and a potential load bearing capacity of at least 60 tons dependent upon sub-surface properties. Mats shall be similar to "Dura-Deck" as manufactured by Signature Fencing & Flooring, NY, NY, or "AlturnaMATS" by Alturnamats, Inc. Titusville, PA or approved equal.

PART 3 EXECUTION

3.1 INSPECTION

- A. The Contractor shall notify both the DDC Commissioner and the Director of Arboriculture and Horticulture Unit of the NYC Department of Parks and Recreation (Captial.Arb-Hort@parks.nyc.gov), a minimum of 48 hours in advance of any work on, or impacting, existing trees.
- B. Examine the areas and conditions where miscellaneous specialties are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the work.
- C. Coordinate as required with other trades to ensure proper and adequate provision in the work of those trades for interface with the work of this Section.

- D. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.

3.2 INSTALLATION OF TEMPORARY TREE PROTECTION: SINGLE TREE

- A. Rough sawn wood boards shall be carefully wrapped around the trunk of the tree, above the flare and secure with steel or aluminum tie wire, as directly by the Commissioner, the Director of Arboriculture and Horticulture Unit of the NYC Department of Parks and Recreation or the designated representative. Tree wrap shall be installed prior to the installation of the tree guards.
- B. The temporary wooden tree guards shall be installed where shown on the contract drawings. Posts shall be installed at approximately eight feet on center, unless otherwise noted on the plans or directed by the Engineer. They shall be installed with line post/stakes securely attached with galvanized or stainless steel screws to the wooden posts and driven 18" into the ground, as directed by the Commissioner, the Director of Arboriculture and Horticulture Unit of the NYC Department of Parks and Recreation or the designated representative, without damage to existing trees. If any temporary wooden tree guards or wrap are damaged during the course of the work, they shall be immediately repaired, or replaced by a new temporary wooden tree guard or wrap at no additional expense.
- C. Temporary wooden tree guards and wrap shall remain in place and not be moved or removed without written permission of the Commissioner, the Director of Arboriculture and Horticulture Unit of the NYC Department of Parks and Recreation or the designated representative until all work which might cause damage or defacement has been completed. Upon completion of the work, to the satisfaction of the Commissioner, the Contractor shall remove and dispose of all temporary wooden tree guards and wraps.

3.3 INSTALLATION OF TEMPORARY TREE PROTECTION: SINGLE HIGH QUALITY SPECIMEN TREE AND TEMPORARY TREE PROTECTION: GROUP OF TREES

- A. The steel stakes shall be driven into the ground to a depth of two (2) feet. Fabric shall be secured to line stakes with three-sixteenth (3/16) inch aluminum or steel tie wire or plastic ties spaced eighteen (18) inches apart on posts. Line post spacing shall not exceed eight (8) feet on center.
 - 1. The Contractor shall maintain the temporary tree protection during the life of this contract and shall repair or replace all members that are disturbed, damaged, destroyed or vandalized at no extra cost. Upon completion of the work, the fence shall be removed by the Contractor.
- B. Relocation: At no extra cost to the City, the Engineer reserves the right to direct the Contractor to remove and reinstall snow fence within the Contract limit line. The Contractor may be asked to relocated the fence a maximum of three (3) times in excess of the initial installation.

1. The Contractor is also responsible for restoration of any lawn pavement disturbed by fence or in areas adjacent to fencing, after removal of fencing is completed. The cost of the restoration shall be included.

3.4 INSTALLATION OF EXISTING TREE ROOTS WITH WOOD CHIPS-6" DEPTH

- A. Wood chips for temporary tree root protection during construction shall be applied by hand to the surface of the tree protection area as shown on the plans or as directed by the Engineer in consultation with a representative of the Arboriculture and Horticulture Unit of the New York City Department of Parks and Recreation and the Commissioner. Wood chips shall be applied to a uniform depth of six (6") inches over the entire area and shall be so distributed as to create a smooth level cover. The Arboriculture and Horticulture Unit of the New York City Department of Parks and Recreation and the Commissioner shall inspect the work and approve the work, as required to assure tree root protection.
- B. Maintenance of six (6") inch depth: If any wood chips are dislocated or depleted during the course of the work, they shall be immediately replaced with new wood chips within 24 hours of the notification at no additional cost.
- C. Removal: At the completion of the work of this contract, unless otherwise directed by the Commissioner, the Contractor shall remove the wood chips by hand. Wood Chips to protect existing roots shall remain in place and not be moved or removed without written permission of the Commissioner and/or the New York City Department of Parks and Recreation until all work which might cause soil compaction or root damage has been completed.
- D. The Contractor may submit a written request to remove by machine to the Arboriculture and Horticulture Unit of the New York City Department of Parks and Recreation. No machine removal shall be allowed without prior approval and supervision by the Arboriculture and Horticulture Unit of the New York City Department of Parks and Recreation. If any trees are damaged during removal of wood chips, the provisions of the New York City Department of Parks and Recreation Specifications, Section C, Article 14 Remediation and Damage Assessment shall apply. Upon completion of the work, the wood chips shall be removed by the Contractor.

3.5 INSTALLATION OF PROTECTION OF EXISTING TREE ROOTS WITH PLYWOOD OR MATS

- A. The Contractor shall place plywood sheets and/or ground surface protection mats in areas shown on the drawings and as directed by the Arboriculture and Horticulture Unit of the New York City Department of Parks. The Arboriculture and Horticulture Unit of the New York City Department of Parks and Recreation and the Commissioner shall inspect the work and approve the work as required to assure tree root protection. The Contractor shall sawcut and fasten plywood sheets if necessary to fit into tree root areas. The Contractor shall place and fasten ground surface protection mats throughout the tree root areas as shown on the tree protection plan. Plywood/Ground surface protection mats shall remain in place and not be moved or removed with the written permission granted by the Arboriculture and Horticulture Unit of the New York

City Department of Parks and Recreation until all work which might cause compaction or root damage has been completed.

- B. If any plywood/ground surface protection mat is dislocated, damaged, or destroyed during the course of the work, it shall be immediately replaced by new or gently used plywood/ground surface protection mat within 48 hours of notification at no additional cost. All hardware shall be removed from the site when plywood/ground surface protection mat is relocated or removed. Plywood sheets/ground surface protection mats and all associated hardware shall be removed as necessary to facilitate construction and when they are no longer required on site as determined by the Construction Manager. If any trees are damaged during removal, the provisions of the New York City Department of Parks and Recreation Specifications of Section C, Article 14 Remediation and Damage Assessment shall apply. Plywood sheets/Ground surface protection mats shall be the property of the Contractor.

END OF SECTION

SECTION 330500

COMMON WORK RESULTS FOR UTILITIES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, and services needed to constructing the on-site and off-site utilities and related structures and apparatus for sanitary sewer, electrical, gas, telephone as shown on the Contract Drawings or as directed by the Commissioner.
- B. This Section includes the following:
 - 1. Piping joining materials.
 - 2. Transition fittings.
 - 3. Piped utility demolition.
 - 4. Piping system common requirements.
- C. Related Sections:
 - 1. Section 333100 - Sanitary Utility Piping and Structures
 - 2. Section 334100 - Storm Drainage System
 - 3. Section 334600 - Sub Drainage

1.3 QUALITY ASSURANCE

- A. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.
- B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.5 SUBMITTALS

- A. LEED submittal requirements

1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject

to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

PART 2 PRODUCTS

2.1 PIPING JOINING MATERIALS

- A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
 - 1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness, unless otherwise indicated.
 - 2. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
 - 3. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.
 - 4. Manufacturers:
 - a. Coast Rubber and Gasket, Inc
 - b. D&D Engineered Products
 - c. Grumen Manufacturing, Inc
 - d. Or Approved Equal
- B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
 - 1. Manufacturers:
 - a. Coast Rubber and Gasket, Inc
 - b. D&D Engineered Products
 - c. Grumen Manufacturing, Inc
 - d. Or Approved Equal
- C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

2.2 TRANSITION FITTINGS

- A. Transition Fittings, General: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

PART 3 EXECUTION

3.1 PIPED UTILITY DEMOLITION

- A. Refer to Section 024000 "Demolition of Existing Structures" for general demolition requirements and procedures.

- B. Disconnect, demolish, and remove piped utility systems, equipment, and components indicated to be removed.
 - 1. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
 - 2. Piping to Be Abandoned in Place: Drain piping. Fill abandoned piping with flowable fill, and cap or plug piping with same or compatible piping material.
- C. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

3.2 PIPING INSTALLATION

- A. Install piping according to the following requirements and utilities Sections specifying piping systems.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on the Coordination Drawings.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
 - 1. Install piping to permit valve servicing.
 - 2. Install piping at indicated slopes.
 - 3. Install piping free of sags and bends.
 - 4. Install fittings for changes in direction and branch connections. Select system components with pressure rating equal to or greater than system operating pressure.
 - 5. Verify final equipment locations for roughing-in
 - 6. Refer to equipment specifications in other Sections for roughing-in requirements.

3.3 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and utilities Sections specify piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

- D. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- E. Pressure-Sealed Joints: Assemble joints for plain-end copper tube and mechanical pressure seal fitting with proprietary crimping tool to according to fitting manufacturer's written instructions.
- F. Plastic Pressure Piping Gasket Joints: Join according to ASTM D 3139.

3.4 PIPING CONNECTIONS

- A. Make connections according to the following, unless otherwise indicated:
 - 1. Install unions, in piping NPS 2" and smaller, adjacent to each valve and at final connection to each piece of equipment.

Install flanges, in piping NPS 2-1/2" and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.5 IDENTIFICATION

- A. Piping Systems: Install pipe markers on each system. Include arrows showing normal direction of flow.
- B. Locate pipe markers on exposed piping according to the following:
 - 1. Locate pipe markers on exposed piping according to the following:
 - 2. Near each valve and control device.
 - 3. Near each branch, excluding short takeoffs for equipment and terminal units. Mark each pipe at branch if flow pattern is not obvious.
 - 4. At manholes and similar access points that permit view of concealed piping.
 - 5. Near major equipment items and other points of origination and termination.
- C. Adjusting: Relocate identifying devices that become visually blocked by work of this or other Divisions.

END OF SECTION 330500

This Page Intentionally Left Blank

SECTION 333100

SANITARY UTILITY PIPING AND STRUCTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. Section Includes:

- 1. Pipe and fittings.
- 2. Cleanouts.
- 3. Manholes.

1.3 ACTION SUBMITTALS

- A. Shop Drawings: For manholes. Include plans, elevations, sections, details, and frames and covers.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Show pipe sizes, locations, and elevations. Show other piping in same trench and clearances from sewer system piping. Indicate interface and spatial relationship between manholes, piping, and proximate structures.
- B. Profile Drawings: Show system piping in elevation. Draw profiles to horizontal scale of not less than 1 inch equals 50 feet and to vertical scale of not less than 1 inch equals 5 feet. Indicate manholes and piping. Show types, sizes, materials, and elevations of other utilities crossing system piping.
- C. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of section of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.

- d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic manholes, pipe, and fittings in direct sunlight.
- B. Protect pipe, pipe fittings, and seals from dirt and damage.
- C. Handle manholes according to manufacturer's written rigging instructions.

1.6 PROJECT CONDITIONS

- A. Interruption of Existing Sanitary Sewerage Service: Do not interrupt service to facilities occupied by City of New York or others unless permitted under the following

conditions and then only after arranging to provide temporary service according to requirements indicated:

1. Notify the Commissioner no fewer than two days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without Commissioner's written permission.

PART 2 - PRODUCTS

2.1 PVC PIPE AND FITTINGS

A. PVC Gravity Sewer Piping:

1. Pipe and Fittings: ASTM F 679, T-1 wall thickness, PVC gravity sewer pipe with bell-and-spigot ends and with integral ASTM F 477, elastomeric seals for gasketed joints.

2.2 CLEANOUTS

A. Cast-Iron Cleanouts:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work.
2. Description: ASME A112.36.2M, round, gray-iron housing with clamping device and round, secured, scoriated, gray-iron cover. Include gray-iron ferrule with inside calk or spigot connection and countersunk, tapered-thread, brass closure plug.
3. Top-Loading Classification(s): Medium Duty.
4. Sewer Pipe Fitting and Riser to Cleanout: ASTM A 74, Service class, cast-iron soil pipe and fittings.

2.3 MANHOLES

A. Standard Precast Concrete Manholes:

1. Description: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
4. Base Section: 6-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section; with separate base slab or base section with integral floor.

5. Riser Sections: 4-inch minimum thickness, of length to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated; with top of cone of size that matches grade rings.
7. Joint Sealant: ASTM C 990, bitumen or butyl rubber.
8. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection.
9. Steps: Individual FRP steps, FRP ladder, or ASTM A 615/A 615M, deformed, 1/2-inch steel reinforcing rods encased in ASTM D 4101, PP; wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
10. Adjusting Rings: Interlocking HDPE rings, with level or sloped edge in thickness and diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.
11. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, with diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope.

B. Manhole Frames and Covers:

1. Description: Ferrous; 24-inch ID by 7- to 9-inch riser, with 4-inch- minimum-width flange and 26-inch- diameter cover. Include indented top design with lettering cast into cover, using wording equivalent to "SANITARY SEWER."
2. Material: ASTM A 48/A 48M, Class 35 gray iron unless otherwise indicated.

2.4 CONCRETE

A. General: Cast-in-place concrete complying with ACI 318, ACI 350/350R, and the following:

1. Cement: ASTM C 150, Type II.
2. Fine Aggregate: ASTM C 33, sand.
3. Coarse Aggregate: ASTM C 33, crushed gravel.
4. Water: Potable.

B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

- C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.
 - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
 - a. Invert Slope: 1 percent through manhole.
 - 2. Benches: Concrete, sloped to drain into channel.
 - a. Slope: 4 percent.
- D. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water/cementitious materials ratio.
 - 1. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
 - 2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

PART 3 - EXECUTION

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Section 312000 "Earthwork."

3.2 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground sanitary sewer piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.
- C. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.
- D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- E. When installing pipe under streets or other obstructions that cannot be disturbed, use pipe-jacking process of micro-tunneling.
- F. Install gravity-flow, non-pressure, drainage piping according to the following:
 - 1. Install piping pitched down in direction of flow, at minimum slope of 1 percent

unless otherwise indicated.

2. Install piping NPS 6 and larger with restrained joints at tee fittings and at changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place-concrete supports or anchors.
 3. Install piping with 36-inch minimum cover.
 4. Install PVC gravity sewer piping according to ASTM D 2321 and ASTM F 1668.
- G. Clear interior of piping and manholes of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed. Place plug in end of incomplete piping at end of day and when work stops.

3.3 PIPE JOINT CONSTRUCTION

- A. Join gravity-flow, non-pressure, drainage piping according to the following:
1. Join PVC gravity sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasket joints.

3.4 MANHOLE INSTALLATION

- A. General: Install manholes complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Form continuous concrete channels and benches between inlets and outlet.
- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 1" above finished surface elsewhere unless otherwise indicated.

3.5 CONCRETE PLACEMENT

- A. Place cast-in-place concrete according to ACI 318.

3.6 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade. Use cast-iron soil pipe fittings in sewer pipes at branches for cleanouts, and use cast-iron soil pipe for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.
1. Use Light-Duty, top-loading classification cleanouts in earth or unpaved foot-traffic areas.
 2. Use Medium-Duty, top-loading classification cleanouts in paved foot-traffic areas.
 3. Use Heavy-Duty, top-loading classification cleanouts in vehicle-traffic service areas.
 4. Use Extra-Heavy-Duty, top-loading classification cleanouts in roads.

- B. Set cleanout frames and covers in earth in cast-in-place-concrete block, 18 by 18 by 12 inches deep. Set with tops 1 inch above surrounding grade.
- C. Set cleanout frames and covers in concrete pavement and roads with tops flush with pavement surface.

3.7 CONNECTIONS

- A. Connect non-pressure, gravity-flow drainage piping to building's sanitary building drains specified in Section 221316 "Sanitary Waste and Vent Piping."
- B. Connect force-main piping to building's sanitary force mains specified in Section 221316 "Sanitary Waste and Vent Piping." Terminate piping where indicated.
- C. Make connections to existing piping and underground manholes.
 - 1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch overlap with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 2. Make branch connections from side into existing piping, NPS 4 to NPS 20. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 3. Make branch connections from side into existing piping, NPS 21 or larger, or to underground manholes by cutting opening into existing unit large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall unless otherwise indicated. On outside of pipe or manhole wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
 - a. Use concrete that will attain a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.
 - b. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
 - 4. Protect existing piping and manholes to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

3.8 CLOSING ABANDONED SANITARY SEWER SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:
 - 1. Close open ends of piping with at least 8-inch- thick, brick masonry bulkheads.

2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
- B. Abandoned Manholes: Excavate around manhole as required and use either procedure below:
1. Remove manhole and close open ends of remaining piping.
 2. Remove top of manhole down to at least 36 inches below final grade. Fill to within 12 inches of top with stone, rubble, gravel, or compacted dirt. Fill to top with concrete.
- C. Backfill to grade according to Section 312000 "Earthwork".

3.9 IDENTIFICATION

- A. Comply with requirements in Section 31200 "Earthwork" for underground utility identification devices. Arrange for installation of green warning tapes directly over piping and at outside edges of underground manholes.
1. Use warning tape or detectable warning tape over ferrous piping.
 2. Use detectable warning tape over nonferrous piping and over edges of underground manholes.

3.10 FIELD QUALITY CONTROL

- A. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.
1. Submit separate report for each system inspection.
 2. Defects requiring correction include the following:
 - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
 - b. Damage: Crushed, broken, cracked, or otherwise damaged piping.
 - c. Infiltration: Water leakage into piping.
 - d. Exfiltration: Water leakage from or around piping.
 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
 4. Re-inspect and repeat procedure until results are satisfactory.
- B. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.

1. Do not enclose, cover, or put into service before inspection and approval.
 2. Test completed piping systems according to requirements of authorities having jurisdiction.
 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
 4. Submit separate report for each test.
 5. Hydrostatic Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction and the following:
 - a. Fill sewer piping with water. Test with pressure of at least 10-foot head of water, and maintain such pressure without leakage for at least 15 minutes.
 - b. Close openings in system and fill with water.
 - c. Purge air and refill with water.
 - d. Disconnect water supply.
 - e. Test and inspect joints for leaks.
 6. Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Option: Test plastic gravity sewer piping according to ASTM F 1417.
 7. Manholes: Perform hydraulic test according to ASTM C 969.
- C. Leaks and loss in test pressure constitute defects that must be repaired.
- D. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.
- 3.11 CLEANING
- A. Clean dirt and superfluous material from interior of piping. Flush with water.

SECTION 334000

FLAP GATE

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, and installing of gates on pipes or in drainage structures, as shown on the Contract Drawings or as directed by the Commissioner.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawing: Drawings showing the dimensions and details required to locate and install the component assemblies shall be submitted for the Commissioner's approval prior to fabrication.
- C. LEED submittal requirements
 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each

product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.

3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.4 PROJECT CONDITIONS

- A. Interruption of Existing Storm Drainage Service: Do not interrupt service to facilities occupied by City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
- B. Notify Commissioner no fewer than two days in advance of proposed interruption of service.
- C. Do not proceed with interruption of service without Commissioner's written permission.

PART 2 PRODUCT

2.1 SEAT

- A. The seat shall be flat back and shall be cast in one piece with a raised section around the perimeter of the waterway opening to mount the seating faces. The raised section shall provide a seating plane diverging top to bottom from the plane of the mounting flange to assist in positive closure of the cover. The seat shall be shaped to provide two bosses extended above the top of the waterway opening for mounting the pivot lugs. Pivot lug bosses shall be drilled and tapped for mounting studs. The back of the seat shall be machined to a plane and drilled to mate the anchor or stud layout. Gates attached to concrete shall be mounted on anchor bolts and grouted in place.

2.2 COVER

- A. The cover shall be cast in one piece with necessary reinforcing ribs, a lifting eye for manual operation, and with bosses to provide a pivot point connection with the links. Bosses shall be designed to place the hinge pins in double shear when the gate is assembled.

2.3 SEATING FACES

- A. A full-width, dovetail slot shall be machined around the perimeter of the cover and the seat. Corrosion-resistant dovetail seating faces shall be mounted in the slot and held securely without use of screws or other fasteners. The seating faces shall be machined to a plane with a minimum 63 micro-inch finish.
- B. Flap gates subjected to mild slamming action shall have a rubber seating face on the seat. Rubber seating faces shall be mounted in a dovetail slot and held securely without use of pins or screws. The seating face on the cover shall be as specified in the previous section.

2.4 PIVOT LUGS

- A. Each pivot lug shall be cast in one piece. Lugs shall have double bosses to place the top hinge pins in double shear when they are assembled through the link. The lugs shall be adjustable in the horizontal plane without removal of the cover from the gate links. The adjustment shall allow the top pivot point to be moved toward the gate seat for reduced sensitivity of the cover, or moved away from the gate seat to provide opening with minimum differential head. Two corrosion-resistant studs shall be used to connect each pivot lug to the gate seat.

2.5 LINKS

- A. The links connecting the cover and pivot lugs shall be heavy duty and cast in one piece. Each link shall be provided with commercial grade, corrosion-resistant bushings at each pivot point. The bottom of the links shall be provided with an adjusting screw to properly align seating faces on the cover with respect to the seat. The links shall be designed to limit the double hinge action, preventing the cover from rotating sufficiently to become wedged in the open position.

2.6 FASTERNERS

- A. All anchor bolts, assembly bolts, screws, studs and nuts shall be of ample size to safely withstand the forces created by operation of the gate under the heads shown in the "Gate Schedule". Quantity and size of the fasteners shall be of recommended by the manufacturer. Anchor bolts shall be furnished with two nuts each to facilitate installation and alignment of the gates when attached to concrete.

2.7 PAINTING

- A. Machined surfaces shall be coated with a water-resistant, rust-preventive compound. All cast iron parts shall be shop cleaned and painted in accordance with the manufacturer's standard practice.

2.8 MATERIALS

- A. The "Material Combination Number" included in the "Gate Schedule" and shown below defines the type of material for the component parts of the gates and accessories included in this specification. Materials shall conform to the requirements of the following ASTM standards. When more than one alloy, type or grade of material is shown, the exact alloy furnished must be at the manufacturer's option.
- B. Cast Iron: ASTM A126, Class B
- C. Austenitic Gray Iron Casting: (Ni-Resist) ASTM A436, Type 2
- D. Stainless Steel (Faces & Anchors): ASTM A276, Type 302 or 304
- E. Stainless Steel (Fasteners): ASTM F593 (Bolts), Alloy Group 1
- F. Monel (Seating Faces and Fasteners): ASTM B164, Class A or B
- G. Naval Bronze (Seating Faces): ASTM B21, Alloy 482
- H. Silicon Bronze (Seating Faces): ASTM B98, Alloy 651
- I. Rubber (Seating Faces): ASTM D2000, Grade 1BE625
- J. Bronze (Bushings): ASTM B584, Alloy 932
- K. Stainless Steel (Bushings and Pins): ASTM A582, Type 303

2.9 PRODUCTS

- A. Manufacturers:
 - 1. 12" Heavy-Duty Flap Gate Series 50C (circular), Flat Back Seat, Adjustable Upper Pivot, as manufactured by Hydro Gate. www.hydrogate.com, phone 800-678-8228.
 - 2. 12" Standard Flap Valve (circular), cast iron body, No. E-3091, as manufactured by Penn-Troy Manufacturing Inc., phone 800-232-4442

3. 12" Flap Gate, Series FG-AC, FG-ACP or FG-SPR, as manufactured by Rodney Hunt / Fontaine, phone 800-448-8860
4. Or approved equal.

PART 3 EXECUTION

3.1 INSTALLATION

- A. Installation of all parts shall be done by the contractor in a workmanlike manner and in accordance with the manufacturer's instructions. It shall be the contractor's responsibility to handle, store and install the gate in strict accord with the manufacturer's drawings and recommendations.

END OF SECTION 334000

SECTION 334100

STORM DRAINAGE SYSTEM

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, and installing pipes and structures, as necessary to construct the drainage improvements as shown on the Contract Drawings or as directed by the Commissioner which include but not limited to:

1. Pipe and fittings
2. Pressure pipe and couplings
3. Cleanouts
4. Encasement for piping
5. Manholes
6. Catch basins
7. Trench drain
8. Area drain
9. Outfalls
10. Level spreader

- B. Related Sections:

1. Section 312000 - Earthwork
2. Section 312319 - Dewatering
3. Section 315000 - Excavation Support and Protection
4. Section 334000 - Flap Gate
5. Section 334500 - Hydraulic Sluice Gate
6. Section 334600 - Sub Drainage
7. Section 334610 - Stormwater Underground Detention

1.3 DEFINITIONS

- A. HDPE: Corrugated High Density Polyethylene Pipes
- B. RCP: Reinforced Concrete Pipe, Type III unless specifically specified otherwise.
- C. PVC: Polyvinyl Chloride pipes.
- D. PP: Polypropylene Pipe
- E. Copper Pipe

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings:
 - 1. Manholes: Include plans, elevations, sections, details, frames, and covers.
 - 2. Catch basins stormwater inlets and. Include plans, elevations, sections, details, frames, covers, and grates.
 - 3. Stormwater Detention Structures: Include plans, elevations, sections, details, frames, covers, design calculations, and concrete design-mix reports.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Show pipe sizes, locations, and elevations. Show other piping in same trench and clearances from storm drainage system piping. Indicate interface and spatial relationship between manholes, piping, and proximate structures.
- B. Profile Drawings: Show system piping in elevation. Draw profiles at horizontal scale of not less than 1 inch equals 50 feet (1:50) and vertical scale of not less than 1 inch equals 5 feet (1:50). Indicate manholes and piping. Show types, sizes, materials, and elevations of other utilities crossing system piping.
- C. Product Certificates: For each type of cast-iron soil pipe and fitting, from manufacturer.
- D. Field quality control reports.
- E. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).

- c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
- 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
 - 3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
 - 4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
 - 5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
 - 6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Protect pipe, pipe fittings, and seals from dirt and damage.
- B. Handle manholes according to manufacturer's written rigging instructions.
- C. Handle catch basins and stormwater inlets according to manufacturer's written rigging instructions.

1.7 PROJECT CONDITIONS

- A. Interruption of Existing Storm Drainage Service: Do not interrupt service to facilities occupied by City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
 - 1. Notify Commissioner no fewer than two days in advance of proposed interruption of service.
 - 2. Do not proceed with interruption of service without Commissioner's written permission.

PART 2 PRODUCTS

2.1 CORRUGATED POLYETHYLENE (PE) PIPE AND FITTINGS - HDPE

- A. Pipe and Fittings: Type S, with smooth waterway for coupling joints.
 - 1. 3" to 10": AASHTO M 252M,
 - 2. 12" to 60": AASHTO M 294M
- B. Silttight Couplings: PE sleeve with ASTM D 1056, Type 2, Class A, Grade 2 gasket material that mates with pipe and fittings.
- C. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work: Advanced Drainage Systems (ADS), Hancor Inc., Contech.

2.2 PVC PIPE AND FITTINGS

- A. PVC Gravity Sewer Piping:
 - 1. Pipe and Fittings: ASTM F 679, T-1 wall thickness, PVC gravity sewer pipe with bell-and-spigot ends and with integral ASTM F 477, elastomeric seals for gasketed joints.
 - 2. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work: Certaineed, J.M. Manufacturing, Vulcan Plastic, North American, ETI, Hawk
- B. PVC Pressure Piping:
 - 1. 4" – 12" Pipe: AWWA C900, Class 150 PVC pipe with bell-and-spigot ends for gasketed joints.
 - 2. 12" and larger, AWWA C905, DR-18 minimum
 - 3. Fittings: AWWA C900, Class 150 PVC pipe with bell ends
 - 4. Gaskets: ASTM F 477, elastomeric seals.

5. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work: Certaineed, J.M. Manufacturing, Vulcan Plastic, North American, ETI.

2.3 CONCRETE PIPE AND FITTINGS

- A. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76 (ASTM C 76M).
 1. Bell-and-spigot or tongue-and-groove ends and gasketed joints with ASTM C 443 (ASTM C 443M), rubber gaskets

2.4 POLYPROPYLENE PIPE

- A. Pipe: ASTM F2736 (for 6 to 30”), ASTM F2764 (for 30 to 60”)
- B. Corrugated polyethylene piping and fittings, with a diameter of 12 inches or more may be used in connection with any type of building for underground yard drainage and storm water piping when used outside of the foundation wall of the building and not connecting to any piping system from the interior of the building.
- C. Corrugated polypropylene piping and fittings shall be designed and installed in accordance with the 2008 NYC Construction Codes and shall be subject to special inspection requirement of Chapter 17 of the Building Code and IRCNY section 101-06.
- D. Polypropylene Pipes can be used as a substitute only upon written approval by the Commissioner.

2.5 COPPER PIPING

- A. Type K copper piping: ASTM B88, size according to Project Drawings.

2.6 PRESSURE PIPE COUPLINGS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to:
 1. Metal, bolted, sleeve-type, reducing or transition coupling, for joining underground pressure piping. Include 200-psig minimum pressure rating and ends sized to fit adjoining pipes.
 2. Center-Sleeve Material: Ductile iron.
 3. Gasket Material: Natural or synthetic rubber.
 4. Metal Component Finish: Corrosion-resistant coating or material.

2.7 MANHOLES

- A. Standard Precast Concrete Manholes:

1. Description: ASTM C 478 (ASTM C 478M), precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section as required to prevent flotation.
4. Base Section: 6-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section, and separate base slab or base section with integral floor.
5. Riser Sections: 4-inch minimum thickness and lengths to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated, and top of cone of size that matches grade rings.
7. Joint Sealant: ASTM C 990 (ASTM C 990M), bitumen or butyl rubber, as manufactured by Ram-Nek or approved equal.
8. Resilient Pipe Connectors: ASTM C 923 (ASTM C 923M), cast or fitted into manhole walls, for each pipe connection.
9. Adjusting Rings: Interlocking HDPE rings with level or sloped edge in thickness and diameter matching manhole frame and cover, and of height required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.

B. Designed Precast Concrete Manholes:

1. Description: ASTM C 913; designed according to ASTM C 890 for A-16 (AASHTO HS20-44), heavy-traffic, structural loading; of depth, shape, and dimensions indicated, with provision for sealant joints.
2. Ballast: Increase thickness of one or more precast concrete sections or add concrete to manhole as required to prevent flotation.
3. Joint Sealant: ASTM C 990 (ASTM C 990M), bitumen or butyl rubber.
4. Resilient Pipe Connectors: ASTM C 923 (ASTM C 923M), cast or fitted into manhole walls, for each pipe connection.
5. Steps: standard manhole steps at 12" on center.
6. Adjusting Rings: Interlocking HDPE rings with level or sloped edge in thickness and diameter matching manhole frame and cover, and of height required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.

C. Manhole Frames and Covers:

1. Description: Ferrous; 24-inch ID by 8-inch riser with 4-inch- minimum width flange and 27-inch diameter cover. Include indented top design with lettering cast into cover, using wording equivalent to "N.Y.C. SEWER." or approved other. Contractor to coordinate with Commissioner.
2. Material: ASTM A 48-A 48M, Class 35B gray cast iron, minimum weight, 130 lbs. unless otherwise indicated.

3. Design Loading: H-20 Highway Loading

2.8 GATE VALES

A. Resilient Seated:

1. Cast iron body, bronze mounted, double disc, resilient seated in conformance with AWWA C509 or C515, with a minimum working pressure of one hundred fifty (150) psi.
2. Valves shall have a two (2) inch operating nut and open left, and shall have O-ring seals.
3. Valve ends shall be mechanical joint or push on joint. Gate valves shall be installed in the upright vertical position.

B. All force main gate valves shall be set true and plumb and have a valve box centered over the valve.

C. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work: Mueller, Kennedy, Clow, or approved equal.

2.9 CONCRETE

A. General: Cast-in-place concrete according to ACI 318, ACI 350/350R (ACI 350M/350RM), and the following:

1. Cement: ASTM C 150, Type II.
2. Fine Aggregate: ASTM C 33, sand.
3. Coarse Aggregate: ASTM C 33, crushed gravel.
4. Water: Potable.

B. Portland Cement Design Mix: 4000 psi (27.6 MPa) minimum, with 0.45 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi (27.6 MPa) minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.

1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert Slope: 1 percent through manhole.
2. Benches: Concrete, sloped to drain into channel. Slope: 4 percent.

D. Ballast and Pipe Supports: Portland cement design mix, 3000 psi (20.7 MPa) minimum, with 0.58 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.

2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

2.10 CATCH BASINS

A. Standard Precast Concrete Catch Basins:

1. Description: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Base Section: 6-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section, and separate base slab or base section with integral floor.
3. Riser Sections: 4-inch minimum thickness, 48-inch diameter, and lengths to provide depth indicated.
4. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
5. Joint Sealant: ASTM C 990, bitumen or butyl rubber.
6. Retain one of first two subparagraphs below if required.
7. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and shape matching catch basin frame and grate. Include sealant recommended by ring manufacturer.
8. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch- diameter frame and grate.
9. Steps: Individual FRP steps; FRP ladder; or ASTM A 615/A 615M, deformed, 1/2-inch steel reinforcing rods encased in ASTM D 4101, PP, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12-inch intervals. Omit steps if total depth from floor of catch basin to finished grade is less than 60 inches.
10. Pipe Connectors: ASTM C 923, resilient, of size required, for each pipe connecting to base section.

B. Designed Precast Concrete Catch Basins: ASTM C 913, precast, reinforced concrete; designed according to ASTM C 890 for A-16 (ASSHTO HS20-44), heavy-traffic, structural loading; of depth, shape, and dimensions indicated, with provision for joint sealants.

1. Joint Sealants: ASTM C 990, bitumen or butyl rubber.
2. Retain one of first two subparagraphs below if required.
3. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and shape matching catch basin frame and grate. Include sealant recommended by ring manufacturer.
4. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch- diameter frame and grate.
5. Steps: wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12-inch

intervals. Omit steps if total depth from floor of catch basin to finished grade is less than 60 inches.

6. Pipe Connectors: ASTM C 923, resilient, of size required, for each pipe connecting to base section.
- C. Frames and Grates: Frames, Grate and Curb Piece: Heavy duty, according to NYCDEP Sewer Design Standards, latest edition.
- D. Catch Basin Types:
1. Curb Inlets: Made with vertical curb opening, of materials and dimensions according to utility standards. NYCDEP Type 1 Catch Basins.
 2. Gutter Inlets: Made with horizontal gutter opening, of materials and dimensions according to utility standards. Include heavy-duty frames and grates. NYCDEP Type 2 Catch Basins.
 3. Combination Inlets: Made with vertical curb and horizontal gutter openings, of materials and dimensions according to utility standards. Include heavy-duty frames and grates.

2.11 CAST IRON HOOD AND HOOKS

- A. All catch basins shall equip with hood and hooks in the inlet.
- B. Material and construction as per NYCDEP Sewer Design Standard "Standard for Cast Iron Hood and Hooks for Catch Basin", latest edition.

2.12 TRENCH DRAIN

A. DURASLOT/LEVEL SPREADER

1. The slot drain type trench drain shall have a smooth interior and annular exterior corrugations with an aluminum slot mounted longitudinally along the length of the pipe to accept the grate frame while maintaining the original pipe diameter.
2. 4- through 10-inch (100 to 250mm) pipe shall meet AASHTO M252, Type S.
3. 12- through 36-inch (300 to 900 mm) pipe shall meet AASHTO M294, Type S or ASTM F2306.
4. Manning's "n" value for use in design shall be 0.012.
5. The aluminum grate frame shall be manufactured from 0.063" tempered commercial aluminum meeting the requirements of ASTM B209, consisting of two parallel plates separated by spacers spanning the slot on 6" centers. The grate shall be ½" - #13 galvanized steel meeting the requirements of ASTM F1267, Type 2, Class 2. The grate shall have a diamond-shaped opening and be ADA compliant. The flange at the bottom of the aluminum grate shall be riveted to the pipe with a minimum of two rivets per linear foot.
6. Fittings: DURASLOT fittings shall be modified from fittings which conform to AASHTO M252, AASHTO M294, or ASTM F2306

7. Manufacturer:
 1. ADS
 2. ACO
 3. Zurn
 4. Or Approved Equal

2.13 AREA DRAIN

- A. Drain basins: manufactured from PVC pipe stock, utilizing a thermo-molding process to reform the pipe stock to the specified configuration and shall conform to ASTM D1784 cell class 12454.
- B. Drainage pipe connection stubs: manufactured from PVC pipe stock formed to provide a watertight connection.
- C. Joint tightness: conform to ASTM D3212 for joints for drain and sewer plastic pipe using flexible elastomeric seals.
- D. Flexible elastomeric seals: conform to ASTM F477.
- E. Pipe bell spigot shall be joined to the main body of the drain basin or catch basin. The raw material used to manufacture the pipe stock that is used to manufacture the main body and pipe stubs of the surface drainage inlets shall conform to ASTM D1784 cell class 12454.
- F. Grates and Frames: ductile iron, painted black, H-20 loading. For sizes 8", 10", 12", 15", 18", 24" and 30" and shall be made specifically for each basin so as to provide a round bottom flange that closely matches the diameter of the surface drainage inlet. For 12" and 15" square grates will be hinged to the frame using pins.
- G. Metal used in the manufacture of the castings shall conform to ASTM A536 grade 70-50-05 for ductile iron.
- H. Manufacturer:
 1. ADS
 2. Nyloplast
 3. Or approved equal.

2.14 PIPE OUTLETS

- A. Headwalls: Cast-in-place reinforced concrete, with apron and tapered sides.
- B. Riprap Aprons: Broken, irregularly sized and shaped, graded stone according to NYSDEC Erosion and Sediment Control Standard.
- C. Filter Stone: No. 4 screen opening, average-size graded stone or according to NYSDEC Erosion and Sediment Control Standard.

- D. Energy Dissipaters: No. A-1, 3-ton average weight armor stone, or according to NYSDEC Erosion and Sediment Control Standard.

2.15 TRACE WIRE

A. Materials

1. General

- a. Install trace wire for all non-gravity storm pipes or pipes that are not located in a straight line between two structures.
- b. All trace wire and trace wire products shall be domestically manufactured in the U.S.A.
- c. All trace wire shall have HDPE insulation intended for direct bury, color coated per APWA standard for the specific utility being marked.

2. Trace wire

- a. Open Trench - Trace wire shall be #12 AWG Copper Clad Steel, High Strength with minimum 450 lb. break load, with minimum 30 mil HDPE insulation thickness.
- b. Directional Drilling/Boring - Trace wire shall be #12 AWG Copper Clad Steel, Extra High Strength with minimum 1,150 lb. break load, with minimum 30 mil HDPE insulation thickness.
- c. Trace wire – Pipe Bursting/Slip Lining - Trace wire shall be 7 x 7 Stranded Copper Clad Steel, Extreme Strength with 4,700 lb. break load, with minimum 50 ml HDPE insulation thickness.

3. Connectors

- a. All mainline trace wires must be interconnected in intersections, at mainline tees and mainline crosses. At tees, the three wires shall be joined using a single 3-way lockable connector. At Crosses, the four wires shall be joined using a 4-way connector. Use of two 3-way connectors with a short jumper wire between them is an acceptable alternative.
- b. Direct bury wire connectors – shall include 3-way lockable connectors and mainline to lateral lug connectors specifically manufactured for use in underground trace wire installation. Connectors shall be dielectric silicon filled to seal out moisture and corrosion, and shall be installed in a manner so as to prevent any un-insulated wire exposure.
- c. Non locking friction fit, twist on or taped connectors are prohibited.

4. Termination/Access

- a. All trace wire termination points must utilize an approved trace wire access box (above ground access box or grade level/in-ground access box as applicable), specifically manufactured for this purpose.
- b. All grade level/in-ground access boxes shall be appropriately identified with “sewer” or “water” cast into the cap and be color coded.

- c. A minimum of 2 ft. of excess/slack wire is required in all trace wire access boxes after meeting final elevation.
- d. All trace wire access boxes must include a manually interruptible conductive/connective link between the terminal(s) for the trace wire connection and the terminal for the grounding anode wire connection.
- e. Grounding anode wire shall be connected to the identified (or bottom) terminal on all access boxes.
- f. Service Laterals on public property - Trace wire must terminate at an approved grade level/inground trace wire access box, located at the edge of the road right-of-way, and out of the roadway.
- g. Service Laterals on private property - Trace wire must terminate at an approved above-ground trace wire access box, affixed to the building exterior directly above where the utility enters the building, at an elevation not greater than 5 vertical feet above finished grade, or terminate at an approved grade level/in-ground trace wire access box, located within 2 linear feet of the building being served by the utility.
- h. Hydrants – Trace wire must terminate at an approved above-ground trace wire access box, properly affixed to the hydrant grade flange. (affixing with tape or plastic ties shall not be acceptable)
- i. Long-runs, in excess of 500 linear feet without service laterals or hydrants - Trace wire access must be provided utilizing an approved grade level/in-ground trace wire access box, located at the edge of the road right-of-way, and out of the roadway. The grade level/in-ground trace wire access box shall be delineated using a minimum 48” polyethylene marker post, color coded per APWA standard for the specific utility being marked.

5. Grounding

- a. Trace wire must be properly grounded at all dead ends/stubs
- b. Grounding of trace wire shall be achieved by use of a drive-in magnesium grounding anode rod with a minimum of 20ft of #14 red HDPE insulated copper clad steel wire connected to anode (minimum 0.5 lb.) specifically manufactured for this purpose, and buried at the same elevation as the utility.
- c. When grounding the trace wire at dead ends/stubs, the grounding anode shall be installed in a direction 180 degrees opposite of the trace wire, at the maximum possible distance.
- d. When grounding the trace wire in areas where the trace wire is continuous and neither the mainline trace wire or the grounding anode wire will be terminated at/above grade, install grounding anode directly beneath and in-line with the trace wire. Do not coil excess wire from grounding anode. In this installation method, the grounding anode wire shall be trimmed to an appropriate length before connecting to trace wire with a mainline to lateral lug connector.
- e. Where the anode wire will be connected to a trace wire access box, a minimum of 2 ft. of excess/slack wire is required after meeting final elevation.

B. Installation

1. General

- a. Trace wire installation shall be performed in such a manner that allows proper access for connection of line tracing equipment, proper locating of wire without loss or deterioration of low frequency (512Hz) signal for distances in excess of 1,000 linear feet, and without distortion of signal caused by multiple wires being installed in close proximity to one another.
- b. Trace wire systems must be installed as a single continuous wire, except where using approved connectors. No looping or coiling of wire is allowed.
- c. Any damage occurring during installation of the trace wire must be immediately repaired by removing the damaged wire, and installing a new section of wire with approved connectors. Taping and/or spray coating shall not be allowed.
- d. Trace wire shall be installed at the bottom half of the pipe and secured (taped/tied) at 5' intervals.
- e. Trace wire must be properly grounded as specified.
- f. Trace wire on all service laterals/stubs must terminate at an approved trace wire access box located directly above the utility, at the edge of the road right-of-way, but out of the roadway. (See Trace wire Termination/Access)
- g. At all mainline dead-ends, trace wire shall go to ground using an approved connection to a drive-in magnesium grounding anode rod, buried at the same depth as the trace wire. (See Grounding)
- h. Mainline trace wire shall not be connected to existing conductive pipes. Treat as a mainline dead end, ground using an approved waterproof connection to a grounding anode buried at the same depth as the trace wire.
- i. All service lateral trace wires shall be a single wire, connected to the mainline trace wire using a mainline to lateral lug connector, installed without cutting/splicing the mainline trace wire.
- j. In occurrences where an existing trace wire is encountered on an existing utility that is being extended or tied into, the new trace wire and existing trace wire shall be connected using approved splice connectors, and shall be properly grounded at the splice location as specified.

2. Storm Sewer System

- a. A mainline trace wire must be installed, with all service lateral trace wires properly connected to the mainline trace wire, to ensure full tracing/locating capabilities from a single connection point.
- b. Lay mainline trace wire continuously, by-passing around the outside of manholes/structures on the North or East side.
- c. Trace wire on all storm service laterals must terminate at an approved trace wire access box color coded green and located directly above the service lateral at the edge of road right of way.

C. Prohibited Products and Methods

1. The following products and methods shall not be allowed or acceptable
 - a. Un-insulated trace wire
 - b. Trace wire insulations other than HDPE
 - c. Trace wires not domestically manufactured
 - d. Non locking, friction fit, twist on or taped connectors
 - e. Brass or copper ground rods
 - f. Wire connections utilizing taping or spray-on waterproofing
 - g. Looped wire or continuous wire installations, that has multiple wires laid side-by-side or in close proximity to one another
 - h. Trace wire wrapped around the corresponding utility
 - i. Brass fittings with trace wire connection lugs
 - j. Wire terminations within the roadway, i.e. in valve boxes, cleanouts, manholes, etc.
 - k. Connecting trace wire to existing conductive utilities

D. Testing

1. All new trace wire installations shall be located using typical low frequency (512Hz) line tracing equipment, witnessed by the contractor, Commissioner and facility owner as applicable, prior to acceptance of ownership.
2. This verification shall be performed upon completion of rough grading and again prior to final acceptance of the project.
3. Continuity testing in lieu of actual line tracing shall not be accepted.

PART 3 EXECUTION

3.1 EARTHWORK

- A. Excavation, trenching, and backfilling are specified in Section 312000 "Earthwork".

3.2 PIPING INSTALLATION

- A. All storm drainage piping and associated fittings, not connected to building interior, shall be composed of polypropylene.
- B. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground storm drainage piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- C. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install

gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

- D. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.
- E. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- F. When installing pipe under streets or other obstructions that cannot be disturbed, use pipe-jacking process of micro-tunneling.
- G. Install gravity-flow, non-pressure drainage piping according to the following:
 - 1. Install piping pitched down in direction of flow.
 - 2. Install piping nominal pipe size 6-inch and larger with restrained joints at tee fittings and at changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place concrete supports or anchors.
 - 3. Install piping with 36-inch minimum cover.
 - 4. Install ductile-iron piping and special fittings according to AWWA C600 or AWWA M41.
 - 5. Install PE corrugated sewer piping according to ASTM D 2321.
 - 6. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.
 - 7. Install reinforced-concrete sewer piping according to ASTM C 1479 and ACPA's "Concrete Pipe Installation Manual."
- H. Install force-main pressure piping according to the following:
 - 1. Install piping with restrained joints at tee fittings and at horizontal and vertical changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place concrete supports or anchors.
 - 2. Install piping with 36-inch minimum cover.
 - 3. Install ductile-iron pressure piping according to AWWA C600 or AWWA M41.
 - 4. Install ductile-iron special fittings according to AWWA C600.
 - 5. Install PVC pressure piping according to AWWA M23, or ASTM D 2774 and ASTM F 1668.
- I. Install corrosion-protection piping encasement over the following underground metal piping according to ASTM A 674 or AWWA C105:
 - 1. Underground copper pipe and fitting.
 - 2. Hub-and-spigot, cast-iron soil pipe and fittings.
 - 3. Hubless cast-iron soil pipe and fittings.
 - 4. Ductile-iron pipe and fittings.

5. Expansion joints and deflection fittings.

3.3 PIPE JOINT CONSTRUCTION

- A. Join gravity-flow, non-pressure drainage piping according to the following:
 1. Join ductile-iron culvert piping according to AWWA C600 for push-on joints.
 2. Join corrugated PE piping according to ASTM D 3212 for push-on joints.
 3. Join PVC corrugated sewer piping according to ASTM D 2321 for elastomeric-seal joints.
 4. Join PVC sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasketed joints.
 5. Join reinforced-concrete sewer piping according to ACPA's "Concrete Pipe Installation Manual" for rubber-gasketed joints.
- B. Join force-main pressure piping according to the following:
 1. Join ductile-iron pressure piping according to AWWA C600 or AWWA M41 for push-on joints.
 2. Join ductile-iron special fittings according to AWWA C600 or AWWA M41 for push-on joints.
 3. Join PVC pressure piping according to AWWA M23 for gasketed joints.

3.4 MANHOLE INSTALLATION

- A. General: Install manholes, complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Where specific manhole construction is not indicated, follow manhole manufacturer's written instructions.
- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 1 inches above finished surface elsewhere unless otherwise indicated.

3.5 CATCH BASIN INSTALLATION

- A. Construct catch basins to sizes and shapes indicated.
- B. Set frames and grates to elevations indicated.

3.6 STORMWATER INLET AND OUTLET INSTALLATION

- A. Construct inlet head walls, aprons, and sides of reinforced concrete, as indicated.
- B. Construct riprap of broken stone, as indicated.
- C. Install outlets that spill onto grade, anchored with concrete, where indicated.

- D. Install outlets that spill onto grade, with flared end sections that match pipe, where indicated.
- E. Construct energy dissipaters at outlets, as indicated.

3.7 CONCRETE PLACEMENT

- A. Place cast-in-place concrete according to ACI 318.

3.8 CONNECTIONS

- A. Piping Systems: Excavate trenches of width and depth, and install piping system, filter fabric, and backfill, according to piping manufacturer's written instructions.
- B. Connect non-pressure, gravity-flow drainage piping in building's storm building drains specified in Section 221413 "Facility Storm Drainage Piping."
- C. Connect force-main piping to building's storm drainage force mains specified in Section 221413 "Facility Storm Drainage Piping." Terminate piping where indicated.
- D. Make connections to existing piping and underground manholes.
 - 1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe; install wye fitting into existing piping; and encase entire wye fitting, plus 6-inch overlap, with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 2. Make branch connections from side into existing piping, nominal pipe size (NPS) 4 to NPS 20. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 3. Make branch connections from side into existing piping, NPS 21 or larger, or to underground manholes and structures by cutting into existing unit and creating an opening large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall unless otherwise indicated. On outside of pipe, manhole, or structure wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
 - a. Use concrete that will attain a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.
 - b. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
 - 4. Protect existing piping, manholes, and structures to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.
- E. Connect pipes and temporary swales to sediment traps specified in Section 312500 "Erosion and Sediment Controls".

- F. Pipe couplings, expansion joints, and deflection fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.
 - 1. Use non-pressure-type flexible couplings where required to join gravity-flow, non-pressure sewer piping unless otherwise indicated.
 - a. Unshielded flexible couplings for same or minor difference OD pipes.
 - b. Unshielded, increaser/reducer-pattern, flexible couplings for pipes with different OD.
 - c. Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.
 - 2. Use pressure-type pipe couplings for force-main joints.

3.9 TRENCH DRAIN INSTALLATION

- A. Install type of trench and slot drains in locations indicated as per manufacturer's specifications and requirements.
- B. Embed drains in 4-inch minimum concrete around bottom and sides.
- C. Fasten grates to drains if indicated.
- D. Set drain frames and covers with tops flush with pavement surface.

3.10 AREA DRAIN INSTALLTION

- A. The PVC area drains shall be installed using conventional flexible pipe backfill materials and procedures. The backfill material shall be crushed stone or other granular material meeting the requirements of class 2 material as defined in ASTM D2321.
- B. Bedding and backfill shall be placed and compacted uniformly in accordance with ASTM D2321.
- C. The drain basin body will be cut at the time of the final grade. No brick, stone or concrete block will be required to set the grate to the final grade height.
- D. For H-20 load rated installations, a concrete ring will be poured under and around the grate and frame. The concrete slab must be designed taking into consideration local soil conditions, traffic loading, and other applicable design factors.
- E. For other installation considerations such as migration of fines, ground water, and soft foundations refer to ASTM D2321 guidelines.

3.11 CLOSING ABANDONED STORM DRAINAGE SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:
 - 1. Close open ends of piping with at least 8-inch- thick, brick masonry bulkheads.

2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
- B. Abandoned Manholes and Structures: Excavate around manholes and structures as required and use one procedure below:
1. Remove manhole or structure and close open ends of remaining piping.
 2. Remove top of manhole or structure down to at least 36 inches below final grade. Fill to within 12 inches of top with stone, rubble, gravel, or compacted dirt. Fill to top with concrete.
- C. Backfill to grade according to Section 312000 "Earthwork."

3.12 IDENTIFICATION

- A. Materials and their installation are specified in Section 312000 "Earthwork." Arrange for installation of green warning tape directly over piping and at outside edge of underground structures.
1. Use warning tape or detectable warning tape over ferrous piping.
 2. Use detectable warning tape over nonferrous piping and over edges of underground structures.

3.13 FIELD QUALITY CONTROL

- A. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.
1. Submit separate reports for each system inspection.
 2. Defects requiring correction include the following:
 - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
 - b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
 - c. Damage: Crushed, broken, cracked, or otherwise damaged piping.
 - d. Infiltration: Water leakage into piping.
 - e. Exfiltration: Water leakage from or around piping.
 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
 4. Re-inspect and repeat procedure until results are satisfactory.
- B. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
1. Do not enclose, cover, or put into service before inspection and approval.

2. Test completed piping systems according to requirements of authorities having jurisdiction.
 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
 4. Submit separate report for each test.
 5. Gravity-Flow Storm Drainage Piping: Test according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Exception: Piping with soiltight joints unless required by authorities having jurisdiction.
 - b. Option: Test plastic piping according to ASTM F 1417.
 - c. Option: Test concrete piping according to ASTM C 924.
 6. Force-Main Storm Drainage Piping: Perform hydrostatic test after thrust blocks, supports, and anchors have hardened. Test at pressure not less than 1-1/2 times the maximum system operating pressure, but not less than 150 psig.
 - a. Ductile-Iron Piping: Test according to AWWA C600, "Hydraulic Testing" Section.
 - b. PVC Piping: Test according to AWWA M23, "Testing and Maintenance" Chapter.
- C. Leaks and loss in test pressure constitute defects that must be repaired.
- D. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

3.14 CLEANING

- A. Clean interior of piping of dirt and superfluous materials. Flush with water.

END OF SECTION 334100

SECTION 334500

HYDRAULIC SLUICE GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, and paving, as necessary to construct temporary excavation support and protection systems necessary for the improvements as shown on the Contract Drawings or as directed by the Commissioner.
- B. Equipment provided shall be cast, fabricated, machined, assembled and placed in proper operating condition per the drawings, specifications, engineering data, instructions and recommendations of the gate manufacturer unless otherwise noted by the Commissioner. Gates and operators shall be supplied with all parts and accessories as specified within the site specifications, drawings and as required for a complete installation.
- C. Cast iron sluice gates where shown in the plans and specifications and listed in the sluice gate schedule shall be as manufactured by Coldwell-Wilcox Technologies, LLC of Cincinnati, Ohio, Rodney Hunt-Fontaine Inc., Penn-Troy Manufacturing, Inc. or Approved Equal. Gates shall be cast iron, ductile iron, 2% nickel or NiResist, self-contained or conventional rising or non-rising stem type with surface mounted guide frames as called out by the specifications and site drawings. Cast iron is most common material of choice.

1.3 REFERENCE STANDARDS

- A. Except as modified or supplemented herein, all gates and operators shall conform to the applicable AWWA standards.

1.4 SUBMITTALS

- A. Manufacturer's data and drawings shall be submitted for approval in accordance with site specifications and engineering drawings. Manufacturer's submittal shall include but not limited to gate material specification sheet, gate data summary sheet, calculation sheets, site plan drawings and paint/coating data sheets. Calculation sheets shall contain operator forces, tensile and buckling strength of stem, structural strength calculations and other calculations to verify that the design meets the specification requirements.
- B. LEED submittal requirements

1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs./gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

1.5 QUALITY ASSURANCE

- A. Gates shall be designed and shop tested to the applicable AWWA governing standard. Design and operating heads shall be per the site schedule and/or specifications.

PART 2 PRODUCTS

2.1 MANUFACTURERS / MATERIALS

- A. All materials will comply with applicable provisions and recommendations of the following, except as otherwise shown or specified:
 - 1. Sluice gates shall be the latest standard product in regular production by a manufacturer whose products have proven reliable in similar service. A single manufacturer shall supply sluice gates.
 - 2. Frame: Leaf (Disc), ASTM A126 Class B Cast Iron, Side Guides, Ductile Cast Iron, ASTM A536, Class B, Wall Thimbles, Cast Iron ASTM A126 Class B with 2% Nickel, NiResist ASTM A436 Type 1 (15% Nickel) or NiResist ASTM A436 Type 2 (22% Nickel)
 - 3. Stem: ASTM A276 Type 304(L) or 316(L) Stainless Steel
 - 4. Wedges: ASTM B584 CA873 Bronze
 - 5. Seat: ASTM B98 CA 655 Bronze
 - 6. Flushbottom Seal: ASTM D2000 50-60 Durometer Neoprene
 - 7. Flushbottom Retainer ASTM A276 Type 304(L) or 316(L) Stainless Steel
 - 8. Thrust Nut: ASTM B584 CA954 Bronze
 - 9. Stop Collars: ASTM B584 CA954 Bronze or ASTM A276 Type 304 or 316 Stainless Steel
 - 10. Stem Coupling: ASTM B584 CA954 Bronze or ASTM A276 Type 304 or 316 Stainless Steel
 - 11. Fasteners: ASTM A276 Type 304 or 316 Stainless Steel
 - 12. Stem Guide: Bearing ASTM B584 CA932/CA864 Bronze or UHMW
 - 13. Stem Guide: Bracket Ductile Iron, 304(L) or 316(L) Stainless Steel or A36 Steel
 - 14. Floorstands: ASTM A126 Class B Cast Iron or A36 Steel Wall Brackets
 - 15. Stem Cover: Butyrate, Clear
 - 16. Handwheel: ASTM A-126, Class B Cast Iron
 - 17. Handcrank: A36 Steel
 - 18. Yoke: A36 Steel

2.2 SLUICE GATES

- A. Sluice gates shall be cast iron, fully bronze mounted and will have side wedges, top wedges and flush bottom seal or bottom wedges. Sluice Gates less than 24" wide shall have side wedges only. Flush bottom type seal shall have a neoprene seal flush across the invert and standard bottom shall have bronze seat face and wedges. CWT standard is flush bottom seal type with bronze seat and wedges optional. All gate components will be designed to safely withstand the heads listed in the sluice gate schedule.

2.3 DISC OR SLIDE

- A. Disc shall be cast iron, one-piece construction, with integrally cast vertical and horizontal ribs. The disc will have machined dovetailed grooves on the seating face into which bronze facings shall be driven and machined to a 63 micro-inch finish. A tongue on each side extending the full length of the disc shall be machined on all sides with a 1/16 inch clearance maintained between the disc tongue and the gate guide groove. Wedge pads for side, top and bottom wedges, when required, will be cast integrally on the disc and machined to receive the adjustable bronze wedges. A heavily reinforced nut pocket shall be cast integrally on the vertical centerline and above the horizontal center and be such shape as to receive the square or rectangular bronze thrust nut with stem attached.

2.4 FRAME

- A. Gate frame and guides shall be cast in one piece and shall be flat back (flange back) as designated in the gate schedule. The back of the frame shall be machined to a plane.
- B. Guides shall be cast as an integral part of the frame or bolted and pinned to the frame and shall be sufficiently long to retain at least one-half of the vertical height of the disc when in the fully opened position. Guides shall be capable of safely withstanding the full thrust due to water pressure and wedging action. Guide grooves shall be accurately machined to provide free movement of the disc tongues and to insure proper engagement of the wedging devices.

2.5 WEDGES

- A. Wedges shall be solid cast bronze and keyed to the cast iron pads to maintain adjustment by preventing undesirable rotation or lateral motion. They will be attached to the disc with 304 or 316 stainless steel studs, nuts, washers and adjusting screws with locking nuts. Silicon bronze studs, nuts and adjusting screws with locking nuts shall be used when specified.

2.6 SEAT FACINGS

- A. All seat facings shall be malleable extruded bronze of a composition, which will resist dezincification and will increase in wearing ability with cold working. The extruded seat facings will be a special shape to fill and permanently lock in the machined dovetail grooves when impacted into place. Attaching pins and screws shall not be allowed. The installed seat facings shall be machined to a 63 micro-inch finish or better.

2.7 FLUSHBOTTOM SEAL

- A. Gates so designated in the gate schedule shall be provided with a flush bottom seal. All gate parts shall be identical to those defined in other paragraphs of this specification except for the bottom of the slide and the seal assembly along the invert of the waterway opening. The flush bottom closure creates a smooth invert which does not impede flow. A heavy resilient neoprene strip flush across the invert width is epoxyed in a stainless steel retainer. The 3/4" minimum bottom thickness of the gate leaf (disc) effectively seals the invert when compressed against the 50-60 durometer neoprene flush bottom seal. The neoprene flushbottom seal replaces the standard bottom seat facings and wedging devices.
- B. Top surface of the seal shall be flush with the invert of the gate opening. Full length of disc bottom edge shall be accurately machined to make contact with the seal when the disc is closed. The seal shall be replaceable without removal of gate disc.

2.8 WALL THIMBLE

- A. Wall thimbles will be furnished as required by specification. Wall thimbles shall be of section "F", "E" or "MJ" (mechanical joint) and depth as indicated on the plans and listed in the gate schedule. They will be cast iron, ductile, 2% nickel or NiResist one-piece construction, of adequate section to withstand all operational and reasonable installation stresses. Wall thimbles will be internally braced during concrete placement. A center ring or water stop will be cast around the periphery of the thimble. The front flange will be machined and have tapped holes for the sluice gate attaching studs and metal stamped vertical centerlines with the word "TOP" for correct alignment.
- B. Large wall thimbles will be provided with holes in the invert to allow satisfactory concrete placement beneath the thimble.

2.9 STEM

- A. Operating stem shall be of Type 304(L) or 316(L) stainless steel minimum 1-1/4 inches diameter and attached to the disc by bronze thrust nut and cast in place disc pocket. Stem shall be designed to transmit in compression at least 2-1/2 times the rated output of the operating mechanism with a 40-pound maximum effort on the crank or hand wheel.
- B. Stems shall have a slenderness ration (L/R) of 200 or less. The threaded portion of the stem shall have machine cut 1/4" pitch by 1/4" lead left hand threads of the Acme type unless otherwise specified. Stainless steel or manganese bronze couplings threaded and keyed, or bored and pinned to the stems shall join stems of more than one section. All threaded and keyed couplings of the same size shall be interchangeable. Stems shall be provided with adjustable stop collars to prevent over travel on manually operated gates.

2.10 STEM GUIDES

- A. Stem guides shall be bronze or UHMW bushed Ductile iron, 304/316 stainless steel or A36 steel. They shall be adjustable in two directions and will be spaced at sufficient intervals to adequately support the stem. Stem guide spacing shall not exceed 10 feet.

2.11 SELF-CONTAINED SLUICE GATES

- A. Self-contained sluice gate shall have the standard extended side guides to allow the gate to fully open. A heavily designed "U" shape structural steel yoke shall be attached to the machined pads a top the side guides. A mounting plate shall be bolted to the yoke horizontal cross supports for manual or electric actuator mounting.

2.12 ADDITIONAL OPTIONAL SEALS (UNSEATING SIDE ONLY)

- A. Neoprene "J" or "P" seal can be bolted to the cast frame for additional sealing capabilities on the unseating side. Hardware shall be Type 304 or 316 stainless steel. Bronze hardware is optional.

2.13 MANUAL OR ELECTRIC OPERATED GATES

A. Handwheel (horizontal mounted) type:

1. A hand wheel operator shall be provided with a 1:1 ratio.
2. An acme threaded manganese bronze lift nut shall be provided to engage the operating stem.
3. Anti-friction bearings shall be provided to properly support both opening and closing thrusts.
4. The hand wheel shall operate the gate under the specified operating heads with not greater than a 40 pound rim pull approximately 36 inches above the operating floor.
5. All components shall be totally enclosed in a cast iron weatherproof housing.
6. Hand wheel operator shall be bench stand (yoke) mounted or floor stand mounted with or without a cast iron or fabricated A36 steel wall bracket.

B. Handcrank or vertical handwheel gearbox mounted type:

1. A hand- crank or handwheel operated gearbox shall be provided with a gear ratio as needed to ensure 40 pounds or less rim pull at the handcrank or handwheel under the specified operating heads approximately 36 inches above the operating floor.
2. An acme threaded manganese bronze lift nut shall be provided to engage the operating stem. Anti-friction bearings shall be provided to properly support both opening and closing thrusts.
3. All components shall be totally enclosed in a cast iron weatherproof housing. Gearbox shall be bench stand (yoke) mounted or floor stand mounted with or without a cast iron or A36 steel fabricated wall bracket.

C. Tee Wrench Type:

1. A tee wrench operated 2" square nut stem mounted with a 1:1 ratio or a 2" square nut gearbox mounted with a gear ratio as needed to ensure 40 pounds or less rim pull at the tee wrench under the specified operating heads.

2. A manganese bronze lift nut shall be provided to engage the operating non-rising stem. Anti-friction bearings shall be provided to properly support both opening and closing thrusts.
3. All components shall be totally enclosed in a cast iron weatherproof housing.
4. Tee wrench operator shall be bench stand mounted (yoke), floor box mounted or cast iron/A36 steel fabricated wall bracket mounted

D. Electric Actuator Type:

1. Electric actuators shall be sized for the required breakout torque and average operating torque including a 1.33 minimum safety factor.
2. Electric actuators shall be bench stand (yoke) or pedestal mounted. Actuators can be either open/close or modulating service and shall be designed for twelve inches (12") per minute disc travel (48 RPM actuator speed).
3. Disc travel may vary from nine (9) to fifteen (15) inches per minute depending on design requirements. Electric motor actuator shall include, but not limited to, the motor, gearing unit, limit switches, torque switches, manganese bronze stem nut, declutch lever, compartment heater and hand wheel for manual operation at 40 pounds or less rim pull.
4. As a minimum, the motor actuator shall be Nema 4 (weathertight) construction. Coldwell-Wilcox Technologies furnishes electric actuators manufactured by EIM, Limitorque, Auma, Rotork or equal.
5. A clear butyrate stem cover with closed, open, 1/4, 1/2 and 3/4 position indicator decals shall be supplied for each rising stem.

2.14 PAINTING

- A. Steel components such as the cast frame, disc, hand wheel and operator bearing housing shall receive manufacturer's standard TNEMEC epoxy series N140-1255 pota-pox beige OR APPROVED EQUAL and TNEMEC series 69 pond 28BL OR APPROVED EQUAL finish prior to shipment. Total system shall be 12-16 mils DFT.
- B. Tnemec coal tar epoxy series 46H-413 or Tnemec potable epoxy series N140 pota pox are available, as specifications require. Coal tar epoxy total system shall be 20-26 mils DFT. Tnemec potable epoxy total system shall be 12-16 mils DFT. Or approved equal.

2.15 SHOP TESTING

- A. Each gate shall be fully assembled and shop-inspected in the vertical position for proper seating. The disc shall be fully opened and closed in its guide system to ensure that it operates freely and seals per the AWWA standard.

2.16 PRODUCTS

- A. Manufacturers:

1. Rodney Hunt
2. Penn-Troy Manufacturing Inc.
3. Golden Harvest, Inc.
4. OR APPROVED EQUAL

END OF SECTION 334500

SECTION 334600

SUBDRAINAGE

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to perform excavation, backfill, trenching, compaction, pipe and drainage structure installation and connections, as necessary to construct the subdrains for landscaping, storm sewer, foundation drains, and retaining wall drains as shown on the Contract Drawings or as directed by the Commissioner.
- B. Coordinate with Site, Plumbing, Structural and Landscaping Drawings.

1.3 RELATED SECTIONS

- A. Section 334100 – Storm Drainage System

1.4 SUBMITTALS

- A. LEED submittal requirements

1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each

product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.

3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with Division 1 – General Requirements.

PART 2 PRODUCTS

2.1 PERFORATED-WALL PIPES AND FITTINGS

A. Perforated Polyethylene (PE) Pipe and Fittings:

1. Nominal pipe size (NPS) 6" and smaller: ASTM F 405 or AASHTO M 252, Type CP; corrugated, for coupled joints.
2. Nominal pipe size (NPS) 8" or larger: ASTM F 667; AASHTO M 252, Type CP; or AASHTO M 294, Type CP; corrugated; for coupled joints.
3. Couplings: Manufacturer's standard, band type.

2.2 SOIL MATERIALS

- #### A. Soil materials are specified in Section 312000 - Earthwork and Section 312316 - Rock Removal.

PART 3 EXECUTION

3.1 EXAMINATION

- A. Examine surfaces and areas for suitable conditions where sub-drainage systems are to be installed.
- B. If sub-drainage is required for landscaping, locate and mark existing utilities, underground structures, and aboveground obstructions before beginning installation and avoid disruption and damage of services.
- C. Verify that drainage panels installed as part of foundation wall waterproofing is properly positioned to drain into sub-drainage system.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Section 312000 "Earthwork" and Section 312316 "Rock Removal".

3.3 FOUNDATION DRAINAGE INSTALLATION

- A. Place impervious fill material on subgrade adjacent to bottom of footing after concrete footing forms have been removed. Place and compact impervious fill to dimensions indicated, but not less than 6 inches deep and 12 inches wide.
- B. Install drainage piping as indicated in "Piping Installation" subsection for foundation subdrainage.
- C. Add drainage course to width of at least 6 inches on side away from wall and to top of pipe to perform tests.
- D. After satisfactory testing, cover drainage piping to width of at least 6 inches on side away from footing and above top of pipe to within 12 inches of finish grade.
- E. Place backfill material over compacted drainage course. Place material in loose-depth layers not exceeding 6 inches. Thoroughly compact each layer. Place final backfill to finish elevations and slope away from building.

3.4 RETAINING-WALL DRAINAGE INSTALLATION

- A. Place supporting layer of drainage course over compacted subgrade to compacted depth of not less than 4 inches.
- B. Install drainage piping as indicated in "Piping Installation" subsection for retaining-wall subdrainage.
- C. Add drainage course to width of at least 6 inches on side away from wall and to top of pipe to perform tests.

- D. After satisfactory testing, cover drainage piping to width of at least 6 inches on side away from footing and above top of pipe to within 12 inches of finish grade.
- E. Fill to Grade: Place satisfactory soil fill material over compacted drainage course. Place material in loose-depth layers not exceeding 6 inches. Thoroughly compact each layer. Fill to finish grade.

3.5 LANDSCAPING DRAINAGE INSTALLATION

- A. Provide trench width to allow installation of drainage conduit. Grade bottom of trench excavations to required slope, and compact to firm, solid bed for drainage system.
- B. Place supporting layer of drainage course over compacted subgrade and geotextile filter fabric, to compacted depth of not less than 4 inches.
- C. Fill to Grade: Place satisfactory soil fill material over drainage course. Place material in loose-depth layers not exceeding 6 inches. Thoroughly compact each layer. Fill to finish grade.

3.6 PIPING INSTALLATION

- A. Install piping beginning at low points of system, true to grades and alignment indicated, with unbroken continuity of invert. Bed piping with full bearing in filtering material. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions and other requirements indicated.
 - 1. Foundation Sub-drainage: Install piping level and with a minimum cover of 36 inches unless otherwise indicated.
 - 2. Retaining-Wall Sub-drainage: When water discharges at end of wall into stormwater piping system, install piping level and with a minimum cover of 36 inches unless otherwise indicated.
 - 3. Landscaping Subdrainage: Install piping pitched down in direction of flow, at a minimum slope of 0.5 percent and with a minimum cover of 36 inches unless otherwise indicated.
 - 4. Lay perforated pipe with perforations down.
 - 5. Excavate recesses in trench bottom for bell ends of pipe. Lay pipe with bells facing upslope and with spigot end entered fully into adjacent bell.
- B. Use increasers, reducers, and couplings made for different sizes or materials of pipes and fittings being connected. Reduction of pipe size in direction of flow is prohibited.
- C. Install thermoplastic piping according to ASTM D 2321.

3.7 PIPE JOINT CONSTRUCTION

- A. Join perforated PE pipe and fittings with couplings according to ASTM D 3212 with loose banded, coupled, or push-on joints.

- B. Special Pipe Couplings: Join piping made of different materials and dimensions with special couplings made for this application. Use couplings that are compatible with and fit materials and dimensions of both pipes.

3.8 BACKWATER VALVE INSTALLATION

- A. Comply with requirements for backwater valves specified in Section 334100 - Storm Drainage System.
- B. Install horizontal backwater valves in header piping downstream from perforated sub-drainage piping.
- C. Install horizontal backwater valves in the manhole where indicated.

3.9 CLEANOUT INSTALLATION

- A. Comply with requirements for cleanouts specified in Section 334100 - Storm Drainage System.
- B. Cleanouts for Foundation Retaining-Wall Landscaping Sub-drainage:
 - 1. Install cleanouts from piping to grade. Locate cleanouts at beginning of piping run and at changes in direction. Install fittings so cleanouts open in direction of flow in piping.
 - 2. In non-vehicular-traffic areas, use NPS 4 PVC pipe and fittings for piping branch fittings and riser extensions to cleanout. Set cleanout frames and covers in a cast-in-place concrete anchor, 12 by 12 by 4 inches deep. Set top of cleanout 1 inch above grade.
 - 3. Comply with requirements for concrete specified in Section 033000 - Cast-in-Place Concrete.

3.10 CONNECTIONS

- A. Comply with requirements for piping specified in Section 334100 - Storm Drainage System. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect low elevations of sub-drainage system to solid-wall-piping storm drainage system.
- C. Where required, connect low elevations of foundation sub-drainage to stormwater sump pumps. Comply with requirements for sump pumps specified in Section 221429 - Sump Pumps.

3.11 IDENTIFICATION

- A. Arrange for installation of green warning tapes directly over piping. Comply with requirements for underground warning tapes specified in specified in Section 312000 - Earthwork.
 - 1. Install PE warning tape or detectable warning tape over ferrous piping.

2. Install detectable warning tape over nonferrous piping and over edges of underground structures.

3.12 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. After installing drainage course to top of piping, test drain piping with water to ensure free flow before backfilling.
2. Remove obstructions, replace damaged components, and repeat test until results are satisfactory.

B. Drain piping will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.13 CLEANING

- A. Clear interior of installed piping and structures of dirt and other superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed. Place plugs in ends of uncompleted pipe at end of each day or when work stops.

END OF SECTION 334600

SECTION 334610

STORMWATER UNDERGROUND DETENTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Examine all drawings and other sections of the specifications for requirements therein affecting the work of this trade.

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, permitting and services needed to construct the underground stormwater detention systems as shown on the Contract Drawings or as directed by the Commissioner, which include but not limited to:
 - 1. Provide excavation and base preparation per Commissioner's recommendations and/or as shown on drawings, to provide adequate support for project designs loads and safety from excavation sidewall collapse. See 2.2 Materials.
 - 2. Provide and install underground detention system products including but not limited to the stormwater storage modular cell units, geotextiles, geogrids, inlet and outlet pipe with connections and installation per the manufacturer's instructions furnished under this section.
 - 3. Contractor may submit an alternate underground detention system with the same or better performance as shown on the Drawings, to the Commissioner for review and approval. The alternate underground detention system and design should have a similar overall footprint and depth, exceeds H-20 loading, provides the same or more storage capacity, limits to the same rate and volume of discharge, and does not affect the upstream and downstream drainage system design.
- B. Related Work: The following items are noted and included in this Section and will be performed under the designated sections:
 - 1. Section 312000 – Earthwork
 - 2. Section 312316 – Rock Removal
 - 3. Section 312319 – Dewatering
 - 4. Section 315000 – Excavation Support and Protection
 - 5. Section 334100 – Stormwater Drainage System

1.3 REFERENCE STANDARDS

- A. The following standards are applicable to the work of this Section to the extent referenced herein:
 - 1. ASTM: American Society for Testing and Materials.
 - 2. ANSI: American National Standards Institute.
 - 3. AASHTO: American Association of State Highway and Transportation Officials.
 - 4. AWWA: American Water Works Association.

1.4 SUBMITTALS

- A. Submit manufacturer's product data and installation instructions.
- B. Submit a modular cell section of the underground detention product for review. Reviewed and accepted samples will be returned to the Contractor.
- C. Submit material certificates for geotextile, geogrid, base course and backfill materials.
- D. Submit shop drawings as reviewed by the manufacturer prior to submit to the Commissioner for review and approval.
- E. LEED submittal requirements
 - 1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
 - 2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.

3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.
 - b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
 - c. Concrete mix used in this section shall contain a minimum of 40% (combined) pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials), subject to the approval of the Commissioner. Certification and submittal of recycled content shall be in accordance with the DDC General Conditions.

1.5 QUALITY ASSURANCE

- A. Refer to information within this specification related to Shop Drawings, Product Data, and Sample requirements.
- B. Installation: Performed only by skilled work people with satisfactory record of performance on pipe, chamber, or pond/landfill construction projects of comparable size and quality.
- C. The Contractor or subcontractor performing the work in this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Protect cells from damage during delivery and store under tarp to protect from sunlight when time from delivery to installation exceeds one week. Storage should occur on smooth surfaces, free from dirt, mud and debris.
- B. Handling is to be performed with equipment appropriate to the size (height) of cells and site conditions, and may include, hand, handcart, forklifts, extension lifts, small cranes, etc., with care given to minimize damage to spacer bars and surrounding cells.

1.7 PROJECT CONDITIONS

- A. Review installation procedures and coordinate the underground detention system work with other work affected, such as grading, excavation, utilities, construction access, erosion control to prevent all non-installation related construction traffic over the completed underground detention system installation, especially with loads greater than design loads.
- B. Cold weather:
 - 1. Do not use frozen materials or materials mixed or coated with ice or frost.
 - 2. Do not build on frozen work or wet, saturated or muddy subgrade.
 - 3. Care must be taken when handling the modular rainwater storage cells when air temperature is at 40 degrees or below as plastic becomes brittle.
- C. Protect partially completed rainwater storage module installation against damage from other construction traffic when work is in progress, and following completion of backfill, with highly visible construction tape, fencing, or other means until construction is complete.
- D. Protect adjacent work from damage during the underground detention system installation.

PART 2 – PRODUCTS

2.1 MANUFACTURER

- A. Manufacturer:
 - 1. Rainstore3 by Invisible Structures, Inc. 1600 Jackson Street, Suite 310, Golden, Colorado 80401. Tel: 800-233-1510. www.invisiblestructures.com
 - 2. R-Tank by ACF Environmental, Tel: 800-448-3636. www.acfenvironmental.com
 - 3. Atlantis D-Raintank Modular Rainwater Storage System by RainHarvest Systems, LL. 6075 Parkway North Drive, Cumming, GA 30040, Tel: 800-654-9283. www.rainharvest.com
 - 4. StormTank Modules by Brentwood Industries. 500 Spring Ridge Drive, Reading, PA 196100. Tel: 610-374-5109. www.brentwoodindustries.com
 - 5. Or Approved Equal

2.2 MATERIALS

- A. Material requirements shall adhere to the Manufacturer's recommendations specific for the particular underground detention system provided.
- B. Base of Excavation: Shall be smooth soil, level and free of lumps or debris. Compact to at least 95% or as required by the manufacturer. Structural fill material may be used to amend the structural capacity of the soil, and should be placed on top of the geogrid layer

if needed. Materials that cannot be stabilized by compaction, such as sand and/or drainage rock, should be avoided.

- C. Geogrid: Use manufacturer approved geogrid product to overlay the excavation floor, the assembled cells, and above the completed liner, extending at least twice the width of side backfill, with geogrid joints overlapped by at least 12”.
- D. Geotextile: Shall be manufacturer approved non-woven PP or PET with a weight of at least 8 oz per square yard, appropriate for the soil type and depth conditions, placed on the floor of the excavation, the sides of the chamber, and chamber top.
- E. Stormwater storage modular cells: Injection molded plastic units (sizes and shapes varies per manufacturer) assembled into vertical columnar and/or horizontal rows of cell structures of variable height and width (custom for each project) with each layer consisting of hollow space from a strong open grid unit. Each modular unit must be installed whole without cutting or modifications unless as permitted by the manufacturer.
- F. Side Backfill: Structural fill free from lumps and debris or any other sharp materials to backfill along the sides of the cellular structure, taking care to compact with powered mechanical compactor, in lifts that do not exceed 12”, to provide a settlement free-surface over the top and sides of the structure. Fill material should NOT consist of high percentage of clay or silt materials. Fill material should increase in shear strength when compacted; thus, no drain rock or pure open-graded rock allowed.
- G. Top Backfill: Use 12” minimum to 36” maximum depth of 3/4” minus sandy/gravel road base material (with fines less than 3%). If backfill mixture must be custom mixed, use a ratio of 2 parts clean 3/4” drainage rock to 1 part clean sharp sand.
- H. Utility Marker: Use metallic tape at corners of install to mark the area for future utility detection.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Examine prepared excavation and conditions for smoothness, compaction and level. Do not start the underground detention system installation until unsatisfactory conditions are corrected. Check for presence of seasonal high water table, which must be kept at levels 3 feet below the bottom of the underground detention structure at all times.
- B. Installation constitutes acceptance of existing conditions and responsibility for satisfactory performance. If existing conditions are found unsatisfactory, contact the Commissioner for resolution.

3.2 EXCAVATION

- A. All excavation and installation requirements shall adhere to the Manufacturer’s recommendations specific for the particular underground detention system provided.
- B. Excavation must be extended at least 20” beyond all sides of the underground detention structures to allow for ease of product installation stormwater storage modular cells and backfill compaction with powered compactor. Soil below must be leveled. A layer of geogrid must be placed on subsoil and extend 20” beyond the sides of the structure.

- C. A 12” minimum, 36” maximum structural base course (no greater than 1” particle size) must cover the geogrid and extend past all perimeters of the underground detention system by 20”. Compact this layer to a minimum 95% modified Proctor density.
- D. Large and deep storage volumes may demand a drivable access route for excavation, leveling, compaction and placing the modular cell structures.
- E. Take extreme care when driving and/or compacting over the modular cell chambers and do not drive over exposed units. Wait until ALL modular cell units are installed, the backfill is complete, fabric and geogrid layers are completed, and an adequate amount of cover material is placed. Mark area to identify the overall underground chamber location.

3.3 PREPARATION

- A. Place geogrid over prepared grade, with any joints overlapped by a minimum of 12”, extending over the entire excavation bottom.
- B. Place the geotextile fabric on the geogrid, extending the excess portion of the rolls up the sides of the excavated area. Overlap the geotextile joints 12” or per manufacturer’s recommendations.
- C. It is helpful to identify the outline of the stormwater storage modular cell placement on the fabric, using spray paint or chalk line to ensure squareness.
- D. The geotextile fabric will later be brought up and encompass all sides and the top of the modular cell units.

3.4 INSTALLATION OF STORMWATER STORAGE MODULAR CELLS

- A. Install the Stormwater storage modular cells by placing side by side, with grid side down. Try to place sides of cells without damaged bumpers along outside of structure to resist backfill forces against fabric and liner materials. DO NOT cut the cells – cells must be installed whole. Cutting of the Stormwater storage modular cells is only permitted for installation of maintenance ports. DO NOT disassemble, reassemble, or reconfigure the height (stacks) of stormwater storage modular cells. Place metallic tape on top corners of install to mark the area for future utility detection. Place a layer of geogrid directly over the top of the cells to bridge columns and joints and provide a secure walking surface. Place geotextile fabric layer over the top and sides to prevent soil entry into the chamber. Take great care to avoid damage to fabric liner material during placement.
- B. After placement of the stormwater storage modular cells, bring liner material up the sides and over the top of the structure, overlapping or sealing joints per manufacturer’s recommendations. Fold excess fabric at corners to lay flat against sides of structure, securing folds and seams with staples or similar methods.
- C. Identify locations of inlet, outlet, inspection ports, and any other penetrations of the liner, securing pipe into prefabricated boots with stainless steel pipe clamps. Support pipe in trenches and during backfill operations to prevent damage to liner or pipe.
- D. With chambers greater than 4 feet deep, place piles of cover material over closed chamber top surface along the edge of the chamber to provide vertical load on perimeter cells. This will ensure compression of the columns and aid in resistance to side pressures from backfill operations.

- E. Use a powered mechanical compactor to conduct backfill operations on structure sides with care to avoid damage to liner while providing required compaction forces to the top level of the structure.
- F. Place a geogrid layer over the top of the structure, extending beyond the outside edge of the excavation by at least 40". Any joints must be overlapped by a minimum of 12".
- G. Place sufficient sandy gravel backfill material over geogrid to ensure support of design loads. Place cover backfill in 6" lifts and compact with vibrating plates or walk-behind rollers (do not use drivable rolling compactors) to a minimum of 95%, with a minimum depth of 12" and a maximum depth of 36". Take care to place backfill on top of structure and avoid damage to structure or liner, using low pressure tire or track vehicles.
- H. Ensure that all non-chamber construction traffic be kept away from the limits of excavation until the project is complete and final surface materials are in place.
- I. Place surfacing materials, such as groundcovers (no shrubs or trees), or paving materials over the structure with care to avoid displacement of cover fill and damage to surrounding areas.
- J. Any slopes creating additional overburden above the underground detention system should be carefully located. The toe of said slope should be 10' away from the closest edge of the underground detention system. This will prevent any additional earth pressure on the underground detention system.

3.5 CLEANING

- A. Perform cleaning during the installation of work and upon completion of the Work. Remove from site all excess materials, debris, and equipment. Repair any damage to adjacent materials and surfaces resulting from installation of this work.

This Page Intentionally Left Blank

SECTION 334713

WETLAND LINERS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

1.2 SUMMARY

- A. The work specified in this Section consists of the labor, equipment, tool, materials, and services needed to install the wetland liner shown on the Contract Drawings or as directed by the Commissioner.
- B. Installation of Wetland Liner includes, but is not limited to, coverage of subgrade in Wetland Cells 1 through 9.
- C. Related Sections
 - 1. Section 312000 – Earthwork
 - 2. Section 327200 – Plantings for Wetland Areas

1.3 REFERENCES

- A. American Society for Testing and Materials (ASTM)
 - 1. ASTM D 638 – Standard Test method for Tensile Properties of Plastics
 - 2. ASTM D 1004 – Test Method for Initial Tear Resistance of Plastic or Film Sheeting
 - 3. ASTM D 2216 – Test Method for Laboratory Determination of Water (Moisture) Content of Soil, Rock, and Soil-aggregate Mixtures
 - 4. ASTM D 4354 – Standard Practice for Sampling of Geosynthetics for Testing
 - 5. ASTM D 4643 – Standard Test Method for Determination of Water (Moisture) Content of Soil by the Microwave Oven Method
 - 6. ASTM D 4759 – Standard of Practice for Determining the Specification Conformance of Geosynthetics
 - 7. ASTM D 4833 – Standard Test Method for Index Puncture Resistance of Geotextiles, Geomembranes and Other Related Products
 - 8. ASTM D 5084 – Test Method for Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter
 - 9. ASTM D 5199 – Measuring Nominal Thickness of Geotextiles and Geomembranes

10. ASTM D 5321 – Standard Test Method for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic and Geosynthetic Friction by the Direct Shear Method
11. ASTM D 5887 – Test Method for Measurement of Index Flux through Saturated Geosynthetic Clay Liner Using Flexible Wall Permeameter
12. ASTM D 5888 – Identification, Storage, and Handling of Geosynthetic Clay Liners
13. ASTM D 5889 – Standard Practice for Quality Control of Geosynthetic Clay Liners
14. ASTM D 5890 – Test Method for Swell Index of Clay Mineral Component of Geosynthetic Clay Liners
15. ASTM D 5891 – Standard Test Method for Fluid Loss of Clay Component of Geosynthetic Clay Liners
16. ASTM D 5993 – Standard Test Method for Measuring Mass Per Unit Area of Geosynthetic Clay Liners
17. ASTM D 6102 – Standard Guide for Installation of Geosynthetic Clay Liners
18. ASTM D 6243 – Standard Test Method for Determining the Coefficient of Soil and GCL or Geosynthetic and GCL Friction by the Direct Shear Method
19. ASTM D 6496 – Standard Test Method for Determining Average Bonding Peel Strength Between the Top and Bottom Layers of Needle-Punched Geosynthetic Clay Liners
20. ASTM D 6768 – Standard Test Method for Tensile Strength of Geosynthetic Clay Liners
21. ASTM E 96 – Standard Test Methods for Water Vapor Transmission of Materials

1.4 DEFINITIONS

- A. Bentonite – Clay soils comprised primarily of sodium montmorillonite, characterized by high swelling potential and low hydraulic conductivity.
- B. Construction Quality Assurance (CQA) Officer – The professional representative of the CQA monitoring firm shall be responsible for implementation of the CQA plan.
- C. Geomembrane – An essentially impermeable membrane of high density polyethylene (HDPE) containing 2 to 3 percent carbon black or titanium dioxide for ultraviolet light resistance.
- D. Geosynthetic Clay Liner (GCL) – Manufactured liner material consisting of a layer of granular bentonite affixed to a minimum average 30 mil thick smooth surface HDPE or LLDPE geomembrane liner by chemical adhesives.
- E. Lot – Group of consecutively numbered rolls from the same manufacturing line.

- F. Minimum Average Roll Value (MARV) – The minimum average value of a particular physical property of a material.
- G. Overlap – The width of material of a GCL panel in contact with an adjacent GCL panel. The distance measures perpendicular from the overlying edge of one panel to the underlying edge of the other.

1.5 SUBMITTALS

A. LEED submittal requirements

1. For all installed products and materials of this section, complete the Materials Reporting Form (blank copy attached at end of Section 018113 Sustainable Design Requirements). Information to be supplied for this form shall include:
 - a. Cost breakdowns for the materials included in the Contractor or subcontractor's work. Cost breakdowns shall include total installed cost and material-only cost.
 - b. The percentages (by weight) of post-consumer and/or post-industrial recycled content in the supplied product(s).
 - c. Indication of whether the manufacturing location of the supplied product(s) is within 500 miles of the project site.
 - d. Indication of the exact distance (in miles) from the location of where the product(s) have been extracted, harvested or recovered, and manufactured.
2. For all field-applied adhesives, sealants, paints and coatings relating to work of this Section that are used on the interior of the building (defined as inside of the waterproofing system), complete the VOC REPORTING FORM (blank copy attached at end of Section 018113 Sustainable Design Requirements). For each product listed, indicate the Volatile Organic Compound (VOC) content in grams/liter or lbs/gallon.
3. Provide back-up documentation to validate information provided on the MATERIALS and VOC REPORTING forms, except Cost data. For each material listed on the Forms, provide documentation to certify each of the material attributes (e.g., recycled content, VOC content).
4. Provide cut sheets with the Contractor's or subcontractor's stamp, confirming that the submitted products are the products installed in the Project.
5. The LEED Submittal information outlined above shall be assembled into one (1) package per Specification section or subcontractor. Two (2) copies of the submittal are required. Incomplete or inaccurate LEED Submittals may be used as the basis for rejecting the submitted products or assemblies.
6. LEED Performance Requirements
 - a. Material specified in this section shall contain recycled content, as available (the percentage of recycled content is based on the weight of the component materials). Certification and submittal of recycled content shall be in accordance with Division 1 General Requirements.

- b. Materials fabricated within, and containing raw materials extracted within 500 miles of the project site shall be documented in accordance with Division 1 General Requirements.
- B. Product Data: Submit the following to ENGINEER prior to shipping material to the site.
 - 1. Geomembrane
 - a. Certification stating that the geomembrane meets the product requirements.
 - b. Copy of quality control tests performed by geomembrane supplier (if different from MANUFACTURER).
 - c. Copy of quality control tests performed by MANUFACTURER.
 - 2. Bentonite
 - a. Certification stating that the bentonite meets the product requirements.
 - b. Copy of quality control tests performed by bentonite supplier (if different from MANUFACTURER).
 - c. Copy of quality control tests performed by MANUFACTURER.
 - 3. GCL
 - a. Certification stating that the GCL meets the product requirements.
 - b. Copy of quality control tests performed by MANUFACTURER.
 - c. Permeability testing on typical product.
 - d. Laboratory test data on typical product for Free Swell (ASTM D 5890).
- C. Qualifications (INSTALLER): Submit the name of INSTALLER, resume of installation supervisor/field engineer to be assigned to the project, and list of projects completed by INSTALLER that involved geomembranes supported GCLs.
- D. Submit Quality Control Plan and Installation Procedures (MANUFACTURER) three (3) weeks prior to installation, including:
 - 1. Copy of MANUFACTURER's quality control plan including list of quality control tests performed and typical testing frequencies.
 - 2. Recommended installation procedures.
 - 3. Panel layout drawing identifying panels and overlaps.

1.6 QUALIFICATIONS

- A. INSTALLER shall meet the following requirements:
 - 1. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening, have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
 - 2. Installer shall have experience in constructing wetland lining/closure projects using GCL products.

1.7 QUALITY ASSURANCE

- A. The Commissioner will engage the services of a CQA officer, and Construction Quality Assurance (CQA) Laboratory for monitoring the quality and installation of the GCL unless otherwise specified.
- B. The INSTALLER shall aid the CQA officer in the product sampling by providing personnel and equipment necessary to move, cut and protect GCL rolls and panels.

1.8 DELIVERY, STORAGE AND HANDLING

- A. General: Conform to the MANUFACTURER's requirements and ASTM D5888 unless otherwise specified.
- B. Delivery
 - 1. Deliver material to the site only after the CQA Officer accepts required submittals.
 - 2. Material shall be covered with a waterproof, tightly-fitting, plastic covering resistant to ultraviolet degradation.
 - 3. Ship less than one month prior to scheduled installation.
 - 4. Each roll shall be marked with the following information:
 - a. manufacturer's name;
 - b. product identification;
 - c. lot or batch number;
 - d. roll number; and
 - e. roll dimensions
- C. Storage
 - 1. Store rolls in space allocated by ENGINEER. Space should be at high ground level or elevated above ground surface.
 - 2. Stack no more than 3 rolls high.
 - 3. Protect rolls from precipitation, other sources of moisture, mud, dirt, dust, puncture, cutting or any other damaging or deleterious conditions.
 - 4. Preserve integrity and readability of roll labels.
- D. Handling
 - 1. Use appropriate handling equipment to MANUFACTURER's recommendations to load, move, or deploy GCL rolls.
 - 2. Handling of rolls shall be done in a competent manner such that damage does not occur to the product or to its protective wrapping. Follow handling procedures outlined in ASTM D 5888.

3. Damage to protective covering due to mishandling or sampling must be repaired immediately. Repairs shall be such that the GCL roll is protected from moisture or other deleterious conditions.
4. INSTALLER is responsible for off-loading, storage, and transporting material from storage area to installation site

1.9 MOCK UP

- A. Wetland Liner shall be included in Mock Up. Mock Up shall be as determined by Commissioner and be approximately 2500 sq feet and located on the site. Mock Up shall be built at least 1 year prior to wetland cell system construction.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. GSE Environmental, LLC., Houston, TX
GundSeal Smooth HDPE Geosynthetic Clay Liner (GCL).
- B. CETCO Lining Technologies, Hoffman Estates, IL
Bentomat ST Standard Reinforced GCL
- C. Or approved equal.

2.2 GENERAL PROPERTIES

- A. The GCL and its components shall exhibit properties and testing that meet or exceed the minimum average values shown in Table 1A.
- B. No GCL shall be installed until the requirements of this Section have been met, and approval of Engineer has been obtained.
- C. Overlap guideline, minimum 6 inches, shall be imprinted on one edge of the component of the GCL to be placed upward in the field as a means for providing quality assurance of the overlap dimension. Lines shall be printed in easily visible, non-toxic ink.

2.3 GEOMEMBRANE SUPPORTED GCL MATERIAL PROPERTIES

- A. Meet the requirements of Table 1A or approved equal.

Table 1A: Geosynthetic Clay Liner (Smooth HDPE)

TESTED PROPERTY		TEST METHOD	FREQUENCY						MINIMUM AVERAGE VALUE
FINISHED GCL PROPERTY			15 mil	20 mil	30 mil	40 mil	60 mil	80 mil	
Bentonite Coating ¹ , lb/ft ² (kg/m ²)	ASTM D 5993	1/40,000 ft ² (1/4000 m ²)	≥ 0.75 (3.66)

PART 3 EXECUTION

3.1 INSTALLATION

- A. Examine substrates, with Installer present, for compliance with requirements for soil compaction and grading; for subgrade free from angular rocks, rubble, roots, vegetation, debris, voids, protrusions, and ground water; and for other conditions affecting performance of geomembrane liner.
- B. Examine anchor trench excavation and concrete perimeter, where geomembrane liner will be secured, for substrate conditions indicated above and for correct location and configuration.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Provide temporary ballast, until edges are permanently secured, that does not damage geomembrane liner or substrate, to prevent uplift of geomembrane liner in areas with prevailing winds.
- B. Prepare surfaces of construction penetrating through geomembrane liner according to geomembrane liner manufacturer's written instructions.
- C. Remove curing compounds and coatings from concrete surfaces to be sealed to geomembrane liner.

3.3 INSTALLATION

- A. General: Place geomembrane liner over prepared surfaces to ensure minimum handling. Install according to Shop Drawings and in compliance with geomembrane liner manufacturer's written instructions. Begin placing geomembrane liner at Project's upwind direction and proceed downwind. Install geomembrane liner in a relaxed condition, free from stress and with minimum wrinkles, and in full contact with subgrade. Do not bridge over voids or low areas in the subgrade. Fit closely and seal around inlets, outlets, and other projections through geomembrane liner. Permanently secure edges.
- B. Field Seams: Comply with geomembrane liner manufacturer's written instructions. Form seams by lapping edges of panels 2 to 4 inches unless instructions require a larger overlap. Wipe contact surfaces clean and free of dirt, dust, moisture, and other foreign materials. Use solvent-cleaning methods and grind geomembrane seam surfaces if recommended by geomembrane liner manufacturer. Proceed with seaming at required temperatures for materials and ambient conditions. Continuously bond sheet to sheet to construct single or double seams of width recommended for method of seaming used. Seal or fuse free seam edges. Inspect seams and reseal voids.
 - 1. Use bonding technique recommended by geomembrane liner manufacturer. Apply pressure to smoothly bond surfaces together. Examine for and patch wrinkles and fishmouths.

3.4 ADJUSTING AND CLEANING

- A. Repair damaged and defective work where possible to eliminate functional and visual defects; where not possible to repair, replace wetland liner.

3.5 PROTECTION

- A. Provide final protection and maintain conditions in a manner acceptable to fabricator and Installer that ensures that wetland liner is without damage or deterioration at the time of Substantial Completion.
- B. Repair or replace areas of geomembrane liner damaged by scuffing, punctures, traffic, rough subgrade, or other unacceptable conditions.
- C. Before initial filling of pond or placement of earth cover, inspect seams and patched areas to ensure tight, continuously bonded installation. Repair damaged geomembrane and seams and re-inspect repaired work.

3.6 MATERIAL INSTALLATION PROCEDURES

- A. General: The GCL installation should follow general guidelines provided by ASTM D 6102 unless otherwise specified.

3.7 PREPARATION OF FOUNDATION LAYER SURFACE

- A. The foundation soil layer surface shall be rolled to a smooth level surface, be free of stones typically greater than 0.50 inch diameter, and prepared as otherwise specified in Section 312000 – Earthwork.

3.8 GCL PLACEMENT

- A. Once the subgrade is accepted by the INSTALLER and approved by ENGINEER, GCL rolls shall be delivered to the working area in their original packaging. Immediately prior to deployment, the packaging shall be carefully removed without damaging the GCL. The GCL shall be placed such that the geomembrane side of the GCL faces upward.
- B. Equipment used to deploy the GCL must be track or rubber tired with 40 psi (2 kPa) maximum ground pressure and is subject to approval by the ENGINEER. Equipment shall not cause rutting of the subgrade surface, shall not make sharp turns, and shall not be driven over the GCL, unless proper demonstration of GCL survivability and approval of ENGINEER can be obtained. Any damage to the subgrade or the GCL shall be the responsibility of the CONTRACTOR to replace or put back to the pre-installation conditions.
- C. Care shall be taken to minimize the extent to which the GCL is dragged across the subgrade in order to avoid damage to the GCLs bentonite surface. A temporary geosynthetic subgrade covering slip sheet or rub sheet may be used, as necessary, to reduce friction damage during placement.
- D. Care shall be taken to not entrap objects or moisture beneath the GCL.
- E. The individual deployed rolls (panels) shall be placed so that overlapping edges are parallel to the direction of the slope. The panels shall be placed to ensure a minimum overlap of minimum 6 inches between panels.

- F. All GCL shall be placed and maintained flat on the underlying surface, with no wrinkles or folds, especially at the exposed edges of the panels.
- G. All exposed bentonite (product deployed bentonite side up) GCL panels shall be covered the same day as they are deployed with a geomembrane or equivalent.
- H. Product deployed geomembrane side up, bentonite side down, shall be ultimately covered with a minimum 12 inches thick layer of cover soil within one week of deployment.
- I. If the bentonite becomes hydrated before the cover soil layer is placed, it shall be tested and replaced, as necessary, to meet the specified maximum allowable moisture contents listed (generally $\leq 30\%$).
- J. On the side slopes, the GCL shall first be anchored securely, at the top of the slope, and then deployed down the slope in a controlled continuous manner. The GCL shall extend continuously from the top to the toe of the slope unless otherwise directed by the CQA Monitor.
- K. During windy conditions, the GCL edges shall be weighted down, if necessary, with a sufficient number of filled sandbags or underlying soil material to prevent damage to the GCL.
- L. The GCL material shall be cut with a sharp utility knife with a hook blade, or other approved device. Do not damage adjacent or underlying materials while cutting the GCL.
- M. The INSTALLER shall examine the GCL surface and remove any harmful foreign objects.
- N. Do not install GCL during periods of rain or in areas of ponded water or unusually moist soils.

3.9 GCL PLACEMENT

- A. The minimum dimension of the longitudinal overlap shall be 6 inches. End-of-roll overlapped seams shall be similarly constructed, with a minimum overlap of 12 inches in all directions. Do not sew or use mechanical connections to hold the panels together. No additional granular bentonite is required for the GCL overlap areas.
- B. Seams at the ends of the panels shall be constructed such that they are shingled in the direction of the grade to prevent the potential for runoff flow to enter the overlap zone.

3.10 DETAIL WORK

- A. The GCL shall be sealed around any penetrations and embedded structures in accordance with the Construction Drawings and the GCL MANUFACTURER's recommendations.

3.11 DEFECTS AND DAMAGE REPAIR

- A. If the GCL is defective or damaged (torn, punctured, perforated, etc.) during installation, it may be possible to repair it by cutting a patch to fit over the damaged

area. The patch shall be obtained from a new GCL roll and shall be cut to size such that a minimum overlap of 12 inches is achieved around all of the damaged area. The patch shall be placed with the bentonite side down. Adhesion tape may be used to hold the patch in place, while cover soil is being placed.

3.12 FIELD QUALITY CONTROL AND QUALITY ASSURANCE

A. General

1. Field quality control is the responsibility of the INSTALLER. The INSTALLER must document that the installation proceeds in accordance with the requirements of this Specification Section.
2. Field construction quality assurance (CQA) is the responsibility of the Commissioner's authorized representatives who shall be assisted by the INSTALLER. CQA consists of inspections, field-testing, laboratory testing, and record keeping.

B. During Installation, the INSTALLER, along with the Commissioner's authorized CQA representatives, shall inspect:

1. Material Storage and Handling: Verify that the material is carefully unloaded and protected against ground moisture, rainfall, and other damaging conditions. Material should be stored and handled in accordance with ASTM D 5888. Wetland liner rolls should be stored in a well-drained area and covered with a tarpaulin or equivalent until the time of deployment.
2. Bentonite Moisture Content: Verify that the delivered product has a moisture content less than the maximum allowed by project specifications. If not otherwise specified, the bentonite coating of wetland liner should have a moisture content up to approximately 30% during installation and soil covering activities. The bentonite can be air-dried or sun-dried just prior to installation if necessary for localized areas of elevated bentonite moisture or hydration. Hydrated areas of bentonite should be covered with wetland liner patch or, alternately, removed.
3. Subgrade: Verify that the subgrade is relatively smooth and uniform. The subgrade should be free of any objects greater than 0.75 inch unless otherwise specified. Final preparation of the subgrade surface may include smooth grading and/or smooth drum rolling the surface. Any surface objects greater than 0.75 inch should be removed by scarifying the surface by manually removing unsuitable objects.
4. Overlapped Seams: Verify that the material is installed and aligned with the proper overlap distance between panels. Minimum standard lengthwise overlap distance is 6 inches and minimum standard widthwise overlap distance is 1 foot. Overlap distance should be adjusted for site specific subgrade conditions. Welded Geomembrane Seams. When the wetland liner geomembrane backing seams are fusion or extrusion welded, standard installation procedures, CQA practices, and seam testing procedures should be utilized as outlined in the *GSE Geomembrane Installation Quality Assurance Manual*.
5. Bentonite Prehydration: For applications that require prehydration of the bentonite at seam overlap areas and adjacent to structures, ensure the bentonite is adequately prehydrated. This should be accomplished by unfolding and exposing overlap

seam areas and structures after the material is installed and subsequently liberally spraying the bentonite coating with tap water. In addition to spraying the bentonite coating of exposed contact areas, the structure surface and overlap geomembrane backing should also be prehydrated as the bentonite coating of the GCL. Compatibility of the bentonite with the hydrating liquid (other than tap water) should be verified with a bentonite free swell test (ASTM D 5890 or a simplified variation).

6. Repairs and Patches: Verify that the installed material is not damaged. For isolated areas where the geomembrane backing is punctured or torn, or where the bentonite coating has been dislodged during installation, the area should be patched. Patches with wetland liner should be placed over the damaged area with the bentonite coating directly against the damaged area. Patches should extend a minimum 1 foot outward around the perimeter of the damaged area.
7. Dislodging of the Bentonite Coating: Verify that the wetland liner product is deployed and covered in a manner that does not scrape or dislodge the bentonite coating. To add protection to the bentonite layer of wetland liner, a thin spunbonded geotextile is attached to the bentonite surface to minimize the potential for dislodging and/or scraping the bentonite layer during installation. In areas where the bentonite coating has been scraped or dislodged, bentonite should be replaced by patching the affected area. For dislodged bentonite at roll edges resulting from material handling, the overlap distance should be increased to account for the bentonite loss.
8. Debris in the Overlapped Seams: Verify that no soil or other debris migrates into wetland liner overlap seams, or between wetland liner and the overlying geomembrane in an encapsulated mode.
9. Material Wrinkles and Fishmouths: Verify that the deployed wetland liner liner does not contain wrinkles or fishmouths. Wrinkles that cannot be pulled out manually should be (1) patched or (2) cut out and the area subsequently patched. Patches are made from the same base wetland liner material with the same specified overlap distances extending around the affected area(s).
10. Attachment to Structures: Verify the material is attached to structures (such as pipes, concrete foundations, and steel tanks) in accordance with the manufacturer's recommendations.
11. Material Anchorage at Slopes: Verify the material is properly anchored adjacent to slopes in accordance with the project design details.
12. Bentonite Protection Deployed Bentonite Side Up: When wetland liner is installed in an encapsulated mode (e.g., deployed with the bentonite side up with a separate overlying geomembrane), verify that all exposed bentonite is covered with the overlying geomembrane at the end of each workday. This will effectively protect the bentonite from premature hydration from stormwater run-off. The overlying geomembrane should be secured with ballast sandbags, or equivalent, around the perimeter of the wetland liner panel.
13. Bentonite Protection Deployed Bentonite Side Down: When wetland liner is installed bentonite side down (geomembrane side up), no additional daily covering is necessary to protect the bentonite. Caution should be taken, however, to protect

the exposed perimeter panel edges from water pooling and subsequently flowing below the liner. This can be accomplished by confirming the perimeter of the deployed wetland liner material lies flat and in intimate contact with the subgrade soil by manually adjusting material. Alternately, temporary ballast, such as sandbags or soil, may be placed on top of the wetland liner material in areas to prevent material bridging over the subgrade.

- C. During soil cover operations, the INSTALLER, along with the Commissioner's authorized CQA representatives, shall inspect:
1. Material Inspection: The Commissioner's authorized CQA representatives shall inspect each panel of GCL placed before the GCL is covered.
 2. General Soil Cover Operations: Verify that wetland liner is covered with soil
 - 1). in a timely manner,
 - 2). in a careful manner, and
 - 3). with adequate soil thickness ≥ 1 foot
 3. Subgrade Moisture Conditions: The following general recommendations are provided for moisture characteristics of soils, the intent being to cover the wetland liner before bentonite migration/displacement due to construction would cause concern:
 - a. If the subgrade is relatively dry (approaching the "wilting point" moisture content that makes it difficult for vegetation to grow), wetland liner should be covered within five days.
 - b. If the subgrade is damp to moist (approaching the "field capacity" moisture content that allows lush vegetation), wetland liner should be covered within three days.
 - c. If the subgrade is moist to wet (approaching saturation), it is advisable to cover wetland liner by the end of the following day.
 4. CQA Observation of Soil Cover Operations: Verify that the soil spreading operations are performed in accordance with the specifications and do not cause damage to the lining system.
 5. Contractor Observation of Soil Cover Operations: In the absence of CQA monitoring during soil cover operations, the contractor performing soil covering should provide a ground person in front of the spreading activities at all times. The primary responsibility of the ground person is (a) to establish and maintain adequate grade control of the cover soil layer, (b) to manually reduce or flatten wrinkles in the installed liner in advance of soil spreading, and (c) to identify and caution against any potential damage to the lining system.
- D. The INSTALLER and the OWNER's authorized CQA representatives shall verify proper installation procedures are followed for all other specified installation precautions.
- E. The INSTALLER shall aid the Commissioner's authorized CQA representatives in collecting samples for testing as follows:
1. According to the requirements of the CQA Plan.

2. Each conformance sample shall be a minimum of 2 feet long and run the entire width of the roll.
3. Under direction of the Commissioner's authorized CQA representatives, the INSTALLER shall mark the roll number and machine direction on each sample.

F. Field Testing:

1. The Commissioner's authorized CQA representatives shall conduct the following conformance tests:
 - a. moisture content (ASTM D 2216)
 - b. mass per unit area (ASTM D 5993)
2. Reported values shall be the average of 5 specimens taken from the sample.
3. If field testing passes (meets the requirements of Table 1), the remaining portion of the sample shall be sent to the CQA laboratory.

G. Laboratory Testing:

1. The following laboratory tests shall be conducted on samples passing field testing:
 - a. moisture content
 - b. mass per unit area (bentonite)
 - c. thickness (geomembrane only)
 - d. permeability (one test only on bentonite for the entire project) or fluid loss

H. In-place moisture content

1. Samples of delivered GCL will be collected and tested for moisture content at the rate of 1 sample per 100,000 square feet.
2. This rate of sampling may be increased, at the discretion of the Commissioner's authorized CQA representatives.
3. The Commissioner's authorized CQA representatives will take samples.
4. Samples shall be minimum of 4 inches x 4 inches roll width.
5. The average moisture content should be 25% (as delivered to the site) and less than 30% during installation minus adhesive content, prior to completed placement of the final cover soil or panel sections will be unconditionally rejected and:
 - a. Bentonite portion allowed to sun dry or mechanically dried to the proper moisture content
 - b. New samples will be taken 50 feet in either direction along the roll length (or at the end of the roll, if less than 50 feet away).
 - c. The entire 100 feet long section of the roll between the new samples will be removed and replaced, following manufacturer's recommended repair procedure). The Commissioner's authorized CQA representatives shall determine the width of the removed segment.

3.13 GCL ACCEPTANCE

- A. The INSTALLER shall retain ownership and responsibility of the GCL until the ENGINEER accepts it.
- B. The ENGINEER will accept the GCL installation after:
 - 1. All required documentation from the MANUFACTURER and INSTALLER has been received and accepted.
 - 2. Test reports verifying material properties have been received and accepted by the Commissioner's authorized CQA representatives.
 - 3. The Commissioner's authorized CQA representatives have completed final inspection and confirms that all noted defects have been repaired.

SECTION 1

INTRODUCTION

1.1 PURPOSE

This Report describes the subsurface exploration program for the design of the Croton Water Treatment Plant, which will be located at the Mosholu Golf Course Driving Range in Van Cortlandt Park, Borough of the Bronx, City of New York.

1.2 BACKGROUND

The Croton water system is the earliest developed of the three New York City upland water supplies. Water is drawn from the Croton Lake Gate House and discharged into the New Croton Aqueduct for transmission to New York City. Water flows by gravity through the aqueduct to Jerome Park Reservoir, a distribution reservoir in the Borough of the Bronx, where Croton water enters the New York City distribution system.

The Mosholu Golf Course Driving Range was selected in December 1998 from eight alternative sites by the NYC Department of Environmental Protection to be the location of the Water Treatment Plant for treating the Croton water supply. The Golf Course, owned by NYC Department of Parks and Recreation, is located in the southeastern corner of Van Cortlandt Park.

The course was established and created from park land in 1914, and is currently being leased to a private concessionaire. In 1989, the original 18-hole golf course was re-landscaped and opened as a 9-hole course with a practice driving range. The Water Treatment Plant along with Raw Water, Finished Water and Backwash Pumping Stations and a Treated Water Reservoir will all be located beneath the Driving Range.

1.3 EXISTING GEOLOGIC CONDITIONS

The Borough of the Bronx is located in the Manhattan Prong Portion of the New England Upland Physiographic Province and underlain by tightly folded Pre-Cambrian metamorphic rock formations. The topography in this area is largely a product of preglacial stream erosion, modified somewhat by glacial erosion and deposition. It is mainly characterized by parallel, linear ridges and valleys having a northeasterly trend. The oldest formation is the Fordham Gneiss, a nearly-massive banded rock of complex composition and structure, which generally underlies the areas of high reliefs in the western portion of the Bronx where the Mosholu Golf Course is located. The other formations in the Bronx are the Inwood Marble, which, in the western portion, underlies the low areas, and the Manhattan Schist, which underlies the eastern two-thirds of the borough. These latter two formations are not present at the Project site.

Generally, the Fordham Gneiss Formation is exposed or is relatively close to the surface, overlain by Upper Pleistocene deposits. These deposits consist chiefly of glacial fluvial stratified sediments, largely outwash sand and gravel that have accumulated in depressions on the bedrock, locally including beds of reddish silt, as well as of unstratified drift deposited as ground moraine (till) over the bedrock or stratified deposits of outwash. Weathering has locally affected the upper bedrock portion, forming a saprolitic horizon (decomposed rock) above the partly weathered or unweathered bedrock. Saprolite can be described as a dense, soil-like material grading from silts to sands, where relict rock structures are retained with less than 10 percent corestones, and is often micaceous. Since the till and saprolitic materials are often difficult to differentiate in samples recovered by subsurface drilling, they are commonly considered as a single unit for design purposes.

1.3.1 Existing Site Features

At the Mosholu Golf Course, bedrock belonging to the Fordham Gneiss Formation is present beneath the outwash soil and till layers over all of the project site. The site consists of gentle slopes on the driving range with large tracts of woodland areas along

the perimeter. In general, the subsurface conditions at the site can be summarized as follows:

- Surficial Soils. These soils consist of 0 up to 34 feet of silty sand, with occasional sandy silt and boulders, variable in color, and their consistency varies, in general, from loose to medium dense (SM, SP-SM, 6-65 and 7-65 soil classes as per the New York City Building Code Numerical Classification System). They also may include organic matter and a few boulders in the upper 2 feet (Class 11-65).
- Glacial Soil. A medium dense to very dense glacial till consisting of well graded silty sand, gravel, cobbles, and boulders (SM and GM, SP-SM and GP-GM, Classes 6-65 and 6-65/5-65), generally underlies the surficial soils. Imported fill or reworked till may overlay the till.
- Saprolitic Soil. Pockets of dense to very dense saprolite as thick as 10 feet are locally encountered above the partly weathered or unweathered bedrock.
- Bedrock. The overburden soils described above are underlain by bedrock from the Fordham Gneiss Formation, consisting of a foliated light-to-medium gray muscovite-biotite-plagioclase-quartz-gneiss locally transitioning to an amphibolitic or a quartz-banded gneiss, which is weathered and fractured at various degrees and depths. The depth to bedrock varies from 4 to 40 feet, averaging 15 feet. Typically, bedrock quality improves with depth, achieving Class 2-65 to 1-65.

1.4 EXPLORATION PROGRAM

The subsurface exploration program consisted of 51 test borings, 35 air-track borings, and 10 test pits. The location of the test borings, air track borings and test pits are shown on Figure 1-1 bound at the end of the Report. Air track borings were performed to provide additional bedrock elevations between the test borings. Standard operating procedures were established for soil borings, rock coring, soil permeability testing and rock water pressure testing to ensure that each drill crew would follow the same drilling and field testing procedures. The drilling work performed by Warren George Inc., Jersey

City, New Jersey, commenced on January 25, 1999 and ended on March 18, 1999 under the supervision of the Joint Venture personnel.

In order to complete the exploration program on schedule, three to five drill rigs were generally employed at the site. Of the 51 borings completed, 6 boreholes were drilled at a 60° angle (from horizontal). In addition, 8 borings utilized oriented-rock coring techniques. Fifteen piezometers with porous points and one monitoring well with a well screen were completed. Three boreholes contain double piezometers with the porous points installed at different elevations in order to verify groundwater continuity between the overburden soil and bedrock.

The soil samples and rock cores recovered during the exploration program are presently stored in the Jerome Pumping Station, Bronx, New York.

SECTION 2

SUBSURFACE EXPLORATION PROGRAM

2.1 TEST BORINGS

The exploration program included drilling 51 borings and associated in-situ and laboratory testing of the soil and rock. The borings generally extended 10 feet below proposed subgrade with a minimum of 5 feet into competent rock. The test boring logs are presented in Appendix A of this Report. Specifically, the drilling program was planned to obtain information on:

- The depth and quality of bedrock in the area of the proposed Water Treatment Plant;
- The nature and extent of the overburden materials encountered;
- The permeability of the overburden soil and rock mass;
- The groundwater conditions and gradient;
- The variation in the strength of the rock mass;
- The orientation of the foliation and joints in the rock mass.

A summary of the subsurface exploration including the location, elevation, depth and in-situ tests performed in each boring is presented in Table 2-1.

2.1.1 Soil Samples

The borings were advanced using standard geotechnical procedures. A 4-inch casing was typically driven or spun to the sampling depth and cleaned out with a tricone roller bit. Standard 2-foot long split spoon samples were obtained continuously to 10 feet starting at the ground surface and every 5 feet thereafter, to the top of rock in accordance with ASTM Standard D-1586. The number of blows required to drive the sampler each 6-inch interval was recorded over a depth of 2 feet for each soil sample taken. All samples were

* Overburden includes topsoil or asphalt

60-degree angle boring, all depths and elevations corrected to vertical

Note: All elevations presented refer to the mean sea level at Sandy Hook, NJ, as established by the US Coast and Geodetic Survey

the Unified Soil Classification and the New York City Building Code Numerical Classification System (Sections 27-675 and 27-678, Table 11-2).

2.1.2 Rock Cores

Continuous NQ-size rock cores (1 7/8-inch sample diameter) were recovered in bedrock. The depth to bedrock and the amount of rock cored are shown in Table 2-1. Generally, 10-foot double tube core barrels were used. The percent recovery and Rock Quality Designation (RQD) were also calculated for each core run. The rock core obtained from the borings were described in detail and classified using the New York City Building Code Numerical Classification System (Sections 27-675 and 27-678, Table 11-2). Description and classification of recovered rock cores were based on the following criteria: recovery, RQD, fracture spacing, hardness of the rock and degree of weathering. Generally, the core recovery and RQD throughout the site was good to very good.

Six boring were completed at a 60° angle (from horizontal). In addition, 8 borings were completed using oriented-rock coring procedures in order to determine the strike and dip of the foliation and joints within the core.

2.1.3 Oriented Cores

Oriented cores were recovered during the exploration program in order to determine the joint trend at the Croton Water Treatment Plant site. Approximately 300 feet of oriented core were recovered from eight borings. The information from the oriented cores was plotted on a lower hemisphere projection of an equal area stereonet. A contour of the poles to the joint/foliation planes is shown on the attached figure in Appendix D.

The contour plot shows concentrations of northwesterly trending joints. There is a set of joints trending approximately N60°W, dipping approximately 60° either to the northeast or southwest. There is another group of joints striking N78°W, with a dip of 66° to the northeast.

The oriented core information, as well as the boring logs, indicate that there are numerous shallow dipping joints. As per the oriented core information, this low angle joint set strikes due east with a dip of 15° to the north.

Another concentration of data presented on the contour plot identify a joint set trending N28°E dipping 72° degrees to the northwest.

In summary, the plot indicates a predominance of jointing trending northwesterly, as well as additional sets of joints with the following trend:

N90°E	15°N
N60°W	58°NE
N62°W	60°SW
N78°W	66°NE
N28°E	72°NW

The boring logs indicated that the dip of the foliation varies. Reconnaissance mapping of rock outcrops along the Mosholu Parkway approximately one-half mile from the site indicates that the jointing parallel to the foliation trends approximately N18°W and dips at 80° to the northeast.

2.1.4 Piezometers and Monitoring Wells

A total of 15 piezometers and one monitoring well were installed during the investigation. The piezometers consisted of a 2-foot porous point groundwater intake placed at specific elevations, usually at the proposed elevations of the treatment plant foundations. Three of the 15 piezometers consisted of two porous points set at different elevations in order to verify the relationship of the groundwater encountered in the soil to the groundwater encountered in the bedrock. A monitoring well was constructed next to the wetland area for soil permeability testing. A summary of piezometer and monitoring

well construction data is presented in Table 2-2, Piezometers and Monitoring Wells. The piezometer and monitoring well as-built construction logs are presented in Appendix E.

The piezometers and the monitoring well were installed in selected boreholes upon completion of the borings. The selected boreholes were backfilled with grout to the appropriate depth as required, and a porous point (for the piezometers) or a well screen (for the monitoring well) and risers were placed down the hole. The annular space around the porous point or screen was backfilled with clean sand to two feet above the porous point or screen. A two-foot bentonite seal was placed above the sand and a one-foot pea gravel layer was placed above the seal. The remaining portion of the hole was backfilled with cement grout. The surface casing was sealed into place with a cement and sand mixture. Flush mount casings were installed for the piezometers and the observation well.

Water levels in the piezometers and the monitoring well were obtained weekly during the exploration period. The water level data are presented in Appendix F. The piezometers and the monitoring well were left in place to provide a means for future monitoring of the groundwater table. It is planned to take water level readings approximately once monthly during the design phase of the project.

2.1.5 Grouting of Boreholes

All boreholes, except those completed as piezometers or monitoring wells, were backfilled with cement grout. The majority of the boreholes were not grouted immediately, in order to allow the measurement of water levels after the boring work in the area had been completed. Groundwater measurements were taken from open boreholes generally 1-2 days after completion.

All boreholes were grouted using a Portland cement-bentonite grout of consistency comparable to that of the adjacent soil in overburden and of stiffer consistency in bedrock. The grout was placed in the borehole by tremie method.

2.2 AIR TRACK BORINGS

Air Track borings were performed to provide additional bedrock elevation data between scheduled borings. A total of 35 Air Track borings were completed using a pneumatic rock drill mounted on a tractor chassis. Their locations are shown on Figure 1-1 bound at the end of this Report. The rock drill would penetrate through the soil until a hard surface was encountered. Drilling was extended a minimum of 5 feet into the hard surface to ensure bedrock was encountered and not a boulder. The Air Track boring data are presented in Appendix B.

2.3 TEST PITS

A total of ten test pits were excavated by a backhoe as part of the exploration program. Their locations are shown on Figure 1-1 and the test pit logs are presented in Appendix C. All test pits were backfilled and compacted with the excavated soil immediately after completion. The depth at which test pit digging was stopped was determined by the density of the material at the bottom of the pit, and test pits ended where digging generally became difficult.

2.4 IN-SITU TESTING

The test procedures used for soil permeability testing and water pressure testing in rock are described by the U.S. Bureau of Reclamation in the "Earth Manual," 2nd Edition, 1974.

2.4.1 Falling Head Tests

Falling head permeability tests were conducted in selected cased borings at various depths to determine the permeability of the soil. The tests were conducted by raising the water level in the casing above the static groundwater table and observing the fall of the water surface in the casing as a function of time. The tests were performed in one of two

ways: with soil cleaned out flush with the bottom of the casing; or after a split spoon sample was taken. The tests were continued until no drop in water level was observed or for at least 30 minutes. A summary of the falling head tests performed is presented in Table 2-3. Data for the falling head tests are presented in Appendix G.

2.4.2 Packer Tests

Water pressure testing of bedrock using packers was performed on 11 borings after coring rock to the required final depth. The testing was generally performed using an inflatable double packer assembly, with 2.2-foot long packer bladders. The packer tests were generally performed with a 10-foot test interval in ascending stages from the bottom of the borehole. A single packer was used for the first interval (the bottom of the borehole) and for each consecutive interval until the bedrock would take a measurable quantity of water. Double packers were then used in subsequent intervals moving upwards. Packer tests were performed in boreholes distributed throughout the site so that a range of permeability values could be determined.

A summary of the packer tests performed is presented in Table 2-4. The packer test data are presented in Appendix H.

2.4.3 Slug Tests

Slug tests were performed in monitoring well MG-B51-99 in order to measure the hydraulic conductivity of the fine grained soils encountered. Slug tests are designed to measure an aquifer's response to an instantaneous change in the static water level. These tests were performed using the method described in "A Slug Test for Determining the Hydraulic Conductivity of Unconfined Aquifers with Completely or Partially Penetrating Wells," by Bouwer, Herman and Rice, R.C. 1976, Water Resources Research, Vol. 12, No. 3, pp 423-428 and the Hvorslev method as described in "Time Lag and Soil

Permeability in Groundwater Observations," U.S. Army Corps of Engineers, Vicksburg MS, April 1951.

Water level changes versus time were recorded in the field during the test. After establishing the static water level in the well, a 2-inch diameter, 5-foot PVC "slug" was gently introduced into the well and the water level was then allowed to stabilize (falling head test). Upon recovering the initial water level, the slug was quickly removed and a rising head test performed by recording water level measurements until the recovery of the initial water level was once again achieved. The volume of the slug is approximately 0.45 gallons.

After the slug was removed from the well, the water level change was recorded over time. A total of three falling and rising slug tests were conducted on monitoring well MG-B51-99. A summary of the slug test data and related graphs are presented in Appendix I.

2.5 MATERIALS TESTING

2.5.1 Soil Tests

Laboratory soils testing was performed on 31 split spoon and test pit samples mainly for grain size and moisture content determination. The tests were performed in accordance with the ASTM Standards listed below:

D-422	Method for Particle-Size Analysis of Soils.
D-854	Test Method for Specific Gravity
D-2216	Test Method for Moisture Content
D-4318	Atterberg Limits

The tests were performed by Long Island Materials Testing Laboratories, Inc., College Point, New York, in order to verify the field classification of the soils and evaluate the

various soil parameters. The soil tests performed are summarized in Table 2-5, Soil Testing Summary, and the laboratory test results are presented in Appendix J.

2.5.2 Rock Tests

Laboratory rock testing was performed on selected rock core samples recovered from various borings. The rock tests were performed by Long Island Materials Testing Laboratories, Inc. The testing included unconfined compressive strength, tensile strength, and instrumented unconfined compressive strength with strain measurements. The tests were performed in accordance with the ASTM Standards listed below:

- | | |
|--------|--|
| D-2938 | Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens |
| D-2936 | Standard Test Method for Direct Tensile Strength of Intact Rock Core Specimens |
| D-3148 | Elastic Moduli of Intact Rock Core Specimens in Uniaxial Compression |

A summary of the rock tests is presented in Table 2-6, Rock Tests, and the laboratory test results are presented in Appendix J. It should be noted that since the laboratory tests are performed on small specimens, the results are not fully representative of a large rock mass condition, that could be significantly influenced by the discontinuities.

2.6 GROUNDWATER QUALITY ANALYSIS

Groundwater samples from selected piezometers were collected for laboratory analysis to determine groundwater quality for dewatering during construction. The groundwater level was measured for each piezometer to calculate the volume of water it held. The slow recharge of the piezometers precluded the evacuation of the standard three piezometer volumes for groundwater sampling. Consequently, only one volume of groundwater that the piezometer held was evacuated prior to retaining the sample. The

Note: All elevations presented refer to the mean sea level at Sandy Hook, NJ, as established by the US Coast and Geodetic Survey

groundwater samples were submitted to Accutest Laboratories, Dayton, New Jersey for analysis. The analysis performed and the results are presented in Appendix K.

SECTION 3

CONCLUSIONS

The subsurface exploration program was conducted at the Mosholu Golf Course to obtain information on:

- The depth and quality of bedrock in the area of the proposed water treatment plant;
- The nature and extent of the overburden materials encountered;
- The permeability of the overburden soil and rock mass;
- The groundwater conditions and gradient;
- The characteristics of the rock mass, i.e., strength, orientation of foliation, joints and fracture system, weathering;
- Orientation of foliation and joints in the rock mass.

The majority of material recovered was rock belonging to the Fordham Gneiss Formation, generally a light-to-medium gray-banded muscovite-biotite-plagioclase-quartz-gneiss. The bedrock is relatively close to the ground surface, 4 to 40 feet.

The laboratory rock testing indicates a variability in the strength and permeability of the rock mass. The joint spacing is also variable, from close (2 to 12 inches) to wide (greater than 3 feet). However, most RQD's are greater than 80 percent, indicating a good quality rock.

The majority of the overlying soil is till or soil-like decomposed rock (saprolite). Imported fill or reworked till may overlay the till or saprolite. The till and saprolite are compact to very compact, and contain boulders and rock fragments.

SECTION 4 LIMITATIONS

4.1 SUBSURFACE INFORMATION

4.1.1 Interface of Strata

The stratification lines shown on the individual boring logs of the Geotechnical Data Report represent the approximate boundaries between soil and rock types and the transitions may be gradual.

4.1.2 Boring Logs

The boring logs contain factual information on the soil conditions represented by the soil samples and on rock cores recovered for each borehole performed.

4.1.3 Water Levels

Water level readings have been made in the exploration on the dates and conditions stated on the individual logs. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, temperature, and other factors.

4.1.4 Pollution/Contamination

Unless specifically indicated to the contrary in this Report, the scope of the Joint Venture's services was limited only to investigation and evaluation of the geotechnical engineering aspects of the site conditions, and did not include any consideration of potential site pollution or contamination resulting from the presence of chemicals, metals, radioactive elements, etc. This Report offers no facts or opinions related to potential pollution/contamination of the site.

4.1.5 Environmental Considerations

Unless specifically indicated to the contrary, this Report does not address environmental considerations, which may affect the site development, e.g., wetlands determinations, flora and fauna, wildlife, etc. The conclusions and recommendations of this Report are not intended to supersede any environmental conditions. Environmental considerations are described in the Final Environmental Impact Statement for the Croton Water Treatment Plant (NYCDEP, May 1999).

4.2 APPLICABILITY OF REPORT

This Report has been prepared in accordance with generally accepted geotechnical engineering practices for the exclusive use of Metcalf & Eddy/Hazen and Sawyer, A Joint Venture for specific application to the design of the proposed improvements. No other warranty, expressed or implied, is made.

This Report may be referred to in the project specifications for general information purposes only, but should not be used as the technical specifications for the work, as it was prepared for design purposes exclusively.

4.3 REINTERPRETATION OF RECOMMENDATIONS

4.3.1 Changes in Location or Nature of Facilities

In the event that any changes in the nature and design or location of the facilities are planned, the conclusions and recommendations contained in this Report shall not be considered valid unless the changes are reviewed and conclusions of this Report modified or verified in writing.

4.4 USE OF REPORT BY PROSPECTIVE BIDDERS

This Geotechnical Data Report was prepared for the project by Metcalf & Eddy/Hazen and Sawyer, A Joint Venture, and may not be sufficient to prepare an accurate bid. Contractors utilizing the information in the Report should do so with the express understanding that its scope is limited to design considerations.

Well Statistics

Well Id = MG-B51-99

Well diameter = 2 inch schedule 40 PVC 20 slot screen

Well screen interval = 8.0' to 16.0' (8 feet screen length)

Well annular space diameter = 3.5" (NW casing used to set well)

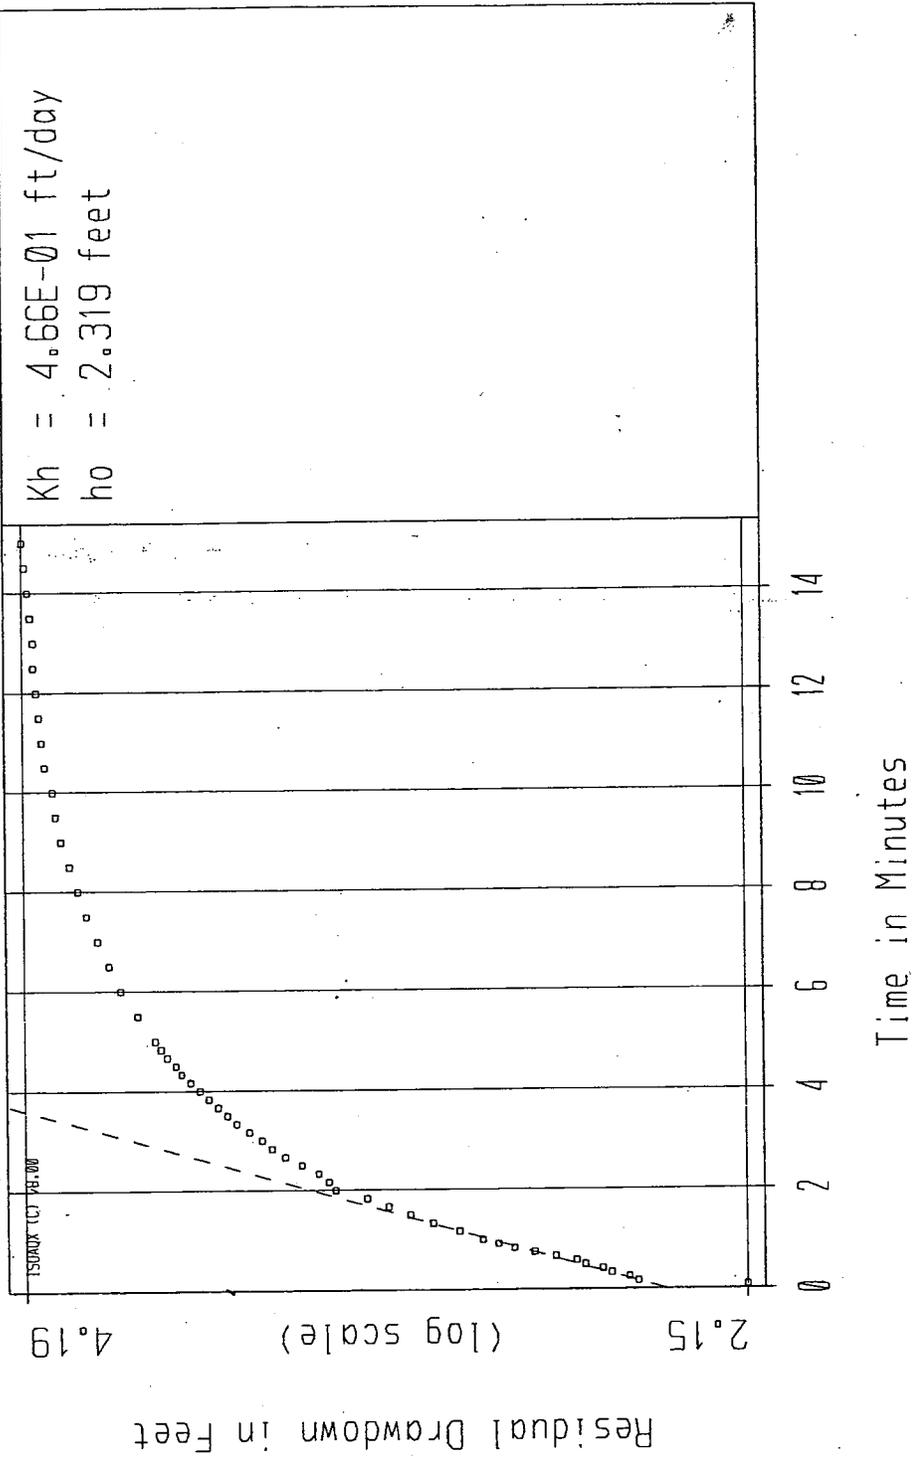

Slug displacement volume = 0.45 gallons

Report No.: 4

Date: April 19, 1999

Client: Metcalf & Eddy of N.Y., Inc./Hazen & Sawyer - J.V.
 Project: CROTON WATER TREATMENT PLANT - HED-543
 (MOSHOLF GOLF COURSE @ VAN CORTLANDT PARK - BRONX, N.Y.)
 Subject: ANALYSIS OF SOIL BORING SAMPLES

Date Samples Rec'd.: March 17, 1999 (P.M.)
 Pick-Up/Delivery By: LIMIL, Inc.

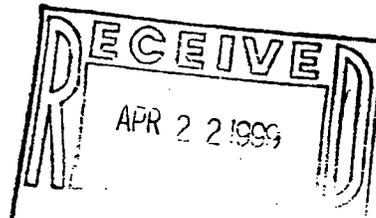

Sampled By: Client

In accordance with your request and direction, soil boring samples were picked up by our personnel and delivered to our laboratory facility for testing. Tests were performed as per report.

MECHANICAL ANALYSIS (ASTM D-422)/MOISTURE CONTENT (ASTM D-2216)/SPECIFIC GRAVITY (ASTM D-854)

Area (sq.in.)	3.14	3.11	2.75	3.08	3.11
Rate of Loading (lbs./min.)	3000				
Total Load (lbs.)	23,600	29,800	38,100	24,900	31,000
Compressive Strength (psi)	7,515	9,580	13,855	8,080	9,970

PROCEDURE A

Young's Modulus, E (ksi)	414	300	880	418	471
Stress Range (psi)	2400-4800	4100-7400	7200-11,600	5200-7500	4000-8000

PROCEDURE B

Poisson's Ratio	0.14	0.34	0.24	0.24	0.10
Stress Range (psi)	3200-5800	4650-6000	3600-6500	3900-6500	2400-5800

CLIENT: Metcalf & Eddy of N.Y.; Inc./Hazen & Sawyer - J.V.
PROJECT: CROTON WATER TREATMENT PLANT - HED-543
(MOSHOLU GOLF COURSE @ VAN CORTLANDT PARK - Bronx, N.Y.)

Report No.: 6
Date: April 29, 1999

SUBJECT: PHYSICAL TESTING OF BORING SAMPLES - ROCK & SOIL

Sample Identification	MG-B8-99	MG-B19-99	
Depth	81.0'-82.0'	68.8'-69.4'	
Moisture Condition	AS RECEIVED		
Height of Specimen (in.)	4.94	4.22	
Diameter (in.)	1.99	1.99	
Area (sq.in.)	3.11	3.11	
Rate of Loading (lbs./min.)	3000		
Total Load (lbs.)	27,700	58,500	
Compressive Strength (psi)	8,910	18,810	

PROCEDURE A

Young's Modulus, E (ksi)	897	479
Stress Range (psi)	3200-8000	7700-12,200

PROCEDURE B

Poisson's Ratio	0.34	0.04
Stress Range (psi)	1600-4800	1,000-18,000

REMARKS: The slope of the axial and lateral curves were determined by taking the average slope of linear portion of the curves within the listed stress range. The compression-positive sign convention was employed in plotting curves.

Title/Cover Page

Deliverable Checklist

Table Of Contents

Section 1 General

- A. Results Summary
- B. Chain of Custody
- C. Laboratory Chronicles

Section 2 GC/MS Support Data (grouped by fraction)

- A. Methodology Review
- B. Conformance/Non-conformance Summary
- C. Surrogate Recovery Results Summary
- D. Matrix Spike/Matrix Spike Duplicate Summary
- E. Method Blank Summary
- F. Tune Results Summary
- G. Calibration Summary (sorted by Instrument)
 - Initial Calibration Check Summary
 - Continuing Calibration Check Summary
- H. Internal Standard Summary
- I. Sample and Blank Chromatograms, Quant Reports, Mass Spectra, and Library Search Data

Section 3 GC Support Data

- A. Methodology Review
- B. Conformance/Non-conformance Summary
- C. Surrogate Recovery Results Summary
- D. Matrix Spike/Matrix Spike Duplicate Summary
- E. Method Blank Summary
- F. Calibration Summary (sorted by Instrument)
 - Initial Calibration Check Summary
 - Continuing Calibration Check Summary
- G. Retention Time Shift Summary
- H. Sample, Blank and Multi-peak Standard Chromatograms and Quant Reports

Section 4 Metals Support Data (sorted by Instrument Type - ICP, Furnace, Flame, Mercury)

- A. Methodology Review
- B. Conformance/Non-conformance Summary
- C. Blank Results Summary
 - Initial and Continuing Calibration Blank Summary
 - Method Blank Summary
- D. Batch Quality Control Summary
 - Matrix Spike and Duplicate Results Summary
 - Spike Blank and Lab Control Sample Summary
 - Serial Dilution Results Summary
- E. Calibration Summary
 - Calibration Check Standards Summary
 - Interfering Elements Check Standard Summary

Section 5 General Chemistry/Petroleum Hydrocarbon Support Data

- A. Methodology Review
- B. Conformance/Non-Conformance Summary
- C. Batch Quality Control Summary
 - Method Blank and Spike Blank Results Summary
 - Matrix Spike Results Summary
 - Duplicate Results Summary
- D. Raw Data and IR Spectra (Petroleum Hydrocarbons)
- E. Raw Data and Run Record (Hexavalent Chromium)

Report of Analysis

Metals Analysis Case Narrative/Conformance/Non-Conformance Summary

- | | | |
|---|-----|---|
| | NO | YES |
| 1. Blank levels below reporting limits? | [] | [<input checked="" type="checkbox"/>] |

If no, list elements above reporting limits: _____

- | | | |
|--|-----|---|
| 2. Spike blank or lab control data within acceptable limits? | [] | [<input checked="" type="checkbox"/>] |
|--|-----|---|

If no, list elements outside of acceptable limits. Refer to QC summary for additional comments: _____

- | | | |
|--|-----|---|
| 3. Matrix Spike data within acceptable limits? | [] | [<input checked="" type="checkbox"/>] |
|--|-----|---|

If no, list elements outside of acceptable limits. Refer to QC summary for additional comments: _____

- | | | |
|--|-----|---|
| 4. Matrix duplicate data within acceptable limits? | [] | [<input checked="" type="checkbox"/>] |
|--|-----|---|

If no, list elements outside of acceptable limits. Refer to QC summary for additional comments: _____

- | | | |
|---|-----|---|
| 5. Samples digested and analyzed within holding time? | [] | [<input checked="" type="checkbox"/>] |
|---|-----|---|

If holding times were not met, list elements where holding times were exceeded and explain: _____

- | | | |
|--|-----|---|
| 6. All analytical criteria met (calibrations, CCV and CCB checks, interfering element checks, etc.)? | [] | [<input checked="" type="checkbox"/>] |
|--|-----|---|

If not met, list affected samples and elements: _____

Additional Comments: _____

Volume 1
Report

City of New York
Department of Environmental Protection
Bureau of Environmental Engineering

November 2000

Metcalf & Eddy of New York, Inc. - Hazen and Sawyer, P.C.

A Joint Venture

The Geotechnical Design Report contains analysis and interpretations of the factual geological and geotechnical data gathered to support the design and construction of the Croton WTP Project. The information contained in this report is one interpretation of the data; other competent professionals may arrive at different interpretations. This report is provided for information only and should read in conjunction with the Geotechnical Data Report (GDR) to assist in understanding the considerations used to establish the design. The bidder is not relieved of its obligation to do any and all investigations and interpretations of data provided necessary for the development of its bid and performance of the Work, if awarded. The Engineer shall not be responsible for and shall not be liable to bidder for its reliance on Engineer's interpretation of such surface, geo-technical data. Moreover, the bidder shall have no cause of action against the Engineer arising out of or relating in any way to the interpretation hereby provided.

SECTION 1 INTRODUCTION

1.1 PURPOSE OF STUDY

This Geotechnical Design Report summarizes work performed by Metcalf & Eddy of New York, Inc. - Hazen and Sawyer, P.C., A Joint Venture, under contract to the New York City Department of Environmental Protection, Bureau of Environmental Engineering, for the proposed Croton Water Treatment Plant which will be located at the Mosholu Golf Course, Borough of the Bronx, City of New York, New York.

The geotechnical evaluations and recommendations outlined in this Report are based on the results of the geotechnical site investigation conducted by the Joint Venture between January and April 1999. The results of this investigation, including boring and test pit logs and associated in-situ and laboratory testing, have been incorporated into a separate two-volume document entitled "Geotechnical Data Report on the Subsurface Exploration for the Croton Water Treatment Plant, at Mosholu Golf Course, Van Cortlandt Park, Borough of the Bronx, City of New York," and dated November 2000.

1.2 SCOPE

Utilizing the specific subsurface information concerning the site, obtained from the subsurface investigation, it was possible to formulate criteria and recommendations regarding the geotechnical engineering aspects of the project. More specifically, the scope of the geotechnical services of this study includes the following tasks:

- Review of available geotechnical information on the site obtained through subsurface exploration
- Evaluation of in-situ conditions based on interpretive soil and rock profiles and characteristics, determination of bearing capacities, and potential seepage through soil and bedrock
- Development of criteria and recommendations regarding the geotechnical aspects of the project design and construction including
 - Foundation type, depths and design parameters for all structures and related works

- Groundwater design considerations
- Seismic considerations
- Site preparation and grading including soil and rock excavation, dewatering, foundation treatment, backfill, drainage requirements and collection systems
- Special problems such as soil slope stability, rock excavation by blasting, rock wall reinforcement, and retaining walls
- Monitoring of vibrations and noise during construction
- Design lateral earth and rock pressures for static and earthquake loading
- Construction considerations

1.3 PROJECT SITE

The Water Treatment Plant will be located beneath the area of the Driving Range of the Mosholu Golf Course, within the Van Cortlandt Park.

Access to the plant site during and after construction will be from Jerome Avenue near the northeast corner of the plant. Early in the construction phase, the entire project site will be fenced and concrete jersey barriers will be placed to demarcate the limits of construction. Laydown areas, off-street queue areas for trucks, and parking for construction workers' vehicles construction equipment and trailers will be located at the north and northeast sides of the plant over existing ground leveled with granular fill as required.

1.4 AVAILABLE HISTORICAL INFORMATION

The Mosholu Golf Course was established and created from parkland in 1914, and is currently leased to a private concessionaire. The present topography of the project site is partially the result of the alteration and shaping of the land in order to create the golf course. In 1989, the original 18-hole golf course was re-landscaped and opened as a 9-hole course with a practice driving range. No other information on the construction of the golf course is available with the NYC Department of Parks and Recreation and the Bronx Public Library. In the surrounding areas, construction activities included the opening of the Woodlawn Elevated Subway Station on Jerome Avenue in 1917 and the construction of Section No. 1 of City Tunnel No. 3 in 1980-1998. Design drawings for the Elevated Subway are available from the NYC Transit Authority (Route No. 16 - Section No. 2 Contract Drawings dated 1913 and Structural Plans dated 1914).

Construction records for City Tunnel No. 3 are available from the NYCDEP. The October 2000 Wastewater Quality Control Application Report prepared by the Joint Venture for the construction of the plant at the Mosholu Golf Course summarizes historical data including prehistoric background.

1.5 FACILITIES LAYOUT

The proposed Water Treatment Plant will be a large underground facility. The existing ground elevations throughout the proposed plant area, range from approximately Elevation 200 on the west to Elevation 170 on the east. The plant footprint will occupy an area of about 11 acres and will be below finished grade. The plant will include an operating floor level at Elevation 183, an access floor level at Elevation 168, and a foundation floor level at Elevation 130. Along the center and northern portion of the plant, there will be two Clearwells for a total capacity of 20 MGs. On the southern portion, there will be filters-to-waste tanks and waste backwash water tanks. A Raw Water Pumping Station, a Finished Water Pumping Station and a Backwater Pumping Station will occupy the west end of the plant, with Pump Room lower floors at various elevations with the deepest floor at Elevation 112 adjacent to the Raw Water and Finished Water Tunnels. These two tunnels will respectively house one raw water conduit, and two finished water conduits installed under the pump room floor slab at Elevation 112, in a pipe trench parallel to the west wall of the plant. The bottom of the trench will be at Elevation 96.5. In order to achieve the finished floor elevations, excavation through till and bedrock will be required. In the Pumping Station area, as much as 75 feet of excavation will be in rock, with an additional 14 feet of rock excavation in the pipe trench beneath the Pump Room floor slab.

The roof of the plant will be at Elevation 203 and covered with a 2-foot thick soil layer acting as a surface for the reconstructed Golf Course Driving Range. The Administration area will occupy the northeast corner of the plant. A new Club House for the Golf Course and a parking lot will be built as part of these facilities. The perimeter of the plant will show berms sloping in steps to match the existing ground elevations from Elevation 205 to Elevation 170 with retaining walls supporting the steepest portions. The plant will be accessed from Jerome Avenue via a new access road constructed along the alignment of the existing entrance road at about Elevation 170. The plant entrance and exit will be accessed through tunnel entrances in the north area. Road construction will require excavation in till and bedrock from ground Elevation 190 to the roads

final grade at Elevation 170±. The facilities layout will be continuously reviewed and developed throughout the final design phases of this project.

1.6 FOUNDATION DESIGN

The conceptual design has been further developed in a report entitled Technical Memorandum on Foundation Design dated May 1999. In this memorandum, several foundation alternatives for dealing with uplift forces and hydrostatic pressures on foundation walls were evaluated. The foundation options considered included rock anchors, concrete self-weight and an underdrained foundation. Based on technical merits, lower cost of construction and reasonableness of long-term operation and maintenance, an underdrain and pumping system was recommended to completely drain the groundwater surrounding the foundation.

SECTION 2 APPLICABLE STANDARDS AND CODES

The latest editions of Standards and Codes referenced below have been utilized for the preparation of this Report.

2.1 STANDARDS

AASHTO - American Association of State Highway and Transportation Officials

ACI - American Concrete Institute ACI 318 and 350

ASTM - American Society For Testing and Materials

NYCDEP Rules and Regulations Governing Concrete Construction

NYCDOT Standard Specifications

2.2 CODES

Building Code of the City of New York

New York City Seismic Code (Local Law No. 17-95)

UBC - Uniform Building Code

SECTION 3 GEOLOGICAL CONDITIONS

3.1 GENERAL GEOLOGY

The Borough of the Bronx is located in the Manhattan Prong Portion of the New England Upland Physiographic Province and underlain by tightly folded Pre-Cambrian metamorphic rock formations. The topography in this area is largely a product of pre-glacial stream erosion, modified somewhat by glacial erosion and deposition. It is mainly characterized by parallel, linear ridges and valleys having a northeasterly trend. The oldest formation is the Fordham Gneiss, a nearly-massive, banded metamorphic rock of complex composition and structure, which generally underlies the areas of high relief in the western portion of the Bronx where the Mosholu Golf Course is situated. The other formations in the Bronx are the Inwood Marble, which, in the western portion, underlies the low areas and the Manhattan Schist which underlies the eastern two-thirds of the borough. These latter two formations are not present at the project site.

Generally, the Fordham Gneiss Formation is exposed or is relatively close to the surface, overlain by Upper Pleistocene deposits. These deposits consist chiefly of glacial fluvial stratified sediments, largely outwash sand and gravel that have accumulated in depressions on the bedrock, locally including beds of reddish silt, as well as unstratified drift deposited as ground moraine (till) over the bedrock or stratified deposits of outwash. Weathering has locally affected the upper bedrock portion, forming a saprolitic horizon (decomposed rock) above the partly weathered or unweathered bedrock. Saprolite can be described as a dense, soil-like material grading from silts to sands, where relict rock structures are retained with less than 10 percent corestones, and is often micaceous. Since the till and saprolitic materials are often difficult to differentiate in samples recovered by subsurface drilling, they are normally considered as a single unit for design purposes.

3.2 SEISMICITY

The Eastern United States is an intraplate region with a moderate level of seismic activity. The probability of a major earthquake (intensity greater than VI) occurring in or near New York State

is small. However, historical earthquake records indicate that moderate epicentral earthquakes with Modified Mercalli Intensities (MMI) of VI (or a magnitude M of 5 on the Richter Scale) or less have occurred in several parts of the State, including New York City. Earthquakes of this magnitude could generate Peak Ground Accelerations (PGA) up to 0.15g. The 0.15g acceleration ($\partial_h\gamma$) is defined as the maximum horizontal ground acceleration for a 500-year return period earthquake. The New York Metropolitan area, being considered a low seismicity area, has been mapped into seismic risk Zone 2A by the 1988 Uniform Building Code (UBC). The New York City Building Code requires a Seismic Zone Factor Z of 0.15 and Site Coefficients of 0.67 for foundations bearing on bedrock and 1.0 for foundations bearing on glacial soil (medium dense to very dense glacial till).

3.3 EXISTING SITE FEATURES AND TOPOGRAPHY

The site slopes gently eastward approximately from Elevation 200 to Elevation 170. The Golf Course rests on firm soil substratum, which is, in general, moderately deep over bedrock. The topography of the general area appears to be bedrock-controlled. Large boulders are visible on the slopes along Jerome Avenue to the east and West Gun Hill Road to the south. The area surrounding the Driving Range is open space parkland with moderate vegetation and a wetland area adjacent to the northeast edge of the plant footprint. Another small wetland is located northwest of the proposed plant location. The original site topography, including areas adjacent to the Golf Course toward Jerome Avenue, has been previously modified through excavation and backfill for landscaping purposes and during construction of the Woodlawn Elevated Subway.

SECTION 4 SUBSURFACE CONDITIONS

4.1 SITE STRATIGRAPHY

In general, the subsurface conditions as determined from the subsurface exploration program at the plant site can be summarized as follows:

- Surficial Soils. These soils consist of 0 up to 34 feet of silty sand with occasional sandy silt and boulders, variable in color, with consistency varying, in general, from loose to medium dense (SM, SP-SM, 6-65 and 7-65 soil classes as per the New York City Building Code Numerical Classification System). In places they may also include organic matter and a few boulders in the upper 2 ft. (Class 11-65).
- Glacial Soil. A medium dense to very dense glacial till consisting of well-graded silty sand, gravel, cobbles, and boulders (SM and GM, SP-SM and GP-GM, Classes 6-65 and 6-65/5-65), generally underlies the surficial soils. The average till thickness is of the order of 10 feet. In places, imported fill or reworked till may overlay the till.
- Saprolitic Soil. Pockets of dense to very dense saprolite as thick as 10 feet are locally encountered above the partly weathered or unweathered bedrock.
- Bedrock. The overburden soils described above are underlain by bedrock from the Fordham Gneiss Formation, consisting of a foliated light-to-medium gray muscovite-biotite-plagioclase-quartz-gneiss locally transitioning to an amphibolitic or a quartz-banded gneiss, which is weathered and fractured at various degrees and depths. The depth to bedrock varies from 4 to 40 feet, averaging 15 feet. Typically, bedrock quality improves with depth, achieving Class 2-65 to 1-65.

The reference plan for subsurface profiles is presented on Sheet No. 1, and the subsurface profiles are presented on Sheet No. 2 through Sheet No. 11 in Volume 2 of this Report. The top of bedrock contours is presented on Sheet No. 12.

4.2 SOIL AND ROCK CHARACTERISTICS

4.2.1 Soil

A review of the field data indicates that most of the soils of glacial origin, including surficial soils, have a consistency varying from medium dense to dense, except for the upper 2 ft. which are generally loose and contain organic matter. The saprolitic soil from chemical weathering of gneissic bedrock is generally denser than the overlying till or silty sand layers. Figures 4-1 and 4-2 show typical gradation envelopes for 17 curves of surficial soils (SM, SP-SM, and 14 curves of till and saprolitic soils (SM and GM, SP-SM and GP-GM). The gradation analyses were performed on representative soil samples recovered from the Standard Penetration Tests (SPT) and presented in Volume 2 of the Geotechnical Data Report on the Subsurface Exploration, dated November 2000. Figures 4-3 and 4-4 show typical SPT profiles with N-values (Standard Penetration Resistance) plotted for the different soils in the vicinity of the south wall of the excavation, indicating the variation of the soil consistency with depth. It appears that there is a trend of increasing density with depth. Water content for these materials appears to be in the range of 7 to 12 percent, with some values as high as 37 percent.

As previous construction activities may have also been undertaken at the site, it is possible that layers of fill or reworked till overlay the till or other natural soil. A sporadic occurrence of cobbles and boulders, generally small in size, has also been detected by the borings.

Both surficial material and glacial soils are not expected to be vulnerable to liquefaction during a seismic event.

4.2.2 Bedrock

Bedrock can be classified as a foliated, light-to-medium gray gneiss transitional to a poorly foliated amphibolitic gneiss and quartz-banded gneiss. Foliation is generally inclined 50° to 80°. Foliation dip direction is variable and details are summarized in the Geotechnical Data Report.

Most of the shallow bedrock appears to be unweathered with localized areas of moderate-to-strong weathering near the surface. Unweathered to slightly weathered bedrock with occasional

lenses of moderate weathering has been encountered in the uppermost zone of the bedrock underlying the saprolite.

Oxidation on joints generally involves a deep portion of rock, averaging about 20 feet in thickness. In general, the rock has moderately close (12 inches to 3 feet) to wide spacing of joints (greater than 3 feet). Scattered zones of close jointing (2 to 12 inches) also exist, especially near the surface. Zones of highly fractured rock (less than 2-inch spacing) with smooth iron-stained and soil-coated joint surfaces are sporadic.

Joints along foliation (50° to 80°) and subhorizontal joints (5° to 30°) are predominant. Most of the foliation joints appear to be tight. Some openings may be related to close subhorizontal jointing and steep jointing across foliation. No major shearing or other important discontinuities, such as faults, have been detected by the boreholes. The foliation and the predominant joint set orientations in relation to the walls of the plant excavation are summarized in Table 4-1. These joint orientations have been measured on oriented cores as presented in Volume 2 of the Geotechnical Data Report on Subsurface Exploration.

A quantitative measure of rock quality available in the boring logs has been provided by the Rock Quality Designation (RQD) percentages. Rock cores have also been identified and classified in accordance with the New York City Building Code rock classification system. Rock cores, in general, vary from Classes 1-65 to 3-65, except for a few seams or relatively thin zones of rock classified as 3-65 to 4-65, indicating softer or more fractured material than a typical 3-65 Class. Rock Classes 1-65 and 2-65 are predominant. Table 4-2 presents the weighted averages of the New York City Building Code rock classes and RQDs encountered throughout the plant area at foundation level. The RQD values indicate generally good rock conditions.

Mechanical properties investigated in the laboratory include Unconfined Compressive Strength (UCS), tensile strength, Young's modulus and Poisson's ratio to provide data for classification and correlation. Table 4-3 lists the range of results obtained from the various tests on intact rock. The average UCS obtained from 48 laboratory tests is about 9,800 psi, and the distribution is shown on Figure 4-5. A Moh's Hardness Rating of 7 can be assumed for these rocks, indicating hard rock.

Rock Type	Number of Tests	Young's Modulus (ksi)	Poisson's Ratio
Gneiss	6	450	0.21
Quartz Banded Gneiss	4	639	0.24
Amphibolitic Gneiss	1	306	0.28
All Rock Types	11	506	0.23

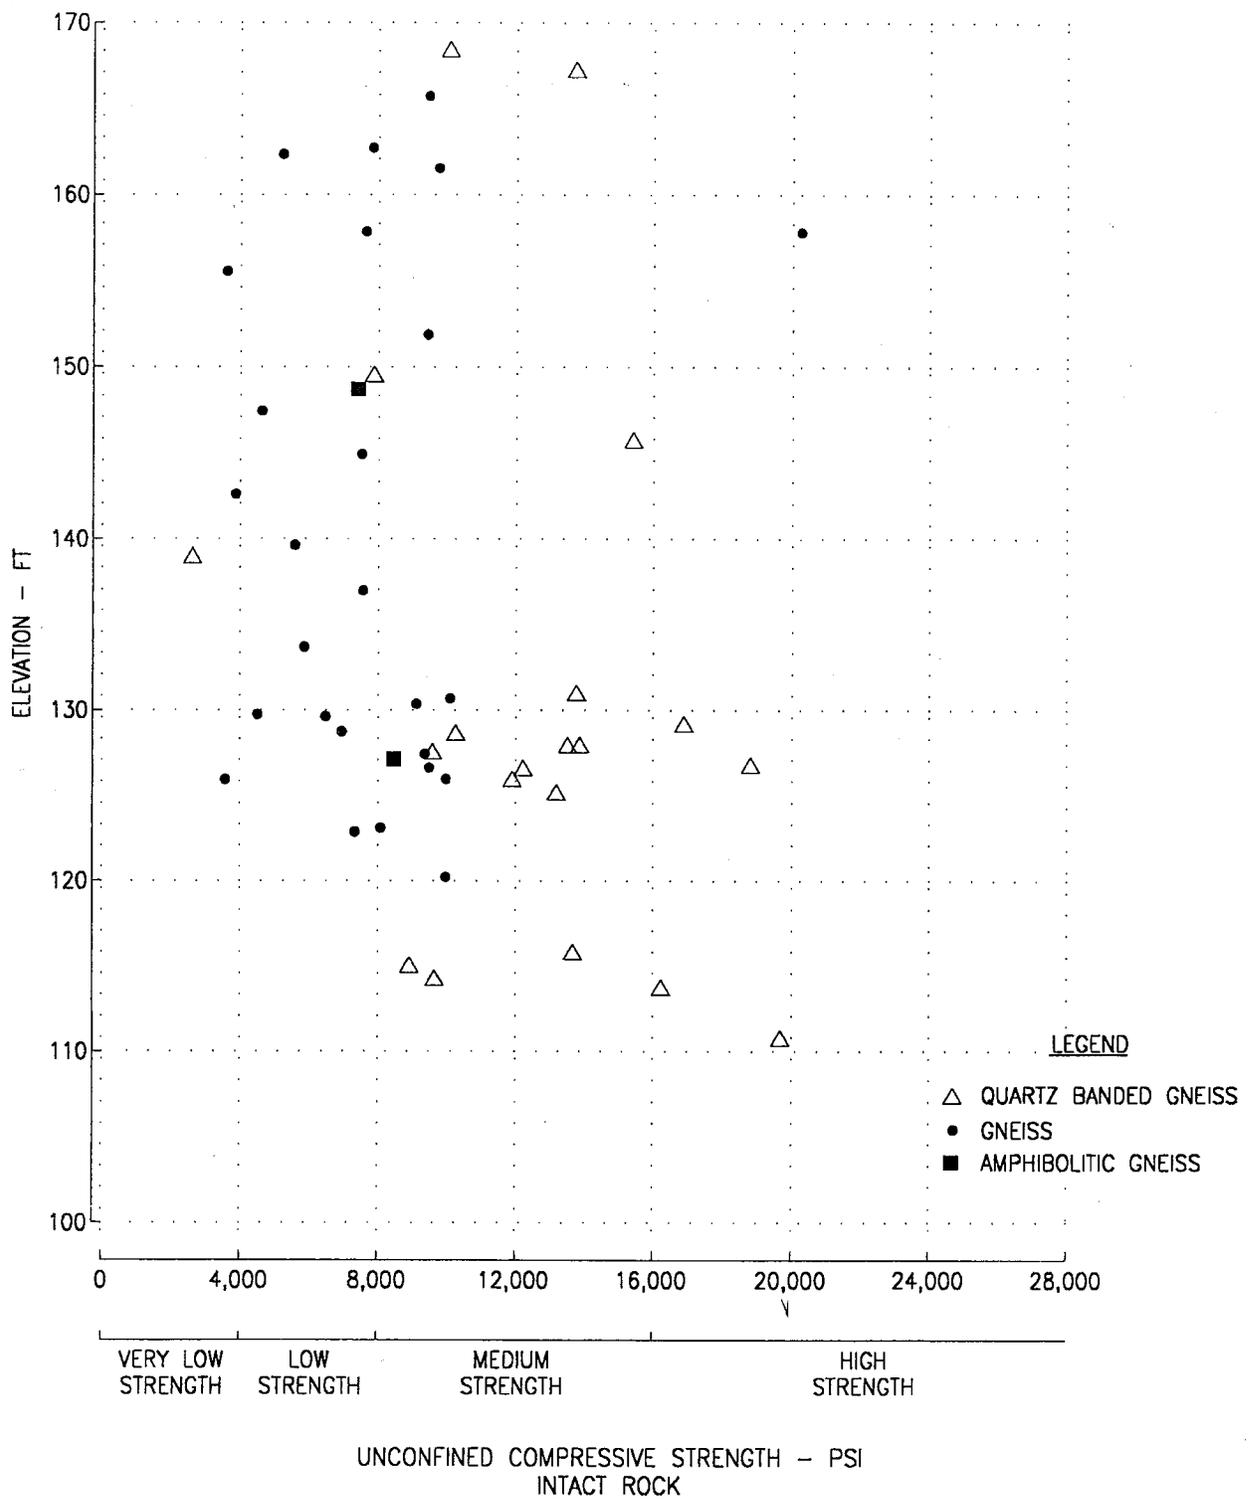

Figure 4-5
Unconfined Compressive Strength Versus Elevation
 Croton Water Treatment Plant at Mosholu Golf Course
 Van Cortlandt Park, Bronx, New York

Tensile strength values obtained from testing are approximately 5 to 10 percent of compressive strength. The presence of oriented features such as foliation and lamination within the intact specimen generally tends to lower the tensile strength as it does for the compressive strength.

Mean values of Poisson's ratio shown on Table 4-3 appears to be typical of gneissic and quartzitic rocks within the elastic domain, for which Poisson's Ratio is generally of the order of 0.15 to 0.30.

4.3 GROUNDWATER

The water table varies between Elevations 186 and 165, dropping from the southwest to the northeast in general. The isolated wetland pockets are perched above the regional groundwater table. Groundwater contours from water level readings of piezometers installed in bedrock are presented in Sheet No. 13 in Volume 2 of this Report.

4.4 SOIL AND ROCK PERMEABILITY

4.4.1 Soil

Coefficients of hydraulic conductivity (K-values) from falling head borehole permeability testing in soil, vary from no absorption to 4.4×10^{-3} cm/sec with most of the values in the 10^{-4} to 10^{-5} cm/sec range, indicating generally poor drainage characteristics. Plot of K-values by elevation is presented on Figure 4-6. The various permeabilities reflect the distribution of the soil types in both horizontal and vertical direction.

4.4.2 Slug Tests

Slug tests conducted in the overburden soils near the existing northeast wetland, yielded permeability values of 1.3×10^{-4} to 1.9×10^{-4} cm/sec, indicating a soil with poor drainage characteristics. Slug test results are summarized on Table 4-4.

Table 4-4

Slug Test Results for Well MG-B51-99

Rising Head No. 2	0.361	0.442
Falling Head No.3	0.517	0.484
Rising Head No. 3	0.394	0.465
Average Falling Head Test Result	0.504	0.496
Average Rising Head Test Result	0.364	0.428
Average Rising & Falling Head Results	0.434	0.462
Average of All Test Results, Both Methods	0.448	

4.4.3 Rock

Permeability tests performed by packer testing in the rock yielded hydraulic conductivity results from no absorption to 9.56×10^{-3} cm/sec. However, the majority of the values are in the range of 10^{-4} to 10^{-5} cm/sec, indicating that the rock formation is semi-impervious with poor drainage characteristics. Low permeability for a rock mass is considered to be 1.0×10^{-6} cm/sec or lower. The hydraulic conductivity values in bedrock are presented on Figure 4-7.

4.5 SELECTED GEOTECHNICAL PARAMETERS FOR SOIL AND BEDROCK

Table 4-5 gives the range of material properties and the recommended values for use in design. Values shown for the soils are mainly based on correlation with N-values. The other values are assumed to be within typical ranges. Values recommended for rock are essentially based on laboratory testing for Modulus of Elasticity and Poisson's Ratio. The recommended value of the Modulus of Elasticity (500 KSI) is based on an average RQD value of 80 percent.

SECTION 5 GEOTECHNICAL ANALYSIS

5.1 GEOTECHNICAL CONCERNS

The geotechnical concerns on this project are listed below:

- Groundwater control
- Stability of excavated slopes in soil and rock, particularly the rock walls
- Restrictions on excessive vibrations, noise or flying debris from blasting operations

5.2 GROUNDWATER EVALUATION

5.2.1 Dewatering

The estimated rate of groundwater inflow is approximately 110 gpm, based on linear footage of excavation using packer test data and typical flow rates for this area. This rate is considered to be the steady state ground water in flow and used to design the underdrain system. It is not to be confused with the temporary dewatering of the excavation during construction which may be substantially higher. During construction, the excavation will be dewatered to maintain the groundwater level below the lowest point of rock excavation in the areas required to progress the work. The current design concept for the proposed Water Treatment Plant calls for control of buoyant uplift forces by permanently lowering groundwater levels beneath and adjacent to the structure. This will be attained by placing an underdrain system below the foundation slab and pumping the water to the existing Combined Sewer on Jerome Avenue. Dewatering during construction will likely be accomplished by pumping from sumps. Stormflows into the excavation would be the major source of water to be vacated during construction. Grouting of the more significant water-producing fractures in the bedrock, if any exist, will be done to reduce the inflow of groundwater.

The Stormwater/Groundwater Plan Memorandum, dated June 11, 1999, describes the drainage system for plant dewatering. The plant would have drainage at three levels: a roof drainage system collecting stormwater; an intermediate drainage system at the top of the bedrock surface between Elevations 160 and 180 to drain ground water from the soil; and a lower underdrain

system below the base slab. The roof water will be drained by gravity to the Combined Sewer on Jerome Avenue. Water from the intermediate level would be conveyed partly to the Combined Sewer and partly to infiltration trench system north of the plant. The water collected by the underdrain pipes would be pumped to the Combined Sewer.

5.2.2 Groundwater Quality

In order to characterize the quality of groundwater that would enter the underdrain system from the deep bedrock, water samples were collected from several of the piezometers for screening purposes and analyzed for alkalinity, total dissolved solids, iron, manganese, pH, and Radon. Sampling analyses indicate quality typical of groundwaters, with elevated alkalinity, turbidity, hardness and solids. Groundwater analysis results can be found in the Dewatering Approval/Wastewater Quality Control Application, dated November 1, 2000.

Preliminary groundwater sampling has detected Radon concentrations in groundwater ranging from less than 50 to 342 pCi/l. There are no current standards available for Radon in groundwater. The EPA standard for Radon in air is 4 pCi/L with a ratio of 10,000 to 1 for Radon in water to air for a confined space. Therefore, the threshold value which could result in exceedence of the limit in confined air space over water is 40,000 pCi/l. The range of concentration so far detected at the Mosholu Golf Course site is over 100 times less than the 40,000 pCi/l limit. Radon, therefore, is not a concern for construction activities or subsequent operation of the WTP at the site. However continued testing for Radon in groundwater and air should be performed periodically during construction.

5.3 SOIL EXCAVATION

The overburden soils at the site can be excavated with standard earth moving equipment. The long-term excavation slopes can be as steep as 1 vertical to 1.5 horizontal in dense soil to provide for adequate stability. Compaction and seeding of the slopes will be required. For steeper slopes, in situ reinforcement of the soil, either a geosynthetic soil reinforcement, soil nailing or other mechanical stabilizers or an earth retention wall will be required, and the design of such reinforcement shall be performed by a New York State registered Professional Engineer hired by the Contractor.

5.4 BEDROCK EXCAVATION AND BLASTING CHARACTERISTICS OF ROCK

Bedrock excavation will be performed by using controlled blasting techniques to control overbreak at the excavation lines and bench blasting for the production blasting (main blast) to remove the rock mass from inside the main excavation pit. Overbreak control methods are presplitting, cushion blasting and line drilling, which will be described later in this Report. Tunnel excavation will be performed using smooth wall blasting technique, which is a form of controlled blasting. Decisions on explosive selection, blast design and delay pattern must take the knowledge of the rock mass into account. For instance, the geological variations and the manner in which the beds and joints are dipping either influence the amount of explosive used or influence the design of the burden.

5.4.1 Rock Properties

Important rock properties related to the fragmentation process are rock density, hardness, strength and seismic velocity. The rock density is an indication of the rock strength, the denser the rock, the more energy needed to overcome its tensile strength for breakage to occur. For the rock types encountered at the site, a density of 2.7 g/cm^3 , a rock factor of 8 for rock strength (Kuznetsov, 1973) and a field seismic velocity (longitudinal wave velocity) of 14,000 fps may be assumed for blasting design in medium hard gneissic rock. The hardness can have a strong effect on blasting results. Slight underblasting of medium-hard to hard rock will often result in a tight muckpile difficult to dig; overblasting of hard rock is known to cause excessive flyrock and airblast.

The seismic velocity, or the velocity with which stress waves propagate in the rock, is related to the distribution of the stress imposed on the rock by the detonating explosives and is used to calculate the impedance characteristics of the rock for selection of the best explosive. It is said that the higher the rock velocity, the higher the explosive required to break it. Explosives with impedance nearly matching that of the rock, transfer energy to the rock more efficiently. Based on the above seismic velocity value, the characteristic impedance for the gneiss at the site would be approximately 42 lb/sec/in^3 . The impedance of an explosive is related to its detonation velocity. Characteristic impedance is only one of the criteria needed for the selection of the explosive. Other factors are rock structure, presence of water, safety and cost.

The structural pattern of the rock exerts a major influence on fragmentation. Corrections for the geologic structure and rock bedding or schistosity should be used in the design of the burden (distance from blasthole to nearest free face at the instant of detonation). The burden should be corrected for number of rows of blastholes and for geologic structure. The correction for the geologic structure would take into account the fracturing of the rock, the joint strength and frequency at the site. A Correction Factor of 1.10 may be used for blocky to massive rock with tight joints, and as a Correction Factor of 1.18 for bedding or foliation steeply dipping into the excavation. The Correction Factor for number of rows is usually 1 for one or two rows of holes and 0.90 for more than two rows. The above Correction Factors appear to be typical of the project site conditions.

Another factor can be the presence of a blocky cap rock at the upper part of the blasthole. This can particularly occur in the top bench (lift) nearest to the weathered zone of the rock mass. The weathered zone at the site varies in thickness from 4 to 9 feet, and can be assumed, for blasting purposes, as a layer parallel to the ground surface. Velocities in more fractured and weathered zones are less than those in the underlying fresh rock. Consequently, blasting techniques should be adjusted. However, as the rock at the site is generally moderately weathered below the top of rock contours as shown in the contour map of bedrock (Volume 2) and the zone of weathering rather small, a method would be to use the same explosive but to slightly decrease the powder factor in the weathered zone. If voids and zone of weakness (open joints, fractured areas) are identified during the drilling of blastholes, steps can be taken during the blasthole loading to improve fragmentation and avoid flyrock. Voids and zones of weakness should be filled with inert stemming materials (drilling cuttings or well-graded crushed stone or gravel) between charges (decking) to give confinement to the explosive gases and to reduce flyrock and airblast. It is recommended that a test blast program prior to the commencement of actual blasting operations be performed by the Contractor for the design of both controlled blasting and production blasting.

Zones saturated by groundwater require explosives with greater water resistances and necessitate more care in stemming.

5.5 ROCK WALL CONDITIONS

The effect of local geologic conditions, such as foliation and jointing, on the profile and stability of the perimeter walls of the excavation, based on of the orientation and description of various joint sets, can be summarized as follows:

5.5.1 North Wall

The strike of the predominant joint sets (foliation joints and subhorizontal joints) will intersect the wall face at an acute angle generally greater than 30°. Consequently, the break line produced by the control technique will be reasonably straight.

If joints are weak, e.g., smooth, weathered joints, backbreak will result. It is expected that moderate backbreak due to weathering and jointing will occur within the upper 7 feet of the wall. In addition, acute angled dipping joints (subhorizontal joints and joints across foliation) will cause pieces of material to fall out from the face during the excavation process in some areas. However, on the whole, the face will be stable and only local reinforcement will be required in the form of rock bolts and shotcrete.

5.5.2 East Wall

In relation to wall profile, the considerations to be made for the east wall are the same as those for the north wall. The face will be generally stable, as it appears that there are only a few joint sets dipping steeply outward from the excavation wall. Some backbreak is expected to occur in the upper 4 feet of the wall. Only local reinforcement will be required in the form of rock bolts and shotcrete.

5.5.3 South Wall

Steep foliation joints appear to be predominant and some slippage is expected to occur along foliation planes during blasting. The wall profile, due to the joint orientation, will be generally rough. Unstable wedges may form due to the combination of foliation joints and steep joints across foliation dipping outward from the wall. Moderate backbreak is expected to occur within

the upper 7 feet of the wall. Rock reinforcement will be required in the form of rock bolts, wire mesh and shotcrete.

5.5.4 West Wall

The dominant joint sets appear to dip into the excavation wall; thus, the stability of the wall is enhanced. As per the boring log description, the west wall has the thickest weathered and fractured upper zone, approximately 9 feet, where some backbreak may occur. However, on the whole, the face will be stable and only local reinforcement will be required in the form of rock bolts and shotcrete.

5.5.5 Scaling

Scaling should be completed after blasting each bench and before excavating deeper. Each wall will be inspected to remove any remaining loose rock, installing rock bolts and other stabilizing measures, such as shotcrete, as needed. The work has to be completed while access remains available; it will be too late to recognize unstable wedges or incompetent, loose, blocks after they are undercut and dangerous to stabilize. The installation of the rock bolts and shotcrete should be organized in such a way that the installation becomes an integral part of the excavation cycle.

Access to low and intermediate-height slopes is possible with suspended power platforms or hydraulic boom cranes. Workers on ropes usually carry out scaling on the upper reaches of high faces. Useful scaling tools include hand pry bars, bencher drills, jackhammer, air operated scaling tools, hydraulic splitters or jacks.

5.6 ROCK WALL STABILITY ANALYSIS

An evaluation of rock slope stability was performed for the excavation faces of the Croton Water Treatment Plant utilizing SWARS. The SWARS program was developed by Dr. Herbert Einstein of Massachusetts Institute of Technology and is distributed by GEOCOMP Corporation. The program allows for the input of numerous joint sets and evaluates the wedges that could develop along an excavation face. Both 2-plane and 3-plane wedges that are developed along each excavation face are analyzed.

The orientation of the predominant joint sets was determined from the oriented core data. The strike and dip of the joint sets used in rock stability analysis are:

N60°W	58°NE
N78°W	66°NE
N62°W	60°SW
N90°E	15°N
N28°E	72°NW

The following assumptions were used regarding the characteristics of the joints:

- Friction angle of 30°
- Faces are planar and smooth (i.e., no asperities)
- Joint plane faces are in contact
- Ten percent of the joint planes are intact rock, with a shear strength of half of the average unconfined compressive strength of 7,800 psi for Gneiss
- Due to the rate of excavation and the dewatering of the site, groundwater pressures are not a factor
- The unit weight of the rock is 168 pcf
- Overburden (125 pcf) and equipment surcharges are imposed on the wedges depending upon the case studied.

The height of the excavation faces is dependent upon the top of rock and the excavation levels for the structures. The bottom of the excavation for this analysis was assumed to be at Elevation 125. The top of the excavation faces was determined from the top of rock map developed for the site. The information on the excavation faces was taken from the conceptual design drawings. The excavation faces analyzed are as follows:

<u>Face</u>	<u>Orientation</u>	<u>Total</u>	
		<u>Height of Rock Face (ft.)</u>	<u>Length (ft.)</u>
North Face	N82°W/85°SW	60	970
East Face	N08°E/85°NW	35	450
South Face	N82°W/85°NE	60	970
West Face	N08°E/85°SE	60	450

The stability analysis was performed for both construction conditions and final conditions. Construction conditions were modeled by introducing a uniform vertical pressure of 300 psf on the top of the slope to represent equipment surcharge. Final conditions were modeled in the same fashion, but the uniform vertical pressure was approximately 3,850 psf for the 50-foot rock excavation faces and 5,300 psf for the 35-foot rock excavation faces. The uniform vertical pressure in the final case is representative of soil overburden. The analysis indicated that the loading from the final conditions was the more critical case.

Based on the assumptions listed earlier, the north, east and west faces are stable without requiring any systematic pattern of permanent rock reinforcement. However, the south face has unstable wedges that will require a stabilization system. Table 5-6 summarizes the data pertaining to possible unstable wedges and the required permanent stabilization system by rock bolting.

A sensitivity analysis was undertaken to determine the critical characteristics of the potential wedges that developed on the south face. The coefficient of friction, asperities, and the percentage of the joint that was intact rock were systematically analyzed to determine whether the south wall could be stabilized using realistic values based on the information currently available. The analysis indicated that the factors of safety for the two critical cases shown on Table 5-6 did not change significantly with changes that could realistically be expected in friction angle, asperities, or percentage of intact rock along the potential joints. The two critical cases could not be stabilized without the use of rock bolts. To stabilize these wedges, a horizontal force of 35,000 Kips was entered into the program to achieve a minimum Factor of Safety of approximately 1.2.

The larger size of the wedges in the south wall apparently are not sensitive to moderate changes in the percentages of intact rock along the foliation and joint planes, i.e., reduction from 10 percent intact rock to 0 percent indicate little, if any, changes in factor of safety. However, smaller wedges such as those developed on the North and East walls are sensitive and become unstable when the percentage of intact rock is reduced from 10 percent to 0 percent.

In summary, the South wall indicates instability in either case; however, there also may be a potential for some instability in the North and East walls depending on the amount of intact rock along the joint planes.

The Contract Documents will show a sequence of construction that removes the overburden in a 40 foot maximum wide band around the perimeter of the excavation (working platform) prior to rock excavation. At that time, the condition of the joints will be reevaluated and permanent rock reinforcement designed where required to prevent any lateral rock pressures on the walls of the structure.

5.7 ALLOWABLE BEARING CAPACITY OF FOUNDATIONS

5.7.1 Soil Foundations

Soil foundations for structures outside the Water Treatment Plant may be constructed on dense till or saprolitic soil. The design allowable bearing pressure on till and saprolitic soil can be assumed to be 10 ksf as an alternative to the conventional rigid approach. A modulus of vertical subgrade reaction of 550 kcf may be used for designing a mat foundation above the water table. Half of this value can be used for a mat below water table with no drainage. The base slab should be built on a 10-inch thick (before compaction) clean crushed rock layer (ASTM D488, Size Number 67) placed on the soil subgrade as a leveling course and drainage layer. The crushed rock layer shall be underlain with a geotextile. Shallow foundations supported on soils shall be embedded a minimum of 4 feet for frost protection.

Within the plant area, approximately 18 inches of crushed stone (stone drainage course) will be placed between the in-situ rock and the concrete slab. In this case, a modulus of vertical subgrade reaction of 600 kcf may be used for design of the plant foundation. A coefficient of friction to use, both between the slab and the stone draining course, and the stone drainage course and the bedrock surface, is 0.55.

5.7.2 Rock Foundations

The following methods have been used in the determination of the allowable bearing capacity of rock:

1. Use allowable values provided by the Local Building Code (TABLE 11-2, ALLOWABLE SOIL BEARING PRESSURES, Paragraph 27-678 of the New York City Building Code). Values may be reduced to account for weathering, fracture intensity, lateral confinement, or non-homogenous rock, based on the information of subsurface conditions and application of some judgement.
2. Use large safety factors in rock capacity in relation to RQD and unconfined compressive strength of intact rock.

Table 4-2 in Section 4 shows that about 89 percent of the rock below Elevation 165 belongs to Classes 1-65 and 2-65 and the remaining 11 percent to Class 3-65 of the New York City Building Code. RQD values higher than 75 percent (good to excellent rock) are of the order of 78 percent for foundations below Elevation 165.

As a result of this analysis and a review of rock core data presented on the boring logs, a bearing capacity of 80 ksf is deemed to be the most practical value for the overall rock conditions. This value is indicative of a rock that is moderately strong and has a moderate fracture spacing and, therefore, it should be adopted as the design allowable bearing capacity, corresponding to Class 2-65 rock for all foundations in bearing. The proposed structure is in deep rock and will be supported by a structural mat foundation bearing on bedrock. This foundation system requires a low bearing capacity with respect to rock bearing values. Consequently, a 3-65 rock class bearing value (40 ksf) could be sufficient for support of many areas of the structure. Provisions, however, should be made in the specifications for rock of a very low capacity that could be encountered in the foundation areas. Low quality bedrock could be either removed, trimmed or treated to enhance the bearing capacity.

Determination of the permissible bearing pressure can also be made from the compressive strength of intact rock by applying a factor of safety that should be somewhat dependent on RQD. In general, the allowable rock bearing pressure is taken in the range of one-fifth to one-tenth the UCS, using RQD as a guide, for instance, one-tenth for a small RQD. Depending on the rock quality, a reduction factor should also be considered. If the design compressive strengths, for example, were based on the average strength of 9,800 psi for all rock types encountered at the site, a RQD of 80 percent, and a safety factor of 7, the allowable rock bearing pressure would be about 129 ksf. This result shows that the method of calculating the bearing capacity by the compressive strength gives, generally, a higher value than that estimated from the Building Code. However, the allowable bearing capacity from the Building Code should be used to account for a wide range of geological conditions that may occur. Increases in the allowable bearing capacity due to embedment of the foundations will be made as required in accordance with the New York City Building Code, Table 11-2, Note (8).

5.8 LATERAL PRESSURES FOR FOUNDATION WALLS

The recommended lateral pressures for design of foundation walls are presented in Figure 5-1. Under the current conceptual design, a maximum 40-foot wide rock bench will be exposed along the entire periphery of the plant to provide a working platform. The actual top of bedrock varies. For simplicity, lateral pressure diagrams for two tops of rock elevations, respectively Elevation 160 and Elevation 185, are shown. The lateral pressure diagram with a top of rock elevation of 160 feet is applicable along the east side of the plant and part way on the north and south faces. Everywhere else along the periphery of the plant, the lateral pressure diagram with a top of rock elevation of 185 feet applies.

5.8.1 Hydrostatic Pressure

Based on the proposed project design, the groundwater will be permanently lowered below the lowest foundation level. Hence, no hydrostatic pressure will act on foundation walls.

5.8.2 Static Soil and Rock Lateral Pressures

Since the natural soils will be stripped to the top of rock and a wide bench will be excavated at the top of rock, the actual soils behind the final walls of the plan will be compacted select common fill. Since the walls will be drained, static lateral pressures for backfill soil are based on at-rest condition assuming a moist unit weight of 125 pcf and a friction angle of 34 degrees for which k_0 (at-rest earth pressure coefficient) is equal to 0.44. This corresponds to an equivalent fluid pressure of 55 pcf/ft. A surcharge lateral pressure due to a vertical surcharge of 300 psf, is added to the soil lateral pressure to account for construction loads. The depth of influence for a surcharge load is considered to be about 30 feet.

Based on experience with competent gneiss in the New York City area and since the rock walls will be permanently stabilized with rock bolts, and shotcrete, a ratio of horizontal to vertical pressure equal to 0.1 ($k_0 = 0.1$) is recommended for design of plant walls cast against a bond breaker membrane attached to the rock face. A moist unit weight of 168 pcf is used for bedrock. The lateral pressure at the top of rock should be taken as the earth overburden pressure at the top of rock multiplied by 0.1.

5.8.3 Seismic Soil and Rock Lateral Pressures

The structure will be designed with a structure stiffness to permit one inch of sway under seismic conditions. This amount of sway is sufficient to mobilize seismic active earth pressures. Under these conditions, the active earth pressure coefficient in soil is $K_a = 0.28$. The active pressure in rock is calculated using $K = 0.1$. The seismic lateral pressures are also based on the New York City Seismic Code procedure for which the total load expected during an earthquake is $P = 0.045\gamma h^2$, where γ is the unit weight of the soil and h is the height of the wall. Then, only in the overburden, the load P is superimposed to the active earth pressures. Since the rock mass will be stabilized by rock bolting and shotcrete, the rock walls will behave as a relatively stable rock mass. Therefore, there will be no additional seismic load to apply below the bedrock surface. Consequently, the seismic lateral force given by the above NYC Seismic Code formula shall be computed only in soil to the top of rock. This force is distributed as an inverted triangle between ground surface and the top of rock and superimposed to the active earth pressures. The active seismic design pressures, including the seismic lateral load, is shown on Figure 5.1. For the active seismic case, in accordance with the NYC Seismic Code, no calculation is made for the temporary vertical surcharge of 300 psf.

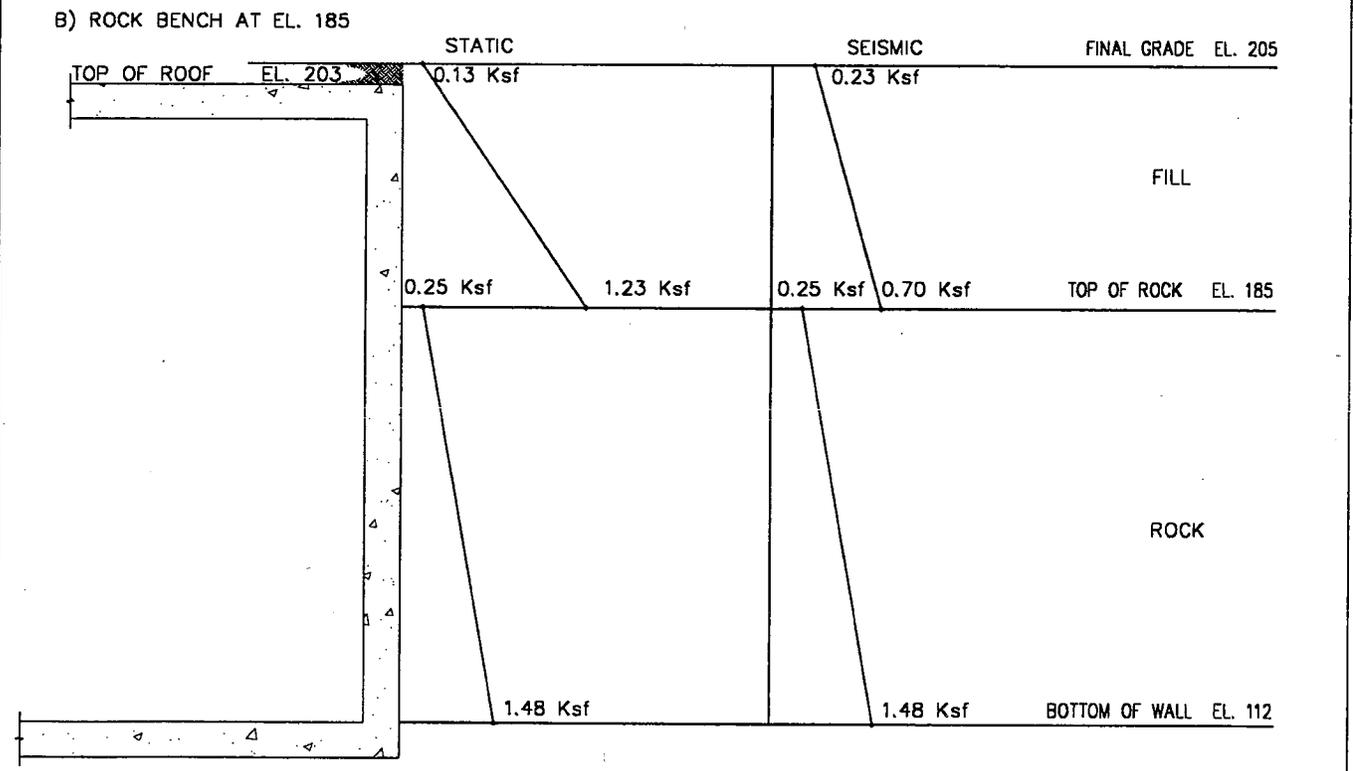

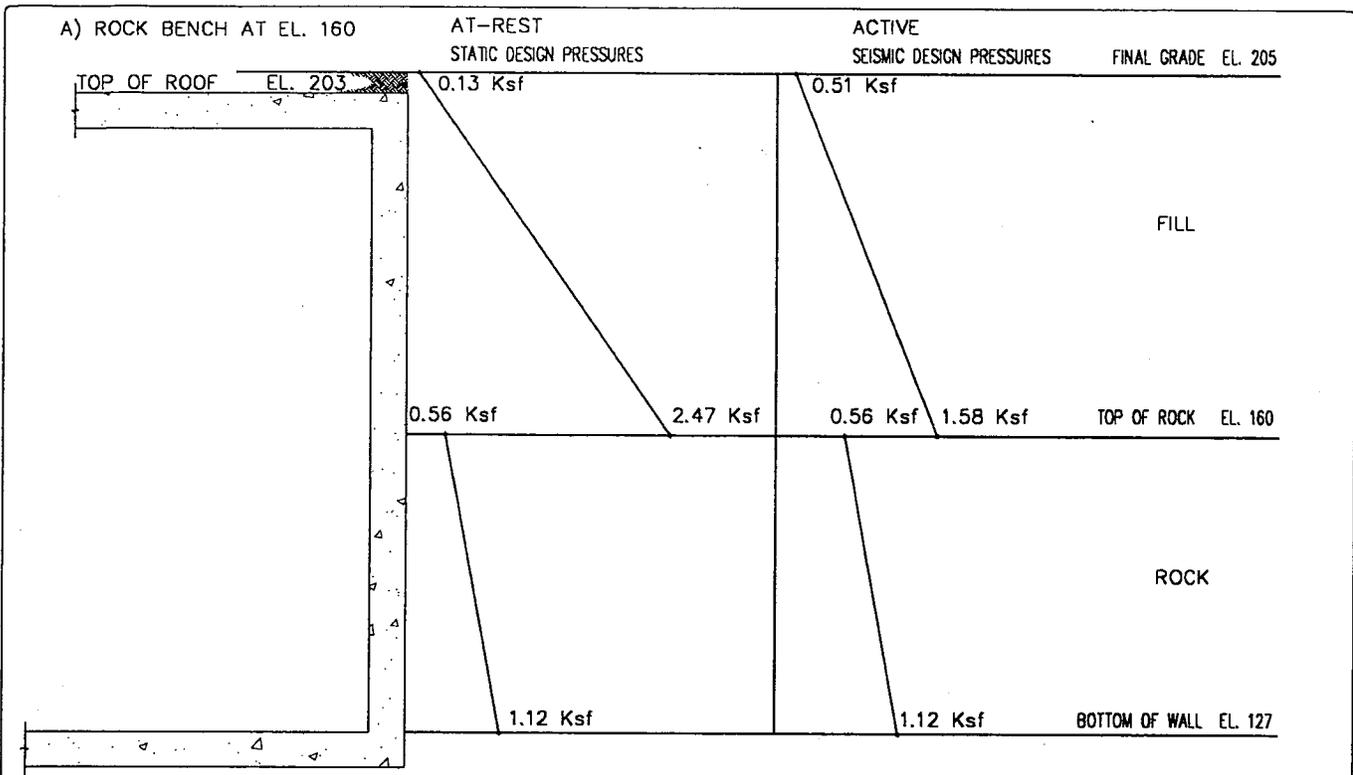

Figure 5-1
Lateral Pressure Diagrams for Design of Foundation Walls
 Croton Water Treatment Plant at Mosholu Golf Course
 Van Cortlandt Park, Bronx, New York

5.9 PERMANENT SOIL RETENTION SYSTEMS

Gravity type retaining walls shall be designed for the same lateral pressures as foundation walls, except that active conditions (i.e., $k_a=0.28$) instead of k_0 shall apply to overburden soils or backfill. This corresponds to an equivalent fluid pressure of 35 pcf/ft. All permanent soil retaining systems shall be provided with a drain to prevent build-up of hydrostatic pressures behind the wall. Lateral pressures for tied-back or anchored soil retention systems, if selected, shall be designed on a case by case basis.

SECTION 6 RECOMMENDED FOUNDATIONS AND WALLS

6.1 FOUNDATIONS

The geotechnical sections presented in Volume 2 of this Report show the outline of the Croton Water Treatment Plant. Although the plant will have several foundation levels, the entire structure will be founded on bedrock. The foundation will consist of a structural mat of varying thickness resting over an 18-inch thick crushed stone layer. The crushed stone layer will play a dual role. It will provide cushioning to allow for minor differential movement between differentially loaded areas of the structure as well as serve as part of the underdrain system for the plant.

The foundation mat shall be designed for the allowable bearing capacity or the vertical subgrade reaction as recommended in Section 5 of this Report. Since the groundwater level will be permanently lowered, the foundation mat will not be subjected to hydrostatic uplift forces.

The rock wall between the various foundation levels should be excavated as vertically as is practically possible. In case of rock overbreak from blasting on the walls, the resulting void should be filled with concrete or shotcrete depending on the size of the void. In the foundations, voids created by blasting in good quality rock can be filled with crushed stone.

6.2 WALLS

The foundation walls shall be designed for the soil and rock lateral pressures presented in Section 5 of this Report. Again, because the groundwater level will be permanently dewatered, hydrostatic pressures will not build-up behind the foundation walls. The foundation walls would be poured against a bond breaker membrane attached to the stabilized rock face. The bond breaker membrane could be a geodrain net (GDN) with a smooth polyethylene membrane toward the side of the concrete, attached to the rock face. In order to minimize the volume of concrete fill, the rock wall shall be excavated as vertical as is practically possible and a limit for payment for rock overbreak will be specified. Above bedrock, the walls shall be formed on both sides and suitable backfill material or crushed rock shall be used as backfill behind the walls.

6.3 DEWATERING SYSTEM

The underdrain and pumping system for the Croton Water Treatment Plant shall be automated and designed with sufficient redundancy to assure uninterrupted operation for the life of the facility. The basic components of the underdrain are as follows:

- An 18-inch thick layer of ¾-inch coarse aggregate shall be placed continuously beneath the foundation mat. In general, a geotextile fabric will not be required over the entire subgrade. The use of geotextile fabric will be restricted to strips only over large soil filled joint opening identified during foundation inspection if required.
- Perforated 4-inch diameter HDPE pipes shall be placed at a close spacing (i.e., about 25 feet) in a North-South direction. These lateral drain pipes shall connect to 8-inch header pipes, which in turn will connect to pump sumps located within the footprint of the building. Each lateral drain pipe and header pipe shall be provided with frequent cleanouts to allow for periodic flushing and removal of possible deposits and encrustation. Detailed design with flat or slightly sloped drains will be developed.
- Four-foot-wide strips of geocomposite drainage net (GDN) shall be securely fasten along the entire height of the rock wall and spaced approximately at 20-foot intervals around the periphery of the excavation. The GDN strips shall extend to meet the crushed stone layer underneath the foundation mat. The GDN shall be selected to resist the hydrostatic pressure from the wet concrete for the maximum height between construction joints in the foundation walls.
- Continuous monitoring of groundwater levels will be required.

SECTION 7

RECOMMENDED BLASTING METHODS AND ROCK REINFORCEMENT

7.1 BLASTING METHODS

7.1.1 Controlled Blasting

Controlled blasting techniques - presplitting, cushion blasting and line drilling - minimize overbreak and permit vertical wall design. At the site, a combination of controlled blasting techniques will be required to cut the excavation to accurate lines and around the several vertical corners proposed in the plant layout. Smooth wall blasting technique will be utilized in the Raw Water and Finished Water Tunnels.

7.1.2 Presplitting

The presplit surface is initiated along the open-cut excavation line by blasting instantaneously or on a short delay (less than 50 ms) between each hole a single row of closely spaced blastholes prior to detonating the primary (main) rounds. The presplit surface reduces the blast effects of the main round on the excavation perimeter wall. A spacing of 24 inches, center to center, and a blasthole diameter of 3 inches are typical. In most presplitting applications there is no subdrilling. Normally holes are stemmed on top 4 feet. The choice of which charges to use depends on the blaster. What is important is that the charges be less than the diameter of the blasthole and preferably not touching the blasthole walls.

Blasthole depth in presplitting is limited by the drilling accuracy of aligned holes which, in turn, is dependent on the quality of the rock mass. Presplit holes are commonly 25 to 40 feet deep.

It is essential that the holes start and remain in the presplit plane. The deviation of holes from the designed plane should not be greater than 4 inches at the bottom of a bench 40 feet high with a hole spacing of 24 inches. For closer hole spacing the allowable deviation should be less than 4 inches. These limits should be specified in the Contract Documents.

Careless presplitting may damage the fractured rock in the uppermost zone near the bedrock surface because liberated gas tends to migrate along these fractures and loosen the mass. This can be minimized by reducing the hole depth and spacing and by stemming carefully.

In relation to the main blast, presplitting and primary blasting are sometimes performed in one operation with the presplit and primary holes drilled at the same time. However, delays of 100 to 200 ms separate the two blasts. The final row in the primary pattern is commonly kept 3 to 4 feet from the presplit row. The outside rows closer to the presplit wall may be loaded lighter to reduce vibration and fragmentation.

7.1.3 Cushion Blasting

Cushion blasting - sometimes referred to as trim blasting - is a controlled blasting technique where a narrow berm is left to reduce damage to the final wall by the main blast. A single row of holes is drilled along the excavation line, loaded with light, well distributed charges, and fired after the main excavation is removed. The spacing of cushion blastholes is normally slightly larger than in presplitting. The annular space in the holes around the charges is filled with sand, crushed stone or gravel the entire column length. The cushion holes are fired instantaneously or with minimum delay between holes. Good hole alignment is essential and criteria for deviation from verticality are the same as for presplitting. Cushion blasting is often performed in combination with unloaded guide holes (line drilling) in non-linear faces. The burden (the shortest distance from blasthole to the rock free face) must be considered in the design of a cushion blast since the production round has been fired. Cushion blasting may be employed by the blasting Contractor in lieu of presplitting in areas of fractured rock in the upper bench, or at the east wall.

7.1.4 Line Drilling

This technique is usually used to protect critical sections of the rock faces and consists of placing a row of unloaded drill holes along the excavation line within 2 to 4 diameters of one another. These unloaded, closely spaced drillholes act as guides to cause cracks to form between them. Line drilling is also employed between presplit or trim blastholes to help guide the cracks and it is recommended prior to presplitting or cushion blasting where additional protection of the wall is or, in order to examine corners, for at least 10 ft. in both directions from a 90° outside corner; or

at the inside corner location. The plant layout at the site will require several outside and inside corners to be excavated by presplitting or cushion blasting in combination with line drilling holes.

In line drilling the primary blast is conducted to within two or three rows of the line-drilled row to decrease the burden. The powder factor should be reduced in the row of primary blastholes nearest the line-drilled rock.

7.1.5 Smooth Wall Blasting

Smooth wall blasting is the method to control overbreak in underground tunneling, consisting of drilling perimeter blastholes on an appropriate burden-to-spacing ratio, loading with light distributed charges and firing with, or after, the last delay period in the round. Smooth wall perimeter blastholes are typically 2 inches in diameter.

7.1.6 Main (Primary) Blasting For Open-Cut Excavation

Production blasting for open-cut excavation shall be designed as a function of fragmentation, ground vibration, airblast, and flyrock.

The selection of the proper blasthole diameter, along with the type of explosive being used, will determine the burden. All other blast dimensions are a function of the burden.

Large diameter blastholes (greater than 4.5 inches) also result in large burdens and spacing; hence, they tend to produce coarser fragmentation. Preferably, the use of small diameter holes (3.5 to 4.5 inches) would provide relatively low unit costs and permit fairly close spacing of holes. This close spacing allows for better distribution of explosives through the rock mass which in turn produces better breakage. An additional advantage using small diameter blastholes is the reduction in the amount of explosive, which in turn reduces ground vibrations. Airblast and flyrock often occur due to an insufficient stemming column (collar distance) above the explosive charge. The ratio of collar distance to blasthole diameter required to prevent airblast and flyrock varies typically from 14:1 to 28:1. A larger collar distance is required where the seismic velocity of the rock exceeds the detonation velocity of the explosive or where the rock is heavily fractured or low in density, e.g., in the fractured zone near the rock surface.

On this regard, the burden design should consider a value of the Stiffness Ratio (bench height divided by burden distance) greater than 2, for good control and fragmentation. An insufficient burden will cause explosive airblast and flyrock, while too large a burden will produce inadequate fragmentation, toe problems and excessive ground vibrations.

Where adequate fragmentation in the stemming zone of the blasthole cannot be attained while still controlling airblast and flyrock, deck charges or small diameter satellite blastholes (mid-spaced with the blastholes) may be required. Good fragmentation, in order to provide as practicable as possible a well-graded material to reduce void ratio and limit the quantity of material requiring haulage off-site, will be required at the site. When the gneiss is broken in a uniform size, it will occupy on the average, 30 to 40 percent more volume (swell factor) than in its solid state.

Ground vibrations are controlled by reducing the weight of explosive fired per delay interval. The use of ms (millisecond) delays between holes in a row results in better fragmentation and reduces the ground vibrations and airblast. When ms delays are used between holes in a row, the spacing-to-burden ratio must also be reduced (1.5 is a typical value). Various delay patterns may be used within the rows. In the primary blast, the delay time between rows should be two to three times the delay time between holes in a row, to obtain good fragmentation and control flyrock. Despite careful planning and good blast design, flyrock may occasionally occur and must always be protected against, for instance, using blasting mats. Some margin for error must always be maintained. An adequate number of guards must be posted at safe distances. Any people within this perimeter must be adequately warned.

In blasting for civil engineering structures where a final grade is specified, subdrilling of final lift is normally restricted. The final lift in structural excavations is normally limited to 5 to 10 feet. Subdrilling is not allowed in the last 5-foot lift, and is limited to a maximum of 2 feet for the 10-foot lift. Depth of subdrilling between the intended bottom of the bench is generally 0.2 to 0.3 times burden. The diameter of the blasthole in the foundations is limited to a maximum of 3.5 inches.

In view of the rock conditions at the project site, which can be defined as being generally good, using a careful presplitting and a production blasting with delay patterns to improve maximum relief to the main blastholes nearest the presplit line, overbreak would not be a major concern.

The excavation can be opened by a deep “V” cut where an initial cut is lacking. The cut is then enlarged to establish the free face. The more free faces a blast has to break, the lower the powder factor requirements. Normally, an elongated cut blast pattern opens in the center and progresses toward each end by means of delays.

As bench heights in cuts through hilly topography change continuously, burden and blasthole spacing must be modified accordingly to comply with the irregular bedrock surface. In practice, bench height for the production blast coincides with the height of the presplit wall. At the site, a maximum bench height of 40 feet is recommended.

7.2 LIMITATIONS ON GROUND VIBRATIONS AND AIRBLAST

7.2.1 Ground Vibrations

Blast vibration levels must be limited to minimize environmental impact, damage to nearby structures, and damage to the rock walls of the excavation.

To check blast vibration levels, there will be a requirement in the specifications for vibration monitoring, and a program of trial blasting in which the blast pattern is progressively modified to achieve the required results. Seismographs can be used throughout the blasting program to record the peak particle velocities and frequencies generated by the blasting rounds, measuring three mutually perpendicular components (radial, transversal, vertical). Seismograph records provide excellent evidence in case of later complaints or law suits on damage or nuisance from blasting.

An effective method for reducing vibrations is to use delayed detonation and sequential blasting so that the vibrations from one line of blastholes can dissipate before the next row is detonated. Alternatively, short delays can be timed such that vibrations from one line of blastholes can dissipate before the next row is detonated, or that vibrations are out of phase with those from adjacent decks, holes and rows. Ground vibration levels are related more to the weight of the explosive in any one short-delay period than to the total explosive in the round. In general, an increase in the number of delay intervals does not affect the vibration level provided that the delay interval is greater than 8 ms and the charge weight per delay remains constant.

Permissible vibration levels are specified in relation to the levels that can be tolerated by the wall rock, by different types of structures and by people. A safe blast is one that is within regulatory particle velocity specifications or scaled distance specifications. Where vibrations are not a serious problem, regulations will often permit the blaster to use the scaled distance equation rather than measure vibrations with a seismograph. For this project, only particle velocity and frequency measurements will be specified. However, the Contractor may use scale distance in combination with particle velocity measurements, for a series of test shots prior to the actual blasting program to calculate typical charge weights and distances, that will produce vibration levels less than the specified particle velocity.

As low-frequency vibrations have greater potential for damage than high-frequency vibrations, this imposes more restrictive limits on vibrations with low frequencies and long durations. Frequencies in the range of 4 to 20 Hz are usually considered the most annoying and troublesome. Regulations restrict the ground vibrations to a peak particle velocity of 0.75 ips when frequencies fall in the range of 4 to 11 Hz and 1.0 ips for frequencies of 11 to 15 Hz. For frequencies of 15 to 40 Hz, the peak particle velocity varies linearly from 1.0 ips to 1.75 ips with 1.5 ips at 20 Hz and 1.75 between 30 and 40 Hz. For frequencies above 40 Hz, the maximum allowable particle velocity is 2.0 ips.

Where blasting operations are to continue during concrete operations, the blasting vibration limits for mass concrete are 0.75 ips for a concrete age of 0 to 24 hours from placement, and 1 ips for a concrete age of 24 hours to 72 hours. Ground vibration and airblast will be monitored at each blast at the Woodlawn Elevated Subway Station and on structures along Jerome Avenue.

7.2.2 Airblast

Airblast and airblast vibrations are generated when explosives are detonated in stemmed blastholes and high pressure gases are released to the atmosphere either through the broken rock or after the stemming has been ejected or by exposed detonation cord and surface delays intentionally placed on the ground surface. The primary causes of excessive airblast pressures are insufficient burden, insufficient stemming in each blasthole, and adverse weather conditions. The term airblast overpressure is often used for the air waves generated by blasting, and it is measured in pounds per square inch (psi).

Sometimes, airblast pressures are reported in decibels (dB), that is, a sound pressure level. 0.0145 psi is equivalent to 134 dB or 1 millibar. The primary blast-design parameters which contribute to the intensity of the airblast pressure are the charge weight per delay interval, and the distance from the charge (depth of burial usually considered to be the depth to the center of the charge). The distance is scaled by the cube root of the maximum charge weight per delay (ft/lbs^{1/3}). The charge per delay interval is the sum of the charges in the holes that are detonated simultaneously. The scaled depth of burial corresponds roughly to the scaled burden for each blasthole.

If overpressures are increased to the level of 0.1 psi or 151 dB, at which some type of damage to residences begins to develop, the results are noted in the form of occasional window breakage. At 1 psi or 171 dB there will be a general window breakage. Plaster will crack at 2 psi or 176 dB. The construction blasting specifications required for this project will limit the airblast overpressure to 0.0145 psi or 134 dB, which has a proven history of application.

Airborne pressures are recorded generally by microphones for pressure measurements from 0.1 to 1 psi, and by piezoelectric pressure gages for overpressure greater than 1 psi. Additionally, in the absence of monitoring, a scaled distance of 500 ft/lbs^{1/3} is normally recommended. However, in this case, a more conservative 1 lb of explosive per delay will be allowed at a distance of 500 feet.

Although airblast damage from planned blasting operations is unusual, it is proposed to monitor all blasting operations.

7.3 BLASTING SPECIFICATIONS

Blasting specifications should require the Contractor to engage the services of a blasting specialist with a long proven blasting project record for designing and directing each blast. The Contractor shall submit blast designs for the Engineer's approval before the start of drilling and loading, and furnish complete information on every blast. Approval does not relieve the Contractor of his responsibility for safety, for producing the specified results, and for obtaining breakage sufficient for handling the broken rock. Provisions should be included for a vibration and airblast control and for the various types of controlled-perimeter blasting that may be required at different locations. When blasting results are desired to produce a certain ground

vibration level and a certain fragmentation, test blasting should be performed prior to the actual blasting program. A pre-construction survey that documents the conditions of the buildings and subway on Jerome Avenue should be performed prior to blasting. In addition, a pre-blast survey helps the blasting Contractor maintain good community relations. Another purpose of a pre-blast survey is to provide a baseline record of the conditions of the structures against which the effects of blasting can be assessed. When combined with a post-blast survey, this will help assure equitable resolution of any blast damage claims.

It is customary in construction contracts that unit bid prices for rock excavation be specified, including all costs of drilling and blasting. If the rock outlining the excavation is to be protected, it is common practice to describe the results required of the excavation stating that any rock excavation that exceeds the prescribed tolerance of lines and grades will be filled with concrete cast monolithically with the plant walls and that any additional cost necessary to do this be at the Contractor's expense. It is the responsibility of the Contractor to select the methods and operate in a manner that will produce the required results. It is expected that a Contractor will include in his bid a contingency item based on his judgement of the difficulty of the required work.

Specifications shall stress the fact that large holes and large spacings cannot be used to give maximum production at the expense of increased vibrations and damage to the perimeter. A range of blasthole sizes, as well as maximum heights of bench and depth tolerances of subdrilling, should be specified, and the bench heights should be linked to the installation of rock support before blasting of a subsequent bench.

The specification should state allowable maximum vibration and airblast levels together with locations and methods of vibration and airblast monitoring. This gives the Contractor greater flexibility, allowing him to come up with low-cost, high-production blast designs while demonstrating that his design is adequate for control of vibrations and damage.

Specifications for controlled-perimeter blasting should also give guidelines on stemming materials and hole alignment tolerances, and should state the use of either simultaneous firing or millisecond delays to reduce ground vibrations as required. Specifications for presplitting and cushion blasting should allow enough latitude that the method can be adjusted to the field conditions.

Unloaded perimeter holes are specified for line drilling. Provisions for unloaded guide holes and line drilling especially for outside corners should be considered.

A performance specification is preferred for excavation work as it leaves the detailed methods of construction up to the Contractor. The specification should state the required end-result in terms of lines of excavation, overbreak, vibration and noise levels, etc., and the general methods thereby these results can be achieved.

7.4 ROCK BOLTING

For permanent applications, the use of fully grouted rock bolts will be considered. The bolts can be either cement grouted, mechanically anchored hollow core bolts with an expansion shell for the anchorage, or resin anchored bolts using a number of setting resin cartridges in the anchorage zone.

In the resin bolt application, a number of fast-setting resin cartridges are inserted at the bottom of the drillhole for anchorage, followed by low-setting cartridges. The bolts can be tensioned within two or three minutes of installation (after the fast anchor resin has set). The tension is then locked in by the later-setting grout cartridges and the resulting installation is a fully tensioned, fully grouted rock bolts. When the bolts are longer than 15 feet, it is recommended to use hollow core mechanically anchored rock bolts that can be fully grouted with a water - cement grout. The grout will also offer a long-term corrosion protection. Pull-out tests will be required at least on 5 percent of the bolts installed for final acceptance.

When conditions are such that installation of support can be carried out very close to an advancing blast or in vertical installation, e.g., to pin down the top layers of rock, cement-grouted dowels can be used in place of rock bolts. The difference between rock bolts and dowels is that tensioned rock bolts apply a positive force to the rock, while the load in the dowels is generated by movements in the rock mass. Once the grout has set, a faceplate and nut may be fitted onto the end of the dowel and pulled up tight.

7.5 SHOTCRETE

Rock reinforcement, where required, can be achieved by applying a layer of shotcrete to the rock surface. The traditional reinforcement in shotcrete is steel-welded wire mesh. However, the trend is to replace the wire mesh in shotcrete with steel fibres. The ductility of steel fibres is higher than of wire mesh. However, in very poor quality, loose rock masses, the wire mesh still provides a significant amount of reinforcement, in combination with shotcrete. For normal applications, steel fibres offer savings in direct cost (material) and time (application of one layer of shotcrete with steel fibres as opposed to two layers with wire mesh). Moreover, the increased rebound caused by wire mesh, as well as the effect of shadows behind the mesh, is avoided. The fibre-reinforced shotcrete will require the use of microsilica in the mix and preferably a wet-mix process. The thickness of the fibre reinforced shotcrete layer should be minimum 2 inches; the thickness of the conventional shotcrete with wire mesh should be minimum 4 inches. The specifications should consider the use of both types of shotcrete for rock mass stabilization, depending on the quality of rock identified during rock wall inspection. For other purposes, such as shotcrete strips on the walls for the dewatering system, the use of steel fibre shotcrete is preferred.

SECTION 8 SITE WORK AND ACCESS ROADS

8.1 SITE GRADING AND BACKFILL

Crushed stone will be backfilled beneath the plant base slab and around the walls above the bedrock. The roof of the proposed Water Treatment Plant will be covered with about 2 feet of sandy loam and topsoil. Grass would be planted and an irrigation system would be installed to ensure successful maintenance of grass on the new driving range. The final grade would be at Elevation 205, approximately at the existing grade at the western side of the project site, and 30 feet above the existing grade at the eastern side of the project site. This change in grade would be handled with vegetated sloping berms constructed with excavated material and imported fill as required.

8.2 ROADS AND PARKING AREAS

Paved areas, including permanent parking lots and access roads, will be constructed on properly prepared subgrade. The exposed subgrade shall be proofrolled to densify the soil. Due to a relatively high silt content that exists in the subgrade soils, this type of material may weave when exposed to excessive moisture and traffic. As a result, in the softer areas of the subgrade, the material must be replaced with new compacted coarser fill (sand and gravel with less than 15 percent silt). A 2-inch maximum size, well graded crushed stone or structural fill subbase must be provided over the subgrade and/or fill as a means of subpavement support and drainage layer. Geotextiles may be used as reinforcement in soft road subgrades as required.

Pavement will consist of 1.5-inch thick top asphaltic concrete wearing course and 4-inch thick bituminous binder course overlying a 12-inch thick stone subbase, compacted to 98 percent of maximum dry density. Design and materials will conform to specifications of New York City Department of Transportation.

Typical minimum California Bearing Ratio (CBR) values for base, subbase and subgrade materials upon which pavement design thicknesses are based, are as follows:

1. **Base.** Well graded clean crushed stone, nominal size 1-in. (80 to 100 percent passing by weight) to No. 200 sieve (0 to 10 percent). CBR 80 percent (soil rating: very good).
2. **Subbase.** Well graded crushed stone, nominal size $\frac{3}{4}$ -in. (90 to 100 percent passing by weight) to No. 200 sieve (0 to 12 percent). CBR 20 percent (good).
3. **Subgrade.** Existing silty sands, poorly graded sand-silt mix, medium dense, moist. CBR 10 percent (acceptable).

SECTION 9 CONSTRUCTION CONSIDERATIONS

9.1 SOIL EXCAVATION AND HAUL ROADS

The overburden soils at the site can be excavated with standard earth moving equipment. The soils will be laid back to form an embankment with slopes no steeper than 1.5 horizontal to 1 vertical, to provide for adequate stability during construction. Alternatively, the Contractor may opt to construct steeper slopes supported by earth retention relocation system, in which case the Contractor shall be required to retained a Professional Engineer registered in the State of New York to design the system.

The embankment slopes will be stabilized with geotextile material, such as an erosion mat, and planted with grass to minimize erosion.

A paved haul road will be constructed from Jerome Avenue to the top of the existing Golf Course along the north and west sides of the plant. The Contract Documents will specify that the overburden excavation will extend up to a maximum of 40 feet beyond the footprint of the plant to create a rock platform around the entire plant serving as a working platform and for haulage of the excavated material. As the overburden is removed, temporary ramps can be constructed as required from the embankment down to the working platform. As rock excavation proceeds below the working platform, lower ramps will be built within the excavation footprint to allow vehicular access to the bottom of the excavation.

The paved haul roads installed during construction, as well as the granular material placed on the fairways to facilitate parking and laydown areas, will be removed. All these areas will be restored in accordance with plans to be developed.

9.2 ROCK EXCAVATION AND TEMPORARY ROCK WALL REINFORCEMENT

Blasting methods for rock excavation and temporary rock wall measures that will be required are discussed in Section 5.5 and Section 7 of this Report.

9.3 DEWATERING

The pumping rate for design of the permanent underdrain system is estimated to be in the order of 110 gpm based on calculation on groundwater inflow. Dewatering rates during construction will include stormwater and can vary substantially from the 110 gpm underdrain design rates. Given the size of the excavation and the time it will take to complete it, dewatering during construction will likely be accomplished with sump pumps placed inside the excavation. Pumped water will be discharged into a nearby sewer. Provisions to handle concentrated flows such as grouting of more significant water-producing fractures will need to be implemented.

Drainage should be provided for the foundation walls. Below the top of rock geodrain strips will be installed and connected to the foundation drain. Above the top of rock, if select common fill is used as backfill, a peripheral drain along the rock bench should be provided to allow the groundwater from the compacted backfill to drain freely. A simple option would be to extend the geodrain strips horizontally 10 feet on top of the rock bench and cover it with one foot of $\frac{3}{4}$ -inch stone. Alternately, a peripheral drain can be installed on top of bedrock to drain by gravity to either the foundation sump or to one of the sewers on Jerome Avenue. If on-site silty sands are allowed as backfill behind foundation walls, the geodrain strips should be extended for the full height of the foundation walls.

SECTION 10
INSTRUMENTATION AND MONITORING

10.1 GEOTECHNICAL INSTRUMENTATION

Geotechnical instrumentation during construction will consist of observation wells to monitor the groundwater, and survey monitoring points and rock bolt extensometers on the rock face of excavation to monitor movement of the rock. A minimum of eight observation wells are recommended around the perimeter of the excavation area. Observation wells will be extended from the ground surface to 5 feet below the final excavation level. The well screen depth should be from 5 feet above the bedrock surface to the bottom of the borehole. Some observation wells will be permanent, some others should be properly backfilled at the end of construction.

Rock bolt extensometers will be used on each wall to detect vertical wall movement toward the excavation. They will be installed in areas where major joint intersections may form potentially unstable wedges of rock. A minimum of 6 rock bolt extensometers would be required on the long walls of the excavation and 4 on the short walls. Additional instrumentation such as survey points and tell-tale mortars on major joints will be installed as necessary. Survey points should be located on each wall bench at 100-foot intervals.

Permanent geotechnical instrumentation after completion of construction will consist of pneumatic or vibrating wire piezometers to monitor the groundwater in the underdrain beneath the plant.

Croton Water Treatment Plant
3851 Jerome Avenue
Van Cortlandt Park
Bronx, New York
DDC Project Number: HED-CLUB
WOL No. : 11505-LIRO-3-10529
Contract Registration No.: 20151405569

Introduction

On behalf of the New York City Department of Design and Construction (NYCDDC), LiRo Engineers, Inc. (LiRo) conducted a Limited Phase II Environmental Subsurface Investigation (ESI) at the Croton Water Treatment Plant (the Site) located at 3851 Jerome Avenue, in Van Cortlandt Park, Bronx, New York (Figures 1 and 2) to characterize and assess the subsurface soils at the Site. The Limited Phase II ESI was performed to determine if the Site's environmental condition might impact proposed construction activities at the Site.

Site Description

The Site is located at 3851 Jerome Avenue within Van Cortlandt Park in Bronx, New York and was undergoing active maintenance and construction at the time of the field activities. The proposed work at the Site related to this Limited Phase II ESI field activity includes excavation for the construction of a golf clubhouse structure.

Scope of Work

As requested by the NYCDDC, LiRo conducted an expedited Limited Phase II ESI of the Site. This work was assigned as a priority project prompting an expeditious completion deadline due to the abbreviated project schedule and a Phase I Environmental Site Assessment (ESA) was not performed for the Site. The objective of the Limited Phase II ESI was to assess the presence of any subsurface contamination that may potentially impact proposed excavation activities.

On May 7, 2016, Ms. Eva Jakubowska of LiRo and the NYCDDC Project Manager conducted a walk through of the Site to select boring locations. In addition, it was determined during the walk through that the borings would need to be advanced to varying depths ranging from 6 to 20 feet below grade (ftbg), depending on location at the Site.

The Phase II ESI activities were conducted between May 24 and 26, 2016 and consisted of the following components:

- The advancement of seven (7) borings (SB-01 through SB-07). Each boring was hand cleared to 6 ftbg using a vacuum excavator/air knife combination. Borings SB-02 through SB-07 were then advanced to their terminal depths indicated above utilizing a GeoProbe with direct push technology through the pre-cleared locations. The depths of the borings were as follows:
 - SB-01 was advanced to 6 ftbg as planned;
 - SB-02 was advanced to 9 ftbg due to refusal;
 - SB-03 was advanced to 10 ftbg as planned;
 - SB-04 was advanced to 12 ftbg due to refusal;
 - SB-05 was advanced to 18 ftbg due to refusal; and,
 - SB-06 and SB-07 were advanced to 3.5 ftbg due to refusal.
- Field screening consisted of qualitative assessment of soils including obtaining photo-ionization detector (PID) readings, and identification of visual and olfactory indicators of contamination (staining, odors) from surface grade to the bottom of each boring. Soil samples were additionally classified in the field using the Unified Soil Classification System (USCS);
- The collection of one (1) grab soil sample from each of the seven (7) soil borings (SB-01 through SB-07). The grab soil samples were analyzed for United States Environmental Protection Agency (USEPA) Target Compound List (TCL) volatile organic compounds (VOCs);
- The collection of one (1) composite soil sample from each of the seven (7) soil borings (SB-01 through SB-07). The composite soil samples were analyzed for the following parameters: (1) Polycyclic Aromatic Hydrocarbons (PAHs) via USEPA Method 8270C; (2) Polychlorinated Biphenyls (PCBs) via USEPA Method 3550B/8082; (3) Total Petroleum Hydrocarbon (TPHC) Diesel Range Organics/Gasoline Range Organics (DRO/GRO) via USEPA Method 8015B; (4) Resource Conservation and Recovery Act (RCRA) Characteristics via USEPA SW-846; and, (5) Toxicity Characteristic Leaching Procedure (TCLP) RCRA Metals via USEPA SW-846;
- The preparation of this report, which includes tables summarizing the laboratory analytical results and figures depicting boring locations, significant site features and, if applicable, contamination occurrence and distribution.

Since groundwater was not encountered within any of the seven (7) boring advanced at the Site, no groundwater samples were collected.

In order to evaluate the subsurface soil quality, laboratory analytical results for the soil samples were compared with the regulatory standards identified in: (1) New York State Department of Environmental Conservation (NYSDEC) Subpart 375-6: Remedial Program Unrestricted and Restricted Use (Track 1 and Track 2) Soil Cleanup Objectives (SCOs); (2) NYSDEC CP-51 Soil Cleanup Levels (SCLs) which include Supplemental Soil Cleanup Objectives (SSCOs) to NYSDEC Subpart 375-6 and SCLs for

gasoline/fuel oil contaminated soil; and/or, (3) Toxicity Characteristic Regulatory Levels for Hazardous Waste published in RCRA and 6 New York City Code for Rules and Regulation (NYCRR) Part 371.

Field Activities

The seven (7) borings were cleared to 6 ftbg unless refusal was encountered sooner (i.e., SB-06 and SB-07 to 3.5 ftbg) using a vacuum excavator/air knife combination. Boring SB-02 through SB-05 were then advanced to their terminal depths utilizing a GeoProbe with direct push technology. Boring SB-01 was terminated at 6 ftbg as proposed.

Soil samples were collected using plastic scoops and/or disposable spoons. Soil boring locations are shown on Figure 3. The designations and sampling intervals for the soil samples that were submitted to the laboratory are included in Table 1.

Soil from each boring was classified and examined for visual evidence (i.e., staining, discoloration) and any olfactory indications (i.e., odors) of contamination. In addition, a PID was used to screen the soil for VOC vapors.

In order to identify representative conditions relative to the presence of PAHs, PCBs, TCLP RCRA Metals, TPHC-DRO/GRO, and RCRA Characteristics over the entire soil column in each boring, composite soil samples were collected by mixing the soil from the entire column in a stainless steel bowl. Boring composite samples were collected from the seven (7) soil borings (SB-01 through SB-07).

In order to identify representative conditions relative to the presence of VOCs, grab soil samples were collected from the bottom 6-inch interval of the borings of all seven (7) borings (SB-01 through SB-07).

All boring equipment was cleaned by rinsing with tap water, scrubbed with phosphate-free detergent (i.e., Alconox®), and then rinsed with deionized water again between each sample interval in accordance to NYSDEC protocols stipulated in the Division of Environmental Remediation (DER) -10. Following the completion of each boring, the open boreholes were back-filled with drill cuttings and restored to its initial surface grade with concrete patches.

The soil samples were submitted to Chemtech of Mountainside, New Jersey, a New York State Department of Health (NYSDOH) certified laboratory (No. 11376). Field derived Quality Assurance/Quality Control (QA/QC) samples (i.e., field blank, trip blank, duplicate) were not collected for this project. Laboratory analytical reports are included in Appendix A.

Field Observations

The subsurface soils encountered during this Phase II ESI consisted predominantly of brown fine to coarse sand with silt and gravel. Fill material, which included mainly blasted rock, was noted throughout the Site. Asphalt millings were noted within four (4) of the on-site borings at the following depths.

Boring No.	Depth (ftbg)
SB-02	7.5
SB-04	8.5
SB-05	0-2
SB-07	0.5-2

Refusal was met at SB-02 and SB-05 through SB-07. LiRo cannot be certain whether this was bedrock or not. Groundwater was not encountered within the seven (7) borings advanced on-site.

Field screening did not identify any visual or olfactory evidence of impacts or elevated PID readings within the soil borings.

Findings

Volatile Organic Compounds (VOCs) in Soil

VOCs were detected in all seven (7) grab soil samples collected. One (1) VOC, acetone, was detected above the Unrestricted Use (Track 1) SCO in one (1) of the seven (7) grab samples collected (SB-07). 1,2,4-trichlorobenzene was detected in one (1) of the seven (7) grab samples (SB-02) at a concentration below the Unrestricted Use (Track 1) SCOs, Restricted Use (Track 2) Residential SCOs, and/or the CP-51 SCLs. Methylene chloride was detected in all seven (7) grab samples (SB-01 through SB-07) at concentrations below the Unrestricted Use (Track 1) SCOs, Restricted Use (Track 2) Residential SCOs, and/or the CP-51 SCLs. Both acetone and methylene chloride are common laboratory cross contaminants and are most likely not representative of subsurface conditions. Refer to Table 2 for a summary of the VOC detections.

Polycyclic Aromatic Hydrocarbons (PAHs) in Soil

PAHs were reported in two (2) of the seven (7) composite soil samples collected. Anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene were all detected at concentrations below the Unrestricted Use (Track 1) SCOs, Restricted Use (Track 2) Residential SCOs, and CP-51 SCLs in the two (2) composite samples (SB-02 and SB-04). The detected PAHs may be attributed to: (a) residuals from potential isolated releases in this portion of the Site; and/or, (b) the presence of historic fill material placed at the Site. Refer to Table 3 for a summary of TCL PAHs detections.

PCBs in Soil

PCBs were not detected in any of the seven (7) composite soil samples collected. Refer to Table 4.

Toxicity Characteristic Leaching Procedure (TCLP) Resource Conservation and Recovery Act (RCRA) Metals in Soil

TCLP RCRA metals, including barium, chromium, and/or selenium, were reported in all seven (7) composite soil samples collected. All reported concentrations were below RCRA standards. Refer to Table 5 for TCLP RCRA metal detections.

Waste Classification of Soil

Ignitability (flash point), reactivity (cyanide and sulfide), and corrosivity (pH) were within the acceptable RCRA ranges. TPHC-DRO were reported in all seven (7) composite samples collected at concentrations ranging from 1.5 milligrams per kilograms (mg/kg) in SB-05 to 1,081 mg/kg in SB-07. There is no regulatory standard for TPHC-DRO. TPHC-GRO was not detected in the seven (7) composite samples collected. Refer to Table 5 for a summary of TPHC-DRO results.

Conclusions

Based on the results of the Limited Phase II ESI, which included the evaluation of the field screening data and the laboratory analytical results, and a comparison to applicable regulatory standards, the following conclusions are presented:

- Field screening did not identify any visual or olfactory evidence of impacts or PID readings within the soil borings;
- Laboratory analytical results did not identify petroleum-impacted soils at the Site. The presence of TPHC-DRO in the subsurface soils may be attributed to: (a) residuals from isolated releases; and/or, (b) the presence of fill material at the Site; and,
- The subsurface soil samples collected from the Site did not exhibit hazardous waste characteristics.

Recommendations

Based on the results of the field investigation and laboratory analytical results, LiRo recommends the following:

- The Contract documents should identify provisions for characterizing and managing, handling, transporting, and disposing of non-hazardous contaminated soil (i.e., TPHC-DRO) and a contingency for managing, handling, transporting, and disposing of petroleum contaminated soil. The Contractor should be required to submit a Material Handling Plan (MHP) to identify the specific protocol and procedures that will be employed to manage the waste in accordance with applicable regulations. Analytical results will need to be compared to levels acceptable by the chosen receiving facility to determine appropriate waste classification prior to off-site disposal;
- Due to the presence of TPHC-DRO in the investigated sites, dust control procedures are recommended during excavation activities to minimize the creation and dispersion of fugitive airborne dust. The Contractor may implement dust control measures to minimize potential airborne contaminants released as a direct result of construction activities;
- Based on the Limited Phase II ESI field activities, groundwater was not encountered within the seven (7) soil borings advanced at the Site. Should dewatering be necessary during construction activities to a sanitary or combined sewer, the contractor should be required to obtain a NYCDEP sewer discharge permit.
- In addition, if discharge into storm sewers (which ultimately discharge to surface waters) is required during dewatering, it may be done under the appropriate NYSDEC State Pollutant Discharge Elimination System (SPDES) permit. Additional sampling and laboratory analysis may be required to satisfy NYSDEC requirements prior to discharge into storm sewers; and,
- Before beginning any excavation activity, the contractor should submit a site-specific HASP that will meet the requirements set forth by the Occupational, Safety, and Health Administration (OSHA), the NYSDOH, and any other applicable regulations. The HASP should identify the possible locations along the Site and risks associated with the potential contaminants that may be encountered, and the administrative and engineering controls that will be utilized to mitigate environmental concerns (i.e., dust control procedures for TPHC-DRO).

Dear Amy Hewson,

9 soil samples for the **OEGS Rush** project were received on **05/26/2016**. The analytical fax results for those samples requested for an expedited turn around time may be seen in this report. Please contact me if you have any questions or concerns regarding this report.

The invoice for this workorder is also attached to the e-mail.

Regards,

Snehal Mehta

(908) 789-8900 Fax (908) 789-8922
www.chemtech.net

CHEMTECH PROJECT NO.
QUOTE NO.
COC Number 037726

CLIENT INFORMATION

REPORT TO BE SENT TO:
COMPANY: Lilo Engineers, Inc.
ADDRESS: 703 Kovi mer street
CITY: Brooklyn STATE: NY ZIP: 11211
ATTENTION: Steve Frank
PHONE: 716 882 9645 FAX: —

CLIENT PROJECT INFORMATION

PROJECT NAME: Croton Water Treatment Plant on Jerome Ave.
PROJECT NO.: 15-008-0268 LOCATION: Bronx, NY
PROJECT MANAGER: Steve Frank
e-mail: franks@lilo.com
PHONE: 716 882-9645 FAX: —

CLIENT BILLING INFORMATION

BILL TO:
ADDRESS: SAME
CITY:
STATE: ZIP:
ATTENTION:
PHONE:

DATA TURNAROUND INFORMATION

FAX: _____ DAYS*
HARD COPY: 2 day 1A _____ DAYS*
E.D.D.: _____ DAYS*
PRE-APPROVED TAT: YES NO prices provided by Joe Deery
*STANDARD TURNAROUND TIME IS 10 BUSINESS DAYS

DATA DELIVERABLE INFORMATION

LEVEL 1: Results only Others
 LEVEL 2: Results + QC
 LEVEL 3: Results (plus results raw data) + QC
 LEVEL 4: Results + QC (all raw data)
 EDD Format:

CHEMTECH SAMPLE ID	PROJECT IDENTIFICATION	SAMPLE MATRIX	SAMPLE TYPE	SAMPLE COLLECTION		# OF BOTTLES	PRESERVATIVES	COMMENTS
				DATE	TIME

SURROGATES							
877-09-8	Tetrachloro-m-xylene	13.8		10 - 166		69%	SPK: 20
2051-24-3	Decachlorobiphenyl	14.4		60 - 125		72%	SPK: 20

Comments:

U = Not Detected

LOQ = Limit of Quantitation

MDL = Method Detection Limit

LOD = Limit of Detection

E = Value Exceeds Calibration Range

P = Indicates >25% difference for detected concentrations between the two GC columns

Q = indicates LCS control criteria did not meet requirements

M = MS/MSD acceptance criteria did not meet requirements

J = Estimated Value

B = Analyte Found in Associated Method Blank

N = Presumptive Evidence of a Compound

* = Values outside of QC limits

D = Dilution

S = Indicates estimated value where valid five-point calibration was not performed prior to analyte detection in sample.

() = Laboratory InHouse Limit

PROJECT NAME : OEGS RUSH

LIRO ENGINEERS, INC.

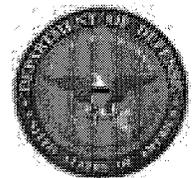

690 Delaware Ave.

Buffalo, NY - 14209

Phone No: 716-882-5476

ORDER ID : H3323

ATTENTION : Amy Hewson

DoD ELAP

284 Sheffield Street, Mountainside, NJ 07092 Phone: 908 789 8900 Fax: 908 789 8922

Date : 06/01/2016

Dear Amy Hewson,

12 soil samples for the **OEGS Rush** project were received on **05/26/2016**. The analytical fax results for those samples requested for an expedited turn around time may be seen in this report. Please contact me if you have any questions or concerns regarding this report.

The invoice for this workorder is also attached to the e-mail.

Regards,

Snehal Mehta

908-728-3149

CAS Number	Parameter	Conc.	Qualifier	MDL	LOD	LOQ / CRQL	Units(Dry Weight)
TARGETS							
DRO	DRO	9464		903	905	1810	ug/kg
SURROGATES							
16416-32-3	Tetracosane-d50	11.8		37 - 130		59%	SPK: 20

Comments:

U = Not Detected

LOQ = Limit of Quantitation

MDL = Method Detection Limit

LOD = Limit of Detection

E = Value Exceeds Calibration Range

P = Indicates >25% difference for detected concentrations between the two GC columns

Q = indicates LCS control criteria did not meet requirements

M = MS/MSD acceptance criteria did not meet requirements

J = Estimated Value

B = Analyte Found in Associated Method Blank

N = Presumptive Evidence of a Compound

* = Values outside of QC limits

D = Dilution

S = Indicates estimated value where valid five-point calibration was not performed prior to analyte detection in sample.

() = Laboratory InHouse Limit

Comments:

U = Not Detected

LOQ = Limit of Quantitation

MDL = Method Detection Limit

LOD = Limit of Detection

E = Value Exceeds Calibration Range

P = Indicates >25% difference for detected concentrations between the two GC columns

Q = indicates LCS control criteria did not meet requirements

M = MS/MSD acceptance criteria did not meet requirements

J = Estimated Value

B = Analyte Found in Associated Method Blank

N = Presumptive Evidence of a Compound

* = Values outside of QC limits

D = Dilution

S = Indicates estimated value where valid five-point calibration was not performed prior to analyte detection in sample.

() = Laboratory InHouse Limit

Attn: Mr. Eric Johnson

Re: Geotechnical Interpretive Report
Croton P4 HED-CLUB
Borough of the Bronx, New York
MRCE 13103

Dear Mr. Johnson:

In accordance with our agreement dated August 23, 2017, Mueser Rutledge Consulting Engineers (MRCE) has reviewed existing subsurface information for the proposed golf clubhouse next to the existing below-grade Croton Water Filtration Plant. This report summarizes our interpretations of subsurface conditions and provides foundation design and construction recommendations.

PROJECT DESCRIPTION

We understand that you are planning to build a one-story golf clubhouse next to the existing below-grade Croton Water Filtration Plant. The site is currently unoccupied and is bound by the MTA NYCT Woodlawn station to the east, and the Mosholu Golf Course above the water treatment facility to the west.

All recommendations are in accordance with the 1968 New York City Building Code latest edition as per project requirements. Elevations in this report are in feet and reference the North America Vertical Datum of 1988 (NAVD88).

EXHIBITS

The following exhibits are attached:

<u>Exhibit</u>	<u>Description</u>
Figure No. B-1	Boring Location Plan
Figure No. GS-1 & GS-2	Geologic Section
Appendix A	2017 Geotechnical Data Report
Appendix B	2000 Boring Logs in Project Vicinity

AVAILABLE INFORMATION

A subsurface investigation for the Croton Water Treatment Plant was performed in 2017 by CDM Smith, consisting of 18 geotechnical borings within the proposed footprint of the clubhouse structure and 2 groundwater observation wells.

A previous investigation was performed in 2000 by Hazen and Sawyer consisting of 51 test borings and 35 air-track probes. From this investigation, four borings are within the proposed footprint of the clubhouse structure.

SUBSURFACE CONDITIONS

The project is located in the Manhattan Prong of the New England Upland Physiographic Province and the bedrock is of the Fordham Gneiss Formation. Bedrock is relatively shallow in this area and is overlain by Upper Pleistocene deposits composed of outwash sand and gravel that has accumulated in depressions on the bedrock.

Our interpretation of the subsurface conditions encountered during the boring investigations by others is described below and shown graphically on Figure Nos. GS-1 and GS-2. The subsurface profile is summarized by strata in order of their general occurrence with depth, as follows:

Stratum F – Fill (NYCBC Class 11-65)

Stratum F is composed of brown fine to coarse sand, some to trace gravel, trace to some silt, cobbles, and boulders. The 2017 borings did not collect split spoon samples through this stratum in several borings. Where recorded, SPT N-values ranged from 7 blows per foot (bpf) to 61 bpf and have an average value equal to 28 bpf. Stratum F is between 5 feet and 10 feet thick across the site.

Stratum S – Sand (NYCBC Class 7-65 to 6-65)

Stratum S was encountered below the fill and is composed of brown fine to medium sand, some to trace silt, and trace gravel. Boulders and layers of gravel with some sand and silt were frequently encountered within this stratum. SPT N-values vary from 10 bpf to refusal and have an average value equal to 51 bpf. The bottom of Stratum S is approximately 12 feet to 45 feet below ground surface (Elev. +166 to +151).

Stratum WR – Weathered Rock (NYCBC Class 3-65 to 4-65)

Weathered rock was encountered above sound bedrock in seven of the 2017 borings and was generally classified as gray and dark gray soft to moderately hard moderately weathered to highly weathered gneiss. Top of weathered rock was encountered between Elev. +152 to +164. Percent recovery was between 22% and 77%, and Rock Quality Designation (RQD) ranged from 0% to 45%.

Stratum R – Bedrock (NYCBC Class 1-65 to 2-65)

Bedrock was classified as gray hard to moderately hard slightly weathered to moderately weathered gneiss with occasional seams of slightly weathered pegmatite. Top of sound bedrock was encountered between Elev. +151 to +168. Percent recovery was between 80% and 100% and the RQD was between 50% and 100%.

Groundwater

Groundwater observation wells were installed in two borings during the 2017 investigation, one in Boring B-1 (OW) at the north end of the site and one at B-13 (OW) at the south end of the site. Groundwater was reported at approximately Elev. +168 at both locations, just above the top of bedrock.

FOUNDATION RECOMMENDATIONS

Shallow Foundation Design

The proposed bottom of foundation elevations follow the general topography of the top of Stratum S on the east side of the building, and are dictated by the proposed basement elevations on the west side of the building. Assuming that all footings will bear on compacted natural granular material (Stratum S), we recommend an allowable bearing pressure equal to 4 tsf for the proposed footings. Design parameters for each subsurface strata are tabulated in Table 1. These values were calculated based on correlations with SPT N-Values and the available laboratory test data.

Table 1: Geotechnical Design Parameters

Stratum	ϕ'	γ	γ'	K_o	K_a
	(deg)	(pcf)	(pcf)		
Fill (F)	30	120	57.6	0.50	0.33
Sand (S)	34	125	62.6	0.44	0.28
Select Common Fill	34	125	62.6	0.44	0.28

Lateral Pressure on Foundation Walls

Natural soils will be excavated for construction of the footings and foundation walls. We recommend using a compacted select common fill behind the finished foundation walls, consisting of granular fill with less than 15% fines. Lateral earth pressures on foundation walls should assume at-rest conditions. Lateral pressures on retaining walls should assume active conditions.

Hydrostatic Uplift Pressures

We recommend using a design groundwater table at Elev. +168. Based on the proposed designs, the groundwater table will be below the lowest foundation level.

Settlement

Due to the dense granular subsurface profile, short term and long term settlement across the site is expected to be minimal and uniform. We estimate total settlement to be on the order of 0.5-0.75 inches and will mostly occur during construction.

Seismic Design

The 1995 NYC Seismic Code was issued as a supplemental Reference Standard to the 1968 NYCBC and recommends a Seismic Zone Factor, Z, for buildings, structures, and portions thereof in New York City equal to 0.15, which represents the effective zero period acceleration for S₁ type rock. The soil profile type, S, for this site is S₁ based on the soil profile and SPT N-values, which corresponds to a Site Coefficient of 1.0 for foundations bearing on medium dense to very dense granular soils.

Liquefaction potential was evaluated based on SPT N-values with depth and compared to criteria presented in the Code. The groundwater table is approximately 20 feet below ground surface and due to the high N-values in Stratum S liquefaction is unlikely and does not need to be considered in design.

CONSTRUCTION CONSIDERATIONS

Excavations will be required to construct the building foundations. These temporary construction excavations should be sloped as necessary for safety and stability or supported by sheeting and bracing in accordance with OSHA regulations while protecting adjacent structures and pavements. Where space

permits, the excavations sides can be sloped no steeper than 1V:1.5H. If sloped excavation sides are not practical, temporary shoring is required,

The construction requires excavation through predominantly granular fill and natural overburden soils. Excavation of these materials using typical earthwork equipment is expected. The majority of the excavation for foundation construction is anticipated to be above the measured groundwater table. At the north end of the site where the groundwater table may be at or slightly below the proposed excavation, temporary dewatering may be required to lower the water table to at least 2 feet below the final footing subgrade.

We understand that the proposed construction includes well structures that may bear on or require shallow excavation of bedrock. An allowable bearing of 20 tsf can be used for any such structures bearing on bedrock. The rock excavation for well structures should be performed prior to excavation for shallow footing foundations. The rock excavation will need to be performed in a controlled manner possibly with perimeter line drilling to reduce the risk of over-breaks and reduce vibrations induced by the rock removal. Hydraulic hoe rams will likely be adequate for the removal. An adequately stiff excavation technique and support will be required where well excavation is within influence of adjacent building footings or other structures. Temporary construction dewatering will also be needed unless the excavation support also provides groundwater cutoff.

A precondition survey of the adjacent structures should be done prior to construction to verify available foundation information and document existing conditions. Following the precondition surveys, the effects of proposed excavation and foundation loads on the adjacent structures should be reviewed. Displacement and vibration monitoring of the structures should be performed during construction.

Care must be exercised to prevent disturbing or loosening of the soil in the sides and bottom of excavations. The proposed structure is founded on footings or slabs on grade and requires support on undisturbed subgrade. Construction documents should require the contractor to lower and control perched water levels in advance of excavation, along with excavation sequencing/sacrificial lifts to minimize soil disturbance due to exposure to water and to prevent freezing in cold weather. Final cut to subgrade should be made carefully using hand tools or an excavator fitted with a smooth edge bucket and working at least two feet above subgrade. Excavation subgrades should be protected from weather to prevent deterioration and graded to avoid ponding and accumulation of surface water, which can cause softening of exposed subgrades. In cold weather, measures should be taken to prevent freezing of foundation subgrades. Equipment should not run directly on the subgrade to avoid rutting or disturbance. If subgrade is loosened or disturbed during excavation, the disturbed soil must be over-excavated and replaced with concrete or compacted structural fill. Structural fill shall be used only if depth of disturbance is less than 2 feet.

For slab on grade and retaining wall construction, subgrade should be proof rolled with a heavy walk-behind static compactor to verify its integrity. Hard points, such as building remnants and boulders, should be removed a minimum of one foot below the subgrade. If soft, spongy, or otherwise unsatisfactory material is encountered, that material should be removed and replaced with compacted granular fill, crushed stone or flowable fill. If additional fill is needed it shall satisfy the gradation requirements for Controlled Fill in the 1968 Code (unless otherwise approved by the Engineer) and should be compacted to a minimum of 95% of Standard Proctor Density. The gradation and compaction means and methods shall be approved by the Engineer. Reuse of existing on-site soils as fill is possible in landscaped areas. If this material is to be used as backfill behind retaining walls or for supporting slab on grade, more detailed gradation testing and evaluations need to be performed to establish the material suitability. Screening of oversized particles from these materials will be required if to be used for any fill.

All subgrade soils supporting the shallow foundation elements must be inspected and approved by a qualified Special Inspector in accordance with the NYC Building Code prior to placing reinforcing steel or concrete.

Please don't hesitate to contact us with any questions.

Very truly yours,
MUESER RUTLEDGE CONSULTING ENGINEERS

Jan Cermak, P.E.

organic silts and very fine sands, low plasticity, silty, sandy silts, silty sands, silty clays, silty clays of low to medium plasticity, gravelly silts, sandy silts, silty clays, lean clays, organic silts and organic silty clays of low plasticity, organic silts, micaceous or diatomaceous fine sand, silty sand, silty sand with high plasticity, organic clays of high plasticity, Fat clays, organic clays of medium to high plasticity, gummy clays, silty clays, silty clays, silty clays and other highly organic soils.

NOTATION

TESTING:

1) - No visible sign of rock material

2) - No visible sign of rock material

3) - No visible sign of rock material

4) - No visible sign of rock material

Discoloration indicates weathering of soil and discontinuity surfaces. All the soil may be discolored by weathering and may be weaker externally than in its interior.

5) (Mod) - Less than half of the rock is decomposed and/or disintegrated to a mass framework or as corestones

6) (Comp) - All rock material is decomposed and/or disintegrated to soil. The mass structure is still largely intact

7) (Mod): 8 inches to 2 feet to 6 feet

8) (Wide): 6 to 20 feet

9) (Mod): 8 inches to 2 feet to 6 feet

10) (Wide): 6 to 20 feet
