1. The tower casing, mechanical equipment support, panels, hot and cold-water basins, distribution covers, fan deck, fan cylinder and structural members and framework shall be constructed of heavy gauge (16-gauge minimum) stainless steel (Type 304, ASTM A666).
2. All hardware, including nuts, bolts, sheet metal washers shall be 304 stainless steel.
3. Hot decks to have vari-flow nozzle cups or similar.
4. Fill and eliminators shall be guaranteed against corrosion, rot, decay and biological attack for the life of the cooling tower.
5. The tower shall be non- combustible except for the fill and eliminators, which shall be fire-rated PVC.
6. PVC, where permitted, shall be self-extinguishing fire rated (per ASTM-568, UL94HB and UL94 V-0 Testing) polyvinyl chloride (PVC), with a flame-spread index of 5 per ASTM E 84 and shall be impervious to rot, decay, fungus and biological attack.
7. Fiberglass casing, polyurethane barriers and thermosetting hybrids and the components they are adhered to are not permitted.
8. The tower structure, anchorage and all its components shall be designed by licensed structural engineers licensed in the State of New York, employed by the tower manufacturer.

**C. Cooling Tower Fan Motors**

1. Comply with requirements as specified herein and in Section "Motors for HVAC Equipment".
2. The variable frequency controllers shall control fan motor.
3. Fan motors shall be as specified herein and under another section of this work.
4. Motors shall be rated for severe duty and designed specifically for cooling tower service.
5. Fan Motor(s) shall be Totally Enclosed, Fan Cooled (TEFC) designed specifically for cooling tower service. The motor(s) shall be furnished with special moisture protection on windings, shafts and bearings and labeled appropriately for cooling tower duty.
6. Energy Efficiency: Premium Efficiency, as defined in NEMA MG1 and with applicable EPACT efficiency standards.
7. Service Factor: 1.15.
8. Insulation: Class H F
9. Inverter-duty rated per NEMA MG-1, Section IV, "Performance Standard Applying to All Machines," Part 31, "Definite-Purpose, Inverter-Fed, Polyphase Motors."
10. Motors shall be designed and labeled for use with VFDs and suitable for use throughout speed range without overheating.
11. Severe-duty rating with the following features:
  - a. Rotor and stator protected with corrosion inhibiting epoxy resin.
  - b. Double-shielded, vacuum-degassed bearings lubricated with premium, moisture-resistant grease suitable for temperatures between minus 20 and 300 deg F (minus 29 and 149 deg C).
  - c. Internal heater automatically energized when motor is de-energized.
  - d. Motor Base: Adjustable, or other suitable provision for adjusting belt tension.

- D. The tower shall include all design and material modifications necessary to meet the requirements of Factory Mutual. The product proposed shall be listed in the FM Approval Guide, latest edition.
- E. An external oil level dipstick shall be located adjacent to the motor at the fan deck surface and shall be accessible from the platform.
- F. Provide low oil level cut out switch.
- G. A portable davit crane shall be mounted on the fan deck of each cooling tower cell and shall be capable of lifting, extending and lowering the heaviest mechanical component (minimum 1500 pounds) over the fan deck and down the air inlet face of the tower. The davit crane system shall include a winch, cable and load hook.
- H. Overall tower dimensions shall not exceed those indicated on the contract documents.

## 2.2 OPEN-CIRCUIT, INDUCED-DRAFT, CROSSFLOW COOLING TOWERS

- A. Furnish and install, as shown on the contract documents, factory assembled, induced draft, crossflow cooling towers with vertical air discharge conforming in all aspects to the specifications, schedules and as shown on the drawings.
- B. Similar to Marley NC Series 8401
- C. Fan:
  - 1. Fans shall comply with the requirements as specified herein and under another section of this work.
  - 2. Fans shall be the manufacturer's low noise design.
  - 3. Fans shall be adjustable –pitch propeller type.
  - 4. Balanced at the factory after assembly.
  - 5. Blade Material: Aluminum.
  - 6. Hub Material: Stainless steel
  - 7. Blade Pitch: Field adjustable.
  - 8. Housing: Hot dipped Galvanized.
  - 9. Protective Enclosure: Removable, heavy-duty galvanized-steel, wire-mesh screens complying with OSHA regulations.
  - 10. Fan Shaft Bearings: Self-aligning ball or roller bearings with moisture-proof seals and premium, moisture-resistant grease suitable for temperatures between minus 20 and plus 300 deg F. Bearings designed for an L-10 life of 120,000 hours.
  - 11. Bearings Grease Fittings: Extended lubrication lines to an easily accessible location.
  - 12. Fan Guard: Removable fan discharge with a rigid framed screen guard, installed over the fan cylinder.
- D. Gear Drive: Right angle, reduced speed, and designed for cooling tower applications according to CTI STD 111. Motor and gear drive shall be aligned before shipment.
  - 1. Gear Drive and Coupling Service Factor: 2.0, based on motor nameplate horsepower.
  - 2. Housing: Cast iron, with epoxy or polyurethane finish, beveled high-strength steel gears continuously bathed in oil, and with lubrication to other internal parts at all operating speeds.
  - 3. Mounting: Directly mounted to fan hub and connected to motor so motor shaft is in horizontal position.
  - 4. Operation: Able to operate both forward and in reverse.

5. Drive-to-Motor Connection: Connected to motor located outside of cooling tower airstream by a full-floating drive shaft.
  6. Drive Shaft Material: Stainless steel and fitted with flexible couplings on both ends. Provide exposed shaft and couplings with guards according to OSHA regulations.
  7. Extend oil fill, drain, and vent to outside of cooling tower casing using galvanized-steel piping. Provide installation with oil-level sight glass.
  8. Gear units shall have an American Gear Manufacturers Association Class II 9 rating.
- E. Gear-Drive, Oil-Level Switch: Low-oil-level warning cutout switch for connection to a BMS.
1. Switch shall, on reaching a low-oil-level set point recommended by cooling tower manufacturer, signal an alarm through the BMS provide low level shutdown switch.
- F. Drift Eliminators:
1. Self-extinguishing (per ASTM-568, UL94HB and UL94 V-0 Testing) polyvinyl chloride (PVC), with a flame-spread index of 5 per ASTM E 84 and shall be impervious to rot, decay, fungus and biological attack.
  2. Eliminators shall effectively trap water droplets entrained in discharge air stream and limit drift loss to less than 0.005 percent of the total water circulated. Sections shall be assembled into easily removable racks of the same material as the casing.
  3. UV Treatment: Inhibitors to protect against damage caused by UV radiation.
  4. Configuration: Multipass, designed and tested to reduce water carryover to achieve performance indicated.
  5. Location: Separate and removable from fill.
  6. Minimum Thickness: 20 mils (minimum), to prevent sagging.
- G. Fill:
1. Materials: Self-extinguishing (per ASTM-568, UL94HB and UL94 V-0 Testing) polyvinyl chloride (PVC), with a flame-spread index of 5 per ASTM E 84 and shall be impervious to rot, decay, fungus and biological attack.
  2. Minimum Thickness: 20 mils (minimum), to prevent sagging.
  3. Fabrication: Fill-type sheets, fabricated, formed, and bonded together after forming into removable assemblies that are factory installed by manufacturer. Spacing between fill sheets shall be a minimum of 3/4 inches (19.1 mm) to reduce the tendency for fouling and ensure proper airflow for maximum cooling capacity.
  4. Fill Material Operating Temperature: Suitable for entering-water temperatures up through 130 deg F (55 deg C).
  5. The fill shall be manufactured, tested and rated by the cooling tower manufacturer and shall be elevated above the cold water floor to facilitate cleaning.
- H. Each cell shall have the capability of independent operation
- I. Cold Water Basin:
1. Material: The cold-water basin shall be constructed of heavy-gauge type 304 stainless steel panels and structural members. All factory seams shall be welded to ensure watertight construction and welded seams shall be warranted against leaks for a period of ten (10) years from date of substantial completion. Stainless steel basins with bolted seams are not acceptable.
  2. All factory seams in the cold-water basin shall be welded to ensure watertight assembly and welded seams shall be warranted against leaks for ten (10) years. Stainless steel basins with bolted seams are not acceptable. FRP casing panels are not acceptable.

- J. Each cell shall have the capability of independent operation.
- K. Bottom Outlet
  - 1. Each cell basin shall be complete with a 304 stainless steel depressed side bottom outlet. Outlet shall be provided with flanged suction connection and flanged equalizer connection, a drain/clean-out connection, a suction screen and vortex baffling anti-cavitation device.
- L. Each basin shall include the following:
  - a. Removable, large area lift-out type 304 stainless-steel strainers with openings smaller than water distribution system nozzle orifices.
  - b. Overflow and drain connections.
    - 1) Makeup water connection.
    - 2) Outlet Connection: Suction - ASME B16.5, Class 150 flat face flange, beveled for welding.
    - 3) Outlet Connection: Equalizer - ASME B16.5, Class 150 flat face flange, beveled for welding
    - 4) Removable anti-vortex device (type 304 stainless steel) to prevent air entrainment.
    - 5) Removable equalization flume plate between adjacent cells of multiple-cell towers.
  - c. Equalizer connection for field installed equalizer piping
  - d. The strainer and vortex device shall be constructed of the same materials as the cold water basin to prevent dissimilar metal corrosion.
- M. Open Gravity Hot Water Distribution Basin:
  - 1. The covered hot water basin shall be equipped with a gravity type hot water distribution system.
  - 2. Non-pressurized, open gravity type design for easy cleaning with head of water level in basin adequate to overcome spray nozzle losses and designed to evenly distribute water over fill throughout the flow range indicated.
  - 3. The basins must be accessible from outside the unit and serviceable during tower operation.
  - 4. Material: Heavy gauge, type 304 Stainless steel.
  - 5. Removable or sliding basin covers shall be factory installed minimum 16-gauge stainless steel of lapped joint construction at seams and secured to the basin with stainless steel wing nuts and captive stainless steel bolts. Covers shall be designed and built to withstand 75 psf live load and 300 # concentrated load. Attach a warning label to top of cover to caution against using the cover as a walking surface or working platform.
  - 6. Basin weirs and PVC metering devices shall be provided to assure the even distribution of water over the fill.
  - 7. Gravity flow nozzles shall be snap-in type for easy removal.
  - 8. Vari-flow nozzle cups or similar.
  - 9. Each cooling tower distribution basin shall be furnished with two adjustable flow control valves with stainless steel stem and locking stop or bar. A single water inlet to the tower, which automatically balances water flow to the hot water distribution basins with factory installed internal non-corroding piping shall be valve to drain the water out of the riser piping upon shutdown of the cooling tower to prevent freezing.
  - 10. Field Pipe Connection: Galvanized-steel pipe arranged to provide balancing of flow within cooling tower cells without the need for additional balancing valves.

11. Pipe each cooling tower cell internally to a single, field connection suitable for mating to ASME B16.5, Class 150 flange.
12. Joints and Seams: Welded watertight.
13. Partitioning Dams: Same material as basin to distribute water over the fill to minimize icing while operating throughout the flow range indicated.
14. Removable Panels: Heavy gauge type 304 stainless steel, designed to withhold 75-psf live load and 300 lbs. constant load to completely cover top of basin. Secure panels to basin with removable stainless-steel hardware.

**N. Air-Intake Louvers:**

1. Air-Intake louvers shall be spaced to minimize air resistance and prevent splash out.
2. Air Inlet louvers shall be separate from the fill and removable to provide easy access for inspection of the air/water interface at the louver face. Louvers shall prevent water splashing out during fan cycling.
3. Material: Removable, corrosion resistant type 304 stainless steel (minimum 20 gauge).
4. UV Treatment: Inhibitors to protect against damage caused by UV radiation.
5. Provide removable type 304 stainless steel mesh air intake screens.
6. Louver Blades: Arranged to uniformly direct air into cooling tower, to minimize air resistance, and to prevent water from splashing out of tower during all modes of operation including operation with fans off.
7. PVC louvers are not permitted.

**O. Provide Vibration Cutout Switch for each fan drive, as specified herein.**

**P. Controls:** In addition to the requirements specified herein, comply with requirements as specified under another section of this work.

**2.3 VARIABLE FREQUENCY DRIVE (VFD)**

- A. The VFD shall be as specified under another section of this work.
- B. There shall be a separate VFD drive system for each cooling tower fan motor. Controlling multiple motors by one drive system will not be allowed.
- C. The VFD shall be furnished and installed at the factory by the cooling tower manufacturer. The variable speed controller shall be mounted in a NEMA 4 enclosure with mechanical heating and cooling and with all power and control wiring between the VFD and cooling tower fan factory installed. Electrical lugs for incoming power wiring shall be provided.
- D. Provide rainshield cover.
- E. The VFD supplier shall warrant the VFD system to have sufficient capacity to operate successfully under all normal tower operating conditions, and its use shall in no way diminish the ten (10) year mechanical equipment warranty.
- F. The cooling tower manufacturer shall supply a start-up engineer to identify and lock out critical speeds, and to verify correct operation.

**2.4 STEEL SUPPORTS AND VIBRATION CONTROL**

- A. The Contractor shall provide steel dunnage as recommended by the cooling tower manufacturer.

- B. Contractor to provide spring vibration isolation between dunnage and building steel as specified herein and under another section of this work.
- C. Wind, Vibration and Seismic design requirements are specified herein and under other sections of the work.
- D. A steel grillage or other foundation suitable to support the tower and the provisions for attaching the tower thereto will be provided under another division of the work. Cooling tower design shall be based on using only two supporting steel members.

## 2.5 ACCESS DOORS

- A. Doors: Two (2) hinged access doors, large enough for personnel to access cooling tower internal components shall be provided at both endwalls of each cell (minimum 30" wide x 36" high). Doors shall be operable from both sides of the door.

2.6 See Section 08 31 13 "Access Doors and Frames" for requirements.

## 2.7 HANDRAILS, PLATFORMS AND LADDERS

### A. External Ladders with Safety Cages:

- 1. Provide an OSHA approved, heavy gauge galvanized steel fixed ladder with ladder extensions to access external platforms and top of cooling tower from roof level without the need for portable ladders (extension ladder shall be firmly attached to tower and anchored at base). Comply with 29 CFR 1910.27.
- 2. A heavy gauge, OSHA approved, safety cage, welded, shall surround the ladder, extending from a point 4'-0" above the foot of the ladder extending to the top of the guardrail.
- 3. A steel, self-closing gate shall be provided at the guardrail level of the ladder.
- 4. External Platforms with Handrails:
- 5. Provide a factory installed stainless steel grating platform walkway surrounding the top of each tower. The platform shall be OSHA compliant and shall be perforated to provide a non-slip surface for personnel safety. The platform shall be surrounded by an OSHA compliant guardrail system, including knee-rail and toeboard.
- 6. Provide an extension platform connecting the platforms at the top of each tower to provide continuous access from the top platform to all tower platforms. The platform shall be OSHA compliant and shall be perforated to provide a non-slip surface for personnel safety. The platform shall be surrounded by an OSHA compliant guardrail system, including knee-rail and toeboard.
- 7. All working surfaces shall be able to withstand 100 psf live load or 300 pound concentrated load.

### B. Handrail:

- 1. Aluminum or stainless steel complete with knee rail and toe board at all platforms and around top of cooling tower to insure the safety of the operation personnel. Provide safety cage. Comply with 29 CFR 1910.23.

### C. Internal Platforms (Plenum Walkway):

- 1. An internal platform/Plenum walkway (minimum 36" wide) with handrails shall be provided in the plenum section to provide for inspection and maintenance. Spanning the collection basin from one end of cooling tower to the other and positioned to form a path

between the access doors. Platform shall be elevated so that all parts are above the high water level of the collection basin.

2. All working surfaces shall be able to withstand 100 psf live load or 300 pound concentrated load.
3. Platform shall be Aluminum or galvanized-steel bar grating.
4. The elevated internal platforms (with OSHA compliant guardrail system) shall be accessible from the fixed vertical ladders to access the fan drive assembly.

**D. Access Door Platform:**

1. Access to the hot water basins for inspection and maintenance of the basins, even during tower operation, shall be provided for each access door on all towers Access Door platforms.
2. Access platform shall be at the base of the tower extending from the vertical ladder to the endwall access doors. The platform shall be surrounded by an OSHA compliant guardrail system. The walking surface of the platform shall be perforated to provide a non-slip surface.
3. Fan deck ladders and handrails, which add to the overall height of the tower, are not acceptable.

**2.8 FAN GUARD**

- A. The fan openings shall be provided with a conical, non-sagging, removable fan guard fabricated of one-piece welded steel rod and wire guard, hot dipped galvanized after fabrication.

**2.9 BALANCING VALVES**

- A. Heavy-duty, high-performance, butterfly valves shall be provided at the hot water inlet connections and arranged to balance or shut off flow to each gravity distribution basin. These valves shall include cast iron bodies, elastomer seat and steel operating stems. There shall be a locking handle to maintain the valve setting in any position. Wafer type field supplied spool piece is required between the inlet connection and the valve.
- B. Valves shall be as specified under another section of this work.

**2.10 COLD WATER BASIN WATER LEVEL CONTROL**

- A. The cooling tower manufacturer shall provide an electric cold-water basin level control (EWLC) system for each cooling tower cell, which shall consist of water level sensing and control units.
- B. Each water level sensing and control unit shall consist of the following:
  1. NEMA 4 enclosure with gasketed access cover;
  2. Sensor: Solid-state controls with multiple stainless steel water level sensing electrode probes and relays factory wired to a terminal strip to control the water makeup valve, low- and high-level alarms, output for shutoff of pump on low level, heater safety cutoff and as required for achieving the specified sequence of operation;
  3. Water Stilling Chamber: Stainless steel.
  4. Electrode Probes: Stainless steel.
  5. Solenoid Valve: Slow closing with stainless-steel body, controlled and powered through level controller in response to water level set point.
  6. Schedule 40 PVC standpipe assembly with vent holes and all necessary stainless steel mounting hardware.

7. Provide PVC union directly below the control enclosure to facilitate the removal and access of electrodes and control enclosure.
8. Float switch shall be weather protected to -15 deg F.

- C. Electrical Connection Requirements: 120 V, single phase, 60 Hz.
- D. This contractor shall provide control wiring with power supply from the nearest BMS control panel.

## 2.11 BASIN HEATERS

- A. Each cell shall have an independent basin heater system in the cold-water basin to maintain 40° F water at -10° F and 25 mph wind velocity.
- B. Electric Basin Heater:
  1. Cooling tower shall be provided with electric immersion heaters with waterproof junction boxes factory mounted in the pan. The tower manufacturer shall include a control thermostat mounted on the tower and low water heater protection consisting of a relay and float less low water cut out.
    - a. Stainless-Steel Electric Immersion Heaters: Installed in a threaded coupling on the side of the collection basin.
    - b. Heater Control Panel: Mounted on the side of each cooling tower cell.
    - c. Enclosure: NEMA 250, Type 4X.
    - d. Magnetic contactors controlled by a temperature sensor/controller to maintain collection basin water-temperature set point. Water-level probe shall monitor cooling tower water level and de-energize the heater when the water reaches low-level set point.
    - e. Control-circuit transformer with primary and secondary side fuses.
    - f. Terminal blocks with numbered and color-coded wiring to match wiring diagram.
    - g. Single-point, field-power connection to a fused disconnect switch and heater branch circuiting complying with NFPA 70.
    - h. Factory Wiring Method: Metal raceway for factory-installed wiring outside of enclosures, except make connections to each electric basin heater with liquid tight conduit.
    - i. Contractor shall provide the following:
      - 1) Master aquastat on leaving water to sequence fans (40° F to 95° F range (adj.))
      - 2) A remote reset with temperature readings both locally and at the BMS will permit the building operator to reset the leaving temperature.
      - 3) A low limit thermostat set at 40°F (adj.) to activate automatic cooling tower bypass valves.

## 2.12 VIBRATION CUTOFF SWITCH

1. A single pole double throw (SPDT) electronic remote vibration limit switch with manual-reset button enclosed in a NEMA 4 housing shall be furnished and installed on the fan/motor equipment support for each cell and wired into the buildings control system's (BMS) closest panel. It shall also be hardwired to fan motor electrical circuit
2. The purpose of this switch will be to interrupt power to the motor in the event of excessive vibration. It shall be adjustable for sensitivity and shall require manual reset.
3. The electronic vibration cutoff switch shall be set to trip at a point so as not to cause damage to the cooling tower. Enclosure: NEMA Type 4X

4. Vibration Detection: Sensor with a field-adjustable, acceleration-sensitivity set point in a range of 0 to 1 g and frequency range of 0 to 3000 cycles per minute. Cooling tower manufacturer shall recommend switch set point for proper operation and protection.
5. Switch shall, on sensing excessive vibration, signal an alarm through the BMS and shut down the fan.

#### 2.13 COOLING TOWER APPURTENANCES

- A. Provide the following with each cooling tower:
  1. Water basin covers
  2. Air Inlet Screens
  3. Galvanized gearbox
  4. Oil sight-glass
  5. External platform with handrails
  6. Internal platform with handrails
  7. Safety ladder with cage, guide/hand rails around the tower and platforms.

#### 2.14 DISCONNECT SWITCH

- A. A heavy-duty, fused safety disconnect switch shall be provided by the cooling tower manufacturer. Switch shall be single-throw, 3-pole design, rated up to 600 VAC. Switch shall have triple padlocking capability, a visible double break rotary blade mechanism, a clearly visible On/Off handle, an interlocking mechanism to prevent door opening with handle in On position, and a clear line shield.
- B. Safety switch shall be provided in a NEMA 4 enclosure.

#### 2.15 COOLING TOWER CONTROLS (coordinate with BMS)

- A. Contractor shall be responsible for full coordination of automation and shall provide wiring for final operation of cooling towers and equipment such as temperature sensors, interlocks with fan operation, pipe wells, etc.
- B. The system shall include a solid state, temperature controller to adjust frequency output of the drive in response to the tower cold-water temperature. The temperature of the cold water shall be displayed on the door of the control panel. It shall also include a complete magnetic bypass that isolates the VFD when in the bypass mode. Transfer to the bypass mode shall be automatic in the event of VFD failure. The bypass contactor shall be cycled on and off while operating in bypass to maintain the set-point temperature of the cold water.
- C. Operator controls shall be mounted on the front of the enclosure and shall consist of start and stop pushbuttons, bypass/VFDs selector switch, Auto//Manual selector switch, manual speed potentiometer, and the solid-state temperature controller.
- D. To prevent heating problems in the fan-cooled motor, the VFC system shall cycle the motor on/off when the minimum allowable motor speed is reached.
- E. Control Package: Factory installed and wired, and functionally tested at factory before shipment.
  1. NEMA 250, Type 4X enclosure with removable internally mount backplate.
  2. Control-circuit transformer with primary and secondary side fuses.
  3. Terminal blocks with numbered and color-coded wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.

4. Microprocessor-based controller for automatic control of fan based on cooling tower leaving-water temperature with control features to improve operating efficiency based on outdoor ambient wet-bulb temperature by using adaptive logic.
5. Fan motor sequencer for multiple-cell and two-speed applications with automatic lead stage rotation.
6. Factory-installed and -wired, collection basin electric/electronic level controller.
7. Collection basin electric/electronic level controller, as specified herein.
8. Electric basin heaters with temperature control and low-water-level safety switch for each cell, complying with requirements as specified herein.
9. Vibration switch for each fan, as specified herein.
10. Single-point, field-power connection to a fused disconnect switch for each cooling tower cell.
  - a. Branch power circuit to each motor and electric basin heater and to controls with a disconnect switch.
  - b. NEMA-rated motor controller, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller with manual bypass and line reactors for each variable-speed motor indicated.
11. Factory-installed wiring outside of enclosures shall be in metal raceway, except make connections to each motor and electric basin heater with liquid tight
12. Visual indication of status and alarm with momentary test push button for each motor.
13. Audible alarm and silence switch.
14. Visual indication of elapsed run time, graduated in hours for each motor.
15. Cooling tower shall have hardware to enable BMS to remotely monitor and display the following:
  - a. Operational status of each motor.
  - b. Position of dampers.
  - c. Cooling tower leaving-fluid temperature.
  - d. Fan vibration alarm.
  - e. Collection basin: high- and low water-level alarms.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements

#### 3.2 SOURCE QUALITY CONTROL

- A. Install cooling tower according to equipment manufacturer's written instructions.
- B. Install cooling towers plumb, level and anchored on structure provided. Coordinate steel structure with cooling tower mounting requirements. If installed on concrete base, refer to Division 03 of specification for concrete materials and installation requirements.
- C. Install vibration controls according to manufacturer's recommendations.
- D. Install anchor bolts to elevations required for proper attachment to supported equipment.
- E. Maintain manufacturer's recommended clearances for service and maintenance.

#### 3.3 EXAMINATION

- A. Examine proposed route of moving cooling towers into place and verify that it is free of interferences.
- B. Before cooling tower installation, examine roughing-in for tower support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting tower performance, maintenance, and operation.
  - 1. Cooling tower locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections
  - 2. Examine elements and surfaces to support cooling tower.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.4 INSTALLATION

- A. Install cooling towers according to manufacturer's written instructions.
- B. Install cooling towers level and plumb, and fasten to supporting structure with vibration isolators and seismic restraints.
- C. Maintain recommended clearances for service and maintenance.
- D. Install cooling towers on support structure indicated.
- E. Install cooling towers and their support structures to withstand the effects of wind and seismic events, as specified in the contract documents and according to the New York Department of Buildings.
- F. Electrical Wiring: Install and provide wiring for electrical devices furnished by cooling tower manufacturer that are not factory mounted.

### 3.5 COOLING TOWER PIPING REQUIREMENTS

- A. Provide flanged connections for piping.
- B. Each return water connection to a cooling tower shall be separately valved (butterfly) for positive shut-off. A water flow control valve in the towers will not be permitted as a substitute.
- C. Each supply pipe from a cooling tower shall be separately valved (butterfly) for positive shut-off.
- D. Provide an equalizer line sized as per manufacturers recommendations and connected to each cell. Provide a positive shut-off valve (butterfly) in such equalizer to permit individual tower cleaning.
- E. Piping installation requirements are specified in another section of this work. Drawings indicate general arrangement of piping, fittings, and specialties. The following are specific connection requirements:
  - 1. Install piping adjacent to cooling towers to allow service and maintenance.
  - 2. Install flexible pipe connections for towers mounted on vibration isolators.
  - 3. Pitch piping down to drain into sump.
  - 4. Provide drain piping with valve at cooling tower drain connections and at low points in piping. Connect overflow drain and bleed lines to sanitary sewage system.

- F. Domestic Water Piping: Comply with applicable requirements of Division 23 Sections. Connect to water-level control with backflow preventer, shutoff valve, water meter, strainer and flange at each connection.
- G. Supply and Return Piping: Comply with applicable requirements in Division 23 Sections. Connect to entering cooling tower connections with shutoff valve, balancing valve, thermometer, plugged tee with pressure gage, flow meter, and drain connection with valve. Connect to leaving cooling tower connection with shutoff valve. Make connections to cooling tower with a flange
- H. Hot-Water Piping: Comply with applicable requirements of Division 23 Sections. Connect to supply and return basin-heater tapplings with shutoff valve, strainer, control valve, and flange on supply connection and flange and balancing valve on return connection.
- I. Condenser-Water Piping: Comply with applicable requirements of Division 23 Sections. Connect to supply and return cooling-tower connections with shutoff valve, strainer, flow control valve, and flange on supply connection to the tower and shutoff valve and flange to return connection from the tower to the chiller.
- J. Equalizer Piping: Piping requirements to match supply and return piping. Connect an equalizer pipe, full size of cooling tower connection, between tower cells. Connect to cooling tower with shutoff valve.
- K. Condenser Water Filter Piping: Comply with applicable requirements of Division 23 sections.
- L. Electrical: Comply with applicable requirements in Division 26 Sections. Ground equipment.
- M. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### 3.6 DIELECTRIC FITTINGS

- A. Provide dielectric fittings to isolate joined dissimilar materials to prevent galvanic action and stop corrosion. Fittings shall be of the non reducing type, which shall be suitable for the system fluid, pressure, and temperature and shall not restrict the flow.
- B. For factory fabricated equipment, manufacturer shall submit method of compliance or exceptions (if applicable) in writing as part of the shop drawings submission for review by Commissioner.
- C. It is the intent of this section that all system components (equipment connections, piping, etc.), whether they are field installed or factory fabricated, shall comply with these requirements.
- D. Insulating Material: Suitable for system fluid, pressure, and temperature, does not restrict flow.

### 3.7 CLEANING

- A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes including chips, scratches, and abrasions

### 3.8 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Report results in writing.
- B. Factory-authorized service representative shall perform start-up services.
- C. Engage a qualified independent Testing Agency to perform inspections for each tower, as specified.
- D. Tests and Inspections: Comply with CTI ATC 105, "Acceptance Test Code for Water Cooling Towers".
- E. Cooling towers will be considered defective if they do not pass inspections.
- F. Prepare test and inspection reports

### 3.9 ON-SITE PERFORMANCE REQUIREMENTS

- A. Engage a qualified independent Testing Agency to supervise field performance testing.
- B. Tests: Comply with CTI ATC 105, "Acceptance Test Code for Water Cooling Towers".
- C. The Commissioner reserves the right to request, at his discretion and at no additional expense, anytime during the first 18 months of full operation, that an on-site thermal performance test be performed in accordance with CTI (Cooling Technology Institute) ATC-105 standards. The test shall be performed by the factory-authorized service representative and under the supervision of the Testing Agency.
- D. Irrespective of CTI standards, the limits of test tolerances for the cooling towers is 5%., under the project design conditions.
- E. Cooling towers will be considered defective if they do not pass tests.
- F. Failure to perform on site: Should tower fail to perform after installation according to the approved performance curves, the contractor shall perform, at no extra expense, a complete tower test on the site, in accordance with the ASME Power Test Code for atmospheric Water Cooling Equipment PTC-23-1958 or CTI Standard 201. If the tower fails to perform within those limits of test tolerance; then the cooling tower manufacturer shall make any and all alterations as necessary to overcome indicated deficiency.
- G. The cooling tower manufacturer shall certify that they will make whatever corrections, including new towers or additional cells, which are required to meet the performance guarantee, at no additional expense to the City of New York, regardless of the extent of the revisions required.
- H. A corporate officer of the manufacturer shall sign the certifications. Certification shall be made at the time of submittal.

### 3.10 START UP

- A. Provide the services of a factory-authorized and qualified representative to perform start up service.
- B. Inspect field-assembled components and equipment installation, including piping and electrical connections.

- C. Verify that accessories are properly installed.
- D. Obtain and review performance curves and tables.
- E. Perform startup checks, according to manufacturer's written instructions, and as noted below:
  - 1. Clean entire unit including basins.
  - 2. Verify that accessories are properly installed.
  - 3. Verify clearances for airflow and for cooling tower servicing.
  - 4. Check for vibration isolation and structural support.
  - 5. Lubricate rotating parts and bearings.
  - 6. Verify fan rotation for correct direction and for vibration or binding and correct problems.
  - 7. Adjust belts to proper alignment and tension.
  - 8. Verify proper oil level in gear-drive housing. Fill with oil to proper level.
  - 9. Operate variable-speed fans through entire operating range and check for harmonic vibration imbalance. Set motor controller to skip speeds resulting in abnormal vibration.
  - 10. Check vibration switch setting. Verify operation.
  - 11. Verify water level in tower basin. Fill to proper startup level. Check makeup water-level control and valve.
  - 12. Verify operation of basin heater and control.
  - 13. Verify that cooling tower air discharge is not recirculating air into tower or HVAC air intakes. Recommend corrective action.
  - 14. Replace defective and malfunctioning units.
  - 15. Operate equipment controls and safeties.
  - 16. Verify that tower discharge does not recirculate into HVAC air intakes. Recommend corrective action.
- F. Adjust water level for operating level and balance condenser water flow to each tower inlet.
- G. Check water treatment water system, including blow down for proper operation of the tower. Check makeup water-level control and valve.
- H. Start cooling tower, including condenser water pumps and verify the tower operation.
- I. Prepare and submit a written report of startup and inspection service to the Commissioner.

### 3.11 INSTRUCTION:

- A. Furnish the services of a competent, factory-trained engineer licensed in the State of New York or technician for a 6-hour period for instructing personnel in operation and maintenance of the equipment, including review of the operation and maintenance manual, on a date requested by the Commissioner.

### 3.12 ADJUSTING

- A. Set and balance water flow to each tower inlet.
- B. Adjust water-level control for proper operating level.

### 3.13 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and service devices. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 23 65 00**

**SECTION 23 71 00****AIR COILS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- D. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- E. Section 23 07 00 – HVAC INSULATION
- F. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- G. Section 23 71 02 – WRAP AROUND HEAT PIPE SYSTEM
- H. Section 23 71 04 – UVC GERMICIDAL TREATMENT.
- I. Section 23 73 13 – FACTORY FABRICATED INDOOR AIR HANDLING UNITS.
- J. Section 23 73 15 – FACTORY FABRICATED CUSTOM AIR HANDLING UNITS.
- K. Section 23 82 10 – FAN COIL UNITS
- L. This section is a part of each Division 23 00 00 section.

**1.2 SUMMARY**

- A. This Section includes the following types of air coils:
  - 1. Hot Water Heating Coil
  - 2. Chilled Water Cooling Coil
  - 3. Glycol/Water Cooling/Heating Coils
  - 4. Heat Pipe Coils
  - 5. Primary and Intermediate Drain Pans
  - 6. Auxiliary Drain Pans

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:

1. Section 01 74 19 "Construction Waste Management and Disposal"
2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"

C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.5 SUBMITTALS

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".
- B. Submit each item in this section according to the Conditions of the Contract and Division 01 Specification Section.
- C. Coils shall meet or exceed the performance capacities set forth in the Schedules. Submit ARI certified coil performance ratings with system operating conditions indicated with shop drawing submittal. Include rated capacity and pressure drop for each air coil.
- D. A computer generated psychrometric chart shall be submitted for each cooling coil with design points and final operating point clearly noted
- E. Shop drawings detailing fabrication and installation of air coils, including material descriptions, dimensions of individual components and profiles, finishes for each air coil. Detail connections to piping. Indicate dimensions, weight loading, weight distribution and clearances required
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For air coils to include in operation and maintenance manuals.

#### 1.6 COORDINATION

- A. Coordinate layout and installation of air coils with air handling unit manufacturers. Revise layout and elevations as required to suit field condition and as reviewed by the Commissioner.

#### 1.7 DI-ELECTRIC FITTINGS

- A. Provide dielectric fittings to isolate joined dissimilar materials to prevent galvanic action and stop corrosion. Fittings shall be of the non-reducing type, which shall be suitable for the system fluid, pressure and temperature and shall not restrict the flow. See Section "COMMON REQUIREMENTS FOR HVAC WORK" for additional requirements.

**1.8 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Single-Source Responsibility: Obtain air coil components from one source and by a single manufacturer.
- C. All coils shall be tested, rated and certified according to ARI 410 and ASHRAE 33.
- D. Water coils to have continuous water circuits f
- E. rom the inlet header to the outlet header. All joints in the water circuit are to be brazed.
- F. Coils are to be of the self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Each drain and vent outlet to be fitted with a hose-end valve, packless type, and a pipe cap. Each coil to bear the seal indicating manufacturer's compliance with ARI Standard 410.
- G. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
  - 1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.
  - 2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- H. ASHRAE Compliance:
  - 1. Comply with ASHRAE 15 for refrigeration system safety.
  - 2. Comply with ASHRAE 33 for methods of testing cooling and heating coils.
  - 3. Comply with applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- I. Seismic fabrication Requirements
  - 1. Fabricate coil section, mounting frame and attachment to coils and other coil section components with reinforcement strong enough to withstand seismic forces defined under another section of this work.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS:**

- A. Subject to compliance with requirements, provide products by one of the following for each product category:
  - 1. Cooling Coils (Chilled Water):
    - a. Aerofin
    - b. Heatcraft
    - c. Carrier Corporation.
    - d. Marlo
    - e. Dunham-Bush, Inc.
    - f. Or approved equal.
  - 2. Hot Water Heating Coils:

- a. Aerofin Corporation
- b. Marlo
- c. Heatcraft
- d. Carrier Corporation.
- e. Dunham-Bush, Inc.
- f. Or approved equal.

3. Glycol/Water Coils:

- a. Aerofin
- b. Heatcraft
- c. Carrier Corporation.
- d. Marlo
- e. Dunham-Bush, Inc.
- f. Or approved equal.

4. Heat Pipe Coils

- a. Heat Pipe Technology, Inc.
- b. Applied Air; Mestek Technology, Inc.
- c. Des Champs Technologies.
- d. Engineered Air.
- e. Gaylord Industries, Inc.
- f. Or approved equal.

2.2 COILS – GENERAL

- A. All coils shall meet or exceed all capacities specified on the schedules.
- B. Coil Pressure Ratings: As described in section 23 05 00 – “COMMON REQUIREMENTS FOR HVAC WORK,” but not less than 125 psig SWP at 200 deg F.
- C. All water coils shall have performance certified by the manufacturer to be in accordance with A.R.I. Standard 410. Each coil shall bear the seal indicating ARI 410 certification.
- D. Testing: before shipment, all coils to be subjected to a 350 psig air test under water or 1-½ times working pressure, whichever is greater. The factory pressure tests shall be continuously maintained for a minimum of two (2) hours.
- E. Integral face and bypass coils are not permissible.

2.3 COOLING COILS (CHILLED WATER)

- A. The maximum air velocity across any single point along the face of the coil shall not exceed 475 FPM.
- B. Coils to have continuous water circuits from the inlet header to the outlet header. All joints in the water circuit are to be brazed. Coils are to be of the self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Each drain and vent outlet to be fitted with a hose-end valve, packless type, and a pipe cap.
- C. Headers: constructed of a heavy wall copper.
- D. Tubes: seamless deoxidized copper, 5/8" O.D. minimum and .035" minimum wall thickness. With the specified circuiting, water velocity not to exceed 6 feet per second.

- E. Fittings: return bends to be fabricated from 5/8" O.D. seamless deoxidized copper tubing. Wall thickness, after forming, must be equal to .020" or greater.
- F. Joints: tube joint between fittings and tubes; and tubes and header to be brazed.
- G. Fins: Copper, plate type. Minimum thickness – 0.010". The plate type copper fins shall be continuous across the entire width and depth of the coil section and the tubes shall be mechanically expanded into the fins.
- H. Casing: Stainless Steel top and bottom casing. Flanges are to be formed into a box shape for strength and durability, with a flat surface for coil stacking. Tube support sheets and coil casings to be stainless steel.
- I. Operating Limits: coils to be designed, tested and guaranteed for operation with water pressure and temperature required by specific job application. Conform pressures designated for valves and fittings.
- J. Coils: installed in more than one section high to have intermediate pans. Each pan to be individually drained with piping to outlet pipe leading to floor drain.
- K. Insulation: shall be closed cell plastic, coated with an asphaltum binder cemented to inside surface with waterproof adhesive.
- L. Coating: Cathodic epoxy e-coat.
- M. Coil Performance: all data pertaining to coil performance are shown elsewhere. All coils shall be piped counterflow.

## 2.4 HOT WATER HEATING COILS

- A. General: round seamless copper tubes are to be rolled into headers to form a permanent pressure tight joint. Coils are to be self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Coil finned tube shall be fabricated to permit expansion without transmitting stresses to casing. Each coil to bear the seal indicating manufacturer's compliance with ARI Standard 410.
- B. Minimum Working-Pressure/Temperature Ratings: 250 psig, 325 deg F.
- C. Provide even distribution of water to each tube.
- D. Tubes (Hot Water Coil): ASTM B 743 seamless deoxidized copper, 5/8" OD minimum and 0.035-inch minimum wall thickness. Water velocity shall not exceed 6 feet per second.
- E. Fins: copper plate type, minimum 0.020 in. thick. The plate type fins shall be continuous across entire coil width. Provide efficient bond between fin and tube, making each fin perform as an integral part of the tube.
- F. Fittings: return bends and expansion bends to be fabricated from 1" O.D. seamless deoxidized copper tubing. Wall thickness, after forming, must be equal to or greater than the tube wall thickness.
- G. Frames: ASTM A 666, Type 316 stainless steel, minimum 0.0625-inch-thick for flanged mounting.

## 2.5 GLYCOL/WATER HEATING/COOLING COILS

- A. The maximum air velocity across any single point along the face of the coil shall not exceed 475 FPM.
- B. Glycol/water coils are to be provided and mounted as an integral part of the air handling units and heat recovery units and shall have the capacities as indicated on the plans and schedules.
- C. Coils are to have ARI Standard 410 certification and bear the ARI symbol.
- D. Coils to have continuous glycol/water circuits from the inlet header to the outlet header. All joints in the water circuit are to be brazed. Coils are to be of the self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Each drain and vent outlet to be fitted with a hose-end valve, packless type, and a pipe cap.
- E. Headers: constructed of a heavy wall copper.
- F. Tubes: seamless deoxidized copper, 5/8" O.D. minimum and .035" minimum wall thickness. With the specified circuiting, water velocity not to exceed 6 feet per second.
- G. Fittings: return bends to be fabricated from 5/8" O.D. seamless deoxidized copper tubing. Wall thickness, after forming, must be equal to .020" or greater.
- H. Joints: tube joint between fittings and tubes; and tubes and header to be brazed.
- I. Fins: Copper, plate type. Minimum thickness – 0.010". The plate type copper fins shall be continuous across the entire width and depth of the coil section and the tubes shall be mechanically expanded into the fins.
- J. Casing: Stainless Steel top and bottom casing flanges are to be formed into a box shape for strength and durability, with a flat surface for coil stacking. Tube support sheets and coil casings to be stainless steel.
- K. Operating Limits: coils to be designed, tested and guaranteed for operation with water pressure and temperature required by specific job application. Conform pressures designated for valves and fittings.
- L. Coils: installed in more than one section high to have intermediate pans. Each pan to be individually drained with piping to outlet pipe leading to floor drain.
- M. Insulation: shall be closed cell plastic, coated with an asphaltum binder cemented to inside surface with waterproof adhesive.
- N. Coating: Cathodic epoxy e-coat.
- O. Coil Performance: all data pertaining to coil performance are shown elsewhere. All coils shall be piped counterflow.

## 2.6 HEAT-PIPE COILS

- A. Casing: Stainless Steel flanged casing, with airtight partition between airstreams.
- B. Refrigerant: R 134A.
- C. Tubes: 5/8-inch- diameter, and .035" minimum wall thickness copper.
- D. Fins: Copper plate type. Minimum thickness 0.010".

- E. Fin Spacing: 10-1/2 fins per inch.
- F. Fin and Tube Joint: Mechanical bond.

## 2.7 COIL LIMITATIONS

- A. Cooling coils: not more than 10-1/2 fins per inch (14 fins per inch for 100% O.A. units)  
Not less than 8 rows.
- B. Hot Water Heating Coil Characteristics:
  - 1. Fin Spacing: Not more than 10-1/2 fins per inch.
  - 2. Rows: Not more than 2 rows.
- C. Reheat Coil Characteristics:
  - 1. Minimum Fin Spacing: Not more than 8 fins per inch.
  - 2. Rows: Not more than 2 rows.
- D. Coating: Cathodic epoxy e-coat.

## 2.8 PRIMARY AND INTERMEDIATE DRAIN PANS

- A. All Cooling Coils, Glycol/water coils, Moisture Eliminators and Humidifiers shall be provided with full-length drain pans.
- B. Provide IAQ style drain pan under the entire cooling coil section, which is in compliance with ASHRAE Standard 62.1- 2004.
- C. Drain pan shall extend a minimum 24 inches downstream of the cooling coil, Moisture Eliminators and Humidifier sections.
- D. The main drain pan and intermediate drain pans shall extend under each complete coil section, Moisture Eliminator and Humidifier section and shall be rigid and watertight with a 1-1/4" stainless steel pipe drain connection. The main drain pan and the intermediate drain pans are to be individually drained with piping outlet pipe leading to floor drain.
- E. Drain pans shall start 2" upstream of the coils and extend beyond the coil by a distance which is at least 1/3 the height of the coil (minimum 24" past coil). Total drain height shall be 6".
- F. Extend drain pans under coil headers and all exposed piping subject to sweating.
- G. The drain pans shall be minimum 12 gauge, 304 stainless steel double pan construction.
- H. Insulate the underside of the entire drain pan with two part sprayed on polyurethane closed cell foam with a minimum of R-14 insulation value. Insulation shall be water impervious rigid type, after curing, and shall occupy all voids and areas between drain pan and outer wall to prevent the occurrence of trapped water, condensation, and microbial growth. Install and seal insulation as is appropriate for the equipment construction.
- I. Drain pan triple sloped to the drain connection to prevent accumulation of standing water to meet the requirements of ASHRAE 62.
- J. Condensate from drain pans shall be piped as indicated on the Drawings. The pipe size shall be 1-1/2 inch minimum diameter, insulated as specified for chilled water piping. A trap as

required to prevent the escape or entry of air through the drain piping shall be provided as indicated on the Drawings.

- K. Provide an insulated intermediate drain pan for all coils more than one section high.
- L. Each pan to be individually drained with piping to outlet pipe leading to floor drain. Multiple coils in air handling equipment shall be provided with intermediate drain pans.
- M. Drain pans shall be triple sloped and constructed of 16 gage Type 304 stainless steel to match the main drain pan and shall be extended 6 inches from the coil face.
- N. Drain pans shall also be provided (non-condensing) for hot water and steam finned tube coils which are to be used for coil cleaning maintenance. Drain piping from the pans shall have NPT end caps that will only be removed on a temporary basis to drain water during coil cleaning or for in place coil tube repairs.
- O. Any condensation from the drain pan or drain connection shall be corrected by unit manufacturer to the satisfaction of the Commissioner, and at no expense to the City of New York.
- P. Drain pan shall comply with ASHRAE 62.1- 2004.
- Q. The drain pans shall be fabricated with two percent slope in at least two planes to collect condensate from coils, humidifiers, etc. (including coil piping connections, coil headers, and return bends) and to direct water toward drain connection to drain completely dry on unit shutdown.
- R. The drain pans shall be minimum 12 gauge, 304 stainless steel double pan construction. The drain pan shall be insulated with minimum 2" thick 3.0 lb. density fiberglass insulation. The insulation shall be covered on the exterior with 20-gauge stainless steel coversheet.
- S. Insulation shall be UL listed and shall be vapor sealed between the inner and outer pan.

## 2.9 AUXILIARY DRAIN PAN

- A. In addition to the primary/intermediate drain pan described above, provide an auxiliary drain pan shall be provided under the unit or coils in which condensation will occur. The pan shall have a minimum depth of 1.5 inches, shall not be less than 3 inches larger than the unit or the coil dimensions (in width and length).
- B. Construct the auxiliary drain pan of Type 304 stainless steel; minimum thickness of not less than 0.0276 inch.
- C. Insulate the underside of the entire drain pan with two part sprayed on polyurethane closed cell foam with a minimum of R-14 insulation value. Insulation shall be water impervious rigid type, after curing, and shall occupy all voids and areas between drain pan and outer wall to prevent the occurrence of trapped water, condensation, and microbial growth. Install and seal insulation as is appropriate for the equipment construction.
- D. Drain pan triple sloped to the drain connection to prevent accumulation of standing water to meet the requirements of ASHRAE 62.1 – 2004.
- E. Extend drain pans under coil headers and all exposed piping subject to sweating.
- F. Insulation shall be UL listed and shall be vapor sealed.

- G. Condensate Overflow Switch: A water level detection device conforming to UL 508 shall be provided that will send an alarm to the BMS and be capable of disabling all mechanical cooling in affected unit in the event that the condensate drain is blocked.
- H. The device shall typically be installed in the auxiliary drain pan, located at a point below the overflow rim of such pan.

## 2.10 UVC GERMICIDAL TREATMENT

- A. UVC Germicidal lights shall be factory installed, wired and mounted at the following locations:
  - 1. Downstream of all cooling and heat recovery coils.
  - 2. Above all condensate drain pans.
  - 3. Up-stream of final filtration sections.
- B. UVC Germicidal Treatment is specified under another section of this work.

## 2.11 MOISTURE ELIMINATORS

- A. No water carry-over from cooling coils into air stream accepted. Eliminators shall be provided where required by unit manufacturer. Pressure drop across eliminator shall be maximum 0.20" W.G. at 500 FPM, coil face velocity.

# PART 3 - EXECUTION

## 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

## 3.2 EXAMINATION

- A. Examine air-handling unit casings, ducts and plenums to receive air coils for compliance with requirements for installation tolerances and other conditions affecting coil performance.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before coil installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

## 3.3 INSTALLATION

- A. Install coils level and plumb.
- B. Install coils in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."
- C. Install moisture eliminators for cooling coils. Extend drain pan under moisture eliminator.
- D. Straighten bent fins on air coils.
- E. Clean coils using materials and methods recommended in writing by manufacturers, and clean inside of casings and enclosures to remove dust and debris.
- F. Fully insulate coil end-caps for all duct mounted heating coils.

**3.4 CONNECTIONS**

- A. Piping installation requirements are specified in other Division 23 00 00 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to coils to allow service and maintenance.
- C. Connect water piping with unions and shutoff valves to allow coils to be disconnected without draining piping. Control valves are specified in Section "HVAC Instrumentation and Controls," and other piping specialties are specified in Section "HVAC Piping."
- D. Connect steam piping with gate valve and union and steam condensate piping with union, strainer, trap, and gate valve. Control valves are specified in Section "HVAC Instrumentation and Controls," and other piping specialties are specified in Division 23 Section "Steam and Condensate Piping."
- E. Ground equipment as specified under Division 26 – Electrical.
- F. Connect wiring as specified under Division 26 – Electrical.

**3.5 FIELD QUALITY CONTROL**

- A. Perform the following field tests and inspections and prepare test reports:
- B. Operational Test: After electrical circuitry has been energized, operate electric coils to confirm proper unit operation.
- C. Leak Test: After installation, fill water coils with water, and test coils and connections for leaks.
- D. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

**END OF SECTION 23 71 00**

**SECTION 23 71 03****UVC GERMICIDAL TREATMENT SYSTEM****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- D. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- E. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- F. Section 23 71 00 – AIR COILS.
- G. Section 23 73 15 – FACTORY FABRICATED CUSTOM AIR HANDLING UNITS.
- H. This section is a part of each Division 23 00 00 section.

**1.2 SUMMARY**

- A. This Section includes the following:
- B. Ultraviolet High-Output Lights in Air Handling Units.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 SUBMITTALS

- A. Shop drawings detailing fabrication and installation of UV Lights, including material descriptions, dimensions of individual components and profiles. Indicate dimensions, weight loading, weight distribution and clearances required
- B. Field quality-control test reports.
- C. Operation and Maintenance Data: Include in operation and maintenance manuals.

1.7 COORDINATION

- A. Coordinate layout and installation of UV lights with air coils, drain pans and filter locations in the air handling unit. Revise layout and elevations as required to suit field condition and as reviewed by the Commissioner.

1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements
- B. Single-Source Responsibility: Obtain UV system components from one source and by a single manufacturer.
- C. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
- D. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.
- E. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- F. ASHRAE Compliance:
  - 1. Comply with ASHRAE 15 for refrigeration system safety.
  - 2. Comply with ASHRAE 33 for methods of testing cooling and heating coils.
  - 3. Comply with applicable requirements in ASHRAE 62.1-2004, Section 5 – "Systems and Equipment" and Section 7 – "Construction and Startup".
- G. Seismic Fabrication Requirements:
  - 1. Fabricate mounting frames and attachments to coils, filters and other coil section components with reinforcement strong enough to withstand seismic forces defined under another section of this work.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS:**

- A. Subject to compliance with requirements, provide products by one of the following
- B. UVC Utility Fixtures:
  - 1. American Ultraviolet
  - 2. York
  - 3. Klaran
  - 4. Or approved equal.

**2.2 GENERAL**

- A. Factory assembled, tested and installed utilizing moisture-proof construction, housing, power source, control panel, reflector, emitter sockets and emitter.
- B. Constructed to withstand HVAC environments.
- C. Lamps and housings shall be UL listed for application in air handling equipment.

**2.3 ULTRA VIOLET GERMICIDAL IRRADIATION SYSTEMS:**

- A. Provide factory installed Ultra Violet (UV) Germicidal Irradiation lamps. Lamps shall provide a minimum irradiance of 9 Watts per square foot at the cooling coil surface (at the coil leaving air temperature scheduled on the Drawings) as well as at the drain pans and filters.
- B. UV lamps shall be located:
  - 1. Downstream of cooling coils.
  - 2. Above condensate drain pans.
  - 3. Up-stream of final filtration sections.
- C. The UVC manufacturer in conjunction with the air handling unit manufacturer shall select and design the UVC device for full surface coverage and equal distribution of UVR energy and maximum effective control of microbial growth, surface bacteria, and mold on coils and condensate drain pans.
- D. Housing: Constructed of hospital grade stainless steel with electrical connection provisions on both ends. Mounting rails and hardware shall be stainless steel.
- E. Power:
  - 1. The air handling unit manufacturer shall factory pre-wire the UVC treatment system as required and provide code approved wiring termination enclosures to permit easy disassembly and field reassembly of the UVC system. Unit wiring shall terminal in a NEMA 3R enclosure terminal panel with a tagged terminal strips.
  - 2. Power Source: 120V, Class P2 rapid start type with power factor of 9.95 and power conversion of not less than seventy-five (75%) percent.
  - 3. Door safety switches will be provided on all doors in AH unit to de-energize the UV lights when an access door is opened. In addition, safety labels will be located on all doors that have a door safety switch. If the segment does not have a door, a label will be added to the segments panel.

4. To safely access the unit where UV lighting has been installed, use the UV Control Panel to turn off the UV lights.
- B. Reflector: Constructed of heavy gauge, specular finished stainless steel and designed to maximize reflectance and minimize corrosion
- C. All fixture components and fixture to fixture mechanical and electrical connections shall be UL approved.
- D. UV Lamps: T5 tube diameter lamps shall be constructed of hard glass quartz producing no ozone or secondary contamination. Lamps shall retain, at minimum, 80% of initial output after 18,000 hours of use. They are sealed for moisture protection with a water-tight connection.
- E. Provide UV filtering glass windows in access doors to block UV lighting, allowing the coil, drain pan and lights to be inspected while in use from outside the AHU.
- F. UVC fixtures shall have been tested and listed as UL under Category Code ABQK, UL standards 153, 1598, and 1995.
- G. UV CONTROL PANEL
  1. A control panel will be provided with every UV light. The control panel will be type NEMA 3R. The Control panel will be mounted in close proximity to the UV lamps.
  2. The purpose of the control panel is to provide a means of disconnecting the UV lighting circuit(s) before opening an access door. Should an access door be opened before disconnecting the UV circuit(s), the door safety switches will turn off the UV lights automatically. The control panel would then be used to reset the UV light circuit(s).

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Examine air-handling unit casings, cooling coils and drain pans to receive UVC Germicidal Treatment fixtures for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.3 INSTALLATION

- A. Install fixtures level and plumb.

#### 3.4 CONNECTIONS

- A. Connect wiring as specified under Division 26 – Electrical.

#### 3.5 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
- B. Operational Test: After electrical circuitry has been energized, operate UVC fixtures to confirm proper unit operation.

- C. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

**END OF SECTION 23 71 03**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 23 73 13****SEMI-CUSTOM AIR HANDLING UNITS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 13 – MOTORS FOR HVAC EQUIPMENT.
- D. Section 23 05 14 – VARIABLE FREQUENCY MOTOR DRIVES.
- E. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- F. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- G. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- H. SECTION 23 33 10 - DAMPERS
- I. Section 23 33 11 – HVAC SOUND ATTENUATION.
- J. Section 23 34 18 – FANS.
- K. Section 23 41 00 – AIR FILTERS.
- L. Section 23 71 00 – AIR COILS.
- M. Section 23 84 13 – HUMIDIFIERS.
- N. This section is a part of each Division 23 00 00 section.

**1.2 SUMMARY**

- A. Section Includes:
  - 1. Variable-air-volume, single-zone air-handling units (AHU - C-1, 1-1, 1-2, and 2-1)

**1.3 REFERENCES**

- A. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.

#### 1.4 PERFORMANCE REQUIREMENTS

- A. Engineering Services: Design vibration isolation and seismic-restraint details, including comprehensive engineering analysis by a qualified professional engineer licensed in the State of New York, using performance requirements and design criteria indicated.
- B. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of  $L/200$  where "L" is the unsupported span length within completed casings.
- C. Seismic Performance: Air-handling units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event.
- D. The minimum external static pressure noted on the schedules is exclusive of all components furnished and/or factory installed by the unit manufacturer as part of the unit including, but not limited to, all coils, all filters (dirty), unit casing, discharge plenum, diffusion section, humidifier, sound attenuator, dampers (inlet and discharge), access platform, etc.

#### 1.5 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  1. Section 01 74 19 "Construction Waste Management and Disposal"
  2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.6 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.7 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.8 SUBMITTALS

- A. Product Data: For each air-handling unit indicated.
  1. Include manufacturer's technical data for each model indicated, including rated capacities of selected model clearly indicated; dimensions; shipping, installed, and operating weights; furnished specialties; accessories; and installation and startup instructions.
  2. Assembly, unit dimensions and weight loading,
  3. Required clearances, construction details, field connection details, and electrical characteristics and connection requirements.
  4. Cabinet material, metal thickness, finishes, insulation, and accessories.

5. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring.
  6. Commissioning Reports: Indicate results of startup and testing commissioning requirements. Submit copies of checklists.
  7. Maintenance Data: Maintenance manuals specified in Division 1.
  8. Warranties: Special warranties specified in this Section
  9. Fans:
    - a. Certified, computer generated fan performance curves for each air handling unit shall be submitted with specific design operating point noted
    - b. Certified fan-sound power ratings.
    - c. Fan construction and accessories.
    - d. Motor ratings, electrical characteristics, and motor accessories.
  10. Sound data for discharge, radiated and return positions shall be submitted by octave band for each unit.
  11. A computer generated psychometric chart shall be submitted for each cooling coil with design points and final operating point clearly noted
  12. Certified coil-performance ratings with system operating conditions indicated.
  13. Calculations for required base rail heights to satisfy condensate trapping requirements of cooling coil shall be included.
  14. Dampers, including housings, linkages, and operators.
  15. Filters with performance characteristics.
- B. Engineering Services Submittal: For vibration isolation and seismic restraints indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer licensed in the State of New York responsible for their preparation.
1. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
  2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
- C. Coordination Drawings: Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for coordination and record drawing Requirements.
- D. Seismic Qualification Certificates: For air-handling units, accessories, and components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
  2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- E. Source quality-control reports.
- F. Field quality-control reports.
- G. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.

1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Air Handling units shall be ETL tested and listed in accordance with UL Standard 1995 and CAN/CSA Standard C22.2 No. 236
- D. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- E. ARI Certification: Air-handling units and their components shall be fabricated and factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.
- F. Air handling unit water heating & cooling coils shall be certified in accordance with the forced circulation air cooling and air heating coils certification program, which is based on ARI Standard 410.
- G. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- H. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- I. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Code for Mechanical Refrigeration."
- J. Energy Efficiency Ratio (EER) of package units shall be equal to or greater than prescribed by ASHRAE 90A "Energy Efficient Design of New Buildings."
- K. AC units and their components shall be factory tested according to the applicable portions of ARI and shall be listed and bear the label of the Air-Conditioning and Refrigeration Institute (ARI).
- L. UL and NEMA Compliance: Provide motors required as part of AC units that are listed and labeled by UL and comply with applicable NEMA standards.
- M. Testing and rating of package units shall be in accordance with ARI 360, "Standard for Commercial and Industrial Air-Conditioning Equipment."
- N. Sound testing and rating of package units shall be in accordance with ARI 270, "Standard for Sound Rating of Outdoor Unitary Equipment."
- O. Fan Performance Ratings: Conform to AMCA 210.
- P. Sound Ratings: ARI 410.
- Q. Filter Media: ANSI/UL 900 listed, Class I or Class II, approved by New York City Department of Buildings

- R. Air Coils: Certify capacities, pressure drops, and selection procedures in accordance with ARI 410.
- S. Package Units shall be listed by UL or E.T.L. and have label as a unit.
- T. Units shall be accepted for use in New York City by the Department of Building, MEA 342-99-E.
- U. Units shall have MEA approval.

#### 1.10 COORDINATION

- A. Coordinate sizes and locations of concrete bases with actual equipment provided.
- B. Coordinate sizes and locations of structural-steel support members, if any, with actual equipment provided.

#### 1.11 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing Air Handler products specified in this section must show a minimum five years documented experience and complete catalog data on total product.

#### 1.12 VERIFICATION OF FACTORY RUN-IN TEST

- A. Every unit shall be factory run-in tested
- B. Prior to the assembly of the unit, pressure test all coils (as specified under another section of this work).
- C. Unit Leakage:
  - 1. Unit manufacturer shall provide tests to verify CASING LEAKAGE. Casing leakage tests shall verify that unit casing leakage is less than 1% of design airflow at 1.33 times the design static pressure (minimum of 5"). Duct openings in positive pressure section shall be sealed. This section shall be connected to a fan developing 1.33 times design positive static pressure and CFM of this fan which shall be read using a calibrated orifice plate device. CFM shall be considered casing leakage. Duct openings in negative pressure section shall be sealed. This section shall be connected to a fan developing 1.33 times design negative static pressure and CFM of this fan which shall be read using a calibrated orifice plate device. CFM shall be considered casing leakage.
- D. Deflection:
  - 1. Unit casing deflection shall be limited to 1/200 of the span at 133 percent of the maximum fan static. Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of L/100 where "L" is the unsupported span length within completed casings.

#### 1.13 SAFETY AGENCY LISTED & CERTIFICATION

- A. Air handler furnished with double width, double inlet (DWDI) fans shall be certified in accordance with the central station air handling units certification program, which is based on ARI Standard 430.

**1.14 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver, store, protect and handle products to site.
- B. Accept products on site on factory-furnished shipping skids. Inspect for damage.
- C. Store in clean dry place and protect from construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

**1.15 EXTRA MATERIALS**

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Filters: One set(s) for each air-handling unit.
  - 2. Fan Belts: One set(s) for each air-handling unit fan.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Ventrol
  - 2. Temptrol
  - 3. Johnson Control
  - 4. Or approved equal.

**2.2 UNIT CASINGS**

- A. General Fabrication Requirements for Casings:
  - 1. Casing – Exterior and interior panels shall be constructed of G90 galvanized steel with welded framework construction. The frame shall be constructed to permit complete removal of the wall and roof panels without affecting the structural integrity of the unit. All panels are removable. The entire unit shall be provided with a full-length, continuous, base rail channel.
  - 2. All segments shall be double wall, formed and reinforced to provide a rigid assembly. The exterior casing shall be constructed of a minimum G90-u galvanized steel. The interior lining shall be a solid lining of a minimum of 18 gage galvanized steel.
  - 3. Forming: Form walls, roofs, and floors with at least two breaks at each joint.
  - 4. Casing Joints: Sheet metal screws or pop rivets.
  - 5. Sealing: Seal all joints with water-resistant sealant.
  - 6. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.
  - 7. All ferrous parts shall have a full 0.90 ounces per square foot of commercial grade galvanizing or have equivalent corrosion resistance when in an unpainted condition. Galvanizing shall be done before construction - all component parts of frame internal and external shall be galvanized.

**B. Casing Insulation and Adhesive:**

1. **Materials:** Moisture proof, fire resistant, two inch (2") thick 1-½ lb. density neoprene coated glass fiber blanket, cemented to internal surfaces, conforming with NFPA Standards for duct lining.
2. **Location and Application:** Factory applied with adhesive and mechanical fasteners to the internal surface of section panels downstream from, and including, the cooling-coil section.
  - a. **Liner Adhesive:** Comply with ASTM C 916, Type I.
  - b. **Mechanical Fasteners:** Galvanized steel, suitable for adhesive attachment, mechanical attachment, or welding attachment to duct without damaging liner when applied as recommended by manufacturer and without causing leakage in cabinet.
  - c. **Liner materials** applied in this location shall have air-stream surface coated with a temperature-resistant coating or faced with a plain or coated fibrous mat or fabric depending on service-air velocity.
3. **Location and Application:** Encased between outside and inside casing for all walls, floors, roof, etc.

**C. Base Rail:**

1. A 6-inch formed 10 gauge G60 galvanized steel base rail shall be provided by the unit manufacturer for structural rigidity and condensate trapping. The following calculation shall determine the required height of the baserail to allow for adequate drainage. Use the largest pressure to determine base rail height. Negative or Positive static pressure in (2) + 4" = required baserail height. Should the unit baserail not be factory supplied at this height, the contractor is required to supply a concrete housekeeping pad to make up the difference.

**D. Inspection and Access Panels and Access Doors:**

1. **Panel and Door Fabrication:** Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.
2. **Inspection and Access Panels:**
  - a. **Fasteners:** Two or more camlock type for panel operation. Arrangement shall allow panels to be opened against air-pressure differential.
  - b. **Gasket:** Neoprene, applied around entire perimeters of panel frames.
  - c. **Size:** Large enough to allow inspection and maintenance of air-handling unit's internal components.
3. **Access Doors:**
  - a. **Hinges:** A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever-type latches, operable from inside and outside. Arrange doors to be opened against air-pressure differential.
  - b. **Gasket:** Neoprene, applied around entire perimeters of panel frames.
  - c. **Fabricate windows** in each component section, motor section, filters section - doors of double-glazed, wire-reinforced safety glass with an air space between panes and sealed with interior and exterior rubber seals.
  - d. **Size:** At least 18 inches wide by full height of unit casing up to a maximum height of 72 inches.

4. Locations and Applications:
  - a. Fan Section: Doors and inspection and access panels.
  - b. Access Section: Doors.
  - c. Coil Section: Doors.
  - d. Damper Section: Inspection and access panels.
  - e. Filter Section: Doors large enough to allow periodic removal and installation of filters.
  - f. Mixing Section: Doors.
  - g. Humidifier Section: Doors.
5. Service Light: A marine-type, 100-W vapor proof service light fixture with switched junction box shall be provided in each unit segment and located inside adjacent to door. Lights shall be factory wired to individual switches with a utility receptacle
  - a. Locations: Each section accessed with door or access panel.

**E. Condensate Drain Pans:**

1. All drain pans shall be furnished and installed to meet the performance requirements set forth in the schedule and as specified herein and under another section of this work.
2. Fabricated with two percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from humidifiers and to direct water toward drain connection.
3. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

**2.3 FANS – GENERAL**

- A. The multiple fan array systems shall include multiple, direct drive, arrangement 4 plenum fans constructed per AMCA requirements for the duty specified Class III as required. Class I and Class II fans are not acceptable.
- B. Fans shall be certified by AMCA for performance. All fans shall be selected to deliver the specified airflow quantity at the specified operating Total Static Pressure and specified fan/motor speed.
- C. Fans shall be direct-drive Plenum Fans, designed for rugged industrial duty and suitable for continuous operation. Fans shall be furnished with an open-mesh protective enclosure screen completely enclosing all sides and the back of the fan wheel. The enclosure shall be removable to provide access to the motor, sheaves and fan wheel. A protective screen shall be mounted at the inlet cone of the fan to prevent foreign objects from entering.
- D. Fan shall be selected and supplied by air handling unit manufacturer with capacities as indicated on the schedule and fully compatible with specific air handling unit systems.
- E. Fans shall be as specified under another section of this work.
- F. All fans shall meet the air flow performance specified and shall not exceed the brake horsepower or sound power levels specified herein and on the HVAC equipment schedule.
- G. Fan capacity shall be AMCA standard 210-74 Rated.
- H. All fans shall include inlet screens.

## 2.4 FAN ARRAY CONSTRUCTION

- A. Fan and motor “cubes” or “cells”, shall be spaced in the air way tunnel cross section to provide a uniform air flow and velocity profile across the entire air way tunnel cross section and components contained therein.
- B. In order to assure uniform velocity profile in the AHU cross section, the fan cube dimensions must be variable, such that each fan rests in an identically sized cube or cell, and in a spacing that must be such that the submitted array dimensions fill a minimum of 90% of the cross sectional area of the AHU air way tunnel.
- C. Each fan/motor “cube” shall include an 11 gage; A60 galvanized steel motor support plate and structure. The fan air inlet cone and motor support structure shall be powdered coated for corrosion resistance. All motors are to be compatible for inverter duty, with sealed bearings and also include shaft grounding.
- D. The fan array shall produce a uniform airflow and velocity profile within the airway tunnel of the air handling unit not to exceed the specified cooling coil and filter bank face velocity when measured 12 inches from the intake side of the fan array intake plenum wall and at a distance of 48 inches from the discharge side of the fan array intake plenum wall.
- E. There shall be no blank off plates or “spacers” between adjacent fan columns or rows to position the fans across the air way tunnel.
- F. Each fan & motor assembly shall be removable through a 30” wide, free area, access door located on the discharge side of the fan wall array without removing the fan wheel from the motor.
- G. Each fan/motor cube shall be equipped with a metal grating fan outlet guard. The manufacturer of the array shall be responsible to determine if the addition of vibration isolators are required to meet the vibration requirements within this scope of work.
- H. Fans shall be rated in accordance with AMCA 210 for performance and AMCA 300 for sound.
- I. Fan motors shall be premium efficiency and compatible for inverter duty
- J. All motors with VFDs shall be compatible with the VFD and tested at the factory. Motors shall be capable of running continuously from 0 up to 120 Hz and deliver full rated horsepower at 60 Hz to 120 Hz operating frequencies
- K. All fan/motor access doors shall open against pressure.

## 2.5 FAN, DRIVE, AND MOTOR SECTION

- A. Fan and Drive Assemblies shall be furnished to meet the performance requirements set forth herein and in the schedules and as specified under another section of this work.
- B. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 15 Section "Common Motor Requirements for HVAC Equipment."
  - 1. Enclosure Type: Totally enclosed, fan cooled.
  - 2. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.

3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 16 Sections.
5. Mount unit-mounted disconnect switches on interior of unit.

## 2.6 VARIABLE FREQUENCY DRIVES (VFD):

- A. Variable Frequency Drives (VFD) shall be furnished and installed to meet the performance requirements set forth herein and in the schedules and as specified under another section of this work.

## 2.7 COIL SECTION

- A. General Requirements for Coil Section: See Section 23 71 00 "Air Coils".
  1. All coils shall be furnished and installed to meet the performance requirements set forth in the schedule and as specified herein and under another section of this work.
  2. Coil section shall completely enclose all connections, coil headers and return bends. Furnish and install factory air seals reviewed by the Commissioner for the coil piping penetrations at the casing. Coil frames shall not be used as structural members of the coil section. The coil section shall be constructed in such a manner that the coils can be removed within the unit (coil pull space not required).
  3. All coils shall be factory installed on tracks for easy removal from the unit. Units that require disassembly of the unit for coil removal are not acceptable. Install coils such that headers and return bends are enclosed by unit casings.
  4. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).
  5. Seismic Fabrication Requirements: Fabricate coil section, internal mounting frame and attachment to coils, and other coil section components with reinforcement strong enough to withstand seismic forces defined in Division 15 Section "Vibration and Seismic Controls for HVAC Piping and Equipment" when coil-mounting frame and air-handling-unit mounting frame are anchored to building structure.

## 2.8 AIR FILTERS

- A. All filters shall be furnished and installed to meet the performance requirements set forth in the schedule and as specified herein and under another section of this work.
- B. Provide filters and filter housing as an integral part of unit.
- C. There shall be a filter gauge for each filter bank – readable from the unit exterior.
- D. Provide a pressure differential sensor (with a contact for the BMS) for each filter bank.
- E. Provide filter holding frames with access doors on both sides of unit. All filters shall be installed on tracks for easy removal and installation from the unit.
- F. Filters shall be removable from either side of the unit or lifted out from access plenum.

## 2.9 DAMPERS

- A. All dampers shall be furnished and installed to meet the performance requirements set forth in the schedule and as specified herein and under another section of this work.

- B. Dampers and damper actuators: Comply with requirements as specified in another section of this work.
- C. All dampers used for modulating service shall be opposed blade type arrange for normally open or normally closed operation as required. The damper is to be sized so that when wide open the pressure drop is a sufficient amount of its close-off pressure drop for effective throttling.
- D. All dampers used for two-position or open-close control shall be parallel blade type arranged for normally open or closed operation as required.
- E. Damper linkage hardware shall be constructed of aluminum or corrosion resistant zinc & nickel-plated steel and furnished as follows:
- F. Bearing support bracket and drive blade pin extension shall be provided for each damper section.
- G. Drive pin may be round only if V-bolt and toothed V-clamp is used to cause a cold weld effect for positive gripping. For Single bolt or set-screw type actuator fasteners, round damper pin shafts must be milled with at least one side flat to avoid slippage.
- H. Damper manufacturer shall supply alignment plates for all multi-section dampers.
- I. Outside Air and Exhaust Air Damper Actuators shall be Mechanical Spring Return. Capacitors or other non-mechanical forms of fail-safe are not acceptable. The actuator mounting arrangement and spring return feature shall permit normally open or normally closed positions of the damper as required.
- J. Economizer Actuators shall utilize digital control 2-10 VDC, tied into the BMS. Floating control is not acceptable.
- K. Electric damper actuators shall be direct shaft mounted and use a V-bolt and toothed V-clamp causing a cold weld effect for positive gripping. Single bolt or setscrew type fasteners are not acceptable.
- L. One electronic actuator shall be direct shaft mounted per damper section. No connecting rods or jackshafts shall be needed. Small outside air and return air economizer dampers may be mechanically linked together if one actuator has sufficient torque to drive both and damper drive shafts are both horizontal installed.
- M. Multi-section dampers with electric actuators shall be arranged so that each damper section operates individually. One electronic actuator shall be direct shaft mounted per damper section.
- N. Electronic Damper Actuators:
  - 1. UL Listed Standard 873 and Canadian Standards Association Class 481302 shall certify Actuators.
  - 2. NEMA 2 rated actuator enclosures. Use additional weather shield to protect actuator when mounted outside
  - 3. 5-year Manufacturer's Warranty. Two-year unconditional + Three-year product defect from date of installation
  - 4. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 15/23.
  - 5. Size to operate with sufficient reserve power to provide smooth modulating action or two-position action.

6. Mechanical spring-return mechanism shall be provided. Mechanical, with external, manual gear release on nonspring-return actuators. Capacitors or other non-mechanical forms of fail-safe are not acceptable.
7. Position indicator device shall be installed and made visible to the exposed side of the Actuator. For damper short shaft mounting, a separate indicator shall be provided to the exposed side of the Actuator
8. Overload Protection: Actuators shall provide protection against actuator burnout by using an internal current limiting circuit or digital motor rotation sensing circuit. Circuit shall insure that actuators cannot burn out due to stalled damper or mechanical and electrical paralleling. End switches to deactivate the actuator at the end of rotation are acceptable only for Butterfly Valve actuators.
9. A push button gearbox release shall be provided for all non-spring actuators.
10. Modulating actuators shall be 24Vac and consume 10VA power or less.
11. Conduit connectors are required when specified and when code requires it.
12. Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
13. Electronic damper position indicator shall have visual scale indicating percent of travel and 2- to 10-V dc, feedback signal. Operator Motors:
14. Coupling: V-bolt and V-shaped, toothed cradle.
15. Power Requirements (Two-Position Spring Return): 24-V ac.
16. Power Requirements (Modulating): Maximum 10 VA at 24-V ac or 8 W at 24-V dc.
17. Proportional Signal: 2- to 10-V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
18. Temperature Rating: Minus 22 to plus 122 deg F.

## 2.10 SOURCE QUALITY CONTROL

- A. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.
- B. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."
- C. Water Coils: Factory tested to 300 psig (2070 kPa) according to ARI 410 and ASHRAE 33.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for steam, hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Equipment Mounting: Install air-handling units on concrete bases using restrained spring isolators. Secure units to anchor bolts installed in concrete bases. Comply with requirements for concrete bases specified in Division 3. Comply with requirements for vibration isolation devices specified in Division 15 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."
  - 1. Minimum Deflection: 2 inches (50 mm).
  - 2. Install galvanized-steel plate to equally distribute weight over elastomeric pad.
  - 3. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
  - 4. Install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 5. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 6. Install anchor bolts to elevations required for proper attachment to supported equipment.
- B. Equipment Mounting: Install air-handling unit using restrained spring isolators. Comply with requirements for vibration isolation devices specified in Division 15 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."
  - 1. Minimum Deflection: 2 inches (50 mm).
  - 2. Install galvanized-steel plate to equally distribute weight over elastomeric pad.
- C. Suspended Units: Suspend and brace units from structural-steel support frame using threaded steel rods and spring hangers. Comply with requirements for vibration isolation devices specified in Division 15 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."
- D. Arrange installation of units to provide access space around air-handling units for service and maintenance.
- E. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.
- F. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

### 3.4 CONNECTIONS

- A. requirements for piping specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to air-handling unit to allow service and maintenance.
- C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.
- D. Connect condensate drain pans using 1-1/4", ASTM B, Type L copper tubing. Extend to nearest equipment or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.

- E. Hot- and Chilled-Water Piping: Comply with applicable requirements in Division 15 Section "Hydronic Piping." Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.
- F. Connect duct to air-handling units with flexible connections. Comply with requirements in Division 15/23.

### 3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Tests and Inspections:
  - 1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks.
  - 2. Charge refrigerant coils with refrigerant and test for leaks.
  - 3. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.
- E. Prepare test and inspection reports.

### 3.6 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
  - 1. Complete installation and startup checks according to manufacturer's written instructions.
  - 2. Verify that shipping, blocking, and bracing are removed.
  - 3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
  - 4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
  - 5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
  - 6. Verify that zone dampers fully open and close for each zone.
  - 7. Verify that face-and-bypass dampers provide full face flow.
  - 8. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
  - 9. Comb coil fins for parallel orientation.
  - 10. Verify that proper thermal-overload protection is installed for electric coils.
  - 11. Install new, clean filters.

B. Starting procedures for air-handling units include the following:

1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace fan and motor pulleys as required to achieve design conditions.
2. Measure and record motor electrical values for voltage and amperage.
3. Manually operate dampers from fully closed to fully open position and record fan performance.

### 3.7 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing" for air-handling system testing, adjusting, and balancing.

### 3.8 CLEANING

- A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

### 3.9 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and maintain devices. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 23 73 13**

**SECTION 23 73 15****FACTORY FABRICATED CUSTOM AIR HANDLING UNITS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 13 – MOTORS FOR HVAC EQUIPMENT.
- D. Section 23 05 14 – VARIABLE FREQUENCY MOTOR DRIVES.
- E. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- F. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- G. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- H. SECTION 23 33 10 - DAMPERS
- I. Section 23 33 11 – HVAC SOUND ATTENUATION.
- J. Section 23 34 18 – PLENUM FANS.
- K. Section 23 41 00 – AIR FILTERS.
- L. Section 23 71 00 – AIR COILS.
- M. This section is a part of each Division 23 00 00 section.

**1.2 SUMMARY**

- A. Section includes work for the following air handling units, as indicated on Drawings:

- 1. AHU –C3-1&1A
- 2. AHU C3-2&2A

Provide complete and fully operational custom-built, factory fabricated, heavy-duty, hospital grade, indoor air-handling units to meet the performance requirements as shown on the equipment schedules, indicated on the drawings and specified herein. Air Handling units shall be complete (factory installed) with casings, frames, access doors, thermal breaks, fans, motors, variable frequency drives, plus accessories which include, but are not limited to, cooling coils, pre-heat coils, reheat coils (integral face and bypass coils are not acceptable), pre-filters, filters, after-filters, mixing section, dampers (fan outlet, isolation, etc.), access sections,

discharge section, diffuser section, humidifier, sound attenuators, controls, etc.

### 1.3 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

### 1.5 SUBMITTALS

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".
- B. Include in the submittal the following for each of the supplied components:
  - 1. Manufacturer's name and model number
  - 2. Drawings with complete dimensional data, weights,
  - 3. Materials for construction
  - 4. Certification, performance guarantee and warranty information.
- C. The thickness of the double wall construction shall be determined based on meeting and exceeding the thermal, structural, acoustical, etc. design criteria outlined herein. Manufacturer shall submit calculations, backup data and test results to substantiate selected wall thickness.
- D. **Product Data:** For each air-handling unit:
  - 1. Unit dimensions and weight.
  - 2. Capacities
  - 3. Pressure drops across each component in the unit.
  - 4. Required Clearances
  - 5. Cabinet material, gauges, metal thickness, finishes, insulation, and accessories.
  - 6. Fans:

- a. Certified fan-performance curves with system operating conditions indicated.
  - b. Certified fan-sound power ratings.
  - c. Fan construction and accessories.
  - d. Motor ratings, electrical characteristics, and motor accessories.
7. Coils:
  - a. Coil selection data sheets, clearly showing input data with proper consideration for altitude, air density.
  - b. Certified coil-performance ratings with system operating conditions indicated.
8. Dampers, including housings, linkages, and operators.
9. Filters with performance characteristics, product data of filter media, filter assembly and filter frames.
10. Details showing condensate drain connection height and required P-trap height.
11. Field connection details for ductwork, steam, water, power, etc.
12. Airflow measuring station details.
- E. Sound data - air handling unit inlet, discharge, and radiated sound power levels at nominal capacity.
- F. In addition, product data shall include accessories, sound data, motor electrical characteristics,
- G. Complete operations and maintenance manuals shall be provided. The manuals shall include a table of contents, specifications, drawings including exploded view of parts, and description of equipment, model number of each piece of equipment, installation instructions, operating instructions, maintenance instructions, parts list, test data, performance curves, and warranty. Include instructions for lubrication, filter replacement, motor and drive replacement and spare parts list.
- H. Contractor shall submit the complete, coordinated MER sheet metal and piping shop drawings to the air handling unit manufacturer prior to submission to the Commissioner. Based on the equipment location, including the ductwork, piping, etc. layout as indicated on the shop drawings, the AHU manufacturer shall review the air performance and acoustical performance of the AHUs and identify any issues that would adversely affect the air and/or acoustical performance or the maintenance of the AHU and then indicate all comments or approval directly on the shop drawing.
- I. Submit details of thermal performance of casing panels, including, but not limited to, thermal break construction details, and performance calculations.
- J. Dimensioned plan and elevation view drawings, including motor starter, VFD and control cabinets, required clearances, and location of all field connections.
- K. Wiring Diagrams: Detail wiring for power supply. Detail ladder-type wiring diagrams for interlock, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring.
- L. Start-up Reports: Indicate results of start-up and testing requirements. Submit copies of checklists.
- M. Operation and Maintenance Manuals: Complete operations and maintenance manuals shall be provided. The manuals shall include a table of contents, specifications, drawings including exploded view of parts, and description of equipment, model number of each piece of

equipment, installation instructions, operating instructions, maintenance instructions, parts list, test data, performance curves, and warranty. Include instructions for lubrication, filter replacement, motor and drive replacement and spare parts list.

#### 1.6 SEISMIC LOAD DESIGN

- A. This project is located within a seismic zone requiring special provisions for the support and restraint of equipment, components and piping.
- B. Fabricate unit sections, internal mounting frames and attachments and other section components with restraints to withstand seismic forces defined under another section of this work.
- C. Provide manufacturer's Seismic Qualifications Certification that the air handling units, accessories and components will withstand seismic forces as defined under another section of this work. Include the following:
  - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
  - 2. Dimensioned Outlined Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchoring provisions.
  - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

#### 1.7 REFERENCED STANDARDS

- A. All factory fabricated air-handling units and accessories shall be designed, manufactured and tested in accordance with the latest applicable industry standards including, but not limited to the following:
  - 1. AMCA 99 - Standard Handbook.
  - 2. AMCA 210 - Laboratory Methods of Testing Fans for Rating Purposes.
  - 3. AMCA 211 - Certified Ratings Program - Air Performance.
  - 4. AMCA 300 - Test Code for Sound Rating Air Moving Devices.
  - 5. AMCA 301 - Method of Publishing Sound Ratings for Air Moving Devices.
  - 6. AMCA 500 - Test Methods for Louver, Dampers, and Shutters.
  - 7. AMCA 611-95 - Methods of Testing Airflow Measurement Stations for Rating.
  - 8. ANSI/AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.
  - 9. ANSI/UL 900 - Test Performance of Air Filter Units.
  - 10. ARI 260 - Sound Rating of Ducted Air Moving and Conditioning Equipment.
  - 11. ARI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils.
  - 12. ARI 430 - Standard for Central-Station Air-Handling Units.
  - 13. ARI 435 - Standard for Application of Central-Station Air Handling Units.
  - 14. NFPA 90A - Installation of Air Conditioning and Ventilation Systems.
  - 15. SMACNA - HVAC Metal Duct Construction Standards.
  - 16. ANSI/ASHRAE 15.
  - 17. ASHRAE 52.11/52.2 - Method of Testing General Ventilation Air Cleaning Devices for Removal Efficiency by Particle Size
  - 18. ASHRAE 62 - Ventilation for Acceptable Indoor Air Quality
  - 19. ASHRAE 90.1 - Energy Standard for Buildings Except Low-Rise Residential Buildings
  - 20. ASME Section VIII Unified Pressure Vessel Code.
  - 21. UL Standard.

22. ASTM A-653: Specification for General Requirements for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dipped Process.
23. OSHA – Occupational Safety and Health Act.
24. ISO – International Organization for Standardization
25. ARI 360 - Standard for Commercial and Industrial Air-Conditioning Equipment.
26. ANSI/UL 900
27. NFPA 70 - National Electric Code (conductors, equipment and raceways)
28. NFPA 90A - Installation of Air Conditioning and Ventilation Systems
29. UL-181 - Mold Growth and Humidity Test
30. UL-1995 - Standard for Safety for Heating and Cooling Equipment
31. ISO/PWD 13261-3 - Sound Power Rating of air-conditioning and air-source heat pump equipment: Part 3, Ducted Equipment.
32. ISO 9614 - Determination of sound power levels of noise sources using sound intensity: Part 1, Measurement at discrete points; Part 2, Measurement by scanning, and Part 3, Precision method for measurement by scanning.
33. ANSI/ASTM C533.
34. ANSI/ASTM C612.
35. ASTM E84.
36. NFPA 255.
37. UL 723.
38. ADC Standards.

#### 1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. The air-handling units shall be UL or ETL listed as a complete unit and shall bear the UL or ETL label.
- C. Air handling units must comply with ASHRAE 90.1.
- D. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of custom, factory fabricated air handling units, of types (including screwless exterior panels) and capacities required, whose products have been in satisfactory use in similar service for not less than 10 years.
- E. Local service shall be available either directly from the factory or through the local certified factory representatives.
- F. Units shall be produced by a recognized manufacturer whose manufacturing process is certified by ISO (latest). Their quality control procedures must be thoroughly documented to ensure a consistently high quality product.
- G. The manufacturer shall certify that the equipment supplied by them meets or exceeds all specified capacities, airflow rates, heat transfer rates, filtration efficiencies, air mixing quality, etc. Any and all deviations must be fully disclosed as part of their bid proposal.
- H. Ratings and Certifications
  1. Air Handling Unit safety : ETL or UL 1995
  2. Air Handling Unit energy use: ASHRAE 90.1
  3. Fans: AMCA-210
  4. Air Coils: ARI 410
  5. Air Handling Unit certification program: ARI 430

6. Filter media: ANSI/UL 900 listed Class I or Class II
  7. Electrical Components: NFPA 70
  8. Control wiring: NEC codes & ETL requirements
  9. Motors: Federally mandated Energy Policy Act (EPACT).
  10. Airflow Monitoring Stations: AMCA 611-95
- I. The Commissioner shall maintain the right to tour the manufacturer's plant anytime during fabrication of the units specified herein. The vendor shall provide a fabrication schedule to the Commissioner informed of any changes in the schedule.
1. The vendor shall include the expenses for three (3) factory visits (4 people per visit) to view the fabrication process, in their bids. This is in addition to the witnessing of the performance tests.
- J. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- K. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- L. ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.
- M. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- N. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- O. Comply with NFPA 70.

#### 1.9 COORDINATION

- A. It shall be the responsibility of this manufacturer and the contractor to confirm all dimensions and structural details based on the latest architectural and structural drawings relating to column, beam or wall locations or any other obstructions that must be accommodated as part of the equipment layout and support or to provide proper equipment clearances.
- B. This contractor shall fully coordinate any such changes or deviations from the drawings and specifications with the Commissioner. These changes and deviations may include but are not limited to, structural steel, weight, size, electrical, and controls. Any resulting expense due to deviation or substitutions from this specification or drawings shall be the sole responsibility of the manufacturer providing the equipment. These expenses shall include but not be limited to any additional engineering, architectural, mechanical or structural expenses.
- C. Any resulting expenses due to failure to coordinate or comply with the contract document requirements shall be the sole responsibility of this contractor.
- D. Provide a unit with a total footprint size (length and width) that will not exceed the one shown on the Drawings, including the height of individual unit components.

#### 1.10 UNIT PERFORMANCE REQUIREMENTS

- A. Casing leakage for the entire AH unit shall be less than 1% of design airflow at 1.5 times total design pressure of the unit (minimum shall be 10" wg static pressure).

- B. The minimum external static pressure noted on the schedules is exclusive of all factory installed components including, but not limited to, all coils, all filters (dirty), unit casing, discharge inlet/discharge plenums, inlet/outlet fan cones, outlet regain elbow attenuator, humidifier, sound attenuator, dampers (inlet and discharge), inlet & discharge duct connections, etc.
- C. Unit shall be constructed with all major components supported directly from an electrically welded, structural steel base with unit casing deflection limited to 1/200 of the span at the maximum fan static pressure (minimum static shall be 10").
- D. Stiffeners of angle steel shall be supplied as required to maintain casing design loading deflection criteria at 30#/sq. inch with a 6" negative and 6" positive static pressure without sagging, pulsating or oil canning. Each unit section shall be equipped with a minimum of four (4) non-removable structural angle-lifting lugs. The entire base shall be coated with corrosion resistant paint.
- E. The entire unit casing (walls, floors, roof, access doors, etc.) shall be heavy-duty, high-pressure, double wall construction with insulated panels, having complete thermal break and continuous vapor barrier construction, suitable for the scheduled duty requirements.
- F. The average thermal conductance of the unit casing shall not exceed 0.06 BTU/SQ.FT. /HR/°F.
- G. The thickness of the double wall construction shall be determined based on meeting the thermal, structural, acoustical, etc. design criteria outlined herein. Manufacturer shall submit calculations, backup data and test results to substantiate selected wall thickness.
- H. The entire housing (casing) of the units (including roof, floor, walls, etc.) shall be provided with a continuous thermal break.

#### 1.11 FACTORY PERFORMANCE TESTING

- A. Every unit when completed and all their components installed shall be factory run-in tested according to the applicable portions of ARI. The components shall be listed and bear the label of the Air-Conditioning and Refrigeration Institute (ARI).
- B. The unit manufacturer shall either have testing facilities within their factory or shall utilize other testing facilities to run these tests. The testing facility shall conform to AMCA 210 airflow and AMCA 300 Sound Power Level standards to perform all the required testing specified herein.
- C. The unit testing shall be witnessed by a certified Engineer licensed in the State of New York with a copy of test reports submitted to the Commissioner for review and acceptance prior to shipping the units.
- D. The Commissioner shall be invited to witness the tests. All expenses associated with the attendance of the Commissioner shall be borne by this manufacturer.
- E. The manufacturer shall include the expenses for four (4) two (2) factory visits (4 people per visit) in their bids to witness the testing. All testing shall be scheduled so as to require no more than 4 visits to the lab.
- F. Prior to the assembly of the unit, pressure test all coils (as specified under another section of this work).
- G. Factory test shall include, but not limited to: dynamic trim balance of completed fan assembly; complete run check of all control and electrical components and safeties, including proper

control sequencing; leak check of completed water circuit, unit leakage test and sound performance testing.

- H. Every unit shall be dynamically balanced and tested at the factory at design RPM to less than 3 mils peak-to-peak. Provide full flow air testing at design CFM and static pressure. In addition, provide 50% flow test at 2/3 the design static pressure.
- I. Casing Leakage Testing:
  - 1. Unit manufacturer to test each completed (fully assembled) unit to verify casing leakage rates. Sections of the unit that will normally operate under positive pressure shall be tested under positive pressure. Sections of the air-handling unit that normally operate under negative pressure shall be tested under negative pressure.
  - 2. Casing leakage tests shall verify that casing leakage for the entire AH unit is less than 1% of design airflow at 1.5 times total design pressure of the unit (minimum shall be 10" wg static pressure).
  - 3. Determine leakage using the testing methods as described in SMACNA HVAC Air Duct Leakage Test Manual. Provide temporary sealing of openings as required for leakage testing.
- J. Deflection:
  - 1. Unit casing deflection shall be limited to 1/200 of the span at the maximum fan static pressure (minimum static shall be 10") to be measured at center of span.
- K. Sound Power Levels:
  - 1. Sound testing shall be conducted in the test lab. All test data shall be according to AMCA 300 and ANSI S12.31-1990 and S12.32-1990. Maximum sound power levels shall not exceed those listed on the equipment schedule and as delineated in specification Section 23 33 11 – HVAC Sound Attenuation.
  - 2. All OA, RA and SA openings shall be sound tested. Measurements shall be taken 5' from associated openings.
- L. Report:
  - 1. Adjust and report performance ratings for the proper altitude of operation.
  - 2. Report air-handling unit performance ratings in accordance with ARI-430 (static pressure, airflow, fan speed, and fan brake horsepower).
  - 3. Report static pressure profiles by component section.
  - 4. Report coil ratings in accordance with ARI -410 (capacities and pressure drops).
  - 5. Report and rate sound power levels in accordance with ARI-260 (ducted discharge, ducted inlet, free inlet sound).
  - 6. Airflow measuring device performance shall be certified and rated in accordance with AMCA-611. Report data in accordance with AMCA-611. Provide AMCA Certified Rating Seal for Airflow Measurement Performance.
  - 7. Report panel deflection at +/-10" w.g., stated in terms of 'L/X' where 'L' is the casing panel length and 'X' is a constant provided by the AHU manufacturer.
  - 8. Report casing leakage rate at +/-10" w.g., specified in terms of percentage of design airflow.
  - 9. Report weight loads and distributions by component section.
  - 10. Report product data for filter media, filter performance data, filter assembly, and filter frames.
  - 11. Report electrical requirements for power supply wiring including wiring diagrams for

- interlock and control wiring, clearly indicating factory-installed and field-installed wiring.
12. Report motor electrical characteristics.
  13. As part of the factory test, all factory installed piping shall be hydrostatically or air pressure leak tested. The test pressure shall be as specified hereinafter.
  14. The factory hydrostatic or air pressure test shall be continuously maintained for a minimum of two (2) hours after which each piping joint, connection, etc., shall be examined to verify there is no evidence of weeping or leakage.
  15. The air handling unit manufacturer shall maintain a pressure test log listing the air handling unit tested, date of test, pressure at start of test, pressure at the end of the test, duration time for the test and the name of the test supervisor for each test. If liquid was used for the pressure testing, it shall be completely drained and blown out of all coils and the internal piping system prior to shipment. The factory test log shall be submitted as part of the certified test report.

#### 1.12 DI-ELECTRIC FITTINGS

- A. Provide dielectric fittings to isolate joined dissimilar materials to prevent galvanic action and stop corrosion. Fittings shall be of the non-reducing type, which shall be suitable for the system fluid, pressure and temperature and shall not restrict the flow.

#### 1.13 DELIVERY, STORAGE, AND HANDLING

- A. Units shall be completely cleaned and vacuumed. All pipe and duct openings shall be plugged or covered in such a manner to prevent entrance of foreign matter. Units shall be delivered with factory installed shipping skids or lifting lugs. Items/components that are shipped loose shall be packed in separate protective packages.
- B. Comply with ASHRAE 62, Section 5 (mold and corrosion resistant casings, filters upstream of wetted surfaces, and drain pan design).
- C. Comply with ASHRAE 62, Section 7 (practices to be followed during construction and startup). Protect equipment from moisture by appropriate in-transit and on-site procedures.
- D. The Air Handling Unit sections shall be shrink-wrapped prior to shipment using 10 mil. plastic sheet. Prior to the shipment from the factory, the manufacturer shall inspect the insides of each unit and clean inside surfaces that have visual appearance of oil, dirt, dust, rust, chips or grease.
- E. Store Air Handling Units in a safe, clean and dry place, off the ground and away from construction traffic and protected from weather and physical damage.
- F. Protect, pack and secure controls devices, motor control devices and other electronic equipment. Do not store electronic equipment in wet or damp areas even when they are sealed and secured.
- G. Enclose and protect control panels, electronic devices, and variable frequency drives; and pack with desiccant bags. Replace desiccant bags every 60 days. For equipment stored in an environment with a relative humidity greater than 60%, change bags every 30 days. Do not store equipment in wet or damp areas even when they are sealed and secured.
- H. Seal openings to protect against damage during shipping, handling and storage.
- I. The entire unit shall be of sectionalized (segmented) construction, if required to allow for ingress to the construction site. The individual sections shall be shipped and rigged into place on one

common perimeter base.

- J. Units with shipping segments shall be either welded or be provided with "male" and "female" connection pieces for easy field assembly. Sealant, gaskets and associated hardware shall be provided for re-connection of unit modules. Units requiring field installation must be assembled under supervision by factory instructed and employed technicians from the air unit manufacturer.
- K. Handle package units and components carefully to prevent damage. Replace damaged package units or components with new.
- L. Rig package units to comply with manufacturer's rigging and installation instructions for unloading package units, and moving them to final location.
- M. Coordinate delivery of units in sufficient time to allow movement into building.
- N. Mount a permanent nameplate on the unit to display the manufacturer, serial number, model number, date of manufacture, horsepower, current and voltage.

#### 1.14 SCHEDULING AND SEQUENCING

- A. Coordinate installation mounting pad with floor structure.
- B. Coordinate opening locations for mechanical and electrical connections.

#### 1.15 COORDINATION

- A. Coordinate installation of equipment supports, including locations for mechanical and electrical connections.

#### 1.16 WARRANTY

- A. Special Warranty: A written warranty, executed by the manufacturer, agreeing to replace (parts and labor) components that fail in materials or workmanship, within the warranty-period, provided manufacturer's written instructions for installation, operation, and maintenance have been followed.
- B. Warranty Period: 3 years after date of Substantial Completion on all components.
- C. Extended warranty period of 5 years after date of Substantial Completion against corrosion of casing, walls, floor and roof panels.

#### 1.17 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Ventrol

2. Buffalo Air Handling
3. Ingenia
4. Huntair
5. Haakon
6. Mainstream
7. Or approved equal.

## 2.2 GENERAL DESCRIPTION

- A. Provide complete and fully operational, piped, wired and tested, custom designed, custom-built, factory fabricated, heavy-duty, hospital grade, indoor air-handling units to meet the performance requirements as shown on the equipment schedules, indicated on the drawings and specified herein.
- B. AH Units shall be complete (factory installed) with double-wall casings, frames, thermal breaks, access doors, fans, motors, variable frequency drives, plus accessories, including but not limited to, cooling coils, pre-heat coils, re-heat coils, heat-pipe coils, pre-filter and after-filters, mixing box, dampers (fan outlet, AHU isolation, etc.), access sections, discharge section, diffuser section, humidifier, sound attenuators, etc.
- C. Provide a unit with a total footprint size (length and width) that will not exceed the one shown on the Drawings, including the height of individual unit components.
- D. The units shall be of the draw-thru type.
- E. The units shall be provided with a fan array configuration, utilizing multiple, direct-drive, plenum fans.
- F. Coil Pressure Ratings: As described in section 23 05 00 – “COMMON REQUIREMENTS FOR HVAC WORK,” but not less than 250 psig SWP at 200 deg F.
- G. The entire unit casing (walls, floors, roof, access doors, etc.) shall be heavy-duty, high-pressure, double wall construction with insulated panels, having complete thermal break and continuous vapor barrier construction, suitable for the scheduled duty requirements.
- H. Walls shall be of the formed panel type. Panels shall be 30" wide maximum. All panels shall be removable without affecting the structural integrity of the unit. The panels are to be internally caulked to prevent water and air leakage.
- I. Casing shall comply with NFPA 90A requirements.
- J. The average thermal conductance of the unit casing shall not exceed 0.06 BTU/SQ.FT. /HR/°F.
- K. Entire casing system as well as each component (panels, walls, roof, floor, access doors, etc.) shall be guaranteed that the acoustical, thermal, cleanliness, structural, etc. performance, as specified herein, are not compromised.
- L. Provide hygienic unit design with interior suitable for washing down. The use of support members framed within the unit casing, which will allow for trapping of debris between the supports and casing will not be allowed. Unit insulation must be completely encapsulated.
- M. Units shall be provided with factory installed chilled water, glycol/water, humidifier and heating coil piping. For coil piping details, see details on drawings and specifications. The factory installed piping shall exit the unit as indicated on the drawings.

- N. The piping and fittings internal to the unit shall be as specified under another section of this work.
- O. The internal piping shall be sized to limit the overall pressure drop of the coil (including the internal piping) to that scheduled on the drawings. All internal cooling coil, heating and condensate piping shall be insulated as specified under another section of this work.
- P. Piping shall be terminated with a flanged connection and an air seal device.
- Q. Internal piping shall be internally braced to prevent any movement during shipping or field assembly.

## 2.3 UNIT BASE

- A. Units shall be constructed from structural steel channel iron around the full perimeter of the unit, with intermediate channel and angle iron supports. Units less than or equal to 20 ft long shall have a minimum 6 in channel, and units greater than 20 ft shall have a minimum 8 in channel.
- B. All internal components shall be mounted on structural steel frames, which shall be isolated from the unit floor. No internal component shall be supported on or by any external cabinet member other than the base frame.
- C. All drain connections on floor mounted air handling units shall terminate at the side of the unit.
- D. Provide clearance for proper external trapping of drain pans and steam condensate.

## 2.4 CABINET / HOUSING

- A. The unit shall be constructed out of double-walls and roof panels. The interior casing walls and roof throughout shall be made of solid 18 gauge Type 304 stainless steel with all joints and seams internally welded and shall be waterproofed.
- B. The thickness of the double wall construction shall be determined based on meeting the thermal, structural, acoustical, etc. design criteria outlined herein. Manufacturer shall submit calculations, backup data and test results to substantiate selected wall thickness.
- C. All panels shall be removable without affecting the structural integrity of the unit.
- D. The exterior casing walls and roof throughout shall be made of solid 16-gauge aluminum with all joints and seams welded. All panels shall be removable without affecting the structural integrity of the unit.
- E. The roof shall be designed to support a minimum live load of 100 #/SF, to allow safe access to the top of the unit.
- F. The interior of the unit shall be constructed and waterproofed to permit washdown by the facility.
- G. The casing panels shall be self supporting, and be capable of withstanding 150% of internal static pressure as specified without pane joints exceeding a deflection of 1/240th of the span dimension while under positive and negative pressure.
- H. Removable access panels shall be designed and constructed such that removal and replacement may be accomplished without disturbing adjacent panels. Airtight integrity must be maintained.

- I. All equipment within air handling unit shall be provided with a minimum 2" high base to raise equipment off unit floor for housekeeping. Equipment mounted directly on unit floor is unacceptable.
- J. All ferrous parts shall have a full 0.90 ounces per square foot of commercial grade galvanizing or have equivalent corrosion resistance when in an unpainted condition. Galvanizing shall be done before construction - all component parts of frame internal and external shall be galvanized. Painting and surface preparation shall be done prior to assembly. Interior and exterior surfaces shall have two (2) coats of an epoxy corrosion resistant primer, and an alkyd enamel finish.
- K. Removable panels and access doors shall be provided for easy access to interior of unit as necessary for maintenance and parts replacement. These shall be of the same thickness and construction as the wall panel units.

## 2.5 CASING FLOOR

- A. The casing floor shall be 12 gauge Type 304 stainless steel, continuously welded, no-slip (checkered) floor, with a 2" turned up lip around the perimeter, with a sub-floor of 18 gauge stainless steel.
- B. The floor shall be suitably braced to prevent oil canning. Insulation on top of the floor or screw heads on the floor surface is unacceptable. The floor shall be of the inverted pan design with standing seams and shall be designed to provide a 2" overhang around the full perimeter of the unit base frame.
- C. The unit base floor shall be designed to support a minimum live load of 100#/SF throughout the unit

## 2.6 FLOOR DRAINS

- A. Each section of the unit shall contain a minimum 1" drain to facilitate system wash down and condensate removal. Areas in the base where potential standing water cannot be removed through drains are not acceptable. Drains shall be piped underneath the topsheet of the unit exterior to allow drainage of the section. Drains shall be provided with removable caps of non-corrosive material.

## 2.7 UNIT ACCESS DOORS

- A. Access doors are constructed with a double wall construction and an extruded aluminum frame. The doorframe features a built-in no-through-metal high density resin barrier and a perimeter gasket. Door frames with no thermal break are not acceptable. The door gasket is seamed together at each corner to prevent leakage through the door. Door is attached to the unit with 3 axes adjustable stainless steel hinges. Doors shall open against higher pressure side. Where this is not feasible due to site constraints, an interlocking mechanism furnished on the fan section access door with a de-energizing switch complying with CAL-OSHA, ETL and the mechanical protection requirements of UL 1995 will be provided.
- B. All access doors shall be double wall and completely insulated between the interior and exterior panels and shall be of the same construction (and panel thickness) as panels described above. Doors shall swing freely 180° and shall under no circumstances open outward when exposed to positive pressure.
- C. All access panels shall be a minimum of 24" wide and 60" high. Access doors shall have

stainless steel frames; gaskets shall be of neoprene rubber with steel rib and shall open against unit static pressure.

- D. Access doors shall provide walk-in service to each section.
- E. All access doors shall be provided with stainless steel hinges and 2-way compression Ventlok #310 hand-locking latches with handle and keyed locking mechanism. A minimum of two (2) latches per door shall be provided. All access doors shall have solid sandwich construction.
- F. Vapor-proof marine lights with switch and convenience outlets on separate switches shall be mounted in each section (lights and outlets shall be factory pre-wired).
- G. Provide dual pane inspection windows in each access door. The windows shall be a minimum of 9" x 9" and made of two 1/4" thick tempered thermally insulated, glass panes separated by an air space. A desiccant pouch shall be placed in the air space to absorb any moisture.
- H. To minimize thermal conductivity and prevent condensation, the entire perimeter frame shall be uniformly insulated.
- I. Casing shall comply with NFPA 90A requirements.

## 2.8 INSULATION

- A. All panels, walls and roof shall have high density 3.0 lb/cu-ft full insulating fiberglass.
- B. To minimize thermal conductivity and prevent condensation, the entire casing and perimeter frame shall be uniformly insulated, with continuous vapor barrier
- C. The casing floor shall be insulated with 2" high-density 3.0 lb/cu-ft fiberglass insulation with continuous vapor barrier between the floor and sub-floor. Provide thermal break.
- D. The average thermal conductance of the unit casing shall not exceed 0.06 BTU/SQ.FT. /HR/°F.

## 2.9 THERMAL BREAK

- A. All panels (cabinet) of the units (including roof, floor, walls, etc.) shall be of continuous thermal break construction.

## 2.10 EXTERIOR FINISH

- A. All units' exterior must be painted using a system of primer and final coating. All parts to be painted shall be cleaned and degreased using a prep solution. A coat of industrial wash primer followed by two coats of exterior low gloss polyurethane must be applied. The completed coating must be able to sustain salt spray testing of 1000 hours, per ASTM 117B. Manufacturer shall confirm that paint system will meet the specification and provide test results

## 2.11 FANS – GENERAL

- A. The multiple fan array systems shall include multiple, direct drive, arrangement 4 plenum fans constructed per AMCA requirements for the duty specified Class III as required. Class I and Class II fans are not acceptable.
- B. Fans shall be certified by AMCA for performance. All fans shall be selected to deliver the specified airflow quantity at the specified operating Total Static Pressure and specified

fan/motor speed.

- C. Fans shall be direct-drive Plenum Fans, designed for rugged industrial duty and suitable for continuous operation. Fans shall be furnished with an open-mesh protective enclosure screen completely enclosing all sides and the back of the fan wheel. The enclosure shall be removable to provide access to the motor, sheaves and fan wheel. A protective screen shall be mounted at the inlet cone of the fan to prevent foreign objects from entering.
- D. Fan shall be selected and supplied by air handling unit manufacturer with capacities as indicated on the schedule and fully compatible with specific air handling unit systems.
- E. Fans shall be as specified under another section of this work.
- F. All fans shall meet the air flow performance specified and shall not exceed the brake horsepower or sound power levels specified herein and on the HVAC equipment schedule.
- G. Fan capacity shall be AMCA standard 210-74 Rated.
- H. The fan casing shall be manufactured from minimum 0.20 in thick mild steel with continuously welded rolled flanges.
- I. The motor shall be supported from mild steel guide vanes or plates continuously welded to the casing.
- J. All fans shall include inlet screens.
- K. All fans shall be provided with outlet dampers, as specified herein.

## 2.12 FAN ARRAY CONSTRUCTION

- A. Fan and motor "cubes" or "cells", shall be spaced in the air way tunnel cross section to provide a uniform air flow and velocity profile across the entire air way tunnel cross section and components contained therein.
- B. In order to assure uniform velocity profile in the AHU cross section, the fan cube dimensions must be variable, such that each fan rests in an identically sized cube or cell, and in a spacing that must be such that the submitted array dimensions fill a minimum of 90% of the cross sectional area of the AHU air way tunnel.
- C. Each fan/motor "cube" shall include an 11 gage; A60 galvanized steel motor support plate and structure. The fan air inlet cone and motor support structure shall be powdered coated for corrosion resistance. All motors are to be compatible for inverter duty, with sealed bearings and also include shaft grounding.
- D. The fan array shall produce a uniform airflow and velocity profile within the airway tunnel of the air handling unit not to exceed the specified cooling coil and filter bank face velocity when measured 12 inches from the intake side of the fan array intake plenum wall and at a distance of 48 inches from the discharge side of the fan array intake plenum wall.
- E. There shall be no blank off plates or "spacers" between adjacent fan columns or rows to position the fans across the air way tunnel.
- F. Each fan & motor assembly shall be removable through a 30" wide, free area, access door located on the discharge side of the fan wall array without removing the fan wheel from the motor.

- G. Each fan/motor cube shall be equipped with a metal grating fan outlet guard. The manufacturer of the array shall be responsible to determine if the addition of vibration isolators are required to meet the vibration requirements within this scope of work.
- H. Fans shall be rated in accordance with AMCA 210 for performance and AMCA 300 for sound.
- I. Fan motors shall be premium efficiency and compatible for inverter duty
- J. All motors with VFDs shall be compatible with the VFD and tested at the factory. Motors shall be capable of running continuously from 0 up to 120 Hz and deliver full rated horsepower at 60 Hz to 120 Hz operating frequencies
- K. All fan/motor access doors shall open against pressure.

## 2.13 FAN ARRAY PERFORMANCE

- A. Scheduled fan performance and static efficiencies shall be based upon actual installed conditions that include the system effects associated with the actual fan mounting arrangement, enclosures around each individual fan, and the effects of any back flow prevention devices, or other appurtenances necessary for proper fan system performance in the event of disabling of one or more fans in the array. All fans in the multiple fan arrays shall be AMCA certified for performance, and that certified performance shall be corrected for system effects introduced by the mounting arrangement, enclosures, back draft dampers, and other fan appurtenances not considered when AMCA certified performance for free inlet and discharge is determined. Submitted AHU performance that does not indicate allowance for system effects for the back flow prevention device(s) and the system effect for the fan and motor enclosure in which each fan is mounted, will be returned to the contractor disapproved and will need to be resubmitted with all of the requested information included for approval.
- B. The array shall produce a uniform air flow profile and velocity profile within the airway tunnel of the air handling unit to equal the specified cooling coil and/or filter bank face velocity by +/- 5% when measured at a point 36" from the intake side of the fan array intake plenum wall, and at a distance of 72" from the discharge side of the fan array intake plenum wall.
- C. Any increase in fan system power requirements or sound power levels that exceed those as specified will be corrected at no additional expense to the City of New York. Corrections for both fan power and sound power levels shall be determined and submitted to the Commissioner for approval prior to release for production of the submitted equipment.
- D. Submittals for units providing less than the scheduled quantity of fans and/or spacing of the fans for multiple fan arrays shall submit CFD modeling of the air flow profile for pre-bid approval that indicates uniform velocity and flow across all internal components without increasing the length of the AHU unit or changing the aspect ratio of the unit casing as designed.

## 2.14 ACOUSTICAL ATTENUATORS

- A. Sound Attenuators shall be of the size, type and quantity as shown on the drawings and shall be designed, fabricated and installed by the air handling unit manufacturer..
- B. Sound attenuators are specified under another section of this work.
- C. The outlet attenuator insertion losses result in a sound power level at the discharge of the outlet attenuator, shall not exceed those listed in the sound attenuator portion of the specification.

**2.15 COILS****A. General:**

1. All cooling and heating coils shall be furnished to meet or exceed the performance requirements set forth in the schedule.
2. Coils are specified under another section of this work.
3. Minimum working-pressure/temperature ratings: 150 psig, 325 deg F.
4. The maximum air velocity across any single point along the face of the coil shall not exceed 475 FPM.
5. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coils. The coil section shall be constructed in such a manner that the coils can be removed within the unit (coil pull space not required). All coils shall be factory installed on tracks for easy removal from the air-handling unit.
6. Units that require dis-assembly of the unit for coil removal are not acceptable.
7. Install coils such that unit casings enclose headers and return bends.
8. Furnish and install factory air seals approved by the Commissioner for the coil piping penetrations at the casing.
9. Coil frames shall not be used as structural members of the coil section. ASTM a 666, type 316 stainless steel, minimum 0.0625 inch thick for flanged mounting.
10. Coil casing to be constructed of 16-gage stainless steel. Intermediate casing supports shall be provided.
11. Provide di-electric fittings to isolated joined dissimilar materials to prevent any galvanized action and stop corrosion.
12. Integral face and bypass coils are not permissible.

**B. Cooling Coils (Chilled Water)**

1. Coils to have continuous water circuits from the inlet header to the outlet header. All joints in the water circuit are to be brazed. Coils are to be of the self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Each drain and vent outlet to be fitted with a hose-end valve, packless type, and a pipe cap.
2. Cooling Coils are specified under another section of this work.

**C. Glycol/Water Cooling/Heating Coils**

1. Glycol/Water Cooling/Heating Coils are specified under another section of this work.
2. Coils to have continuous water circuits from the inlet header to the outlet header. All joints in the water circuit are to be brazed. Coils are to be of the self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header. Each drain and vent outlet to be fitted with a hose-end valve, packless type, and a pipe cap.

**D. Heating Coils (Hot Water)**

1. General: round seamless copper tubes are to be rolled into headers to form a permanent pressure tight joint. Coils are to be self-venting type. A vent connection is to be provided in the supply header and a drain connection in the return header.
2. Coil finned tube shall be fabricated to permit expansion without transmitting stresses to casing.
3. Minimum working-pressure/temperature ratings: 250 psig, 325 deg F.
4. Provide even distribution of water to each tube.

5. Heating Coils are specified under another section of this work.
6. Pre-Heating coil characteristics:
  - a. Minimum fin spacing: not more than 10-1/2 fins per inch.
  - b. Rows: not more than 2 rows.
7. Reheat coil characteristics:
  - a. Minimum fin spacing: not more than 8 fins per inch.
  - b. Rows: not more than 2 rows.

**E. Heat Pipe Wrap-Around Coils**

1. Casing: Stainless Steel flanged casing.
2. Refrigerant: R 134A.
3. Tubes: 5/8-inch- diameter, copper.
4. Fins: Copper.
  - a. Fin Spacing: 10-1/2 fins per inch.
  - b. Fin and Tube Joint: Mechanical bond.
5. Control: Pivot center of bottom of heat-pipe coil on shaft and bearings to tilt coil. Include tilt controls with electronic controller, electric actuator and linkage, thermostats and sensors for automatic supply temperature regulation, summer/winter changeover, and frost protection.
6. Provide solenoid valve for reheat control.
7. Coils are specified under another section of this work.

**2.16 PRIMARY & AUXILIARY DRAIN PAN**

- A. All Cooling Coils, Moisture Eliminators, and Humidifiers and piping subject to sweating shall be provided with full-length drain pans.
- B. Drain pan shall comply with ASHRAE 62.1- 2004.
- C. Primary and Auxiliary drain pans are specified under section 23 71 00 – AIR COILS.
- D. The drain pans shall be 12 gauge 316 stainless steel and insulated with 2" - 3 #/cu-ft insulation. The pan shall be sloped a minimum of 1" in direction of airflow and 2" in the width of the unit to minimize standing water.
- E. Drain pans shall start 2" upstream of coil and extend beyond the coil by a distance, which is at least 1/3, the height of the bottom coil (minimum 18" past coil). Total drain pan height shall be 6".
- F. Intermediate drain pans for stacked coils shall have drains on both sides piped with 1" copper tubing to the main pan. Intermediate drain pan shall be constructed with same material as main pan described above.
- G. Extend drain pans under coil headers and all exposed piping subject to sweating.
- H. Insulation shall be UL listed and shall be vapor sealed between the inner and outer pan.

- I. Multiple coils in air handling equipment shall be provided with intermediate drain pans.
- J. Coil racks, galvanized 304 stainless steel, are provided to allow independent removal of coils.

**2.17 MOISTURE ELIMINATORS**

- A. No water carry-over from cooling coils into air stream accepted. Eliminators shall be provided where required by unit manufacturer. Pressure drop across eliminator shall be maximum 0.15" W.G. at 500 FPM, face velocity.

**2.18 FAN OUTLET BACKDRAFT DAMPERS**

- A. Each individual supply and return fan in the air-handling units' fan arrays shall be provided with an integral back flow prevention device (damper) that prohibits recirculation of air in the event a fan or multiple fans become disabled or is not operating.
- B. All fans shall be provided with a back flow prevention means that produces near zero static pressure drop and/or system effect when that fan is enabled.
- C. The system effects for the back flow prevention device(s) shall be included in the criteria for TSP determination for fan selection purposes, and shall be indicated as a separate line item SP loss in the submittals.
- D. Damper performance data that is per AMCA ducted inlet and discharge arrangements will not be accepted. Damper data must be for the specific purpose of preventing back flow in any disabled fan and that is close coupled to the entering face of the inlet of each fan.
- E. AHU Manufacturers that do not manufacture the fans being submitted must provide tested and certified performance data for fans as installed in the AHU unit including the backflow prevention damper system effects introduced by close coupled back flow prevention dampers at the fan inlet.
- F. Backdraft dampers are specified under another section of this work.
- G. Dampers shall be factory installed in the air-handling units.
- H. All dampers installed in air handling units or exposed to ambient conditions shall be constructed of aluminum with stainless steel linkages, fittings, etc.

**2.19 AIR HANDLING UNIT ISOLATION DAMPERS**

- A. Air handling units shall be provided with isolation dampers at the unit inlet and discharge. The purpose is to isolate the unit to prevent migration of smoke.
- B. AHU Isolation dampers shall be smoke dampers.
- C. Dampers shall be furnished to meet the performance requirements set forth in the schedule and as specified under another section of this work.
- D. All Dampers shall be of low leak design.
- E. All dampers installed in air handling units or exposed to ambient conditions shall be constructed of aluminum with stainless steel linkages, fittings, etc.

- F. The contractor shall furnish the damper actuators for the fan isolation dampers. The actuators shall be shipped to the factory and installed by the damper manufacturer. The actuators shall be mounted outside of the airstream.
- G. There shall be two (2) end switches for each damper to indicate at the BMS and FAS full open and full closed positions.
- H. Dampers shall close when unit is not running and shall open when the unit is commanded to run. Once the damper is fully open, as sensed by the second end switch, the unit shall start.
- I. The dampers shall be connected to the FAS.

## 2.20 AIR FILTERS

- A. Filters are specified under another section of this work.
- B. All filters shall be furnished to meet the performance requirements set forth in the schedule and as specified under another section of this work. All filters shall have performance certified in accordance with ASHRAE and shall be UL Rated.
- C. The filter frames shall be constructed of stainless steel and be built as an integral part of the unit. All filter segments shall be serviceable with access doors.
- D. General Requirements for Air Filters:
  - 1. Comply with NFPA 90A.
  - 2. Provide minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
  - 3. Provide filter holding frames arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lifted out from access plenum.
- E. An electronic, differential pressure gage shall be factory installed and flush mounted on drive side to measure the pressure drop across the filters. Coordinate with BMS.

## 2.21 HUMIDIFIERS

- A. Humidifiers shall be furnished to meet or exceed the performance requirements set forth in the schedule and as specified under another Section of this work.

## 2.22 WRAP AROUND HEAT PIPE SYSTEM

- A. Furnish a wrap-around heat pipe heat recovery system, as shown in the schedule and as specified under this scope of work.
- B. The system is to be factory installed within the air-handling units to provide enhanced dehumidification.
- C. The Wrap Around Heat Pipe System is specified under another section of this work.

## 2.23 ULTRA-VIOLET GERMICIDAL IRRADIATION SYSTEMS

- A. UV Germicidal Irradiation Systems are specified under another section of this work.

- B. Provide factory installed Ultra Violet (UV) Germicidal Irradiation lamps. UV lamps shall be located:
  - 1. Downstream of cooling coils.
  - 2. Above condensate drain pans.
  - 3. Up-stream of final filtration sections.
- C. Lamps and ballasts shall be UL listed for application in air handling systems.
- D. Lighting systems shall be moisture resistant with electronic ballasts and shall be wired using moisture resistant conduit.
- E. UV lamps shall be capable of being switched on and off at the respective AHU section access door.
- F. Lamps shall be interlocked with access door position limit switches such that they are de-energize when the doors open.
- G. Units with view port windows from which the lamps can be seen shall be labeled to warn of possible eye damage.
- H. All penetrations through AHU walls shall be thoroughly sealed to ensure no leakage. All UV susceptible materials in the AHU shall be shielded from line of sight UV. Installer shall remove all foreign matter such as dirt and metal shavings upon completion of installation.

#### 2.24 AIRFLOW MEASURING STATIONS

- A. Each fan shall be supplied with a complete airflow measuring system. Airflow measuring stations required to measure the supply & return air shall be factory installed by the air handling unit manufacturer. Airflow measuring stations shall be of heavy gauge metal construction, and shall be furnished with an air straightening section with an open face area of not less than 97%.
- B. The flow measuring station shall not obstruct the inlet of the fan and shall have no effect on fan performance (flow or static) or sound power levels
- C. Provide all materials and equipment necessary for a complete and properly operating airflow measuring station in each unit.
- D. Each airflow measuring station shall measure airflow by means of a network of static and total pressure sensors factory positioned and connected in parallel to produce an averaged velocity pressure. The measured velocity pressure converted to airflow (CFM) shall have an accuracy of 2% of the full scale throughout the velocity range from 700 to 4,000 FPM when measured under ideal laboratory conditions. The location of stations shall meet manufacturer's guidelines.
- E. The maximum resistance to airflow shall not exceed 0.6 times the velocity head. The unit shall be suitable to withstand temperatures up to 250°F.
- F. All interconnecting tubing between the air measuring and any remote metering or control shall be furnished and installed by the supplier of the station. A minimum of one static and one total pressure sensor shall be used for every 16 sq. Inches of AHU duct cross sectional area for AHU ducts up to four sq.ft. In cross section. For larger ducts, a minimum of one static and one total pressure sensor shall be used for every 36 sq. Inches of duct cross sectional area.
- G. Interconnecting sensor manifolds shall equalize and relate each type of sensor measurement into one total pressure and one static pressure metering port. The permanent system pressure

loss created by the unit shall not exceed .15 of a velocity head. Each airflow measuring station shall consist of 16-gauge sheet metal casing and an air straightening section with an open face area not less than 97%.

- H. Provide air monitor with an accuracy of + 2%, a turndown of 6 to 1, and no pressure loss across the station.
- I. Final locations to be coordinated with fan & unit manufacturer to ensure installed actual accuracy meets specifications.
- J. Airflow sensing tubes may be mounted in the fan inlet as approved by the manufacturer for AHU applications.

## 2.25 CONTROL PANELS

- A. Each fan motor shall be individually wired to a motor control panel (NEMA 3R) containing motor overloads and VFDs. VFD configuration shall be as follows:
  - 1. Each VFD (with bypass) shall control three (3) fans.
- B. AHU manufacturer will factory mount all the controls including sensors & actuators that will be supplied by the contractor. These controls shall be wired and terminated to a termination strip in the control panel mounted on the outer casing of the AHU or on the MER wall.

## 2.26 ELECTRICAL CHARACTERISTICS AND COMPONENTS

- A. Units shall operate on 460/3 voltage/phase, 60 Hz. as scheduled on the documents. Unit shall be guaranteed to operate continuously at that voltage plus or minus 10% without injurious overheating.
- B. Units shall require only one electrical connection, and shall include downstream overcurrent protection and disconnect means for each VFD drive and motor.
- C. The air handling unit manufacturer shall pre-wire the casing sections as required and provide code approved wiring termination enclosures to permit easy disassembly and field reassembly of the various air handling unit casing sections, fan motors, internal lights and switches, 120 volt GFI power receptacles, etc. for a complete factory pre-wired air handling unit assembly. Unit wiring shall terminal in a NEMA 1 3R enclosure terminal panel with a tagged terminal strips.
- D. Lights & GFI Receptacle
  - 1. The air handling unit manufacturer shall factory pre-wire and surface mount industrial quality service lights (marine type, 100 W, vapor tight, fully enclosed, gasketed, and rugged service light fixture) with switched junction box, in each unit segment and located inside unit adjacent to doors. The exposed metal parts shall of weatherproof, corrosion resistant surface hardened die cast aluminum.
  - 2. Lights shall be factory wired to individual switches with a 120-volt ground fault circuit interrupting utility receptacle. A separate 120-volt power connection shall be required at the GFI receptacle to provide power for the lights and receptacles. Lights are to be provided at each section accessed with door or access panel.
  - 3. Each unit section shall be provided with a minimum of two (2) service lights.
- E. Controls: Specified under another section of this work.

F. Test:

1. Energize and run test for not less than ½ hr all electrical components to prove satisfactory operation, and that all circuits are free from short circuits and unspecified ground. Each Variable speed drive unit shall be completely functionally tested under actual motor load. Test that the insulation resistance to ground of all non-grounded circuits is not less than one mega ohms at 1000 volts DC. Arrange to have units factory inspected and perform other testing as required to obtain ETL Label.

2.27 ELECTRIC MOTORS

- A. Electric motors are specified under another section of this work.
- B. All motors shall be premium efficiency.
- C. All motors shall be standard foot mounted type, TEAO motors selected at the specified operating voltage, RPM, and efficiency.
- D. Motors shall meet the requirements of NEMA MG-1 Part 31.
- E. Motors shall be as manufactured by Toshiba or Baldor for use in multiple fan arrays that operate at varying synchronous speeds as driven by an approved VFD with all features required for use in multiple fan arrays.
- F. Each motor shall be provided with an appropriately sized NEMA 3R unfused disconnect switch.
- G. Motors shall include permanently sealed bearings and shaft grounding to protect the motor bearings from electrical discharge machining due to stray shaft currents.
- H. Scheduled brake horsepower shall not be exceeded. The fan motor shall be factory pre-wired.
- I. The motor shall be mounted on the same isolation base as the fan. The motor shall be on a slide base to permit adjustment of belt tension. The fan and motor drive vibration isolation base shall be mounted on seismic type spring isolators selected for 2" deflection and sized for 95% isolation efficiency.
- J. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in another section of this work.
  1. Enclosure Type: Totally enclosed, fan cooled.
  2. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.
  3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
  4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
  5. Mount unit-mounted disconnect switches on exterior of unit.
- K. Fan unloading for variable-air-volume control shall be accomplished through a variable frequency drive, as specified under another Section.
- L. After final assembly, the fan and motor assembly shall be factory balanced for 10 - 100% of design speed of the air-handling unit. Units that are balanced for a specific point of operation shall be field balanced for the entire RPM range.

**2.28 VARIABLE FREQUENCY CONTROLLERS (DRIVES)**

- A. Variable frequency controllers (drives) are specified under another section of this work.
- B. The VFD for the air-handling units shall be factory installed.
- C. For AHUs with multiple fans (fan array), one VFD will control a maximum of three (3) fans, each fan shall be provided with an independent VFD.
- D. After the air handling unit is installed, the unit VFC VFDs shall be field commissioned by a factory trained and employed service technician.
- E. See section VARIABLE FREQUENCY CONTROLLERS for additional details.

**2.29 MONORAIL SYSTEM**

- A. As part of each unit, provide a factory installed monorail system within each coil and fan section for the rigging and removal of coils, fans and motors.
- B. Monorail system shall be sized by unit manufacturer to handle maximum weight of piece of equipment (coil, motor, etc.) with safety factor to meet 2014 New York City Construction Codes.

**2.30 PERFORMANCE**

- A. Performance: Noted on schedules, to be rated as a completely assembled unit.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 INSTALLATION OF AIR HANDLING UNITS**

- A. Install air handling units where indicated on the contract drawings, in accordance with equipment manufacturer's published installation instructions.
- B. Access: Provide access space around the air-handling units for service as required and as indicated on the drawings but not less than that recommended by the manufacturer.
- C. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of New York Department of Buildings.
- D. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings have been lubricated, and fans have been test run under observation of the Commissioner.
- E. Arrange fans and surrounding components in such a way that poor fan performance does not result.
- F. It is the manufacturer's responsibility to verify opening dimensions and installation methods to ensure unit sections and components can be physically installed into the designated space.
  - 1. The manufacturer has the responsibility to transport sections to the Project Site and to supervise reassembling the sections together for all air handlers. Unload and hoist the

- sections onto the designated floor space.
  2. Reassemble the sections together for all air handlers in their footprint under the direction of the manufacturer.
  3. Additional unit section or component splits required for installation during construction shall be the responsibility of the manufacturer without additional expense to the City of New York.
  4. Units must be bolted together for reassembly. Drive screw construction at unit splits is unacceptable.
  5. All internal coil piping shall be extended to casing walls.
  6. The unit manufacturer shall provide a written acceptance letter to the Commissioner stating the unit was assembled and complies with manufacturer's assembly requirements.
- G. Install in conformance with ARI 435.
- H. Assemble high-pressure units by bolting segments together. Isolate fan segment with flexible duct connections.
- I. Provide for connection to electrical service.
- J. Controls devices shall be provided by the contractor and installed by the manufacturer in the factory.
- K. Field Adjustments: Adjust fan vibration isolators in accordance with manufacturer's instructions.
- L. Duct Connections: Provide ductwork, accessories, flex connection as indicated on the drawing.
- M. Install units on vibration isolation.
- N. Provide connections to chilled water piping, hot water piping, glycol/water piping and drain piping.
- O. All internal wiring shall be factory installed in accordance with the NEC Code, local code regulations and requirements using UL listed components.
- P. Supports: Provide supports and miscellaneous steel members for equipment and be responsible for coordinating this work and setting equipment in place.
1. Lubrication
    - a. Lubricate all equipment installed up to time of acceptance by Commissioner.
    - b. Lubricants shall be of grade and quality specified by equipment whose literature shall contain said data or Written specifications provided with equipment delivered.
- Q. Manufacturer's Start-Up Assistance
1. Provide the services of qualified trained field engineers to verify that equipment installation is proper and to supervise initial startup of equipment. The unit manufacturer shall provide a minimum of fifteen (15) days start-up supervision by a factory-trained technician.
- ### 3.3 FIELD PERFORMANCE TESTING
- A. All factory installed piping shall be air pressure leak tested for a minimum of 2 hours, prior to
- 116<sup>th</sup> Precinct Station House  
QUEENS, NY
- FACTORY FABRICATED CUSTOM AIR HANDLING UNITS  
23 73 15- 25

connection to the system piping.

- B. The contractor is responsible to coordinate that the unit is operating correctly and that all connections to the units are complete.
- C. Once each unit is installed, the following field tests shall be run by the contractor under the direct supervision of a manufacturer's representative and the Commissioner.
  - 1. A casing leakage test shall be performed as outlined under paragraph 1.06 of this section.
  - 2. A performance test on the unit shall be run, verifying airflows, water pressure losses, air pressure losses, and coil performance.
  - 3. All adjustable frequency drive driven components including motor, and fans must have vibration levels checked at all speeds between 2 and 100 percent of the driven unit's design rpm. Vibration must be checked at fan shaft bearings in radial (vertical and horizontal) and axial directions. If excessive vibration is found at any frequency, special balancing and structural changes must be provided to minimize harmonic vibrations.

### 3.4 INSTALLATION OF AIR HANDLING UNITS

- A. General: Install air handling units where indicated on the contract drawings, in accordance with equipment manufacturer's published installation instructions.
- B. Access: Provide access space around the air-handling units for service as indicated on the drawings but not less than that recommended by the manufacturer.
- C. Field Adjustments: Adjust fan vibration isolators in accordance with manufacturer's instructions.
- D. Duct Connections: Provide ductwork, accessories, flex connection as indicated on the drawing.

### 3.5 TESTING & COMMISSIONING

- A. Unit manufacturer shall provide the services of a trained technician to supervise the installation of the unit and to perform the start up of the unit. After the unit is installed, perform inspection, start-up and checkout of the equipment. Do not start up equipment until the following operations are complete:
  - 1. Confirm shipping bracket and bracing is removed.
  - 2. Confirm unit components are secured on mountings and supporting devices and verify that connections for electrical and piping are complete. Verify proper thermal overload protection is installed in motors, starters and disconnects.
  - 3. Inspect and confirm satisfactory completion of all field joints.
  - 4. Verify proper motor rotation direction and verify fan wheel free rotation and smooth bearing operation.
  - 5. Lubricate bearings, pulleys, belts and other moving parts with factory recommended lubricants.
- B. Verify manual and automatic volume controls in connected ductwork systems are in the full open positions.
- C. See section 23 08 00 "Commissioning of HVAC" for commissioning requirements.

### 3.6 AERODYNAMIC PERFORMANCE TEST

- A. The flow through the unit shall be measured across the discharge and inlet. A calibrated hot wire anemometer shall be used for velocity measurement across the discharge and inlet sections. The inlet of the unit shall be covered with steel net and filter to simulate the system load. The static pressure rise across the fan shall be measured by total and static pressure probe traverse at inlet and at discharge of fan. The alternative procedure for measuring flow velocity across the coils or filters can be a face traverse as per ASHRAE TP 3359 using a rotating vane anemometer measuring velocity reading on downstream side of a coil or filter. Airflow shall be within 5% of design.

**END OF SECTION 23 73 15**

THIS PAGE INTENTIONALLY LEFT BLANK

## **SECTION 23 73 39**

### **PACKAGED, INDOOR HEATING AND VENTILATING UNITS**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 13 – MOTORS FOR HVAC EQUIPMENT.
- D. Section 23 05 14 – VARIABLE FREQUENCY MOTOR DRIVES.
- E. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- F. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- G. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- H. SECTION 23 33 10 - DAMPERS
- I. Section 23 33 11 – HVAC SOUND ATTENUATION.
- J. Section 23 41 00 – AIR FILTERS.
- K. Section 23 71 00 – AIR COILS.
- L. This section is a part of each Division 23 00 00 section.

##### **1.2 SUMMARY**

- A. Furnish and install new factory-built, packaged, indoor, Heating & Ventilating ((H & V) units as herein specified and as indicated on the drawings. Units shall be completely factory assembled and tested.
- B. All units shall be capable of meeting or exceeding the scheduled capacities for cooling and heating and air delivery.
- C. All unit dimensions for each model shall be considered maximum.
- D. Each unit shall be specifically designed for outdoor applications and include weatherproof casing and cabinets. Units shall be of the modular design with factory installed access sections to provide maximum access flexibility to all components.

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- E. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- F. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- G. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures"

#### 1.6 SUBMITTALS

- A. **Product Data:** Include rated capacities, furnished specialties, and accessories.
- B. **Shop Drawings:** Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection. Prepare the following by or under the supervision of a qualified professional engineer:
  - 1. **Design Calculations:** Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
  - 2. **Mounting Details:** For securing and flashing roof curb to roof structure. Indicate coordinating requirements with roof membrane system.
  - 3. **Vibration Isolation Base Details:** Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.
  - 4. **Wiring Diagrams:** Power, signal, and control wiring.
- C. **Coordination Drawings:** Roof-mounted units and roof-curb mounting details drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Size and location of rooftop unit mounting rails and anchor points and methods for anchoring units to curb.
  2. Required roof penetrations for ducts, pipes, and electrical raceways, including size and location of each penetration.
- D. Startup service reports.
- E. Operation and Maintenance Data: For direct-fired H&V units to include in emergency, operation, and maintenance manuals.
- 1.7 QUALITY ASSURANCE
- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to New York Department of Buildings, and marked for intended use.
- C. Comply with NFPA 70.
- D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- E. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- 1.8 COORDINATION
- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
- B. Coordinate size, location, installation, and structural capacity of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."
- C. Coordinate size, location and installation of unit manufacturer's roof curbs and equipment supports with roof Installer.
1. Coordinate installation of restrained vibration isolation roof-curb rails, which are specified in Section 23 05 48 "Vibration Isolation, Seismic, Flood, and Wind Load Restraints for HVAC Components".

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AAON
  2. Trane
  3. Carrier Corporation.
  4. Mammoth
  5. Or approved equal.

## 2.2 PACKAGED UNITS

- A. Furnish a complete, factory assembled and tested, packaged, roof mounted air-cooled, H & V unit of the size and capacities listed on the Contract Documents.
- B. The unit shall be constructed as per the configuration and dimensions indicated on the drawings. The unit dimensions shall not vary more than 6" in any direction. Configuration of the discharge and inlet conditions as well as the interior walls, components shall be as indicated on the drawings.
- C. Provide adequate service space and code mandated clearances for electrical equipment in each section.
- D. The minimum external static pressure noted on the schedules is exclusive of components furnished by the unit manufacturer as part of the unit, including, but not limited to, heating coil, boiler, preheat coils, air filters (dirty), unit casing, discharge plenum, intake plenum, diffusion section, humidifier, sound attenuator, dampers (inlet and discharge), etc.
- E. The internal piping shall be sized to limit the overall pressure drop of the coils (including the internal piping) to that scheduled on the drawings. All internal coils and piping shall be insulated.
- F. Internal piping shall be braced to prevent any movement during shipping or field assembly.

## 2.3 UNIT CONSTRUCTION

- A. Unit shall be specifically designed and constructed for this application. Each unit shall be completely factory assembled, factory run-tested, piped internally, wired including vapor proof lighting in each section and maintenance power receptacles in each section.
- B. The unit casing shall utilize 2-inch double wall construction. The interior wall and ceiling shall be 18-gauge galvanized steel and shall form the air seal between the conditioned air and ambient air.
- C. The unit cabinet shall be designed to operate at total static pressure of 3 in w.g.
- D. Factory-assembled, prewired, self-contained unit consisting of cabinet, supply fan, controls, filters and coils.

## 2.4 CABINET

- A. Cabinet: Double-wall galvanized-steel panels, formed to ensure rigidity and supported by galvanized-steel channels or structural channel supports with lifting lugs. Cabinet shall be fully weatherized for outside installation.
- B. Access Panels: Piano hinged with cam-lock fasteners for furnace and fan motor assemblies on both sides of unit.
- C. Internal Insulation: Fibrous-glass duct lining, comply with ASTM C 1071, Type II, applied on complete unit.
  - 1. Thickness: 2 inches
  - 2. Insulation Adhesive: Comply with ASTM C 916, Type I.

3. Mechanical Fasteners: Galvanized steel suitable for adhesive attachment, mechanical attachment, or welding attachment to casing without damaging liner when applied as recommended by manufacturer and without causing air leakage.

D. Finish: Heat-resistant, baked enamel.

E. Roof Curb: Full-perimeter curb of sheet metal, minimum 16 inches (400 mm) high, with wood nailer, neoprene sealing strip, and welded Z-bar flashing.

F. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1, latest version.

## 2.5 SUPPLY-AIR FAN

A. Fan Type: Centrifugal, rated according to AMCA 210; statically and dynamically balanced, galvanized steel; mounted on solid-steel shaft with heavy-duty, pillow-block bearings rated for L50 or 200,000 hours with external grease fittings.

B. Motor: Totally enclosed, single speed motor.

C. Drive: V-belt drive with matching fan pulley and adjustable motor sheaves and belt assembly.

D. Mounting: Fan wheel, motor, and drives shall be mounted in fan casing with spring isolators.

## 2.6 OUTDOOR-AIR INTAKE

A. Outdoor-Air Hood: Galvanized steel with rain baffles, bird screen complying with ASHRAE 62.1-2004, and finish to match cabinet; and sized to supply maximum 100 percent outdoor air.

## 2.7 AIR FILTERS

A. Comply with NFPA 90A.

B. Cleanable Filters: 2-inch-0 (50-mm-) thick, cleanable metal mesh.

C. Disposable Panel Filters: 2-inch- (50-mm-) thick, factory-fabricated, flat-panel-type, disposable air filters with holding frames, with a minimum efficiency report value of 6 according to ASHRAE 52.2 and 90 percent average arrestance according to ASHRAE 52.1.

1. Media: Interlaced glass fibers.

2. Frame: Galvanized steel.

## 2.8 DAMPERS

A. Outdoor-Air and Return-Air Damper: Galvanized-steel, opposed-blade dampers with vinyl blade seals and stainless-steel jamb seals, having a maximum leakage of 10 cfm/sq. ft. (51 L/s per sq. m) of damper area, at differential pressure of 2-inch wg (448 Pa).

B. Fan-Discharge Dampers: Galvanized-steel, opposed-blade damper.

C. Balancing/Bypass Dampers: Galvanized-steel, opposed-blade damper.

D. Damper Operator: Direct coupled, electronic with spring return or fully modulating as required by the control sequence.

## 2.9 CONTROLS

- A. Factory-wired, fuse-protected control transformer, connection for power supply and field-wired unit to remote control panel.
- B. Control Panel: Surface-mounted and/or Recessed, with trim ring, remote panel, with engraved plastic cover, and the following lights and switches:
  - 1. On-off-auto switch.
  - 2. Automatic changeover.
  - 3. Supply-fan operation indicating light.
  - 4. Heating operation indicating light.
  - 5. Damper position potentiometer.
  - 6. Thermostat.
  - 7. Cooling operation indicating light.
  - 8. Dirty-filter indicating light operated by unit-mounted differential pressure switch.
  - 9. Safety-lockout indicating light.
- C. Refer to Section 23 09 00 "HVAC Instrumentation and Controls" for control equipment and sequence of operation.
- D. Control Devices:
  - 1. Remote Thermostat: Adjustable room thermostat with temperature readout.
  - 2. Remote Setback Thermostat: Adjustable room thermostat without temperature readout.
  - 3. Static-Pressure Transmitter: Nondirectional sensor with suitable range for expected input, and temperature compensated.
  - 4. Fire-Protection Thermostats: Fixed or adjustable settings to operate at not less than 75 deg F (24 deg C) above normal maximum operating temperature.
  - 5. Timers: Seven-day, programming-switch timer with synchronous-timing motor and seven-day dial; continuously charged, nickel-cadmium-battery-driven, eight-hour, power-failure carryover; multiple-switch trippers; minimum of two and maximum of eight signals per day with two normally open and two normally closed output contacts.
  - 6. Timers: Solid-state, programmable time control with 4 separate programs; 24-hour battery carryover; individual on-off-auto switches for each program; 365-day calendar with 20 programmable holidays; choice of fail-safe operation for each program; and system fault alarm.
  - 7. Ionization-Type Smoke Detectors: 24-V dc, nominal; self-restoring; plug-in arrangement; integral visual-indicating light; sensitivity that can be tested and adjusted in place after installation; integral addressable module; remote controllability; responsive to both visible and invisible products of combustion; self-compensating for changes in environmental conditions.
  - 8. Fan-Speed Controllers: Solid-state model providing field-adjustable proportional control of motor speed. Equip with filtered circuit to eliminate radio interference.
- E. Fan Control: Interlock fan to start with exhaust fans. See Section 23 09 05 "Sequence of Operations for HVAC Controls" and Section 23 09 00 "HVAC Instrumentation and Controls" for exhaust fan controls.
- F. Fan Control: Timer starts and stops H&V unit and exhaust fan(s).
  - 1. Smoke detectors, located in supply and return air, shall stop fans when the presence of smoke is detected.
  - 2. Controls motor controller using static-pressure transmitter.

- G. Outdoor-Air Damper Control, 100 Percent Outdoor-Air Units: Outdoor-air damper shall open when supply fan starts, and close when fan stops.
- H. Outdoor-Air and Fan-Discharge Damper Control, 100 Percent Outdoor-Air Units:
  - 1. Outdoor-air damper shall open when supply fan starts, and close when fan stops.
  - 2. Fan-discharge dampers shall operate to vary the amount of outdoor air to match exhaust-fan operation.
- I. DDC: Stand-alone control module for link between unit controls and DDC system. Control module shall be compatible with temperature-control system specified in Section 23 09 00 "HVAC Instrumentation and Controls".
  - 1. Provide start and stop interface relay, and relay to notify DDC system alarm condition.
  - 2. Provide hardware interface or additional sensors as follows:
    - a. Room temperature.
    - b. Discharge-air temperature.

## 2.10 MOTORS

- A. Comply with requirements in Section 23 05 13 "Motors for HVAC Equipment".

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting installation of direct-fired H&V units.
- B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.
- C. Examine roof curbs and equipment supports for suitable conditions where rooftop replacement-air units will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Install gas-fired units according to NFPA 54, "National Fuel Gas Code."
- B. Install floor-mounted units on restrained spring isolators with minimum 1-inch (25-mm) static deflection; refer to Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."
- C. Install controls and equipment shipped by manufacturer for field installation with direct-fired H&V units.

### 3.4 CONNECTIONS

- A. Piping Connections: Drawings indicate general arrangement of piping, fittings, and specialties. Install piping adjacent to machine to allow service and maintenance.
  - 1. Drain: Comply with requirements in Section 22 13 16 "Sanitary Waste and Vent Piping" for traps and accessories on piping connections to evaporative cooling units.
- B. Duct Connections: Duct installation requirements are specified in Section 23 31 13 "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect supply and return ducts to direct-fired H&V units with flexible duct connectors.
- C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
- D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

### 3.5 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
  - 1. Inspect casing insulation for integrity, moisture content, and adhesion.
  - 2. Verify that clearances have been provided for servicing.
  - 3. Verify that controls are connected and operable.
  - 4. Verify that filters are installed.
  - 5. Inspect and adjust vibration isolators and seismic restraints.
  - 6. Verify bearing lubrication.
  - 7. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
  - 8. Adjust fan belts to proper alignment and tension.
  - 9. Start unit according to manufacturer's written instructions.
  - 10. Complete startup sheets and attach copy with Contractor's startup report.
  - 11. Inspect and record performance of interlocks and protective devices; verify sequences.
  - 12. Operate unit for run-in period recommended by manufacturer.
  - 13. Calibrate thermostats.
  - 14. Adjust and inspect high-temperature limits.
  - 15. Inspect dampers, if any, for proper stroke and interlock with return-air dampers.
  - 16. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.
  - 17. Measure and record airflow. Plot fan volumes on fan curve.
  - 18. Verify operation of remote panel, including pilot-operation and failure modes. Inspect the following:
    - a. High-limit heat.
    - b. Alarms.
  - 19. After startup and performance testing, change filters, verify bearing lubrication, and adjust belt tension.
- C. Remove and replace malfunctioning components that do not pass tests and inspections and retest as specified above.

- D. Prepare written report of the results of startup services.

**3.6 ADJUSTING**

- A. Adjust initial temperature set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

**3.7 DEMONSTRATION**

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and maintain devices. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 23 73 39**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 23 77 33****FACTORY FABRICATED DOUBLE WALL ABOVE GROUND FUEL OIL STORAGE TANK****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC, FLOOD AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- D. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- E. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- F. Section 23 11 13 – FACILITY FUEL OIL PIPING.

**1.2 SUMMARY**

- A. Furnish and install all factory fabricated cylindrical double-wall steel fuel oil storage tank as specified herein and as indicated on the contract documents.
- B. All systems, equipment and materials shall be approved for use by the New York City Department of Buildings and New York City Fire Department.
- C. Tank shall be single wall steel fabricated in accordance with New York City Building code and New York State Department of Environmental Conservation Standards 6NYCRR Part 613 and 6NYCRR Part 614 for Petroleum Bulk storage latest edition.
- D. Tank shall be UL 142 approved, built to withstand 150 PSI test as per 2014 NYC Mechanical Code, Chapter 13 - Fuel Oil Piping and Storage.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"

- C. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – “Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings”, where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.5 REFERENCED STANDARDS

- A. Factory fabricated tank shall be designed, manufactured and tested in accordance with the latest applicable industry standards including, but not limited to the following:
  1. UL 142 A
  2. UL 2244
  3. UL 224t
  4. 6NYCRR Part 614
  5. NFPA-30/31A
  6. AWS D1-1
  7. AWTM A 36-81a
  8. ASTM A635-81
  9. ASTM A-36-81a

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

#### 1.7 SUBMITTALS

- A. Include in the submittal the following for each of the supplied components:
  1. Manufacturer’s name and model number
  2. Drawings with complete dimensional data
  3. Materials for construction
  4. Certified factory pressure test results.
  5. Welder Certificates signed by manufacturer certifying that welders comply with requirements specified under another section of this work under “Welding Procedures”
  6. Certification for weld radiographs
  7. Certification, performance guarantee and warranty information.
- B. Provide certified technical product data showing dimensions, weights, are capacities, required clearances, field connection details and methods of support.

**1.8 SEISMIC LOAD DESIGN**

- A. This project is located within a seismic zone requiring special provisions for the support and restraint of equipment, components and piping.
- B. Factory-installed support attachments for storage tank, including but not limited to, internal mounting frames and attachments shall withstand seismic forces defined under another section of this work.
- C. Design seismic restraints for the fuel oil storage tank, tank supports, mounting base, access platforms, structure, vibration isolators, pipe connections and connecting piping supports, including preparing comprehensive engineering analysis (signed and sealed) by a qualified professional engineer, commissioned by the tank manufacturer, using performance requirements and design criteria defined under another section of this work.
- D. Provide manufacturer's Seismic Qualifications Certification that the tank, accessories and components will withstand seismic forces as defined under another section of this work. Include the following:
  - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
  - 2. Dimensioned Outlined Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchoring provisions.
  - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

**1.9 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Prior to shipment, tank shall be hydrostatically tested at the factory at 150 PSI in accordance with 2014 New York City Building code and New York City Fire Department requirements.
- C. Manufacturer's Qualifications: Manufacturer regularly engaged in the manufacture of custom, factory fabricated tank, the capacities required, whose products have been in satisfactory use in similar service for not less than 10 years.
- D. All equipment and material to be furnished and installed on this project shall be listed by Underwriters' Laboratories Inc. (UL) or ETL listed, in accordance with the requirements of the New York City Department of Buildings, and suitable for its intended use on the project.
- E. Supply all equipment and accessories in complete compliance with and in accordance with the applicable standards listed in reference standards of this division and with 2014 New York City Construction Codes.
- F. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."
  - 1. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

- G. Thirty percent (30%) of welds shall be radiographed. by an independent company. Submit certified test results before shipping.

#### 1.10 COORDINATION

- A. In addition to the coordination requirements specified elsewhere in the contract documents, it shall be the responsibility of the Contractor to confirm all dimensions and structural details based on the latest architectural and structural drawings relating to column, beam or wall locations or any other obstructions that must be accommodated as part of the equipment layout and support or to provide proper equipment clearances.
- B. This contractor shall fully coordinate any such changes or deviations from the drawings and specifications with the Commissioner. These changes and deviations may include but are not limited to, structural steel, weight, size, electrical, and controls. Any resulting expense due to deviation or substitutions from this specification or drawings shall be the sole responsibility of the manufacturer providing the equipment. These expenses shall include but not be limited to any additional engineering, architectural, mechanical or structural expenses.
- C. Any resulting expenses due to failure to coordinate or comply with the contract document requirements shall be the sole responsibility of this contractor.

#### 1.11 DELIVERY, STORAGE, AND HANDLING

- A. Units shall be delivered with factory installed shipping skids or lifting lugs. Items/Components that are shipped loose shall be packed in separate protective packages.
- B. Lift and support storage tanks only at designated lifting or supporting points, as shown on Shop Drawings. Do not move or lift tank unless empty.
- C. The tank shall be fully wrapped in shrink-wrap during transport.
- D. The tank shall be shipped FOB Destination, such that the manufacturer will pay all shipping expenses and will remain responsible for the equipment until date of substantial completion.
- E. Store tank in safe, clean and away from construction traffic and protected from physical damage.
- F. Rig unit to comply with manufacturer's rigging and installation instructions for unloading package units, and moving them to final location.
- G. Coordinate delivery of units in sufficient time to allow movement into building.

#### 1.12 SCHEDULING AND SEQUENCING

- A. Coordinate installation mounting with floor and vault structure.
- B. Coordinate opening locations for mechanical and electrical connections.

#### 1.13 COORDINATION

- A. Coordinate installation of equipment supports, including locations for mechanical and electrical connections.

**1.14 WARRANTY**

- A. Warranty Period: 10 (ten) years after date of Substantial Completion on all components.
- B. Extended warranty period of 20 years against corrosion of walls (external or internal), fittings and support saddles.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS:**

- A. Subject to compliance with requirements, provide products by one of the following:

- 1. Mass Tank Corporation
- 2. Highland Tank
- 3. Convault Inc.
- 4. General Industries Inc.
- 5. Or approved equal.

**2.2 GENERAL DESCRIPTION**

- A. Provide complete and fully operational, factory fabricated, 4000 Gallon aboveground, UL 142, double wall steel fuel oil storage tank as indicated on the drawings and specified herein, providing full 360-degree double containment.
- B. Tank shall bear the New York City and New York State labels, and also bear Underwriters' Label, which shall include:
  - 1. Certify the tanks conform with 6NYCRR Parts 612, 613 & 614
  - 2. The name of the manufacturer and the year of manufacture
  - 3. The standard of design by which the tank was manufactured
  - 4. The thickness of the tank plates
  - 5. Capacity of the tank
  - 6. Type of petroleum products to be stored, etc.
  - 7. MEA number
- C. Tanks shall be built to Steel Tank Institute (STI) specifications.
- D. A second label showing all the above information as well as the date of installation shall be conspicuously displayed and permanently affixed to the fill box.
- E. Tank shall be factory fabricated and tested prior to shipment, as described above.
- F. Aboveground cylindrical tank shall be built from new carbon steel plates made by the open-hearth process and known as "tank steel". Minimum inner tank thickness ¼" head and shell. Minimum outer tank thickness 10-gauge head and shell. All tanks shall be continuously welded inside and outside with either double- welded butt joints or double- welded full fillet lap joint with a minimum overlap of 1". Welding shall be in accordance with AWS D1-1 to provide a watertight tank that will not warp or deform excessively under load.
- G. The tank shall comply with one of the following classifications:

1. Comply with Specifications for structural Steel ASTM A 36- 81a.
  2. Specification for steel, Carbon (0.15 maximum percent) Hot- rolled
  3. Sheet and Strip, Commercial Quality, Heavy thickness coils (formerly plate) ASTM A635-81.
- H. Fittings to be supplied as shown on the drawings and as per jobsite requirements. All fittings to be located on the top centerline of the tank and shall be 4" NPT unless otherwise noted. Openings on the tank shall be as follows:
1. One (1) Fill line connection
  2. One (1) Vent line connection
  3. One (1) Suction line connection
  4. One (1) Return/ overflow line connection
  5. One (1) Gauge connection, must be 4" NPT for WF Float
  6. Three (3) Spare
  7. One (1) Emergency Vent connection, 8" dia. 150# RF flange.
- I. A square striker plate, 1/8" minimum thickness and 12" square shall be installed at the tank invert under each tank fitting, except vent line connection.
- J. Cylindrical tank to be factory mounted and welded to saddles. Quantity of saddles as required by tank size/ capacity. Saddles to be welded to floor to prevent floating in the event of a flood.
- K. Tank shall be provided with OSHA approved access ladder, platform and handrail on top of tank for access to fittings and connections.
- L. Exterior protective primer coating to be rustproof red oxide. Two coats minimum dry thickness of 3 mils on shell and heads.
- M. Finish coat to be black rustproof enamel. Finish coat to be a minimum dry thickness of 3 mils on shell and heads.

### PART 3 - EXECUTION

- A. Refer to DDC General Conditions for execution requirements.
- B. Install in accordance with manufacturer's instruction.
- C. Provide seismic restraints for the fuel oil storage tank, tank supports, mounting base, access platforms, structure, vibration isolators, pipe connections and connecting piping supports, commissioned by the tank manufacturer, using performance requirements and design criteria defined herein and under another section of this work.
- D. Tank shall be installed in the building cellar (lowest floor level inside the building), in a dedicated room with a 3-hour rated fire resistance construction. Base of tank room (+6'0") shall be sealed to serve as a containment area. Align tank in vault. Level and grout saddles to concrete floor.
- E. Provide all piping connections with approved fittings.
- F. Tank to be hydrostatically tested at 150 PSI in accordance with 2014 New York City Building code and New York City Fire Department requirements.

**3.2 FIELD PERFORMANCE TESTING**

- A. All factory installed piping shall be air pressure leak tested for a minimum of 2 hours, prior to connection to the system piping.
- B. Once each unit is installed, the following field tests shall be run by this contractor under the direct supervision of a manufacturer's representative and the commissioning agent.

**END OF SECTION 23 77 33**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 23 81 23****COMPUTER ROOM AIR-CONDITIONING UNITS (CRAC UNITS)****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 13 – MOTORS FOR HVAC EQUIPMENT.
- D. Section 23 05 14 – VARIABLE FREQUENCY MOTOR DRIVES
- E. Section 23 05 23 – VALVES FOR HVAC
- F. Section 23 05 48 – VIBRATION ISOLATION, SEISMIC AND WIND LOAD RESTRAINTS FOR HVAC COMPONENTS.
- G. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- H. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.
- I. Section 23 34 16 – HVAC FANS.
- J. Section 23 41 00 – AIR FILTERS.
- K. Section 23 71 00 – AIR COILS.
- L. This section is a part of each Division 23 00 00 section.

**1.2 SUMMARY**

- A. Section Includes:
  - 1. Floor-mounted computer-room air handling units
  - 2. Ceiling Mounted computer-room air handling units

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"

- C. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – “Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings”, where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

**1.5 DEFINITION**

- A. BMS: Building Management System.

**1.6 PERFORMANCE REQUIREMENTS**

- A. **Seismic Performance:** Computer-room air conditioners shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
  1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

**1.7 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

**1.8 SUBMITTALS**

- A. **Product Data:** For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. **Shop Drawings:** For computer-room air conditioners. Include plans, elevations, sections, details, and attachments to other work.
  1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  2. **Wiring Diagrams:** For power, signal, and control wiring.
- C. **Color Samples:** For unit cabinet, discharge grille, and exterior louver and for each color and texture specified.
- D. **Coordination Drawings:** Plans, elevations, and other details, drawn to scale, using input from Installers of the items involved.
- E. **Seismic Qualification Certificates:** For computer-room air conditioners, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

F. Field quality-control reports.

G. Warranty: Sample of special warranty.

H. Operation and Maintenance Data: For computer-room air conditioners to include in emergency, operation, and maintenance manuals.

#### 1.9 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Belts: One set(s) for each belt-driven fan.
2. Filters: One set(s) of filters for each unit.

#### 1.10 QUALITY ASSURANCE

A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. ASHRAE Compliance:

1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."
2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality," Section 5 - "Systems and Equipment," Section 6 - "Ventilation Rate Procedures," and Section 7 - "Construction and Startup."

D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.

E. ASME Compliance: Fabricate and label water-cooled condenser shell to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

#### 1.11 COORDINATION

A. Coordinate layout and installation of AHU computer-room air conditioners and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

B. Coordinate installation of computer-room air conditioners with computer-room access flooring Installer.

C. Coordinate sizes and locations of concrete bases with actual equipment provided.

D. Coordinate sizes and locations of equipment supports with actual equipment provided.

**1.12 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of computer-room air conditioners that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period for Control Boards: Manufacturer's standard, but not less than three years from date of Substantial Completion.

**PART 2 - PRODUCTS****2.1 FLOOR-MOUNTED UNITS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Stulz – ATS
  - 2. Liebert Corporation
  - 3. McQuay
  - 4. Compu-Aire
  - 5. Or approved equal.
- B. Description: Packaged, factory assembled, chilled water, prewired, and pre-piped; consisting of cabinet, fans, filters, humidifier, and controls.
- C. Unit Pressure Ratings: As described in section 23 05 00 – “COMMON REQUIREMENTS FOR HVAC WORK,” but not less than 125 psig SWP at 200 deg F.
- D. Cabinet and Frame: Welded steel, braced for rigidity, and supporting compressors and other mechanical equipment and fittings.
  - 1. Doors and Access Panels: Galvanized steel with polyurethane gaskets, hinges, and concealed fastening devices.
  - 2. Insulation: Thermally and acoustically insulate cabinet interior with 1-inch thick duct liner.
  - 3. Finish of Interior Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
  - 4. Finish of Exterior Surfaces: Baked-on, textured vinyl enamel; color as selected from manufacturer's standard colors.
  - 5. Floor Stand: Welded tubular steel with adjustable legs and vibration isolation pads.
- E. Supply-Air Fan(s):
  - 1. Double-inlet, forward-curved centrifugal fan(s); statically and dynamically balanced.
  - 2. Drive: V-belt, with steel shaft with self-aligning ball bearings and cast-iron or steel sheaves, variable- and adjustable-pitch motor sheave, minimum of two matched belts, with drive rated at a minimum of two times the nameplate rating of motor.
- F. Hydronic Cooling Coil: Seamless copper tubes expanded into copper fins with modulating two-way control valve.
  - 1. Cooling Medium: Chilled Water.
  - 2. Cooling coil is specified under another section of this work.
  - 3. Class 300
- G. Control Valve:

1. Control Valve is specified under another section of this work.
  2. Class 150 body.
  3. Maximum Pressure Drop: 3 psig at design flow rate.
  4. Close-Off (Differential) Pressure Rating: 100 percent of pressure differential across valve or 100 percent of total system (pump) head.
- H. Mount cooling coil assembly over stainless-steel drain pan complying with ASHRAE 62.1 and having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir.
- I. Filter:
1. MERV 7 (ASHRAE 52.2)
  2. Extended-Surface, Disposable, Panel Filter: Pleated, lofted, nonwoven, reinforced cotton fabric; supported and bonded to welded-wire grid; enclosed in cardboard frame with 2-inch-thick, disposable, glass-fiber pre-filter.
  3. Thickness: 2 inches
  4. Filters are specified under another section of this work.
- J. Mount cooling coil assembly over stainless-steel drain pan complying with ASHRAE 62.1 and having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir.
- K. Integral Electrical Controls: Unit-mounted electrical enclosure with piano-hinged door, grounding lug, combination magnetic starters with overload relays, circuit breakers and cover interlock, and fusible control-circuit transformer.
- L. Disconnect Switch: Non-automatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- M. Electronic-Control System: Solid state, with start button, stop button, temporary loss of power indicator, manual-reset circuit breakers, temperature control, humidity control, and monitor panel.
1. Monitor Panel: Backlighted, with no visible indicator lights until operating function is activated; indicators include cooling, humidification, loss of airflow, change filters, high temperature, low temperature, high humidity, low humidity, high head pressure (each compressor), and low suction pressure (each compressor).
  2. Temperature- and Humidity-Control Modules: Solid state, plug-in; with adjustable set point, push-to-test calibration check button, and built-in visual indicators to show mode of operation.
  3. Location: Behind hinged door in front of unit; isolated from conditioned airstream to allow service while system is operating.
- N. Microprocessor-Control System: Continuously monitors operation of process cooling system; continuously displays room temperature and room relative humidity; sounds alarm on system malfunction and simultaneously displays problem. If more than one malfunction occurs, system displays fault in sequence with room temperature and continues to display fault when malfunction is cleared until system is reset.
1. Malfunctions:
    - a. Power loss.
    - b. Loss of airflow.
    - c. Clogged air filter.

- d. High room temperature.
  - e. Low room temperature.
  - f. Smoke/fire.
  - g. Water on floor.
  - h. Supply fan overload.
- 2. Digital Display:
  - a. Control power on.
  - b. Dehumidifying.
  - c. Heat operating.
  - d. Economy cooling.
- 3. Push buttons shall stop and start process cooling system, silence audible alarm, test indicators, and display room's relative humidity.
- 4. BMS Interface: Factory-installed hardware and software to enable the BMS to monitor, control, and display unit status and alarms.
  - a. ASHRAE 135 (BACnet) communication interface with the BAS shall enable the BAS operator to remotely control and monitor the unit from an operator workstation. Control features and monitoring points displayed locally at unit control panel shall be available through the BAS.

## 2.2 FAN MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 23 05 13 "Motors for HVAC Equipment".
  - 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
  - 2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for hydronic piping systems to verify actual locations of piping connections before equipment installation.
- C. Examine walls, floors, and ceilings for suitable conditions where computer-room air conditioners will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Install computer-room air conditioners level and plumb, maintaining manufacturer's recommended clearances. Install according to ARI Guideline B.
- B. Computer-Room Air-Conditioner Mounting: Install using restrained spring isolators with seismic restraint. Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration Isolation, Seismic and Wind Load Restraints for HVAC Components"
  - 1. Minimum Deflection: 1.5 inch.

### 3.4 CONNECTIONS

- A. Piping installation requirements are specified in other heating, ventilating, and air-conditioning Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Water and Drainage Connections: Comply with applicable requirements in Section 22 11 16 "Domestic Water Piping." Provide adequate connections for water-cooled units, condensate drain, and humidifier flushing system.
- D. Chilled Water Piping, Hot-Water Heating Piping: Comply with applicable requirements in Section 23 21 13 "HVAC Piping." Provide shutoff valves in inlet and outlet piping to heating coils.

### 3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Tests and Inspections:
  - 1. Inspect for and remove shipping bolts, blocks, and tie-down straps.
  - 2. After installing computer-room air conditioners and after electrical circuitry has been energized, test for compliance with requirements.
  - 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Computer-room air conditioners will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports.
- F. After startup service and performance test, change filters and flush humidifier.

**3.6 ADJUSTING**

- A. Adjust initial temperature and humidity set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to four visits to Project during other-than-normal occupancy hours for this purpose.

**3.7 DEMONSTRATION**

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and maintain devices. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 23 81 23**

## **SECTION 23 82 33**

### **HVAC HEATING RADIATORS AND CONVECTORS**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

##### **1.2 SUMMARY**

- A. This Section includes the following:
1. Hydronic baseboard radiators.
  2. Hydronic finned-tube radiators.
  3. Hydronic convectors.

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 "Construction Waste Management and Disposal"
  2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

##### **1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

##### **1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

## 1.6 SUBMITTALS

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Plans, elevations, sections, and details.
  - 2. Details of custom-fabricated enclosures indicating dimensions.
  - 3. Location and size of each field connection.
  - 4. Location and arrangement of piping valves and specialties.
  - 5. Location and arrangement of integral controls.
  - 6. Enclosure joints, corner pieces, access doors, and other accessories.
  - 7. Wiring Diagrams: Power, signal, and control wiring.
- C. Coordination Drawings: Floor plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
  - 1. Structural members, including wall construction, to which convection units will be attached.
  - 2. Method of attaching convection units to building structure.
  - 3. Penetrations of fire-rated wall and floor assemblies.
- D. Color Samples for Initial Selection: For units with factory-applied color finishes.
- E. Color Samples for Verification: For each type of exposed finish required.
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For convection heating units to include in emergency, operation, and maintenance manuals.

## 1.7 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

## PART 2 - PRODUCTS

### 2.1 HOT-WATER BASEBOARD RADIATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Sterling Inc.
  - 2. Runtal
  - 3. Rittling, a div. of Hydro-Air Components.
  - 4. Or approved equal.

- B. Performance Ratings: Rate baseboard radiators according to Hydronics Institute's "I=B=R Testing and Rating Standard for Baseboard Radiation."
- C. Heating Elements: Copper tubing mechanically expanded into flanged collars of evenly spaced aluminum fins resting on polypropylene element glides. One end of tube shall be belled.
  - 1. Tube Diameter: NPS 1/2 (DN 15).
  - 2. Fin Size: 3 by 3 inches (76 by 76 mm).
  - 3. Fin Spacing: 40 per foot (131 per meter)
  - 4. Number of Tiers: 1
  - 5. Heat Output: 600 Btu/h/ft.
  - 6. Entering Air Temperature: 65 deg F (18 deg C).
  - 7. Average Water Temperature: 130 deg F (82 deg C).
  - 8. Minimum Water Velocity: 1/2 fps.
- D. Enclosures: Minimum 0.0428-inch thick steel, removable front cover.
- E. Rust-Resistant Enclosures: Minimum 0.052-inch- thick ASTM A 653/A 653M, G60 galvanized-steel, removable front cover.
  - 1. Full-height back.
  - 2. Full-length damper.
  - 3. End panel.
  - 4. End caps.
  - 5. Inside and outside corners.
  - 6. Valve access door.
  - 7. Joiner pieces to snap together.  
Finish: Baked-enamel finish in manufacturer's standard color as selected by Commissioner.
  - 8. Element Brackets: Primed and painted steel to support front panel and element.

## 2.2 HOT-WATER CONVECTORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Sterling.
  - 2. Vulcan.
  - 3. Indecco.
  - 4. Or approved equal.
- B. Convector Elements: Seamless copper tubing mechanically expanded into evenly spaced aluminum fins and rolled into brass headers with inlet/outlet and air vent; steel side plates and supports. Factory-pressure-test element at minimum 100 psig (690 kPa).
  - 1. Element Height: 24"
  - 2. Element Depth: 10"
  - 3. Element Length: 60"
  - 4. Entering Air Temperature: 65 deg F (18 deg C).
  - 5. Heat Output: see schedules
  - 6. Average Water Temperature: 130 deg F (82 deg C)
  - 7. Temperature Drop: 20 deg F (11.1 deg C)
  - 8. Pressure Loss: See schedules on drawings.
  - 9. Heat Output (Square Feet EDR): See schedules on drawings.

- C. Floor-Mounting Pedestals: Conceal conduit for power and control wiring at maximum 36-inch (914-mm) spacing. Pedestal-mounting back panel shall be solid panel matching front panel.
- D. Support Brackets: Locate at maximum 36-inch (914-mm) spacing to support front panel and element.
- E. Insulation: 1/2-inch- (13-mm-) thick, fibrous glass on inside of the back of the enclosure.
- F. Finish: Baked-enamel finish in manufacturer's standard color as selected by Commissioner.
- G. Damper: Knob-operated internal damper.
- H. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, minimum size 6 by 7 inches, integral with enclosure.
- I. Enclosure Style: Flat top.
  - 1. Front Inlet Grille: Punched louver; painted to match enclosure.
  - 2. Front Inlet Grille: Extruded-aluminum linear bar grille; pencil-proof bar spacing.
    - a. Mill-finish aluminum.
    - b. Anodized finish, color as selected by Commissioner from manufacturer's standard colors.
    - c. Painted to match enclosure.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Examine areas to receive convection heating units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.3 BASEBOARD RADIATOR INSTALLATION

- A. Install units level and plumb.
- B. Install baseboard radiators according to Guide 2000 - Residential Hydronic Heating.
- C. Install enclosure continuously around corners, using outside and inside corner fittings.
- D. Join sections with splice plates and filler pieces to provide continuous enclosure.
- E. Install access doors for access to valves.
- F. Install enclosure continuously from wall to wall.
- G. Terminate enclosures with manufacturer's end caps except where enclosures are indicated to extend to adjoining walls.

- H. Install valves within reach of access door provided in enclosure.
- I. Install air-seal gasket between wall and recessing flanges or front cover of fully recessed unit.
- J. Install piping within pedestals for freestanding units.

### 3.4 FINNED-TUBE RADIATOR INSTALLATION

- A. Install units level and plumb.
- B. Install finned-tube radiators according to Guide 2000 - Residential Hydronic Heating.
- C. Install enclosure continuously around corners, using outside and inside corner fittings.
- D. Join sections with splice plates and filler pieces to provide continuous enclosure.
- E. Install access doors for access to valves.
- F. Install enclosure continuously from wall to wall.
- G. Terminate enclosures with manufacturer's end caps, except where enclosures are indicated to extend to adjoining walls.
- H. Install valves within reach of access door provided in enclosure.
- I. Install air-seal gasket between wall and recessing flanges or front cover of fully recessed unit.
- J. Install piping within pedestals for freestanding units.

### 3.5 CONVECTOR INSTALLATION

- A. Install units level and plumb.
- B. Install valves within reach of access door provided in enclosure.
- C. Install air-seal gasketing between wall and recessing flanges or front cover of fully recessed unit.
- D. Install piping within pedestals for freestanding units.

### 3.6 CONNECTIONS

- A. Piping installation requirements are specified in Section 23 21 13 - "HVAC Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect hot-water units and components to piping according to Section 23 21 13 - "HVAC Piping".
  - 1. Install shutoff valves on inlet and outlet, and balancing valve on outlet.
  - 2. Install shutoff valve on inlet; install strainer, steam trap, and shutoff valve on outlet.
- C. Install control valves as required by Section 23 09 00 – "HVAC Instrumentation and Controls".

- D. Install piping adjacent to convection heating units to allow service and maintenance. Ground electric convection heating units according to Section 26 05 26 – “Grounding and Bonding for Electrical Systems”
- E. Connect wiring according to Section 26 05 19 - "Low-Voltage Electrical Power Conductors and Cables."

### 3.7 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
  - 2. Operational Test: After electrical circuitry has been energized, start units to confirm proper convection heating unit operation.
  - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Remove and replace convection heating units that do not pass tests and inspections and retest as specified above.

**END OF SECTION 23 82 33**

**SECTION 23 82 39****UNIT HEATERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 "Construction Waste Management and Disposal"
  2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.3 LEED BUILDING SUBMITTALS:**

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

**1.4 SUMMARY**

- A. Section Includes:
1. Cabinet unit heaters with centrifugal fans and hot-water coils.
  2. Propeller unit heaters with hot-water coils.

**1.5 DEFINITIONS**

- A. BAS: Building automation system.

- B. CWP: Cold working pressure.
- C. PTFE: Polytetrafluoroethylene plastic.
- D. TFE: Tetrafluoroethylene plastic.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 SUBMITTALS

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Plans, elevations, sections, and details.
  - 2. Location and size of each field connection.
  - 3. Details of anchorages and attachments to structure and to supported equipment.
  - 4. Equipment schedules to include rated capacities, operating characteristics, furnished specialties, and accessories.
  - 5. Location and arrangement of piping valves and specialties.
  - 6. Location and arrangement of integral controls.
  - 7. Wiring Diagrams: Power, signal, and control wiring.
- C. Coordination Drawings: Floor plans, reflected ceiling plans, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
  - 1. Suspended ceiling components.
  - 2. Structural members to which unit heaters will be attached.
  - 3. Method of attaching hangers to building structure.
  - 4. Size and location of initial access modules for acoustical tile.
  - 5. Items penetrating finished ceiling, including the following:
    - a. Lighting fixtures.
    - b. Air outlets and inlets.
    - c. Speakers.
    - d. Sprinklers.
    - e. Access panels.
  - 6. Perimeter moldings for exposed or partially exposed cabinets.
- D. Samples for Initial Selection: Finish colors for units with factory-applied color finishes.
- E. Samples for Verification: Finish colors for each type of cabinet unit heater and wall and ceiling heaters indicated with factory-applied color finishes.
- F. Manufacturer Seismic Qualification Certification: Submit certification that cabinet unit heaters, accessories, and components will withstand seismic forces defined in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
  - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
  - b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Field quality-control test reports.

H. Operation and Maintenance Data: For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

## 1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- D. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."

## 1.9 MANUFACTURER'S WARRANTY

- A. Provide full manufacturer's warranty for unit heaters, for all components that fail in materials or workmanship, for a period of three (3) years from the date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 CABINET UNIT HEATERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Airtherm; a Mestek Company.
  2. Trane.
  3. Indeeco.
  4. International Environmental Corporation.
  5. Or approved equal.
- B. Description: A factory-assembled and -tested unit complying with ARI 440.
  1. Comply with UL 2021.

- C. Coil Section Insulation: ASTM C 1071; surfaces exposed to airstream shall be aluminum-foil facing to prevent erosion of glass fibers.
1. Thickness: 1/2 inch (13 mm).
  2. Thermal Conductivity (k-Value): 0.26 Btu x in./h x sq. ft. at 75 deg F (0.037 W/m x K at 24 deg C) mean temperature.
  3. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
  4. Adhesive: Comply with ASTM C 916 and with NFPA 90A or NFPA 90B.
  5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.
- D. Coil Section Insulation: Comply with NFPA 90A or NFPA 90B. Unicellular polyethylene thermal plastic, preformed sheet insulation complying with ASTM C 534, Type II, except for density.
1. Thickness: 3/8 inch (9 mm).
  2. Thermal Conductivity (k-Value): 0.24 Btu x in./h x sq. ft. at 75 deg F (0.034 W/m x K at 24 deg C) mean temperature.
  3. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM C 411.
  4. Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A or NFPA 90B.
  5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.
- E. Cabinet: Steel with baked-enamel finish with manufacturer's standard paint, in color selected by Commissioner.
1. Vertical Unit, Exposed Front Panels: Minimum 0.0528-inch- (1.35-mm thick, galvanized, sheet steel, removable panels with channel-formed edges secured with tamperproof cam fasteners.
  2. Horizontal Unit, Exposed Bottom Panels: Minimum 0.0528-inch- (1.35-mm) thick, galvanized, sheet steel, removable panels secured with tamperproof cam fasteners and safety chain.
  3. Recessing Flanges: Steel, finished to match cabinet.
  4. Control Access Door: Key operated.
  5. Base: Minimum 0.0528-inch- (1.35-mm-) thick steel, finished to match cabinet, 4 inches (100 mm) high with leveling bolts.
  6. Extended Piping Compartment: 8-inch- (200-mm-) wide piping end pocket.
  7. False Back: Minimum 0.0428-inch- (1.1-mm-) thick steel, finished to match cabinet.
- F. Filters: Minimum arrestance according to ASHRAE 52.1 and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
1. Pleated: 90 percent arrestance and 7 MERV.
- G. Hot-Water Coil: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 200 psig (1378 kPa) and a maximum entering-water temperature of 220 deg F (104 deg C). Include manual air vent and drain.
- H. Fan and Motor Board: Removable.

1. Fan: Forward curved, high static, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.
  2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."
  3. Wiring Terminations: Connect motor to chassis wiring with plug connection.
- I. Factory, Hot-Water Piping Package: ASTM B 88, Type L (ASTM B 88M, Type B) copper tube with wrought-copper fittings and brazed joints. Label piping to indicate service, inlet and outlet.
1. Two-way, modulating control valve. Three-way valve packages shall include bypass line with manually adjustable balance device.
  2. Hose Kits: Minimum 400-psig (2758-kPa) working pressure, and operating temperatures from 33 to 211 deg F (0.5 to 99 deg C). Tag hose kits to equipment designations.
    - a. Length: 24 inches (600 mm)
    - b. Minimum Diameter: Equal to cabinet unit heater connection size.
  3. Two-Piece, Ball Valves: Bronze body with full-port, chrome-plated bronze ball; PTFE or TFE seats; and 600-psig (4140-kPa) minimum CWP rating and blowout-proof stem.
  4. Calibrated-Orifice Balancing Valves: Bronze body, ball type, 125-psig (860-kPa) working pressure, 250 deg F (121 deg C) maximum operating temperature; with calibrated orifice or venture, connection for portable differential pressure meter with integral seals, threaded ends, and equipped with a memory stop to retain set position.
  5. Automatic Flow-Control Valve: Brass or ferrous-metal body, 300-psig (2068-kPa) working pressure at 250 deg F (121 deg C), with removable, corrosion-resistant, tamperproof, self-cleaning, piston-spring; factory set to maintain constant indicated flow with plus or minus 10 percent over differential pressure range of 2 to 80 psig (13.8 to 552 kPa).
  6. Y-Pattern, Hot-Water Strainers: Cast-iron body (ASTM A 126, Class B); 125-psig (860-kPa) minimum working pressure; with threaded connections, bolted cover, perforated stainless-steel basket, and bottom drain connection. Include minimum NPS 1/2 (DN 15) threaded pipe and full-port ball valve in strainer drain connection.
  7. Wrought-Copper Unions: ASME B16.22.
- J. Control devices and operational sequences are specified in Division 23 Sections "Instrumentation and Control for HVAC" and "Sequence of Operations for HVAC Controls."
- K. Basic Unit Controls:
1. Control voltage transformer.
  2. Wall-mounting thermostat with the following features.
    - a. Heat-off switch.
    - b. Fan on-auto switch.
    - c. Manual fan speed switch.
    - d. Adjustable deadband.
    - e. Concealed set point.
    - f. Concealed indication.
    - g. Deg F indication.
  3. Unoccupied period override push button.
  4. Data entry and access port.

- a. Input data includes room temperature, and occupied and unoccupied periods.
- b. Output data includes room temperature, supply-air temperature, entering-water temperature, operating mode, and status.

**L. DDC Terminal Controller:**

- 1. Scheduled Operation: Occupied and unoccupied periods on seven-day clock with a minimum of four programmable periods per day.
- 2. Unoccupied Period Override: Two < hours.
- 3. Unit Supply-Air Fan Operations:
  - a. Occupied Periods: Fan runs continuously.
  - b. Unoccupied Periods: Fan cycles to maintain setback room temperature.
- 4. Heating Coil Operations:
  - a. Occupied Periods: Modulate control valve to provide heating if room temperature falls below thermostat set point.
  - b. Unoccupied Periods: Start fan and modulate control valve if room temperature falls below setback temperature.
- 5. Outdoor-Air Damper Operation:
  - a. Occupied Periods: Open dampers. Delay damper opening if room temperature is more than three degrees below set point.
  - b. Unoccupied Periods: Close damper.
- 6. Controller shall have volatile-memory backup.

**M. BAS Interface Requirements:**

- 1. Interface relay for scheduled operation.
- 2. Interface relay to provide indication of fault at central workstation.
- 3. Interface shall be BAC-net compatible for central BAS workstation and include the following functions:
  - a. Adjust set points.
  - b. Cabinet unit heater start, stop, and operating status.
  - c. Data inquiry, including supply-air and room-air temperature.
  - d. Occupied and unoccupied schedules.

**N. Electrical Connection: Factory wire motors and controls for a single field connection.**

**O. Capacities and Characteristics:**

- 1. Cabinet:
  - a. Vertical, Surface Mounted: Upflow.
    - 1) Top: Flat.
    - 2) Air Inlet: Open bottom
    - 3) Air Outlet: Front

## 2.2 PROPELLER UNIT HEATERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Airtherm; a Mestek Company.
  2. Engineered Air Ltd.
  3. McQuay International.
  4. Rosemex Products.
  5. Trane.
  6. Or approved equal.
- B. Description: An assembly including casing, coil, fan, and motor in vertical and horizontal discharge configuration with adjustable discharge louvers.
- C. Comply with UL 2021.
- D. Comply with UL 823.
- E. Cabinet: Removable panels for maintenance access to controls.
- F. Cabinet Finish: Manufacturer's standard baked enamel applied to factory-assembled and -tested propeller unit heater before shipping.
- G. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.
- H. Discharge Louver: Adjustable fin diffuser for horizontal units and conical diffuser for vertical units.
- I. General Coil Requirements: Test and rate hot-water propeller unit heater coils according to ASHRAE 33.
- J. Hot-Water Coil: Copper tube, minimum 0.025-inch (0.635-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 200 psig (1380 kPa) and a maximum entering-water temperature of 325 deg F (163 deg C), with manual air vent. Test for leaks to 350 psig (2413 kPa) underwater.
- K. Hot-Water Coil: Cupronickel tube, minimum 0.031-inch (0.78-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 400 psig (2760 kPa) and a maximum entering-water temperature of 450 deg F (232 deg C), with manual air vent. Test for leaks to 600 psig (4137 kPa) underwater.
- L. Hot-Water Coil: Red brass tube, minimum 0.049-inch (1.24-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 260 psig (1793 kPa) and a maximum entering-water temperature of 390 deg F (199 deg C), with manual air vent. Test for leaks to 390 psig (2689 kPa) underwater.
- M. Hot-Water Coil: Steel tube, minimum 0.049-inch (1.24-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum

working pressure of 400 psig (2760 kPa) and a maximum entering-water temperature of 450 deg F (232 deg C), with manual air vent. Test for leaks to 600 psig (4137 kPa) underwater.

- N. Hot-Water Coil: Vertical steel tube, minimum 0.065-inch (1.65-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 400 psig (2760 kPa) and a maximum entering-water temperature of 450 deg F (232 deg C), with steel headers at top and bottom. Test for leaks to 600 psig (4137 kPa) underwater.
- O. Fan: Propeller type with aluminum wheel directly mounted on motor shaft in the fan venturi.
- P. Fan Motors: Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."
  - 1. Motor Type: Permanently lubricated, variable speed.
- Q. Control Devices:
  - 1. Unit-mounted fan-speed switch.
  - 2. Wall-mounting thermostat.

### PART 3 - EXECUTION

#### 3.1 EXAMINATION

- A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in for piping and electrical connections to verify actual locations before unit heater installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.2 INSTALLATION

- A. Install wall boxes in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Section 07 92 00 "Joint Sealants".
- B. Install cabinet unit heaters to comply with NFPA 90A.
- C. Install propeller unit heaters level and plumb.
- D. Suspend cabinet unit heaters from structure with elastomeric hanger and seismic restraints. Vibration isolators and seismic restraints are specified in Section 23 05 48 Vibration Isolation, Seismic, Flood and Wind Load Restraints for HVAC Components
- E. Suspend propeller unit heaters from structure with all-thread hanger rods and spring hangers with vertical-limit stop. Vibration hangers are specified in 23 05 48 Vibration Isolation, Seismic, Flood and Wind Load Restraints for HVAC Components.
- F. Install wall-mounting thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.

- G. Install new filters in each fan-coil unit within two weeks of Substantial Completion.

### 3.3 CONNECTIONS

- A. Piping installation requirements are specified in Section 23 21 13 - "HVAC Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Connect piping to cabinet unit heater's factory, hot-water piping package. Install the piping package if shipped loose.
- D. Connect supply and return ducts to cabinet unit heaters with flexible duct connectors specified in Section 23 31 13 – "Metal Ducts".
- E. Unless otherwise indicated, install union and gate or ball valve on supply-water connection and union and calibrated balancing valve on return-water connection of unit heater. Hydronic specialties are specified in Section 23 21 13 - "HVAC Piping".
- F. Ground equipment according to Section 26 05 26 – "Grounding and Bonding for Electrical Systems".
- G. Connect wiring according to Section 26 05 19 - "Low-Voltage Electrical Power Conductors and Cables."

### 3.4 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 2. Operate electric heating elements through each stage to verify proper operation and electrical connections.
  - 3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- B. Remove and replace malfunctioning units and retest as specified above.

### 3.5 ADJUSTING

- A. Adjust initial temperature set points in coordination with Commissioner.

### 3.6 DEMONSTRATION

- A. Engage a service representative that is properly trained by the manufacturer to instruct the City of New York's service operators to adjust, operate, and service cabinet unit heaters. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 23 82 39**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 23 82 50****MISCELLANEOUS MECHANICAL SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 23 05 00 – COMMON REQUIREMENTS FOR HVAC WORK.
- C. Section 23 05 23 – VALVES FOR HVAC.
- D. Section 23 21 13 – HVAC PIPING.
- E. Section 23 05 93 – TESTING, ADJUSTING AND BALANCING.
- F. Section 23 09 00 – HVAC INSTRUMENTATION AND CONTROLS.

**1.2 SUMMARY**

- A. Section includes:
  - 1. Expansion Tanks
  - 2. Air Separators
  - 3. Buffer Tanks
  - 4. Miscellaneous Mechanical Systems.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints, and Coatings for LEED Buildings", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

**1.5 SUBMITTALS**

- A. Product data – for each product type specified, describing all dimensions and compliance with all requirements.
- B. Shop drawings – indicating piping plans, wiring diagrams.
- C. Product warranty – for all buffer and expansion tanks.
- D. Operation and maintenance data – for all buffer and expansion tanks.

**1.6 REFERENCE STANDARDS**

- A. ASHRAE 55
- B. ASTM – 653
- C. ASTM-B209
- D. ASTM-C1071-05
- E. ASTM- E84 25/50
- F. UL 94 V-0
- G. UL 2043
- H. UL 181
- I. AHRI 410

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”
- B. Drawings indicating size, profiles, and dimensional requirements.
- C. Electrical Components, Devices and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to New York City Department of Buildings, and marked for intended use.

**1.8 COORDINATION**

- A. Coordinate layout and installation of chilled beams and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, lab utility panels, HVAC equipment, fire-suppression system, and partition assemblies.

**1.9 MANUFACTURER'S WARRANTY**

- A. Buffer tanks shall have a 5-year warranty starting from date of Substantial Completion, covering manufacturing or material defects and/or leaks.
- B. Expansion tanks shall have a 7-year warranty starting from date of Substantial Completion, covering manufacturing or material defects and/or leaks.

**PART 2 - PRODUCTS**

**2.1 EXPANSION TANKS/ AIR SEPARATORS MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- 1. Taco, Inc.
- 2. ITT Bell & Gossett
- 3. Amtrol
- 4. Trox
- 5. Or approved equal.

- B. GENERAL

- 1. Tank Construction: Closed, welded steel, tested and stamped in accordance with Section VIII, Division 1, of ANSI/ASME Boiler and Pressure Vessel Code.
- 2. Supplied with rating from National Board Form U-1, rated for working pressure of 150 psi, with flexible heavy duty butyl rubber bladder. Bladder shall be able to accept the full volume of the expansion tank and shall be removable and replaceable.
- 3. Clean, prime coat, and supply with steel support saddles. Supply with renewable heavy duty butyl rubber bladder. Construct tank with tappings for installation of accessories.
- 4. Provide with quick connect air charging valve connection (standard tire valve) tank drain.
- 5. Provide automatic cold water fill assembly complete with pressure relief valve, pressure reducing valve, reduced pressure double check back flow preventer, test cocks, strainer, vacuum breaker and valved bypass.
- 6. Set expansion tank pressure relief valve and pressure reducing valve at pressures indicated on Drawings.
- 7. Tank dimensions are as scheduled on Drawings.

- C. STRAINERS

- 1. There shall be approved strainers in the inlet connections to each bucket or combination float and thermostatic steam trap, each water feeder and make-up connection, each water regulating valve, each pump, each vent and each valve. The intention is to protect, by strainers, all apparatus of an automatic or manual character whose proper functioning would be interfered with by dirt on the seat, or by scoring of the seat.
- 2. All strainers in waterlines (including all pump inlets) and in steam lines shall be Y-pattern, set in a horizontal (or vertical downward) run of pipe. Where this is not feasible, strainers may be of the enlarged cross-section type. Strainers shall be arranged so as not to "trap" pipes and to facilitate disconnection and opening up for cleaning. Unless otherwise indicated, strainers shall be line size.
- 3. Provide approved valved and capped dirt blow off connection for each strainer.
- 4. All strainers shall be provided with flanged covers for screen removal in lieu of screwed covers for screen removal wherever obtainable.
- 5. All strainer screens 6" and above shall be reinforced for the operating conditions.
- 6. Y-Pattern Strainers:

- a. Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.
  - b. End Connections: Threaded ends for strainers 2" and smaller; flanged ends for strainers 2-1/2" and larger.
  - c. Strainer Screen: Stainless-steel mesh strainer, and stainless steel basket - perforated (1/32" for steam and condensate and for water: 1/16" for sizes up to 3" and 1/8" for sizes above 4")
  - d. Tapped blowoff plug.
  - e. CWP Rating: 300-psig working steam pressure.
7. Basket Strainers:
- a. Body: ASTM A 126, Class B high-tensile cast iron, with bolted cover and bottom drain connection.
  - b. End Connections: Threaded ends for strainers 2" and smaller; flanged ends for strainers 2-1/2" and larger.
  - c. Strainer Screen: Stainless steel, mesh strainer, and perforated (1/32" for steam and condensate and for water: 1/16" for sizes up to 3" and 1/8" for sizes above 4") stainless-steel basket.
8. CWP Rating: 300-psig working steam pressure

**D. AIR CONTROL DEVICES**

1. Expansion Tanks:
- a. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature, with taps in bottom of tank for tank fitting and taps in end of tank for gage glass. Tanks shall be factory tested with taps fabricated and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
  - b. Air-Control Tank Fitting: Cast-iron body, copper-plated tube, brass vent tube plug, and stainless-steel ball check, 100-gal. unit only; sized for compression-tank diameter. Provide tank fittings for 125-psig working pressure and 250 deg F maximum operating temperature.
  - c. Tank Drain Fitting: Brass body, nonferrous internal parts; 125-psig working pressure and 240 deg F maximum operating temperature; constructed to admit air to compression tank, drain water, and close off system.
  - d. Gage Glass: Full height with dual manual shutoff valves, 3/4-inch diameter gage glass, and slotted-metal glass guard.
2. Diaphragm-Type Expansion Tanks:
- a. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test with taps fabricated and supports installed and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
  - b. Diaphragm: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.
  - c. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.

## 2.2 SEPARATORS

- A. Manufacturers: Subject to compliance with requirements, provide one of the following:
  - 1. Bruner
  - 2. Culligan
  - 3. Cuno
  - 4. Dollinger
  - 5. Honeywell
  - 6. Or approved equal.
- B. Maximum Working Pressure: As specified in Section – 23 05 00 – “Common Requirements for HVAC Work”.
- C. Maximum Operating Temperature: Up to 300 deg F.
- D. Tangential-Type Air Separators:
  - 1. Manufacturers: Subject to compliance with requirements, provide one of the following:
    - a. Bell & Gossett Type RL
    - b. Armstrong
    - c. Amtrol
    - d. Taco
    - e. Or approved equal.
  - 2. Tank: Welded steel; ASME constructed and labeled for 125-psig minimum working pressure and 375 deg F maximum operating temperature.
  - 3. Air Collector Tube: Perforated stainless steel, constructed to direct released air into expansion tank.
  - 4. Tangential Inlet and Outlet Connections: Threaded for 2” and smaller; flanged connections for 2-1/2” and larger.
  - 5. Blowdown Connection: Threaded.
  - 6. Size: Match system flow capacity.
- E. In-Line Air Separators:
  - 1. Tank: One-piece cast iron with an integral weir constructed to decelerate system flow to maximize air separation.
  - 2. Cartridge type impingement filter, with replaceable 100 micron or 300 micron filter media. Size and capacity shall be as indicated on drawings.

## 2.3 BUFFER TANKS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Lochinvar,
  - 2. Niles,
  - 3. John Wood,
  - 4. Or approved equal.
- B. Buffer tank Summary and Configuration:

1. Furnish and install as shown on plans, an A.S.M.E. compliant Buffer Tank. The tank must be and MAWP stamped for pressure rating 250 psi @ -20F to 450F in accordance with section VIII, Division I of the A.S.M.E. Boiler and Pressure Vessel code and registered with the National Board of boiler and pressure vessel inspections.
2. The buffer tank shall be painted with 1 coat of red oxide shop primer paint.
3. A manufacturers data report for pressure vessels, Form U-1A as required by the provisions of the A.S.M.E. Boiler and Pressure Vessel code shall be furnished for each buffer tank.
4. Tanks shall be either vertical and horizontal, as indicated on drawings. Tanks shall be equipped with an internal central baffle and with flanged connections at the top and bottom. Horizontal tanks are not required to have internal baffles.
5. Grooved pipe end fittings are not acceptable, provide flanged connections.

C. Buffer tank Construction:

1. Buffer Tank Construction: Closed, welded steel, tested and stamped in accordance with Section VIII, Division 1, of ANSI/ASME Boiler and Pressure Vessel Code.
2. Provide buffer tank with center baffle plate with inlet and outlet on upper shell, With FNPT port at top of tank for air vent; and FNPT drain port at bottom of the tank.
3. Provide manway on top of tank on all closed loop systems.
4. Inlet connection shall be located at the top of the side wall.
5. Grooved end piping systems (including piping, couplings, fittings, valves and accessories) is not acceptable
6. Type "M" copper tubing is not permitted.

D. Buffer tank options, details, and accessories:

1. Shell: Carbon Steel with exterior gray primer finish
2. Center baffle plate: Carbon Steel
3. Inlet/outlet connections: Flanged
4. Vent and drain connections: 1" FNPT
5. Standard angle legs provide 16" clearance from the bottom of the head to the floor
6. Provide 12" x 16" manhole inspection opening.
7. Tank shall be insulated with 2-part, 2" closed cell high-density foam insulation with vapor barrier to meet the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. Insulation shall be suitable for outdoor applications.
8. Factory applied protective white semi-gloss finish for use over insulation — suitable for indoor and outdoor applications.
9. Unless specified otherwise, all steel piping shall be Type ASTM-A-53-Grade B seamless or ERW. Furnace butt weld pipe is not acceptable.
10. Grooved end piping systems (including piping, couplings, fittings, valves and accessories) is not acceptable.

## 2.4 BAKED PHENOLIC COATINGS

- A. All equipment as indicated hereinafter shall receive three (3) base coats of Heresite P-403 or an equivalent product by Metcoat, Delta Coatings, or approved equal, general purpose coating and applied over with two (2) additional coats of Heresite L-66 403 or approved equal baked industrial coating providing a hard and glossy surface (minimum thickness of 5 mils) having anti-stick qualities and ease of cleaning properties.
- B. The finish coating shall have a temperature resistance of up to 450% F and a dielectric strength of 300 volts per mil of thickness.
- C. All coatings shall be applied in accordance with manufacturer's recommendations.

## 2.5 EPOXY PHENOLIC COATED STEEL SHEET

- A. Base material to be black steel sheet with continuous welded seams and free of pits and undercutting. Duct joints to be flanged. Sand blast to white metal finished and apply first coat within 24 hours.
- B. Apply epoxy phenolic cold set coating to minimum 7 mils dry film thickness (DFT).

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine areas to receive chilled beams for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for hot- and chilled-water piping to verify actual locations of piping connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Maintain sufficient clearance for normal services, maintenance, or in accordance with construction drawings and manufacturers recommendations.
- B. Coordinate layout and installation of chilled beams and suspension-system components with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, communications system, security system, and partition assemblies.
- C. Seismic Restraints: Comply with requirements for seismic-restraint devices specified in Section 23 05 48 "Vibration Isolation, Seismic, Flood and Wind Load Restraints For HVAC Components".
- D. Comply with requirements for general-duty valves specified in Section 23 05 23 "Valves for HVAC Piping".
- E. Install continuous-thread hanger rods of size required to support chilled-beam weight.
- F. Comply with NECA 1.
- G. Piping installation requirements are specified in other Division 23 Sections. Drawings indicated general arrangement of piping, fittings, and specialties.
- H. Install piping adjacent to active or passive beams to allow service and maintenance.
- I. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".

- J. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening.
- K. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
- L. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

#### 3.4 CONNECTIONS

- A. Comply with requirements for piping as specified under section 232113 of this work. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. This scope of work shall include the complete coordination of the piping and connections.
- C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
- D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

#### 3.5 IDENTIFICATION

- A. Identify electrical-system components, wiring, cabling, and terminals. Comply with requirements for identification as specified under section 230553.
- B. Identify hydronic piping and valves. Comply with requirements as specified under section 230523.

#### 3.6 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test. Inspect, and adjust components, assemblies, and equipment installations, including connections.
- B. Prepare test and inspection reports.

#### 3.7 CLEANING AND PROTECTION

- A. Clean all visible surfaces of equipment; touch up as required.
- B. Protect all units before, during and after installation. Damage materials due to improper protection shall be cause for rejection.

**END OF SECTION 23 82 50**

## **SECTION 26 05 00**

### **COMMON REQUIREMENTS FOR ELECTRICAL WORK**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

##### **1.2 SUMMARY**

- A. This Section includes general requirements for electrical installations. These requirements are applicable to all Division 26 work. The following requirements are included in this Section to expand the requirements specified in DDC General Conditions:
  - 1. Submittals.
  - 2. Coordination drawings.
  - 3. Record documents.
  - 4. Maintenance manuals.
  - 5. Rough-ins.
  - 6. Electrical installations.
  - 7. Cutting and patching.
  - 8. Codes, Permits and Inspections.
  - 9. Definitions and Interpretations.

- B. This section is part of each Division 26 00 00 Section.

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures."

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

1.7 SUBMITTALS

- A. Additional copies may be required by individual sections of these Specifications.
- B. Prior to assembling or installing the work, the following shall be submitted for review:
  - 1. Scale drawings indicating insert and sleeve locations

1.8 COORDINATION DRAWINGS

- A. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for coordination drawing requirements.
  - 1. Indicate the proposed locations of major raceway systems, equipment, and materials on coordination and record drawings. Include the following:
    - a. Clearances for servicing equipment, including space for equipment disassembly required for periodic maintenance.
    - b. Exterior wall and foundation penetrations.
    - c. Fire-rated wall and floor penetrations.
    - d. Equipment connections and support details.
    - e. Sizes and location of required concrete pads and bases.
  - 2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
  - 3. Prepare floor plans, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.

1.9 RECORD DRAWINGSS

- A. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for record drawing requirements.
  - 1. A complete set of "as-built" or record electric drawings shall be made up and delivered to the Commissioner.
  - 2. The drawings shall show:
    - a. All electric work installed exactly in accordance with the original design.
    - b. All electric work installed as a modification or addition to the original design.

- c. The dimensional information necessary to delineate the exact location of all circuitry and wiring runs (other than lighting and appliance branch circuitry and small control, signal and communications runs) which are so buried or concealed as to be untraceable by inspection through the regular means of access established for inspection and maintenance.
- d. The numbering information necessary to correlate all electrical energy consuming items (or outlets for same) to the panel or switchboard circuits from which they are supplied.

#### 1.10 MAINTENANCE MANUALS

- A. Prepare maintenance manuals in accordance with DDC General Conditions. In addition to the requirements specified in DDC General Conditions, include the following information for major equipment items such as engine generator set(s), UPS equipment, alarm system(s), communications systems, switchboards, Panelboards, automatic transfer switches, lighting fixtures, and other items as specified elsewhere.
  - 1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
  - 2. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions.
  - 3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, restore, and reassembly; aligning and adjusting instructions.
  - 4. Servicing instructions.

#### 1.11 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

#### 1.12 CODES, PERMITS AND INSPECTIONS

- A. All work shall meet or exceed the latest requirements of the NYC Building Code 2014 and NYC Electrical Code 2014.
- B. All work shall meet or exceed the latest requirements of the NYC Department of Buildings. These include, but are not limited to the following:
  - 1. 2014 New York City Construction Codes
  - 2. NFPA National Fire Codes
- C. All required permits and inspection certificates shall be obtained, paid for, and made available at the completion of the work.
- D. Any portion of the work which is not subject to the requirements of the NYCEC shall be governed by the National Electrical Code and other applicable sections of the National Fire Code, as published by the National Fire Protection Association.
- E. Equipment, material, layout and installation provided as part of the electrical work shall conform to the applicable requirements of:
  - 1. The Advisory Board of the Bureau of Electrical Control (Department of Buildings),

2. The Mechanical Equipment Acceptance Division of the Building Department (MEA),
3. The Board of Standards and Appeals (BSA),
4. Fire Department of New York (FDNY).
5. Include as part of the electrical work all required filings and submissions for approval.
6. Equipment furnished separate from - but installed as part of - the electrical work, which does not have all necessary approvals, shall not be installed until approvals are obtained by the parties furnishing the equipment.
7. Controlled and special inspection(s) for certain portions of the work as called for in the New York City Building Code 2014, Section C27-132 and Section C27-136 and the filing of all necessary reports for approval, Form TR-1 and TR-8, with the Building Department shall be included as part of the electric work. The name of the registered Professional Commissioner licensed in the State of New York who will be responsible for making the inspections on Form TR-1 and TR-8 shall be submitted for approval as soon as possible but not more than 90 days of the award of the contract.

- F. Installation procedures, methods and conditions shall comply with the latest requirements of the Federal Occupational Safety and Health Administration (OSHA).

#### 1.13 DEFINITIONS

- A. Regardless of their usage in codes or other industry standards, certain words as used in the drawings or specifications for the electrical work, shall be understood to have the specific meanings ascribed to them in the following list:
- B. "Circuitry" -- Any electric work (not limited to light and power distribution) which consists of wires, cables, raceways, and/or specialty wiring method assemblies taken all together complete with associated junction boxes, pull boxes, outlet boxes, joints, couplings, splices and connections except where limited to a lesser meaning by specific description.
- C. "Wiring" -- Same as Circuitry.
- D. "Circuit" -- Any specific run of circuitry.
- E. "Branch Circuit" -- Any light and power distribution system circuit which, at its load end, is directly connected to one or more electrical energy consuming items with no overcurrent protection devices interposed, other than (where required) those protecting the energy consuming items from overloading or overheating.
- F. "Appliance Panel" -- Any panel, used in a light and power distribution system, containing single pole and/or multipole branches rated in various sizes.
- G. "Lighting Panel" -- Any panel used in a light and power distribution system, having all (or the majority) of its branches single pole and rated the same.
- H. "Lighting and Appliance Branch Circuitry" -- All or any portion of branch circuits outgoing from a lighting or appliance panel or panelette.
- I. "Feeder" -- Any item of light and power circuitry used in a distribution system which is not lighting and appliance branch circuitry.
- J. "Main Feeder" -- Any feeder which, at its supply end, is connected through its own overcurrent protection (and switching) device, and none other, directly to a main service or a main service overcurrent protection (and switching) device.

- K. "Branch Feeder" -- A feeder, other than a main feeder, which complies with the definition of a branch circuit.
- L. "Submain Feeder" -- Any feeder which is neither a main feeder nor a branch feeder.
- M. "Distribution Panel" -- Any panel, used in a light and power distribution system, containing only multi-pole branches and with all (or the majority) of its branches used for feeders supplying other panels. "Power Panel" -- Same as distribution panel, except with all (or the majority) of its branches used for feeders which do not supply other panels.
- N. "Motor Power Circuit" -- Any circuit which operates nominally at 100 volts or more, and which carries electrical input energy to a motor.
- O. "Motor Control Circuit" (used in conjunction with a motor for which a magnetic starter is supplied) -- Any circuit (other than a motor power circuit), which operates nominally at 100 volts or more, and which carries current intended for directing or indicating the performance of a motor starter. "Motor Control Circuit" (used in conjunction with a motor for which a manual starter is supplied) -- Any circuit containing an extension of power circuit wires, other than those constituting the direct connection between source of supply, starter and motor.
- P. "Motor Control Actuating Device" -- Any device which performs a switching function in a motor control circuit (pushbuttons, automatic contacting devices, etc.).
- Q. "Motor Control Actuated Device" -- Any device which functions in response to voltage received from a motor control circuit (pilot lights, solenoids, etc.)
- R. "Package Unit" -- An item of equipment having one or more motors or other electric energy consuming elements integrally factory mounted on a single base, complete with all associated control devices and interconnecting wiring.
- S. "Low Voltage" -- Below 50 volts.
- T. "Process Control System" -- An overall control and/or logging system of a low voltage, electronic or pneumatic type available as a fully installed "package" from specialty manufacturers (commonly referred to as a "Temperature Control System" or an "Automatic Control System" or a "Building Management System" where used in conjunction with air conditioning).
- U. "Grade Slab" -- A building floor slab which is in contact with or directly over grade (earth). "Building Confines" -- The extent of a building, as defined by the outside surfaces of its peripheral walls, the top surface of its roof, and the underside surface of its grade slab.
- V. "Distribution Switch" -- Any switch used in a light and power system other than a tumbler, toggle or specialty switch in the "wiring device" category.
- W. "Normal Electric Work Conditions" -- Locations within building confines which are neither damp, wet nor hazardous and which are not used for air handling.
- X. "Underground" -- Subsurface and exterior to building foundations.
- Y. "At Underside of Grade Slab" -- Under a grade slab and integrated into it.
- Z. "Below Grade Slab" -- Under a grade slab but not integrated into it.

- AA. "Standard" (as applied to wiring devices) -- Not of a separately designated individual type. "Raceway" -- Any pipe, duct, extended enclosure, or conduit (as specified for a particular system) which is used to contain wires, and which is of such nature as to require that the wires be installed by a "pulling in" procedure.
- BB. "Concealed" (as applied to circuitry) -- Covered completely by building materials, except for penetrations (by boxes and fittings) to a level flush with the surface as necessitated by functional or specified accessibility requirements.
- CC. "Exposed" (as applied to circuitry) -- Not covered in any way by building materials.
- DD. "Subject to Mechanical Damage" -- Exposed within seven feet of the floor in mechanical rooms, manufacturing spaces, vehicular spaces, or other spaces where heavy items (over 100 pounds) are moved around or rigged as a common practice or as required for replacement purposes.
- EE. "Secondary" (as applied to light and power distribution) -- Under 600 volts.
- FF. "Assembly" -- A defined set of elements of electric work.
- GG. Where the word "conduit" is used without specific reference to type, it shall be understood to mean "raceway."
- HH. Except where modified by a specific notation to the contrary, it shall be understood that the indication and/or description of any electrical item in the drawings and specifications for electrical work carries with it the instruction to furnish, install and connect the item as part of the electrical work regardless of whether or not this instruction is explicitly stated.
- II. It shall be understood that the specifications and drawings are complementary and are to be taken together for a complete interpretation of the work. Where there are conflicts between the drawings and specifications or within the specifications or drawings themselves, the items of higher standard shall govern.
- JJ. No exclusion from or limitation in, the symbolism used on the drawings for electrical work or the language used in the specifications for electrical work shall be interpreted as a reason for omitting the appurtenances or accessories necessary to complete any required system or item of equipment.
- KK. The drawings for electrical work utilize symbols and schematic diagrams which have no dimensional significance. The work shall, therefore, be installed to fulfill the diagrammatic intent expressed on the electrical drawings, but in conformity with the dimensions indicated on the final working drawings, field layouts and shop drawings of all trades. In particular, information as to the exact size, location and electrical connection points for mechanical equipment shall be derived by reference to HVAC and Plumbing documents.
- LL. Certain details appear on the drawings for electrical work which are specific with regard to the dimensioning and positioning of the work. These are intended only for general information purposes. They do not obviate field coordination for individual items of the indicated work.
- MM. Information as to general construction and architectural general construction and architectural features and finishes shall be derived from structural and architectural drawings and specifications only.
- NN. The use of words in the singular shall not be considered as limiting where other indications denote that more than one item is referred to.

- OO. Ratings of devices, materials and equipment specified without reference to specific performance criteria shall be understood to be nominal or nameplate ratings established by means of industry standard procedures.

#### 1.14 INTERPRETATION OF THE DRAWINGS AND SPECIFICATIONS

- A. The drawings show the general layout of the various items of equipment. However, the drawings, in general, are diagrammatic and indicate sizes, general locations and equipment connections and do not necessarily indicate every required fitting, support or similar items required for a complete installation. Provide all necessary offsets, fittings, hangers, supports, valves, drains as required for a complete and fully operational mechanical system.
- B. Except where modified by a specific notation to the contrary, it shall be understood that the indication and/or description of any item, in the drawings or specifications or both, carries with it the instruction to furnish and install the item, regardless of whether or not this instruction is explicitly stated as part of the indication or description.
- C. The contractor shall follow the drawings in laying out the work and check drawings of all trades to verify spaces in which work will be installed. Maintain maximum headroom and where space conditions appear inadequate, the Commissioner shall be notified before proceeding with the installation.
- D. It shall be understood that the specifications and drawings are complementary and are to be taken together for a complete interpretation of the work. Where there are conflicts between the drawings and specifications or within the specifications or drawings themselves, the items of higher standard shall govern.
- E. No exclusions from, or limitations, in the language used in the drawings or specifications shall be interpreted as meaning that the appurtenances or accessories necessary to complete any required system or item of equipment are to be omitted.
- F. No interpretation shall be made from the limitations of symbols and diagrams that any elements necessary for complete work are excluded.
- G. Certain details appear on the drawings which are specific with regard to the dimensioning and positioning of the work. These details are intended only for the purpose of establishing general feasibility. They do not obviate field coordination for the indicated work.
- H. Typical details, where shown on the drawings, apply to each and every item of the project where such items are applicable. Typical details are not repeated in full on the plans and are diagrammatic only, but with the intention that such details shall be incorporated in full.
- I. Information as to the general construction shall be derived from structural and architectural drawings and specifications only.
- J. The use of words in the singular shall not be considered as limiting where other indications denote that more than one item is referred to.

#### 1.15 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.
- B. Deliver, store and handle all materials to keep clean and protected from damage.

- C. Equipment shall be shipped with all listed items and control wiring factory installed unless specified otherwise herein and specifically noted on the submittals as a substitution.
- D. Ship materials and equipment in crated sections of sizes to permit passing through available spaces, where required. Store products in shipping containers and maintain in place until installation.
- E. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.
- F. The Vendor shall shrink-wrap all electronic equipment and spare parts prior to shipping.
- G. Store products in shipping containers and maintain in place until installation.
- H. Protect stored pipes and tubes from moisture and dirt. Elevate above grade. When stored inside, do not exceed structural capacity of floor.
- I. Protect flanges, fittings, and piping specialties from moisture and dirt.
- J. Protect stored plastic pipes from direct sunlight. Support to prevent sagging and bending.
- K. Protect equipment and other materials from damage after installed from construction debris and other damage.
- L. The Contractor shall check all materials and equipment upon their arrival on the Project Site and verify their condition and compliance with the Contract documents.

#### 1.16 PROTECTION AND CLEANING

- A. The inlet and discharge opening of all terminal units as well as all duct and pipe openings (end pieces) shall be kept capped until all local plastering, parging, etc. is completed, and the units are ready to run.
- B. Equipment and material if left in the open and damaged shall be replaced, repainted, or otherwise refurbished at the discretion of the Commissioner. Equipment and material is subject to rejection and replacement if in the opinion of the Commissioner, or in the opinion of the manufacturer's engineering department, the equipment has deteriorated or been damaged to the extent that its immediate use is questionable, or that its normal life expectancy has been curtailed.
- C. During the erection, protect all ductwork, duct lining, insulation, piping, and equipment from damage and dirt. Cap the openings of all ductwork and piping installed. After completion of project, clean the exterior and interior surface of all equipment.

#### 1.17 FIRE AND SMOKE DETECTION

- A. The ductwork and sheet metal work in this project provide suitable openings (as recommended the Smoke Detection System Manufacturer) in sheet metal for sensing elements of the building's specified fire and smoke detection systems. See Section 28 31 11 "Fire Alarm and Integrated Audio/Visual Evacuation System.
- B. Provide access doors to make all such detection heads accessible. See Section 08 31 13 "Access Doors and Frames" for access door requirements.

- C. Provide bracing for smoke detections sampling tubes which exceed 48" in length.

#### 1.18 ACCESS PANELS

- A. See Section 08 31 13 "Access Doors and Frames" for access door requirements.
- B. Locate access panels to access valves, traps, control valves or devices, dampers, damper motors, etc. Access panels shall be sized as necessary for ample access, or as indicated on drawings, but no smaller than 18" x 18" where devices are within easy reach of operator, and at least 24"x24" when operator must pass through opening in order to reach the devices.
- C. Access panels in fire rated walls or ceilings must be U.L. labeled for intended use.

#### 1.19 GUARANTEES AND CERTIFICATIONS

- A. All work shall be guaranteed to be free from leaks or defects. Any defective materials or workmanship as well as damage to the work of all trades resulting from same shall be replaced or restored as directed for the duration of stipulated guaranteed periods.
- B. The duration of guarantee periods following the date of beneficial use of the system shall be one year. Beneficial use is defined as operation of the system to obtain its intended use. For example, in the case of refrigeration systems, it means that the plant has a cooling load. Similarly, for all other systems.
- C. The date of acceptance shall be the date of the final payment for the work or the date of a formal notice of acceptance, whichever is earlier.
- D. Non-durable replaceable items such as air filter media do not require replacement after the date of acceptance. If received in writing, requests to have earlier acceptance dates established for these items will be honored.
- E. Certification shall be submitted attesting to the fact that specified performance criteria are met by all items of heating and air conditioning equipment.

#### 1.20 SEISMIC AND WIND RESTRAINTS DESIGN

- A. It shall be understood that the requirements of this seismic section are complementary to requirements delineated elsewhere for the support and fastening of equipment and, piping work nothing on the drawings or specifications shall be interpreted as a reason to waive the requirements of this seismic section.
- B. This project requires special provisions for the support and restraint of equipment, piping, ductwork, etc., in the event of earthquake or wind condition so as to comply with the latest edition of the NYCBC 2014.
- C. Contractor shall provide all required design services, labor, materials, tools and equipment necessary for a complete seismic and wind restraint system for all isolated and non-isolated equipment as indicated in these documents or which may be reasonably implied as essential, whether mentioned in the drawings and specifications or not.
- D. It is the intent of the seismic section of this specification to keep all HVAC building system components in place during a seismic or wind event and operational after the seismic event.

- E. As part of the work, Contractor shall engage the services of a professional engineer, licensed in the State of New York, with experience in the field of equipment support, wind and seismic restraints. He shall select and coordinate the restraints and supports based on the final coordinated drawings showing exact location of piping and equipment and shall coordinate with the Commissioner to ascertain that the connections to the structure will resist the wind and seismic forces to which they might be subjected.
- F. Seismic and wind support and restraints are specified on the drawings as well as under another section of this work.

## **PART 2 - PRODUCTS**

- 2.1 As Herein Specified in Division 26 Sections.

## **PART 3 - EXECUTION**

### **3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

### **3.2 ROUGH-IN**

- A. Verify final locations for rough-ins with field measurements and with the requirements of the actual equipment to be connected.
- B. Refer to equipment specifications for rough-in requirements.

### **3.3 ELECTRICAL INSTALLATIONS**

- A. General: Sequence, coordinate, and integrate the various elements of electrical systems, materials, and equipment. Comply with the following requirements:
  - 1. Coordinate electrical systems, equipment, and materials installation with other building components.
  - 2. Verify all dimensions by field measurements.
  - 3. Arrange for chases, slots, and openings in other building components during progress of construction, to allow for electrical installations.
  - 4. Coordinate the installation of required supporting devices and sleeves to be set in poured-in-place concrete and other structural components, as they are constructed.
  - 5. Sequence, coordinate, and integrate installations of electrical materials and equipment for efficient flow of the Work. Give particular attention to large equipment requiring positioning prior to closing in the building.
  - 6. Where mounting heights are not detailed or dimensioned, install systems, materials, and equipment to provide the maximum headroom possible.
  - 7. Coordinate connection of electrical systems with exterior underground and overhead utilities and services. Comply with requirements of the Commissioner of NYC Dept. of Bldgs., franchised service companies, and controlling agencies. Provide required connection for each service.
  - 8. Install systems, materials, and equipment to conform with approved submittal data, including coordination drawings, to greatest extent possible. Conform to arrangements indicated by the Contract Documents, recognizing that portions of the Work are shown only in diagrammatic form. Where coordination requirements conflict with individual system requirements, refer conflict to the Commissioner.

9. Install systems, materials, and equipment level and plumb, parallel and perpendicular to other building systems and components, where installed exposed in finished spaces.
10. Install electrical equipment to facilitate servicing, maintenance, and restore or replacement of equipment components. As much as practical, connect equipment for ease of disconnecting, with minimum of interference with other installations.
11. Install systems, materials, and equipment giving right-of-way priority to systems required to be installed at a specified slope.

### 3.4 CUTTING AND PATCHING

- A. General: Perform cutting and patching in accordance with DDC General Conditions. In addition to the requirements specified in DDC General Conditions, the following requirements apply:
  1. Perform cutting, fitting, and patching of electrical equipment and materials required to:
    - a. Uncover Work to provide for installation of ill-timed Work.
    - b. Remove and replace defective Work.
    - c. Remove and replace Work not conforming to requirements of the Contract Documents.
    - d. Upon written instructions from the Commissioner, uncover and restore Work to provide for the Commissioner's observation of concealed Work.
  2. Protection of Installed Work: During cutting and patching operations, protect adjacent installations.

### 3.5 ESSENTIAL ELECTRICAL SYSTEM

- A. This project will be supplied at 208/120 volts, 3-phase, 4-wire, 60 HERTZ from Con Edison.
  - B. Power shall be delivered from normal and emergency switchboards.
  - C. The facility will be backed-up by a diesel driven engine generator set.
  - D. Emergency power distribution shall be accomplished through circuit breaker type Panelboards(s).
  - E. Power will be transferred automatically via automatic transfer switch(s).
- B. Those items to be connected to the emergency power system will generally be indicated on the drawings, however, the following items shall be connected to the emergency power system shall include, but not be limited to, the following:
1. Life Safety Branch:
    - a. Lighting at:
      - 1) All exit signs
      - 2) Fixtures on all stair landings
      - 3) Selected fixtures in corridors and main routes of egress
      - 4) Selected fixtures in conference rooms

### 3.2 Voltage

- A. 120/208V system shall be utilized for

1. All lighting
  2. Office equipment and receptacles
  3. Motors
- B. Electric service is being provided by a Con Edison REACH, at 208/120 volt, 3-phase, 4-wire via an underground electric service.
- C. Division of responsibilities shall be as follows:
1. Utility company i.e. Con Ed shall
    - a. Provide 208/120v service feeders (REACH) to property line box and connections at same.
- D. Contractor shall provide:
1. All work and installation associated with property line box (P.L.B.) i.e. disconnect manhole, service crabs and service drop from crabs to service end box, service end box and conduits from P.L.B. and service switchboard.
  2. All work shall be in conformance with these specifications and appropriate Con Edison specifications and drawings as hereinafter listed and/or as indicated on construction documents.
- |    | Document  | Description  |
|----|-----------|--|
| a. | EO-1005   | Cementations Water Proofing for Distribution Structure   |
| b. | EO-1007   | Membrane Method of Waterproofing Electrical Distribution Structures                                |
| c. | EO-1008   | Plain and Reinforced Concrete  |
| d. | EO-1121   | Structural Design Procedures for Manholes and Vaults   |
| e. | EO-2113   | Transfer of Load From Company's Supply to Customer's Emergency Generators                          |
| f. | EO-4082   | Operation and Maintenance – Conduit Systems, Cables and Equipment – Private Prop Lt Meter Install. |
| g. | EO-4152   | Buildings During Extreme Emergencies   |
| h. | EO-5089   | Performance Specification for Duct Sealing Compounds.  |
| i. | EO-8413-A | Mounting Details and Wiring for 1000-4000 AMP. Window Type Current Transformers                    |

### 3.3 MISCELLANEOUS SYSTEMS

- A. Mechanical Equipment Power Requirements
1. Mechanical equipment for this project will generally be operated at 208 volts, 3-phase.
  2. Power for the mechanical equipment shall be derived from both the normal building power and emergency power.
  3. Power shall be supplied from the main distribution panel and building power panels.
  4. Motors shall operate on 208 3-phase or 120 volts, 1-phase.
  5. Fire pump controllers shall be as supplied under Fire Protection Scope Division and shall be connected as follows:
    - a. Normal building power shall be provided from normal distribution system, sized to be capable of carrying the locked rotor current of the fire pump motor indefinitely.
    - b. Emergency building power shall be provided from the emergency system, to the fire pump controller which shall have an automatic transfer switch integral to the

- fire pump controller which is furnished under the fire protection system.
- c. Emergency power feeder to the fire pump ATS controller shall be full weight rigid galvanized and provided with 1 hr fire protection enclosure.
- d. Normal power feeder run to the fire pump/ATS controller shall be installed in galvanized steel rigid conduit encased in 2-hour concrete envelope or equivalent alternate system.

**B. Electrical Connections to Equipment and Systems**

1. Wiring shall be provided under this scope of work, except the following, which shall be provided by under another Division:
  - a. Wiring and devices necessary for control and sequence of operation shall be supplied, wired, installed and connected under Division 23, unless noted elsewhere.
  - b. Associated temperature control wiring.
2. Starters, disconnect switches, and combination fused starter disconnect switches, and motor control centers shall be furnished, wired and installed under Division 26. Where equipment is specified to be supplied factory installed or shipped loose with the equipment, the furnishing and installation shall come under Division 23 with the power wiring under 26.
3. Fuses, overload elements, control transformers, and accessories shall be supplied and installed under the Division supplying the starters, disconnect switches, and other control devices.
4. The Division responsible for furnishing the equipment to be controlled shall furnish all control devices required for the equipment to operate, regardless of whether the device is to be wired in a control or power circuit.
5. The horsepower rating of starters shall be checked against the actual motor to be controlled before installation, and correct size overload elements shall be provided in starters based on name plate and manufacturer's recommendations.

**C. Boiler Plant Wiring:**

1. Responsibility for wiring shall be divided as follows:
  - a. Under Electrical Work wiring from power source to local disconnect switch adjacent to boiler panel and wiring from break-glass switches to boiler control panel.
2. Under HVAC Work
  - a. Wiring beyond local disconnect switch

**D. Fire Smoke Dampers**

1. Furnish transformer, conduit and wire for smoke and fire damper release system for systems. Smoke and fire damper units shall be provided under another Division 23 of the specification. Contractor shall make complete connections between fire and smoke damper power supplies and respective BMS control panel.
2. Contractor shall coordinate secondary voltage of transformers with voltage of smoke and fire damper units as finally purchased. Transformer shall be mounted in recessed cabinets with hinged door and shall be a maximum of 4 inches deep.
3. Wiring shall be installed in conduit as specified for light and power.

E. Refrigeration Plant Wiring

1. Under Division 26:

- a. Wiring from power source to controllers and motors.
- b. Wiring from break-glass switches to unit control panels, and refrigeration room exhaust fans.

2. Under Division 23

- a. Wiring from unit control panels to and between refrigeration unit control devices.
- b. Break-glass switches.

F. HVAC Control Wiring

- 1. In accordance with applicable wiring diagrams and schedules, the following work shall be provided:
  - a. All control wiring interlocks between starters on Motor Control Centers.
  - b. All control wiring for smoke detection and control systems.
  - c. Mounting of starters and auxiliary electrical devices.
  - d. Power supply for Mechanical control panels.

G. Elevators

- 1. Refer to Division 26 05 12 and DDC General Conditions 4 10 00 for scope of work.

3.4 TESTING ADJUSTING AND BALANCING

A. All tests shall be performed prior to acceptance of equipment and or systems.

B. All tests shall be performed in accordance these specifications and applicable and or at least these codes:

- 1. NYC Electrical code (NFPA 70 2005)
- 2. NFPA 110
- 3. NFPA 99
- 4. NFPA 72
- 5. International Testing Association
- 6. NETA

C. In addition to specific test requirements for systems indicated hereinafter all equipment components and systems shall be tested as follows:

D. Polarity: A verification of polarity shall be made, and it shall be ensured that all fuses, circuit breakers and control devices are connected in the line side (hot) conductors only. Bayonet and Edison socket lamp holders shall have their outer shell connected to the neutral. Polarity of all receptacles shall be verified.

E. Ground Continuity Test: A ground continuity test shall be made between main ground system and equipment frame, and system neutral. A minimum of 10 amps D.C. shall be used between ground reference and each ground point tested. Resistance shall be calculated and shall not exceed 25 ohms.

F. Insulation:

1. This test shall be made before the installation is completed. The installation may be divided into sections containing up to 50 outlets. D.C. voltage of 1000 VDC shall be applied for the measurement of insulation resistance.
2. When insulation resistance must be determined with all switchboards, panelboard's, fuse holders, switches, and Overcurrent devices in place, the insulation resistance, when tested at 500 DVC shall be no less than 1 megohm for No.14 and No.12 AWG and 250k ohm for circuits 25 amps and above. Perform insulation resistance test of each cable with respect to ground and adjacent cable.
3. Wherever practicable, so that all parts of the wiring may be tested, all lamps shall be removed and all current using apparatus shall be closed; where the removal of lamps and/or the disconnection of current using apparatus are impracticable, the local switches controlling such lamps and/or apparatus shall be open. This test is not applicable to ground concentric wiring system.
4. Where apparatus is disconnected for the tests, the insulation resistance between the case or framework and all live parts of each item of fixed apparatus shall be measured separately and shall be not less than 0.5 megohm.

G. Phase Balancing: All feeders and branch circuits shall be connected to panelboards main distribution panels, and switchboard, so that loads are distributed equally on all phases.

H. Ground electrode Resistance

1. Prior to installing the ground electrode system, the contractor shall carry out ground resistance tests for all relevant locations.
2. The total resistance of each ground electrode system shall be 25-ohm maximum between earth and ground.

I. Switchboard and Panels

1. Test the switchboards, panels and cubicle type equipment as follows:
  - a. 1000 volt D.C. insulation test.
  - b. Current transformer polarity test.
  - c. Polarity test on main connection using 1000-volt megger test –phase-phase.
  - d. 1000-volt megger test –phase- earth.
  - e. Simulation of all control functions.
  - f. Trip and close operations.
2. The entire switchboard shall be subjected, after completed assembly, to a high potential test of the switchboard to rated voltage plus 1000 volts. Any defects which develop shall be corrected and the manufacturer shall certify that the equipment has been subjected to the high potential test and no ground or crosses are indicated.

J. Distribution Cables

1. All main distribution cables shall be subjected to 1000-volt megger tests between phase – phase, and phase – earth. The minimum resistance acceptable shall be 1 megohm measured under damp conditions.
2. Tests on cables shall be carried out after installation and joining.

K. Lighting

1. Demonstrate to Commissioner that all lighting, ballasts, wiring and equipment are in proper condition. All fixtures shall be complete with clean and undamaged components.

**L. Fire Alarm System**

1. Wiring shall be checked and tested by the Contractor in accordance with the instructions provided by the manufacturer to assure that the system is free of grounds, opens and shorts.
2. Upon completion of the installation, a factory-instructed technician shall perform necessary electrical test and adjustments and demonstrate the operation of the system to Commissioner and NYC Building Department.
3. Every manual station shall be tested.
4. Every smoke detector shall be tested by manufacturer's properly trained tester and approved methods.
5. Sprinkler and dry pipe systems shall be tested by flowing water, closing valves, and testing air pressure on dry systems.
6. All circuits shall be opened at two locations to test for supervision.
7. Speakers shall be checked for proper sound levels.
8. Telephone jacks and phones shall be tested.
9. Stair Pressurization System.
10. Smoke doors and hatch operation.

- M.** At the completion of this installation, the manufacturer shall issue a letter to Commissioner and the Contractor certifying that the system is installed and operating in accordance with the contract documents and requirements of NYC Building Department.

**3.5 ADJUSTMENTS**

- A.** Adjustments of the system(s) shall be accomplished to the complete satisfaction of The Commissioner at the time installation is completed.

**3.6 PAINTING**

- A.** Painting of electrical systems, equipment, and components is specified in Section 09 91 00 "Painting".
- B.** Damage and Touchup: Restore marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

**3.7 CONCRETE BASES**

- A.** Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.
1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.
  2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.
  3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
  4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  5. Install anchor bolts to elevations required for proper attachment to supported equipment.

6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
  7. Use 3000-psi, 28-day compressive-strength concrete and reinforcement as specified in Section 03 30 00 "Cast-in-Place Concrete."
- B. Coordinate concrete base height with air handling unit manufacturer to assure proper coil condensate drainage.

**END OF SECTION 26 05 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 19****LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
  - 1. Building wires and cables rated 600 V and less.
  - 2. Connectors, splices, and terminations rated 600 V and less.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**PART 2 - PRODUCTS****2.1 CONDUCTORS AND CABLES**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Alcan Products Corporation; Alcan Cable Division.
  2. Alpha Wire.
  3. Belden Inc.
  4. Encore Wire Corporation.
  5. General Cable Technologies Corporation.
  6. Southwire Incorporated.
  7. Or approved equal.
- B. Copper Conductors: Comply with NEMA WC 70/ICEA S-95-658.
- C. Conductor Insulation: Comply with NEMA WC 70/ICEA S-95-658 for Type THHN-2-THWN-2, Type XHHW-2, Type UF, Type USE, and, Type SO as required by location.
- D. Multiconductor Cable: Comply with NEMA WC 70/ICEA S-95-658 for armored cable, Type A, metal-clad, Type MC, mineral-insulated, metal-sheathed cable, Type MI, Type SO and Type USE with ground wire.

**2.2 CONNECTORS AND SPLICES**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AFC Cable Systems, Inc.
  2. Hubbell Power Systems, Inc.
  3. Ideal Industries, Inc.
  4. IlSCO; a brand of Bardes Corporation.
  5. NSI Industries LLC.
  6. O-Z/Gedney; a brand of the EGS Electrical Group.
  7. 3M; Electrical Markets Division.
  8. Tyco Electronics.
  9. Or approved equal.
- B. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

**2.3 SYSTEM DESCRIPTION**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.

**PART 3 - EXECUTION**

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 CONDUCTOR MATERIAL APPLICATIONS

- A. Feeders: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.
- B. Branch Circuits: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger, except VFC cable, which shall be extra flexible stranded.

### 3.3 INSTALLATION OF CONDUCTORS AND CABLES

- A. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.
- B. Complete raceway installation between conductor and cable termination points according to Section 26 05 33 "Raceways and Boxes for Electrical Systems" prior to pulling conductors and cables.
- C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
- D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips that will not damage cables or raceway.
- E. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.
- F. Support cables according to Section 26 05 29 "Hangers and Supports for Electrical Systems."
- G. Complete cable tray systems installation according to Section 26 05 36 "Cable Trays for Electrical Systems" prior to installing conductors and cables.

### 3.4 CONNECTIONS

- A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
- C. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

### 3.5 IDENTIFICATION

- A. Identify and color-code conductors and cables according to Section 260553 "Identification for Electrical Systems."
- B. Identify each spare conductor at each end with identity number and location of other end of conductor, and identify as spare conductor.

**3.6 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS**

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 26 05 44 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

**3.7 FIRESTOPPING**

- A. Apply fire stopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 07 84 10 "Firestopping."

**3.8 FIELD QUALITY CONTROL**

- A. Testing Agency: Engage qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
  - 1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors and conductors feeding distribution panelboards.
  - 2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Training Specification. Certify compliance with test parameters.
  - 3. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each splice in conductors No.3 AWG and larger. Remove box and equipment covers so splices are accessible to portable scanner. Correct deficiencies determined during the scan.
    - a. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each splice 11 months after date of Substantial Completion.
    - b. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
    - c. Record of Infrared Scanning: Prepare a certified report that identifies splices checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
- D. Test and Inspection Reports: Prepare a written report to record the following:
  - 1. Procedures used.
  - 2. Results that comply with requirements.
  - 3. Results that do not comply with requirements and corrective action taken to achieve compliance with requirements.
- E. Cables will be considered defective if they do not pass tests and inspections.

**END OF SECTION 26 05 19**

**SECTION 26 05 26****GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes grounding and bonding systems and equipment, plus the following special applications:
  - 1. Underground distribution grounding.
  - 2. Ground bonding common with lightning protection system.
  - 3. Foundation steel electrodes.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Subject to compliance with requirements, provide products by one of the following:

1. Burndy; part of Hubbell Electrical Systems.
2. Dossert; AFL Telecommunications LLC.
3. ERICO International Corporation
4. O-Z/Gedney; a brand of the EGS Electrical Group.
5. Siemens Power Transmission & Distribution, INC.
6. Or approved equal.

**2.2 SYSTEM DESCRIPTION**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with UL467 for grounding and bonding materials and equipment.

**2.3 CONDUCTORS**

- A. Insulated Conductors: Copper wire or cable insulated for 600 V unless otherwise required by New York City Electrical Code 2014.
- B. Bare Copper Conductors:
1. Solid Conductors: ASTM B 3.
  2. Stranded Conductors: ASTM B 8.
  3. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch in diameter.
  4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
  5. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
- C. Grounding Bus: Predrilled rectangular bars of annealed copper, 1/4 by 4 inches in cross section, with 9/32-inch holes spaced 1-1/8 inches apart. Stand-off insulators for mounting shall comply with UL 891 for use in switchboards, 600 V and shall be Lexan or PVC, impulse tested at 5000 V.

**2.4 CONNECTORS**

- A. Listed and labeled by an NRTL acceptable to New York City Building Code 2014 and New York City Electrical Code 2011 for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.
- B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy.

- C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.
- D. Bus-Bar Connectors: Mechanical type, cast silicon bronze, solderless compression - type wire terminals, and long-barrel, two-bolt connection to ground bus bar.

## 2.5 GROUNDING ELECTRODES

- A. Ground Rods: Copper-clad 3/4 inch by 10 feet
- B. Chemical-Enhanced Grounding Electrodes: Copper tube, straight or L-shaped, charged with nonhazardous electrolytic chemical salts
  - 1. Termination: Factory-attached No. 4/0 AWG bare conductor at least 48 inches long.
  - 2. Backfill Material: Electrode manufacturers recommended material.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 APPLICATIONS

- A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.
- B. Underground Grounding Conductors: Install bare copper conductor, No. 2/0 AWG minimum.
  - 1. Bury at least 24 inches below grade.
  - 2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.
- C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.
- D. Grounding Bus: Install in electrical equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
  - 1. Install bus horizontally, on insulated spacers 2 inches minimum from wall, 6 inches above finished floor unless otherwise indicated.
  - 2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down; connect to horizontal bus.
- E. Conductor Terminations and Connections:
  - 1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
  - 2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
  - 3. Connections to Ground Rods at Test Wells: Bolted connectors.
  - 4. Connections to Structural Steel: Welded connectors.

### 3.3 GROUNDING AT THE SERVICE

- A. Equipment grounding conductors and grounding electrode conductors shall be connected to the ground bus. Install a main bonding jumper between the neutral and ground buses.

### 3.4 GROUNDING SEPARATELY DERIVED SYSTEMS

- A. Generator: Install grounding electrode(s) at the generator location. The electrode shall be connected to the equipment grounding conductor and to the frame of the generator.

### 3.5 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

- A. Comply with IEEE C2 grounding requirements.
- B. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches will extend above finished floor. If necessary, install ground rod before manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, nonshrink grout.
- C. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Instruct conductor's level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.

### 3.6 EQUIPMENT GROUNDING

- A. Install insulated equipment grounding conductors with all feeders and branch circuits.
- B. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:
  - 1. Feeders and branch circuits.
  - 2. Lighting circuits.
  - 3. Receptacle circuits.
  - 4. Single-phase motor and appliance branch circuits.
  - 5. Three-phase motor and appliance branch circuits.
  - 6. Flexible raceway runs.
  - 7. Armored and metal-clad cable runs.
- C. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.
- D. Water Heater, and Heat-Tracing, Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

- E. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.
- F. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.
- G. Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.
- H. Metallic Fences: Comply with requirements of IEEE C2.
  - 1. Grounding Conductor: Bare copper, not less than No. 8 AWG.
  - 2. Gates: Shall be bonded to the grounding conductor with a flexible bonding jumper.
  - 3. Barbed Wire: Strands shall be bonded to the grounding conductor.

### 3.7 INSTALLATION

- A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to impact or damage.
- B. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor and install in conduit.
- C. Ground Rods: Drive rods until tops are 2 inches below finished floor or final grade unless otherwise indicated.
  - 1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
  - 2. For grounding electrode system, install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.
- D. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Section 260543 "Underground Ducts and Raceways for Electrical Systems," and shall be at least 12 inches deep, with cover.
  - 1. Test Wells: Install at least one test well for each service unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.
- E. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

**F. Grounding and Bonding for Piping:**

1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

**G. Bonding Interior Metal Ducts:** Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned bonding jumper to bond across flexible duct connections to achieve continuity.

**H. Grounding for Steel Building Structure:** Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 feet apart.

**I. Ground Ring:** Install a grounding conductor, electrically connected to each building structure ground rod and to each steel column as indicated and extending around the perimeter of building.

1. Install copper conductor not less than No. 2/0 AWG for ground ring and for taps to building steel.
2. Bury ground ring not less than 24 inches from building's foundation.

**J. Concrete-Encased Grounding Electrode (Ufer Ground):** Fabricate according to NFPA 70; use a minimum of 20 feet of bare copper conductor not smaller than No. 4 AWG.

1. If concrete foundation is less than 20 feet long, coil excess conductor within base of foundation.
2. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building's grounding grid or to grounding electrode external to concrete.

**K. Concrete-Encased Grounding Electrode (Ufer Ground):** Fabricate according to NFPA 70; using electrically conductive coated steel reinforcing bars or rods, at least 20 feet long. If reinforcing is in multiple pieces, connect together by the usual steel tie wires or exothermic welding to create the required length.

**3.8 FIELD QUALITY CONTROL**

**A. Testing Agency:** Shall be selected and approved by the Commissioner a qualified testing agency to perform tests and inspections.

- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- D. Tests and Inspections:
  - 1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
  - 2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
  - 3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells, and at individual ground rods. Make tests at ground rods before any conductors are connected.
    - a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
    - b. Perform tests by fall-of-potential method according to IEEE 81.
  - 4. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.
- E. Grounding system will be considered defective if it does not pass tests and inspections.
- F. Prepare test and inspection reports.
- G. Report measured ground resistances that exceed the following values:
  - 1. Power and Lighting Equipment or System with Capacity of 500 to 1000 kVA: 5 ohms.
  - 2. Power Distribution Units or Panelboards Serving Electronic Equipment: 3 ohm(s).
  - 3. Substations 5 ohms.
- H. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Commissioner promptly and include recommendations to reduce ground resistance.

**END OF SECTION 26 05 26**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 29****HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. This Section includes the following:
1. Hangers and supports for electrical equipment and systems.
  2. Construction requirements for concrete bases.
- B. Related Sections include the following:
1. Section 26 05 48 "Vibration and Seismic Controls for Electrical Systems" for products and installation requirements necessary for compliance with seismic and vibration criteria.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

1.7 DEFINITIONS

- A. EMT: Electrical metallic tubing.
- B. IMC: Intermediate metal conduit.
- C. RMC: Rigid metal conduit.

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Allied Tube & Conduit.
    - b. Cooper B-Line, Inc.; a division of Cooper Industries.
    - c. ERICO International Corporation.
    - d. Thomas & Betts Corporation.
    - e. Unistrut; Tyco International, Ltd.
    - f. Or approved equal.
  - 2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4
  - 3. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.
  - 4. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
  - 5. Channel Dimensions: Selected for applicable load criteria.
- B. Raceway and Cable Supports: Clevis hangers, riser clamps, conduit straps, threaded C clamps with retainers, ceiling trapeze hangers, wall brackets, and spring steel clamps.
  - 1. Fasteners: Types, materials, and construction features as follows:
  - 2. Expansion Anchors: Carbon steel wedge or sleeve type.
  - 3. Toggle Bolts: All steel springhead type.
- C. Power Driven Threaded Studs: Heat treated steel, designed specifically for the intended service.
  - 1. Conduit Sealing Bushings: Factory fabricated watertight conduit sealing bushing assemblies suitable for sealing around conduit, or tubing passing through concrete floors and walls. Construct seals with steel sleeve, malleable iron body, neoprene sealing grommets or rings, metal pressure rings, pressure clamps, and cap screws.

2. U Channel Systems: 16 gage steel channels, with 9/16-inch diameter holes, at a minimum of 8 inches on center, in top surface. Provide fittings and accessories that mate and match with U channel and are of the same manufacture.
- D. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.
- E. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
- F. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- G. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
  1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
    - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      - 1) Hilti Inc.
      - 2) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
      - 3) MKT Fastening, LLC.
      - 4) Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit.
      - 5) Or approved equal.
  2. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
    - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following.
      - 1) Cooper B-Line, Inc.; a division of Cooper Industries.
      - 2) Empire Tool and Manufacturing Co., Inc.
      - 3) Hilti Inc.
      - 4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
      - 5) MKT Fastening, LLC.
      - 6) Or approved equal.
  3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
  4. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
  5. Toggle Bolts: All-steel springhead type.
  6. Hanger Rods: Threaded steel.

## 2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

- A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.
- B. Materials: Comply with requirements in Section 055000 "Metal Fabrications" for steel shapes and plates.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 APPLICATION

- A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.
- B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NYC Electrical Code. Minimum rod size shall be 1/4-inch in diameter.
- C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
  - 1. Secure raceways and cables to these supports with single-bolt conduit clamps.
- D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

### 3.3 SUPPORT INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this Article.
- B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.
- C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
  - 1. To Wood: Fasten with lag screws or through bolts.
  - 2. To New Concrete: Bolt to concrete inserts.
  - 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
  - 4. To Existing Concrete: Expansion anchor fasteners.
  - 5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inches thick or

greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.

6. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69.
7. To Light Steel: Sheet metal screws.
8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.

- D. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

### 3.4 INSTALLATION OF FABRICATED METAL SUPPORTS

- A. Comply with installation requirements in Section 05 50 00 "Metal Fabrications" for site-fabricated metal supports.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
- C. Field Welding: Comply with AWS D1.1/D1.1M.

### 3.5 CONCRETE BASES

- A. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.
- B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 03 30 00 "Cast-in-Place Concrete."
- C. Anchor equipment to concrete base.
  1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  2. Install anchor bolts to elevations required for proper attachment to supported equipment.
  3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

### 3.6 PAINTING

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
  1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.
- B. Touchup: Comply with requirements in Section 09 91 00 "Painting" for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-restore paint to comply with ASTM A 780.

**END OF SECTION 26 05 29**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 33****RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes:

1. Metal conduits, tubing, and fittings.
2. Nonmetal conduits, tubing, and fittings.
3. Metal wireways and auxiliary gutters.
4. Nonmetal wireways and auxiliary gutters.
5. Surface raceways.
6. Boxes, enclosures, and cabinets.
7. Handholes and boxes for exterior underground cabling.

B. Related Requirements:

1. Section 26 05 43 "Underground Ducts and Raceways for Electrical Systems" for exterior duct banks, manholes, and underground utility construction.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. ARC: Aluminum rigid conduit.
- B. GRC: Galvanized rigid steel conduit.
- C. IMC: Intermediate metal conduit.

**PART 2 - PRODUCTS****2.1 METAL CONDUITS, TUBING, AND FITTINGS**

- A. Manufacturers: Subject to compliance with requirements provide products by one of the following:
  - 1. AFC Cable Systems, Inc.
  - 2. Allied Tube & Conduit; a TYCO International Ltd. Co.
  - 3. O-Z/Gedney; a brand of EGS Electrical Group.
  - 4. Robroy Industries.
  - 5. Southwire Company.
  - 6. Thomas & Betts Corporation.
  - 7. Western Tube and Conduit Corporation.
  - 8. Wheatland Tube Company; a division of John Maneely Company.
  - 9. Or approved equal.
- B. Listing and Labeling: Metal conduits, tubing, and fittings shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. GRC: Comply with ANSI C80.1 and UL 6.
- D. ARC: Comply with ANSI C80.5 and UL 6A.
- E. IMC: Comply with ANSI C80.6 and UL 1242.
- F. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit.
  - 1. Comply with NEMA RN 1.
  - 2. Coating Thickness: 0.040 inch, minimum.

- G. EMT: Comply with ANSI C80.3 and UL 797.
- H. FMC: Comply with UL 1; zinc-coated steel
- I. LFMC: Flexible steel conduit with PVC jacket and complying with UL 360.
- J. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
  - 1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886 and NFPA 70.
  - 2. Fittings for EMT:
    - a. Material: Steel.
    - b. Type: Setscrew or compression.
  - 3. Expansion Fittings: PVC or steel to match conduit type, complying with UL 651, rated for environmental conditions where installed, and including flexible external bonding jumper.
  - 4. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch, with overlapping sleeves protecting threaded joints.
- K. Joint Compound for IMC, GRC, or ARC: Approved, as defined in NFPA 70 2014, by New York City Electrical Code 2011 for use in conduit assemblies and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

## 2.2 METAL WIREWAYS AND AUXILIARY GUTTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Cooper B-Line, Inc.
  - 2. Hoffman; a Pentair company.
  - 3. Mono-Systems, Inc.
  - 4. Square D; a brand of Schneider Electric
  - 5. Or approved equal.
- B. Description: Sheet metal, complying with UL 870 and NEMA 250, Type 1, Type 3R, Type 4, Type 12 as required unless otherwise indicated, and sized according to NFPA 70.
  - 1. Metal wireways installed outdoors shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
- D. Wireway Covers: Hinged type or Flanged-and-gasketed type unless otherwise indicated.
- E. Finish: Manufacturer's standard enamel finish.

## 2.3 SURFACE RACEWAYS

- A. Listing and Labeling: Surface raceways and tele-power poles shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Surface Metal Raceways: Galvanized steel with snap-on covers complying with UL %. Manufacturer's standard enamel finish in color selected by Commissioner.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Panduit Corp.
    - b. Wiremold/Legrand.
    - c. Clark
    - d. Or approved equal.

## 2.4 BOXES, ENCLOSURES, AND CABINETS

- A. Manufacturers: Subject to compliance with requirements, Provide products by one of the following:
  - 1. Cooper Technologies Company; Cooper Crouse-Hinds.
  - 2. EGS/Appleton Electric.
  - 3. Wiremold/Legrand.
  - 4. Hoffman; a Pentair company.
  - 5. Hubbell Incorporated; Killark Division.
  - 6. Thomas & Betts Corporation.
  - 7. Or approved equal.
- B. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets installed in wet locations shall be listed for use in wet locations.
- C. Sheet Metal Outlet and Devices Box: Comply with NEMA OS 1 and UL 514A.
- D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy, Type FD, with gasketed cover.
- F. Metal Floor Boxes:
  - 1. Material: Cast metal.
  - 2. Type: Fully adjustable.
  - 3. Shape: Rectangular.
  - 4. Listing and Labeling: Metal floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- G. Luminaire Outlet Boxes: Nonadjustable, designed for attachment of luminaire weighing 50 lb (23 kg). Outlet boxes designed for attachment of luminaires weighing more than 50 lb (23 kg) shall be listed and marked for the maximum allowable weight.
- H. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

- I. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum with gasketed cover.
- J. Box extensions used to accommodate new building finishes shall be of same material as recessed box.
- K. Device Box Dimensions: 4 inches square by 2-1/8 inches deep (100 mm square by 60 mm deep).
- L. Gangable boxes are allowed.
- M. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1, Type 3R, Type 4, or Type 12 depending on location with continuous-hinge cover with flush latch unless otherwise indicated.
  - 1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
  - 2. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.
- N. Cabinets:
  - 1. NEMA 250, Type 1, Type 3R, or Type 12 depending on location galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
  - 2. Hinged door in front cover with flush latch and concealed hinge.
  - 3. Key latch to match panel boards.
  - 4. Metal barriers to separate wiring of different systems and voltage.
  - 5. Accessory feet where required for freestanding equipment.
- O. Cast-Metal/Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, galvanized, cast iron with gasketed cover.

## 2.6 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

- A. General Requirements for Handholes and Boxes:
  - 1. Boxes and handholes for use in underground systems shall be designed and identified as defined in NFPA 70, for intended location and application.
  - 2. Boxes installed in wet areas shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel, fiberglass, or a combination of the two.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Armorcast Products Company.
    - b. Carson Industries LLC.
    - c. CDR Systems Corporation; Hubbell Power Systems.
    - d. NewBasis
    - e. Oldcastle Precast, Inc.; Christy Concrete Products.
    - f. Synertech Moulded Products; a division of Oldcastle Precast, Inc.
    - g. Or approved equal.

2. Standard: Comply with SCTE 77.
  3. In "Cast-Metal Outlet and Device Boxes" Paragraph below, aluminum boxes are suitable for use with steel raceways in most environments. Type FD is a device box with extra depth. Many other configurations are available.
  4. Configuration: Designed for flush burial with closed bottom unless otherwise indicated.
  5. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
  6. See Editing Instruction No. 2 in the Evaluations for a discussion of floor boxes.
  7. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
  8. Cover Legend: Molded lettering, "ELECTRIC".
  9. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
  10. Handholes 12 Inches Wide by 24 Inches Long (300 mm Wide by 600 mm Long) and Larger: Have inserts for cable racks and pulling-in irons installed before concrete is poured.
- C. Fiberglass Handholes and Boxes: Molded of fiberglass-reinforced polyester resin, with frame and covers of polymer concrete, reinforced concrete, cast iron or fiberglass.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Armorcast Products Company
    - b. Carson Industries LLC.
    - c. CDR Systems Corporation; Hubbell Power Systems.
    - d. NewBasis.
    - e. Nordic Fiberglass Inc.
    - f. Oldcastle Precast, Inc.; Christy Concrete Products.
    - g. Synertech Moulded Products; a division of Oldcastle Precast, Inc.
    - h. Or approved equal.
  2. Standard: Comply with SCTE 77.
  3. Color of Frame and Cover: Gray.
  4. Configuration: Designed for flush burial with closed bottom unless otherwise indicated.
  5. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
  6. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
  7. Cover Legend: Molded lettering, "ELECTRIC".
  8. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
  9. Handholes 12 Inches Wide by 24 Inches Long (300 mm Wide by 600 mm Long) and Larger: Have inserts for cable racks and pulling-in irons installed before concrete is poured.

## 2.7 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

- A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
1. Tests of materials shall be performed by an independent testing agency.

## PART 3 – EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 RACEWAY APPLICATION

- A. Outdoors: Apply raceway products as specified below unless otherwise indicated:

1. Exposed Conduit: RNC, Type EPC-40-PVC and RNC, Type EPC-80-PVC.
2. Concealed Conduit, Aboveground: EMT.
3. Underground Conduit: RNC, Type EPC-40-PVC, Type EPC-80-PVC.
4. Connection to Vibrating Equipment (Including Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
5. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R.

- B. Indoors: Apply raceway products as specified below unless otherwise indicated:

1. Exposed, Not Subject to Physical Damage: EMT.
2. Exposed, Not Subject to Severe Physical Damage: RNC identified for such use.
3. Exposed and Subject to Severe Physical Damage: GRC. Raceway locations include the following:

- a. For traffic of mechanized carts, forklifts, and pallet-handling units.

4. Concealed in Ceilings and Interior Walls and Partitions: EMT.
5. Connection to Vibrating Equipment (Including Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LMFC in damp or wet locations.
6. Damp or Wet Locations: IMC.
7. Boxes and Enclosures: NEMW 250, Type 1, except use NEMA 250, Type 4 stainless steel in damp or wet locations.

- C. Minimum Raceway Size: 3/4 –inch (21 mm) trade size.

- D. Raceway Fittings: Compatible with raceways and suitable for use and location.

1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
3. EMT: Use setscrew, steel fittings. Comply with NEMA FB 2.10.
4. Flexible Conduit: Use only fittings listed for use with flexible conduit. Comply with NEMA FB 2.20.

- E. Install nonferrous conduit or tubing for circuits operating above 60 Hz. Where aluminum raceways are installed for such circuits and pass through concrete, install in nonmetallic sleeve.

- F. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth.

- G. Install surface raceways only where indicated on Drawings.

- H. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F.

### 3.3 INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NECA 102 for aluminum conduits. Comply with NYCEC limitations for types of raceways allowed in specific occupancies and number of floors.
- B. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.
- C. Complete raceway installation before starting conductor installation.
- D. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for hangers and supports.
- E. Arrange stub-ups so curved portions of bends are not visible above finished slab.
- F. Install no more than the equivalent of three 90-degree bends in any conduit run except for control wiring conduits, for which fewer bends are allowed. Support within 12 inches of changes in direction.
- G. Conceal conduit and EMT within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
- H. Support conduit within 12 inches of enclosures to which attached.
- I. Raceways Embedded in Slabs:
  - 1. Run conduit larger than 1-inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support. Secure raceways to reinforcement at maximum 10-foot intervals.
  - 2. Arrange raceways to cross building expansion joints at right angles with expansion fittings.
  - 3. Arrange raceways to keep a minimum of 2 inches of concrete cover in all directions.
  - 4. Do not embed threadless fittings in concrete unless specifically approved by Commissioner for each specific location.
  - 5. Change from ENT to GRC or IMC before rising above floor.
- J. Stub-ups to Above Recessed Ceilings:
  - 1. Use EMT, IMC, or RMC for raceways.
  - 2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.
- K. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.

- L. Coat field-cut threads on PVC-coated raceway with a corrosion-preventing conductive compound prior to assembly.
- M. Retain one of first two paragraphs below to exceed NFPA 70 requirements. NFPA 70 requires insulated bushings or other smooth, rounded entry provisions for conduit terminations at all locations where conductors are No. 4 AWG and larger, regardless of the environment. NFPA 70 requires bonding of all service conductors, but does not require bonding to be accomplished with grounding bushings. See Evaluations for further discussion.
- N. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors including conductors smaller than No. 4 AWG.
- O. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to 1-1/4-inch trade size and insulated throat metal bushings on 1-1/2-inch trade size and larger conduits terminated with locknuts. Install insulated throat metal grounding bushings on service conduits.
- P. Install raceways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus 1/4 turn more.
- Q. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.
- R. Cut conduit perpendicular to the length. For conduits 2-inch trade size and larger, use roll cutter or a guide to make cut straight and perpendicular to the length.
- S. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.
- T. Surface Raceways:
  - 1. Install surface raceway with a minimum 2-inch radius control at bend points.
  - 2. Secure surface raceway with screws or other anchor-type devices at intervals not exceeding 48 inches and with no less than two supports per straight raceway section. Support surface raceway according to manufacturer's written instructions. Tape and glue are not acceptable support methods.
- U. Install raceway sealing fittings at accessible locations according to NYCEC and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings according to NYCEC.
- V. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all raceways at the following points:
  - 1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
  - 2. Where an underground service raceway enters a building or structure.
  - 3. Where otherwise required by NYCEC.

- W. Comply with manufacturer's written instructions for solvent welding RNC and fittings.
- X. Expansion-Joint Fittings:
  - 1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F and that has straight-run length that exceeds 25 feet. Install in each run of aboveground RMC and EMT conduit that is located where environmental temperature change may exceed 100 deg F and that has straight-run length that exceeds 100 feet.
  - 2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
    - a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F temperature change.
    - b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
    - c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
  - 3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F of temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F of temperature change for metal conduits.
  - 4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.
  - 5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.
- Y. Flexible Conduit Connections: Comply with NEMA RV 3. Use a maximum of 72 inches of flexible conduit for recessed and semi recessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
  - 1. Use LFMC in damp or wet locations subject to severe physical damage.
  - 2. Use LFMC or LFNC in damp or wet locations not subject to severe physical damage.
- Z. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
- AA. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box.
- BB. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.
- CC. Locate boxes so that cover or plate will not span different building finishes.
- DD. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.

- EE. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.
- FF. Set metal floor boxes level and flush with finished floor surface.
- GG. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

### 3.4 INSTALLATION OF UNDERGROUND CONDUIT

#### A. Direct-Buried Conduit:

1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Section 312000 "Earth Moving" for pipe less than 6 inches in nominal diameter.
2. Install backfill as specified in Section 312000 "Earth Moving."
3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in Section 312000 "Earth Moving."
4. Install manufactured duct elbows for stub-ups at poles and equipment and at building entrances through floor unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.
5. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.
  - a. Couple steel conduits to ducts with adapters designed for this purpose and encase coupling with 3 inches of concrete for a minimum of 12 inches on each side of the coupling.
  - b. For stub-ups at equipment mounted on outdoor concrete bases and where conduits penetrate building foundations, extend steel conduit horizontally a minimum of 60 inches from edge of foundation or equipment base. Install insulated grounding bushings on terminations at equipment.
6. Warning Planks: Bury warning planks approximately 12 inches above direct-buried conduits but a minimum of 6 inches below grade. Align planks along centerline of conduit.
7. Underground Warning Tape: Comply with requirements in Section 26 05 53 "Identification for Electrical Systems."

### 3.5 INSTALLATION OF UNDERGROUND HANDHOLES AND BOXES

- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

- C. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch above finished grade.
- D. Install handholes with bottom below frost line below grade.
- E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables but short enough to preserve adequate working clearances in enclosure.
- F. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

### 3.6 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 26 05 44 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

### 3.7 FIRESTOPPING

- A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 07 84 10 "Firestopping."

### 3.8 PROTECTION

- A. Protect coatings, finishes, and cabinets from damage and deterioration.
  - 1. Restore damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
  - 2. Restore damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

**END OF SECTION 26 05 33**

## **SECTION 26 05 43**

### **UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

##### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Direct-buried conduit, ducts, and duct accessories.
  - 2. Concrete-encased conduit, ducts, and duct accessories.
  - 3. Handholes and boxes.
  - 4. Manholes.

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

##### **1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

##### **1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. Trafficways: Locations where vehicular or pedestrian traffic is a normal course of events.

**PART 2 - PRODUCTS****2.1 CONDUIT**

- A. See Editing Instruction No. 1 in the Evaluations for cautions about named manufacturers and products. For an explanation of options and Contractor's product selection procedures, see Section 016000 "Product Requirements."
- B. RNC: NEMA TC 2, Type EPC-80-PVC, UL 651, with matching fittings by same manufacturer as the conduit, complying with NEMA TC 3 and UL 514B.

**2.2 NONMETALLIC DUCTS AND DUCT ACCESSORIES**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cantex, Inc.
  2. CertainTeed Corp.; Pipe & Plastics Group.
  3. Condux International, Inc.
  4. Electri-Flex Company.
  5. Lamson & Sessions; Carlon Electrical Products.
  6. Manhattan/CDT; a division of Cable Design Technologies.
  7. Spiraduct/AFC Cable Systems, Inc.
  8. Or approved equal.
- B. Duct Accessories:
1. Duct Separators: Factory-Fabricated rigid PVC interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling.
  2. Warning Tape: Underground-line warning tape specified in Section 260553 "Identification for Electrical Systems."
  3. Concrete Warning Planks: Nominal 12 by 24 by 3 inches in size, manufactured from 600-psi concrete.
    - a. Color: Red dye added to concrete during batching.
    - b. Mark each plank with "ELECTRIC" in 2-inch high, 3/8-inch deep letters.

**2.3 PRECAST CONCRETE HANDHOLES AND BOXES**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carder Concrete Products.
  2. Christy Concrete Products.
  3. Elmhurst-Chicago Stone Co.

4. Oldcastle Precast Group.
  5. Riverton Concrete Products; a division of Cretex Companies, Inc.
  6. Utility Concrete Products, LLC.
  7. Utility Vault Co.
  8. Wausau Tile, Inc.
  9. Or approved equal.
- B. Comply with ASTM C 858 for design and manufacturing processes.
- C. Description: Factory-Fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or box.
1. Frame and Cover: Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
  2. Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
  3. Frame and Cover: Weatherproof steel frame, with hinged steel access door assembly with tamper-resistant, captive, cover-securing bolts.
    - a. Cover Hinges: Concealed, with hold-open ratchet assembly.
    - b. Cover Handle: Recessed.
  4. Frame and Cover: Weatherproof aluminum frame with hinged aluminum access door assembly with tamper-resistant, captive, cover-securing bolts.
    - a. Cover Hinges: Concealed with hold-open ratchet assembly.
    - b. Cover Handle: Recessed.
  5. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
  6. Cover Legend: Molded lettering, "ELECTRIC."
  7. Configuration: Units shall be designed for flush burial and have integral closed bottom, unless otherwise indicated.
  8. Extensions and Slabs: Designed to match with bottom of enclosure. Same material as enclosure.
    - a. Extension shall provide increased depth of 12 inches.
    - b. Slab: Same dimensions as bottom of enclosure and arranged to provide closure.
  9. Windows: Precast openings in walls, arranged to match dimensions and elevations of approaching ducts and duct banks plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
    - a. Windows shall be located no less than 6 inches from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.
    - b. Window opening shall have cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct banks.
    - c. Window openings shall be framed with at least two additional No.4 steel reinforcing bars in concrete around each opening.
  10. Duct Entrances in Handhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.

- a. Type and size shall match fittings to duct or conduit to be terminated.
- b. Fittings shall align with elevations of approaching ducts and be located near interior corners of handholes to facilitate racking of cable.

11. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

## 2.4 HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

### A. Description: Comply with SCTE 77.

1. Color: Gray.
2. Configuration: Units shall be designed for flush burial and have integral closed bottom, unless otherwise indicated.
3. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
5. Cover Legend: Molded lettering, "ELECTRIC."
6. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.
7. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
8. Handholes 12 inches wide by 24 inches long (300 mm wide by 600 mm long) and larger shall have factory-installed inserts for cable racks and pulling-in irons.

### B. Polymer Concrete Handholes and Boxes with Polymer Concrete Cover: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Armorcast Products Company.
  - b. Carson Industries LLC.
  - c. CDR Systems Corporation.
  - d. NewBasis.
  - e. Or approved equal.

### C. Fiberglass Handholes and Boxes with Polymer Concrete Frame and Cover: Sheet-molded, fiberglass-reinforced, polyester resin enclosure joined to polymer concrete top ring or frame.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Armorcast Products Company
  - b. Carson Industries LLC.
  - c. Christy Concrete Products.
  - d. Synertech Moulded Products, Inc.; a division of Oldcastle Precast.
  - e. Or approved equal.

### D. Fiberglass Handholes and Boxes: Molded of fiberglass-reinforced polyester resin, with covers of cast iron.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Carson Industries LLC.
  - b. Christy Concrete Products.
  - c. Nordic Fiberglass, INC.
  - d. Or approved equal.

## 2.5 PRECAST MANHOLES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Carder Concrete Products.
  2. Christy Concrete Products.
  3. Elmhurst-Chicago Stone Co.
  4. Oldcastle Precast Group.
  5. Riverton Concrete Products; division of Cretex Companies, Inc.
  6. Utility Concrete Products, LLC.
  7. Utility Vault Co.
  8. Wausau Tile, Inc.
  9. Or approved equal.
- B. Comply with ASTM C 858, with structural design loading as specified in Part 3 "Underground Enclosure Application" Article and with interlocking mating sections, complete with accessories, hardware, and features.
  1. Windows: Precast openings in walls, arranged to match dimensions and elevations of approaching ducts and duct banks plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
    - a. Windows shall be located no less than 6 inches from interior surfaces of walls, floors, or roofs of manholes, but close enough to corners to facilitate racking of cables on walls.
    - b. Window opening shall have cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct banks.
    - c. Window openings shall be framed with at least two additional No.4 steel reinforcing bars in concrete around each opening.
    - d. Legend: "ELECTRIC-HV" for duct systems with medium-voltage cables.
  2. Duct Entrances in Manhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.
    - a. Type and size shall match fittings to duct or conduit to be terminated.
    - b. Fittings shall align with elevations of approaching ducts and be located near interior corners of manholes to facilitate racking of cable.
- C. Concrete Knockout Panels: 1-1/2 to 2 inches thick, for future conduit entrance and sleeve for ground rod.
- D. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

## 2.6 CAST-IN-PLACE MANHOLES

- A. Description: Underground utility structures, constructed in place, complete with accessories, hardware, and features. Include concrete knockout panels for conduit entrance and sleeve for ground rod.
- B. Materials: Comply with ASTM C 858 and with Section 033000 "Cast-in-Place Concrete."
- C. Structural Design Loading: As specified in Part 3 "Underground Enclosure Application" Article.

## 2.7 UTILITY STRUCTURE ACCESSORIES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Bilco Company (The).
  - 2. Campbell Foundry Company.
  - 3. Carder Concrete Products.
  - 4. Christy Concrete Products.
  - 5. Oldcastle Precast Group.
  - 6. Osburn Associates, Inc.
  - 7. Pennsylvania Insert Corporation.
  - 8. Riverton Concrete Products; a division of Cretex Companies, Inc.
  - 9. Utility Concrete Products, LLC.
  - 10. Utility Vault Co.
  - 11. Wausau Tile, Inc.
  - 12. Or approved equal.
- B. Manhole Frames, Covers, and Chimney Components: Comply with structural design loading specified for manhole.
  - 1. Frame and Cover: Weatherproof, grey cast iron complying with ASTM A 48/A 48M, Class 30B with milled cover-to-frame bearing surfaces; diameter, 26 inches
    - a. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
    - b. Special Covers: Recess in face of cover designed to accept finish material in paved areas.
  - 2. Cover Legend: Cast in, selected to suit system.
    - a. Legend: "ELECTRIC-LV" for duct systems with power wire and cables for systems operating at 600 V and less.
    - b. Legend: "ELECTRIC-HV" for duct systems with medium-voltage cables.
    - c. Legend: "SIGNAL" for communications, data, and telephone duct systems.
  - 3. Manhole Chimney Components: Precast concrete rings with dimensions matched to those of roof opening.
    - a. Mortar for Chimney Ring and Frame and Cover Joints: Comply with ASTM C 270, Type M, except for Quantities less than 2.0 cu. Ft. where packaged mix complying with ASTM C 387, Type M, may be used.
- C. Manhole Sump Frame and Grate: ASTM A 48/A 48M, Class 30B, gray cast iron.

- D. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch diameter eye, and 1-by-4-inch bolt.
  - 1. Working Load Embedded in 6-Inch, 4000-psi Concrete: 13,000-lbf minimum tension.
- E. Pulling Eyes in Nonconcrete Walls: Eyebolt with reinforced fastening, 1-1/4-inch diameter eye, rated 2500-lbf minimum tension.
- F. Pulling-In and Lifting Irons in Concrete Floors: 7/8-inch- diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
  - 1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.
- G. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2-inch ID by 2-3/4 inches deep. Flared to 1-1/4 inches minimum at base.
  - 1. Tested Ultimate Pullout Strength: 12,000 lbf minimum.
- H. Expansion Anchors for Installation after Concrete is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2-inch bolt, 5300-lbf rated pullout strength, and minimum 68000-lbf rated shear strength.
- I. Cable Rack Assembly: Steel, hot-dip galvanized, except insulators.
  - 1. Stanchions: T-section or channel; 2-1/4-inch nominal size; punched with 14 holes on 1-1/2-inch centers for cable-arm attachment.
  - 2. Arms: 1-1/2-inches wide, lengths ranging from 3 inches with 450-lb minimum capacity to 18 inches with 250-lb minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.
  - 3. Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.
- J. Cable Rack Assembly: Nonmetallic. Components fabricated from nonconductive, fiberglass-reinforced polymer.
  - 1. Stanchions: Nominal 36 inches high by 4 inches wide, with minimum of 9 holes for an arm attachment.
  - 2. Arms: Arranged for secure, drop-in attachment in horizontal position at any location on cable stanchions, and capable of being locked in position. Arms shall be available in lengths ranging from 3 inches with 450-lb minimum capacity to 20 inches with 250-lb minimum capacity. Top of arm shall be nominally 4 inches wide, and arm shall have slots along full length for cable ties.
- K. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 deg F (2 deg C). Capable of withstanding temperature of 300 deg F (150 deg C) without slump and adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation, materials, and common metals.
- L. Fixed Manhole Ladders: Arranged for attachment to wall and floor of manhole. Ladder and mounting brackets and braces shall be fabricated from nonconductive, structural-grade, fiberglass-reinforced resin.

- M. Portable Manhole Ladders: UL-listed, heavy-duty fiberglass specifically designed for portable use for access to electrical manholes. Minimum length equal to distance from deepest manhole floor to grade plus 36 inches (900 mm).
- N. Cover Hooks: Heavy duty, designed for lifts 60 lbf (270 N) and greater. Two required.

## 2.8 SOURCE QUALITY CONTROL

- A. Test and inspect precast concrete utility structures according to ASTM C 1037.
- B. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of manholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
  - 1. Tests of materials shall be performed by an independent testing agency.
  - 2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer licensed in the State of New York shall certify tests by manufacturer.
  - 3. Testing machine pressure gages shall have current calibration certification, complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 PREPARATION

- A. Coordinate layout and installation of ducts, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Notify Commissioner if there is a conflict between areas of excavation and existing structures or archaeological sites to remain.
- B. Coordinate elevations of ducts and duct-bank entrances into manholes, handholes, and boxes with final locations and profiles of ducts and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Commissioner.
- C. Clear and grub vegetation to be removed and protect vegetation to remain according to Section 31 10 00 "Site Clearing, Removals, and Preparation". Remove and stockpile topsoil for reapplication according to Section 31 10 00 "Site Clearing, Removals, and Preparation."

### 3.3 UNDERGROUND DUCT APPLICATION

- A. Ducts for Electrical Feeders 600 V and Less: RNC, NEMA Type EPC-80 PVC, in concrete-encased duct bank unless otherwise indicated.
- B. Ducts for Electrical Feeders 600 V and Less: RNC, NEMA Type EPC-80 PVC, in direct-buried duct bank unless otherwise indicated.
- C. Ducts for Electrical Branch Circuits: RNC, NEMA Type EPC-80-PVC, in direct-buried duct bank unless otherwise indicated.

- D. Underground Ducts Crossing Paved Paths, Walks, Driveways and Roadways: RNC, NEMA Type EPC-40-PVC, encased in reinforced concrete.

### 3.4 UNDERGROUND ENCLOSURE APPLICATION

- A. Handholes and Boxes for 600 V and Less:
  - 1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete. AASHTO HB 17, H-20 structural load rating.
  - 2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Precast concrete, AASHTO HB 17, H-20 structural load rating.
  - 3. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Precast concrete, AASHTO HB 17, H-10 structural load rating.
  - 4. Units Subject to Light-Duty Pedestrian Traffic Only: High-density plastic, structurally tested according to SCTE 77 with 3000-lbf vertical loading.
  - 5. Cover design load shall not exceed the design load of the handhole or box.
- B. Manholes: Precast or cast-in-place concrete.
  - 1. Units Located in Roadways and Other Deliberate Traffic Paths by Heavy or Medium Vehicles: H-20 structural load rating according to AASHTO HB 17.
  - 2. Units Not Located in Deliberate Traffic Paths by Heavy or Medium Vehicles: H-10 load rating according to AASHTO HB 17.

### 3.5 EARTHWORK

- A. Excavation and Backfill: Comply with Section 31 00 00 "Earthwork" but do not use heavy-duty, hydraulic-operated, compaction equipment.
- B. Restore surface features at areas disturbed by excavation and re-establish original grades unless otherwise indicated. Replace removed sod immediately after backfilling is completed.
- C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary top soiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Section 32 91 13 "Planting Soils".

### 3.6 DUCT INSTALLATION

- A. Install ducts according to NEMA TCB 2.
- B. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes, to drain in both directions.
- C. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches, both horizontally and vertically, at other locations unless otherwise indicated.
- D. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane.

- E. Installation Adjacent to High-Temperature Steam Lines: Where duct banks are installed parallel to underground steam lines, perform calculations showing the duct bank will not be subject to environmental temperatures above 40 deg C. Where environmental temperatures are calculated to rise above 40 deg C, and anywhere the duct bank crosses above an underground steam line, install insulation blankets listed for direct burial to isolate the duct bank from the steam line.
- F. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10 inches o.c. for 5-inch ducts, and vary proportionately for other duct sizes.
  - 1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell without reducing duct line slope and without forming a trap in the line.
  - 2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to manhole or handhole. Install an expansion fitting near the center of all straight line direct-buried duct banks with calculated expansion of more than 3/4 inch.
  - 3. Grout end bells into structure walls from both sides to provide watertight entrances.
- G. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least 10 feet outside the building wall, without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."
- H. Sealing: Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.
- I. Pulling Cord: Install 100-lbf test nylon cord in empty ducts.
- J. Concrete-Encased Ducts: Support ducts on duct separators.
  - 1. Excavate trench bottom to provide firm and uniform support for duct bank. Prepare trench bottoms as specified in Section 31 00 00 "Earthwork" for pipes less than 6 inches in nominal diameter.
  - 2. Width: Excavate trench 12 inches wider than duct bank on each side.
  - 3. Width: Excavate trench 3 inches wider than duct bank on each side.
  - 4. Depth: Install top of duct bank at least 24 inches below finished grade in areas not subject to deliberate traffic, and at least 30 inches below finished grade in deliberate traffic paths for vehicles unless otherwise indicated.
  - 5. Support ducts on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
  - 6. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts, with not less than five spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent floating during concreting. Stagger separators approximately 6 inches between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
  - 7. Minimum Space between Ducts: 3 inches between ducts and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and signal ducts.
  - 8. Elbows: Use manufactured duct elbows for stub-ups at poles and equipment, at building entrances through floor, and at changes of direction in duct run unless otherwise indicated. Extend concrete encasement throughout length of elbow.

9. Elbows: Use manufactured rigid steel conduit elbows for stub-ups at poles and equipment, at building entrances through floor, and at changes of direction in duct run.
    - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
    - b. Stub-Ups to Equipment: For equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.
  10. Reinforcement: Reinforce concrete-encased duct banks where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
  11. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
  12. Concrete Cover: Install a minimum of 3 inches of concrete cover at top and bottom, and a minimum of 2 inches on each side of duct bank.
  13. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
    - a. Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations or use other specific measures to prevent expansion-contraction damage.
    - b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.
  14. Pouring Concrete: Comply with requirements in "Concrete Placement" Article in Section 03 30 00 "Cast-in-Place Concrete." Place concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.
- K. Direct-Buried Duct Banks:
1. Excavate trench bottom to provide firm and uniform support for duct bank. Comply with requirements in Section 31 00 00 "Earthwork" for preparation of trench bottoms for pipes less than 6 inches in nominal diameter.
  2. Support ducts on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
  3. Space separators close enough to prevent sagging and deforming of ducts, with not less than five spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6 inches between tiers.
  4. Depth: Install top of duct bank at least 36 inches below finished grade unless otherwise indicated.
  5. Set elevation of bottom of duct bank below frost line.
  6. Install ducts with a minimum of 3 inches between ducts for like services and 6 inches between power and signal ducts.
  7. Elbows: Install manufactured duct elbows for stub-ups at poles and equipment, at building entrances through floor, and at changes of direction in duct run unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.

8. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment, at building entrances through floor, and at changes of direction in duct run.
    - a. Couple steel conduits to ducts with adapters designed for this purpose and encase coupling with 3 inches of concrete.
    - b. For equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60 inches from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.
  9. After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4 inches over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction. Comply with requirements in Section 312000 "Earth Moving" for installation of backfill materials.
    - a. Place minimum 3 inches of sand as a bed for duct bank. Place sand to a minimum of 6 inches above top level of duct bank.
    - b. Place minimum 6 inches of engineered fill above concrete encasement of duct bank.
  - L. Warning Planks: Bury warning planks approximately 12 inches above direct-buried ducts and duct banks, placing them 24 inches o.c. Align planks along the width and along the centerline of duct bank. Provide an additional plank for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional planks 12 inches apart, horizontally.
  - M. Warning Tape: Bury warning tape approximately 12 inches above all concrete-encased ducts and duct banks. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.
- 3.7 INSTALLATION OF CONCRETE MANHOLES, HANDHOLES, AND BOXES
- A. Cast-in-Place Manhole Installation:
    1. Finish interior surfaces with a smooth-troweled finish.
    2. Windows for Future Duct Connections: Form and pour concrete knockout panels 1-1/2 to 2 inches thick, arranged as indicated.
    3. Comply with requirements in Section 03 30 00 "Cast-in-Place Concrete" for cast-in-place concrete, formwork, and reinforcement.
  - B. Precast Concrete Handhole and Manhole Installation:
    1. Comply with ASTM C 891 unless otherwise indicated.
    2. Install units level and plumb and with orientation and depth coordinated with connecting ducts, to minimize bends and deflections required for proper entrances.
    3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
  - C. Elevations:

1. Manhole Roof: Install with rooftop at least 15 inches below finished grade.
  2. Manhole Frame: In paved areas and trafficways, set frames flush with finished grade. Set other manhole frames 1 inch above finished grade.
  3. Install handholes with bottom below frost line.
  4. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch above finished grade.
  5. Where indicated, cast handhole cover frame integrally with handhole structure.
- D. Drainage: Install drains in bottom of manholes where indicated. Coordinate with drainage provisions indicated.
- E. Manhole Access: Circular opening in manhole roof; sized to match cover size.
1. Manholes with Fixed Ladders: Offset access opening from manhole centerlines to align with ladder.
  2. Install chimney, constructed of precast concrete collars and rings, to support cast-iron frame to connect cover with manhole roof opening. Provide moisture-tight masonry joints and waterproof grouting for frame to chimney.
- F. Waterproofing: Apply waterproofing to exterior surfaces of manholes after concrete has cured at least three days. Waterproofing materials and installation are specified in Section 071353 "Elastomeric Sheet Waterproofing." After ducts have been connected and grouted, and before backfilling, waterproof joints and connections, and touch up abrasions and scars. Waterproof exterior of manhole chimneys after mortar has cured at least three days.
- G. Waterproofing: Apply waterproofing to exterior surfaces of manholes after concrete has cured at least three days. Waterproofing materials and installation are specified in Section 07 10 00 "Foundation Waterproofing" After ducts are connected and grouted, and before backfilling, dampproof joints and connections, and touch up abrasions and scars. Waterproof exterior of manhole chimneys after mortar has cured at least three days.
- H. Hardware: Install removable hardware, including pulling eyes, cable stanchions, and cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.
- I. Fixed Manhole Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in manholes.
- J. Field-Installed Bolting Anchors in Manholes and Concrete Handholes: Do not drill deeper than 3-7/8 inches for manholes and 2 inches for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.
- 3.8 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE
- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting ducts, to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of ducts, and seal joint between box and extension as recommended by manufacturer.
  - B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
  - C. Elevation: In paved areas and trafficways, set cover flush with finished grade. Set covers of other handholes 1 inch above finished grade.

- D. Install handholes and boxes with bottom below frost line.
- E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in enclosure.
- F. Field cut openings for ducts and conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

### 3.9 GROUNDING

- A. Ground underground ducts and utility structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

### 3.10 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections and prepare test reports:
  - 1. Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.
  - 2. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for out-of-round duct. Provide a minimum 6-inch long mandrel equal to 80 percent fill of duct. If obstructions are indicated, remove obstructions and retest.
  - 3. Test manhole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 26 05 26 "Grounding and Bonding for Electrical Systems."
- B. Correct deficiencies and retest as specified above to demonstrate compliance.

### 3.11 CLEANING

- A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.
- B. Clean internal surfaces of manholes, including sump. Remove foreign material.

**END OF SECTION 26 05 43**

**SECTION 26 05 44****SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes:

1. Sleeves for raceway and cable penetration of non-fire-rated construction walls and floors.
2. Sleeve-seal systems.
3. Sleeve-seal fittings.
4. Grout.
5. Silicone sealants.

B. Related Requirements:

1. Section 078413 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

### PART 2 - PRODUCTS

#### 2.1 SLEEVES

- A. Wall Sleeves:
  - 1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, plain ends.
  - 2. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.
- B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies: Galvanized-steel sheet; 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.
- C. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.
- D. Molded-PVC Sleeves: With nailing flange for attaching to wooden forms.
- E. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.
- F. Sleeves for Rectangular Openings:
  - 1. Material: Galvanized sheet steel.
  - 2. Minimum Metal Thickness:
    - a. For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16-inch thickness shall be 0.052 inch.
    - b. For sleeve cross-section rectangle perimeter 50 inches or more and one or more sides larger than 16 inches, thickness shall be 0.138 inch.

#### 2.2 SLEEVE-SEAL SYSTEMS

- A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by the following:

- a. Advance Products & Systems, Inc.
  - b. CALPICO, Inc.
  - c. Metraflex Company (The).
  - d. Pipeline Seal and Insulator, Inc.
  - e. Proco Products, Inc.
  - f. Or approved equal.
2. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
  3. Pressure Plates: Carbon steel or Plastic Stainless steel.
  4. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, or Stainless steel of length required to secure pressure plates to sealing elements.

## 2.3 SLEEVE-SEAL FITTINGS

- A. Description: Manufactured plastic, sleeve-type, waterstop assembly made for embedding in concrete slab or wall. Unit shall have plastic or rubber waterstop collar with center opening to match piping OD.
  1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Presealed Systems.
    - b. Advance Products & Systems, Inc.
    - c. CALPICO, Inc.
    - d. Or approved equal.

## 2.4 GROUT

- A. Description: Nonshrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.
- B. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- C. Design Mix: 5000-psi, 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

## 2.5 SILICONE SEALANTS

- A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
  1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.
  2. Sealant shall have VOC content of g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
  3. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

- B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

- A. Comply with NECA 1.
- B. Comply with NEMA VE 2 for cable tray and cable penetrations.
- C. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
  - 1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
    - a. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 079200 "Joint Sealants."
    - b. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall, so no voids remain. Tool exposed surfaces smooth; protect material while curing.
  - 2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
  - 3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed or unless seismic criteria require different clearance.
  - 4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
  - 5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.
- D. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies:
  - 1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
  - 2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.
- E. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- F. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- G. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

### 3.3 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.
- B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

### 3.4 SLEEVE-SEAL-FITTING INSTALLATION

- A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
- B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.
- C. Secure nailing flanges to concrete forms.
- D. Using grout, seal the space around outside of sleeve-seal fittings.

**END OF SECTION 26 05 44**

THIS PAGE INTENTIONALLY LEFT BLANK

## **SECTION 26 05 48**

### **VIBRATION AND SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

##### **1.2 SUMMARY**

- A. This Section includes the following:
1. Isolation pads.
  2. Spring isolators.
  3. Restrained spring isolators.
  4. Channel support systems.
  5. Restraint cables.
  6. Hanger rod stiffeners.
  7. Anchorage bushings and washers.
- B. Related Sections include the following:
1. Section 26 05 29 "Hangers and Supports for Electrical Systems" for commonly used electrical supports and installation requirements.

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

1.7 DEFINITIONS

- A. The IBC: International Building Code.
- B. ICC-ES: ICC-Evaluation Service.
- C. OSHPD: Office of Statewide Health Planning and Development for the State of California.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATORS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Ace Mountings Co., Inc.
  - 2. Isolation Technology, Inc.
  - 3. Mason Industries.
  - 4. Vibration Eliminator Co., Inc.
  - 5. Vibration Isolation.
  - 6. Vibration Mountings & Controls, Inc.
  - 7. Or approved equal.
- B. Pads: Arrange in single or multiple layers of sufficient stiffness for uniform loading over pad area, molded with a nonslip pattern and galvanized-steel baseplates, and factory cut to sizes that match requirements of supported equipment.
  - 1. Resilient Material: Oil- and water-resistant neoprene.
- C. Spring Isolators: Freestanding, laterally stable, open-spring isolators.
  - 1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
  - 2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
  - 3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
  - 4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- (6-mm-) thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 500 psig (3447 kPa).
  6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.
- D. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.
1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled baseplate bonded to 1/4-inch- (6-mm-) thick, neoprene or rubber isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
  2. Restraint: Seismic or limit-stop as required for equipment and New York City Building Code 2014.
  3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
  4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
  5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
  6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

## 2.2 SEISMIC-RESTRAINT DEVICES

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Cooper B-Line, Inc.; a division of Cooper Industries.
  2. Hilti Inc.
  3. Mason Industries.
  4. TOLCO Incorporated; a brand of NIBCO INC.
  5. Unistrut; Tyco International, Ltd.
  6. Or approved equal.
- B. General Requirements for Restraint Components: Rated strengths, features, and application requirements shall be as defined in reports an agency acceptable to New York City Building Code 2014.
- C. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.
- D. Channel Support System: MFMA-3, shop- or field-fabricated support assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; and rated in tension, compression, and torsion forces.
- E. Restraint Cables: ASTM A 603 galvanized steel cables with end connections made of steel assemblies with thimbles, brackets, swivels, and bolts designed for restraining cable service; and with a minimum of two clamping bolts for cable engagement.
- F. Hanger Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections or Reinforcing steel angle clamped to hanger rod. Do not weld stiffeners to rods.

- G. Bushings for Floor-Mounted Equipment Anchor: Neoprene bushings designed for rigid equipment mountings and matched to type and size of anchors and studs.
- H. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings and matched to type and size of attachment devices.
- I. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.
- J. Mechanical Anchor: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchors with strength required for anchor and as tested according to ASTM E 488. Minimum length of eight times diameter.
- K. Adhesive Anchor: Drilled-in and capsule anchor system containing polyvinyl or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

## 2.3 FACTORY FINISHES

- A. Finish: Manufacturer's standard prime-coat finish ready for field painting.
- B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.
  - 1. Powder coating on springs and housings.
  - 2. All hardware shall be galvanized. Hot-dip galvanize metal components for exterior use.
  - 3. Baked enamel or powder coat for metal components on isolators for interior use.
  - 4. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 APPLICATIONS

- A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to New York City Building Code 2014.
- B. Hanger Rod Stiffeners: Install hanger rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.
- C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

### 3.4 SEISMIC-RESTRAINT DEVICE INSTALLATION

- A. Equipment and Hanger Restraints:
  - 1. Install restrained isolators on electrical equipment.
  - 2. Install resilient, bolt-isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).
  - 3. Install seismic-restraint devices using methods approved by an agency acceptable to New York City Building Code 2014 providing required submittals for component.
- B. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.
- C. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.
- D. Drilled-in Anchors:
  - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the Commissioner if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
  - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
  - 3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
  - 4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
  - 5. Set anchors to manufacturer's recommended torque, using a torque wrench.
  - 6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

### 3.5 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

- A. Install flexible connections in runs of raceways, cables, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where they terminate with connection to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

### 3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.
- B. Perform tests and inspections.
- C. Tests and Inspections:
  - 1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to New York City Building Code 2014.
  - 2. Schedule test with The City of New York, through the Commissioner, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.
  - 3. Obtain the Commissioner's approval before transmitting test loads to structure. Provide temporary load-spreading members.
  - 4. Test at least four of each type and size of installed anchors and fasteners selected by the Commissioner.
  - 5. Test to 90 percent of rated proof load of device.
  - 6. Measure isolator restraint clearance.
  - 7. Measure isolator deflection.
  - 8. Verify snubber minimum clearances.
  - 9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Prepare test and inspection reports.

### 3.7 ADJUSTING

- A. Adjust isolators after isolated equipment is at operating weight.
- B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
- C. Adjust active height of spring isolators.
- D. Adjust restraints to permit free movement of equipment within normal mode of operation.

### 3.8 ELECTRICAL VIBRATION-CONTROL AND SEISMIC-RESTRAINT DEVICE SCHEDULE

- A. Supported or Suspended Equipment:
  - 1. Equipment Location:
  - 2. Pads:
    - a. Material: Neoprene.
  - 3. Isolator Type:
    - a. Component Importance Factor: 1.0.
    - b. Component Response Modification Factor: 1.5

- c. Component Amplification Factor: 1.0

**END OF SECTION 26 05 48**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 53****IDENTIFICATION FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
1. Identification for raceways.
  2. Identification of power and control cables.
  3. Identification for conductors.
  4. Underground-line warning tape.
  5. Warning labels and signs.
  6. Instruction signs.
  7. Equipment identification labels.
  8. Miscellaneous identification products.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

## 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

## 1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

## PART 2 - PRODUCTS

### 2.1 POWER AND CONTROL RACEWAY IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway size.
- B. Colors for Raceways Carrying Circuits at 600 V or Less:
  - 1. Black letters on an orange field.
  - 2. Legend: Indicate voltage and system or service type indicate where served from and what is being fed.
- C. Colors for Raceways Carrying Circuits at More Than 600 V:
  - 1. Black letters on an orange field.
  - 2. Legend: "DANGER CONCEALED HIGH VOLTAGE WIRING."
- D. Vinyl Labels for Raceways Carrying Circuits at 600 V or Less: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing ends of legend label.
- E. Snap-Around Labels for Raceways Carrying Circuits at 600 V or Less: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- F. Snap-Around, Color-Coding Bands for Raceways Carrying Circuits at 600 V or Less: Slit, pretensioned, flexible, solid-colored acrylic sleeve, 2 inches long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- G. Tape and Stencil for Raceways Carrying Circuits More Than 600 V: 4-inch wide black stripes on 10-inch centers diagonally over orange background that extends full length of raceway or duct and is 12 inches wide. Stop stripes at legends.
- H. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch, with stamped legend, punched for use with self-locking cable tie fastener.
- I. Write-On Tags: Polyester tag, 0.015-inch-thick, with corrosion-resistant grommet and cable tie for attachment to conductor or cable.
  - 1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
  - 2. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

## 2.2 ARMORED AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each cable size.
- B. Colors for Cables Carrying Circuits at 600 V and Less:
  - 1. Black letters on an orange field indicate where fed from and what it's serving.
  - 2. Legend: Indicate voltage and system.
- C. Colors for Cables Carrying Circuits at More Than 600 V:
  - 1. Black letters on an orange field.
  - 2. Legend: "DANGER HIGH VOLTAGE WIRING."
- D. Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing ends of legend label.
- E. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches (50 mm) wide; compounded for outdoor use.
- F. Heat-Shrink Preprinted Tubes: Flame-retardant polyolefin tube with machine-printed identification label. Sized to suit diameter of and shrinks to fit firmly around cable it identifies. Full shrink recovery at a maximum of 200 deg F (93 deg C). Comply with UL 224.

## 2.3 POWER AND CONTROL CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each cable size.
- B. Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing ends of legend label.
- C. Self-Adhesive, Self-Laminating Polyester Labels: Preprinted, 3-mil- (0.08-mm-) thick flexible label with acrylic pressure-sensitive adhesive that provides a clear, weather- and chemical-resistant, self-laminating, protective shield over the legend. Labels sized to fit the cable diameter such that the clear shield overlaps the entire printed legend.
- D. Heat-Shrink Preprinted Tubes: Flame-retardant polyolefin tube with machine-printed identification label. Sized to suit diameter of and shrinks to fit firmly around cable it identifies. Full shrink recovery at a maximum of 200 deg F (93 deg C). Comply with UL 224.
- E. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch, with stamped legend, punched for use with self-locking cable tie fastener.
- F. Write-On Tags: Polyester tag, 0.010-inch-thick, with corrosion-resistant grommet and cable tie for attachment to conductor or cable.
  - 1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
  - 2. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

- G. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of cable it identifies and to stay in place by gripping action.
- H. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeve, 2 inches long, with diameter sized to suit diameter of cable it identifies and to stay in place by gripping action.

## 2.4 CONDUCTOR IDENTIFICATION MATERIALS

- A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils (0.08 mm) thick by 1 to 2 inches (25 to 50 mm) wide.
- B. Self-Adhesive, Self-Laminating Polyester Labels: Preprinted, 3-mil thick flexible label with acrylic pressure-sensitive adhesive that provides a clear, weather- and chemical-resistant, self-laminating, protective shield over the legend. Labels sized to fit the conductor diameter such that the clear shield overlaps the entire printed legend.
- C. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of conductor it identifies and to stay in place by gripping action.
- D. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeve with diameter sized to suit diameter of conductor it identifies and to stay in place by gripping action.
- E. Heat-Shrink Preprinted Tubes: Flame-retardant polyolefin tube with machine-printed identification label. Sized to suit diameter of and shrinks to fit firmly around conductor it identifies. Full shrink recovery at a maximum of 200 deg F (93 deg C). Comply with UL 224.
- F. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.
- G. Write-On Tags: Polyester tag, 0.015-inch-thick, with corrosion-resistant grommet and cable tie for attachment to conductor or cable.
  - 1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
  - 2. Labels for Tags: Self-adhesive label, machine-printed with permanent, waterproof, black ink recommended by printer manufacturer, sized for attachment to tag.

## 2.5 FLOOR MARKING TAPE

- A. 2-inch wide, 5-mil pressure-sensitive vinyl tape, with black and white stripes and clear vinyl overlay.

## 2.6 UNDERGROUND-LINE WARNING TAPE

- A. Tape:
  - 1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.
  - 2. Printing on tape shall be permanent and shall not be damaged by burial operations.
  - 3. Tape material and ink shall be chemically inert, and not subject to degrading when exposed to acids, alkalis, and other destructive substances commonly found in soils.
- B. Color and Printing:

1. Comply with ANSI Z535.1 through ANSI Z535.5.
2. Inscriptions for Red-Colored Tapes: ELECTRIC LINE, HIGH VOLTAGE.
3. Inscriptions for Orange-Colored Tapes: TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE.

C. Tag: Type I:

1. Pigmented polyolefin, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Thickness: 4 mils (0.1 mm).
3. Weight: 18.5 lb/1000 sq. ft..
4. 3-Inch Tensile According to ASTM D 882: 30 lbf, and 2500 psi.

D. Tag: Type II:

1. Multilayer laminate consisting of high-density polyethylene scrim coated with pigmented polyolefin, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Thickness: 12 mils.
3. Weight: 36.1 lb/1000 sq. ft..
4. 3-Inch Tensile According to ASTM D 882: 400 lbf, and 11,500 psi.

E. Tag: Type ID:

1. Detectable three-layer laminate, consisting of a printed pigmented polyolefin film, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Overall Thickness: 5 mils.
3. Foil Core Thickness: 0.35 mil.
4. Weight: 28 lb/1000 sq. ft..
5. 3-Inch Tensile According to ASTM D 882: 70 lbf, and 4600 psi.

F. Tag: Type IID:

1. Reinforced, detectable three-layer laminate, consisting of a printed pigmented woven scrim, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Overall Thickness: 8 mils.
3. Foil Core Thickness: 0.35 mil.
4. Weight: 34 lb/1000 sq. ft..
5. 3-Inch Tensile According to ASTM D 882: 300 lbf and 12,500 psi.

## 2.7 WARNING LABELS AND SIGNS

- A. Comply with NFPA 70 and 29 CFR 1910.145.
- B. Self-Adhesive Warning Labels: Factory-printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment unless otherwise indicated.
- C. Baked-Enamel Warning Signs:

1. Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application.
2. 1/4-inch grommets in corners for mounting.
3. Nominal size, 7 by 10 inches.

D. Metal-Backed, Butyrate Warning Signs:

1. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396-inch galvanized-steel backing; and with colors, legend, and size required for application.
2. 1/4-inch grommets in corners for mounting.
3. Nominal size, 10 by 14 inches.

E. Warning label and sign shall include, but are not limited to, the following legends:

1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."
3. Other warning labels required for Arc Flash, multiple services, etc.

## 2.8 INSTRUCTION SIGNS

A. Engraved, laminated acrylic or melamine plastic, minimum 1/16-inch-thick for signs up to 20 sq. inches and 1/8-inch-thick for larger sizes.

1. Engraved legend with black letters on white face.
2. Punched or drilled for mechanical fasteners.
3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

B. Adhesive Film Label: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch.

C. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch. Overlay shall provide a weatherproof and UV-resistant seal for label.

## 2.9 EQUIPMENT IDENTIFICATION LABELS

A. Adhesive Film Label: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch.

B. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch. Overlay shall provide a weatherproof and UV-resistant seal for label.

C. Self-Adhesive, Engraved, Laminated Acrylic or Melamine Label: Adhesive backed, with white letters on a dark-gray background. Minimum letter height shall be 3/8 inch.

D. Engraved, Laminated Acrylic or Melamine Label: Punched or drilled for screw mounting. White letters on a dark-gray background. Minimum letter height shall be 3/8 inch.

E. Stenciled Legend: In nonfading, waterproof, black ink or paint. Minimum letter height shall be 1 inch.

**2.10 CABLE TIES**

- A. General-Purpose Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking, Type 6/6 nylon.
  - 1. Minimum Width: 3/16 inch.
  - 2. Tensile Strength at 73 deg F, According to ASTM D 638: 12,000 psi.
  - 3. Temperature Range: Minus 40 to plus 185 deg F.
  - 4. Color: Black except where used for color-coding.
- B. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self-extinguishing, one piece, self-locking, Type 6/6 nylon.
  - 1. Minimum Width: 3/16 inch (5 mm).
  - 2. Tensile Strength at 73 deg F, According to ASTM D 638: 12,000 psi.
  - 3. Temperature Range: Minus 40 to plus 185 deg F.
  - 4. Color: Black.
- C. Plenum-Rated Cable Ties: Self-extinguishing, UV stabilized, one piece, self-locking.
  - 1. Minimum Width: 3/16 inch (5 mm).
  - 2. Tensile Strength at 73 deg F, According to ASTM D 638: 7000 psi.
  - 3. UL 94 Flame Rating: 94V-0.
  - 4. Temperature Range: Minus 50 to plus 284 deg F.
  - 5. Color: Black.

**2.11 MISCELLANEOUS IDENTIFICATION PRODUCTS**

- A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Select paint system applicable for surface material and location (exterior or interior).
- B. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 INSTALLATION**

- A. Verify identity of each item before installing identification products.
- B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.
- C. Apply identification devices to surfaces that require finish after completing finish work.
- D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

- E. Attach signs and plastic labels that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.
- F. Attach plastic raceway and cable labels that are not self-adhesive type with clear vinyl tape with adhesive appropriate to the location and substrate.
- G. System Identification Color-Coding Bands for Raceways and Cables: Each color-coding band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.
- H. Aluminum Wraparound Marker Labels and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.
- I. Cable Ties: For attaching tags. Use general-purpose type, except as listed below:
  - 1. Outdoors: UV-stabilized nylon.
  - 2. In Spaces Handling Environmental Air: Plenum rated.
- J. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.
- K. Painted Identification: Comply with requirements in painting Sections for surface preparation and paint application.

### 3.3 IDENTIFICATION SCHEDULE

- A. Concealed Raceways, Duct Banks, More Than 600 V, within Buildings: Tape and stencil 4-inch-wide black stripes on 10-inch centers over orange background that extends full length of raceway or duct and is 12 inches wide. Stencil legend "DANGER CONCEALED HIGH VOLTAGE WIRING" with 3-inch high black letters on 20-inch centers. Stop stripes at legends. Apply to the following finished surfaces:
  - 1. Floor surface directly above conduits running beneath and within 12 inches of a floor that is in contact with earth or is framed above unexcavated space.
  - 2. Wall surfaces directly external to raceways concealed within wall.
  - 3. Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.
- B. Accessible Raceways, Armored and Metal-Clad Cables, More Than 600 V: Self-adhesive vinyl labels. Install labels at 10-foot maximum intervals.
- C. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 60 A, and 120 V to ground: Identify with self-adhesive vinyl label. Install labels at 30-foot maximum intervals.
- D. Accessible Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive vinyl labels with the wiring system legend and system voltage. System legends shall be as follows:
  - 1. Emergency Power.

2. Power

- E. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use color-coding conductor tape to identify the phase.
  - 1. Color-Coding for Phase and Voltage Level Identification, 600 V or Less: Use colors listed below for ungrounded service, feeder and branch-circuit conductors.
    - a. Color shall be factory applied for sizes larger than No. 8 AWG.
    - b. Colors for 208/120-V Circuits:
      - 1) Phase A: Black.
      - 2) Phase B: Red.
      - 3) Phase C: Blue.
    - c. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches (150 mm) from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.
- F. Install instructional sign including the color-code for grounded and ungrounded conductors using adhesive-film-type labels.
- G. Control-Circuit Conductor Identification: For conductors and cables in pull and junction boxes, manholes, and handholes, use write-on tags, self-adhesive, self-laminating polyester labels with the conductor or cable designation, origin, and destination.
- H. Control-Circuit Conductor Termination Identification: For identification at terminations provide self-adhesive, self-laminating polyester labels with the conductor designation.
- I. Conductors to Be Extended in the Future: Attach write-on tags to conductors and list source.
- J. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.
  - 1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
  - 2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
  - 3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual.
- K. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.
  - 1. Limit use of underground-line warning tape to direct-buried cables.
  - 2. Install underground-line warning tape for both direct-buried cables and cables in raceway.
- L. Workspace Indication: Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.

- M. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Baked-enamel warning signs.
1. Comply with 29 CFR 1910.145.
  2. Identify system voltage with black letters on an orange background.
  3. Apply to exterior of door, cover, or other access.
  4. For equipment with multiple power or control sources, apply to door or cover of equipment including, but not limited to, the following:
    - a. Power transfer switches.
    - b. Controls with external control power connections.
- N. Operating Instruction Signs: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.
- O. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and the Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.
1. Labeling Instructions:
    - a. Indoor Equipment: Engraved, laminated acrylic or melamine label. Unless otherwise indicated, provide a single line of text with 1/2-inch high letters on 1-1/2-inch high label; where two lines of text are required, use labels 2 inches high.
    - b. Outdoor Equipment: Engraved, laminated acrylic or melamine label, Stenciled legend 4 inches high.
    - c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
    - d. Unless provided with self-adhesive means of attachment, fasten labels with appropriate mechanical fasteners that do not change the NEMA or NRTL rating of the enclosure.
  2. Equipment to Be Labeled:
    - a. Panelboards: Typewritten directory of circuits in the location provided by panelboard manufacturer. Panelboard identification shall be engraved, laminated acrylic or melamine label.
    - b. Enclosures and electrical cabinets.
    - c. Access doors and panels for concealed electrical items.
    - d. Switchgear.
    - e. Switchboards.
    - f. Emergency system boxes and enclosures.
    - g. Motor-control centers.
    - h. Enclosed switches.
    - i. Enclosed circuit breakers.
    - j. Enclosed controllers.
    - k. Variable-speed controllers.
    - l. Push-button stations.
    - m. Power transfer equipment.
    - n. Contactors.
    - o. Remote-controlled switches, dimmer modules, and control devices.

- p. Battery-inverter units.
- q. Battery racks.
- r. Power-generating units.
- s. Monitoring and control equipment.

**END OF SECTION 26 05 53**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 72****OVERCURRENT PROTECTIVE DEVICE SHORT-CIRCUIT STUDY****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes a computer-based, fault-current study to determine the minimum interrupting capacity of circuit protective devices.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

## 1.7 DEFINITIONS

- A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.
- B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
- D. SCCR: Short-circuit current rating.
- E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

## PART 2 - PRODUCTS

### 2.1 COMPUTER SOFTWARE

- A. Available Computer Software Developers: Subject to compliance with requirements companies offering computer software programs that may be used in the Work include, but are not limited to, the following:
  - 1. CGI CYME
  - 2. EDSA MICRO Corporation
  - 3. ESA Inc.
  - 4. Or approved equal.
- B. Comply with IEEE 399 and IEEE 551.
- C. Analytical features of fault-current-study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output.

### 2.2 SHORT-CIRCUIT STUDY REPORT CONTENTS

- A. Executive summary.
- B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of the computer printout.
- C. One-line diagram, showing the following:
  - 1. Protective device designations and ampere ratings.
  - 2. Cable size and lengths.
  - 3. Motor and generator designations and kVA ratings.
  - 4. Switchgear, switchboard, motor-control center, and panelboard designations.
- D. Comments and recommendations for system improvements, where needed.

E. Protective Device Evaluation:

1. Evaluate equipment and protective devices and compare to short-circuit ratings.
2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
3. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
5. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

F. Short-Circuit Study Input Data: As described in "Power System Data" Article in the Evaluations.

G. Short-Circuit Study Output:

1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
  - a. Voltage.
  - b. Calculated fault-current magnitude and angle.
  - c. Fault-point X/R ratio.
  - d. Equivalent impedance.
2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
  - a. Voltage.
  - b. Calculated symmetrical fault-current magnitude and angle.
  - c. Fault-point X/R ratio.
  - d. Calculated asymmetrical fault currents:
    - 1) Based on fault-point X/R ratio.
    - 2) Based on calculated symmetrical value multiplied by 1.6.
    - 3) Based on calculated symmetrical value multiplied by 2.7.
3. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
  - a. Voltage.
  - b. Calculated symmetrical fault-current magnitude and angle.
  - c. Fault-point X/R ratio.
  - d. No AC Decrement (NACD) ratio.
  - e. Equivalent impedance.
  - f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
  - g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Obtain all data necessary for the conduct of the study.
  - 1. Verify completeness of data supplied on the one-line diagram. Call any discrepancies to the attention of the Commissioner.
  - 2. For equipment provided that is Work of this Project, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
- B. Gather and tabulate the following input data to support the short-circuit study. Comply with recommendations in IEEE 551 as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the contractor's professional engineer licensed in the State of New York in charge of performing the study who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
  - 1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
  - 2. Obtain electrical power utility impedance at the service.
  - 3. Power sources and ties.
  - 4. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
  - 5. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
  - 6. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
  - 7. Motor horsepower and NEMA MG 1 code letter designation.
  - 8. Cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).

**3.3 SHORT-CIRCUIT STUDY**

- A. Perform study following the general study procedures contained in IEEE 399.
- B. Calculate short-circuit currents according to IEEE 551.
- C. Base study on the device characteristics supplied by device manufacturer.
- D. The extent of the electrical power system to be studied is indicated on Drawings.
- E. Begin short-circuit current analysis at the service, extending down to the system overcurrent protective devices as follows:
  - 1. To normal system low-voltage load buses where fault current is 10 kA or less.

- F. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.
- G. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.
  - 1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.
- H. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault at each of the following:
  - 1. Electric utility's supply termination point.
  - 2. Incoming switchgear.
  - 3. Unit substation primary and secondary terminals.
  - 4. Low-voltage switchgear.
  - 5. Motor-control centers.
  - 6. Control panels.
  - 7. Standby generators and automatic transfer switches.
  - 8. Branch circuit panelboards.
  - 9. Disconnect switches.

#### 3.4 ADJUSTING

- A. Make minor modifications to equipment as required to accomplish compliance with short-circuit study.

#### 3.5 DEMONSTRATION

- A. Instruct the City of New York's service operators to adjust, operate, and service devices. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 26 05 72**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 05 73****OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes computer-based, overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.

- 1. Study results shall be used to determine coordination of series-rated devices.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

- B. Refer to the following sections:

- 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

- 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- B. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
- C. SCCR: Short-circuit current rating.
- D. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

**PART 2 - PRODUCTS****2.1 COMPUTER SOFTWARE DEVELOPERS**

- A. Software Developers: Subject to compliance with requirements, provide software by one of the following:
  - 1. ESA Inc.
  - 2. Operation Technology, Inc.
  - 3. Power Analytics, Corporation.
  - 4. SKM Systems Analysis, Inc.
  - 5. Or approved equal.
- B. Comply with IEEE 242 and IEEE 399.
- C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.
  - 1. Optional Features:
    - a. Arcing faults.
    - b. Simultaneous faults.
    - c. Explicit negative sequence.
    - d. Mutual coupling in zero sequence.

**2.2 PROTECTIVE DEVICE COORDINATION STUDY REPORT CONTENTS**

- A. Executive summary.

- B. Study descriptions, purpose, basis and scope. Include case descriptions, definition of terms and guide for interpretation of the computer printout.
- C. One-line diagram, showing the following:
  - 1. Protective device designations and ampere ratings.
  - 2. Cable size and lengths.
  - 3. Motor and generator designations and kVA ratings.
  - 4. Switchgear, switchboard, motor-control center, and panelboard designations.
- D. Study Input Data: As described in "Power System Data" Article.
- E. Short-Circuit Study Output: As specified in "Short-Circuit Study Output" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."
- F. Protective Device Coordination Study:
  - 1. Report recommended settings of protective devices, ready to be applied in the field. Use manufacturer's data sheets for recording the recommended setting of overcurrent protective devices when available.
    - a. Phase and Ground Relays:
      - 1) Device tag.
      - 2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value.
      - 3) Recommendations on improved relaying systems, if applicable.
    - b. Circuit Breakers:
      - 1) Adjustable pickups and time delays (long time, short time, ground).
      - 2) Adjustable time-current characteristic.
      - 3) Adjustable instantaneous pickup.
      - 4) Recommendations on improved trip systems, if applicable.
    - c. Fuses: Show current rating, voltage, and class.
- G. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:
  - 1. Device tag and title, one-line diagram with legend identifying the portion of the system covered.
  - 2. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
  - 3. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
  - 4. Plot the following listed characteristic curves, as applicable:
    - a. Power utility's overcurrent protective device.

- b. Low-voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.
  - c. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
  - d. Cables and conductors damage curves.
  - e. Ground-fault protective devices.
  - f. Motor-starting characteristics and motor damage points.
  - g. Generator short-circuit decrement curve and generator damage point.
  - h. The largest feeder circuit breaker in each motor-control center and panelboard.
5. Series rating on equipment allows the application of two series interrupting devices for a condition where the available fault current is greater than the interrupting rating of the downstream equipment. Both devices share in the interruption of the fault and selectivity is sacrificed at high fault levels. Maintain selectivity for tripping currents caused by overloads.
6. Provide adequate time margins between device characteristics such that selective operation is achieved.
7. Comments and recommendations for system improvements.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.
  - 1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

#### 3.3 PROTECTIVE DEVICE COORDINATION STUDY

- A. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.
- B. Comply with IEEE 399 for general study procedures.
- C. The study shall be based on the device characteristics supplied by device manufacturer.
- D. The extent of the electrical power system to be studied is indicated on Drawings.
- E. Begin analysis at the service, extending down to the system overcurrent protective devices as follows:
  - 1. To normal system low-voltage load buses where fault current is 10 kA or less.
- F. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

G. Transformer Primary Overcurrent Protective Devices:

1. Device shall not operate in response to the following:
  - a. Inrush current when first energized.
  - b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
  - c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.

H. Motor Protection:

1. Select protection for low-voltage motors according to IEEE 242 and NFPA 70.
2. Select protection for motors served at voltages more than 600 V according to IEEE 620.

I. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

J. Generator Protection: Select protection according to manufacturer's written recommendations and to IEEE 242.

K. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.

1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.

L. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and single line-to-ground fault at each of the following:

1. Electric utility's supply termination point.
2. Switchgear.
3. Unit substation primary and secondary terminals.
4. Low-voltage switchgear.
5. Motor-control centers.
6. Standby generators and automatic transfer switches.
7. Branch circuit panelboards.

M. Protective Device Evaluation:

1. Evaluate equipment and protective devices and compare to short-circuit ratings.
2. Adequacy of switchgear, motor-control centers, and panelboard bus bars to withstand short-circuit stresses.
3. Any application of series-rated devices shall be recertified, complying with requirements in NFPA 70.

### 3.4 LOAD-FLOW AND VOLTAGE-DROP STUDY

- A. Perform a load-flow and voltage-drop study to determine the steady-state loading profile of the system. Analyze power system performance two times as follows:
  - 1. Determine load-flow and voltage drop based on full-load currents obtained in "Power System Data" Article.
  - 2. Determine load-flow and voltage drop based on 80 percent of the design capacity of the load buses.
  - 3. Prepare the load-flow and voltage-drop analysis and report to show power system components that are overloaded, or might become overloaded; show bus voltages that are less than as prescribed by NFPA 70.

### 3.5 MOTOR-STARTING STUDY

- A. Perform a motor-starting study to analyze the transient effect of the system's voltage profile during motor starting. Calculate significant motor-starting voltage profiles and analyze the effects of the motor starting on the power system stability.
- B. Prepare the motor-starting study report, noting light flicker for limits proposed by IEEE 141, and voltage sags so as not to affect the operation of other utilization equipment on the system supplying the motor.

### 3.6 POWER SYSTEM DATA

- A. Obtain all data necessary for the conduct of the overcurrent protective device study.
  - 1. Verify completeness of data supplied in the one-line diagram on Drawings. Call discrepancies to the attention of the Commissioner.
  - 2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
  - 3. For existing equipment, whether or not relocated obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. The qualifications of technicians and engineers shall be qualified as defined by NFPA 70E.
- B. Gather and tabulate the following input data to support coordination study. The list below is a guide. Comply with recommendations in IEEE 551 for the amount of detail required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study and shall be by contractor's professional engineer licensed in the State of New York who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
  - 1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
  - 2. Electrical power utility impedance at the service.
  - 3. Power sources and ties.
  - 4. Short-circuit current at each system bus, three phase and line-to-ground.
  - 5. Full-load current of all loads.
  - 6. Voltage level at each bus.

7. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
8. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
9. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
10. Maximum demands from service meters.
11. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
12. Motor horsepower and NEMA MG 1 code letter designation.
13. Low-voltage cable sizes, lengths, number, conductor material, and conduit material (magnetic or nonmagnetic).
14. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:
  - a. Special load considerations, including starting inrush currents and frequent starting and stopping.
  - b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
  - c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
  - d. Generator thermal-damage curve.
  - e. Ratings, types, and settings of utility company's overcurrent protective devices.
  - f. Special overcurrent protective device settings or types stipulated by utility company.
  - g. Time-current-characteristic curves of devices indicated to be coordinated.
  - h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
  - i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
  - j. Panelboards, switchboards, motor-control center ampacity, and SCCR in amperes rms symmetrical.
  - k. Identify series-rated interrupting devices for a condition where the available fault current is greater than the interrupting rating of the downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

### 3.7 FIELD ADJUSTING

- A. Adjust relay and protective device settings according to the recommended settings provided by the coordination study. Field adjustments shall be completed by the engineering service division of the equipment manufacturer under the Startup and Acceptance Testing contract portion.
- B. Make minor modifications to equipment as required to accomplish compliance with protective device coordination studies.
- C. Testing and adjusting shall be by a full-time employee of the Field Adjusting Agency, who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
  1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters. Perform NETA tests and inspections for all adjustable overcurrent protective devices.

**3.8 DEMONSTRATION**

- A. Instruct the City of New York's service operators in the following:
1. Acquaint operators in the fundamentals of operating the power system in normal and emergency modes.
  2. Hand-out and explain the objectives of the coordination study, study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpreting the time-current coordination curves.
  3. Adjust, operate, and service overcurrent protective device settings.

**END OF SECTION 26 05 73**

**SECTION 26 05 74****OVERCURRENT PROTECTIVE DEVICE ARC-FLASH STUDY****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes a computer-based, arc-flash study to determine the arc-flash hazard distance and the incident energy to which facility staff could be exposed during work on or near electrical equipment.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- B. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
- C. SCCR: Short-circuit current rating.
- D. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

**PART 2 - PRODUCTS****2.1 COMPUTER SOFTWARE DEVELOPERS**

- A. Software Developers: Subject to compliance with requirements, provide software by one of the following:
  - 1. ESA Inc.
  - 2. Operation Technology, Inc.
  - 3. Power Analytics, Corporation.
  - 4. SKM Systems Analysis, Inc.
  - 5. Or approved equal.
- B. Comply with IEEE 1584 and NFPA 70E.
- C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

**2.2 ARC-FLASH STUDY REPORT CONTENT**

- A. Executive summary.
- B. Study descriptions, purpose, basis and scope.
- C. One-line diagram, showing the following:
  - 1. Protective device designations and ampere ratings.
  - 2. Cable size and lengths.
  - 3. Motor and generator designations and kVA ratings.
  - 4. Switchgear, switchboard, motor-control center and panelboard designations.
- D. Study Input Data: As described in "Power System Data" Article.

- E. Short-Circuit Study Output: As specified in "Short Circuit Study Output" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."
- F. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 260573 "Overcurrent Protective Device Coordination Study."
- G. Arc-Flash Study Output:
  - 1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
    - a. Voltage.
    - b. Calculated symmetrical fault-current magnitude and angle.
    - c. Fault-point X/R ratio.
    - d. No AC Decrement (NACD) ratio.
    - e. Equivalent impedance.
    - f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
    - g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.
- H. Incident Energy and Flash Protection Boundary Calculations:
  - 1. Arcing fault magnitude.
  - 2. Protective device clearing time.
  - 3. Duration of arc.
  - 4. Arc-flash boundary.
  - 5. Working distance.
  - 6. Incident energy.
  - 7. Hazard risk category.
  - 8. Recommendations for arc-flash energy reduction.
- I. Fault study input data, case descriptions, and fault-current calculations including a definition of terms and guide for interpretation of the computer printout.

## 2.3 ARC-FLASH WARNING LABELS

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems." Produce a 3.5-by-5-inch thermal transfer label of high-adhesion polyester for each work location included in the analysis.
- B. The label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:
  - 1. Location designation.
  - 2. Nominal voltage.
  - 3. Flash protection boundary.
  - 4. Hazard risk category.
  - 5. Incident energy.
  - 6. Working distance.
  - 7. Engineering report number, revision number, and issue date.
- C. Labels shall be machine printed, with no field-applied markings.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Examine Project overcurrent protective device submittals. Proceed with arc-flash study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to arc-flash study may not be used in study.

**3.3 ARC-FLASH HAZARD ANALYSIS**

- A. Comply with NFPA 70E and its Annex D for hazard analysis study.
- B. Preparatory Studies:
  - 1. Short-Circuit Study Output: As specified in "Short-Circuit Study Output" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."
  - 2. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 260573 "Overcurrent Protective Device Coordination Study."
- C. Calculate maximum and minimum contributions of fault-current size.
  - 1. The minimum calculation shall assume that the utility contribution is at a minimum and shall assume no motor load.
  - 2. The maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.
- D. Calculate the arc-flash protection boundary and incident energy at locations in the electrical distribution system where facility staff could perform work on energized parts.
- E. Safe working distances shall be specified for calculated fault locations based on the calculated arc-flash boundary, considering incident energy of 1.2 cal/sq.cm.
- F. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:
  - 1. Fault contribution from induction motors should not be considered beyond three to five cycles.
  - 2. Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g., contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).
- G. Arc-flash computation shall include both line and load side of a circuit breaker as follows:
  - 1. When the circuit breaker is in a separate enclosure.
  - 2. When the line terminals of the circuit breaker are separate from the work location.

- H. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

### 3.4 POWER SYSTEM DATA

- A. Obtain all data necessary for the conduct of the arc-flash hazard analysis.
  - 1. Verify completeness of data supplied on the one-line diagram on Drawings and under "Preparatory Studies" Paragraph in "Arc-Flash Hazard Analysis" Article. Call discrepancies to the attention of the Commissioner.
  - 2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
  - 3. For existing equipment, whether or not relocated, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers licensed in the State of New York.
- B. Electrical Survey Data: Gather and tabulate the following input data to support study. Comply with recommendations in IEEE 1584 and NFPA 70E as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study and shall be by contractor's professional engineer licensed in the State of New York who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
  - 1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
  - 2. Obtain electrical power utility impedance at the service.
  - 3. Power sources and ties.
  - 4. Short-circuit current at each system bus, three phase and line-to-ground.
  - 5. Full-load current of all loads.
  - 6. Voltage level at each bus.
  - 7. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
  - 8. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
  - 9. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
  - 10. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
  - 11. Motor horsepower and NEMA MG 1 code letter designation.
  - 12. Low-voltage cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).

### 3.5 LABELING

- A. Apply one arc-flash label for 208-V ac panelboards and disconnects and for each of the following locations:
  - 1. Motor-control center.
  - 2. Low-voltage switchboard.
  - 3. Switchgear.
  - 4. Medium-voltage switch.

5. Control panel.

### 3.6 APPLICATION OF WARNING LABELS

- A. Install the arc-fault warning labels under the direct supervision and control of the Arc-Flash Study Specialist.

### 3.7 DEMONSTRATION

- A. Engage the Arc-Flash Study Specialist Engage a factory-authorized service representative to instruct the City of New York's service operators in potential arc-flash hazards. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 26 05 74**

**SECTION 26 08 00****COMMISSIONING OF ELECTRICAL****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]

**1.2 SUMMARY**

- A. This section includes commissioning process requirements for Electrical systems, assemblies, and equipment.
- B. Related Sections:
  - 1. DDC General Conditions Section "General Commissioning Requirements" for general commissioning process requirements.

**1.3 DESCRIPTION**

- A. Commissioning is a systematic process of confirming that all building systems perform interactively according to the Commissioner's Project Requirements and the Basis of Design and continuing through construction, acceptance and the warranty period with actual verification of performance.
- B. The Commissioning process does not take away from or reduce the responsibility of the installing contractors to provide a finished and fully functioning product.
- C. The CxA directs and coordinates the commissioning activities and reports to the Commissioner. All members in the construction process work together to fulfill their contracted responsibilities and meet the objectives of the Commissioner's Project Requirement's as detailed in the Contract Documents.

**1.4 DEFINITIONS**

- A. Refer to DDC General Conditions Section "General Commissioning Requirements" for definitions.

**1.5 SUBMITTALS**

- A. The CxA will review and approve submittals related to the commissioned equipment for conformance to the Contract Documents as it relates to the commissioning process, to the functional performance of the equipment and adequacy for developing test procedures. This review is intended primarily to aid in the development of functional testing procedures and only secondarily to verify compliance with equipment

specifications. The CxA will notify the Contractor, or Commissioner as requested, of items missing or areas that are not in conformance with Contract Documents and which require resubmission.

- B. The CxA will receive a copy of the final approved submittals.
- C. In addition, the contractor is to provide the following:
  - 1. Certificates of readiness
  - 2. Certificates of completion of installation, prestart, and startup activities.
  - 3. O&M manuals
  - 4. Test reports
- D. Refer to DDC General Conditions Section “General Commissioning Requirements” for general commissioning submittal requirements.

## **1.6 QUALITY ASSURANCE**

- A. Test Equipment Calibration Requirements: Contractors will comply with test manufacturer’s calibration procedures and intervals. Recalibrate test instruments immediately after instruments have been repaired resulting from being dropped or damaged. Affix calibration tags to test instruments. Furnish calibration records to CxA upon request.

## **1.7 COORDINATION**

- A. Commissioning Kick-Off Meeting – Construction Team: Contractors will attend a meeting of the Commissioning Team, chaired by the CxA, to review the scope of commissioning process activities and the Commissioning Plan with discussions on milestones, activities, and assignments of responsibilities. The flow and type of documents and the amount of submittal data given to the CxA will be determined. Meeting minutes will then be distributed to all parties by the CxA.
- B. Commissioning Meetings: Contractors will attend coordination meetings with the Commissioning Team, chaired by the CxA, to review progress on the Commissioning Plan, construction deficiencies, scheduling conflicts, and to discuss strategies and processes for upcoming commissioning process activities.
- C. Miscellaneous Construction Meetings: The CxA attends selected planning and job-site meetings in order to remain informed on construction progress and to update parties involved in the commissioning process.
- D. Pre-testing Meetings: Contractors will attend pretest meetings with the Commissioning Team, chaired by the CxA, to review startup reports, pre-test inspection results, testing procedures, testing personnel and instrumentation requirements, and manufacturers’ authorized service representative services for each system, sub-system, equipment, and component to be tested.

- E. Testing: Contractors will coordinate with testing personnel and agencies for timing and access for CxA to witness test.
- F. Manufacturers' Inspection and Startup Services: Contractors will coordinate services of manufacturers' inspection and startup services.
- G. Testing, Adjusting and Balancing: Contractors will coordinate with plan and schedule for testing, adjusting and balancing for timing and access for CxA to witness process.

## **PART 2 - PRODUCTS**

### **2.1 TEST EQUIPMENT**

- A. All standard testing equipment required to perform startup, initial checkout and functional performance testing shall be provided by the Contractor for the equipment being tested. For example, the contractor shall ultimately be responsible for all standard testing equipment for the electrical systems and controls systems in Division 26. A sufficient quantity of two-way radios shall be provided by each contractor.
- B. Proprietary test equipment and software required by any equipment manufacturer for programming and/or start-up, whether specified or not, shall be provided by the manufacturer of the equipment. Manufacturer shall provide the test equipment, demonstrate its use, and assist in the commissioning process as needed. Proprietary test equipment (and software) shall become the property of the City of New York upon completion of the commissioning process.
- C. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified in the Specifications. If not otherwise noted, the following minimum requirements apply: Temperature sensors and digital thermometers shall have a certified calibration within the past year to accuracy of 0.5°F and a resolution of + or - 0.1°F. Pressure sensors shall have an accuracy of + or - 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.

## **PART 3 - EXECUTION**

### **3.1 GENERAL DOCUMENTATION REQUIREMENTS**

- A. With assistance from the installing contractors, the CxA will prepare Pre-Functional Checklists for all commissioned components, equipment, and systems
- B. Red-lined Drawings (As-Builts): The contractor will verify all equipment, systems, instrumentation, wiring and components are shown correctly on red-lined drawings. Preliminary red-lined drawings must be made available to the Commissioning Team for use prior to the start of Functional Performance Testing. Changes, as a result of Functional Testing, must be incorporated into the final as-built drawings, which will be created from the red-lined drawings. The contracted party, as defined in the Contract Documents will create the as-built drawings.

- C. Operation and Maintenance Data: Contractor will provide a copy of O&M literature within 45 days of each submittal acceptance for use during the commissioning process for all commissioned equipment and systems. The CxA will review the O&M literature once for conformance to project requirements. The CxA will receive a copy of the final approved O&M literature once corrections have been made by the Contractor.
- D. Demonstration and Orientation: Contractor will provide demonstration and orientation as required by the specifications. A complete orientation plan and schedule must be submitted by the Contractor to the CxA four weeks (4) prior to any orientation. A orientation agenda for each orientation session must be submitted to the CxA one (1) week prior the orientation session

### **3.2 CONTRACTOR'S RESPONSIBILITIES**

- A. Refer to DDC General Conditions Section “General Commissioning Requirements” for general contractor’s responsibilities.
- B. Attend construction phase controls coordination meetings.
- C. Provide information requested by the CxA for final commissioning documentation.
- D. Prepare preliminary schedule for Electrical system orientations and inspections, operation and maintenance manual submissions, orientation sessions, equipment start-up and task completion for The City of New York. Distribute preliminary schedule to commissioning team members.
- E. Provide measuring instruments and logging devices to record test data, and provide data acquisition equipment to record data for the complete range of testing for the required test period.
- F. Provide detailed startup procedures.
- G. Provide a written list of all user adjustable set-points and reset schedules with a brief discussion of the purpose of each and the range of reasonable adjustments with energy implications
- H. Provide a written schedule frequency to review the various set-points and reset schedules to ensure they are current relevant and efficient values.
- I. Respond to provided new deficiencies and/or responses within five (5) business days
- J. Gather operation and maintenance literature on all equipment, and assemble in binders as required by the specifications. Submit to CxA 45 days after submittal acceptance.
- K. Coordinate with the CxA to provide 48-hour advanced notice so that the witnessing of equipment and system start-up and testing can begin.
- L. Notify the CxA a minimum of two weeks in advance of the time for start of the testing and balancing work. Attend the initial testing and balancing meeting for review of the official testing and balancing procedures.
- M. Provide written notification to the Commissioner and CxA that the following work has been completed in accordance with the contract documents, and that the equipment, systems, and sub-system are operating as required.
  - 1. Electrical equipment including switchgear, panel boards, motor control centers, lighting, receptacles, dimmers and all other equipment furnished under this Division.
  - 2. Emergency generators, ATS switches, UPS systems, and emergency power systems.

3. Solar Photovoltaic Systems

- N. The equipment supplier shall document the performance of his equipment.
- O. Provide a complete set of red-lined drawings to the CxA prior to the start of Functional Performance Testing.
- P. Equipment Suppliers
  - 1. Provide all requested submittal data, including detailed start-up procedures and specific responsibilities of the City of New York, to keep warranties in force.
  - 2. Assist in equipment testing per agreements with Contractors.
  - 3. Provide information requested by CxA regarding equipment sequence of operation and testing procedures.

### **3.3 CxA'S RESPONSIBILITIES**

A. Roles and Responsibilities

- 1. Refer to DDC General Conditions Section “General Commissioning Requirements” for general CxA responsibilities.

B. Cx Team Meetings

- 1. Commissioning during construction will begin with a ‘Commissioning Kick-Off Meeting – for Construction Team’ conducted by the CxA where the commissioning process is reviewed with all of the commissioning team members.
- 2. Additional meetings will be required throughout construction, and will be scheduled by the CxA on a weekly basis with necessary parties of the commissioning team attending, in order to plan, scope, coordinate, and schedule future activities and resolve problems.

C. Coordination and Scheduling

- 1. Coordinate and direct commissioning activities in a logical, sequential and efficient manner using consistent protocols and forms, centralized documentation, clear and regular communications, and consultations with all necessary parties.
- 2. Coordinate commissioning work with the Commissioner to ensure that commissioning activities are being scheduled into the master project schedule.
- 3. Coordinate with the Commissioner to witness tests, inspections, and systems startup.

D. Commissioning Progress

- 1. Perform site visits to observe component and system installations.
- 2. Report deficiencies to the Commissioner including but not limited to issues related adequate accessibility required for component maintenance replacement and repair.
- 3. Attend selected planning and jobsite meetings to obtain information on construction progress.
- 4. Review construction meeting minutes for revisions/substitutions relating to the commissioning process.

E. Pre-Functional Checks

- 1. Verify proper installation of components, equipment, systems and assemblies. Sampling procedures may NOT be employed on systems and equipment.

F. Equipment and System Startup and Verification

1. Review and approve component, equipment, system, and assembly startup plan developed and submitted by the Contractor.
2. Approve system startup by reviewing startup reports, if contracted; and by selected site observation.
3. Review the Testing, Adjusting and Balancing execution plan for the project, which shall be submitted by the Contractor.
4. Verify and document the accuracy of the air and water systems balancing by spot testing the air and water reported field values with Contractor and by reviewing completed reports.

**G. Functional Performance Testing**

1. With assistance from the Contractor, write Functional Performance Testing procedures for all components, equipment or systems to be commissioned.
2. With the assistance of the Contractors, coordinate Functional Performance Testing. Witness and approve Functional Performance Testing performed by the Contractors.
3. With the assistance of the Contractors, coordinate retesting as necessary until satisfactory performance is achieved.
4. Witness seasonal or deferred Functional Performance Testing as necessary.

**H. Issue/Deficiency Logs**

1. The CxA shall prepare a formal, ongoing, online record of deficiencies, problems and concerns – and their resolution – raised by members of the Commissioning Team during the Commissioning Process.
2. Issues will be recorded on an online Commissioning Issues Log for the contractors to resolve to the satisfaction of the Commissioner. Issues will be added by the CxA. Team members are required to post their own responses to issues pertaining to their work. Team members are required to respond to issues added to the list within five (5) working days of being added by the CxA.
3. Issues will be revisited one (1) time to verify that the proper corrections have been made.
4. When issues are resolved, they will be closed on the Issues Log by the CxA

**I. Operation and Maintenance Data**

1. The CxA shall review of the documentation submitted by the Contractor as required by the Specifications for completeness and accuracy. This commissioning review supplements, but does not replace, the Commissioner's review.
2. Review equipment warranties.

**J. Instruction**

1. The Contractor will provide all documentation and qualified instruction personnel for instruction.
2. The CxA will verify through the Contractor's plan and schedule, instruction agendas, and select observations that proper instruction procedures were followed on all commissioned systems.
3. The CxA will verify that Instruction Video Recordings are executed, collected, and provided to the Commissioner.
4. See appropriate section below pertaining to instruction.

**K. Systems Manual Requirements**

1. Index of Systems Manual with notation as to content storage location if not in actual manual.
2. Executive Summary
3. A list of recommended operational record keeping procedures at the facility level, including sample forms, trend logs, or others, and a rationale for each.
4. Maintenance procedures, schedules and recommendations.

5. Ongoing Optimization
6. Other Attachments

**L. Post Occupancy Review**

1. The CxA will return to the site within the 12-month warranty period to address the following: review current building operations with facility staff and address outstanding issues related to the Commissioner's Project Requirements; Interview facility staff and identify problems or concerns with operating the building; Identify problems covered under warranty or under the original construction contract.
2. The CxA will make suggestions for improvements in the content of the O&M Manuals. Any required changes shall be made by the contractor responsible for that section.
3. The CxA shall assist facility staff in developing reports, documents and requests for services to remedy outstanding problems.

**M. Commissioning Final Report**

1. The CxA shall provide a final report following the completion of all Functional Performance Testing. The report is to outline compliance and non-compliance to the construction documents, as well as identify concerns relative to future performance.

### **3.4 TESTING PREPARATION**

- A. Certify in writing to the CxA that Electrical systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.
- B. Certify in writing to the CxA that Electrical instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.
- C. Certify in writing that testing procedures have been completed and that testing reports have been submitted, discrepancies corrected, and corrective work approved.
- D. Place systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
- E. Inspect and verify the position of each device and interlock identified on checklists.
- F. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.
- G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the CxA.

### **3.5 GENERAL TESTING REQUIREMENTS**

- A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of the CxA.
- B. Scope of Electrical testing shall include the entire Electrical installation, from the incoming power equipment throughout the distribution system. Testing shall include measuring, but not limited to resistance, voltage, and amperage of system(s) and devices.

- C. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.
- D. The CxA along with the contractor shall prepare detailed testing plans, procedures, and checklists for Electrical systems, subsystems, and equipment.
- E. Tests will be performed using design conditions whenever possible.
- F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
- G. The CxA may direct that set points be altered when simulating conditions is not practical.
- H. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- I. If tests cannot be completed because of a deficiency outside the scope of the Electrical system, document the deficiency and report it to the Commissioner. After deficiencies are resolved, reschedule tests.
- J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

### **3.6 ELECTRICAL SYSTEMS, SUBSYSTEMS, AND EQUIPMENT TESTING PROCEDURES**

- A. Equipment Testing and Acceptance Procedures: Testing requirements are specified in individual Division 26 sections. Provide submittals, test data, inspector record, infrared camera and certifications to the CA.
- B. Electrical Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Division 26 Sections "Instrumentation and Control" and "Sequence of Operations" Assist the CxA with preparation of testing plans.
- C. Emergency Generator Testing and Acceptance Procedures: Provide technicians, load banks, infrared cameras, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested. –
- D. Electrical Distribution System Testing: Provide technicians, load banks, infrared cameras, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested
- E. Vibration and Sound Tests: Provide technicians, instrumentation, tools, and equipment to test performance of vibration isolation and seismic controls.
- F. The work included in the commissioning process involves a complete and thorough evaluation of the operation and performance of all components, systems and sub-systems. The following equipment and systems shall be evaluated:

- 1. Automatic temperature controls integrated with the electrical systems

2. Automatic Transfer Switch
3. Emergency Generator
4. Emergency Power System
5. Uninterruptible Power Supplies
6. Motor Control Center
7. Panelboard
8. Power Distribution System
9. Switchboard
10. Transformer
11. Lighting Controls
12. Occupancy Sensors
13. Solar Photovoltaic Array Systems
14. VFDs

### **3.7 DEFICIENCIES/NON-CONFORMANCE, FAILURE DUE TO MANUFACTURER DEFECT**

#### **A. Deficiencies/Non-Conformance**

1. The CxA will record the results of the functional test on the test form. All deficiencies or non-conformance items shall be noted and reported to the Commissioner and Contractors on a standardized form.
2. The Contractor shall respond to new deficiencies within five (5) business days. The response shall either indicate the issue will be corrected with anticipated date of completion indicated or the response should clearly indicate why the Contractor disputes the claim while referencing the contract document in dispute or request further information to clarify the concern.
3. Corrections of minor deficiencies identified may be made during the tests at the discretion of the CxA.
4. Every effort will be made to expedite the testing process and minimize unnecessary delays, while not compromising the integrity of the procedures.
5. As tests progress and a deficiency is identified, the CxA discusses the issue with the executing Contractor.
6. When there is no dispute on the deficiency and the Contractor accepts responsibility to correct it, the CxA documents the deficiency and the Contractor's response and intentions or corrections. The CxA and Contractor then proceed to another test or sequence. Once the Contractor corrects the deficiency, the test is rescheduled and repeated in the anticipation of correct operation or function.
7. When there is a dispute about a deficiency, regarding whether it is a deficiency or who is responsible, the CxA documents the deficiency and the Contractor's response. The deficiency is then forwarded to parties assumed to be responsible for the deficiency. Resolutions are made at the lowest management level possible. Other parties are brought into the discussion as needed. Final interpretive authority is with the Commissioner. Final acceptance authority is with the Commissioner and CxA. The CxA will then document the resolution process. Once the interpretation and resolution have been decided, the appropriate party corrects the deficiency. The CxA then reschedules the test as stated in the section above.

#### **B. Failure due to Manufacturer Defect**

1. If 10% or three, whichever is greater, of identical pieces (size alone does not constitute a difference) of equipment fail to perform to the Contract Documents (mechanically or substantively) due to manufacturing defect, not allowing it to meet its submitted performance spec, all identical units may be considered unacceptable only by the Commissioner. In such case, the Contractor shall provide the Commissioner with the following.
  - i. Within one week of notification from the Contractor the manufacturer's representative shall examine all other identical units making a record of the findings. The findings shall be provided to the Commissioner within two weeks of the original notice.

- ii. Within two weeks of the original notification, the Contractor or manufacturer shall provide a signed and dated, written explanation of the problem, cause of failures, etc. and all proposed solutions which shall include full equipment submittals. The proposed solutions shall not significantly exceed the specification requirements of the original installation.
- iii. The Commissioner will determine whether a replacement of all identical units or a repair is acceptable.
- iv. Two examples of the proposed solution will be installed by the Contractor and the Contractor will be allowed to test the installations for up to one week, upon which the Commissioner will decide whether to accept the solution.
- v. Upon acceptance, the Contractor and/or manufacturer shall replace or repair all identical items, at their expense and extend the warranty accordingly, if the original equipment warranty had begun. The replacement/repair work shall proceed with reasonable speed beginning within one week from when parts can be obtained.

### **3.8 APPROVAL**

- A. The CxA notes each satisfactorily demonstrated function on the test form. Formal approval of the functional test is made later after review by the CxA. The CxA recommends acceptance of each test to the Commissioner using a standard form.

### **3.9 DEFERRED TESTING**

- A. Unforeseen Deferred Testing – If any check or test cannot be completed due to the building structure, required occupancy condition or other deficiency, execution of checklists and functional testing may be delayed upon approval of the Commissioner. These tests will be conducted in the same manner as the seasonal tests, as soon as possible. Services of necessary parties will be negotiated.
- B. Seasonal Testing – During the warranty period, seasonal testing (tests delayed until weather conditions are closer to the system's design) shall be completed as part of this contract. The CxA shall coordinate this activity. Tests will be executed, documented and deficiencies corrected by the appropriate Contractors, with facilities staff and the CxA witnessing. Any final adjustments to the O&M manuals and record documents due to seasonal testing will be made by the Contractor.

### **3.10 MANUFACTURER'S MANUALS**

- A. The Operation and Maintenance Manuals shall conform to Contract Documents requirements as stated in DDC General Conditions.
- B. The specific content and format requirements for the standard O&M manuals are detailed in DDC General Conditions. Special requirements for the controls contractor and TAB contractor are found in Division 26.
- C. CxA Review and Approval – Prior to substantial completion, the CxA shall review the O&M manuals, documentation and record documents for systems that were commissioned to verify compliance with the Specifications. The CxA will communicate deficiencies in the manuals to the Contractor, or Commissioner, as requested. Upon a successful review of the corrections, the CxA recommends approval and acceptance of these sections of the O&M manuals to the Commissioner. The CxA also reviews each equipment warranty and verifies that all requirements to keep the warranty valid are clearly stated.

### **3.11 INSTRUCTION OF NEW YORK CITY PERSONNEL**

- A. The Contractor shall be responsible for instruction coordination, scheduling, and ultimately for ensuring that instruction is completed.
- B. The CxA shall oversee the instruction of the City of New York for commissioned equipment and systems.
  - 1. The CxA shall interview the City of New York to determine the special needs and areas where instruction will be most valuable. The Commissioner and CxA shall decide how rigorous the instruction should be for each piece of commissioned equipment. The CxA shall communicate the results to the Contractor, who will in turn communicate to the subcontractors and vendors who also have instruction responsibilities.
  - 2. In addition to these general requirements, the specific instruction requirements of the City of New York by Contractors, subcontractors and vendors are specified in the individual sections listed in Section 1.2 – SUMMARY.
  - 3. Each Sub and vendor responsible for instruction will submit a written instruction plan to the Contractor for review and approval prior to instruction. The Contractor will submit one comprehensive instruction plan to the CxA and the Commissioner.
  - 4. The plan will be reviewed by the CxA and the Commissioner. Comments pertaining to its deficiencies will be forwarded to the Contractor. The instruction plan will be rewritten until approved by the CxA and the Commissioner. The final approved instruction plan will cover the following elements:
    - a. Equipment (included in instruction)
    - b. Intended audience
    - c. Location of instruction
    - d. Objectives
    - e. Subjects covered (description, duration of discussion, special methods, etc.)
    - f. Duration of instruction on each subject
    - g. Qualified instructor for each subject
    - h. Instructor qualifications
    - i. Methods (classroom lecture, video, site walk-through, actual operational demonstrations, written handouts, etc.)
  - 5. For the primary equipment, the Contractor shall provide a discussion of the control of the equipment during the instruction conducted by each subcontractor or vendor.
  - 6. Instruction documentation shall include the following items:
    - a. Copy of the instruction plan, including schedule, syllabus, and agenda.
    - b. Copy of the Commissioner's Project Requirements.
    - c. Copy of the Basis of Design.
    - d. Compiled operations manuals.
    - e. Compiled maintenance manuals.
    - f. Completed manufacturer instruction manuals.
    - g. Red-lined drawings.
    - h. Other pertinent documents.
  - 7. The CxA develops criteria for determining that the instruction was satisfactorily completed, including attending some of the instruction, etc. The CxA recommends approval of the instruction to the Commissioner using a standard form. The Commissioner signs the approval form/letter template.

8. At one of the instruction sessions, the CxA presents a presentation discussing the use of the blank functional test forms for re-commissioning equipment
9. Videotaping of the instruction sessions in DVD format will be provided by the CxA.

**3.12 FUNCTIONAL BUILDING SYSTEMS DEMONSTRATION TEST (72 HOURS)**

- A. Refer to Addendum to the General Conditions Section “General Commissioning Requirements” for requirements pertaining to 72-Hour Functional Building Systems Demonstration Testing.

**END OF SECTION 260800**

## **SECTION 26 09 43**

### **LIGHTING CONTROL SYSTEM**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

##### **1.2 SUMMARY**

- A. Types: Types of control systems in this Section shall include the following:
  - 1. Architectural lighting control systems
  - 2. Auxiliary equipment and control systems associated with lighting
- B. Related Sections: Provide a system in accordance with the requirements specified under this section, as shown on the Contract Drawings and as required for the lighting system to comply with 2014 New York City Electrical Code. Refer to the following sections for related requirements:
  - 1. Section 23 09 00 "HVAC Instrumentation and Controls"
  - 2. Section 26 05 53 "Identification for Electrical Systems"
  - 3. Section 26 05 00 "Common Requirements for Electrical Work"
  - 4. Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables"
  - 5. Section 26 05 33 "Raceway and Boxes for Electrical Systems"
  - 6. Section 26 08 00 "Commissioning of Electrical"
  - 7. Section 26 24 13 "Panelboards."
  - 8. Section 26 27 26 "Wiring Devices"
  - 9. Section 26 51 00 "Interior Lighting" and
  - 10. Section 26 56 00 "Exterior Lighting."
- C. The extent of lighting control work includes, but is not limited to, the furnishing and installation of all lighting control components into complete and working lighting control systems as specified in this section, on the drawings, and as required by job conditions. System components include, but are not limited to:
  - 1. Factory pre-assembled and pre-wired networkable lighting control panelboards for dimmed control of 0-10VDC dimmed and switching control of non-dimmed loads.
  - 2. Control stations, including wall mounted low voltage remote controls.
  - 3. Control system network low voltage wiring and/or fiber cabling for interconnection of lighting control panelboards, remote switches and master control stations.
  - 4. Photosensor(s) and timeclock(s) for operation of selected circuits.
  - 5. Permanently installed terminal(s) and master control stations for system programming and feedback.
  - 6. Control system shall be suitable to integrate with the Niagara AX Framework.
  - 7. Conformance: System shall be manufactured in strict accordance with the Contract Drawings and Specifications.
  - 8. Important: Information regarding circuit designation, sizes and quantities is indicated elsewhere. Circuiting indicated in this section is included only to specify dimmer sizes and

control capacities. Do not use this information for sizing branch circuit breaker panelboards, wiring or any other work not included in this section.

### 1.3 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – Construction Waste Management and Disposal
  - 2. Section 01 81 13 – Sustainable Design Requirements for LEED Buildings
  - 3. Section 01 81 19 – Indoor Air Quality Requirements for LEED Buildings
- C. LEED Building Performance Requirements: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 "Indoor Air Quality Management", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

### 1.4 LEED BUILDING SUBMITTALS

- A. LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

### 1.6 SUBMITTALS

- A. Product Data: Provide catalog cut sheets for each type of product indicated. Catalog submittals lacking sufficient detail to indicate compliance with contract documents shall not be acceptable.
- B. Shop Drawings: Submit dimensioned drawings of control system components. Submit shop drawings with proposed component and accessories clearly indicated on each sheet. Shop drawings must be submitted for review before fabrication. Fabrication details may vary slightly from those shown on drawings provided those changes do not adversely affect ease of installation, durability, performance or suitability.
- C. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on this Project.
  - 1. Outline Drawings: Indicate dimensions, weights, arrangement of components, and clearance and access requirements in complete facility floor plans indicating location of all components raceways and wiring of the lighting control system.
  - 2. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components.

3. Wiring Diagrams: Power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.
- D. Coordination Drawings: Submit evidence that lighting controls are compatible with connected monitoring and control devices and systems specified in other Sections.
1. Show interconnecting signal and control wiring and interfacing devices that prove compatibility of inputs and outputs.
  2. For networked controls, list network protocols and provide statements from manufacturers that input and output devices meet interoperability requirements of the network protocol.
  3. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for coordination and record drawing Requirements.
- E. Provide a load schedule which indicates the actual connected load and load type per circuit, circuits and their respective control zones, circuits that are on emergency, and the capacity, phase, and corresponding circuit numbers (per the electrical drawings).
- F. Manuals: Prior to final inspection, provide six (6) complete sets of operating and maintenance manuals. Include technical data sheets and parts ordering information. Include testing and maintenance requirements and instructions for emergency transfer components.
- G. Shop drawings shall be submitted in reproducible form. Fixture fabrication details shall be drawn at either full size or half size scale. Fabrication details shall illustrate a minimum of three (3) critical views indicating all fabrication and assembly methods, materials, material gauges and finishes to be employed.
- H. Catalogue submittals lacking sufficient detail to indicate compliance with contract documents shall not be acceptable.
- I. Complete facility floor plans indicating location of all components raceways and wiring of the lighting control system.
- J. Refer to control intent diagram for occupancy sensor/photocell sensor intent. Submit complete occupancy sensor/photocell sensor layout.

#### 1.7 QUALITY ASSURANCE

- A. All lighting control systems and components and sub-components shall be manufactured, furnished and installed in compliance with the requirements of 2014 New York City Construction Codes and the Fire Department of New York. All fixtures shall bear the appropriate UL (or ETL) and IBEW identifications. Panelboards and integral Lighting Control Chassis are to be UL listed under UL 916 Energy Management Equipment, UL 67 Panelboard Interiors and UL 5 panelboard box.
1. Source Limitations: Obtain lighting control module and power distribution components through one source from a single manufacturer.
  2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to New York City Department of Buildings, and marked for intended use.
  3. Comply with 47 CFR, Subparts A and B, for Class A digital devices.
- B. Manufacturers: The manufacturer providing the material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such similar material or equipment

provided by the manufacturer must have been in satisfactory service for not less than five (5) years.

- C. National Fire Protection Association (NFPA): Comply with NFPA 70, "National Electrical Code," 2017 as applicable to construction and installation of interior building lighting fixtures and emergency lighting.
- D. Regulatory Requirements: Cabinets and all related switch components and subsystems shall comply with the following regulatory requirements.
  - 1. National Electric Code (N.E.C) Article 100 2017
  - 2. National Electrical Manufacturer's Association (N.E.M.A)
  - 3. Underwriter's Laboratories, Inc. (UL) or (ETL)
  - 4. 2014 New York City Construction Codes
- E. Regulatory Requirements: Cabinets and all related components and subsystems shall comply with regulatory requirements including NFPA 70 National Electric Code (NEC), NFPA 110 – Emergency and Standby Power systems, National Electrical Manufacturer's Association (N.E.M.A), NEMA ICS 10 – AC Transfer Switch Equipment, Underwriter's Laboratories, Inc. (UL) or (ETL), UL924- EM Bypass Relays, as well as 2014 New York City Electrical Code.
- F. Manufacturers: All manufacturers must comply with the following:
  - 1. Refer to Quality Assurance Requirements and DDC General Conditions.
  - 2. Samples: Upon request, Manufacturers shall submit a prototype sample of each control station for review by the Commissioner. Prototype control station samples shall be sufficiently detailed and operational to allow evaluation of compliance with the salient features of the specification. Preliminary design or shop drawings shall not be accepted in place of prototype samples.
  - 3. Single Line Diagrams: All manufacturers' control system submission must include a single line diagram for all key project areas both interior and exterior demonstrating understanding of all critical project requirements as identified in the Contract Documents.
- G. All major system components for products specified in this section shall be manufactured and supplied by one company.
- H. Manufacturer shall have their quality system registered to the ISO 9001 Quality Standard.
- I. Lighting control system shall meet IEC801-2, tested to withstand a 15kV electrostatic discharge without damage or loss of memory.

## 1.8 COORDINATION

- A. Coordinate lighting controls. Design display graphics showing building areas controlled by this system; include the status of lighting controls in each area.
- B. Coordinate lighting control components specified in this Section with components specified in Section 26 24 13 "Panelboards".
- C. Coordinate general and electrical trades in terms of installation sequencing and installation of site lighting control equipment to be located in buildings. See Electrical Drawings.

## 1.9 MANUFACTURER'S WARRANTY

- A. **Manufacturer's Warranty:** Manufacturer's standard form in which manufacturer agrees to restore or replace components of lighting controls that fail in materials or workmanship within specified warranty period.
    1. Failures include, but are not limited to, the following:
      - a. Software: Failure of input/output to execute switching commands.
      - b. Failure of modular relays to operate under manual or software commands.
      - c. Damage of electronic components due to transient voltage surges.
  - B. **Warranty Period:** Bear all expenses to restore or replace malfunctioning parts for five (5) years from date of substantial completion.
    1. **Extended Warranty Period:** Expenses of replacement parts that failed in service due to transient voltage surges (in-panel transient surge suppression device rated for 5A at 277VAC) (materials only, f.o.b. the nearest shipping point to Project site) for eight years
    2. **Extended Warranty Period:** Expenses to restore or replace electrically / mechanically held relays for 10 years from date of Substantial Completion.
  - C. **Extended Warranty Period:** Expenses of replacement parts that failed in service due to transient voltage surges (in-panel transient surge suppression device rated for 5A at 277VAC) (materials only, f.o.b. the nearest shipping point to Project site) for eight years.
  - D. **Extended Warranty Period:** Expenses to restore or replace electrically / mechanically held relays for 10 years from date of final written acceptance by the Commissioner
  - E. Warranty shall ensure that the Lighting Control System manufactured and supplied will be the kind and quality described in the specification and will be free of defects in workmanship and material.
- 1.10 **TECHNICAL AND ADMINISTRATIVE REQUIREMENTS**
- A. Ensure that the lighting control system manufacturer shall keep on file and make available for review by the Commissioner complete Quality Control and Quality Assurance records for all phases of production for all lighting equipment to be supplied under this project.
  - B. Submit for review itemized (line item) unit equipment expenses for all equipment to be provided under the Scope of this Contract.
  - C. The Contractor shall be solely responsible for coordinating and expediting the timely procurement and delivery for the lighting control system, equipment and related components for the project.
  - D. Specifications and drawings are intended to convey the salient features, function and character of the control system only, and do not undertake to illustrate or set forth every item or detail necessary for the work. Minor details not usually indicated on the drawings nor specified, but that are necessary or normally required for the proper execution, completion, installation and operation of the control systems shall be included, the same as if they were herein specified or indicated on the drawings.
  - E. The Commissioner shall not be held responsible for the omission or absence of any detail, construction feature, etc. which may be normally required in the production of the lighting control equipment. The full and complete responsibility for accurately fabricating and providing the control systems described herein to the fulfillment of those specifications shall rest solely with the Contractor and the control system manufacturer.

#### 1.11 SAMPLES

- A. Submit for review one representative sample of each lighting control station required under this Contract. After sample acceptance, the control station shall be sent to the project for final installation. In the event the submission is rejected, the control station will be returned to the manufacturer who shall immediately make a new submission which meets the contract requirements.
- B. Shipping: The samples must be actual working devices to be supplied and shall be submitted complete, ready for energizing and examining and shall be shipped (prepaid) by Contractor to the Commissioner or as otherwise specified or directed by Commissioner.

#### 1.13 PROJECT/SITE CONDITIONS

- A. The lighting controls must operate in an ambient temperature range of 0°C (32°F) to 40°C (104°F) and 90% non-condensing relative humidity without the requirement of a regularly scheduled maintenance program for air filtration components. Where lighting control equipment is to be located outdoors, such equipment must be housed in an approved NEMA 4X rated temperature and humidity regulated enclosure to be provided by the Contractor. Provide to the Commissioner cutsheets of enclosure and air conditioning/heating unit for review and consideration.

### PART 2 – PRODUCTS

#### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following (listed alphabetically):

- |                                    |                            |
|------------------------------------|----------------------------|
| 1. Acuity Brands New York Digital: | New York, NY 212-462-0088  |
| 2. Eaton:                          | Cleveland, OH 800-386-1911 |
| 3. ETC Architectural:              | New York, NY 212-397-8080  |
| 4. Or approved equal.              |                            |

#### 2.2 FUNCTIONAL SYSTEM DESCRIPTION

- A. General
  - 1. The lighting control system is a networked system that shall be compatible with a Niagara AX Framework. The system must be able to communicate with fully digital centralized relay panels, dimming relay panels, digital switches, photocells, various interfaces and shall include all operational software. The intent of the specification is to integrate all lighting control into one system, except for areas controlled by a single motion sensor such as rooms with a single luminaire. Lighting control system shall include all hardware and software. Software to be resident within the lighting control system. System shall provide local access to all programming functions at the master LCP and remote access to all programming functions via dial up modem and through the Niagara AX Framework. Desktop computers are not part of this section and will be provided by others.
  - 2. System software shall provide real time status of each relay, each zone and each group.
  - 3. Lighting control system shall be able to be monitored by and take commands from a remote PC. At any time, should the remote PC go off-line all system programming uploaded to the lighting control system shall continue to operate as intended. Systems requiring an on-line PC or server for normal operation are not acceptable.

4. All programs, schedules, time of day, etc., shall be held in non-volatile memory for a minimum of 10 years at power failure. At restoration of power, lighting control system shall implement programs required by current time and date.
5. System shall be capable of flashing lights Off/On any relay or any zone prior to the lights being turned Off. The warning interval time between the flash and the final lights off signal shall be definable for each zone. Occupant shall be able to override any scheduled Off sweep using local wall switches within the occupied space. Occupant override time shall be locally and remotely programmable and not exceed 2-hours.
6. The lighting control system shall provide the ability to control each relay and each relay group per this specifications requirement. All programming and scheduling shall be able to be done locally at the master LCP and remotely via dial up modem and via the Internet. Remote connection to the lighting control system shall provide real time control and real time feedback. Lighting control panels shall be able to be programmed and managed through a Niagara AX graphical user interface, which will be accessible utilizing a standard web browser by any authorized individual with the proper security credentials.
7. System may consist of centralized or distributed relays, dimmers, digital switches, photocells, and various digital interfaces. Verify exact components specified. All control devices shall communicate as one network via RS485. Global functionality relative to the lighting control system, such as building schedules, data logging, and alarm configuration will reside on the Niagara AX network, and will be accessible and fully configurable from a web page.
8. All software required for network programming and configuration will be resident on the Niagara AX manager, eliminating the need for manufacturer specific software, and a dedicated PC. The software shall be licensed to and shall be fully accessible via a standard browser as noted above.
9. Lighting control system start-up and initial programming of lighting control system software shall be provided by a technician authorized by the lighting controls manufacturer. Niagara AX integration & programming shall be provided by BMS manufacturer or the Contractor.
10. Contractor to provide stainless steel coverplates for all manual switches. Multi-gang switch stations should be grouped under a single stainless steel coverplate.

## 2.3 SYSTEM PERFORMANCE REQUIREMENTS

### A. System Architecture

1. System shall have an architecture that is based upon three main concepts: (1) networkable intelligent lighting control devices, (2) standalone lighting control zones using distributed intelligence, (3) optional system backbone for remote, time based and global operation between control zones.
2. Intelligent lighting control devices shall have individually addressable network communication capability and consist of one or more basic lighting control components: occupancy sensor, photocell sensor, relay, dimming output, contact closure input, analog 10V input, and manual wall station capable of indicating switching, dimming, and/or scene control. Combining one or more of these components into a single device enclosure shall be permissible so as to minimize overall device count of system.
3. System must be capable of interfacing directly with networked luminaires such that either low voltage network cabling or wireless RF communication is used to interconnect networked luminaires with control components such as sensors, switches and system backbone (see Control Zone Characteristics sections for each type of network connection, wired or wireless).
4. Lighting control zones consisting of one or more networked luminaires and intelligent lighting control devices and shall be capable of providing automatic control from sensors (occupancy

and/or photocell) and manual control from local wallstations without requiring connection to a higher-level system backbone; this capability is referred to as “distributed intelligence.”

Lighting control zones (wired and wireless) of at least 128 devices per zone shall be supported.

5. The system shall be capable of providing individually addressable switching and dimming control of the following: networked luminaires, control zones, and relay and dimming outputs from centralized panels to provide design flexibility appropriate with sequence of operations required in each project area or typical space type.
6. Networked luminaires and intelligent lighting control devices shall support individual (unique) configuration of device settings and properties.
7. Networked luminaires and intelligent lighting control devices shall have distributed intelligence programming stored in non-volatile memory such that following any loss of power the lighting control zones shall operate according to their defined default settings and sequence of operations.
8. Lighting control zones shall be capable of being networked with a higher-level system backbone to provide time based control, remote control from inputs and/or systems external to the control zone, and remote configuration and monitoring through a software interface.
9. The system may include one or more system controllers that provide time-based control and global system control across multiple control zones and backbone network segments. The system controller also provides a means of connecting the lighting control system to a system software interface and building management systems via BACnet/IP protocol.
10. The system may include “communication bridge” devices that route communication from lighting control zones (wired or wireless) to and from the system controller, for purposes of decreasing system wiring requirements.
11. All system devices shall support remote firmware update, such that physical access to each device is not necessary, for purposes of upgrading functionality at a later date.

**B. Wired Networked Control Zone Characteristics**

1. Connections to devices within a wired networked lighting control zone and to backbone components shall be with a single type of low voltage network cable, which shall be compliant with CAT5e specifications or higher. To prevent wiring errors and provide expenses savings, the use of mixed types of low voltage network cables shall not be permitted.
2. Devices in an area shall be connected via a “daisy-chain” topology; requiring all individual networked devices to be connected back to a central component in a “hub-and-spoke” topology shall not be permitted, so as to reduce the total amount of network cable required for each control zone.
3. System shall provide the option of having pre-terminated plenum rated low voltage network cabling supplied with hardware so as to reduce the opportunity for improper wiring and communication errors during system installation.
4. Following proper installation and provision of power, all networked devices connected together with low voltage network cable shall automatically form a functional lighting control zone without requiring any type of programming, regardless of the programming mechanism (e.g., software application, handheld remote, pushbutton). The “out of box” default sequence of operation is intended to provide typical sequence of operation so as to minimize the system startup and programming requirements and to also have functional lighting control operation prior to system startup and programming.
5. Once software is installed, system shall be able to automatically discover all connected devices without requiring any provisioning of system or zone addresses.
6. All networked devices shall have the ability to detect improper communication wiring and blink its LED in a specific cadence as to alert installation/startup staff.
7. Networked control devices intended for control of egress and/or emergency light sources shall not require the use of additional, externally mounted UL924 shunting and/or 0-10V disconnect devices, so as to provide a compliant sequence of operation while reducing the

overall installation and wiring expenses of the system. The following types of wired networked control devices shall be provided for egress and/or emergency light fixtures:

- a. Low-Voltage power sensing: These devices shall automatically provide 100% light level upon detection of loss of power sensed via the low voltage network cable connection.
- b. UL924 Listed Line-Voltage power sensing: These devices shall be listed as emergency relays under the UL924 standard, and shall automatically close the load control relay(s) and provide 100% light output upon detection of loss of power sensed via line voltage connections.

**C. Supported Sequence of Operations**

1. The following characteristics and performance requirements shall apply to wired and wireless control zones provided by the system.
2. Control Zones
  - a. Networked luminaires and intelligent lighting control devices installed in an area (also referred to as a group of devices) shall be capable of transmitting and tracking occupancy sensor, photocell sensor, and manual switch information within at least 48 unique control zones to support different and reconfigurable sequences of operation within the area. These shall also be referred to as local control zones.
  - b. Networked luminaires and intelligent lighting control devices located in different areas shall be able to transmit and track occupancy, photocell, and switch information within at least 128 system-wide control zones to support required sequences of operation that may span across multiple areas. These shall also be referred to as global control zones.
3. Wallstation Capabilities  
Wallstations shall be provided to support the following capabilities:
  - a. On/Off of a local control zone and global control zone simultaneously, as required.
  - b. Continuous dimming control of light level of a local control zone and global control zone simultaneously, as required.
  - c. Preset Scenes that can activate a specific combination of light levels across multiple local and global channels, as required.
  - d. Profile Scenes that can modify the sequence of operation for the devices in the area (group) in response to a button press. This capability is defined as supporting "Local Profiles" and is used to dynamically optimize the occupant experience and lighting energy usage. Parameters that shall be configurable and assigned to a Local Profile include light level, response to occupancy sensors (including enabling/disabling response), response to daylight sensors (including enabling/disabling response), and enabling/disabling of wallstations.
  - e. 3-way / multi-way control: multiple wallstations shall be capable of controlling the same local and global control zones, so as to support "multi-way" switching, dimming, preset scene, and profile scene control.
  - f. Electrical contractor to provide low-voltage Panic Push Button (in red color) per specification for connection to dry-contact input on lighting control system to manually activate Disorder Control Lights.
4. Occupancy Sensing Capabilities
  - a. Local and global control: Occupancy sensors shall be configurable to control a local and global zone simultaneously, as required.

- b. Multi-sensor control: multiple occupancy sensors shall be capable of controlling the same local and global control zones. This capability combines occupancy sensing coverage from multiple sensors without consuming multiple control zone addresses.
  - c. System shall support the following types of occupancy sensing sequence of operations:
    - i. On/Off Occupancy Sensing
    - ii. Partial-On Occupancy Sensing
    - iii. Partial-Off Occupancy Sensing
    - iv. Vacancy Sensing (Manual-On / Automatic-Off)
  - d. On/Off, Partial-On, and Partial-Off Occupancy Sensing modes shall function according to the following sequence of operation:
    - i. Occupancy sensors automatically turn lights on to a designated level when occupancy is detected. To support fine tuning of Partial-On sequences the designated occupied light level shall support at least 100 dimming levels.
    - ii. Occupancy sensors automatically turn lights off or to a dimmed state (Partial-Off) when vacancy occurs or if sufficient daylight is detected. To support fine tuning of Partial-Off sequences the designated unoccupied dim level shall support at least 100 dimming levels.
    - iii. To provide additional energy savings the system shall also be capable of combining Partial-Off and Full-Off operation by dimming the lights to a designated level when vacant and then turning the lights off completely after an additional amount of time.
    - iv. Photocell readings, if enabled in the Occupancy Sensing control zone, shall be capable of automatically adjusting the light level during occupied or unoccupied conditions as necessary to further reduce energy usage. Additional requirements and details for photocell sensing capabilities are indicated under Photocell Sensing Capabilities.
    - v. The use of a wallstation shall change the dimming level or turn lights off as selected by the occupant. The lights shall remain in this manually-specified light level until the zone becomes vacant; upon vacancy the normal sequence of operation, as defined above, shall proceed.
5. Vacancy Sensing mode (also referred to as Manual-On / Automatic-Off) shall function according to the following sequence of operation:
- a. The use of a wallstation is required turn lights on. The system shall be capable of programming the zone to turn on to either to a designated light level or the previous light level. Initially occupying the space without using a wallstation shall not result in any change in light level.
  - b. Occupancy sensors shall automatically turn lights off when vacancy occurs is detected. To provide an enhanced occupant experience the system shall also be capable of dimming the lights when vacant and then turning the lights off completely after an additional amount of time.
  - c. To minimize occupant impact in case the area or zone is still physically occupied following dimming or shutoff of the lights due to detection of vacancy, the system shall support an “automatic grace period” immediately following detection of vacancy, during which time any detected occupancy shall result in the lights reverting to the previous level. After the grace period has expired, the use of a wallstation is required to turn lights on.
  - d. Photocell readings, if enabled in the Occupancy Sensing control zone, shall be capable of automatically adjusting the light level as necessary to further reduce energy usage. Additional requirements and details for photocell sensing capabilities are indicated under Photocell Sensing Capabilities.

- e. At any time, the use of a wallstation shall change the dimming level or turn lights off as selected by the occupant. The lights shall remain in this manually-specified light level until the zone becomes vacant; upon vacancy the normal sequence of operation, as defined above, shall proceed.
  - f. To accommodate different types of environments, vacancy time delays before dimming or shutting off lights shall be specifiable for control zones between 15 seconds to 2 hours.
- 6. Photocell Sensing Capabilities (Automatic Daylight Sensing)
  - a. Photocell sensing devices shall be configurable to control a local and global zone simultaneously, as required.
  - b. The system shall support the following types of photocell-based control:
    - i. On/Off: The control zone is automatically turned off if the photocell reading exceeds the defined setpoint and automatically turned on if the photocell reading is below the defined setpoint. A time delay or adaptive setpoint adjustable behavior may be used to prevent the system from exhibiting nuisance on/off switching.
    - ii. Continuous Dimming: The control zone automatically adjusts its dimming output in response to photocell readings, such that a minimum light level consisting of both electric light and daylight sources is maintained at the task. The photocell response shall be configurable to adjust the photocell setpoint and dimming rates.
- 7. Schedule and Global Profile Capabilities
  - a. The system shall be capable of automatically modifying the sequence of operation for selected devices in response to any of the following: a time-of-day schedule, contact closure input state, RS-232/RS-485 command, BACnet input command, and demand response signal. This capability is defined as supporting "Global Profiles" and is used to dynamically optimize the occupant experience and lighting energy usage.
  - b. Scheduling. Global profiles may be scheduled with the following capabilities:
    - i. Global Profiles shall be stored within and executed from the system controller (via internal timeclock) such that a dedicated software host or server is not required to be online to support automatic scheduling and/or operation of Global Profiles.
    - ii. Global Profile time of day schedules shall be capable of being given the following recurrence settings: daily, specific days of week, every "n" number of days, weekly, monthly, and yearly. Lighting control profile schedules shall support definition of start date, end date, end after "n" recurrences, or never ending. Daylight savings time adjustments shall be capable of being performed automatically, if desired.
    - iii. Global Profiles shall be capable of being scheduled to run according to timed offsets relative to sunrise or sunset. Sunrise/sunset times shall be automatically derived from location information using an astronomical clock.
    - iv. Blink warning and timed extension capabilities. At the end of a scheduled period, the system shall be capable of providing a visible "blink warning" 5 minutes prior to the end of the schedule. Wallstations may be programmed to provide timed overrides that turn the lights on for an additional period of time. Timed override duration shall be programmable for each individual device, zone of devices, or customized group of devices, ranging from 5 minutes to 12 hours.
    - v. Software management interface shall be capable of displaying a graphic calendar view of profile schedules for each control zone.
  - c. System Global Profiles shall have the following additional capabilities:

- i. Global Profiles shall be capable of being manually activated directly from the system controller, specially programmed input devices, and software management interface.
    - ii. Global Profiles shall be selectable to apply to a single device, zone of devices, or customized group of devices.
    - iii. Parameters that shall be configurable and assigned to a Global Profile include light level, response to occupancy sensors (including enabling/disabling response), response to daylight sensors (including enabling/disabling response), and enabling/disabling of wallstations.
  - d. A backup of Local and Global Profiles shall be stored on the software's host server such that the Profile backup can be applied to a replacement system controller or wallstation.
8. Automated demand response capabilities. Profiles created for automated demand response events shall support automatic reduction of light level to programmable values. At least four levels of demand response profiles shall be supported by the system.

## 2.4 SYSTEM SOFTWARE INTERFACES

### A. Historical Database and Analytics Interface

1. System shall provide a historical database that stores device operational history and calculates energy usage for all networked luminaires and intelligent control devices.
2. System shall be capable of reporting lighting system events and performance data back to the historical database for display and analysis.
3. Historical database shall be capable of recording historical data for up to 20,000 networked devices for a period of at least 1 calendar year.
4. An "Energy Scorecard" shall be displayed that shows calculated energy savings in dollars, kWh, or CO<sub>2</sub>.
5. Software shall calculate the allocation of energy savings to different control measures (occupancy sensors, photocells, manual switching, etc.).
6. Energy savings data shall be calculated for the system as a whole or for individual zones.
7. A time scaled graph showing all relay transitions shall be presented.
8. A time scaled graph showing a zones occupancy time delay shall be presented
9. A time scaled graph showing the total light level shall be presented.
10. User shall be able to customize the baseline run-time hours for a space.
11. User shall be able to customize up to four time-of-day billing rates and schedules.
12. Historical data shall be exportable from the Historical Database via a "CSV" type of file format.

### B. Visualization Interfaces

1. System shall provide a web-based visualization interface that displays graphical floorplan.
2. Graphical floorplan shall offer the following types of system visualization:
  - a. Full Device Option - A master graphic of the entire building, by floor, showing each control device installed in the project with zones outlined to include but not be limited to the following:
    - i. Controls embedded light fixtures
    - ii. Controls devices not embedded in light fixtures
    - iii. Daylight Sensors
    - iv. Occupancy Sensors
    - v. Wall Switches and Dimmers
    - vi. Scene Controllers
    - vii. Networked Relays

- viii. Bridges
- ix. System Controllers
- x. Panels
- xi. Zone outlines
- b. Zone Only Option - A master graphic of the entire building, by floor, showing control zones:
  - i. Zones outlined
- c. Allow for pan and zoom commands so smaller areas can be displayed on a larger scale simply by panning and zooming each floor's master graphic.
- d. A mouse click on any control device shall display the following information (as applicable):
  - i. The device catalog number.
  - ii. The device name and custom label.
  - iii. Device diagnostic information.
  - iv. Information about the device status or current configuration is available with an additional mouse click.

**C. Personal Control Applications**

- 1. Software interface shall support personal control software applications that provide user-specific control of individual luminaires, control zones, and scene presets.
- 2. Personal control applications shall support control of dimming output or definition of dimming presets for luminaires and devices that are dimmable.
- 3. The system administrator shall be capable of defining personal control permissions for each user account.
- 4. Software interface shall provide a Microsoft Windows operating system taskbar application for personal lighting control.
- 5. Software interface shall provide an Apple iOS operating system application (supported by mobile phones and mobile tablet devices) for personal lighting control.

**D. Smartphone Programming Interface for Wired Devices**

- 1. Application interface shall be provided for both Apple iOS and Android operating systems that allows configuration of lighting control settings.
- 2. The application shall support the configuration of wired networked control devices via a Bluetooth Low Energy (BLE) Programming Device.
  - a. Application shall support a security pin-code to access the zone of lighting control devices.
  - b. The application shall provide indication of signal strength where multiple Bluetooth Low Energy Programming Devices are available for configuration.
  - c. The application shall indicate the number of wired networked control devices. The application shall indicate the number of wired networked control devices.
- 3. Programming capabilities through the application shall include, but not be limited to, the following:
  - a. Switch/occupancy/photosensor group configuration
  - b. Manual/automatic on modes
  - c. Turn-on dim level
  - d. Occupancy sensor time delays
  - e. Dual technology occupancy sensors sensitivity
  - f. Trim level settings

## 2.5 SYSTEM BACKBONE AND SYSTEM INTEGRATION EQUIPMENT

### A. Network System Controller

1. System Controller shall be multi-tasking, real-time digital control processor consisting of modular hardware with plug-in enclosed processors, communication controllers, and power supplies.
2. System Controller shall have 32-bit microprocessor operating at a minimum of 1 GHz.
3. System Controller shall have minimum of 512MB memory, with a minimum of 4GB non-volatile flash, to support its own operating system and databases.
4. System Controller shall perform the following functions:
  - a. Facilitation of global network communication between different areas and control zones.
  - b. Time-based control of downstream wired and wireless network devices.
  - c. Linking into an Ethernet network.
  - d. Integration with Building Management Systems (BMS) and Heating, Ventilation and Air Conditioning (HVAC) equipment.
  - e. Connection to various software interfaces, including management interface, historical database and analytics interface, visualization interface, and personal control applications.
5. System Controller shall have an integral web server to support configuration, diagnostics and hosting of software interfaces.
6. Device shall have option for a graphical touch screen to support configuration and diagnostics.
7. Device shall have three RJ-45 networked lighting control ports for connection to any of the following:
  - a. The graphical touch screen
  - b. Wired communication bridges
  - c. Direct connection to networked wired luminaires and intelligent lighting control devices (up to 128 total devices per port)
8. Device shall be capable of communicating with wireless mesh network bridges and software interfaces via LAN connection.
9. Device shall automatically detect all networked devices connected to it, including those connected to wired and wireless communication bridges.
10. Device shall have a standard internal time clock.
11. Device shall have 2 switched RJ-45 10/100 BaseT Ethernet ports for local area network (LAN) connection
  - a. Ethernet connection shall support daisy chain wiring to other lighting control system LAN devices, such as other system controllers and wireless mesh networked communication bridges.
  - b. Ethernet connection shall support IPv4 and shall be capable of using a dedicated static or DHCP assigned IP address.
12. Device shall have 2 x USB 2.0 Expansion ports for
  - a. 802.11 Wi-Fi Adapter enabling wireless connectivity including:
    - i. Hot Spot
    - ii. Access Point
    - iii. Client
    - iv. Spanning Tree Protocol

13. Each System Controller shall be capable of managing and operating at least 1500 networked devices (wired or wireless).
  - a. Multiple System Controllers may be networked together via LAN connection to scale the system up to 20,000 networked devices.
14. System Controller shall support BACnet/IP and BACnet/MSTP protocols to directly interface with BMS and HVAC equipment without the need for additional protocol translation gateways.
  - a. BACnet/MSTP shall support up to minimum of 50 additional BACnet MS/TP controllers in addition to the Expansion I/O modules.
  - b. BACnet/MSTP shall support 9600 to 115200 baud.
  - c. System Controller shall be BACnet Testing Laboratory (BTL listed) using Device Profile BACnet Building Controller (B-BC) with outlined enhanced features.
15. Shall contain a “FIPS 140-2 Level 1 Compliant” cryptographic module.

## 2.6 WIRED NETWORK DEVICES

### A. Wired Networked Wall Switches, Dimmers, Scene Controllers

1. Devices shall recess into single-gang switch box and fit a standard GFI opening.
2. Communication and low voltage power shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors.
3. All switches shall have the ability to detect when it is not receiving valid communication and blink its LED in a pattern to visually indicate a potential wiring issue.
4. Devices with mechanical push-buttons shall provide tactile and LED user feedback.
5. Devices with mechanical push-buttons shall be made available with custom button labeling.
6. Wall switches & dimmers shall support the following device options:
  - a. Number of control zones: 1, 2 or 4
  - b. Control Types Supported: On/Off or On/Off/Dimming
  - c. Colors: Ivory, White, Light Almond, Gray, Black, Red
7. Scene controllers shall support the following device options:
  - a. Number of scenes: 1, 2 or 4
  - b. Control Types Supported:
    - i. On/Off
    - ii. On/Off/Dimming
    - iii. Preset Level Scene Type
    - iv. Reprogramming of other devices within daisy-chained zone so as to implement user selected lighting scene
    - v. Selecting a lighting profile to be run by the system’s upstream controller so as to implement a selected lighting profile across multiple zones
    - vi. Colors: Ivory, White, Light Almond, Gray, Black, Red

### B. Wired Networked Graphic Wall Stations

1. Device shall surface mount to single-gang switch box.
2. Device shall have a 3.5” full color touch screen.
3. Device shall be powered with Class 2 low voltage supplied locally via a directly wired power supply.
4. Device shall have a micro-USB style connector for local computer connectivity.
5. Communication shall be over standard low voltage network cabling with RJ-45 connectors.

6. Device shall enable user supplied screen saver image to be uploaded within one of the following formats: jpg, png, gif, bmp, tif.
7. Device shall enable configuration of all switches, dimmers, and lighting preset scenes via password protected setup screens.
8. Graphic wall stations shall support the following device options:
  - a. Number of control zones: Up to 16
  - b. Number of scenes: Up to 16
  - c. Colors: Ivory, White, Light Almond, Gray, Black

**C. Wired Networked Auxiliary Input / Output (I/O) Devices**

1. Devices shall be plenum rated and be inline wired, screw mountable, or have an extended chase nipple for mounting to a ½ in knockout.
2. Communication and low voltage power shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors.
3. Auxiliary Input/Output Devices shall be specified as an input or output device with the following options:
  - a. Contact closure input
    - i. Input shall be programmable to support maintained or momentary inputs that can activate local or global scenes and profiles, ramp light level up or down, or toggle lights on/off.
  - b. 0-10V analog input
    - i. Input shall be programmable to function as a daylight sensor.
  - c. RS-232/RS-485 digital input
    - i. Input supports activation of local or global scenes and profiles, and on/off/dimming control of up to 16 local control zones.
  - d. 0-10V dimming control output, capable of sinking up to 20mA of current
    - i. Output shall be programmable to support all standard sequence of operations supported by system.

**D. Wired Networked Occupancy and Photosensors**

1. Occupancy sensors shall sense the presence of human activity within the desired space and fully control the on/off function of the lights.
2. Sensors shall utilize passive infrared (PIR) technology, which detects occupant motion, to initially turn lights on from an off state, thus preventing false on conditions. Ultrasonic or Microwave based sensing technologies shall not be accepted.
3. For applications where a second method of sensing is necessary to adequately detect maintained occupancy (such as in rooms with obstructions), a sensor with an additional “dual” technology shall be used.
4. Dual technology sensors shall have one of its two technologies not require motion to detect occupancy. Acceptable dual technology includes PIR / Microphonics (also known as Passive Dual Technology or PDT) which both looks for occupant motion and listens for sounds indicating occupants. Sensors where both technologies detect motion (PIR / Ultrasonic) shall not be acceptable.
5. All sensing technologies shall be acoustically passive, meaning they do not transmit sound waves of any frequency (for example in the Ultrasonic range), as these technologies have the potential for interference with other electronic devices within the space (such as electronic white board readers). Acceptable detection technologies include Passive Infrared (PIR), and/or Microphonics technology. Ultrasonic or Microwave based sensing technologies shall not be accepted.
6. Communication and low voltage power shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors.

7. All sensors shall have the ability to detect when it is not receiving valid communication and blink its LED in a pattern to visually indicate a potential wiring issue.
  8. Sensor programming parameter shall be available and configurable remotely from the software and locally via the device push-button.
  9. Network system shall have ceiling, fixture, recessed & corner mounted sensors available, with multiple lens options available customized for specific applications.
  10. Sensors shall be available with zero or one integrated dry contact switching relays, capable of switching 1 amp at 24 VAC/VDC (resistive only).
  11. Sensors shall be available with one or two occupancy “poles”, each of which provides a programmable time delay.
  12. Sensors shall have optional features for photosensor/daylight override, dimming control, and low temperature/high humidity operation.
  13. Photosensor shall provide for an on/off set-point, and a deadband to prevent the artificial light from cycling. Delay shall be incorporated into the photocell to prevent rapid response to passing clouds.
  14. Photosensor and dimming sensor’s set-point and deadband shall be automatically calibrated through the sensor’s microprocessor by initiating an “Automatic Set-point Programming” procedure. Min and max dim settings as well as set-point may be manually entered.
  15. Deadband setting shall be verified and modified by the sensor automatically every time the lights cycle to accommodate physical changes in the space (i.e., furniture layouts, lamp depreciation, or lamp outages).
  16. A dual zone option shall be available for On/Off Photocell, Automatic Dimming Control Photocell, or Combination units. The secondary daylight zone shall be capable of being controlled as an “offset” from the primary zone.
- E. Wired Networked Wall Switch Sensors
1. Devices shall recess into single-gang switch box and fit a standard GFI opening.
  2. Communication and low voltage power shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors.
  3. All wall switch sensors shall have the ability to detect when it is not receiving valid communication and blink its LED in a pattern to visually indicate a potential wiring issue.
  4. Devices with mechanical push-buttons shall provide tactile user feedback.
  5. Wall switches sensors shall support the following device options:
    - a. User Input Control Types Supported: On/Off or On/Off/Dimming
    - b. Occupancy Sensing Technology: PIR only or Dual Tech acoustic
    - c. Daylight Sensing Option: Inhibit Photosensor
    - d. Colors: Ivory, White, Light Almond, Gray
- F. Wired Networked Embedded Sensors
1. Network system shall have embedded sensors consisting of occupancy sensors and/or dimming photocells that can be embedded into luminaire such that only the lens shows on luminaire face.
  2. Occupancy sensor detection pattern shall be suitable for 7.5 ft. to 20 ft. mounting heights. USC
  3. Embedded sensors shall support the following device options:
    - a. Occupancy Sensing technology: PIR only or Dual Tech acoustic
    - b. Daylight Sensing Option: Occupancy only, Daylight only, or combination Occupancy/Daylight sensor
- G. Wired Networked Power Packs and Secondary Packs

1. Power Packs shall incorporate one optional Class 1 relay, optional 0-10 VDC dimming output, and contribute low voltage Class 2 power to the rest of the system.
2. Power Packs shall accept 120 or 277 VAC (or optionally 347 VAC) and carry a plenum rating.
3. Secondary Packs shall incorporate the relay and 0-10 VDC or line voltage dimming output, but shall not be required to contribute system power.
4. Power Supplies shall provide system power only, but are not required to switch line voltage circuit.
5. Auxiliary Relay Packs shall switch low voltage circuits only, capable of switching 1 amp at 40 VAC/VDC (resistive only).
6. Communication shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors. Secondary packs shall receive low voltage power via standard low voltage network cable.
7. Power Pack programming parameter shall be available and configurable remotely from the software and locally via the device push-button.
8. Power Pack shall securely mount to junction location through a threaded ½ in chase nipple or be capable of being secured within a luminaire ballast/driver channel. Plastic clips into junction box shall not be accepted. All Class 1 wiring shall pass through chase nipple into adjacent junction box without any exposure of wire leads. Note: UL Listing under Energy Management or Industrial Control Equipment automatically meets this requirement, whereas Appliance Control Listing does not meet this safety requirement.
9. When required by local code, Power Pack must install inside standard electrical enclosure and provide UL recognized support to junction box. All Class 1 wiring is to pass through chase nipple into adjacent junction box without any exposure of wire leads.
10. Power/Secondary Packs shall be available with the following options:
  - a. Power Pack capable of full 16-Amp switching of all normal power lighting load types, with optional 0-10V dimming output capable of up to 100mA of sink current.
  - b. Secondary Pack with UL924 listing for switching of full 16-Amp Emergency Power circuits, with optional 0-10V dimming output capable of up to 100mA of sink current.
  - c. Power and Secondary Packs capable of full 20-Amp switching of general purpose receptacle (plug-load) control.
  - d. Secondary Pack capable of full 16-Amp switching of all normal power lighting load types.
  - e. Secondary Pack capable of 5-Amps switching and dimming 120 VAC incandescent lighting loads or 120/277 VAC line voltage dimmable fluorescent ballasts (2-wire and 3-wire versions).
  - f. Secondary Pack capable of 5-Amps switching and dimming of 120/277 VAC magnetic low voltage transformers.
  - g. Secondary Pack capable of 4-Amps switching and dimming of 120 VAC electronic low voltage transformers.
  - h. Secondary Pack capable of louver/damper motor control for skylights.
  - i. Secondary Pack capable of providing a pulse on/pulse off signal for purposes of controlling shade systems via relay inputs.
  - j. Secondary Pack capable of switching 1 amp at 40 VAC/VDC (resistive only) with the intent to provide relay signal to auxiliary system (e.g. BMS).
  - k. Power Supply capable of providing auxiliary bus power (no switched or dimmed load).

**H. Wired Networked Communication Bridge**

1. Device shall surface mount to a standard 4" x 4" square junction box.
2. Device shall have 8 RJ-45 ports for connection to lighting control zones (up to 128 devices per port), additional network bridges, and System Controller.

3. Device shall be capable of aggregating communication from multiple lighting control zones for purposes of minimizing backbone wiring requirements back to System Controller.
4. Device shall be powered with Class 2 low voltage supplied locally via a directly wired power supply, or powered via low voltage network connections from powered lighting control devices (e.g. power packs).
5. Wired Bridge shall be capable of redistributing power from its local supply and connected lighting control zones with excess power to lighting control zones with insufficient local power. This architecture also enables loss of power to a particular area to be less impactful on network lighting control system.

## 2.7 TOUCH PANEL CONTROLS

### A. Touch Screen Control Station

### B. Preset lighting scene controller

1. General Requirements:
  - a. 7" full color multi-touch capacitive touchscreen for controlling lighting and system components
  - b. Control up to 65,000 zones of lighting/shades per system
  - c. Control up to 72 lighting channels/scenes per touch screen that include on/off, dimming, tunable white, RGB, and/or shade control
  - d. Link up to 24 touch screens for a possibility of 864 lighting zones/scenes
  - e. Connect up to 128 network devices per touch screen
  - f. On screen lighting design
  - g. Lighting zones/scenes can be comprised of lighting intensity, color, color temperature, and luminaire position
  - h. Modify color and color temperature using a digital color palette and dUV rating scale
  - i. Proximity screen sensor for auto "wake-up"
  - j. Auto dimming and user adjustable backlight
  - k. User programmable screen lock limiting access to all feature control and programming
  - l. Full alpha-numeric scene and zone naming
  - m. Configurable interface to reflect project requirements
  - n. Lighting zones/scenes support control of forward/reverse phase dimming, 0-10v, RGB, certain types of control enabled luminaires, DMX, DALI, tunable white and moving fixtures
  - o. Integral astronomical time clock enables lighting scenes
  - p. Partition status control and visualization
  - q. Direct DMX control for a single universe (512 slots)
  - r. Connect up to 128 enabled devices
  - s. Digital motion sensor control
  - t. Digital daylight harvesting response
  - u. RS-232/contact closure capable for 3rd party integration
  - v. Local wireless Bluetooth connectivity with mobile app
  - w. Compatible with Fresco Lighting Management Panels (LMP)
  - x. Frame Color: White
2. Electrical:
  - a. Fresco Input: 24VDC
  - b. Fresco Power Supply: 120-277V AC
  - c. RS-485 network terminal
  - d. RJ-45 ports (in/out)
  - e. CAT5e Ethernet network terminal
  - f. (DMX/RDM network terminal)

3. Mounting:
  - a. Installs in a standard triple gang US back box
  - b. Remote mounted power supply
  - c. Plug in wire harness for RS-485 and DMX connections
4. Protocols:
  - a. RS-485
  - b. IEEE 802.15 Bluetooth compliant
  - c. (Controller is compliant to industry standard ANSI E1.11 - 2008, USITT DMX512-A)
  - d. (Supports extended RDM capability as defined by ANSI E1.20)
  - e. IEEE 802.11 Ethernet compliant
  - f. Network digital communication
  - g. BACnet/IP ISO 16484-5

## 2.8 MOBILE CONTROL

- A. iPad Device Application
- B. Allows mobile control and programming of the Touchscreen Controller
  1. General requirements:
    - a. Mobile Apple device supports Bluetooth communication protocol
    - b. Provides user control and edit capability of lighting scenes and zones
    - c. Edit intensity, color, color temperature, and movement
    - d. Edit lighting schedules
    - e. Restrict number of users able to connect to touchscreen
    - f. Restrict access to making system changes
    - g. No PC required for mobile operation

## 2.9 SYSTEM DESIGN CRITERIA

- A. See electrical drawings for location of all panelboards and devices.
- B. The number of circuits and control groups, as well as type of control shall be as indicated on the electrical drawings. All controls shall be remote as described in the specifications.
- C. System shall consist of:
  1. Relay Panel
  2. Dimming Interface
  3. Photocell
  4. Occupancy Sensor
  5. Master Control Station
  6. Remote Station
- D. The system shall be designed to control the building's exterior and interior lighting fixtures and provide a link to BMS and Fire Alarm Control Panel to monitor the status of each of the buildings lighting areas.

The following types of control will be required:

1. Site:
  - a. General: All lights control by photocell and astronomical timeclock override (except

- the disorder control lights)
- b. Disorder Control Lights: Control by Push Bottom (locate at the 1<sup>st</sup> FL Main Desk Area).

2. Interior Spaces:

- a. All interior lights connect to EM Generator.
- b. 1<sup>st</sup> FL Vestibule & Entry/Lobby: Daylight dimming and local switch override.
- c. 1<sup>st</sup> FL Reception: Local dimmer switch override
- d. Lightwell above Main Desk Area: Daylight dimming and local dimmer switch override
- e. Corridor (Typical): Occupancy sensor with dimming
- f. Stairway (Typical): Occupancy sensor with dimming
- g. 1<sup>st</sup> FL Community Room: Daylight dimming, occupancy sensor with dimming and local dimmer switch override
- h. 1<sup>st</sup> FL Muster/Community Training Room: Occupancy sensor with dimming and local dimmer switch override
- i. Conference Room (Typical): Vacancy sensor and local dimmer switch override
- j. 2<sup>nd</sup> FL Staff Lounge: Occupancy sensor with dimming
- k. Offices with Exterior Windows (Typical): Daylight dimming, vacancy sensor and local dimmer switch override
- l. Offices without Windows (Typical): Vacancy sensor and local dimmer switch override
- m. 1<sup>st</sup> FL Hazardous Cleanup: Occupancy Sensor with Dimming
- n. Property Room (Typical): Local switch
- o. Camera Room (Typical): Occupancy sensor with dimming
- p. 1<sup>st</sup> FL Prisoner Processing (cells): Local dimmer switch
- q. 1<sup>st</sup> FL Prisoner Processing Restroom: Local switch
- r. Video Booking (Typical): Local dimmer switch
- s. Debriefing Interview/ Juvenile Interview (Typical): Local dimmer switch
- t. Detective Detention Arrest Processing: Local switch
- u. Corridor (anti-crime viewing) (Typical): Local switch
- v. Locker Room/ Changing Room (Typical): Occupancy sensor with dimming
- w. Rest Area (Typical): Local dimmer switch
- x. Common/ Group Toilets and showers (Typical): Occupancy sensor with dimming
- y. Individual Toilet and shower (Typical): Vacancy sensor switch
- z. Cellar FL Stress Reduction: Occupancy sensor with dimming
- aa. Cellar FL Maintenance Workshop: Vacancy sensor and local dimmer switch override
- bb. Storage/Equipment Room/Janitor Closet (Typical): Vacancy sensor switch
- cc. Electrical/ Mechanical Rooms (Typical): Occupancy Sensor with dimming
- dd. Cellar FL Gas Meter Room and Fuel Oil Tank: Time Switch with 2 minutes Shut Down Waring
- ee. 1<sup>st</sup> FL Evidence Vehicles: Occupancy Sensor with dimming and dimmer switch override

## 2.10 SINGLE LINE DIAGRAM

- A. Network Backbone Single Line Diagram (For Connection with Building Management System):  
Refer to Electrical Drawings for full size single line diagram and load schedule.

### Note:

1. For information regarding emergency lighting systems and interface to UPS panel see riser diagram on electrical drawings.
2. See electrical drawings for complete panelboard schedule and load information.
3. See electrical drawings for device quantity and power pack dimming types.

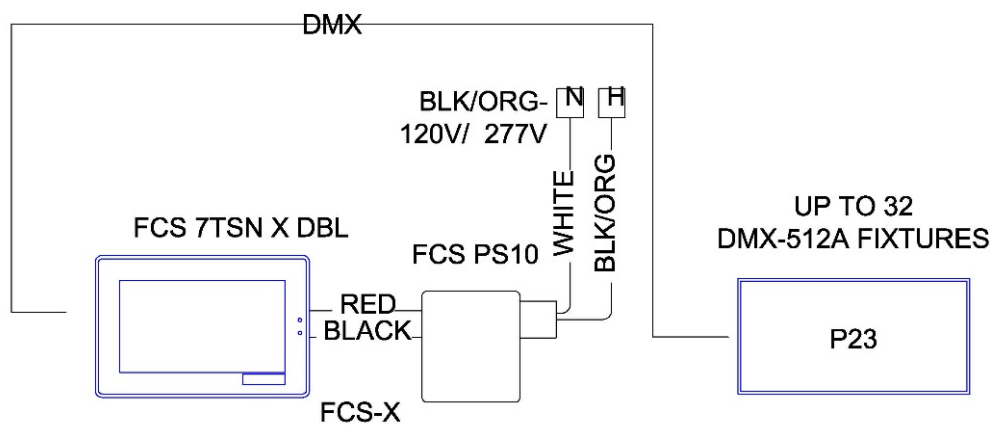

- B. Typical Distributed Zone Wiring Diagram (For Connection with Building Management System):  
Refer to Electrical Drawings for full size single line diagram and load schedule.

**Note:**

1. For information regarding emergency lighting systems and interface to UPS panel see riser diagram on electrical drawings.
2. See electrical drawings for complete panelboard schedule and load information.
3. See electrical drawings for device quantity and power pack dimming types.

- C. DMX Distributed Zone Wiring Diagram (For Connection with Building Management System):  
Refer to Electrical Drawings for full size single line diagram and load schedule.

**Note:**

1. For information regarding emergency lighting systems and interface to UPS panel see riser diagram on electrical drawings.
2. See electrical drawings for complete panelboard schedule and load information.
3. See electrical drawings for device quantity and power pack dimming types.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 INSTALLATION**

- A. **Delivery Storage Handling:** Deliver products to the job site in manufacturer's original containers marked with job name, Contractor's name and labeling that clearly indicates the contents. Deliver, store and handle products in accordance with manufacturer's written admonishments.
- B. **Job Conditions:** Maintain job site conditions in accordance with manufacturer's recommendations.
- C. **Reject and do not install any damaged or unsatisfactory equipment.** Replace unsatisfactory equipment with new equipment that is satisfactory if so directed by the Commissioner.
- D. The system shall be installed utilizing complete manufacturer's shop drawings and in accordance with these specifications.
- E. Install Control Stations only after "wet" work such as plastering and painting is complete and the area is cleaned.
- F. The breaker cabinets and controls shall be stored in their original cartons or crates in a dry location free from dirt and dust until ready to install. Provide protection and protective coverings as appropriate to prevent damage to the equipment during installation and until the Commissioner accepts. Restore or replace damaged equipment as directed.
- G. Mount equipment at locations and heights indicated on approved shop drawings, or as directed by the Commissioner. Locations indicated on the electrical drawings are general and approximate - carefully verify locations with Commissioner's plans prior to installation. Check for adequacy of headroom and clearance with other equipment such as ducts, pipes and openings. Bring all conflicts to the attention of the Commissioner prior to proceeding with the work.
- H. Upon completion of the installation, test all line voltage and control wiring for continuity and accuracy of all connections.
- I. Upon completion of the installation, the lighting control equipment shall operate per specifications and be free from defects in condition and finish. Moveable parts must operate freely and with uniform friction throughout their range. Any components damaged prior to the final inspection must be replaced by the Contractor prior to inspection.
- J. Ensure that the manufacturer makes any calibrations and adjustments necessary for proper operation of the system.

**3.3 SYSTEM START-UP**

- A. Upon completion of the installation, the system shall be checked out and started up by a factory instructed technician. Contractor to have completed and tested all wiring, installed all controls and lamped all fixtures before start up.
- B. Upon completion of system start up, the factory instructed technician shall demonstrate the operation of the system to the Contractor and the Commissioner. Contractor to advise Commissioner prior to scheduling start up so all persons designated by the Commissioner are present for instruction. See Paragraph 3.4 of this section. The following system start-up services shall be supplied by a factory instructed Technician during a single site visit.

1. Check installation of all Lighting Control Panelboards
  2. Test operation of all Breakers and Lighting Breakers
  3. Test operation of all Low Voltage Inputs
  4. Test operation of all Telephone Override Lines
  5. Test operation of all Network Communication
  6. Test operation of Lighting or Building Management Station and Associated Printer
  7. Load Application Specific Software Control Modules and test operation
  8. Restore or replace any defective component
  9. Test operation of complete Lighting or Building Management System
- C. Equipment manufacturer to provide six (6) bound copies of a "Maintenance and Operation Manual" to the Commissioner. Manuals shall contain "As Built" shop drawings, wiring diagrams, description of all control functions, all instruction sheets for all components, calibration and adjustment procedures for all applicable components, maintenance procedures and instructions, component specifications, copy of warranty, address and phone contacts for troubleshooting and service help. Manufacturer's start up engineer to review contents of manual with the Commissioner.
- D. The Commissioner will schedule a final inspection with the Contractor. The Contractor will make any necessary adjustments and calibrations, whether the inspection is scheduled within or outside normal working hours, at no additional expense to the City of New York.
- E. If deficiencies that can be corrected immediately are apparent, correct them as soon as possible and schedule another final inspection with the Commissioner. System must be approved prior to acceptance by the Commissioner.

### 3.4 INSTRUCTION

- A. Factory technician will schedule, in coordination with the Commissioner, an instruction period for the City of New York's staff or designated appointees. This instruction period to be a minimum of 3 hours. Instruction shall encompass entire scope of the system including operation, adjustment, maintenance and troubleshooting until completely understood. Manufacturer shall submit names and period of attendance of those instructed to Commissioner.
- B. The following system instruction services shall be supplied by Contractor's factory Field Engineer licensed in the State of New York during a single site visit:
1. System review of all Hardware Components and their functions
  2. System review of all software Components and their function
  3. Hands-On "Operator" instruction to develop experience with Supplied Control Functions
  4. Hands-On "Building Engineer" instruction to develop experience with system Software Programming
  5. Walk through of User's Guide and Programmer's Guide

### 3.5 SYSTEM PROGRAMMING

- A. The following system programming services shall be supplied by Contractor's factory Field Engineer licensed in the State of New York during a single site visit:
1. Advise the Commissioner on developing a control scenario for each application
  2. Program the Commissioner supplied control scenario into the lighting management system
  3. Review the programmed information with the Commissioner and the City of New York's staff and walk through the operation of the program.
  4. Submit electronic files of the control program to the Commissioner.

**3.6 DOCUMENTATION**

- A. The following documentation shall be supplied:
1. System Single-Line Diagram: show system components and quantities including panelboards, breakers, low-voltage switches and sensors, dataline, telephone override lines and Lighting or Building Management Station.
  2. Panelboard Configuration Diagram: Show PC board configuration, breaker configuration and power supply location.
  3. Panelboard Wiring Schedule: Show breaker/load relationship with direct switch override if applicable.
  4. Wiring Diagram: Show typical wiring application diagram for each system component supplied.
  5. Installation Guide: Provide instructions as to how to install system components.
  6. Manual: Provide User's Guide and Programmer's Guide in a loose leaf three ring binder with step by step illustrated instructions.
  7. Riser Diagram: Provided by specifier along with reflected ceiling plans showing control schematic.

**3.7 CONTRACTOR'S QUALITY CONTROL REQUIREMENTS**

- A. Comply with applicable provisions of DDC General Conditions "Quality Requirements" for requirements for Contractor's Quality Control Program.

**END OF SECTION 26 09 43**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 24 13****SWITCHBOARDS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
1. Service and distribution switchboards rated 600 V and less.
  2. Transient voltage suppression devices.
  3. Disconnecting and overcurrent protective devices.
  4. Instrumentation.
  5. Control power.
  6. Accessory components and features.
  7. Identification.
  8. Mimic bus.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**PART 2 - PRODUCTS****2.1 MANUFACTURED UNITS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Siemens Energy & Automation, Inc.
  2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
  3. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  4. All City Switchboard
  5. Atlas
  6. Electrotech
  7. Lincoln Electric
  8. Or approved equal.
- B. Front-Connected, Front-Accessible Switchboards:
1. Main Devices: Panel mounted.
  2. Branch Devices: Panel mounted.
  3. Sections front and rear aligned.
- C. Front- and Side-Accessible Switchboards:
1. Main Devices: Fixed, individually mounted.
  2. Branch Devices: Panel mounted.
  3. Sections front and rear aligned.
- D. Nominal System Voltage: 208Y/120V.
- E. Main-Bus Continuous: 2000 A.
- F. Seismic Requirements: Fabricate and test switchboards according to IEEE 344 to withstand seismic forces defined in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- G. Indoor Enclosures: Steel, NEMA 250, Type 1.
- H. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
- I. Barriers: Between adjacent switchboard sections.
- J. Insulation and isolation for main bus of main section and main and vertical buses of feeder sections.

- K. Utility Metering Compartment: Fabricated, barrier compartment and section complying with utility company's requirements; hinged sealed door; buses provisioned for mounting utility company's current transformers and potential transformers or potential taps as required by utility company. If separate vertical section is required for utility metering, match and align with basic switchboard. Provide service entrance label and necessary applicable service entrance features.
- L. Customer Metering Compartment: A separate customer metering compartment and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks. Include potential transformers having primary and secondary fuses with disconnecting means and secondary wiring terminated on terminal blocks.
- M. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
- N. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
- O. Pull Box on Top of Switchboard:
  - 1. Adequate ventilation to maintain temperature in pull box within same limits as switchboard.
  - 2. Set back from front to clear circuit-breaker removal mechanism.
  - 3. Removable covers shall form top, front, and sides. Top covers at rear shall be easily removable for drilling and cutting.
  - 4. Bottom shall be insulating, fire-resistive material with separate holes for cable drops into switchboard.
  - 5. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.
- P. Buses and Connections: Three phase, four wire unless otherwise indicated.
  - 1. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity, silver-plated, with tin-plated aluminum or copper feeder circuit-breaker line connections.
  - 2. Phase- and Neutral-Bus Material: Tin-plated, high-strength, electrical-grade aluminum alloy with tin-plated aluminum circuit-breaker line connections.
  - 3. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity, silver-plated, or tin-plated, high-strength, electrical-grade aluminum alloy.
  - 4. Load Terminals: Insulated, rigidly braced, runback bus extensions, of same material as through buses, equipped with compression connectors for outgoing circuit conductors. Provide load terminals for future circuit-breaker positions at full-ampere rating of circuit-breaker position.
  - 5. Ground Bus: 1/4-by-2-inch Minimum-size required by UL 891, hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
  - 6. Main Phase Buses and Equipment Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
  - 7. Neutral Buses: 50 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.

- 8. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
- 9. Isolation Barrier Access Provisions: Permit checking of bus-bolt tightness.

- Q. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.
- R. Bus-Bar Insulation: Factory-applied, flame-retardant, tape wrapping of individual bus bars or flame-retardant, spray-applied insulation. Minimum insulation temperature rating of 105 deg C.
- S. Fungus Proofing: Permanent fungicidal treatment for overcurrent protective devices and other components including instruments and instrument transformers.

## 2.2 TRANSIENT VOLTAGE SUPPRESSION DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Siemens Energy & Automation, Inc.
  - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
  - 3. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 4. All City Switchboard
  - 5. Atlas
  - 6. Electrotech
  - 7. Lincoln Electric
  - 8. Or approved equal.
- B. Surge Protection Device Description: IEEE C62.41-compliant, integrally mounted, bolt-on, solid-state, parallel-connected, modular with field-replaceable modules) type, with sine-wave tracking suppression and filtering modules, UL 1449, second edition, short-circuit current rating matching or exceeding the switchboard short-circuit rating, and with the following features and accessories:
  - 1. Fuses, rated at 200-kA interrupting capacity.
  - 2. Fabrication using bolted compression lugs for internal wiring.
  - 3. Integral disconnect switch.
  - 4. Redundant suppression circuits.
  - 5. Redundant replaceable modules.
  - 6. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
  - 7. LED indicator lights for power and protection status.
  - 8. Audible alarm, with silencing switch, to indicate when protection has failed.
  - 9. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of system operation. Contacts shall reverse position on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
  - 10. Six-digit, transient-event counter set to totalize transient surges.
- C. Peak Single-Impulse Surge Current Rating: 120 kA per mode/240 kA per phase.
- D. Withstand Capabilities: 12,000 IEEE C62.41, Category C3 (10 kA), 8-by-20-mic.sec. surges with less than 5 percent change in clamping voltage.

- E. Protection modes and UL 1449 SVR for grounded wye circuits with 208/120V, three-phase, four-wire circuits shall be as follows:
  - 1. Line to Neutral: 700 V for 208Y/120.
  - 2. Line to Ground: 1200 V for 208Y/120.
  - 3. Neutral to Ground: 1000 V for 208Y/120.
- F. Protection modes and UL 1449 SVR for 240/120-V, three-phase, four-wire circuits with high leg shall be as follows:
  - 1. Line to Neutral: 700 V, 800 V from high leg.
  - 2. Line to Ground: 700 V.
  - 3. Neutral to Ground: 1000 V.

## 2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - c. Pringle Electrical Manufacturing Company, Inc.
    - d. Boltswitch, Inc.
    - e. Or approved equal.
  - 2. Main-Contact Interrupting Capability: Minimum of 12 times the switch current rating.
  - 3. Operating Mechanism: Manual handle operation to close switch; stores energy in mechanism for opening and closing
    - a. Electrical Trip: Operation of lever or push-button trip switch, or trip signal from ground-fault relay or remote-control device, causes switch to open.
    - b. Mechanical Trip: Operation of mechanical lever, push button, or other device causes switch to open.
  - 4. Auxiliary Switches: Factory installed, single pole, double throw, with leads connected to terminal block, and including one set more than quantity required for functional performance indicated.
  - 5. Service-Rated Switches: Labeled for use as service equipment.
  - 6. Ground-Fault Relay: Comply with UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.
    - a. Configuration: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
    - b. Internal Memory: Integrates the cumulative value of intermittent arcing ground-fault currents and uses the effect to initiate tripping.
    - c. No-Trip Relay Test: Permits ground-fault simulation test without tripping switch.
    - d. Test Control: Simulates ground fault to test relay and switch (or relay only if "no-trip" mode is selected).

7. Open-Fuse Trip Device: Arranged to trip switch open if a phase fuse opens.

B. Fused Switch: NEMA KS 1, Type HD; quick-make, quick-break, trip free type with clips to accommodate specified fuses; lockable handle.

C. Fuses are specified in Section 262813 "Fuses."

## 2.4 INSTRUMENTATION

A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:

1. Potential Transformers: IEEE C57.13; 120 V, 60 Hz, tapped secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.
2. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
3. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
4. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.

B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:

1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
  - a. Phase Currents, Each Phase: Plus or minus 1 percent.
  - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
  - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
  - d. Megawatts: Plus or minus 2 percent.
  - e. Megavars: Plus or minus 2 percent.
  - f. Power Factor: Plus or minus 2 percent.
  - g. Frequency: Plus or minus 0.5 percent.
  - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
  - i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
  - j. Contact devices to operate remote impulse-totalizing demand meter.
2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.

C. Ammeters, Voltmeters, and Power-Factor Meters: ANSI C39.1.

1. Meters: 4-inch diameter or 6 inches square, flush or semiflush, with antiparallax 250-degree scales and external zero adjustment.
2. Voltmeters: Cover an expanded-scale range of nominal voltage plus 10 percent.

D. Instrument Switches: Rotary type with off position.

1. Voltmeter Switches: Permit reading of all phase-to-phase voltages and, where a neutral is indicated, phase-to-neutral voltages.
  2. Ammeter Switches: Permit reading of current in each phase and maintain current-transformer secondaries in a closed-circuit condition at all times.
- E. Feeder Ammeters: 2-1/2-inch minimum size with 90 or 120-degree scale. Meter and transfer device with off position, located on overcurrent device door for indicated feeder circuits only.
- F. Watt-Hour Meters and Wattmeters:
1. Comply with ANSI C12.1.
  2. Three-phase induction type with two stators, each with current and potential coil, rated 5 A, 120 V, 60 Hz.
  3. Suitable for connection to three- and four-wire circuits.
  4. Potential indicating lamps.
  5. Adjustments for light and full load, phase balance, and power factor.
  6. Four-dial clock register.
  7. Integral demand indicator.
  8. Contact devices to operate remote impulse-totalizing demand meter.
  9. Ratchets to prevent reverse rotation.
  10. Removable meter with drawout test plug.
  11. Semiflush mounted case with matching cover.
  12. Appropriate multiplier tag.
- G. Impulse-Totalizing Demand Meter:
1. Comply with ANSI C12.1.
  2. Suitable for use with switchboard watt-hour meter, including two-circuit totalizing relay.
  3. Cyclometer.
  4. Four-dial, totalizing kilowatt-hour register.
  5. Positive chart drive mechanism.
  6. Capillary pen holding a minimum of one month's ink supply.
  7. Roll chart with minimum 31-day capacity; appropriate multiplier tag.
  8. Capable of indicating and recording 30-minute integrated demand of totalized system.

## 2.5 CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer.
- B. Control Circuits: 120-V ac, supplied from remote branch circuit.
- C. Control Circuits: V dc.
- D. Electrically Interlocked Main and Tie Circuit Breakers: Two control-power transformers in separate compartments, with interlocking relays, connected to the primary side of each control-power transformer at the line side of the associated main circuit breaker. 120-V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.
- E. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

- F. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

## 2.6 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Portable Test Set: For testing functions of solid-state trip devices without removing from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.
- C. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.

## 2.7 IDENTIFICATION

- A. Mimic Bus: Entire single-line switchboard bus work, as depicted on factory record drawing, on a photoengraved nameplate.
  - 1. Nameplate: At least 0.032-inch thick anodized aluminum, located at eye level on front cover of the switchboard incoming service section.
- B. Mimic Bus: Entire single-line switchboard bus work, as depicted on factory record drawing, on an engraved laminated-plastic (Gravoply) nameplate.
  - 1. Nameplate: At least 0.0625-inch thick laminated plastic (Gravoply), located at eye level on front cover of the switchboard incoming service section.
- C. Mimic Bus: Continuously integrated mimic bus factory applied to front of switchboard. Arrange in single-line diagram format, using symbols and letter designations consistent with final mimic-bus diagram.
- D. Coordinate mimic-bus segments with devices in switchboard sections to which they are applied. Produce a concise visual presentation of principal switchboard components and connections.
- E. Presentation Media: Painted graphics in color contrasting with background color to represent bus and components, complete with lettered designations.
- F. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.

- B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
- C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Install switchboards and accessories according to NEMA PB 2.1.
- B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
- C. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
  - 1. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 2. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 3. Install anchor bolts to elevations required for proper attachment to switchboards.
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.
- E. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration and Seismic Controls for Electrical Systems."
- F. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.
- G. Install filler plates in unused spaces of panel-mounted sections.
- H. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.
  - 1. Set field-adjustable switches and circuit-breaker trip ranges.
- I. Install spare-fuse cabinet.
- J. Comply with NECA 1.

### 3.4 CONNECTIONS

- A. Comply with requirements for terminating feeder bus specified in Section 262500 "Enclosed Bus Assemblies." Drawings indicate general arrangement of bus, fittings, and specialties.
- B. Comply with requirements for terminating cable trays specified in Section 260536 "Cable Trays for Electrical Systems." Drawings indicate general arrangement of cable trays, fittings, and specialties.

### 3.5 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

### 3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- D. Acceptance Testing Preparation:
  - 1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
  - 2. Test continuity of each circuit.
- E. Tests and Inspections:
  - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  - 3. Perform the following infrared scan tests and inspections and prepare reports:
    - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
    - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
    - c. Instruments and Equipment:
      - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

F. Switchboard will be considered defective if it does not pass tests and inspections.

- G. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.7 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

### 3.8 PROTECTION

- A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer's written instructions, until switchboard is ready to be energized and placed into service.

### 3.9 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram microprocessor-based trip, monitoring, and communication units.

**END OF SECTION 26 24 13**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 24 16****PANELBOARDS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
1. Distribution panelboards.
  2. Lighting and appliance branch-circuit panelboards.
  3. Electronic-grade panelboards.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

1.7 DEFINITIONS

- A. ATS: Acceptance testing specification.
- B. GFCI: Ground-fault circuit interrupter.
- C. GFEP: Ground-fault equipment protection.
- D. HID: High-intensity discharge.
- E. MCCB: Molded-case circuit breaker.
- F. SPD: Surge protective device.
- G. VPR: Voltage protection rating.

PART 2 - PRODUCTS

2.1 PANELBOARDS AND COMMON REQUIREMENTS

- A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces defined in Section 260548.16 "Seismic Controls for Electrical Systems."
- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NEMA PB 1.
- E. Comply with NFPA 70.
- F. Enclosures: Flush and Surface -mounted, dead-front cabinets.
  - 1. Rated for environmental conditions at installed location.
    - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
    - b. Outdoor Locations: NEMA 250, Type 3R.
    - c. Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
    - d. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
    - e. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.
  - 2. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box. Trims shall cover all live parts and shall have no exposed hardware.
  - 3. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover. Trims shall cover all live parts and shall have no exposed hardware.

4. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.
  5. Gutter Extension and Barrier: Same gage and finish as panelboard enclosure; integral with enclosure body. Arrange to isolate individual panel sections.
  6. Finishes:
    - a. Panels and Trim: Steel and galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
    - b. Back Boxes: Galvanized steel.
    - c. Fungus Proofing: Permanent fungicidal treatment for overcurrent protective devices and other components.
  7. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover.
- G. Incoming Mains Location: Top and bottom, refer to drawings.
- H. Phase, Neutral, and Ground Buses:
1. Material: Hard-drawn copper, 98 percent conductivity.
  2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
  3. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box.
  4. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads.
- I. Conductor Connectors: Suitable for use with conductor material and sizes.
1. Material: Hard-drawn copper, 98 percent conductivity.
  2. Main and Neutral Lugs: Compression type, with a lug on the neutral bar for each pole in the panelboard.
  3. Ground Lugs and Bus-Configured Terminators: Compression type, with a lug on the bar for each pole in the panelboard.
  4. Feed-Through Lugs: Compression type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
  5. Subfeed (Double) Lugs: Compression type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
  6. Gutter-Tap Lugs: Compression type suitable for use with conductor material and with matching insulating covers. Locate at same end of bus as incoming lugs or main device.
  7. Extra-Capacity Neutral Lugs: Rated 200 percent of phase lugs mounted on extra-capacity neutral bus.
- J. Service Equipment Label: NRTL labeled for use as service equipment for panelboards or load centers with one or more main service disconnecting and overcurrent protective devices.
- K. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
- L. Panelboard Short-Circuit Current Rating: Rated for series-connected system with integral or remote upstream overcurrent protective devices and labeled by an NRTL. Include six and type of allowable upstream and branch devices, listed and labeled for series-connected short-circuit rating by an NRTL.

- M. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

## 2.2 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
  - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
- B. Surge Suppression: Factory installed as an integral part of indicated panelboards, complying with UL 1449 SPD Type 1.

## 2.3 POWER PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Siemens Energy & Automation, Inc.
  - 2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  - 3. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 4. All City Switchboard.
  - 5. Electrotech.
  - 6. Lincoln Electric.
  - 7. Or approved equal.
- B. Panelboards: NEMA PB 1, power and feeder distribution type.
- C. Doors: Secured with vault-type latch with tumbler lock; keyed alike with 511s Locks. Door within a Door Construction. Provide two (2) #47 keys per panel.
  - 1. For doors more than 36 inches high, provide two latches, keyed alike.
- D. Mains: Circuit breaker, Fused switch, as indicated on drawings.
- E. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes 125 A and Smaller:
- F. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes Larger than 125 A: Bolt-on circuit breakers; Plug-in circuit breakers where individual positive-locking device requires mechanical release for removal.
- G. Branch Overcurrent Protective Devices: Fused switches.
- H. Contactors can be incorporated to switch the entire panelboard or only a portion of the circuits. Coordinate with Drawings and schedules to indicate contactor connections, type, quantity of circuits controlled, current ratings, external control circuits, and number of poles. Verify with manufacturers for their respective limitations on short-circuit ratings and availability of contactors, which may not be available in all sizes or from all manufacturers.
- I. Contactors in Main Bus: NEMA ICS 2, Class A, electrically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.

1. Internal Control-Power Source: Control-power transformer, with fused primary and secondary terminals, connected to main bus ahead of contactor connection.
2. External Control-Power Source: 120-V branch circuit.

## 2.4 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

Panelboards, as specified in this article, comply with requirements of "Lighting and Appliance Branch-Circuit Panelboards" in NEMA PB 1.

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Siemens Energy & Automation, Inc.
  2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  3. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  4. All City Switchboard.
  5. Atlas.
  6. Electrotech.
  7. Lincoln Electric.
  8. Or approved equal.
- B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.
- C. Mains: Circuit breaker.
- D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
- E. Contactors in Main Bus: NEMA ICS 2, Class A, electrically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.
  1. Internal Control-Power Source: Control-power transformer, with fused primary and secondary terminals, connected to main bus ahead of contactor connection.
  2. External Control-Power Source: 120-V branch circuit. Retain one or both "Doors" paragraphs below to describe the type of door required. If retaining both indicate on the Drawings which door type applies to each panel.
- F. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike with 511 Locks. Door within a door construction. Provide two (2) #47 keys per panel.
- G. Column-Type Panelboards: Narrow gutter extension, with cover, to overhead junction box equipped with ground and neutral terminal buses.

## 2.5 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Siemens Energy & Automation, Inc.
  2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  3. Eaton Electrical Inc.; Cutler – Hammer Business Unit.
  4. All City Switchboard.
  5. Atlas.
  6. Electrotech.

7. Lincoln Electric.
  8. Or approved equal.
- B. Molded Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
1. Thermal- Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
  3. Electronic Trip Circuit Breakers with rms sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
    - 1) Instantaneous trip.
    - 2) Long- and short-time pickup levels.
    - 3) Long and short time adjustments.
    - 4) Ground-fault pickup level, time delay, and I squared T response.
  4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
  5. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mA trip).
  6. GFEP Circuit Breakers: Class B ground-fault protection (30-mA trip).
  7. Arc-Fault Circuit Interrupter Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.
  8. MCCB Features and Accessories:
    - a. Standard frame sizes, trip ratings, and number of poles.
    - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor materials.
    - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and HID lighting circuits.
    - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
    - e. Communication Capability: Circuit-breaker-mounted Integral communication module with functions and features compatible with power monitoring and control system specified in Section 260913 "Electrical Power Monitoring and Control."
    - f. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.
    - g. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage with field-adjustable 0.1- to 0.6-second time delay.
    - h. Auxiliary Contacts: Two, SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts and "b" contacts operate in reverse of circuit-breaker contacts.
    - i. Alarm Switch: Single-pole, normally open contact that actuates only when circuit breaker trips.
    - j. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
    - k. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function with other upstream or downstream devices.
    - l. Multipole units enclosed in a single housing factory assembled to operate as a single unit.
    - m. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.

- n. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.
- C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.
  - 1. Fuses and Spare-Fuse Cabinet: Comply with requirements specified in Section 262813 "Fuses."
  - 2. Fused Switch Features and Accessories: Standard ampere ratings and number of poles.
  - 3. Auxiliary Contacts: One normally open and normally closed contact(s) that operate with switch handle operation.

## 2.6 ACCESSORIES AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, service, and operation.
- B. Portable Test Set: For testing functions of solid-state trip devices without removing from panelboard. Include relay and meter test plugs suitable for testing panelboard meters and switchboard class relays.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.
- B. Examine panelboards before installation. Reject panelboards that are damaged, rusted, or have been subjected to water saturation.
- C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 INSTALLATION

- A. Install panelboards and accessories according to NEMA PB 1.1.
- B. Equipment Mounting: Install panelboards on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete." Or Section 033053 "Miscellaneous Cast-in-Place Concrete."
  - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around full perimeter of base.
  - 2. For panelboards, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 4. Install anchor bolts to elevations required for proper attachment to panelboards.
  - 5. Attach panelboard to the vertical finished or structural surface behind the panelboard.

- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.
- D. Comply with mounting and anchoring requirements specified in Section 260548 "Vibration Seismic Controls for Electrical Systems."
- E. Mount top of trim 90 inches above finished floor unless otherwise indicated.
- F. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
- G. Install overcurrent protective devices and controllers not already factory installed.
  - 1. Set field-adjustable, circuit-breaker trip ranges.
- H. Install filler plates in unused spaces.
- I. Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.
- J. Arrange conductors in gutters into groups and bundle and wrap with wire ties and labeling tags after completing load balancing.
- K. Comply with NECA 1.

### 3.4 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with requirements in Section 26 05 53 "Identification for Electrical Systems."
- B. Create a directory to indicate installed circuit loads after balancing panelboard loads; incorporate Commissioner's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- D. Device Nameplates: Label each branch circuit device in power panelboards with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

### 3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Acceptance Testing Preparation:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

E. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:
  - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
  - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
  - c. Instruments and Equipment:
    - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

F. Panelboards will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.6 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."
- C. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes. Prior to making circuit changes to achieve load balancing, inform the Commissioner of effect on phase color coding.
  1. Measure loads during period of normal facility operations.
  2. Perform circuit changes to achieve load balancing outside normal facility operation schedule or at times directed by the Commissioner. Avoid disrupting services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
  3. After changing circuits to achieve load balancing, recheck loads during normal facility operations. Record load readings before and after changing circuits to achieve load balancing.

4. Tolerance: Maximum difference between phase loads, within a panelboard, shall not exceed 20 percent.

### 3.7 PROTECTION

- A. Temporary Heating: Prior to energizing panelboards, apply temporary heat to maintain temperature according to manufacturer's written instructions.

**END OF SECTION 26 24 16**

**SECTION 26 24 19****MOTOR-CONTROL CENTERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes MCCs for use with ac circuits rated 600 V and less and having the following factory-installed components:
1. Incoming main lugs and OCPDs.
  2. Full-voltage magnetic controllers.
  3. Reduced-voltage magnetic controllers.
  4. Reduced-voltage, solid-state controllers.
  5. Multispeed controllers.
  6. VFCs.
  7. Feeder-tap units.
  8. Instrumentation.
  9. Auxiliary devices.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

#### 1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”

#### 1.7 DEFINITIONS

- A. CE: Conformance Europeene (European Compliance).
- B. CPT: Control power transformer.
- C. DDC: Direct digital control.
- D. EMI: Electromagnetic interference.
- E. GFCI: Ground fault circuit interrupting.
- F. IGBT: Insulated-gate bipolar transistor.
- G. LAN: Local area network.
- H. LED: Light-emitting diode.
- I. MCC: Motor-control center.
- J. MCCB: Molded-case circuit breaker.
- K. MCP: Motor-circuit protector.
- L. NC: Normally closed.
- M. NO: Normally open.
- N. OCPD: Overcurrent protective device.
- O. PCC: Point of common coupling.
- P. PID: Control action, proportional plus integral plus derivative.
- Q. PT: Potential transformer.
- R. PWM: Pulse-width modulated.
- S. RFI: Radio-frequency interference.
- T. SCR: Silicon-controlled rectifier.
- U. TDD: Total demand (harmonic current) distortion.

V. THD(V): Total harmonic voltage demand.

W. VFC: Variable-frequency controller.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURED UNITS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Siemens Energy & Automation, Inc.
2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
3. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
4. Or approved equal.

B. General Requirements for MCCs: Comply with NEMA ICS 18 and UL 845.

### 2.2 FUNCTIONAL FEATURES

A. Description: Modular arrangement of main units, controller units, control devices, feeder-tap units, instruments, metering, auxiliary devices, and other items mounted in vertical sections of MCC.

B. Controller Units: Combination controller units.

1. Install units up to and including Size 3 on drawout mountings with connectors that automatically line up and connect with vertical-section buses while being racked into their normal, energized positions.
2. Equip units in Type B and Type C MCCs with pull-apart terminal strips for external control connections.

C. Feeder-Tap Units: Through 225-A rating shall have drawout mountings with connectors that automatically line up and connect with vertical-section buses while being racked into their normal, energized positions.

D. Future Units: Compartments fully bused and equipped with guide rails or equivalent, ready for insertion of drawout units.

E. Spare Units: Installed in compartments indicated "spare."

### 2.3 INCOMING MAINS

A. Incoming Mains Location: Top.

B. Main Lugs Only: Conductor connectors suitable for use with conductor material and sizes.

1. Material: Hard-drawn copper, 98 percent conductivity.
2. Main and Neutral Lugs: Compression type.

C. MCCB: Comply with UL 489, with series-connected rating to meet available fault currents.

1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
  3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
    - a. Instantaneous trip.
    - b. Long- and short-time pickup levels.
    - c. Long- and short-time time adjustments.
    - d. Ground-fault pickup level, time delay, and  $I^2t$  response.
  4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
  5. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker; trip activation on fuse opening or on opening of fuse compartment door.
  6. MCCB Features and Accessories:
    - a. Standard frame sizes, trip ratings, and number of poles.
    - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor material.
    - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
    - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
    - e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
    - f. Communication Capability: Universal-mounted communication module with functions and features compatible with power monitoring and control system specified in Section 260913 "Electrical Power Monitoring and Control."
    - g. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.
    - h. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
    - i. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
    - j. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
- D. Insulated-Case Circuit Breaker: 80 percent rated, sealed, insulated-case power circuit breaker with interrupting capacity rating to meet available fault current.
1. Fixed circuit-breaker mounting.
  2. Two-step, stored-energy closing.
  3. Standard-function, microprocessor-based trip units with interchangeable rating plug, trip indicators, and the following field-adjustable settings:
    - a. Instantaneous trip.
    - b. Long- and short-time time adjustments.
    - c. Ground-fault pickup level, time delay, and  $I^2t$  response.

4. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
5. Remote trip indication and control.
6. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 260913 "Electrical Power Monitoring and Control."
7. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
8. Control Voltage: 40-V dc.

## 2.4 COMBINATION CONTROLLERS

### A. Full-Voltage Controllers:

1. General Requirements for Full-Voltage Enclosed Controllers: Comply with NEMA ICS 2, general purpose, Class A.
2. Magnetic Controllers: Full voltage, across the line, electrically held.
  - a. Configuration: Nonreversing and reversing.

### B. Reduced-Voltage Magnetic Controllers:

1. General Requirements for Reduced-Voltage Magnetic Controllers: Comply with NEMA ICS 2, general purpose, Class A; closed transition; adjustable time delay on transition.
2. Reduced-Voltage Magnetic Controllers: Reduced voltage, electrically held.
  - a. Configuration:
  - b. Wye-Delta Controller: Four contactors, with a three-phase starting resistor/reactor bank.
  - c. Part-Winding Controller: Separate START and RUN contactors, field-selectable for one-half or two-thirds winding start mode, with either six- or nine-lead motors; with separate overload relays for starting and running sequences.
  - d. Autotransformer Reduced-Voltage Controller: Medium-duty service, with integral overtemperature protection; taps for starting at 50, 65, and 80 percent of line voltage; two START and one RUN contactors.

### C. Reduced-Voltage, Solid-State Controllers:

1. General Requirements for Reduced-Voltage, Solid-State Controllers: Comply with UL 508.
2. Reduced-Voltage, Solid-State Controllers: An integrated unit with power SCRs, heat sink, microprocessor logic board, door-mounted digital display and keypad, bypass contactor, and overload relay; suitable for use with NEMA MG 1, Design B, polyphase, medium-induction motors.
  - a. Configuration: Standard duty.
  - b. Starting Mode: Voltage ramping.
  - c. Stopping Mode: Coast to stop.
  - d. Shorting (Bypass) Contactor: Operates automatically when full voltage is applied to motor and bypasses the SCRs. Solid-state controller protective features shall remain active when the shorting contactor is in the bypass mode.
  - e. Shorting and Input Isolation Contactor Coils: Pressure-encapsulated type; manufacturer's standard operating voltage, matching control power or line voltage,

- depending on contactor size and line-voltage rating. Provide coil transient suppressors.
- f. Logic Board: Identical for all ampere ratings and voltage classes, with environmental protective coating.
  - g. Adjustable acceleration-rate control using voltage or current ramp, and adjustable starting torque control with up to 400 percent current limitation for 20 seconds.
  - h. SCR bridge shall consist of at least two SCRs per phase, providing stable and smooth acceleration with external feedback from the motor or driven equipment.
  - i. Keypad, front accessible; for programming the controller parameters, functions, and features; shall be manufacturer's standard and include not less than the following functions:
    - j. Adjusting motor full-load amperes, as a percentage of the controller's rating.
    - k. Adjusting current limitation on starting, as a percentage of the motor full-load current rating.
    - l. Adjusting linear acceleration and deceleration ramps, in seconds.
    - m. Initial torque, as a percentage of the nominal motor torque.
    - n. Adjusting torque limit, as a percentage of the nominal motor torque.
    - o. Adjusting maximum start time, in seconds.
    - p. Adjusting voltage boost, as a percentage of the nominal supply voltage.
    - q. Selecting stopping mode and adjusting parameters.
    - r. Selecting motor thermal-overload protection class between 5 and 30.
    - s. Activating and de-activating protection modes.
    - t. Selecting or activating communications modes.
    - u. Digital display, front accessible; for showing motor, controller, and fault status; shall be manufacturer's standard and include not less than the following:
      - v. Controller Condition: Ready, starting, running, stopping.
      - w. Motor Condition: Amperes, voltage, power factor, power, and thermal state.
      - x. Fault Conditions: Controller thermal fault, motor overload alarm and trip, motor underload, overcurrent, shorted SCRs, line or phase loss, phase reversal, and line frequency over or under normal.
    - y. Controller Diagnostics and Protection:
      - z. Microprocessor-based thermal protection system for monitoring SCR and motor thermal characteristics and providing controller overtemperature and motor overload alarm and trip; settings selectable via the keypad.
    - aa. Protection from line-side reverse phasing; line-side and motor-side phase loss; motor jam, stall, and underload conditions; and line frequency over or under normal.
    - bb. Input isolation contactor that opens when the controller diagnostics detect a faulted solid-state component, or when the motor is stopped.
    - cc. Shunt trip that opens the disconnecting means when the controller diagnostics detect a faulted solid-state component.
    - dd. Remote Output Features:
      - ee. All outputs prewired to terminal blocks.
      - ff. Form C status contacts that change state when controller is running.
      - gg. Form C alarm contacts that change state when a fault condition occurs.
    - hh. Optional Features:
      - ii. Analog output for field-selectable assignment of motor operating characteristics; 0 to 10-V dc.
    - jj. Additional field-assignable Form C contacts for alarm outputs.
    - kk. Surge suppressors in solid-state power circuits providing three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
  - ll. Full-voltage bypass contactor operating automatically. Power contacts shall be totally enclosed, double break, and silver-cadmium oxide; and assembled to allow inspection and replacement without disturbing line or load wiring.

**D. Multispeed Magnetic Controllers:**

1. General Requirements for Multispeed Magnetic Controllers: Comply with NEMA ICS 2, general purpose, Class A.
2. Multispeed Magnetic Controllers: Two speed, full voltage, across the line, electrically held. Compelling relay to ensure that motor will start only at low speed.
  - a. Configuration: Nonreversing.
  - b. Compelling relays shall ensure that motor starts only at low speed.
  - c. Accelerating timer relays shall ensure properly timed acceleration through speeds lower than that selected.
  - d. Decelerating timer relays shall ensure automatically timed deceleration through each speed.
  - e. Antiplugging timer relays shall ensure a time delay when transferring from FORWARD to REVERSE and back.

**E. Disconnecting Means and OCPDs:**

1. Fusible Disconnecting Means:
  - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J and Class L fuses.
  - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - c. Auxiliary Contacts: NO/NC, arranged to activate before switch blades open.
2. MCP Disconnecting Means:
  - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
  - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
  - d. NC alarm contact that operates only when MCP has tripped.
  - e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
3. MCCB Disconnecting Means:
  - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
  - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
  - e. NC alarm contact that operates only when MCCB has tripped.
4. Molded-Case Switch Disconnecting Means:
  - a. UL 489, NEMA AB 1, and NEMA AB 3, with in-line fuse block for Class J or L power fuses (depending on ampere rating), providing an interrupting capacity to

comply with available fault currents; MCCB with fixed, high-set instantaneous trip only.

- b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
- c. Auxiliary contacts "a" and "b" arranged to activate with molded-case switch handle.
- d. NC alarm contact that operates only when molded-case switch has tripped.

**F. Overload Relays:**

**1. Melting-Alloy Overload Relays:**

- a. Inverse-time-current characteristic.
- b. Class 10 tripping characteristic.
- c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.

**2. Bimetallic Overload Relays:**

- a. Inverse-time-current characteristic.
- b. Class 10 tripping characteristic.
- c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
- d. Ambient compensated.
- e. Automatic resetting.

**3. Solid-State Overload Relays:**

- a. Switch or dial selectable for motor running overload protection.
- b. Sensors in each phase.
- c. Class 10 tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
- d. Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
- e. Analog communication module.

- 4. NC isolated overload alarm contact.
- 5. External overload reset push button.

**G. Control Power:**

- 1. Control Circuits: 24-V ac; obtained from integral CPT, with primary and secondary fuses with CPT of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.
  - a. CPT Spare Capacity: 50 VA.

**2.5 VFCS**

- A. General Requirements for VFCs: Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 508C.
- B. Application: Constant torque.
- C. VFC Description: Variable-frequency power converter (rectifier, dc bus, and IGBT PWM inverter) factory packaged in an enclosure, with integral disconnecting means and overcurrent

and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.

1. Units suitable for operation of NEMA MG 1, Design A and Design B motors as defined by NEMA MG 1, Section IV, Part 30, "Application Considerations for Constant Speed Motors Used on a Sinusoidal Bus with Harmonic Content and General Purpose Motors Used with Adjustable-Voltage or Adjustable-Frequency Controls or Both."
  2. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
  3. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to New York City Electrical Division.
  4. Listed and labeled for single-phase use by an NRTL acceptable to New York City Electrical Division
  5. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- D. Output Rating: Three-phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.
- E. Unit Operating Requirements:
1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFC input voltage rating.
  2. Input AC Voltage Unbalance: Not exceeding 5 percent.
  3. Input Frequency Tolerance: Plus or minus 3 percent of VFC frequency rating.
  4. Minimum Efficiency: 96 percent at 60 Hz, full load.
  5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
  6. Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
  7. Starting Torque: Minimum of 100 percent of rated torque from 3 to 60 Hz.
  8. Speed Regulation: Plus or minus 5 percent.
  9. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.
  10. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.
- F. Inverter Logic: Microprocessor based, 32 bit, isolated from all power circuits.
- G. Isolated Control Interface: Allows VFCs to follow remote-control signal over a minimum 40:1 speed range.
1. Signal: Electrical.
  2. Signal: Pneumatic.
- H. Internal Adjustability Capabilities:
1. Minimum Speed: 5 to 25 percent of maximum rpm.
  2. Maximum Speed: 80 to 100 percent of maximum rpm.
  3. Acceleration: 0.1 to 999.9 seconds.
  4. Deceleration: 0.1 to 999.9 seconds.
  5. Current Limit: 30 to a minimum of 150 percent of maximum rating.
- I. Self-Protection and Reliability Features:

1. Input transient protection by means of surge suppressors to provide three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
  2. Loss of Input Signal Protection: Selectable response strategy including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
  3. Under- and overvoltage trips.
  4. Inverter overcurrent trips.
  5. VFC and Motor Overload/Overtemperature Protection: Microprocessor-based thermal protection system for monitoring VFCs and motor thermal characteristics, and for providing VFC overtemperature and motor overload alarm and trip; settings selectable via the keypad; NRTL approved.
  6. Critical frequency rejection, with three selectable, adjustable deadbands.
  7. Instantaneous line-to-line and line-to-ground overcurrent trips.
  8. Loss-of-phase protection.
  9. Reverse-phase protection.
  10. Short-circuit protection.
  11. Motor overtemperature fault.
- J. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.
- K. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped, unless "Bidirectional Autospeed Search" feature is available and engaged.
- L. Bidirectional Autospeed Search: Capable of starting VFC into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.
- M. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- N. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- O. Integral Input Disconnecting Means and OCPD: NEMA KS 1, fusible switch with pad-lockable, door-mounted handle mechanism.
1. Disconnect Rating: Not less than 115 percent of VFC input current rating.
  2. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFC input current rating, whichever is larger.
  3. Auxiliary Contacts: NO/NC, arranged to activate before switch blades open.
  4. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.
  5. NC alarm contact that operates only when circuit breaker has tripped.

## 2.6 VFC CONTROLS AND INDICATION

- A. Status Lights: Door-mounted LED indicators displaying the following conditions:
1. Power on.
  2. Run.
  3. Overvoltage.

4. Line fault.
  5. Overcurrent.
  6. External fault.
- B. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.
1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
  2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
    - a. Control Authority: Supports at least four conditions: Off, local manual control at VFC, local automatic control at VFC, and automatic control through a remote source.
- C. Historical Logging Information and Displays:
1. Running log of total power versus time.
  2. Total run time.
  3. Fault log, maintaining last four faults with time and date stamp for each.
- D. Indicating Devices: Digital display and additional readout devices as required, mounted flush in VFC door and connected to display VFC parameters, including, but not limited to:
1. Output frequency (Hz).
  2. Motor speed (rpm).
  3. Motor status (running, stop, fault).
  4. Motor current (amperes).
  5. Motor torque (percent).
  6. Fault or alarming status (code).
  7. PID feedback signal (percent).
  8. DC-link voltage (V dc).
  9. Set point frequency (Hz).
  10. Motor output voltage (V ac).
- E. Control Signal Interfaces:
1. Electric Input Signal Interface:
    - a. A minimum of two programmable analog inputs: 0- to 10-V dc.
    - b. A minimum of six multifunction programmable digital inputs.
  2. Pneumatic Input Signal Interface: 3 to 15 psig.
  3. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the DDC system for HVAC or other control systems:
    - a. 0- to 10-V dc.
    - b. 4- to 20-mA dc.
    - c. Potentiometer using up/down digital inputs.
    - d. Fixed frequencies using digital inputs.

4. Output Signal Interface: A minimum of one programmable analog output signal(s) 0- to 10-V dc, which can be configured for any of the following:
    - a. Output frequency (Hz).
    - b. Output current (load).
    - c. DC-link voltage (V dc).
    - d. Motor torque (percent).
    - e. Motor speed (rpm).
    - f. Set point frequency (Hz).
  5. Remote Indication Interface: A minimum of two programmable dry-circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
    - a. Motor running.
    - b. Set point speed reached.
    - c. Fault and warning indication (overtemperature or overcurrent).
    - d. PID high- or low-speed limits reached.
- F. PID Control Interface: Provides closed-loop set point, differential feedback control in response to dual feedback signals. Allows for closed-loop control of fans and pumps for pressure, flow, or temperature regulation.
1. Number of Loops: One.
- G. Interface with DDC System for HVAC: Factory-installed hardware and software to enable the DDC system for HVAC to monitor, control, and display VFC status and alarms and energy usage. Allows VFC to be used with an external system within a multidrop LAN configuration; settings retained within VFC's nonvolatile memory.
1. Network Communications Ports: Ethernet and RS-422/485.
  2. Embedded DDC system for HVAC Protocols for Network Communications: ASHRAE 135 BACnet, Siemens System 600 APOGEE; protocols accessible via the communications ports.

## 2.7 VFC LINE CONDITIONING AND FILTERING

- A. Input Line Conditioning: Based on the harmonic analysis study and report, provide input filtering, as required, to limit TDD at input terminals of VFCs to less than 5 percent and THD(V) to 3 percent.
- B. Input Line Conditioning: Based on the harmonic analysis study and report, provide input filtering, as required, to limit TDD and THD(V) at the defined PCC per IEEE 519.
- C. Input Line Conditioning:
- D. VFC Output Filtering:
- E. EMI/RFI Filtering: CE marked; certify compliance with IEC 61800-3 for Category C2.
- F. EMI/RFI Filtering:

## 2.8 VFC BYPASS SYSTEMS

- A. Bypass Operation: Safely transfers motor between power converter output and bypass circuit, manually, automatically, or both. Selector switches set modes, and indicator lights indicate mode selected. Unit is capable of stable operation (starting, stopping, and running) with motor completely disconnected from power converter.
- B. Bypass Mode: Manual operation only; requires local operator selection at VFC. Transfer between power converter and bypass contactor and retransfer shall only be allowed with the motor at zero speed.
- C. Bypass Mode: Field-selectable automatic or manual, allows local and remote transfer between power converter and bypass contactor and retransfer, either via manual operator interface or automatic control system feedback.
- D. Bypass Controller: Two-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter and permit safe troubleshooting and testing, both energized and de-energized, while motor is operating in bypass mode.
  - 1. Bypass Contactor: Load-break, NEMA-rated contactor.
  - 2. Output Isolating Contactor: Non-load-break, NEMA-rated contactor.
  - 3. Isolating Switch: Non-load-break switch arranged to isolate power converter and permit safe troubleshooting and testing of the power converter, both energized and de-energized, while motor is operating in bypass mode; pad-lockable, door-mounted handle mechanism.
- E. There is some concern among various listed manufacturers that the input isolating contactor of the three-contactor bypass, without an isolating switch and a barrier between the power converter and the bypass, may not comply with NFPA 70 requirements for safe isolation of the power converter during energized maintenance, because the contactor is not a positive, lockable disconnecting means, and lack of a barrier can lead to accidental contact with live parts in the bypass. Consult Commissioner if this is a concern.
- F. Bypass Controller: Three-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter input and output and permit safe testing and troubleshooting of the power converter, both energized and de-energized, while motor is operating in bypass mode.
  - 1. Bypass Contactor: Load-break, NEMA-rated contactor.
  - 2. Input and Output Isolating Contactors: Non-load-break, NEMA-rated contactors.
  - 3. Isolating Switch: Non-load-break switch arranged to isolate power converter and permit safe troubleshooting and testing of the power converter, both energized and de-energized, while motor is operating in bypass mode; pad-lockable, door-mounted handle mechanism.
- G. Bypass Contactor Configuration: Full-voltage (across-the-line) type.
  - 1. NORMAL/BYPASS selector switch.
  - 2. HAND/OFF/AUTO selector switch.
  - 3. NORMAL/TEST Selector Switch: Allows testing and adjusting of VFC while the motor is running in the bypass mode.
  - 4. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.

- a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
  - b. Power Contacts: Totally enclosed, double break, and silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
- 5. Control Circuits: 120-V ac; obtained from integral CPT, with primary and secondary fuses, with CPT of sufficient capacity to operate all integral devices and remotely located pilot, indicating, and control devices.
- 6. CPT Spare Capacity: 50 VA.
- H. Overload Relays: NEMA ICS 2.
  - 1. Melting-Alloy Overload Relays:
    - a. Inverse-time-current characteristic.
    - b. Class 10 tripping characteristic.
    - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  - 2. Bimetallic Overload Relays:
    - a. Inverse-time-current characteristic.
    - b. Class 10 tripping characteristic.
    - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
    - d. Ambient compensated.
    - e. Automatic resetting.
  - 3. Solid-State Overload Relays:
    - a. Switch or dial selectable for motor-running overload protection.
    - b. Sensors in each phase.
    - c. Class 10 tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
    - d. Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
    - e. Analog communication module.
    - f. NC isolated overload alarm contact.
    - g. External overload reset push button.

## 2.9 OPTIONAL VFC FEATURES

- A. Multiple-Motor Capability: VFC suitable for variable-speed service to multiple motors. Overload protection shuts down VFC and motors served by it, and generates fault indications, when overload protection activates.
  - 1. Configure to allow two or more motors to operate simultaneously at the same speed; separate overload relay for each controlled motor.
  - 2. Configure to allow two motors to operate separately; operator selectable via local or remote switch or contact closures; single overload relay for both motors; separate output magnetic contactors for each motor.
  - 3. Configure to allow two motors to operate simultaneously and in a lead/lag mode, with one motor operated at variable speed via the power converter and the other at constant speed via the bypass controller; separate overload relay for each controlled motor.

- B. Damper control circuit with end of travel feedback capability.
- C. Sleep Function: Senses a minimal deviation of a feedback signal and stops the motor. On an increase in speed-command signal deviation, VFC resumes normal operation.
- D. Motor Preheat Function: Preheats motor when idle to prevent moisture accumulation in the motor.
- E. Firefighter's Override (Smoke Purge) Input: On a remote contact closure from the firefighter's control station, this password-protected input:
  - 1. Overrides all other local and external inputs (analog/digital, serial communication, and all keypad commands).
  - 2. Forces VFC to operate motor, without any other run or speed command, at a field-adjustable, preset speed.
  - 3. Forces VFC to transfer to Bypass Mode and operate motor at full speed.
  - 4. Causes display of Override Mode on the VFC display.
  - 5. Reset VFC to normal operation on removal of override signal automatically.
- F. Remote Indicating Circuit Terminals: Mode selection, controller status, and controller fault.
- G. Remote digital operator kit.
- H. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.

## 2.10 FEEDER-TAP UNITS

- A. MCCB: Comply with UL 489, with series-connected rating to meet available fault currents.
  - 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  - 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
  - 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:
    - a. Instantaneous trip.
    - b. Long- and short-time pickup levels.
    - c. Long- and short-time time adjustments.
    - d. Ground-fault pickup level, time delay, and  $I^2t$  response.
  - 4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
  - 5. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker; trip activation on fuse opening or on opening of fuse compartment door.
  - 6. MCCB Features and Accessories:
    - a. Standard frame sizes, trip ratings, and number of poles.
    - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor material.

- c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
  - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
  - e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
  - f. Communication Capability: Circuit-breaker-mounted communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 "Electrical Power Monitoring and Control."
  - g. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.
  - h. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
  - i. Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
  - j. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
- B. Fusible Switch: NEMA KS 1, Type HD, clips to accommodate specified fuses with lockable handle.
- C. Fuses are specified in Section 26 28 13 "Fuses."

## 2.11 INSTRUMENTATION

- A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
- 1. PTs: IEEE C57.13; 120 V, 60 Hz, single secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.
  - 2. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
  - 3. CPTs: Dry type, mounted in separate compartments for units larger than 3 kVA.
  - 4. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.
- B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
- 1. Listed or recognized by a nationally recognized testing laboratory.
  - 2. Inputs from sensors or 5-A current-transformer secondaries, and potential terminals rated to 600 V.
  - 3. Switch-selectable digital display of the following values with the indicated maximum accuracy tolerances:
    - a. Phase Currents, Each Phase: Plus or minus 1 percent.
    - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
    - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
    - d. Three-Phase Real Power (Megawatts): Plus or minus 2 percent.
    - e. Three-Phase Reactive Power (Megavars): Plus or minus 2 percent.

- f. Power Factor: Plus or minus 2 percent.
    - g. Frequency: Plus or minus 0.5 percent.
    - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
    - i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
    - j. Contact devices to operate remote impulse-totalizing demand meter.
  - 4. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.
- C. Ammeters, Voltmeters, and Power-Factor Meters: ANSI C39.1.
  - 1. Meters: 4-inch diameter or 6 inches square, flush or semiflush, with antiparallax 250-degree scale and external zero adjustment.
  - 2. Voltmeters: Cover an expanded-scale range of nominal voltage plus 10 percent.
- D. Instrument Switches: Rotary type with off position.
  - 1. Voltmeter Switches: Permit reading of all phase-to-phase voltages and phase-to-neutral voltages where a neutral is included.
  - 2. Ammeter Switches: Permit reading of current in each phase and maintain current-transformer secondaries in a closed-circuit condition at all times.
- E. Feeder Ammeters: 2-1/2-inch minimum size with 90- or 120-degree scale. Meter and transfer device with off position, located on overcurrent device door for feeder circuits, unless otherwise indicated.
- F. Watt-Hour Meters and Wattmeters:
  - 1. Comply with ANSI C12.1.
  - 2. Three-phase induction type with two stators, each with current and potential coil, rated 5 A, 120 V, 60 Hz.
  - 3. Suitable for connection to three- and four-wire circuits.
  - 4. Potential indicating lamps.
  - 5. Adjustments for light and full load, phase balance, and power factor.
  - 6. Four-dial clock register.
  - 7. Integral demand indicator.
  - 8. Contact devices to operate remote impulse-totalizing demand meter.
  - 9. Ratchets to prevent reverse rotation.
  - 10. Removable meter with drawout test plug.
  - 11. Semiflush mounted case with matching cover.
  - 12. Appropriate multiplier tag.
- G. Impulse-Totalizing Demand Meter:
  - 1. Comply with ANSI C12.1.
  - 2. Suitable for use with MCC watt-hour meter, including two-circuit totalizing relay.
  - 3. Cyclometer.
  - 4. Four-dial, totalizing kilowatt-hour register.
  - 5. Positive chart drive mechanism.
  - 6. Capillary pen holding a minimum of one month's ink supply.
  - 7. Roll chart with minimum 31-day capacity; appropriate multiplier tag.
  - 8. Capable of indicating and recording five-minute integrated demand of totalized system.

## 2.12 MCC CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from CPT.
- B. Control Circuits: 120-V ac, supplied from remote branch circuit.
- C. Control Circuits: 24-V dc.
- D. Electrically Interlocked Main and Tie Circuit Breakers: Two CPTs in separate compartments, with interlocking relays, connected to the primary side of each CPT at the line side of the associated main circuit breaker. 120-V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.
- E. Control Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.
- F. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

## 2.13 ENCLOSURES

- A. Indoor Enclosures: Freestanding steel cabinets unless otherwise indicated. NEMA 250, Type 1 unless otherwise indicated to comply with environmental conditions at installed location.
- B. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
- C. Compartments: Modular; individual lift-off doors with concealed hinges and quick-captive screw fasteners. Interlocks on units requiring disconnecting means in off position before door can be opened or closed, except by operating a permissive release device.
- D. Interchangeability: Compartments constructed to allow for removal of units without opening adjacent doors, disconnecting adjacent compartments, or disturbing operation of other units in MCC; same size compartments to permit interchangeability and ready rearrangement of units, such as replacing three single units with a unit requiring three spaces, without cutting or welding.
- E. Wiring Spaces:
  - 1. Vertical wireways in each vertical section for vertical wiring to each unit compartment; supports to hold wiring in place.
  - 2. Horizontal wireways in bottom and top of each vertical section for horizontal wiring between vertical sections; supports to hold wiring in place.

## 2.14 AUXILIARY DEVICES

- A. General Requirements for Control-Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.
  - 1. Push Buttons, Pilot Lights, and Selector Switches: Heavy-duty type.
    - a. Push Buttons: Covered types; maintained contact unless otherwise indicated.
    - b. Pilot Lights: LED types; Red; push to test.

- c. Selector Switches: Rotary type.
  - 2. Elapsed-Time Meters: Heavy duty with digital readout in hours; resettable.
  - 3. Meters: Panel type, 2-1/2-inch minimum size with 90- or 120-degree scale and plus or minus 2 percent accuracy with selector switches having an off position.
  - B. NC contactor auxiliary contact(s).
  - C. Control Relays: Auxiliary and adjustable solid-state time-delay relays.
  - D. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.
  - E. Space heaters, with NC auxiliary contacts, to mitigate condensation in enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
  - F. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
  - G. Cover gaskets for Type 1 enclosures.
  - H. Terminals for connecting power factor correction capacitors to the line or load side overload relays as directed by Commissioner.
  - I. Spare control-wiring terminal blocks; unwired.
  - J. Spare-Fuse Cabinet: Identified and compartmented steel box.
- 2.15 CHARACTERISTICS AND RATINGS
- A. Wiring: NEMA ICS 18, Class I.
  - B. Wiring: NEMA ICS 18, Class II.
  - C. Control and Load Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.
  - D. Nominal System Voltage: 208/120 V, three phase, four wire.
  - E. Short-Circuit Current Rating for Each Unit: Combination series rated; 22, 42, 65, 100 kA.
  - F. Short-Circuit Current Rating of MCC: Combination series rated with its main overcurrent device; 22, 42, 65, 100 kA.
  - G. Environmental Ratings:
    - 1. Ambient Temperature Rating: Not less than 0 deg F (minus 18 deg C) and not exceeding 104 deg F (40 deg C), with an average value not exceeding 95 deg F (35 deg C) over a 24-hour period.
    - 2. Ambient Storage Temperature Rating: Not less than minus 4 deg F (minus 20 deg C) and not exceeding 140 deg F (60 deg C)
    - 3. Humidity Rating: Less than 95 percent (noncondensing).

4. Altitude Rating: Not exceeding 6600 feet, or 3300 feet if MCC includes solid-state devices.
- 
- H. Main-Bus Continuous Rating: 1000, 1200, 1600 A.
  - I. Vertical-Bus Minimum Continuous Rating: 1200 A.
  - J. Horizontal and Vertical Bus Bracing (Short-Circuit Current Rating): Match MCC short-circuit current rating.
  - K. Main Horizontal and Equipment Ground Buses: Uniform capacity for entire length of MCC's main and vertical sections. Provide for future extensions from both ends.
  - L. Vertical Phase and Equipment Ground Buses: Uniform capacity for entire usable height of vertical sections, except for sections incorporating single units.
  - M. Phase and Neutral Bus Material: Hard-drawn copper of 98 percent conductivity, silver plated.
  - N. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
  - O. Ground Bus: Minimum size required by UL 845, hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit equipment grounding conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
  - P. Front-Connected, Front-Accessible MCCs:
    1. Main Devices: Fixed mounted.
    2. Controller Units: fixed mounted.
    3. Feeder-Tap Units: fixed mounted.
    4. Sections front and rear aligned.
  - Q. Bus Transition and Incoming Pull Sections: Matched and aligned with basic MCC.
  - R. Pull Box on Top of an MCC:
    1. Adequate ventilation to maintain temperature in pull box within same limits as MCC.
    2. Set back from front to clear circuit-breaker removal mechanism.
    3. Removable covers forming top, front, and sides. Top covers at rear easily removable for drilling and cutting.
    4. Insulated bottom of fire-resistive material with separate holes for cable drops into MCC.
    5. Cable supports arranged to facilitate cabling and adequate to support cables, including those for future installation.
    6. Isolation Barrier Access Provisions: Permit checking of bus-bolt tightness.
  - S. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of unit.
  - T. Bus-Bar Insulation: Factory-applied, flame-retardant, tape wrapping of individual bus bars or flame-retardant, spray-applied insulation. Minimum insulation temperature rating of 105 deg C.

- U. Fungus Proofing: Permanent fungicidal treatment for OCPDs and other components including instruments and instrument transformers.

## 2.16 SOURCE QUALITY CONTROL

- A. MCC Testing: Inspect and test MCCs according to requirements in NEMA ICS 18.
- B. VFC Testing: Test and inspect VFCs according to requirements in NEMA ICS 61800-2.
  - 1. Test each VFC while connected to its specified motor.
  - 2. Verification of Performance: Rate VFCs according to operation of functions and features specified.
- C. MCCs will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Examine areas and surfaces to receive MCCs, with Installer present, for compliance with requirements for installation tolerances, and other conditions affecting performance of the Work.
- B. Examine enclosed controllers before installation. Reject enclosed controllers that are wet, moisture damaged, or mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.3 HARMONIC ANALYSIS STUDY

- A. Perform a harmonic analysis study to identify the effects of nonlinear loads and their associated harmonic contributions on the voltages and currents throughout the electrical system. Analyze possible operating scenarios, including recommendations for VFC input filtering to limit TDD and THD(V) at the defined PCC to specified levels.
- B. Prepare a harmonic analysis study report complying with IEEE 399 and NETA Acceptance Testing Specification.

### 3.4 INSTALLATION

- A. Coordinate layout and installation of MCCs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Floor-Mounting Controllers: Install MCCs on 4-inch nominal thickness concrete base. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
  - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.

2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  4. Install anchor bolts to elevations required for proper attachment to supported equipment.
- C. Seismic Bracing: Comply with requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in each fusible switch.
- F. Install fuses in control circuits if not factory installed. Comply with requirements in Section 262813 "Fuses."
- G. Install heaters in thermal-overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- H. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- I. Install power factor correction capacitors. Connect to the line side of overload relays. If connected to the load side of overload relays, adjust overload heater sizes to accommodate the reduced motor full-load currents.
- J. Comply with NECA 1.

### 3.5 IDENTIFICATION

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for identification of MCC, MCC components, and control wiring.
1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  2. Label MCC and each cubicle with engraved nameplate.
  3. Label each enclosure-mounted control and pilot device.
  4. Mark up a set of manufacturer's connection wiring diagrams with field-assigned wiring identifications and return to manufacturer for inclusion in Record Drawings.
- B. Operating Instructions: Frame printed operating instructions for MCCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of MCCs.

### 3.6 CONTROL WIRING INSTALLATION

- A. Install wiring between enclosed controllers and remote devices and facility's DDC system for HVAC. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."
- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic-control selection devices where applicable.

1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switch is in manual-control position.
2. Connect selector switches within enclosed controller circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

### 3.7 CONNECTIONS

- A. Comply with requirements for installation of conduit in Section 26 05 33 "Raceways and Boxes for Electrical Systems." Drawings indicate general arrangement of conduit, fittings, and specialties.
- B. Comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems."

### 3.8 FIELD QUALITY CONTROL

- A. Testing Agency: Commissioner to engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
  1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- D. Acceptance Testing Preparation:
  1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
  2. Test continuity of each circuit.
- E. Tests and Inspections:
  1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
  2. Test insulation resistance for each enclosed controller element, component, connecting motor supply, feeder, and control circuits.
  3. Test continuity of each circuit.
  4. Verify that voltages at controller locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify the Commissioner before starting the motor(s).
  5. Test each motor for proper phase rotation.
  6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  8. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:
    - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each multipole enclosed

- controller. Remove front panels so joints and connections are accessible to portable scanner.
      - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each multipole enclosed controller 11 months after date of Substantial Completion.
      - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
    - 9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
    - 10. Mark up a set of manufacturer's drawings with all field modifications incorporated during construction and return to manufacturer for inclusion in Record Drawings.
  - F. Enclosed controllers will be considered defective if they do not pass tests and inspections.
  - G. Prepare test and inspection reports, including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
- 3.9 STARTUP SERVICE
- A. Engage a factory-authorized service representative to perform startup service.
    - 1. Complete installation and startup checks according to manufacturer's written instructions.
- 3.10 ADJUSTING
- A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
  - B. Adjust overload relay heaters or settings if power factor correction capacitors are connected to the load side of the overload relays.
  - C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable, instantaneous trip elements. Initially adjust to six times the motor nameplate full-load amperes and attempt to start motors several times, allowing for motor cool-down between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify the Commissioner before increasing settings.
  - D. Set the taps on reduced-voltage autotransformer controllers at 50 percent.
  - E. Set field-adjustable switches and program microprocessors for required start and stop sequences in reduced-voltage, solid-state controllers.
  - F. Program microprocessors in VFCs for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.
  - G. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

3.11 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.
- B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.12 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and service enclosed controllers, and to use and reprogram microprocessor-based, reduced-voltage, solid-state controllers.

**END OF SECTION 26 24 19**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 26 53****ELECTRIC VEHICLE CHARGING EQUIPMENT****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes EV charging equipment that provides Level 2 EV charging.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 DEFINITIONS**

- A. EV: Electric vehicle.
- B. EV Cable: The off-board cable containing the conductor(s) to connect the EV power controller to the EV that provides both power and communications during energy transfer.
- C. EV Capable: Parking spaces that include nearby termination of raceway (conduit) to a power source with sufficient electrical panel capacity designed for simultaneous charging of electric vehicles in all planned EV parking spaces. Electrical wiring need not be pulled through raceway (conduit) until charging station is installed.
- D. EV Charger or EV Charging Equipment: See "EVSE".
- E. EV Connector: A conductive device that, when electrically coupled to an EV inlet, establishes an electrical connection to the EV for the purpose of power transfer and information exchange. This device is part of the EV coupler.

- F. EV Coupler: A mating EV inlet and connector set.
- G. EV Inlet: The device in the vehicle into which the EV connector is inserted, and a conductive connection is made for the transfer of power and communication. This device is part of the EV coupler.
- H. EV Make Ready: Parking spaces that include nearby termination of raceway (conduit) and electrical wiring pulled to a power source with sufficient electrical panel capacity for simultaneous charging of electric vehicles in all EV parking spaces.
- I. EVSE: Electric Vehicle Supply Equipment. It includes the EV charging equipment and conductors, including the ungrounded, grounded, and equipment grounding conductors and EV cables, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for transferring energy between the premise wiring and the EV.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 ACTION SUBMITTALS

- A. Product Data: For each type of product.
  - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for EV charging equipment.
  - 2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For EV charging equipment.
  - 1. Include plans, elevations, sections, and mounting details.
  - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 3. Detail fabrication and assembly of mounting assemblies for EV charging equipment.
  - 4. Include diagrams for power, signal, and control wiring.
  - 5. Include verification of wireless communications service at each location of EV charging equipment.
- C. Product Schedule: For EV charging equipment. Match designations on electrical drawings.

#### 1.8 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Area plans and details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
  - 1. Structural members to which equipment will be attached.
  - 2. Electrical service.
  - 3. Communications service, including wireless communications equipment.
  - 4. Items penetrating concrete pad surface.
- B. Seismic Qualification Certificates: For charging equipment, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's warranty.

#### 1.9 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For EV charging equipment to include in operation and maintenance manuals.

B. Software and Firmware Operational Documentation:

1. Online instruction and help documentation.
2. Station activation sticker.

#### 1.10 QUALITY ASSURANCE

A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

B. Installer Qualifications: An authorized representative who is properly trained by the manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

D. Comply with UL 2231-1, UL 2231-2, UL 2594, and NEC Article 625.

E. Comply with SAE J1772.

F. Comply with FCC Part 15 Class A.

#### 1.11 FIELD CONDITIONS

A. Wireless Survey: Complete wireless survey to determine if wireless provider signals meet or exceed manufacturer's recommended minimum values.

B. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not exceeding minus 22 to plus 122 deg F.
2. Altitude: Not exceeding 6600 feet.

C. Rate Equipment for non-operation under the following conditions:

1. Ambient Temperature: Not exceeding minus 40 to plus 140 deg F.
2. Altitude: Not exceeding 6600 feet.

- D. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by the City of New York or Long Island Railroad unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
  - 1. Notify Commissioner no fewer than two days in advance of proposed interruption of electric service.
  - 2. Do not proceed with interruption of electric service without Commissioner's written permission.

## 1.12 WARRANTY

- A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components of EV charging units that fail(s) in materials or workmanship within specified warranty period.
  - 1. Warranty Period: One year from date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide ChargePoint CT4000 family of electric vehicle charging stations, or an equivalent product from one of the following approved manufacturers:
  - 1. Bosch
  - 2. Electric Motor Werks, Inc.
  - 3. Or approved equal.
- B. Source Limitations: Obtain EV charging equipment from single manufacturer.

### 2.2 EV CHARGING EQUIPMENT DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
- B. Comply with NFPA 70.
- C. ADA compliant.
- D. Metering: +/- 2 percent from 2 percent to full scale of output (30 A).
- E. EV Charging Equipment Mounting: Bollard mount.
- F. Enclosures:
  - 1. Rated for environmental conditions at installed location.
    - a. NEMA 250, Type 3R.
    - b. Aluminum and UV-resistant plastic.
    - c. Paint and Anodized.
    - d. Charging components protected by security screws.
    - e. Charging connectors in locking holsters.
    - f. Meter, modem, and CPU, tamper resistant.

G. EV Cable and Connectors:

1. SAE J1772 connector.
2. One connector with locking holster.
3. 23-foot cable with cable management system.

H. Status Indicators:

1. LEDs to indicate power, vehicle charging, charging complete, system status, faults, and service, as well as authorization.

I. Display Screen:

1. VGA-resolution, daylight-viewable LCD screen with UV protection. Daylight readable and fingerprint resistant.
2. Displays power, charging, charging complete, remote control, system status, faults, payment and pricing details, and service.

J. Networking:

1. WAN Communications: Cellular GSM/GPRS and CDMA.
2. LAN Communications: 2.4 GHz Wi-Fi 802.11b/g/n.
3. Capable of remote configuration, diagnostics and reporting.
4. Capable of remote software updates (future proof).

K. Payment System:

1. RFID (ISO 15693, ISO 14443), NFC, Contactless credit card reader.
2. PCI (Payment Card Industry) compliant.
3. Capable of remote control and authorization including mobile phone application or toll free phone number.

L. Charging Network: Compatible with the EV manufacturer's charging network.

1. Multiple units shall independently connect to charging network.
2. Multiple units shall have one unit designated as a master unit that is configured as a gateway unit between the EV charging equipment and the charging network.
3. Individual units shall be capable of indicating station status and availability providing or connecting user to customer support and remote control.

## 2.3 PERFORMANCE REQUIREMENTS

A. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

B. Surge Withstand: 6 kV at 3000 A.

C. Integral GFCI.

D. Auto-GFCI fault retry.

E. Input Power:

1. Two 40A, 208/240-V ac, 60 Hz, single phase per charger.

2. Dual circuits do not need to be interlocked.

F. EV Charging Levels:

1. Single vehicle: AC Level 2 at up to 7.2 kW (CT4000) or up to 7.7 kW (CPF25) per vehicle.

2.4 GENERAL FINISH REQUIREMENTS

- A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

3.2 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for EV charging equipment electrical conduit to verify actual locations of conduit connections before equipment installation.
- C. Examine walls, floors, and pavement for suitable conditions where EV charging equipment will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION

- A. Comply with NECA 1 and NECA 413.
- B. Concrete Base Mounting:
  1. Install EV charging equipment on 6-inch nominal-thickness concrete base. Base should be 24-inch (minimum 12-inch from the center located conduit stub-up). Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete".
    - a. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
    - b. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
    - c. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
    - d. Install anchor bolts to elevations required for proper attachment to supported equipment.

- e. Secure EV charging equipment to concrete base according to manufacturer's written instructions.
  - C. Bollard Mounting:
    - 1. Allow a minimum of 24 inches of clearance around EV charging equipment.
    - 2. EV charging equipment receptacles or holders shall be not less than 24 inches and not more than 4 feet above finished grade.
    - 3. Mount EV charging equipment plumb and rigid without distortion of enclosure.
    - 4. Secure EV charging equipment according to manufacturer's written instructions.
  - D. Comply with mounting and anchoring requirements specified in Section 26 05 48 "Vibration and Seismic Controls for Electrical Systems."
  - E. Wiring Method: Install cables in raceways and cable trays. Conceal raceway and cables except in unfinished spaces.
    - 1. Comply with requirements for raceways and boxes specified in Section 26 05 33 "Raceways and Boxes for Electrical Systems."
    - 2. Comply with requirements for underground raceways and enclosures specified in Section 26 05 43 "Underground Ducts and Raceways for Electrical Systems."
  - F. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
  - G. Wiring within Enclosures: Bundle, lace, and fix conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
  - H. Circuit Breakers: Comply with Section 26 28 16 "Enclosed Switches and Circuit Breakers."
  - I. Secure covers to enclosure.
- 3.4 CONNECTIONS
- A. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
  - B. Comply with grounding requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems."
  - C. Comply with requirements for installation of conduit in Section 26 05 33 "Raceways and Boxes for Electrical Systems." Drawings indicate general arrangement of conduit, fittings, and specialties.
  - D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- 3.5 IDENTIFICATION
- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

**3.6 FIELD QUALITY CONTROL**

- A. Manufacturer's Startup Field Service: Engage a service representative that is properly trained by the manufacturer to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections with a service representative that is properly trained by the manufacturer.
- C. Tests and Inspections:
  - 1. For each unit of EV charging equipment, perform the following tests and inspections:
    - a. Unit self-test.
    - b. Operation test with load bank.
    - c. Network communications test.
- D. EV charging equipment will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

**3.7 INSTRUCTION**

- A. Refer to the DDC General Conditions for instruction requirements.
- B. Contractor shall engage a factory-authorized service representative to instruct City of New York's service operators to adjust, operate, and service electric vehicle charging equipment.

**END OF SECTION 26 26 53**

**SECTION 26 27 13****ELECTRICITY METERING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes equipment for electricity metering.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. KY Pulse: Term used by the metering industry to describe a method of measuring consumption of electricity that is based on a relay opening and closing in response to the rotation of the disk in the meter.

**PART 2 - PRODUCTS****2.1 EQUIPMENT FOR ELECTRICITY METERING BY UTILITY COMPANY**

- A. Meters will be furnished by utility company.
- B. Current-Transformer Cabinets: Comply with requirements of electrical-power utility company.
- C. Meter Sockets: Comply with requirements of electrical-power utility company.
- D. Meter Sockets: Steady-state and short-circuit current ratings shall meet indicated circuit ratings.

**2.2 EQUIPMENT FOR ELECTRICITY METERING BY THE CITY OF NEW YORK**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal.
  - 1. E-Mon; a division of Hunt Power.
  - 2. General Electric.
  - 3. Eaton.
  - 4. Electro Industries.
  - 5. Or approved equal.
- B. General Requirements for The City of New York's Meters:
  - 1. Comply with UL 1244.
  - 2. Meters used for billing shall have an accuracy of 0.5 percent of reading, complying with requirements in ANSI C12.20.
  - 3. Enclosure: NEMA 250, Type 1 minimum, with hasp for padlocking or sealing.
  - 4. Identification: Comply with requirements in Section 260553 "Identification for Electrical Systems."
  - 5. Memory Backup: Self-contained to maintain memory throughout power outages of 72 hours, minimum.
  - 6. Sensors: Current-sensing type, with current or voltage output, selected for optimum range and accuracy for meters indicated for this application.
    - a. Type: Split and solid core.
  - 7. Current-Transformer Cabinet: Listed or recommended by metering equipment manufacturer for use with sensors indicated.
  - 8. Building Automation System (BAS) Interface: One digital KY pulse to a user-definable increment of energy measurement. Match signal to BAS input and arrange to convey the instantaneous, integrated, demand level measured by meter to provide data for processing and possible programmed demand control action by destination system.
- C. Kilowatt-hour Meter: Electronic three phase meters, measuring electricity used.

1. Voltage and Phase Configuration: Meter shall be designed for use on circuits with voltage rating and phase configuration indicated for its application.
  2. Display: LCD with characters not less than 0.25-inch-high, indicating accumulative kilowatt-hours and current kilowatt load. Retain accumulated kilowatt-hour in a nonvolatile memory, until reset.
  3. Display: Digital electromechanical counter, indicating accumulative kilowatt-hours.
- D. Kilowatt-hour/Demand Meter: Electronic three-phase meters, measuring electricity use and demand. Demand shall be integrated over a 15-minute interval.
1. Voltage and Phase Configuration: Meter shall be designed for use on circuits with voltage rating and phase configuration indicated for its application.
  2. Display: LCD with characters not less than 0.25-inch-high, indicating accumulative kilowatt-hours, current time and date, current demand, and historic peak demand, and time and date of historic peak demand. Retain accumulated kilowatt-hour and historic peak demand in a nonvolatile memory, until reset.
- E. Data Transmission Cable: Transmit KY pulse data over Class 1 control-circuit conductors in raceway. Comply with Section 26 05 23 "Control-Voltage Electrical Power Cables."
- F. Software: PC based, a product of meter manufacturer, suitable for calculation of utility fee allocation.
1. Utility Fee Allocation: Automatically import energy-usage records to allocate energy fees for the following:
    - a. At least 100 tenants.
  2. Tenant or Activity Billing Software: Automatically import energy-usage records to automatically compute and prepare activity demand and energy-use statements based on metering of energy use and peak demand. Maintain separate directory for each tenant's historical billing information. Prepare summary reports in user-defined formats and time intervals.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 INSTALLATION

- A. Comply with equipment installation requirements in NECA 1.
- B. Install meters furnished by utility company. Install raceways and equipment according to utility company's written requirements. Provide empty conduits for metering leads and extend grounding connections as required by utility company.
- C. Install modular meter center according to NECA 400 switchboard installation requirements.

#### 3.3 IDENTIFICATION

- A. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

1. Series Combination Warning Label: Self-adhesive type, with text as required by NFPA 70.
2. Equipment Identification Labels: Adhesive film labels with clear protective overlay. For residential meters, provide an additional card holder suitable for printed, weather-resistant card with occupant's name.

### 3.4 FIELD QUALITY CONTROL

#### A. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

#### B. Tests and Inspections:

1. Connect a load of known kilowatt rating, 1.5 kW minimum, to a circuit supplied by metered feeder.
2. Turn off circuits supplied by metered feeder and secure them in off condition.
3. Run test load continuously for eight hours minimum, or longer, to obtain a measurable meter indication. Use test-load placement and setting that ensures continuous, safe operation.
4. Check and record meter reading at end of test period and compare with actual electricity used, based on test-load rating, duration of test, and sample measurements of supply voltage at test-load connection. Record test results.

#### C. Electricity metering will be considered defective if it does not pass tests and inspections.

#### D. Prepare test and inspection reports.

**END OF SECTION 26 27 13**

**SECTION 26 27 26****WIRING DEVICES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:

1. Receptacles, receptacles with integral GFCI, and associated device plates.
2. Twist-locking receptacles.
3. Isolated-ground receptacles.
4. Tamper-resistant receptacles.
5. Weather-resistant receptacles.
6. Snap switches and wall-box dimmers.
7. Solid-state fan speed controls.
8. Wall-switch and exterior occupancy sensors.
9. Communications outlets.
10. Pendant cord-connector devices.
11. Cord and plug sets.
12. Floor service outlets, poke-through assemblies, service poles, and multioutlet assemblies.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

#### 1.7 DEFINITIONS

- A. EMI: Electromagnetic interference.
- B. GFCI: Ground-fault circuit interrupter.
- C. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
- D. RFI: Radio-frequency interference.
- E. TVSS: Transient voltage surge suppressor.
- F. UTP: Unshielded twisted pair.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

- A. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles. Subject to compliance with requirements, manufacturers whose products can be incorporated into the work include:
  - 1. Cooper Wiring Devices; Division of Cooper Industries, Inc. (Cooper).
  - 2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
  - 3. Leviton Mfg. Company Inc. (Leviton).
  - 4. Pass & Seymour/Legrand (Pass & Seymour).
  - 5. Or approved equal.
- B. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

#### 2.2 GENERAL WIRING-DEVICE REQUIREMENTS

- A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, and NYC Electrical Code, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70 and 2014 NYC Electrical Code.
- C. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:

1. Connectors shall comply with UL 2459 and shall be made with stranding building wire.
2. Devices shall comply with the requirements in this Section.

## 2.3 STRAIGHT-BLADE RECEPTACLES

- A. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; 5351 (single), HBL5352 (duplex).
- b. Hubbell; HBL5351 (single), HBL5352 (duplex).
- c. Leviton; 5891 (single), 5352 (duplex).
- d. Pass & Seymour, 5361 (single), 5362 (duplex).
- e. Or approved equal.

- B. Isolated-Ground, Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; IG5362RN.
- b. Hubbell; IG5362.
- c. Leviton; 5362-IG.
- d. Pass & Seymour; IG5362.
- e. Or approved equal.

2. Description: Straight blade; equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

- C. Tamper-Resistant Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498 Supplement sd, and FS W-C-596.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; TR8300.
- b. Hubbell; HBL8300SGA.
- c. Leviton; 8300-SGG.
- d. Or approved equal.

## 2.4 GFCI RECEPTACLES

- A. General Description:

1. Straight blade, non-feed -through type.
2. Comply with NEMA WD 1, NEMA WD 6, UL 498, UL 943 Class A, and FS W-C-596.
3. Include indicator light that shows when the GFCI has malfunctioned and no longer provides proper GFCI protection.

- B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; VGF20.
- b. Hubbell; GFR5352L.
- c. Pass & Seymour; 2095.
- d. Leviton; 7590.
- e. Or approved equal.

C. Tamper-Resistant GFCI Convenience Receptacles, 125 V, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Hubbell; GFTR20.
- b. Pass & Seymour, 2095TR.
- c. Leviton, equal product to Hubbell GFTR20,
- d. Or approved equal.

2.5 HAZARDOUS (CLASSIFIED) LOCATION RECEPTACLES

A. Available Wiring Devices for Hazardous (Classified) Locations: Comply with NEMA FB 11 and UL 1010.

- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- 2. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:

- a. Cooper Crouse-Hinds.
- b. EGS/Appleton Electric.
- c. Killark; Division of Hubbell Inc.
- d. Or approved equal.

2.5 TWIST-LOCKING RECEPTACLES

B. Single Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; CWL520R.
- b. Hubbell; HBL2310.
- c. Leviton; 2310.
- d. Pass & Seymour; L520-R.
- e. Or approved equal.

C. Isolated-Ground, Single Convenience Receptacles, 125 V, 20 A:

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; IGL520R.
- b. Hubbell; IG2310.
- c. Leviton; 2310-IG.
- d. Pass & Seymour; IG4700.
- e. Or approved equal.

2. Description:

- a. Comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.
- b. Equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

2.6 PENDANT CORD-CONNECTOR DEVICES

A. Description:

1. Matching, locking-type plug and receptacle body connector.
2. NEMA WD 6 Configurations L5-20P and L5-20R, heavy-duty grade, and FS W-C-596.
3. Body: Nylon, with screw-open, cable-gripping jaws and provision for attaching external cable grip.
4. External Cable Grip: Woven wire-mesh type made of high-strength, galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.7 CORD AND PLUG SETS

A. Description:

1. Match voltage and current ratings and number of conductors to requirements of equipment being connected.
2. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.
3. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.8 TOGGLE SWITCHES

A. Comply with NEMA WD 1, UL 20, and FS W-S-896.

B. Switches, 120/277 V, 20 A:

1. Single Pole:
  - a. Cooper; AH1221.
  - b. Hubbell; HBL1221.
  - c. Leviton; 1221-2.
  - d. Pass & Seymour; CSB20AC1.
  - e. Or approved equal.
2. Two Pole:
  - a. Cooper; AH1222.
  - b. Hubbell; HBL1222.
  - c. Leviton; 1222-2.
  - d. Pass & Seymour; CSB20AC2.
  - e. Or approved equal.

3. Three Way:
    - a. Cooper; AH1223.
    - b. Hubbell; HBL1223.
    - c. Leviton; 1223-2.
    - d. Pass & Seymour; CSB20AC3.
    - e. Or approved equal.
  4. Four Way:
    - a. Cooper; AH1224.
    - b. Hubbell; HBL1224.
    - c. Leviton; 1224-2.
    - d. Pass & Seymour; CSB20AC4.
    - e. Or approved equal.
- C. Pilot-Light Switches, 20 A:
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; AH1221PL for 120 and 277 V.
    - b. Hubbell; HBL1201PL for 120 and 277 V.
    - c. Leviton; 1221-LH1.
    - d. Pass & Seymour; PS20AC1RPL for 120 V, PS20AC1RPL7 for 277 V.
    - e. Or approved equal.
  2. Description: Single pole, with factory-supplied key in lieu of switch handle.
- D. Key-Operated Switches, 120/277 V, 20 A:
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; AH1221L.
    - b. Hubbell; HBL1221L.
    - c. Leviton; 1221-2L.
    - d. Pass & Seymour; PS20AC1-L.
    - e. Or approved equal.
  2. Description: Single pole, with factory-supplied key in lieu of switch handle.
- E. Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 1995.
    - b. Hubbell; HBL1557.
    - c. Leviton; 1257.
    - d. Pass & Seymour; 1251.
    - e. Or approved equal.
- F. Key-Operated, Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 1995L.
    - b. Hubbell; HBL1557L
    - c. Leviton; 1257L.
    - d. Pass & Seymour; 1251L.
    - e. Or approved equal.
- 2.9 DECORATOR-STYLE DEVICES
- G. Convenience Receptacles: Square face, 125 V, 15 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-15R, and UL 498.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 6252.
    - b. Hubbell; DR15.
    - c. Leviton; 16252.
    - d. Pass & Seymour; 26252.
    - e. Or approved equal.
- H. Tamper-Resistant Convenience Receptacles: Square face, 125 V, 15 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-15R, and UL 498.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; TR6252.
    - b. Hubbell; DR15TR.
    - c. Pass & Seymour; TR26252.
    - d. Or approved equal.
  2. Description: Labeled to comply with NFPA 70, "Receptacles, Cord Connectors, and Attachment Plugs (Caps)" Article, "Tamper-Resistant Receptacles in Dwelling Units" Section.
- I. Tamper-Resistant and Weather-Resistant Convenience Receptacles: Square face, 125 V, 15 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-15R, and UL 498.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; TWRBR15.
    - b. Hubbell; DR15TR.
    - c. Leviton; TRW15.
    - d. Pass & Seymour; TRW26252.
    - e. Or approved equal.
  2. Description: Labeled to comply with NFPA 70, "Receptacles, Cord Connectors, and Attachment Plugs (Caps)" Article, "Tamper-Resistant Receptacles in Dwelling Units" Section, when installed in wet and damp locations.
- J. GFCI, Non-Feed-Through Type, Convenience Receptacles: Square face, 125 V, 15 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-15R, UL 498, and UL 943 Class A.
1. Products: Subject to compliance with requirements, provide one of the following:

- a. Cooper; VGF15.
  - b. Hubbell; GF15LA.
  - c. Leviton; 8599.
  - d. Pass & Seymour; 1594.
  - e. Or approved equal.
- K. GFCI, Tamper-Resistant and Weather-Resistant Convenience Receptacles: Square face, 125 V, 15 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-15R, UL 498, and UL 943 Class A.
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; TWRVGF15.
    - b. Hubbell; GFTR15.
    - c. Pass & Seymour; 1594TRWR.
    - d. Or approved equal.
  - 2. Description: Labeled to comply with NFPA 70, "Receptacles, Cord Connectors, and Attachment Plugs (Caps)" Article, "Tamper-Resistant Receptacles in Dwelling Units" Section.
- L. Toggle Switches, Square Face, 120/277 V, 15 A: Comply with NEMA WD 1, UL 20, and FS W-S-896.
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 7621 (single pole), 7623 (three way).
    - b. Hubbell; DS115 (single pole), DS315 (three way).
    - c. Leviton; 5621-2 (single pole), 5623-2 (three way).
    - d. Pass & Seymour; 2621 (single pole), 2623 (three way).
    - e. Or approved equal.
- M. Lighted Toggle Switches, Square Face, 120 V, 15 A: Comply with NEMA WD 1 and UL 20.
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 7631 (single pole); 7633 (three way).
    - b. Hubbell; DS120IL (single pole), DS320 (three way).
    - c. Leviton; 5631-2 (single pole), 5633-2 (three way).
    - d. Pass & Seymour; 2625 (single pole), 2626 (three way).
    - e. Or approved equal.
  - 2. Description: With neon-lighted handle, illuminated when switch is "off."

## 2.10 WALL-BOX DIMMERS

- A. Dimmer Switches: Modular, full-wave, solid-state units with integral, quiet on-off switches, with audible frequency and EMI/RFI suppression filters.
- B. Control: Continuously adjustable slider or toggle switch; with single-pole or three-way switching. Comply with UL 1472.
- C. Incandescent Lamp Dimmers: 120 V; control shall follow square-law dimming curve. On-off

switch positions shall bypass dimmer module.

1. 600 W; dimmers shall require no derating when ganged with other devices. Illuminated when "off."

- D. Fluorescent Lamp Dimmer Switches: Modular; compatible with dimmer ballasts; trim potentiometer to adjust low-end dimming; dimmer-ballast combination capable of consistent dimming with low end not greater than 20 percent of full brightness.

## 2.11 WALL PLATES

- A. Single and combination types shall match corresponding wiring devices.
  1. Plate-Securing Screws: Metal with head color to match plate finish.
  2. Material for Finished Spaces: 0.035-inch- (1-mm- thick, satin-finished, Type 302 stainless steel or as required by the Commissioner.
  3. Material for Unfinished Spaces: Galvanized steel.
  4. Material for Damp Locations: Cast aluminum with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.
- B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum with lockable cover.

## 2.12 FLOOR SERVICE FITTINGS

- A. Type: Modular, flush-type, dual-service units suitable for wiring method used.
- B. Compartments: Barrier separates power from voice and data communication cabling.
- C. Service Plate: Round, solid brass with satin finish.
- D. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.
- E. Voice and Data Communication Outlet: Blank cover with bushed cable opening.

## 2.13 FINISHES

- A. Device Color:
  1. Wiring Devices Connected to Normal Power System: As selected by the Commissioner unless otherwise indicated or required by NFPA 70 or device listing.
  2. TVSS Devices: Blue.
  3. Isolated-Ground Receptacles: Orange.
- B. Wall Plate Color: For plastic covers, match device color.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 INSTALLATION

- A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.
- B. Coordination:
  - 1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
  - 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
  - 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
  - 4. Install wiring devices after all wall preparation, including painting, is complete.
- C. Conductors:
  - 1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
  - 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
  - 3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
  - 4. Existing Conductors:
    - a. Cut back and pigtail, or replace all damaged conductors.
    - b. Straighten conductors that remain and remove corrosion and foreign matter.
    - c. Pigtailing existing conductors is permitted, provided the outlet box is large enough.
- D. Device Installation:
  - 1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
  - 2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
  - 3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
  - 4. Connect devices to branch circuits using pigtails that are not less than 6 inches (152 mm) in length.
  - 5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
  - 6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
  - 7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
  - 8. Tighten unused terminal screws on the device.
  - 9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.
- E. Receptacle Orientation:
  - 1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.
- F. Device Plates: Do not use oversized or extra-deep plates. Restore wall finishes and remount

outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

G. Dimmers:

1. Install dimmers within terms of their listing.
2. Verify that dimmers used for fan speed control are listed for that application.
3. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' device listing conditions in the written instructions.

H. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

I. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

3.3 GFCI RECEPTACLES

- A. Install non-feed-through-type GFCI receptacles where protection of downstream receptacles is not required.

3.4 IDENTIFICATION

- A. Comply with Section 26 05 53 "Identification for Electrical Systems."
- B. Identify each receptacle with panelboard identification and circuit number. Use hot, stamped, or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Test Instruments: Use instruments that comply with UL 1436.
2. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

B. Tests for Convenience Receptacles:

1. Line Voltage: Acceptable range is 105 to 132 V.
2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
3. Ground Impedance: Values of up to 2 ohms are acceptable.
4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
5. Using the test plug, verify that the device and its outlet box are securely mounted.
6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

C. Test straight-blade for the retention force of the grounding blade according to NFPA 99. Retention force shall be not less than 4 oz. (115 g).

D. Wiring device will be considered defective if it does not pass tests and inspections.

- E. Prepare test and inspection reports.

**END OF SECTION 26 27 26**

**SECTION 26 28 13****FUSES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:

1. Cartridge fuses rated 600 V ac and less for use in the following:
  - a. Control circuits.
  - b. Motor-control centers.
  - c. Panelboards.
  - d. Switchboards.
  - e. Enclosed controllers.
  - f. Enclosed switches.
2. Spare-fuse cabinets.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

## 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

## 1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Cooper Bussmann, Inc.
  - 2. Edison Fuse, Inc.
  - 3. Ferraz Shawmut, Inc.
  - 4. Lihel Fuse, Inc.
  - 5. Or approved equal.
- B. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

### 2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.
- D. Comply with NFPA 70.
- E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

### 2.3 SPARE-FUSE CABINET

- A. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.
  - 1. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.
  - 2. Finish: Gray, baked enamel.
  - 3. Identification: "SPARE FUSES" in 1-1/2-inch high letters on exterior of door.
  - 4. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

**PART 3 - DEXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.3 FUSE APPLICATIONS**

- A. Cartridge Fuses:
  - 1. Service Entrance: Class L, fast acting, Class L, time delay, Class RK1, fast acting, Class RK1, time delay, Class J, fast acting, Class J, time delay, Class T, fast acting.
  - 2. Feeders: Class L, fast acting, Class L, time delay, Class RK1, fast acting, Class RK1, time delay, Class RK5, fast acting, Class RK5, time delay, Class J, fast acting, Class J, time delay.
  - 3. Motor Branch Circuits: Class RK1, Class RK5, Class CC, motor duty, time delay.
  - 4. Large Motor Branch (601-4000 A): Class L, time delay.
  - 5. Power Electronics Circuits: Class J, high speed, Class T, fast acting.
  - 6. Other Branch Circuits: Class RK1, time delay, Class RK5, time delay, Class J, fast acting, Class J, time delay, Class CC, fast acting.
  - 7. Control Transformer Circuits: Class CC, time delay, control transformer duty.
  - 8. Provide open-fuse indicator fuses or fuse covers with open fuse indication.

**3.4 INSTALLATION**

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- B. Install spare-fuse cabinet(s) in location shown on the Drawings or as indicated in the field by the Commissioner.

**3.5 IDENTIFICATION**

- A. Install labels complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

**END OF SECTION 26 28 13**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 28 16****ENCLOSED SWITCHES AND CIRCUIT BREAKERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
1. Fusible switches.
  2. Nonfusible switches.
  3. Receptacle switches.
  4. Shunt trip switches.
  5. Molded-case circuit breakers (MCCBs).
  6. Molded-case switches.
  7. Enclosures.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

1.7 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, double throw.

**PART 2 - PRODUCTS**

2.1 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
  - 3. Siemens Energy & Automation, Inc.
  - 4. All City Switchboard.
  - 5. Atlas.
  - 6. Electrotech.
  - 7. Lincoln Electric.
  - 8. Or approved equal.
- B. Type GD, General Duty, Single Throw, 240-V ac, 800 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with cartridge fuse interiors to accommodate specified fuses, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Single Throw, 240, 600 -V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- D. Type HD, Heavy Duty, Six Pole, Single Throw, 240, 600 -V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- E. Type HD, Heavy Duty, Double Throw, 240, 600 -V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- F. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
5. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.
6. Hookstick Handle: Allows use of a hookstick to operate the handle.
7. Lugs: Compression type, suitable for number, size, and conductor material.
8. Service-Rated Switches: Labeled for use as service equipment.
9. Accessory Control Power Voltage: Remote mounted and powered; 120-V ac derived from power feed.

## 2.2 NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, Provide products by one of the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  3. Siemens Energy & Automation, Inc.
  4. All City Switchboard.
  5. Atlas.
  6. Electrotech.
  7. Lincoln Electric.
  8. Or approved equal.
- B. Type GD, General Duty, Single Throw, 600 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Single Throw, 600 -V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- D. Type HD, Heavy Duty, Six Pole, Single Throw, 600 -V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- E. Type HD, Heavy Duty, Double Throw, 600 -V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- F. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
  2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
  3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

4. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.
5. Hookstick Handle: Allows use of a hookstick to operate the handle.
6. Lugs: Compression type, suitable for number, size, and conductor material.
7. Accessory Control Power Voltage: Remote mounted and powered; 120-V ac.

## 2.3 SHUNT TRIP SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Cooper Bussman, Inc.
  2. Ferraz Shawmut, Inc.
  3. Littelfuse, Inc.
  4. Or approved equal.
- B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with 200-kA interrupting and short-circuit current rating when fitted with Class J fuses.
- C. Switches: Three-pole, horsepower rated, with integral shunt trip mechanism and Class J fuse block; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.
- D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, with a control power transformer of enough capacity to operate shunt trip, connected pilot, and indicating and control devices.
- E. Accessories:
  1. Oiltight key switch for key-to-test function.
  2. Oiltight green ON pilot light.
  3. Isolated neutral lug; 100 percent rating.
  4. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.
  5. Form C alarm contacts that change state when switch is tripped.
  6. Three-pole, double-throw, fire-safety and alarm relay; 120-V ac coil voltage.
  7. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.

## 2.4 MOLDED-CASE CIRCUIT BREAKERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Eaton Electrical Inc.; Cutler – Hammer Business Unit.
  2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  3. Siemens Energy & Automation, Inc.
  4. Or approved equal.
- B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.
- C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

- D. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- E. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
  - 1. Instantaneous trip.
  - 2. Long- and short-time pickup levels.
  - 3. Long- and short-time time adjustments.
  - 4. Ground-fault pickup level, time delay, and  $I^2t$  response.
- F. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.
- G. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.
- H. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
- I. Ground-Fault, Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).
- J. Features and Accessories:
  - 1. Standard frame sizes, trip ratings, and number of poles.
  - 2. Lugs: Compression type, suitable for number, size, trip ratings, and conductor material.
  - 3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
  - 4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
  - 5. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system, specified in Section 260913 "Electrical Power Monitoring and Control."
  - 6. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
  - 7. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
  - 8. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
  - 9. Alarm Switch: One NO contact that operates only when circuit breaker has tripped.
  - 10. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
  - 11. Zone-Selective Interlocking: Integral with ground-fault trip unit; for interlocking ground-fault protection function.
  - 12. Electrical Operator: Provide remote control for on, off, and reset operations.
  - 13. Accessory Control Power Voltage: Integrally mounted, self-powered, 120-V ac.

## 2.5 MOLDED-CASE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Eaton Electrical Inc.; Cutler – Hammer Business Unit.
  - 2. General Electric Company; GE Consumer & Industrial – Electrical Distribution.
  - 3. Siemens Energy & Automation, Inc.
  - 4. Or approved equal.
- B. General Requirements: MCCB with fixed, high-set instantaneous trip only, and short-circuit withstand rating equal to equivalent breaker frame size interrupting rating.
- C. Features and Accessories:
  - 1. Standard frame sizes and number of poles.
  - 2. Lugs: Compression type, suitable for number, size, trip ratings, and conductor material.
  - 3. Ground-Fault Protection: Comply with UL 1053; remote-mounted and powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
  - 4. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
  - 5. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
  - 6. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic switch contacts, "b" contacts operate in reverse of switch contacts.
  - 7. Alarm Switch: One NO contact that operates only when switch has tripped.
  - 8. Key Interlock Kit: Externally mounted to prohibit switch operation; key shall be removable only when switch is in off position.
  - 9. Zone-Selective Interlocking: Integral with ground-fault shunt trip unit; for interlocking ground-fault protection function.
  - 10. Electrical Operator: Provide remote control for on, off, and reset operations.
  - 11. Accessory Control Power Voltage: Integrally mounted, self-powered, 120-V ac.

## 2.6 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
  - 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
  - 2. Outdoor Locations: NEMA 250, Type 3R.

3. Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.
6. Hazardous Areas Indicated on Drawings: NEMA 250, Type 9.

## **PART 3 - EXECUTION**

### **3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

### **3.2 EXAMINATION**

- A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.3 INSTALLATION**

- A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- B. Comply with mounting and anchoring requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Install fuses in fusible devices.
- E. Comply with NECA 1.

### **3.4 IDENTIFICATION**

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems."
  1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  2. Label each enclosure with engraved metal or laminated-plastic nameplate.

### **3.5 FIELD QUALITY CONTROL**

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
  1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Acceptance Testing Preparation:

1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

E. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:
  - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.
  - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.
  - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

F. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

**END OF SECTION 26 28 16D**

**SECTION 26 29 13****ENCLOSED CONTROLLERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes the following enclosed controllers rated 600 V and less:
1. Full-voltage manual.
  2. Full-voltage magnetic.
  3. Reduced-voltage magnetic.
  4. Reduced-voltage solid state.
  5. Multispeed.
- B. Related Section:
1. Section 26 29 23 "Variable-Frequency Motor Controllers" for general-purpose, ac, adjustable-frequency, pulse-width-modulated controllers for use on variable torque loads in ranges up to 200 hp.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.7 DEFINITIONS**

- A. CPT: Control power transformer.
- B. MCCB: Molded-case circuit breaker.
- C. MCP: Motor circuit protector.
- D. N.C.: Normally closed.
- E. N.O.: Normally open.
- F. OCPD: Overcurrent protective device.
- G. SCR: Silicon-controlled rectifier.

**PART 2 - PRODUCTS****2.1 FULL-VOLTAGE CONTROLLERS**

- A. General Requirements for Full-Voltage Controllers: Comply with NEMA ICS 2, general purpose, Class A.
- B. Motor-Starting Switches: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off or on.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 2. Configuration: Two speed.
  - 3. Surface mounting.
  - 4. Red pilot light.
  - 5. Additional Nameplates: HIGH and LOW for two-speed switches.
  - 6. Or approved equal.

- C. Fractional Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  2. Configuration: Two speed.
  3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button; bimetallic type
  4. First option in first subparagraph below is available only with NEMA 250, Type 1 enclosures but not from all listed manufacturers. Consult manufacturers for availability of flush enclosures and finishes for flush cover plates because each manufacturer offers different types.
  5. Surface mounting.
  6. Red pilot light.
  7. Additional Nameplates: HIGH and LOW for two-speed controllers
  8. One-, two-, and three-pole integral horsepower manual controllers are suitable for use with single- and three-phase ac motors up to 10 hp at 208-V ac. See "Integral Horsepower Manual Controllers" Article in the Evaluations for additional guidance on their use.
- D. Integral Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  2. Configuration: Two speed.
  3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters and sensors in each phase, matched to nameplate full-load current of actual protected motor and having appropriate adjustment for duty cycle; external reset push button; bimetallic type.
  4. Surface mounting.
  5. Red pilot light.
  6. Additional Nameplates: HIGH and LOW for two-speed controllers.
  7. N.O. auxiliary contact.
- E. Magnetic Controllers: Full voltage, across the line, electrically held.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  2. Configuration: Non-reversing.
  3. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.
    - a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
  4. Power Contacts: Totally enclosed, double-break, silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
  5. Control Circuits: 24-V ac; obtained from integral CPT, with primary and secondary fuses, with CPT of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.
    - a. CPT Spare Capacity: 100VA.
  6. Melting Alloy Overload Relays:
    - a. Inverse-time-current characteristic.
    - b. Class 10 tripping characteristic.
    - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  7. Bimetallic Overload Relays:
    - a. Inverse-time-current characteristic.
    - b. Class 10 tripping characteristic.
    - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
    - d. Ambient compensated.
    - e. Automatic resetting.
  8. Solid-State Overload Relay:
    - a. Switch or dial selectable for motor running overload protection.
    - b. Sensors in each phase.
    - c. Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
    - d. Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
    - e. Analog communication module.
  9. N.O., isolated overload alarm contact.
  10. External overload reset push button.
- F. Combination Magnetic Controller: Factory-assembled combination of magnetic controller, OCPD, and disconnecting means.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.

- b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  - 2. Fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J, Class R or indicated fuses.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - 3. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  - 4. Non-fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, non-fusible switch.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  - 5. MCP Disconnecting Means:
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
    - d. N.O. alarm contact that operates only when MCP has tripped.
    - e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
  - 6. MCCB Disconnecting Means:
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
    - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
    - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
    - e. N.O. alarm contact that operates only when MCCB has tripped.
- 2.2 REDUCED-VOLTAGE MAGNETIC CONTROLLERS
- A. General Requirements for Reduced-Voltage Magnetic Controllers: Comply with NEMA ICS 2, general purpose, Class A; closed-transition; adjustable time delay on transition.
  - B. Reduced-Voltage Magnetic Controllers: Reduced voltage, electrically held.
    - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- a. Siemens Energy & Automation, Inc.
  - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
  - c. Rockwell Automation, Inc.; Allen-Bradley brand.
  - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - e. Or approved equal.
2. Configuration:
  - a. Wye-Delta Controller: Four contactors, with a three-phase starting resistor/reactor bank.
  - b. Part-Winding Controller: Separate START and RUN contactors, field-selectable for 1/2- or 2/3-winding start mode, with either six- or nine-lead motors; with separate overload relays for starting and running sequences.
  - c. Autotransformer Reduced-Voltage Controller: Medium-duty service, with integral over temperature protection; taps for starting at 50, 65, and 80 percent of line voltage; two START and one RUN contactors.
3. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.
  - a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
4. Power Contacts: Totally enclosed, double-break, silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
5. Control Circuits: 24-V ac; obtained from integral CPT, with primary and secondary fuses with CPT control power source of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.
  - a. CPT Spare Capacity: 100 VA.
6. Melting Alloy Overload Relays:
  - a. Inverse-time-current characteristic.
  - b. Class 10 tripping characteristic.
  - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
7. Bimetallic Overload Relays:
  - a. Inverse-time-current characteristic.
  - b. Class 10 tripping characteristic.
  - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  - d. Ambient compensated.
  - e. Automatic resetting.
8. Solid-State Overload Relay:
  - a. Switch or dial selectable for motor running overload protection.
  - b. Sensors in each phase.
  - c. Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
  - d. Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
  - e. Analog communication module.

9. N.O., isolated overload alarm contact.
  10. External overload reset push button.
- C. Combination Reduced-Voltage Magnetic Controller: Factory-assembled combination of reduced-voltage magnetic controller, OCPD, and disconnecting means.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  2. Fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J or indicated fuses.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  3. Non-fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, non-fusible switch.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  4. MCP Disconnecting Means:
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
    - d. N.C., N.O. alarm contact that operates only when MCP has tripped.
    - e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
  5. MCCB Disconnecting Means:
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
    - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
    - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
    - e. N.C., N.O. alarm contact that operates only when MCCB has tripped.

## 2.3 REDUCED-VOLTAGE SOLID-STATE CONTROLLERS

- A. General Requirements for Reduced-Voltage Solid-State Controllers: Comply with UL 508.
- B. Reduced-Voltage Solid-State Controllers: An integrated unit with power SCRs, heat sink, microprocessor logic board, door-mounted digital display and keypad, bypass contactor, and overload relay; suitable for use with NEMA MG 1, Design B, polyphase, medium induction motors.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 2. Configuration: Standard duty; nonreversible.
  - 3. Starting Mode: Voltage ramping; field selectable.
  - 4. Stopping Mode: Adjustable braking; field selectable.
  - 5. Shorting (Bypass) Contactor: Operates automatically when full voltage is applied to motor, and bypasses the SCRs. Solid-state controller protective features shall remain active when the shorting contactor is in the bypass mode.
  - 6. Shorting and Input Isolation Contactor Coils: Pressure-encapsulated type; manufacturer's standard operating voltage, matching control power or line voltage, depending on contactor size and line-voltage rating. Provide coil transient suppressors.
  - 7. Logic Board: Identical for all ampere ratings and voltage classes, with environmental protective coating.
  - 8. Control Circuits: 24-V ac; obtained from integral CPT, with primary and secondary fuses, with CPT control power source of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.
    - a. CPT Spare Capacity: 100 VA.
  - 9. Adjustable acceleration-rate control using voltage or current ramp, and adjustable starting torque control with up to 400 percent current limitation for 20 seconds.
  - 10. SCR bridge shall consist of at least two SCRs per phase, providing stable and smooth acceleration with external feedback from the motor or driven equipment.
  - 11. Keypad, front accessible; for programming the controller parameters, functions, and features; shall be manufacturer's standard and include not less than the following functions:
    - a. Adjusting motor full-load amperes, as a percentage of the controller's rating.
    - b. Adjusting current limitation on starting, as a percentage of the motor full-load current rating.
    - c. Adjusting linear acceleration and deceleration ramps, in seconds.
    - d. Initial torque, as a percentage of the nominal motor torque.
    - e. Adjusting torque limit, as a percentage of the nominal motor torque.
    - f. Adjusting maximum start time, in seconds.
    - g. Adjusting voltage boost, as a percentage of the nominal supply voltage.
    - h. Selecting stopping mode, and adjusting parameters.
    - i. Selecting motor thermal overload protection class between 5 and 30.
    - j. Activating and de-activating protection modes.
    - k. Selecting or activating communication modes.
  - 12. Digital display, front accessible; for showing motor, controller, and fault status; shall be manufacturer's standard and include not less than the following:

- a. Controller Condition: Ready, starting, running, stopping.
- b. Motor Condition: Amperes, voltage, power factor, power, and thermal state.
- c. Fault Conditions: Controller thermal fault, motor overload alarm and trip, motor underload, overcurrent, shorted SCRs, line or phase loss, phase reversal, and line frequency over or under normal.

13. Controller Diagnostics and Protection:

- a. Microprocessor-based thermal protection system for monitoring SCR and motor thermal characteristics, and providing controller over temperature and motor-overload alarm and trip; settings selectable via the keypad.
- b. Protection from line-side reverse phasing; line-side and motor-side phase loss; motor jam, stall, and underload conditions; and line frequency over or under normal.
- c. Input isolation contactor that opens when the controller diagnostics detect a faulted solid-state component or when the motor is stopped.
- d. Shunt trip that opens the disconnecting means when the controller diagnostics detect a faulted solid-state component.

14. Optional Features:

- a. Analog output for field-selectable assignment of motor operating characteristics; 0 to 10-V dc.
- b. Additional field-assignable Form C contacts, as indicated, for alarm outputs.
- c. Surge suppressors in solid-state power circuits providing three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
- d. Full-voltage bypass contactor operating manually, with NORMAL/BYPASS selector switch. Power contacts shall be totally enclosed, double break, and silver-cadmium oxide; and assembled to allow inspection and replacement without disturbing line or load wiring.
- e. Melting Alloy Overload Relays:
  - 1) Inverse-time-current characteristic.
  - 2) Class 10 tripping characteristic.
  - 3) Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
- f. Bimetallic Overload Relays:
  - 1) Inverse-time-current characteristic.
  - 2) Class 10 tripping characteristic.
  - 3) Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  - 4) Ambient compensated.
  - 5) Automatic resetting.
- g. Solid-State Overload Relay:
  - 1) Switch or dial selectable for motor running overload protection.
  - 2) Sensors in each phase.
  - 3) Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.

- 4) Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
  - 5) Analog communication module.
  - h. N.O., isolated overload alarm contact.
  - i. External overload reset push button.
- C. **Combination Reduced-Voltage Solid-State Controller:** Factory-assembled combination of reduced-voltage solid-state controller, OCPD, and disconnecting means.
  - 1. **Manufacturers:** Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 2. **Fusible Disconnecting Means:**
    - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J, Class L or as indicated fuses.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  - 3. **MCP Disconnecting Means:**
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
    - d. N.O. alarm contact that operates only when MCP has tripped.
    - e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
  - 4. **MCCB Disconnecting Means:**
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
    - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
    - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
    - e. N.O. alarm contact that operates only when MCCB has tripped.
  - 5. **Molded-Case Switch Disconnecting Means:**

- a. UL 489, NEMA AB 1, and NEMA AB 3, with in-line fuse block for Class J or L power fuses (depending on ampere rating), providing an interrupting capacity to comply with available fault currents; MCCB with fixed, high-set instantaneous trip only.
- b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
- c. Auxiliary contacts "a" and "b" arranged to activate with molded-case switch handle.
- d. N.O. alarm contact that operates only when molded-case switch has tripped.

## 2.4 MULTISPEED MAGNETIC CONTROLLERS

- A. General Requirements for Multispeed Magnetic Controllers: Comply with NEMA ICS 2, general purpose, Class A.
- B. Multispeed Magnetic Controllers: Two speed, full voltage, across the line, electrically held.
  1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  2. Configuration: Non-reversing; two winding.
  3. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.
    - a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
  4. Power Contacts: Totally enclosed, double break, silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
  5. Control Circuits: 24V ac; obtained from integral CPT, with primary and secondary fuses, with CPT control power source of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.
    - a. CPT Spare Capacity: 100 VA.
  6. Compelling relays shall ensure that motor will start only at low speed.
  7. Accelerating timer relays shall ensure properly timed acceleration through speeds lower than that selected.
  8. Decelerating timer relays shall ensure automatically timed deceleration through each speed.
  9. Anti-plugging timer relays shall ensure a time delay when transferring from forward to reverse and back.
  10. Melting Alloy Overload Relays:
    - a. Inverse-time-current characteristic.
    - b. Class 10 tripping characteristic.
    - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  11. Bimetallic Overload Relays:
    - a. Inverse-time-current characteristic.

- b. Class 10 tripping characteristic.
  - c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  - d. Ambient compensated.
  - e. Automatic resetting.
- 12. Solid-State Overload Relay:
  - a. Switch or dial selectable for motor running overload protection.
  - b. Sensors in each phase.
  - c. Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
  - d. Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
  - e. Analog communication module.
- 13. N.O., isolated overload alarm contact.
- 14. External overload reset push button.
- C. Combination Multispeed Magnetic Controller: Factory-assembled combination of reduced-voltage magnetic controller, OCPD, and disconnecting means.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Siemens Energy & Automation, Inc.
    - b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - e. Or approved equal.
  - 2. Fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class J or indicated fuses.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  - 3. Non-fusible Disconnecting Means:
    - a. NEMA KS 1, heavy-duty, horsepower-rated, non-fusible switch.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
  - 4. MCP Disconnecting Means:
    - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
    - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
    - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
    - d. N.O. alarm contact that operates only when MCP has tripped.

- e. Current-limiting module to increase controller short-circuit current (withstand) rating to 100 kA.
5. MCCB Disconnecting Means:
- a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
  - b. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  - c. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - d. Auxiliary contacts "a" and "b" arranged to activate with MCCB handle.
  - e. N.O. alarm contact that operates only when MCCB has tripped.

## 2.5 ENCLOSURES

- A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.
- 1. Dry and Clean Indoor Locations: Type 1.
  - 2. Outdoor Locations: Type 3R.
  - 3. Wash-Down Areas: Type 4X stainless steel.
  - 4. Other Wet or Damp Indoor Locations: Type 4.
  - 5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.
  - 6. Hazardous Areas Indicated on Drawings: Type 9.

## 2.6 ACCESSORIES

- A. General Requirements for Control Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.
- 1. Push Buttons, Pilot Lights, and Selector Switches: Heavy-duty, oil-tight type.
    - a. Push Buttons: Covered types; momentary as indicated.
    - b. Pilot Lights: LED types; colors as indicated; push to test.
    - c. Selector Switches: Rotary type.
  - 2. Elapsed Time Meters: Heavy duty with digital readout in hours; non-resettable.
  - 3. Meters: Panel type, 2-1/2-inch (64-mm) minimum size with 90- or 120-degree scale and plus or minus two percent accuracy. Where indicated, provide selector switches with an off position.
- B. N.O. auxiliary contact(s).
- C. Control Relays: Auxiliary and adjustable solid-state time-delay relays.
- D. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.

- E. Breather and drain assemblies, to maintain interior pressure and release condensation in Type 4, Type 4X, Type 9 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- F. Space heaters, with N.C. auxiliary contacts, to mitigate condensation in Type 3R, Type 4X, Type 12 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- G. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
- H. Cover gaskets for Type 1 enclosures.
- I. Terminals for connecting power factor correction capacitors to the line side of overload relays.
- J. Spare control wiring terminal blocks, quantity as indicated; unwired

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Examine areas and surfaces to receive enclosed controllers, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
- B. Examine enclosed controllers before installation. Reject enclosed controllers that are wet, moisture damaged, or mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.3 INSTALLATION

- A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Section 26 05 29 "Hangers and Supports for Electrical Systems."
- B. Floor-Mounted Controllers: Install enclosed controllers on 4-inch (100-mm) nominal-thickness concrete base. Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete."
  - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
  - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 4. Install anchor bolts to elevations required for proper attachment to supported equipment.

- C. Seismic Bracing: Comply with requirements specified in Section 26 05 48 "Vibration and Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in each fusible-switch enclosed controller.
- F. Install fuses in control circuits if not factory installed. Comply with requirements in Section 26 28 13 "Fuses."
- G. Install heaters in thermal overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- H. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- I. Install power factor correction capacitors. Connect to the line side of overload relays. If connected to the load side of overload relays, adjust overload heater sizes to accommodate the reduced motor full-load currents.
- J. Comply with NECA 1.

### 3.4 IDENTIFICATION

- A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
  - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  - 2. Label each enclosure with engraved nameplate.
  - 3. Label each enclosure-mounted control and pilot device.

### 3.5 CONTROL WIRING INSTALLATION

- A. Install wiring between enclosed controllers and remote devices and facility's central control system. Comply with requirements in Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic-control selection devices where applicable.
  - 1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switch is in manual-control position.
  - 2. Connect selector switches with enclosed-controller circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

### 3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- D. Acceptance Testing Preparation:
  - 1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
  - 2. Test continuity of each circuit.
- E. Tests and Inspections:
  - 1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
  - 2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
  - 3. Test continuity of each circuit.
  - 4. Verify that voltages at controller locations are within plus or minus 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify the Commissioner before starting the motor(s).
  - 5. Test each motor for proper phase rotation.
  - 6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  - 8. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:
    - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each multi-pole enclosed controller. Remove front panels so joints and connections are accessible to portable scanner.
    - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each multi-pole enclosed controller 11 months after date of Substantial Completion.
    - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
  - 9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- F. Enclosed controllers will be considered defective if they do not pass tests and inspections.
- G. Prepare test and inspection reports including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

**3.7 ADJUSTING**

- A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
- B. Adjust overload-relay heaters or settings if power factor correction capacitors are connected to the load side of the overload relays.
- C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify the Commissioner before increasing settings.
- D. Set the taps on reduced-voltage autotransformer controllers at 50 percent.
- E. Set field-adjustable switches and program microprocessors for required start and stop sequences in reduced-voltage solid-state controllers.
- F. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

**3.8 PROTECTION**

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.
- B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

**3.9 DEMONSTRATION**

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, and maintain enclosed controllers, and to use and reprogram microprocessor-based, reduced-voltage solid-state controllers.

**END OF SECTION 26 29 13**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 29 23****VARIABLE-FREQUENCY MOTOR CONTROLLERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section includes separately enclosed, preassembled, combination VFCs, rated 600 V and less, for speed control of three-phase, squirrel-cage induction motors.
- B. Related Requirements:
  - 1. Section 262419 "Motor-Control Centers" for VFCs installed in motor-control centers.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”

**1.7 DEFINITIONS**

- A. BAS: Building automation system.
- B. CE: Conformance Europeene (European Compliance).
- C. CPT: Control power transformer.
- D. EMI: Electromagnetic interference.
- E. LED: Light-emitting diode.
- F. NC: Normally closed.
- G. NO: Normally open.
- H. OCPD: Overcurrent protective device.
- I. PID: Control action, proportional plus integral plus derivative.
- J. RFI: Radio-frequency interference.
- K. VFC: Variable-frequency motor controller.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Cerus Industrial, Inc.
  - 2. Danfoss Inc; Danfoss Drives Div.
  - 3. Siemens Energy & Automation, Inc.
  - 4. Rockwell Automation, Inc; Allen-Bradley Brand.
  - 5. Schneider Electric USA, Inc.
  - 6. Eaton Electrical Sector; Eaton Corporation; Cutler-Hammer Business Unit.
  - 7. Yaskawa Electric America, Inc.
  - 8. Or approved equal.

**2.2 SYSTEM DESCRIPTION**

- A. General Requirements for VFCs:
  - 1. VFCs and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
  - 2. Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 508, UL 508C.
- B. Application: Constant torque and variable torque.

- C. VFC Description: Variable-frequency motor controller, consisting of power converter that employs pulse-width-modulated inverter, factory built and tested in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.
1. Units suitable for operation of NEMA MG 1, Design A and Design B motors, as defined by NEMA MG 1, Section IV, Part 30, "Application Considerations for Constant Speed Motors Used on a Sinusoidal Bus with Harmonic Content and General Purpose Motors Used with Adjustable-Voltage or Adjustable-Frequency Controls or Both."
  2. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
  3. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to New York City Electrical Division.
- D. Design and Rating: Match load type, such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- E. Output Rating: Three phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.
- F. Unit Operating Requirements:
1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFC input voltage rating.
  2. Input AC Voltage Unbalance: Not exceeding 3 percent.
  3. Input Frequency Tolerance: Plus or minus 3 percent of VFC frequency rating.
  4. Minimum Efficiency: 96 percent at 60 Hz, full load.
  5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
  6. Minimum Short-Circuit Current (Withstand) Rating: 65 kA.
  7. Ambient Temperature Rating: Not less than 32 deg F and not exceeding 104 deg F.
  8. Humidity Rating: Less than 95 percent (noncondensing).
  9. Altitude Rating: Not exceeding 3300 feet.
  10. Vibration Withstand: Comply with NEMA ICS 61800-2.
  11. Overload Capability: 1.5 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
  12. Starting Torque: Minimum 100 percent of rated torque from 3 to 60 Hz.
  13. Speed Regulation: Plus or minus 5 percent.
  14. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.
  15. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.
- G. Inverter Logic: Microprocessor based, 32 bit, isolated from all power circuits.
- H. Isolated Control Interface: Allows VFCs to follow remote-control signal over a minimum 40:1 speed range.
1. Signal: Electrical
- I. Internal Adjustability Capabilities:
1. Minimum Speed: 5 to 25 percent of maximum rpm.
  2. Maximum Speed: 80 to 100 percent of maximum rpm.
  3. Acceleration: 0.1 to 999.9seconds.
  4. Deceleration: 0.1 to 999.9seconds.

5. Current Limit: 30 to minimum of 150 percent of maximum rating.
- J. Self-Protection and Reliability Features:
1. Surge Suppression: Factory installed as an integral part of the VFC, complying with UL 1449 SPD, Type 1 or Type 2.
  2. Surge Suppression: Field-mounted surge suppressors complying with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits," UL 1449 SPD, Type 2.
  3. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
  4. Under- and overvoltage trips.
  5. Inverter overcurrent trips.
  6. VFC and Motor-Overload/Over temperature Protection: Microprocessor-based thermal protection system for monitoring VFCs and motor thermal characteristics, and for providing VFC over temperature and motor-overload alarm and trip; settings selectable via the keypad.
  7. Critical frequency rejection, with three selectable, adjustable deadbands.
  8. Instantaneous line-to-line and line-to-ground overcurrent trips.
  9. Loss-of-phase protection.
  10. Reverse-phase protection.
  11. Short-circuit protection.
  12. Motor-over temperature fault.
- K. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.
- L. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped, unless "Bidirectional Autospeed Search" feature is available and engaged.
- M. Bidirectional Autospeed Search: Capable of starting VFC into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.
- N. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- O. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- P. Integral Input Disconnecting Means and OCPD: UL 489, instantaneous-trip circuit breaker with pad-lockable, door-mounted handle mechanism.
1. Disconnect Rating: Not less than 115 percent of VFC input current rating.
  2. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFC input current rating, whichever is larger.
  3. Auxiliary Contacts: NO or NC, arranged to activate before switch blades open.
  4. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.
  5. NO alarm contact that operates only when circuit breaker has tripped.

## 2.3 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: VFCs shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. The designated VFCs shall be tested and certified by an NRTL as meeting the ICC-ES AC 156 test procedure requirements.
  - 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

## 2.4 CONTROLS AND INDICATION

- A. Status Lights: Door-mounted LED indicators displaying the following conditions:
  - 1. Power on.
  - 2. Run.
  - 3. Overvoltage.
  - 4. Line fault.
  - 5. Overcurrent.
  - 6. External fault.
- B. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English-language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.
  - 1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
  - 2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
    - a. Control Authority: Supports at least four conditions: Off, local manual control at VFC, local automatic control at VFC, and automatic control through a remote source.
- C. Historical Logging Information and Displays:
  - 1. Real-time clock with current time and date.
  - 2. Running log of total power versus time.
  - 3. Total run time.
  - 4. Fault log, maintaining last eight faults with time and date stamp for each.
- D. Indicating Devices: Digital display and additional readout devices as required, mounted flush in VFC door and connected to display VFC parameters including, but not limited to:
  - 1. Output frequency (Hz).
  - 2. Motor speed (rpm).
  - 3. Motor status (running, stop, fault).
  - 4. Motor current (amperes).
  - 5. Motor torque (percent).
  - 6. Fault or alarming status (code).
  - 7. PID feedback signal (percent).
  - 8. DC-link voltage (V dc).
  - 9. Set point frequency (Hz).

10. Motor output voltage (V ac).
- E. Control Signal Interfaces:
  1. Electric Input Signal Interface:
    - a. A minimum of two programmable analog inputs: 0- to 10-V dc
    - b. A minimum of six multifunction programmable digital inputs.
  2. Pneumatic Input Signal Interface: 3 to 15 psig (20 to 104 kPa).
  3. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BAS or other control systems:
    - a. 0- to 10-V dc.
    - b. 4- to 20-mA dc.
    - c. Potentiometer using up/down digital inputs.
    - d. Fixed frequencies using digital inputs.
  4. Output Signal Interface: A minimum of one programmable analog output signal(s) (0- to 10-V dc), which can be configured for any of the following:
    - a. Output frequency (Hz).
    - b. Output current (load).
    - c. DC-link voltage (V dc).
    - d. Motor torque (percent).
    - e. Motor speed (rpm).
    - f. Set point frequency (Hz).
  5. Remote Indication Interface: A minimum of two programmable dry-circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
    - a. Motor running.
    - b. Set point speed reached.
    - c. Fault and warning indication (over temperature or overcurrent).
    - d. PID high- or low-speed limits reached.
- F. PID Control Interface: Provides closed-loop set point, differential feedback control in response to dual feedback signals. Allows for closed-loop control of fans and pumps for pressure, flow, or temperature regulation.
  1. Number of Loops: One.
- G. BAS Interface: Factory-installed hardware and software shall interface with BAS to monitor, control, display, and record data for use in processing reports. VFC settings shall be retained within VFC's nonvolatile memory.
  1. Hardwired Points:
    - a. Monitoring: On-off status,
    - b. Control: On-off operation,
  2. Communication Interface: Comply with ASHRAE 135. Communication shall interface with BAS to remotely control and monitor lighting from a BAS operator workstation. Control

features and monitoring points displayed locally at lighting panel shall be available through the BAS.

## 2.5 LINE CONDITIONING AND FILTERING

- A. Input Line Conditioning: Based on the manufacturer's harmonic analysis study and report, provide input filtering, as required, to limit total demand (harmonic current) distortion and total harmonic voltage demand at the defined point of common coupling to meet IEEE 519 recommendations.
- B. Output Filtering:
- C. EMI/RFI Filtering: CE marked; certify compliance with IEC 61800-3 for Category C2.
- D. EMI/RFI Filtering:

## 2.6 BYPASS SYSTEMS

- A. Bypass Operation: Safely transfers motor between power converter output and bypass circuit, manually, automatically, or both. Selector switches set modes and indicator lights indicate mode selected. Unit is capable of stable operation (starting, stopping, and running) with motor completely disconnected from power converter.
- B. Bypass Mode: Manual operation only; requires local operator selection at VFC. Transfer between power converter and bypass contactor, and retransfer shall only be allowed with the motor at zero speed.
- C. Bypass Mode: Field-selectable automatic or manual, allows local and remote transfer between power converter and bypass contactor and retransfer, either via manual operator interface or automatic-control system feedback.
- D. Bypass Controller: Two-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter and permit safe troubleshooting and testing, both energized and de-energized, while motor is operating in bypass mode.
  - 1. Bypass Contactor: Load-break, IEC-rated contactor.
  - 2. Output Isolating Contactor: Non-load-break, IEC-rated contactor.
  - 3. Isolating Switch: Non-load-break switch arranged to isolate power converter and permit safe troubleshooting and testing of the power converter, both energized and de-energized, while motor is operating in bypass mode; pad-lockable, door-mounted handle mechanism.
- E. Bypass Controller: Three-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter input and output and permit safe testing and troubleshooting of the power converter, both energized and de-energized, while motor is operating in bypass mode.
  - 1. Bypass Contactor: Load-break, IEC-rated contactor.
  - 2. Input and Output Isolating Contactors: Non-load-break, IEC-rated contactors.
  - 3. Isolating Switch: Non-load-break switch arranged to isolate power converter and permit safe troubleshooting and testing of the power converter, both energized and de-energized, while motor is operating in bypass mode; pad-lockable, door-mounted handle mechanism.
- F. Bypass Contactor Configuration: Full-voltage (across-the-line) type.

1. NORMAL/BYPASS selector switch.
2. HAND/OFF/AUTO selector switch.
3. NORMAL/TEST Selector Switch: Allows testing and adjusting of VFC while the motor is running in the bypass mode.
4. Contactor Coils: Pressure-encapsulated type with coil transient suppressors.
  - a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.
  - b. Power Contacts: Totally enclosed, double break, and silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
5. Control Circuits: 120V ac; obtained from integral CPT, with primary and secondary fuses, with CPT of sufficient capacity to operate all integral devices and remotely located pilot, indicating, and control devices.
  - a. CPT Spare Capacity: 100VA.
6. Overload Relays: NEMA ICS 2.
  - a. Melting-Alloy Overload Relays:
    - 1) Inverse-time-current characteristic.
    - 2) Class 10 tripping characteristic.
    - 3) Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
  - b. Bimetallic Overload Relays:
    - 1) Inverse-time-current characteristic.
    - 2) Class 10 tripping characteristic.
    - 3) Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
    - 4) Ambient compensated.
    - 5) Automatic resetting.
  - c. Solid-State Overload Relays:
    - 1) Switch or dial selectable for motor-running overload protection.
    - 2) Sensors in each phase.
    - 3) Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
    - 4) Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
    - 5) Analog communication module.
  - d. NO isolated overload alarm contact.
  - e. External overload, reset push button.

## 2.7 OPTIONAL FEATURES

- A. Multiple-Motor Capability: VFC suitable for variable-speed service to multiple motors. Overload protection shuts down VFC and motors served by it and generates fault indications when overload protection activates.

1. Configure to allow two or more motors to operate simultaneously at the same speed; separate overload relay for each controlled motor.
  2. Configure to allow two motors to operate separately; operator selectable via local or remote switch or contact closures; single overload relay for both motors; separate output magnetic contactors for each motor.
  3. Configure to allow two motors to operate simultaneously and in a lead/lag mode, with one motor operated at variable speed via the power converter and the other at constant speed via the bypass controller; separate overload relay for each controlled motor.
- B. Damper control circuit with end-of-travel feedback capability.
- C. Sleep Function: Senses a minimal deviation of a feedback signal and stops the motor. On an increase in speed-command signal deviation, VFC resumes normal operation.
- D. Motor Preheat Function: Preheats motor when idle to prevent moisture accumulation in the motor.
- E. Firefighter's Override (Smoke Purge) Input: On a remote contact closure from the firefighter's control station, this password-protected input:
1. Overrides all other local and external inputs (analog/digital, serial communication, and all keypad commands).
  2. Forces VFC to operate motor, without any other run or speed command, at a field-adjustable, preset speed.
  3. Forces VFC to transfer to bypass mode and operate motor at full speed.
  4. Causes display of override mode on the VFC display.
  5. Reset VFC to normal operation on removal of override signal manually.
- F. Remote Indicating Circuit Terminals: Mode selection, controller status, and controller fault.
- G. Remote digital operator kit.
- H. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.

## 2.8 ENCLOSURES

- A. VFC Enclosures: NEMA 250, to comply with environmental conditions at installed location.
1. Dry and Clean Indoor Locations: Type 1
  2. Outdoor Locations: Type 3R or Type 4X or as indicated.
  3. Wash-Down Areas: Type 4X, stainless steel.
  4. Other Wet or Damp Indoor Locations: Type 4.
  5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.
- B. Plenum Rating: UL 1995; NRTL certification label on enclosure, clearly identifying VFC as "Plenum Rated."

## 2.9 ACCESSORIES

- A. General Requirements for Control-Circuit and Pilot Devices: NEMA ICS 5; factory installed in VFC enclosure cover unless otherwise indicated.

1. Push Buttons: Covered.
  2. Pilot Lights: Push to test.
  3. Selector Switches: Rotary type.
  4. Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.
- B. NO bypass contactor auxiliary contact(s).
- C. Control Relays: Auxiliary and adjustable solid-state time-delay relays.
- D. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.
1. Current Transformers: Continuous current rating, basic impulse insulating level (BIL) rating, burden, and accuracy class suitable for connected circuitry. Comply with IEEE C57.13.
- E. Supplemental Digital Meters:
1. Elapsed-time meter.
  2. Kilowatt meter.
  3. Kilowatt-hour meter.
- F. Breather and drain assemblies, to maintain interior pressure and release condensation in NEMA 250, Type 4, Type 4X, Type 12 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- G. Space heaters, with NC auxiliary contacts, to mitigate condensation in NEMA 250, Type 3R, Type 4X, Type 12 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- H. Cooling Fan and Exhaust System: For NEMA 250, Type 1, Type 12; UL 508 component recognized: Supply fan, with stainless-steel intake and exhaust grills and filters; 120V ac; obtained from integral CPT.
- I. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
- J. Spare control-wiring terminal blocks; wired.
- 2.10 SOURCE QUALITY CONTROL
- A. Testing: Test and inspect VFCs according to requirements in NEMA ICS 61800-2.
1. Test each VFC while connected to its specified motor.
  2. Verification of Performance: Rate VFCs according to operation of functions and features specified.
- B. VFCs will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Examine areas, surfaces, and substrates to receive VFCs, with Installer present, for compliance with requirements for installation tolerances, and other conditions affecting performance of the Work.
- B. Examine VFC before installation. Reject VFCs that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFC installation.
- D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.3 INSTALLATION**

- A. Wall-Mounting Controllers: Install with tops at uniform height and with disconnect operating handles not higher than 72 inches (1829 mm) above finished floor, unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not on walls, provide freestanding racks complying with Section 26 05 29 "Hangers and Supports for Electrical Systems."
- B. Floor-Mounting Controllers: Install VFCs on 4-inch (100-mm) nominal thickness concrete base (where possible). Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete."
  - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
  - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 4. Install anchor bolts to elevations required for proper attachment to supported equipment.
- C. Roof-Mounting Controllers: Install VFC on roofs with tops at uniform height and with disconnect operating handles not higher than 72 inches (1829 mm) above finished roof surface unless otherwise indicated, and by bolting units to curbs or mounting on freestanding, lightweight, structural-steel channels bolted to curbs. Seal roof penetrations after raceways are installed.
  - 1. Curbs and roof penetrations are specified in Section 07 72 00 "Roof Accessories."
  - 2. Structural-steel channels are specified in Section 26 05 29 "Hangers and Supports for Electrical Systems."
- D. Seismic Bracing: Comply with requirements specified in Section 26 05 48 "Vibration and Seismic Controls for Electrical Systems."

- E. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- F. Install fuses in each fusible-switch VFC.
- G. Install fuses in control circuits if not factory installed. Comply with requirements in Section 26 28 13 "Fuses."
- H. Install heaters in thermal-overload relays. Select heaters based on actual nameplate full-load amperes after motors are installed.
- I. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- J. Comply with NECA 1.

### 3.4 CONTROL WIRING INSTALLATION

- A. Install wiring between VFCs and remote devices and facility's central-control system. Comply with requirements in Section 26 05 23 "Control-Voltage Electrical Power Cables."
- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic-control devices where applicable.
  - 1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switches are in manual-control position.
  - 2. Connect selector switches with control circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor-overload protectors.

### 3.5 IDENTIFICATION

- A. Identify VFCs, components, and control wiring. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
  - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  - 2. Label each VFC with engraved nameplate.
  - 3. Label each enclosure-mounted control and pilot device.
- B. Operating Instructions: Frame printed operating instructions for VFCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFC units.

### 3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections with the assistance of a factory-authorized service representative.

D. Acceptance Testing Preparation:

1. Test insulation resistance for each VFC element, bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

E. Tests and Inspections:

1. Inspect VFC, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
2. Test insulation resistance for each VFC element, component, connecting motor supply, feeder, and control circuits.
3. Test continuity of each circuit.
4. Verify that voltages at VFC locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify the Commissioner before starting the motor(s).
5. Test each motor for proper phase rotation.
6. Perform tests according to the Inspection and Test Procedures for Adjustable Speed Drives stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
8. Perform the following infrared (thermographic) scan tests and inspections, and prepare reports:
  - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each VFC. Remove front panels so joints and connections are accessible to portable scanner.
  - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each VFC 11 months after date of Substantial Completion.
  - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

F. VFCs will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports, including a certified report that identifies the VFC and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.7 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.8 ADJUSTING

A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.

- B. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
- C. Adjust the trip settings of instantaneous-only circuit breakers and thermal-magnetic circuit breakers with adjustable, instantaneous trip elements. Initially adjust to 6 times the motor nameplate full-load amperes and attempt to start motors several times, allowing for motor cool-down between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed 8 times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify the Commissioner before increasing settings.
- D. Set the taps on reduced-voltage autotransformer controllers.
- E. Set field-adjustable circuit-breaker trip ranges in accordance with Overcurrent Protective Device Coordination Study.
- F. Set field-adjustable pressure switches.

### 3.9 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until controllers are ready to be energized and placed into service.
- B. Replace VFCs whose interiors have been exposed to water or other liquids prior to Substantial Completion.

### 3.10 DEMONSTRATION

- A. Engage a factory-authorized service representative to instruct the City of New York's service operators to adjust, operate, reprogram, and maintain VFCs.

**END OF SECTION 26 29 23**

**SECTION 26 31 00****PHOTOVOLTAIC COLLECTORS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Description: A 74.25 kW-DC (kilowatt) photovoltaic system made up of solar collector panels, and inverters. The system will be owned by the City of New York.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

## 1.7 WARRANTY AND SERVICE

- A. Provide a complete manufacturer's warranty of all components including replacement labor extending 5 years after date of Substantial Completion.

## 1.8 SUBMITTALS

### A. Product Data

1. PV Module manufacturer's catalog data, MSDS, cut sheets, performance data and detailed shop drawings.
2. Inverter manufacturer's catalog cut sheets, performance data and detailed drawings.
3. Disconnect switch manufacturer's catalog cut sheets and detailed drawings.
4. Complete list of materials and catalog cuts of all balance of system components being provided, including wire and terminations.

### B. Shop Drawings and submittals (1 hardcopy and 1 electronic copy) (include 2 copies of installation manual with submittals)

1. Complete as-built detailed 1-Line wiring diagram of the system. Signed and sealed by a qualified professional engineer licensed in the state of New York.
2. Complete as-built three-line wiring diagrams for the PV system. Signed and sealed by a qualified professional engineer licensed in the state of New York.
3. A complete scaled drawing showing the exact system layout including detailed shop drawings of all components and accessories being provided or required for operation as specified herein.
4. Drawings shall include the functional relationship of various equipment and shall include weights and dimensions of each unit.
5. If at least 10 percent of module locations vary from "Basis of Design", contractor shall provide a detailed shading study using shading analysis tools such as Solmetric SunEye, Solar Pathfinder, Helioscope or approved as equal. An updated production estimate meeting the requirements of the performance guarantee shall also be provided.
6. List of preventive service routines.
7. Wind and Snow Load Design Calculations: Signed and sealed by a qualified professional engineer licensed in the state of New York.
8. Certified Summary of Performance Tests: Demonstrate compliance with specified requirement to meet performance criteria.
9. Service Data: For system components and for each PV system and accessories to include in service manuals specified in DDC General Conditions

### C. Interconnection and Net Metering Application and Submittals.

1. Contractor is responsible for registering the project with Con Edison's Project Center and initiating, filing and submitting all required information and documents through New York State Standard Interconnection Requirement (SIR) for review and approval. Submittals shall include, but are not limited to:
  - a. New York State Standardized Acknowledgement of Property
  - b. Description / Narrative of the project and site proposed.
  - c. System Three-Line diagram, signed and sealed by a NYS licensed engineer.
  - d. All required product and equipment manufacturer data sheets.
  - e. Certificates of UL compliance for all required equipment.
  - f. Copy of the manufacturer's verification test procedures, if required.
  - g. Any additional information required by Con Edison.

- h. Complete Net metering application and all necessary documents.

## 1.9 QUALITY ASSURANCE

### A. General Requirements

1. Comply with 2014 New York City Construction Codes and FDNY regulations.
2. Coordinate with the Utility Company and file all forms required for Net Metering and Interconnection between the utility grid and PV system.
  - a. Reverse Power Relay will not be required for this project.
3. It is the responsibility of the Contractor to provide an energy-modeled estimate of the performance of the system in PV Watts.
4. Installation crew must follow OSHA regulations, including but not limited standard 1926 - Safety and Health Regulations for Construction.
5. Where additional details or instructions are required to complete the work, the Solar Contractor is deemed to have made an allowance in the bid for the completing of such work, consistent with adjoining or similar details and/or the best accepted practices of the trade, whichever is more expensive.
6. Purchase the equipment and material required in accordance with field measurements taken at the proper time during the construction process.
7. Prior to commencement of any work, Contractor is required to file and obtain all permits.
8. At completion of work, Contractor is required to provide all required signoffs from the New York City Building Department for the work specified in this document.
9. The Contractor shall be responsible for payments of all fees necessary to obtain required permits and sign-offs.

### B. Codes, Standards and Permits

All work shall be in strict accordance with the following codes and standards:

1. 2014 New York City Construction Codes, and zoning laws.
2. Con Edison's technical requirements for interconnection with solar energy systems
3. All applicable Solar PV-specific standards set forth by the Solar America Board for Codes and Standards
4. IEEE 1547 Standard for Interconnecting Distributed Resources with Electric Power
5. IEEE 519 "Recommended Practices and Requirements for Harmonic Control in Electric Power Systems"
6. IEC-61-215
7. UL-1741 "Inverters, Converters, and Interconnection System Equipment for Use with Distributed Energy Resources"
8. UL-1703 "Flat-Plate Photovoltaic Modules and Panels"
9. All products shall be UL listed or certified by other Nationally Recognized Testing Laboratory (NRTL) whenever possible.
10. NFPA 70: National Electrical Code 2008
  - a. Article 690, Solar Electric Systems
  - b. Article 705, Interconnected Electrical Power Production Sources
11. ANSI C12.1 "Code for Electricity Metering"
12. FCC electromagnetic Interference (EMI) Part 15 A & B

### C. Simulation

1. If submitting a design, provide a simulation using PVWatts.
  - a. URL of PVWatts is <http://pvwatts.nrel.gov/pvwatts.php>.
2. PVWatts DC to AC Derate Factor: determined by Contractor and subject to performance requirements given below, and acceptance by Commissioner.

**D. Waste Removal**

1. Refer to the DDC General Conditions for construction waste management and disposal requirements.
2. Contractor shall be responsible for the removal and on-site disposal of any and all materials considered waste during the course of the work.
3. In the event there is damage to any portion of the building exterior or interior, to the sidewalk, to the stairs, and/or any area affected by the work. Promptly restore, clean and restore to the full satisfaction of the Commissioner any and all damage at no additional expense or delay to The City of New York.

**1.10 PROJECT INFORMATION**

**A. Electrical**

1. Service voltage: 120/208V 3-PHASE 4W
2. Metering: CONED Meter new not know at this time
3. Interconnection: Refer to Electrical Drawings

**B. Roof: SBS with granular cap sheet. Refer to Section 07 52 16 "SBS Modified Bituminous Membrane Roofing".**

**C. Structural: concrete slab on steel deck, concrete and concrete masonry curbs.**

**D. Find as-built structural details on architectural drawings**

**E. Roof membrane and warranty: Refer to Section 07 52 16 "SBS Modified Bituminous Membrane Roofing".**

**F. Pitch: less than 5 degrees.**

**1.11 SOLAR SYSTEM**

**A. Solar system nameplate: 74.25 kW-DC**

1. Quantity of modules: refer to drawings – 265W Monocrystalline
2. Quantity of inverters: refer to drawings – 9kW-AC
3. Quantity of transformers: N/A

**B. Solar system location: Southern, Western, Eastern and Northern sections of the three East, West and South roofs.**

**C. PV performance display monitor: The Contractor will install and program a display monitor to display the PV system's production information and related environmental sensors captured by the Data Monitoring System (DMS). The Contractor is required to provide infrastructure and coordinate with the Commissioner for the display.**

## PART 2 - PRODUCTS

### 2.1 PHOTOVOLTAIC MODULES

- A. Procure and install modules with the following requirements:
  - 1. 265 Watt, 60 cell, multicrystalline.
  - 2. Modules shall be listed by Underwriters Laboratories (certified UL1703), ETL or other NRTL for electrical and fire safety for use in systems up to 600 VDC.
  - 3. Total nominal system capacity must be greater than or equal to the specified capacity.
- B. Manufacturers:
  - 1. JA Solar #JAM6(K)-60-265/4BB (Basis-of-Design)
  - 2. Yingli Solar, 270 Watt, #YL270P-8.77b
  - 3. Longi Solar, 295 Watt, #LR6-60
  - 4. Or approved equal.

### 2.2 INVERTERS

- A. Procure and install inverters at each site with the following requirements:
  - 1. 9kWAC transformer-less string inverter.
    - a. 208 VAC 3-phase
    - b. Integrated DC and AC disconnects
    - c. Integrated shade cover
  - 2. Inverter(s) shall be installed in the location as per Contract Drawings.
  - 3. Inverter(s) shall have a CEC Weighted Efficiency of greater than 96.0%; UL listed, utility interactive, matched to phase, voltage, voltage and current requirements of PV system with maximum power point tracking (MPPT) and electronics.
  - 4. Inverter(s) shall meet and be certified to all UL 1741 and IEEE 1547 requirements, including but not limited to:
    - a. Over and under voltage trip points and times
    - b. Over and under frequency trip points and time
    - c. Total harmonic distortion control IEEE 519
    - d. Anti-islanding protection
    - e. DC ground-fault detection and interruption
    - f. Inverter shall have automatic start-up, shut-down and self-diagnosis.
    - g. Inverters must be Rapid-Shutdown compliant.
    - h. Inverter Decibel (dBA) rating not to exceed 50 dBA @ 3 meters.
- B. The inverters shall be compatible with Solar PV Systems' array outputs and sized accordingly.
- C. Wiring shall follow the three-line diagram included in Contract Drawings
- D. Manufacturers:
  - 1. SOLAREEDGE SE 9kus inverter (Basis-of-Design),
  - 2. Solectria, 14.4kWAC, 208VAC 3-phase, #PVI 14TL Inverter,
  - 3. Fronius, 15kWAC, 208VAC 3-Phase, #Symo 15.0-3 208,

4. Or approved equal.

## 2.3 OPTIMIZER

- A. Procure and install optimizer at each location with the following requirements:

1. 600W optimizer
2. MPPT operating range: 12.5 – 80 VDC
3. Max short circuit current: 10 Amps Iscc
4. Max DC input current: 12.5 Amps
5. Max efficiency: 99.5%
6. Max output current: 15 Amps
7. Max output voltage: 85 Volts
8. Dimensions: 5.97" x 1.69"
9. Weight: 2.05 lb
10. Connector type: MC4 compatible

- B. Manufacturers:

1. SOLAREEDGE Model P600 (Basis-of-Design)
2. Tigo Energy, Inc. Model TS4
3. Or approved equal.

## 2.4 MOUNTING SYSTEM

- A. Procure and install solar mounting system with the following requirements:

1. All modules shall be secured to roof via a ballasted racking solution.
2. No roof penetrations are authorized on this roof.
3. Include wind and snow load design calculations signed and sealed by a qualified professional engineer licensed in the state of New York.
4. 10-degree tilt angle on panel racks.

- B. All structural components shall be installed in a manner commensurate with attaining a minimum 25-year design life.

- C. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. DynoRaxx (Basis-of-Design)
2. Ecolibrium
3. Unirac
4. Preformed Line Products / DPW Solar
5. Or approved equal.

## 2.5 BALANCE OF SYSTEMS COMPONENTS (BOS)

- A. Procure and install BOS components with the following requirements:

1. Follow requirements described on three-line diagram.
2. Conduit pull boxes as required by installer.

- B. Solar array combiner boxes: UL listed, series fusing or circuit breakers for solar roof panel source circuits in NEMA enclosure rating as required by installation location.

- C. Solar array DC disconnect switches: UL listed, blade-type, heavy duty fused safety switches on the output of the solar array in NEMA enclosure rating as required by installation location or may be integrated to the Inverters.
- D. AC disconnect switches: UL listed, blade-type, heavy duty fused safety switches on the output of Inverter(s) in NEMA enclosure as required by installation location or may be integrated to the Inverter.

## 2.6 DATA MONITORING SYSTEM (DMS)/ DATA ACQUISITION SYSTEM (DAS)

- A. Contractor is responsible for coordinating with facility IT staff to connect DMS to the existing internet service. The inverter may be used as the DMS as long as it meets the requirements below.
- B. Provide a Data Monitoring System (DMS) capable of collecting, recording, and displaying Solar PV System energy generation. The DMS shall provide the following features:
  - 1. Follow requirements described on three-line diagram.
  - 2. Capable of directly-acquiring energy production data from inverter.
  - 3. DMS shall be capable of capturing 15-minute data from Solar PV System. This meter system shall be installed with remote communication abilities and make all data available on a web interface.
  - 4. The DMS shall monitor the status of the inverters, capture inverter fault codes, and provide immediate e-mail notification if communication is lost or any errors are reported by the inverters.
  - 5. The DMS shall monitor the status of the system energy production and provide immediate email notification if energy production drops below expected levels.
  - 6. Educational information from the DMS shall be made available to the school's students, teachers and visitors through a display monitor located in the hallway of the first floor. Information shall also be available to administrators and educators through a common web portal supplied by inverter manufacturer.
- C. Contractor is responsible for installing the data monitoring system and paying the up-front expenses associated with the data monitoring system.
- D. Data monitoring system includes, but is not limited to:
  - 1. Data logger: Solrenview Datalogger used in design. Fully compatible with inverters and internet monitoring system.
    - a. Integrated DC powered by inverter
    - b. Outdoor rate NEMA4X enclosure
    - c. Connection: Modbus RS-485 daisy chained to inverters
    - d. LAN connection: Ethernet, TCP/IP
    - e. Networking connection: DHCP or Static IP
  - 2. Display Monitor: Fixed to wall with low profile adjustable tilt bracket. Minimum specifications:
    - a. Size: Nominal 42 inch (diagonal)
    - b. Display type: LED, 4K color
    - c. Resolution: High Definition
    - d. Sound: Built in speakers

- e. Network compatibility: Ethernet

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 GENERAL

- A. Install and wire the entire PV system as shown on the Contract Drawings, as indicated in all of the various system components manufacturer's instructions and as required for a neat, workmanlike and fully integrated and operational system. Ensure that all required and recommended clearances are maintained.
- B. Pre-installation Conference: Before beginning construction, conduct a pre-installation conference at the project site with the installer, the Commissioner, The City of New York and other interested parties to review procedures schedules, and coordination of the installation with other elements of the Work.
- C. Before installing or wiring PV modules, read all safety instructions in the product manual and these specifications.

### 3.3 INSTALLATION

- A. All PV module strings shall be field-tested to verify electrical integrity and specified performance per the manufacturer's recommendations. All PV module strings shall be tested, under good, clear weather conditions, for open circuit voltage (Voc) after ten minutes of sunlight exposure. The PV measurements and PV module serial numbers are to be recorded and the results shall be compared with values provided by PV module manufacturer.
- B. In the event the measurements are out of the expected ranges, the PV module shall be deemed defective and a replacement from the manufacturer shall be provided and installed.
- C. A copy of all of the measurements that are taken shall be included in the Operation and Maintenance Manual as described herein.
- D. Inspection – Examine the roof and the conditions under which the work is to be installed and notify the Commissioner in writing of any conditions deemed detrimental to the proper and timely completion of the work. Be very careful as not to cover any roof drains or other type of penetrations, to allow for future maintenance. Do not proceed with the work until unsatisfactory conditions have been corrected in the manner acceptable to the Commissioner.

### 3.4 ELECTRICAL ENGINEERING SERVICES

- A. All engineering services shall be provided by Contractor's professional engineer licensed in the State of New York and submitted for review and approval by Commissioner.
- B. Follow requirements described on Three Line Diagram.
- C. For multiple inverter systems tied into a single utility meter, Contractor's electrical

engineering services shall include the combination of AC outputs of inverters within Electrical PV AC Combiner Panel.

- D. Design shall include DC Disconnect Switches in accordance with Specification Supporting Documents.
- E. Grounding Conductors shall be sized and selected as per National Electrical Code and 2014 New York City Electrical Code.
- F. The PV DC system ground shall be connected directly to the base building AC grounding electrode.
- G. Comply with NYC 2014 Electrical Code, article 690.47(C).
- H. The PV System's DC system ground shall be installed per 2014 New York City Construction Codes.

### 3.5 WIRING

- A. Wiring practices and grounding shall be completed in a neat and workmanlike fashion and conform to 2014 New York City Construction Codes and NEC. Sealant shall be used as directed by manufacturer, subject to review by Commissioner.
- B. Wiring shall be contained in an organized and functional wire management system.
- C. All module to module wiring shall be secured to the back of the modules and rails with UV-resistant and anti-corrosive stainless steel straps, clamps, or ties. Care shall be taken to ensure as little slack in the exposed wire as possible, so as to limit damage from wind and abrasion.
- D. Cable running under PV panels shall be continuously supported and shall not make contact with roof surface.

### 3.6 LABELING

- A. Install signage posted at site, including at least the following but also any signage required by the NEC and 2014 New York City Electrical Code:
  - 1. Laminated Diagrams including:
    - a. AC and DC disconnect locations for the system indicated on a site plan.
    - b. Electrical one-line diagram of system
  - 2. All signage required shall be mounted in appropriate and visible locations
- B. All equipment shall be appropriately identified with permanent, self-adhesive labels.
- C. Each DC disconnect shall be labeled with label material described above for operating DC current (Imp), system operating DC voltage (Vmp), maximum string DC voltage (Voc), and maximum system DC current (Isc).
- D. The PV system interconnection point (as described in Electrical Drawings) shall be labeled as such indicating the PV system AC voltage, current, and the PV array rating in Watts DC and Watts AC.

### 3.7 INSTALLATION INSPECTIONS

- A. Conduct an in-depth inspection to ensure that the PV system is installed in a workmanlike manner and consistent with industry practice, National Electrical Code and 2014 New York City Electrical Code.
- B. Maintain a photo-record of the installation and major components, including PV modules, inverters, transformers and combiners. Photos will show connections within all installed enclosures.
- C. Provide a copy of the photos in the Operation and Maintenance Manual described herein.

### 3.8 ACCEPTANCE TEST/COMMISSIONING

- A. Notify the Commissioner writing when the entire PV system is correctly installed and properly wired. Actual acceptance of the system will only take place after the system passes all parts of the Acceptance Test, work successfully during a 30-day conditioning and system rating period, and meets the contractual system peak power rating. The contractor is required to perform start-up and validation of the system in the field prior to Commissioner's site acceptance test.
- B. Acceptance Test
  - 1. Array Tests
    - a. Test each PV string for Voc and Isc under good, clear weather conditions and follow the PV manufacturer's instructions when conducting tests. The measurements are to be recorded and compared to the manufacturer's specification.
    - b. Grounding: Resistance between ground connection and accessible conductive part should be less than 0.1 Ohm, tested with 25 A current.
    - c. Insulation resistance testing shall be performed (at the combiner boxes) on disconnected homerun string circuits during system commissioning. If string resistance measurement is less than 1 MegaOhm at 500 VDC, then test on each module individually to check for faulty connections. System Commissioner reserves the right to approve measured string resistance if no faulty connections are found.
    - d. Insulation resistance testing also serves as a baseline for maintenance checks during system operation.
    - e. All measurements taken shall be documented and included in the Operation and Maintenance Manual described herein.
  - 2. Inverter Operational Tests
    - a. Refer to and explicitly follow the Manufacturer's Instruction Manual for the particular testing requirements of the model inverter being tested.
    - b. Test each inverter independently and document the results of the tests.
    - c. Check that the AC and DC voltages, at the line side of the open inverter disconnect switches, are within manufactures specification.
    - d. Close the AC and DC disconnect switches and observe the inverter startup process. Refer to the Manufacturer's Instruction Manual for the correct sequence.
    - e. After successful completion of the inverter tests, the AC and DC disconnects shall be left open until the PV system is ready for commissioning.

**3.9 INITIAL START-UP**

- A. Prior to initial start-up tests, testing as described in the previous sections shall be satisfactorily completed.
- B. The goals of the commissioning process are as follows:
  - 1. Certification that the systems meet the requirements set forth in the specification.
  - 2. Review results of the inspection, array and inverter tests.
  - 3. Provide demonstration of PV system performance.
  - 4. Facilitate successful project closeout and warranty transition.
- C. The following PV system performance tests will be conducted at the project site by the Contractor and witnessed by commissioning team:
  - 1. Turn on the PV system and verify that it is working as specified.
  - 2. Verify proper system shutdown for loss of grid voltage via the AC disconnect switch.
  - 3. Verify proper system operation following loss of grid voltage.
- D. Verify proper operation of Monitoring System by viewing system operating parameters on the Monitoring System's web page.
- E. Provide manufacturer's operations manual for the inverters and be available to answer questions concerning proper system operating procedures.

**3.10 INSTRUCTION**

- A. Contractor shall be responsible for the instruction of The City of New York's service operators for both the equipment and systems pertaining to this installation.
- B. Instruction shall consist of a minimum of (2) 4-hour sessions. Instruction sessions and demonstration sessions shall not be consecutive and are separate and apart from start-up. Instruction shall consist of both classroom and in-the-field instruction. All instruction materials and a curriculum unique to this project will be presented to the Commissioner 2 months in advance of the on-site instruction. Instruction will commence only after the approval of the curriculum and agenda by the Commissioner.
- C. Refer to the DDC General Conditions for instruction requirements.

**END OF SECTION 26 31 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 32 13****ENGINE GENERATORS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Specification Sections:
  - 1. Division 26, Section 26 05 48 "Vibration Isolation, Seismic, Wind & Flood Load Restraints for Electrical Components".
- C. Drawings:
  - 1. Electrical Drawings: All electrical project drawings are part of this project and are required for a complete and accurate price for this work.

**1.2 SUMMARY**

- A. The contractor is directly responsible for providing all services and equipment within the scope of this specification to include the following:
  - 1. Provide the Engine Generator and all specified accessories and equipment.
  - 2. Perform a factory test of all equipment. The test shall be witnessed by the Commissioner as specified.
  - 3. Refer to Section 26 08 00 "Commissioning of Electrical" for commissioning requirements.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 "Construction Waste Management and Disposal"
  - 2. Section 01 81 13 "Sustainable Design Requirements for LEED Buildings"
  - 3. Section 01 81 19 "Indoor Air Quality Requirements for LEED Buildings"
- C. **LEED BUILDING PERFORMANCE REQUIREMENTS:** The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SYSTEM DESCRIPTION**

- A. Generator System Requirements - The intent of this specification is to describe the requirements for one Engine-Generator with the following ratings and or classifications:
  - 1. Emergency Standby Power Rating per ISO-8528-1 of 600KW / 750KVA.
  - 2. EPA Tier (2) Emissions Rating.
  - 3. Rated Voltage of 208Y/120V, 3 phase, 4 wire.
  - 4. Rated Frequency 60Hz
  - 5. NFPA 110 EPSS Level 1 system.
  - 6. NFPA 110 EPSS Type 10 system, or power restoration in 10 seconds. The type defines the maximum time, in seconds that the EPSS will permit the load terminals of the downstream transfer switch to be without acceptable electrical power
  - 7. Minimum generator transient performance standards shall be per the latest ISO 8528-5 Performance Class G2
- B. Generator System Equipment - In general the Engine-Generator defined in this specification includes the following subsystem assemblies:
  - 1. Diesel Engine
  - 2. Generator (Alternator)
  - 3. Engine mounted Radiator.
  - 4. Radiator Mounted Load Bank
  - 5. Fuel System.
  - 6. Standalone Fuel Oil Cooler
  - 7. Generator Output Protection.
  - 8. Vibration Isolation System.
  - 9. Battery Chargers
  - 10. Starting Batteries and associated Racks.
  - 11. Dual Jacket Water Heaters
  - 12. Dual Starters.
  - 13. Generator Control Panel
  - 14. Generator Exhaust and Silencer system.
  - 15. Fuel Oil Base Tank
  - 16. Spare Parts
- C. The Engine Generator manufacturer shall be responsible for the performance of the entire Engine Generator. This responsibility extends to all component parts of vendors that provide sub systems that together make a functioning engine generator set. If any sub system causes the performance of the engine generator to fail at the factory or site performance test, it's the generator manufacturer's responsibility to replace or fix the non performing component until the performance of the engine generator system meets all specified performance requirements with no additional expenses to the City of New York.

**1.6 DEFINITIONS**

- A. As used in the drawings and specifications for electrical work, certain non-technical words shall be understood to have specific meanings as follows regardless of indications to the contrary in the General Conditions or other documents governing the electric work.
1. EPSS - Emergency Power Supply Systems.
  2. BHP –Brake HorsePower is the horsepower of an engine measured by the degree of resistance offered by a brake, that represents the useful power that the machine can develop.
  3. Generator – Used interchangeably with alternator throughout the specification. A single non-redundant device consisting of all the necessary components to convert mechanical energy to electrical energy and provide an AC voltage source to the load.
  4. Engine - A single mechanical device that utilizes internal combustion to convert liquid fuels to mechanical energy efficiently. This machine serves as the prime mover for the generator.
  5. Governor - An electromechanical feedback control system that regulates the steady state speed (RPM) of the Engine by controlling air and fuel input into the engine. The synchronous speed of the generator derives the frequency and voltage output of the system.
  6. Voltage Regulator – An electrical feedback control system that controls that excitation current of the generator to regulate the steady state output Voltage
  7. Emergency Standby Power Rating – In accordance with ISO-8528-1 the emergency standby power rating is applicable to emergency power applications where power is supplied for the duration of normal power interruption. This rating is only applicable to variable loads with an average load factor of 70% over 24 hours of the standby rating for a maximum of 200 hours of operation per year. This rating only applies to generators that serve as a back up to the normal utility source. No prolonged operation in parallel with utility is permitted with this rating.
  8. Prime Power Rating (Unlimited Hours) – In accordance with ISO-8528-1 the prime power rating is defined as being the maximum power which a generating set can deliver continuously whilst supplying a variable load. Continuous operation is limited to the average power output shall not exceed 70% of the Prime Power rating over 24 hours for an unlimited number of hours per year.
  9. Continuous Power Rating (Base Load Rating) – In accordance with ISO-8528-1 the continuous power rating is defined as being the maximum power which the generating set is capable of delivering continuously whilst supplying a constant electrical load. The constant load shall be capable of being served for an unlimited amount of hours by engine generator. Prolonged operation in parallel with utility is permitted with continuous power rating.
  10. Rated Frequency (Declared Frequency) – The engine generator frequency at 100% of the power rating of the engine generator.
  11. Frequency Droop – Frequency difference between rated no-load frequency and the rated frequency (expressed in percentage) at the declared engine generator set power rating.
  12. Transient Frequency Difference from Initial Frequency – The reduction in initial frequency from no load to 100% load or the increase in initial frequency from 100% load to no load. Initial frequency is defined as the frequency at the beginning of a transient event.
  13. Transient Frequency Deviation from Rated Frequency – The reduction in rated frequency from no load to 100% load or the increase in initial frequency from 100% load to no load.
  14. Rated Voltage – Line-to-Line voltage at the terminals of the engine generator at rated frequency and at rated power rating. Rated voltage is the voltage used for operating and performance characteristics.
  15. Power Output Rating – Gross electrical power output of diesel engine generator set minus total power requirements of cooling fans pumps and other accessories.
  16. RPM – Revolutions Per Minute.
  17. BHP –Break HorsePower, the maximum power an engine can supply to an Alternator.
  18. in<sup>3</sup> – Cubic inches.

19. Steady State Voltage Modulation – the uniform cyclical variation of voltage within the operational bandwidth, expressed in hertz.
20. Operational Bandwidth - The total variation from the lowest to the highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.
21. the expenses of the required service in the price of Engine – Generator.
22. UL – Underwriter Laboratories

#### 1.7 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures."

#### 1.8 SUBMITTALS

- A. Provide completely dimensioned outline drawings (minimum scale  $\frac{1}{4}" = 1'-00"$ ) of all Engine Generator equipment to include the Engine Generator Set, Heat Exchanger, Silencer, Generator Output Section and Breakers and Starting Batteries. Provide detailed dimensional information suitable for use as an installation drawing.
- B. Provide a completely dimensioned top view, right side view, and left side view of the proposed Engine Generator Unit (scale  $\frac{1}{4}" = 1'-00"$ ). All views shall indicate relative location of all circuit breakers, output cable landings, auxiliary fans, output bus work, and auxiliary equipment.
- C. Provide data sheets for the alternator proposed. Include rated capacities, transient, and sub-transient reactance, maximum short circuit output. In addition, include the following:
  1. Thermal Alternator damage curve to protect the alternator.
  2. Time-current characteristic curves for generator protective device.
- D. Engine Generator Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified. Detailed plan view, front elevation, side
  2. Design Calculations: Signed and sealed by a qualified professional engineer licensed in the State of New York. Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
  3. Vibration Isolation Base Details: Signed and sealed by a qualified professional engineer licensed in the State of New York. Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include base weights.
  4. Wiring Diagrams: Show details of power and control connections and differentiating between factory-installed and field-installed wiring. Complete system point-to-point external wiring from diesel generators, output box, control cabinet and mimic panel. All wiring diagrams shall be clearly labeled and numbered to indicate exact actual termination points as required by this specific project. Connections to equipment not provided by this vendor shall be updated to include all terminal numbers and connections required for the final installation.
  5. Ratings make and model of diesel engine and generator.
  6. CO, CO<sub>2</sub>, NOX emission level at 25-50-75-100% loads in lbs. /hour, based on different fuel types. Provide a matrix indicating various values. The emission level must follow local and State environmental standards and requirements.

7. Battery sizing calculations shall be provided with the battery shop drawing to validate the battery size based on the number of cranking cycles, duration of cranking cycles and the required accessories to be powered during engine starting.
8. Provide data sheets for engine mounted radiators to display the temperature ratings vs static pressure.
9. Catalog sheets indicating features, specifications, noise level, application data, cooling, controllers and accessories.
10. Schedule with Milestone Dates for shop drawing submittal, factory test, fabrication and delivery to site.
11. Transient response data and curves indicating compliance with ISO 8528-5.
12. Exits exhaust gas temperature, gas flow and maximum back pressure.

#### 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Emergency Response: The manufacturer shall maintain a service center capable of emergency maintenance and repairs at the project site within 4 hours' maximum response time on site.
- C. Source Limitations: Obtain engine generator set and auxiliary components specified in this Section through one source from a single manufacturer with the responsibility for the entire system.
- D. References and Standards: The generator set covered by these specifications shall be designed, tested, rated, assembled and installed in strict accordance with all applicable standards below:
  1. International Standards Organization
    - a. ISO 8528 1 through 7
  2. NEMA MG-1-22
  3. Underwriters Laboratory
    - a. UL 508
    - b. UL2200
    - c. UL142
  4. National Fire Protection Association (NFPA)
    - a. NFPA 70(2008) "National Electric Code" with (2011) New York City Amendments.
    - b. NFPA 99
    - c. NFPA 110
    - d. NFPA 30 Flammable and Combustible Liquids Code
    - e. NFPA 37 "Installation and Use of Stationary Combustion Engines and Gas Turbines.
- E. Engine Exhaust Emissions: Comply with 2014 New York City Construction Codes and NYCDEP requirements.
- F. All electrical components shall be listed and labeled per NFPA – 70.
- G. Warranty - Provide 5-year manufacturer's warranty for the generator sets beginning on the date of Substantial Completion.

1. Include all parts required to restore the engine should engine defects in workmanship, or components arise.
2. Include all labor required associated with engine restoration. Labor provided for all restorations shall be provided by a factory trained technician who is thoroughly familiar with the type of Engine Generator being provided.
3. Include all factory upgrades to the Engine Generator at no expense to the City of New York within the warranty period.

**1.10 DELIVERY STORAGE & HANDLING**

1. The Contractor shall provide the engine generator system in its entirety, including transport of the Engine Generator equipment to the project site, rigging, and installation, and shall be responsible for all associated permits and fees.
2. Protection – The manufacturer shall provide the following protection during shipping the equipment:
  - a. Shrink wrap all switchgear prior to leaving the factory.
  - b. Label all equipment and palates with a unique label indicating the equipment in the palate which shall be correlated to a bill of lading.
  - c. Provide tipping indicators for all equipment with a maximum tipping angle of 15 degrees or less.
  - d. All items that will be loose shipped to the third-party rigging company shall be placed on a palate and shrink wrapped together.
3. Corrosion Protection – In the event that the Engine Generator will be stored for more than three months the manufacturer shall provide corrosion protection for the Engine Generator when shipping from the factory. Additionally, in the event of a three-month storage or longer all cylinders shall be borescoped prior to start up to ensure that the cylinders and pistons are not corroded. Pay all expenses associated with the testing.
4. Provide a detailed shipping manifest detailing each component of the shipment and which truck it will be shipped in.
5. Shipping – The generator and associated equipment covered by this specification, shall be shipped after the Commissioner formally accepts the switchgear at the conclusion of the factory witness test.
6. All switchgear in this order shall be shipped via a dedicated truck which shall not make any stops aside from the switchgear for this project.
7. Provide tie downs and bracing for each individual section and under no circumstance can any component in this shipment be allowed to tip beyond 15 degrees.
8. The manufacturer is responsible for selecting the route to ship the equipment from the factory to the third-party enclosure manufacturer. Any damage to the equipment during shipment from the factory to the third-party rigger is the responsibility of the manufacturer.
9. The manufacturer is responsible for obtaining all state, local, and federal approvals for shipping the switchgear and outdoor enclosure over state lines. Pay all fees required to complete the shipment of this equipment.
10. In the case of wide loads the manufacturer shall provide all necessary leading and trailing vehicles required by New York City, New York State and Federal departments of transportation to accompany a wide load shipment of the nature required.
11. Responsibilities for Damages During Shipping
  - a. In the event of damage of the outdoor enclosure due to hitting an overpass or other physical damage the manufacturer shall return the enclosure to the manufacturer's factory. Under no circumstance may a manufacturer continue the delivery of a damaged piece of equipment.

- b. It is the sole right of the Commissioner to accept or reject equipment that has been damaged during shipment. If the Commissioner rejects a damaged piece of equipment the manufacturer shall arrange for shipment of the equipment back to the factory to correct the damage at no expense to the City of New York.
  - c. Any structural damage to any equipment shall result in reconstruction of the entire piece of equipment.
  - d. In the case of any damaged equipment that needs to be returned to the manufacturer's factory the manufacturer shall assume the expense of all shipping expenses back to the factory. Once damage has been corrected the expense of shipment back to the site is the responsibility of the manufacturer.
12. The manufacturer shall insure all shipments against damage during shipment to the new value of the equipment being shipped.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers - Subject to compliance with this specification, the manufacturers listed in this section are approved for use in the engine generator.
- B. Engine Generator Sets – The completed engine generator set shall be supplied by the Manufacturer's authorized distributor only. The generator set suppliers listed in the approved generator set manufacturers have been prequalified to work dimensionally and from as systems engineering standpoint to coordinate with the MEP design of the project.
  - 1. Caterpillar, Inc (Generator Set C18, Supplier H.O. Penn),
  - 2. Kohler (Generator Set 600REOZVB, Supplier Cooper Power Systems),
  - 3. MTU / Onsite Power. (MTU12V1600DS6, Supplier Stewart & Stevenson Power Products),
  - 4. Or equivalent product from an approved equal manufacturer.
- C. Radiator Mounted Load Bank
  - 1. Avtron.
  - 2. Simplex
  - 3. Or approved equal.
- D. Exhaust Silencer
  - 1. Maxim
  - 2. Nelson
  - 3. Harco
  - 4. Or approved equal.
- E. Vibration Isolators
  - 1. Mason Industries
  - 2. Vibration Eliminator Co.
  - 3. Cooper industries
  - 4. Or approved equal.
- F. Starting Batteries

1. Lamarche
2. Nife
3. Charles
4. Or approved equal.

G. Battery Charger

1. Lamarche
2. Nife
3. Charles
4. Or approved equal.

H. Jacket Water Heaters

1. Kim
2. Chromalux
3. Clifford
4. Or approved equal.

I. Governors

1. Woodward
2. Westerbeke
3. Aspire
4. Or approved equal.

J. Alternators

1. Century
2. Kato
3. Marathon
4. Or approved equal.

K. Voltage Regulators

1. Caterpillar VRS
2. Basler
3. Kohler
4. Or approved equal.

2.2 OPERATING ENVIRONMENT

A. Prototype Environment: The generator set control shall be prototyped tested and certified to the following environmental conditions:

1. -40°C to +70°C Operating Range
2. 95% humidity non-condensing, 30 °C to 60 °C
3. 5% salt spray, 48 hours, +38°C, 36.8V system voltage
4. Sinusoidal vibration 4.3G's RMS, 24-1000Hz
5. Electromagnetic Capability (89/336/EEC, 91/368/EEC, 93/44/EEC, 93/68/EEC, BS EN 50081-2, 50082-2)
6. Shock: withstand 15G

- B. Project Specific Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
  - 1. Ambient Temperature: -40C to 70C
  - 2. Relative Humidity: Zero to 95 percent.
  - 3. Altitude: Sea level to 500 feet
- C. Oversizing of engine or generator with respect to the rated power output of the engine may be required to meet certain performance requirement.
  - 1. Unusual Service Conditions – Unusual service conditions affecting the generator may affect the general stated performance. Unusual service conditions for the purposes of this specification are high or low ambient temperature areas of operation, elevations over 500 feet, high dust or dirt environment.
  - 2. Generator Nameplate: For oversized generators, show ratings required by the Contract Documents that are consistent with engine capacity rather than component oversize ratings.
  - 3. Usable Generator Capacity: The generator shall be sized to provide the published rated generator capacity to the load. The generator shall be provided with additional generator capacity if necessary, to run generator auxiliaries such as fans, pumps, and/or remote radiators during operation.

## 2.3 ENGINE GENERATOR-SET PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Engine-generator set housing, engine-generator set, batteries, battery racks, silencers, load banks, and sound attenuating equipment, accessories, and components shall withstand the effects of earthquake motions determined according to ASCE/SEI 7
  - 1. Shake-table testing shall comply with ICC-ES AC156. Testing shall be performed with all fluids at worst case normal levels
  - 2. Component Importance Factor: 1.5.
- B. ASME Compliance: Comply with ASME B15.1.
- C. ISO 8528 “Performance Class G2 Operating Parameters” govern the overall Engine Generator performance metrics for this project. Project specific performance requirements are as follows:
  - 1. Frequency Droop: 0% electronic isochronous frequency control required by the governor specification.
  - 2. Transient frequency difference from initial frequency prior to 100% sudden power decrease: +12% deviation from the initial frequency prior to the deviation.
  - 3. Transient frequency difference from initial frequency prior to 100% sudden power increase: -10% deviation from the initial frequency prior to the deviation.
  - 4. Frequency recovery time: Transient frequency recovery from 100% load addition or subtraction to recovery to initial frequency 5 seconds.
  - 5. Transient voltage difference from initial voltage prior to 100% sudden power decrease: +25% from initial voltage prior to deviation.
  - 6. Transient voltage difference from initial voltage prior to 100% sudden power increase: -20% from initial voltage prior to deviation.
  - 7. Voltage recovery time: Transient voltage recovery from 100% load addition or subtraction to recovery to initial voltage 6 seconds.
  - 8. Steady-State Voltage regulation: Less than  $\pm 0.25\%$  of nominal from no load to full load.
  - 9. Steady state Frequency regulation: Less than 0.25Hz from no load to full load.

10. Unbalanced Load: Shall be capable operating continuously with a negative phase sequence current up to and including 10% of the rated current.

D. Miscellaneous Performance Requirements:

1. Output Waveform: At no load, harmonic content measured line-to-neutral does not exceed 2.0 percent total with no slot ripple. The telephone influence factor (TIF), determined according to NEMA MG 1, does not exceed 50.
2. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at the system output terminals, the system will supply a minimum of 300 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to winding insulation or any other generator system component.
3. Nonlinear Load Performance: System performance is not degraded from that specified in this Article by continuous operation, with full-load current having a minimum total harmonic content of 40 percent RMS, with a minimum single harmonic magnitude of 25 percent RMS.

- E. Starting Time: Given the project specific Operating Environment the maximum total time period for a cold start, is 10 seconds as defined in NFPA 110.

## 2.4 ENGINE

- A. The engine utilized for this project shall be a Diesel Engine. The following engine performance metrics are a combination of the approved manufacturers for this project. The generator room that this Engine Generator set is going into has been designed to the requirements indicated below. The engine provided shall be provided with the following capacities, ratings, and flows.

1. Fuel: Diesel fuel oil grade DF-2.
2. Engine Type – 4 cycle
3. Minimum Engine Cylinders – Minimum allowed 6 cylinders
4. Engine Revolutions Per Minute – 1,800 RPM.
5. Minimum Engine Break Horsepower – No less than 896 BHP.
6. Minimum Engine Total Displacement – No less than 984 in<sup>3</sup>.
7. Maximum Fuel Consumption at Full Load – No greater than 43 GPH.
8. Maximum Total Fuel Flow – No greater than 107 GPH.
9. Radiator Mounted Air Flow – No greater than 28,357 CFM
10. Radiator Mounted Temperature Rating 122°F @ 0.50 H<sub>2</sub>O
11. Radiator Mounted Temperature Rating: 118°F @ 0.75 H<sub>2</sub>O
12. Combustion Air Flow – No greater than 1,937 CFM.

- B. Positive Crankcase Ventilation - Provide crank case emissions redemption device. Include a redemption system that pipes the crankcase emissions to filtration canister, where emissions are filtered and sent back to the engine intake combustion filter assembly. Collected lube oil is drained back to the engine oil sump or provide drain provisions.

- C. Lubrication System: Pressurized by a positive-displacement pump driven from engine crankshaft. The following items are mounted on the engine or skid:

1. Filter and Strainer: Rated to remove 90 percent of particles 5 microns and smaller while passing full flow.
2. Fuel Oil Cooler: Fuel shall be piped from the filter/water separators to the intake of the engine fuel pump, and then to the engine. Excess fuel shall be piped through a self-contained electric motor fan cooled fuel cooler and returned to the main fuel tank. The

- fuel cooler shall be capable of exchanging heat rejected at full load with the cooling medium, including 10% reserve to accommodate fouling.
3. Thermostatic Control Valve: Controls flow in system to maintain optimum oil temperature. Unit is capable of full flow and is designed to be fail-safe.
  4. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without the use of pumps or siphons or special tools or appliances.
- D. Jacket Coolant Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity. Coordinate the heater voltage with the available voltage from the generator accessories panel.
- E. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine-generator-set mounting frame and integral engine-driven coolant pump.
1. Radiator – A rail-mounted, engine-driven radiator with blower fan and all accessories. The cooling system shall be sized to operate at rated load at the maximum temperatures indicated in paragraph 2.4 (A).
  2. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
  3. Size of Radiator: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
  4. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
  5. Coolant Hose: Steel braided flexible assembly with inside surface of nonporous rubber and outer covering of aging-, ultraviolet-, and abrasion-resistant fabric.
  6. Rating: 50-psig maximum working pressure with coolant at 180 deg F, and non-collapsible under vacuum.
  7. End Fittings: Flanges or steel pipe nipples with clamps to suit piping and equipment connections.
- F. Muffler/Silencer: Critical type, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements.
1. Minimum sound attenuation of 25 dB at 500 Hz.
  2. Sound level measured at a distance of 25 feet from exhaust discharge after installation is complete shall be 78 dBA or less.
- G. Air-Intake Filter: Heavy duty, engine-mounted air cleaner with replaceable dry-filter element and "blocked filter" indicator shall be provided.
- 2.5 Engine Starting System:
- A. Provide a dual Lead Acid battery system complete with dual chargers, starters, batteries and battery racks. Each battery shall be capable of starting the battery without the assistance of the second battery.
  - B. 24V electric, with negative ground.
  - C. Components: All cable and components shall be sized so they are not damaged during a full engine-cranking cycle within maximum ambient temperature at maximum specified in "Operating Environment" Article of this section

- D. Cranking Motor: Heavy-duty unit that automatically engages and releases from engine flywheel without binding.
- E. Cranking Cycle: A complete cranking cycle shall consist of an automatic crank period of 15 seconds followed by a 15 second rest period. The batteries shall be sized to allow for 5 unsuccessful cranking attempts then start the engine on the next start.
- F. Battery: Lead Acid with capacity within ambient temperature range specified in "Performance Requirements" Article to provide specified cranking cycle without recharging.
- G. Battery Cable: Size as required for to allow for maximum engine starting current and the number of required cranking cycles and the length of battery conductors. Battery conductors shall be stranded Diesel Locomotive Cable with compression connectors for all terminations.
- H. Battery Stand: Factory-fabricated, two-tier metal with acid-resistant finish designed to hold the quantity of battery cells required and to maintain the arrangement to minimize lengths of battery interconnections.
- I. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation and 35 A minimum continuous rating.
- J. Battery Charger: Current-Limiting, automatic-equalizing and float-charging type designed for Lead Acid batteries. Unit shall comply with UL 1236 and include the following features:
  - 1. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
  - 2. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 deg F to 140 deg F to prevent overcharging at high temperatures and undercharging at low temperatures.
  - 3. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
  - 4. Ammeter and Voltmeter: Flush mounted in door. Meters shall indicate charging rates. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
- K. Enclosure and Mounting: Provide a two tier battery rack for the batteries. NEMA 250, Type 1, wall-mounted cabinet.

## 2.6 Engine Fuel System

- A. Integral Injection Pumps: Driven by engine camshaft. Pumps are adjustable for timing and cylinder pressure balancing.
- B. Main Fuel Pump: Mounted on engine. Pump ensures adequate primary fuel flow under starting and load conditions.
- C. Fuel Oil Filters: Primary and secondary. Primary filter to include water separator. Provide Racor 79/1000 series or equivalent product from an approved manufacturer listed above. Include bypass isolation valves to allow for filter element change during operation.

- D. Relief/Bypass Valve: Automatically regulates pressure in fuel line and returns excess fuel to source.
- E. Continuous reading analog fuel gage at fuel oil input to the engine.
- F. Self-contained electric motor driven air-cooled fuel oil cooler, mounting by contractor
- G. Fire valve for emergency fuel shutoff in event of a fire.

## 2.7 ENGINE COOLING SYSTEM

- A. Provide a unit mounted radiator. Radiator shall have an ambient capability of 114°F at .5" H2O. Radiator design shall include a minimum of 7°F Rise above ambient. Include OSHA approved safety guards for all drive belts and rotating components. Include a radiator duct mounting flange. Provide low coolant level sensor.

## 2.8 FUEL SUPPLY SYSTEM

- A. Comply with NFPA 30 and NFPA 37.
- B. Fuel Oil Piping and Fuel Oil Storage Tank: Provided as part of this specification. Fuel oil tank shall be sub base tank sized for one-day fuel capacity. Provide all required accessories, pumps, pipes, valves, appurtenances, etc. Construction must comply with NYC MC 2014 1305.14 Alternate tank design and construction standards.
- C. Interior Fuel Oil Piping: Include required field installed piping between the fuel system and the engine.

## 2.9 ENGINE EXHAUST SYSTEM

- A. The exhaust silencer shall be a super critical grade low profile silencer with the capacity to attenuate engine exhaust sound at a rate to meet all required sound frequency attenuation levels as specified.
- B. Exhaust sound level shall be as required to achieve the attenuation rating in the enclosure specification section.
- C. The exhaust back pressure loss through the silencer shall not exceed ten inches of water column.
- D. The silencer shall be constructed with an interior fiberglass pack lining with a minimum thickness of 2.0 inches along the interior top, bottom, and side walls in order to facilitate high frequency sound attenuation. The exhaust silencer shall be of double walled construction, with the required thickness of fiberglass pack lining secured between the perforated inner shell and plate steel outer shell. The surface temperature of the silencer shall not exceed 180 Degree F when the engine is in operation.
- E. The silencer shall be constructed of 0.25-inch-thick, heavy gauge, all welded plate steel. The silencer shall be furnished with a rust resistant primer undercoating and an outer coating capable of withstanding temperatures of up to 1200 Degree F.
- F. The exhaust silencer shall be a super critical grade type.
  - 1. Subject to compliance with requirements, provide products by one of the following:

- a. HARCO
  - b. SILEX
  - c. GT Exhaust.
  - d. Or approved equal.
2. The Contractor shall provide detailed silencer performance data detailing the overall exhaust noise insertion loss, maximum silencer backpressure, exhaust noise reduction by octave band center (63 Hz to 8,000 Hz), and a detailed octave band Db to overall DbA calculation. Overall DbA level shall not exceed 83 DbA @ 23 feet. This data must be based on the specific silencer model being offered in as it would function on a specific engine.
- G. Expansion joints shall be installed between the engine exhaust outlets and silencer inlets in order to prevent transmission of mechanical vibration thru the exhaust system as well as absorbing all thermal growth. The expansion joint shall be designed with the capability to absorb concurrently up to 2.00 inches of axial compression and up to 0.25 inches of lateral offset. The expansion joint shall be designed for a minimum of 10,000 cycles. The expansion bellows component of the assembly shall be two ply and fabricated from Type 321 Stainless Steel. The expansion joint shall be designed in accordance with the standards of the Expansion Joint Manufacturers Association. All welding required in the manufacture of the expansion joint assembly shall be in accordance with ASME Code - Section IX. The expansion joint assembly shall be designed with a floating flange at one end with the capability of being rotated 360 degrees and shall be secured to the body of the expansion joint assembly in a Van Stone configuration. The Van Stone assembly shall be fabricated as an integral part of the expansion bellows. The use of welded necks, rings, or lips in securing the flange to the expansion joint assembly will not be accepted.
- H. Connections from Engine to Exhaust System: Flexible section of corrugated stainless-steel pipe.
- 2.10 GOVERNOR
  - A. Type: Adjustable electronic isochronous load sharing type, with speed droop provisions. It shall include isolation and filtering. The control section of each governor shall be installed in the generator control switchgear.
- 2.11 VIBRATION/SEISMIC ISOLATORS
  - A. Engine generator set shall be furnished with suitable heavy-duty spring seismic vibration isolator 1" deflection a minimum of 95% absorption.
  - B. All isolation devices shall be selected for a uniform deflection (minimum ½") under imposed load, where unequal distribution of weight occurs.
  - C. The engine/generator manufacturer shall be responsible for the selection of all vibration eliminators for the local seismic zone that the generators sets will be installed.
- 2.12 ALTERNATOR, EXCITER, AND VOLTAGE REGULATOR
  - A. Comply with NEMA MG 1 and specified performance requirements.

- B. Drive: Generator shaft is directly connected to engine shaft. Exciter is rotated integrally with generator rotor.
- C. Alternator Temperature Rating: Alternator temperature rise shall be limited to NEMA MG1 temperature limit of 130C measured at a 40C ambient.
- D. Alternator Insulation: Class H, 130C.
- E. Stator-Winding Leads: Brought out to terminal box to permit future reconnection for other voltages if required.
- F. Construction prevents mechanical, electrical, and thermal damage due to vibration, over speed up to 125 percent of rating, and heat during operation at 100 percent of rated capacity.
- G. Excitation uses no slip or collector rings, or brushes, and is arranged to sustain generator output under short-circuit conditions as specified.
- H. Enclosure: Drip-proof.
- I. Generator Specifications: The generator shall be a synchronous, three phase, four pole, 2/3 pitch, random wound, single or double bearing, and IP23 drip proof. Bearing(s) shall be double shielded and maintenance free. The insulation system shall meet NEMA MG 1 and UL1446 standards for Class H insulation. Generator temperature rise shall be limited to NEMA MG1 temperature limit of 130C measured at a 40C ambient or as required to meet UL2200 criteria. The excitation system shall enable the generator to sustain 300% of rated current for ten seconds at rating during a fault condition and shall improve the immunity of the voltage regulator to non-linear distorting loads. Excitation shall be permanent magnet type.
- J. The generator together with its associated voltage regulator, exciter, instrumentation and controls shall be of a type which is suitable for applications where the load to be supplied consists of substantial amounts of non-linear (i.e., harmonic producing) equipment. Isolation transformers, complete with filtering equipment, shall be provided to minimize the effect of distortion on the voltage regulator power supply and sensing circuits, on governor control and supply circuits, on instrumentation and relaying and on other voltage sensing components. Voltage and current sensing devices shall sense true RMS values, and frequency sensing devices shall sense zero crossover.
- K. Excitation System: The generator shall be equipped with a permanent magnet generator excitation system. The output of the PMG shall be used to supply power to the voltage regulator and to effectively isolate the regulator power circuits from the distortion that occurs when the generator supplies large non-linear loads. Under short circuit conditions, the system shall be capable of sustaining 300 percent of rated current for 10 seconds. The rotating rectifier shall use a three-phase full wave rectifier assembly with hermetically sealed silicon diodes protected against abnormal transient conditions by a surge protector.
- L. Voltage Regulator: The voltage regulator shall be completely solid-state digital voltage regulator. The voltage regulator shall be provided with the following:
  - 1. The voltage regulator encapsulated for protection against vibration and atmospheric deterioration.
  - 2. The regulator shall include three phase RMS sensing, true volts per hertz operation with adjustable cut in and provisions for parallel operation.
  - 3. The voltage regulator shall incorporate all features necessary for synchronizing and paralleling of the generator set with other sets.

4. The regulator shall be installed in the generator control switchgear specified hereinbefore complete with provisions for manual adjustment.
5. A voltage adjusting rheostat shall be provided on the control panel to permit a  $\pm 10$  percent adjustment in generator voltage.
6. The voltage regulator shall also include circuits that provide loss of sensing voltage shutdown and over excitation shutdown with inverse time characteristic to protect the generator and the connected load from abnormal voltages. Loss of sensing shutdown shall not activate if a short circuit condition were to occur.

M. Strip Heater: Thermostatically controlled unit arranged to maintain stator windings above dew point.

N. Windings: Two-thirds pitch stator form wound, winding and fully linked amortisseur winding.

O. Subtransient Reactance: 12 percent, maximum.

## 2.13 GENERATOR OUTPUT BOX & OUTPUT CIRCUIT BREAKER SWITCHBOARD

A. The generator output shall be supplied with an output box for connection of the facility loads to the generator. Provide three separate copper phase (A, B, C) and one copper neutral bus. The generator output box shall be sized to fit all specified busses in the box. Box size shall comply with all NEMA sizing for energized surfaces to ground depending on the voltage.

1. NEMA Drilling - The phase and neutral busses shall be provided with NEMA drilling for two-hole compression lugs. The quantity of holes for the cables to be connected to the phase busses shall be provided with at a minimum of two additional holes per phase (Refer to the One Line Diagram for cable size and quantity).
2. Bus Capacity - All phase and neutral busses shall be sized to sustain 700 amps per square inch.
3. Phase & Neutral Isolation – All neutral busses shall be isolated from the box enclosure with fiberglass isolation standoffs.
4. Alternator Wiring - The alternator manufacturer shall extend the alternator wiring without splice from the alternator output to the copper phase and neutral busses, which shall be located in a generator output box. All manufacturer alternator terminations shall be with compression lugs.
5. Ground Bus – Provide a 25% copper ground solidly connected to the generator output box.
6. Lowest Bus – The lowest energized bus in the generator output box shall be no lower than 12 inches from the enclosure floor.

B. Main Generator Circuit Breaker – Provide a main generator circuit breaker to protect the generator damage curve of the alternator and the facility load conductors. The breaker shall be a 100% continuous rated insulated case circuit, breaker provided with a microprocessor based electronic trip unit. The circuit breaker shall be provided with the following features:

1. Independent Support – Provide independent support of the generator circuit breaker. The breaker shall not be dependent on the generator output box, or generator skid for support in any direction. Provide flexible collar between the generator output box and the generator breaker.
2. Breaker Options
  - a. Lock Open - The breaker shall be provided with the ability to lock the breaker in the open position.

- b. Overall Plastic Cover - Provide a clear plastic cover over the entire front of the breaker not just the trip unit to prevent the breaker from being inadvertently tripped or opened during operation.
  - c. Auxiliary Contacts - Provide all auxiliary contacts required for generator operation. In addition to the required auxiliary contacts provide (2) Auxiliary A and (2) Auxiliary B contacts for generator annunciation.
  - d. Power Conductor Termination - The circuit breaker shall be provided with long barrel compression lugs.
  - e. Shunt Trip – Provide a shunt trip relay for the breaker that is powered from the breaker line side.
- 3. Electronic Trip Unit
  - a. The trip unit shall be provided with electronically adjustable long time, long time delay, short time, short time delay, and instantaneous settings.
  - b. The trip unit shall provide ground fault alarm, with the ability to change from ground fault alarm to ground fault trip without and circuit breaker modifications.
  - c. The trip unit shall be provided with a plastic cover over the trip unit to allow sealing of the trip unit after the breaker has been set.
  - d. Indicate Line to Line Voltage Vab, Vbc, and Vca
  - e. Indicate Line to Neutral Voltage Van, Vbn, and Vcn
  - f. Indicate Phase current Ia, Ib, and Ic
  - g. Indicate KW, KVA, and KVAR.
  - h. The trip unit shall be provided with the ability to operate the LCD display at 0% load by separate power supply. Provide all necessary wire and accessories to provide a complete back lit display at 0%.
- C. Load Bank Circuit Breaker – Provide a thermal magnetic molded case circuit breaker to provide NEC required overcurrent protection for the load bank and conductors feeding the load bank. The full load of the load bank shall be no more than 80% of the selected trip unit size.
  - 1. Independent Support – Provide independent support of the load bank circuit breaker. The breaker shall not be dependent on the generator output box for support in any direction. Provide flexible collar between the generator output box and the generator breaker.
  - 2. Breaker Options
    - a. The breaker shall be provided with the ability to lock the breaker in the open position.
    - b. Provide a means of tripping the load bank in the event of a legitimate call to start comes from a transfer switch in the emergency power system. Trip the load bank circuit breaker by means of an auxiliary shunt trip coil, and wire to provide a complete load bank tripping command.
    - c. Provide all auxiliary contacts required for load bank operation. In addition to the required auxiliary contacts provide (2) Auxiliary A and (2) Auxiliary B contacts for generator annunciation.
- D. Fire Pump Circuit Breaker - Provide a thermal magnetic molded case circuit breaker with adjustable instantaneous trip to provide NEC required overcurrent protection for the fire pump and conductors feeding the fire pump. The breaker shall be sized per the included one line. A. The fire pump shall be provided with the following features.
  - 1. Independent Support – Provide independent support of the load bank circuit breaker. The breaker shall not be dependent on the generator output box for support in any

direction. Provide flexible collar between the generator output box and the generator breaker.

2. Breaker Options

- a. The breaker shall be provided with a Red overall enclosure cover.
- b. The breaker shall be provided with a thermal magnetic trip unit with an adjustable magnetic trip.
- c. Provide auxiliary contacts. In addition to the required auxiliary contacts provide (2) Auxiliary A and (2) Auxiliary B contacts for generator annunciation.

E. Fire Alarm Circuit Breaker - Provide a thermal magnetic molded case circuit breaker with adjustable instantaneous trip to provide NEC required overcurrent protection for the fire pump and conductors feeding the fire pump. The breaker shall be sized per the included one line. The fire pump shall be provided with the following features.

1. Independent Support – Provide independent support of the load bank circuit breaker. The breaker shall not be dependent on the generator output box for support in any direction. Provide flexible collar between the generator output box and the generator breaker.

2. Breaker Options

- a. The breaker shall be provided with a Red overall enclosure cover.
3. Breaker shall be lockable in the closed position.
4. The breaker shall be provided with a thermal magnetic trip unit.

F. Separation of Life Safety – All life safety circuit breakers shall be installed in a separate physical section of the generator output switchboard. The separation shall include a sheet metal separation between all non-life safety circuit breaker in the switchboard.

2.14 CONTROLS PROTECTION & MONITORING

A. General - Provide a fully solid-state, microprocessor based, generator set control. The control panel shall be designed and built by the engine manufacturer. The control shall provide all operating, monitoring, and control functions for the generator set. The control panel shall provide real time digital communications to all engine and regulator controls via SAE J1939. The controls, protection, and monitoring systems of the generator set and its operation shall be the responsibility of the generator set manufacturer. All subsystem components, interfaces, and logic shall be compatible with engine mounted devices.

B. Environmental

1. The generator set control shall be tested and certified to the following environmental conditions:
  - a. -40°C to +70°C Operating Range
  - b. 100% condensing humidity, 30°C to 60°C
  - c. IP22 protection for rear of controller; IP55 when installed in control panel
  - d. 5% salt spray, 48 hours, +38°C, 36.8V system voltage
  - e. Sinusoidal vibration 4.3G's RMS, 24-1000Hz
  - f. Electromagnetic Capability (89/336/EEC, 91/368/EEC, 93/44/EEC, 93/68/EEC, BS EN 50081-2, 50082-2)

- g. Shock: withstand 15GWiring – The manufacturer shall provide all wiring, and electronic sensors to provide indicated alarms, warnings and operational parameters.
- C. Cycle Cranking: A cycle crank timer shall provide (5) five 15 second cranking periods separated by 10-second rest periods.
- D. Functional Requirements
  - 1. The control shall include a minimum 64 x 240 pixel, 28mm x 100mm, white backlight graphical display with text-based alarm/event descriptions
  - 2. The control shall include a minimum of 3-line data display
  - 3. Audible horn for alarm and shutdown with horn silence switch
  - 4. Standard ISO labeling
  - 5. Multiple language capability
  - 6. Remote start/stop control
  - 7. Local run/off/auto control integral to system microprocessor
  - 8. Cool down timer - Engine Cool down: A cool down timer shall provide an adjustable 0-30 minute engine-running period before shutdown after removal of load.
  - 9. Speed adjust
  - 10. Lamp test
  - 11. Push button emergency stop button
  - 12. Voltage adjust
  - 13. Voltage regulator V/Hz slope – adjustable
  - 14. Password protected system programming
- E. Digital Monitoring Capability - The controls shall provide the following digital readouts for the engine and generator. All readings shall be indicated in either metric or English units.
  - 1. Engine
    - a. Engine oil pressure
    - b. Engine oil temperature
    - c. Engine coolant temperature
    - d. Engine RPM
    - e. Battery volts
    - f. Engine hours
    - g. Engine crank attempt counter
    - h. Engine successful start counter
    - i. Service interval
    - j. Real time clock
    - k. Oil filter differential pressure
    - l. Fuel temperature
    - m. Fuel pressure
    - n. Fuel filter differential pressure
    - o. Fuel consumption rate
    - p. Total fuel consumed
    - q. Engine intake manifold temperature
    - r. Engine intake manifold pressure
    - s. Engine crankcase pressure
    - t. Air filter differential pressure
    - u. Boost pressure
    - v. Oil filter differential pressure
    - w. Engine exhaust stack temperature
    - x. Engine main bearing temperature

2. Generator / Alternator

- a. Generator AC volts (Line to Line, Line to Neutral and Average)
- b. Generator AC current (Avg and Per Phase)
- c. Generator AC Frequency
- d. Generator kW (Total and Per Phase)
- e. Generator kVA (Total and Per Phase)
- f. Generator kVAR (Total and Per Phase)
- g. Power Factor (Avg and Per Phase)
- h. Total kW-hr
- i. Total kVAR-hr
- j. % kW
- k. % kVA
- l. % kVAR
- m. Voltage Regulation
- n. Excitation voltage
- o. Excitation current

F. Alarms and Shutdowns - The control shall monitor and provide alarm indication and subsequent shutdown for the following conditions. All alarms and shutdowns are accompanied by a time, date, and engine hour stamp that are stored by the control panel for first and last occurrence:

1. Engine Alarm/Shutdown
2. Low oil pressure alarm/shutdown
3. High coolant temperature alarm/shutdown
4. Loss of coolant shutdown
5. Overspeed shutdown
6. Overcrank shutdown
7. High intake manifold temperature alarm/shutdown
8. High exhaust manifold temperature alarm/shutdown
9. High crankcase pressure alarm/shutdown
10. High air inlet temperature alarm/shutdown
11. Emergency stop depressed shutdown
12. Low coolant temperature alarm
13. Low battery voltage alarm
14. High battery voltage alarm
15. Control switch not in auto position alarm
16. Battery charger failure alarm

G. Generator Alarm / Shutdown – The controller shall perform shutdowns for the following generator faults:

1. Generator overvoltage
2. Generator undervoltage
3. Generator overfrequency
4. Generator underfrequency
5. Generator reverse power
6. Generator overcurrent

H. Voltage Regulator Alarm /Shutdown

1. Loss of excitation alarm/shutdown
2. Instantaneous over excitation alarm/shutdown
3. Time over excitation alarm/shutdown

4. Rotating diode failure
  5. Loss of sensing
  6. Loss of PMG
- I. Remote Communications - The controller shall be provided with the ability to communicate via Modbus RTU and Ethernet TCP/IP. The manufacturer shall provide all required adapters and converter modules to provide this capability.
- J. Miscellaneous Local and Remote Annunciation Requirements
1. Local Annunciator (NFPA 99/110, CSA 282): Provide a local, control panel mounted, annunciator to meet the requirements of NFPA 110, Level 1.
  2. Annunciators shall be networked directly to the generator set control
  3. Local Annunciator shall include a lamp test pushbutton, alarm horn and alarm acknowledge pushbutton
  4. The annunciator shall provide remote annunciation of all points stated above and shall incorporate ring-back capability so that after silencing the initial alarm, any subsequent alarms will sound the horn
  5. Ability to be located up to 800 ft. from the generator set
  6. Provide the following individual light indications for protection and diagnostics
    - a. Overcrank (Shutdown/lockout after 5 attempts)
    - b. Low coolant temperature
    - c. High coolant temperature warning
    - d. High coolant temperature shutdown
    - e. Low oil pressure warning
    - f. Low oil pressure shutdown
    - g. Overspeed
    - h. Low coolant level
    - i. EPS supplying load
    - j. Control switch not in auto
    - k. High battery voltage
    - l. Low battery voltage
    - m. Battery charger AC failure
    - n. Emergency Stop
- K. Provide one (1) remote annunciator that is NFPA 110 level 1 compliant for the generator set. Provide all necessary media converter for remote locations of greater than 300 feet. Include copper to fiber conversion as required.
- L. Inputs and Outputs – Provide interface signals for the purpose of providing discrete generator indications to the BMS system, to open the air intake louvers when the generator starts or Fire Alarm indications. At a minimum provide the following the City of New York accessible inputs or outputs.
1. Programmable Digital Inputs: The Controller shall include the ability to accept programmable 16 digital input signals. The signals may be programmed for either high or low activation using programmable Normally Open or Normally Closed contacts.
  2. Programmable Relay Outputs: The control shall include the ability to operate 16 programmable relay output signals. The output relays shall be rated for 2A @ 30VDC and consist of six (6) Form A (Normally Open) contacts and two (2) Form C (Normally Open & Normally Closed) contacts.
  3. Programmable Discrete Outputs: The control shall include the ability to operate two (2) discrete outputs, integral to the controller, which can sink up to 300mA.

2.15 LOAD BANK

- A. General: The load bank shall be radiator mounted. The load bank shall include all resistive load elements, load control devices, protective devices, and a remote wall mounted control panel to be located near switchgear. The load bank shall be UL listed.
  - 1. The load bank shall be listed and labeled for use as a radiator mounted load bank. Refer to the drawings for location and size of the load bank.
  - 2. The load bank shall be listed and labeled for use as a standalone load bank. Refer to the drawings for location and size of the load bank.
  - 3. Ambient Temperature of Operation: -20°F to 120°F.
- B. Construction
  - 1. Capacity: The load bank shall be a 3-phase, 3-wire, 60Hz, resistive load bank which is sized to be 50% of the KW size of the engine-generator.
  - 2. Operating Altitude; 3000ft
  - 3. Relative humidity; 0-100%
  - 4. Tolerance: 5% nominal
  - 5. Cooling Failure
  - 6. A failure circuit shall be provided to monitor the load bank exhaust and to disconnect the load steps to prevent damage.
  - 7. A temperature switch in the load chamber exhaust shall be provided to monitor for excessive exhaust temperature and signal upon sensing an air temperature greater than 275°F. Fuses
  - 8. Each 50 KW resistor branch circuit is to be protected by 200,000AIC fuses.
  - 9. Fuses shall be provided for protection of the control power transformer and wiring.
- C. Load Bank Resistive Elements:
  - 1. The load elements shall be helically wound coils made of corrosion resistant chromium alloy that are continuously supported. If the resistor alloy should fail, the resistor material shall be held captive to prevent contact with surrounding resistors or ground.
  - 2. The resistors continuous support shall consist of segmented ceramic tubes assembled on stainless steel rods with fastening provided to compensate for thermal expansion of the ceramic tubes
  - 3. The resistors shall not require a cool down period. Normal shutdown or failure of the cooling fan during operation shall not cause any damage or shorten the life expectancy of the resistors.
- D. Control Panel - The control panel and protective circuits shall operate at 120 volts and be serviced internally from the main load bus utilizing an integral control power transformer.
  - 1. Control panel to include the following:
  - 2. Master load switch
  - 3. Load step switch
  - 4. Remote Load dump circuit to allow use of remote dry contacts (close to run) to trip load bank off line in the event of remote contact opening.
  - 5. Load step active indicator
  - 6. Control power indicator
  - 7. Normal operation indicator
  - 8. Cooling Failure indicator

9. Controls - The load bank controls shall be integrated with the Switchboard controls to load the generator(s) sequentially enabling the load bank to come on line @50kw increments.

## 2.16 FUEL OIL STORAGE

- A. General: The manufacturer shall provide a belly tank for the local generator set fuel storage suitable for the storage of 330 gallons of Diesel Fuel. The tank shall be located below the generator between the skid rails. This tank shall be listed and labeled for use in New York City, compliant with 2014 New York City Construction Codes, and shall comply with UL 142 and NFPA 37.
- B. Construction: The tank shall be constructed of reinforced 10-gauge steel with continuously welded seams throughout, and channel side supports.
- C. System shall include at a minimum:
  1. Fire Safety Valve: Provide a fusible link carbon steel Emergency Shut-Off Valve constructed per API 607 at pump set supply and at all equipment supply connections and as indicated on drawings. Provide fusible link package and limit switch assembly to monitor the valve position. Switches shall be tied into the fuel control/monitoring system
  2. Electric Solenoid Fill Valve: Direct Acting, carbon steel or stainless steel body, "0" PSIG pressure differential, normally closed, NEMA 4, watertight, threaded pipe and conduit connections. Provide manual over-ride switches for the solenoid fill valve and fuel return pump in the control panel.
  3. Deadman By-pass Valve: Provide a carbon steel spring-return valve constructed per API 607 at each day tank fill valve as a manual bypass and as indicated on drawings.
- D. Day Tank Level Controller. Level Controls shall have five (5) float operated switches rated at 100 watts and factory installed in the day tank. Levels of control: emergency high-level alarm and total pump shutdown (90% capacity), pump off (80% capacity), pump on (50% capacity), and emergency low-level secondary pump on and annunciation (40% capacity) and 10% Engine shutdown (direct to engine panel). Unit shall be suitable for pressures to 150 psi and shall be made entirely of non-ferrous material. Electrical connections shall be contained in a factory installed weatherproof junction box. Level Control shall be Preferred Model PLS- 5- Z1121.
- E. Electric Solenoid Fill Valve: Direct Acting, carbon steel or stainless-steel body, "0" PSIG pressure differential, normally closed, NEMA 4, watertight, threaded pipe and conduit connections. Provide manual over-ride switches for the solenoid fill valve and fuel return pump in the control panel.
- F. Deadman By-pass Valve: Provide a carbon steel spring-return valve constructed per API 607 at each day tank fill valve as a manual bypass and as indicated on drawings.
- G. Overfill Prevention Valve: Each main tank compartment shall include an overfill prevention valve in the re-fueling connection port to automatically stop the flow of fuel into the tank at 90% of maximum tank capacity. The valve shall be a two stage, float operated and suitable for either above grade or below grade tanks as required by project conditions. Tanks 3,000 gallons and smaller shall have a 2" valve, larger tanks shall have a 3" valve. Valve assembly shall be UL listed and include a drop tube extended to within 6" of tank bottom
- H. Vent Sensor. Provide and factory install a leak detector for alarming and fuel supply pump shut down via detection of oil in the vent line. Unit to be lever float operated and magnetically actuated with redundant vapor and fluid provisions. Electrical connections shall be contained in a factory installed weatherproof junction box. Switch shall be a Preferred Model RBS.

- I. Rupture Basin: The Belly tank shall be equipped with a fuel containment in the event of a leak of the fuel compartment. The containment basin shall be a tank in tank arrangement with the fuel compartment inside. The containment basin shall be sized to contain 200% of the volume of the fuel compartment that it protects contains.
- J. Leak Detection: Day Tank Leak Sensor. Provide and factory install a rupture basin leak detector for alarming and fuel supply pump shut down. Electrical connections shall be contained in a factory installed NEMA 4X weatherproof junction box. Switch shall be a Preferred Model RBS.
- K. Tank Fittings for Alarms & Piping: All piped with reinforced, welded pipe adapters. Fuel fill, inlet and return must be supplied with factory installed drop tubes to prevent surging and foaming in the day tank. shall Include:
  - 1. 2" NPT Generator Fuel Supply w/Fire Link Valve, provided with factory installed drop tubes within 6" of the bottom of the tank.
  - 2. 2" NPT Normal Vent
  - 3. 2" NPT Generator Fuel Return.
  - 4. 2" NPT Manual Fuel Fill provided with factory installed drop tubes within 6" of the bottom of the tank.
  - 5. 2" NPT Rupture Basin Alarm Fuel inlet.
  - 6. 2" NPT 90% High Fuel alarm.
  - 7. 2" NPT 80% High Fuel warning.
  - 8. 2" NPT 40% Emergency Low Fuel alarm.
  - 9. 2" NPT 10% Emergency Low shutdown.
  - 10. Provide 4 2" NPT Spare fittings for future use.
  - 11. 8" NPT Emergency Vent (Containment Basin Space)
  - 12. 8" NPT Emergency Vent (Fuel Tank Space)
- L. Level Control Wiring. Level Controls shall have five (5) float operated switches rated at 100 watts and factory installed in the belly tank.:
  - 1. Emergency high-level alarm and all fuel oil pumps shutdown (90% capacity)
  - 2. Pump Off (80% capacity), pump on (50% capacity)
  - 3. Emergency Low-Level secondary pump on and annunciation (40% capacity)
  - 4. Engine shutdown at 10% capacity (direct to engine control panel).
  - 5. Floats shall be suitable for pressures to 150 psi and shall be made entirely of non-ferrous material.
  - 6. Electrical connections shall be contained in a factory installed weatherproof junction box.
- M. Indications and annunciation:
  - 1. The fuel tank shall be fitted with a low fuel level alarm, which shall be wired to an indicating light on the generator control panel of the generator set. This switch shall activate whenever the fuel level in the tank is 40% or less remaining.
  - 2. The fuel tank shall be fitted with a high fuel level alarm, which shall be wired to an indicating light on the generator control panel of the generator set. This switch shall activate whenever the fuel level in the tank is 100% or more remaining.
  - 3. The fuel tank shall be fitted with a rupture basin leak alarm, which shall be wired to an indicating light on the generator control panel of the generator set. This switch shall activate whenever the fuel level in the rupture tank is 5% or more remaining.
  - 4. The Belly Tank located in the generator enclosure is part of a fuel oil system from the basement. The Contractor shall provide all the necessary wiring and conduit for the following tank indications from the belly tank to the fuel oil tank in the basement:
  - 5. Low fuel level alarm.

6. High fuel level alarm.
7. Rupture basin fuel alarm

- N. Factory Testing. Hydrostatic testing is required to ensure tightness prior to shipment. The minimum pressure for testing the tank shall be five (25) PSI. The hydrostatic pressure shall be maintained until all joints and connections have been visually inspected for leaks, but in no case for less than two hours. The tank shall not show any permanent deformation as a result of the test. The Rupture basin shall be hydrostatic tested prior to shipment. A copy of the test procedures shall be made available. The City of New York, the Commissioner, at their discretion, shall observe this and all other tests. All travel expenses to attend the factory testing shall be borne by the manufacturer.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 FACTORY TEST

- A. General – The factory witness test is intended to prove to the extent possible that the Engine Generator Set is working and properly and meets all requirements of this specification.
- B. Factory Test Observation by Commissioner – The manufacturer shall include in their pricing all expenses associated with the demonstrating the Engine-Generator at the factory for the benefit of the Commissioner. Include the following for the factory witness testing:
1. Should the switchgear fail the testing the manufacturer shall include in their pricing all required travel & accommodations to bring the Commissioner, and up to 4 service operators designated by the Commissioner, back to the factory to conclude witnessing of testing.
- C. Test Preparation –
1. Create a written test procedure for the required testing at least 14 days prior to the planned testing date.
  2. Six full sets of paper generator switchgear drawings shall be printed and provided one to each anticipated attendee. Copies shall be printed prior to the factory witness test and be available for factory witness test.
  3. Prior to the testing provide each attendee of the testing a copy of the final approved shop drawings for review prior to testing.
  4. The manufacturer shall be available for answering questions for the entire duration of the test. Provide sufficient manpower to efficiently complete the test in one day.
  5. Provide all fuel and associated temporary fuel oil piping during testing.
  6. Provide all temporary power cable necessary for performing the indicated testing.
- D. Factory Tests: The following tests are the minimum acceptable number of tests for the Factory Witness Testing:
1. Cold Crank Test – Defeat the ability of the engine generator to start. Attempt to start the engine 5 consecutive times with 15 second rest periods. After the fifth attempt restore the engines ability to start and allow the engine to start. Perform this test with both starting battery systems.
  2. Load Bank Testing: After the cold crank test perform a 4-hour Burn in Test at 100% rated load. The burn in testing shall be run for 4 hours and 15 minutes. The first 15 minutes

will be a 25% to warm up the engine, and 4 hours at 100% rated load (600kW / 750 kVA). During the testing record the following engine parameters:

- a. Voltage line to line, and line to neutral.
  - b. Current per phase with a balanced load.
  - c. Fuel consumption at the input to the fuel oil filters. Install a calibrated analog fuel flow gauge for the reading.
  - d. Radiator Air flow averaged over 4 locations across the radiator with an anemometer.
  - e. Engine temperature read from the engine controller.
  - f. Coolant temperature read from the engine controller
3. Alarms: Test all alarms available via the Engine Controller shall be demonstrated. Alarms may be simulated via a technician's laptop if they are impractical to simulate or will harm the engine in anyway.
- a. Engine Alarm/Shutdown
  - b. Low oil pressure alarm/shutdown
  - c. High coolant temperature alarm/shutdown
  - d. Loss of coolant shutdown
  - e. Overspeed shutdown
  - f. Overcrank shutdown
  - g. High intake manifold temperature alarm/shutdown
  - h. High exhaust manifold temperature alarm/shutdown
  - i. High crankcase pressure alarm/shutdown
  - j. High air inlet temperature alarm/shutdown
  - k. Emergency stop depressed shutdown
  - l. Low coolant temperature alarm
  - m. Low battery voltage alarm
  - n. High battery voltage alarm
  - o. Control switch not in auto position alarm
  - p. Battery charger failure alarm
4. Steady State Loading: Perform tests demonstrating the accuracy and calibration of the generator metering, and to demonstrate no load to full load frequency, and voltage regulation. Record the following values at 0%, 50%, 75% & 100% load:
- a. Voltage line to line, and line to neutral.
  - b. Current per phase with a balanced load.
  - c. 10% Unbalanced phase current load. Phase A, 100%, Phase B 90%, Phase C 80%.
  - d. Fuel consumption at the input to the fuel oil filters. Install a calibrated analog fuel flow gauge for the reading.
  - e. Radiator Air flow averaged over 4 locations across the radiator with an anemometer.
  - f. Engine temperature read from the engine controller.
  - g. Coolant temperature read from the engine controller
5. Transient Testing – Record the Engine Generator sets voltage and frequency response to block loads with a calibrated disturbance analyzer. All transients shall be performed with a load bank provided by the manufacturer at a power factor of 0.8. Perform and record the following transients and document the results in the final Factory Test report.
- a. 0 – 25% load step (0 kW / 0 kVA) – (150kW/ 187 kVA)
  - b. 0 – 50% load step (0 kW / 0 kVA) – (300kW/ 375 kVA)

- c. 0 – 75% load step (0 kW / 0 kVA) – (450kW/ 562 kVA)
    - d. 0 – 75% load step (0 kW / 0 kVA) – (600kW/ 750 kVA)
  - 6. Alarms
  - 7. Steady State Loading
  - 8. Transient Testing
  - 9. Load Bank Testing
- E. Test Equipment: Use instruments calibrated within the previous 12 months and with accuracy directly traceable to the National Institute of Standards and Technology.
- F. Provide a report of the Factory Witness Test documenting all the required tests have been performed.

### 3.3 INSTALLATION

- A. Install generator sets, generator control switchgear, load bank, and other components as indicated, in accordance with equipment manufacturers written instructions, and with recognized industry practices, to ensure proper performance in accordance with the specifications. Comply with applicable NEMA standards pertaining to installation of engine-generator sets and accessories.
- B. The engine-generator sets shall be provided with a structural steel base. The base shall have sufficient rigidity for spring type isolators in quantities as required between enclosure floor and generator. Mounting shall incorporate a leveling device, vertical stops, and three layers of neoprene acoustical pad, with each layer separated by a steel plate. The mountings shall be installed directly under the structural steel base and shall be positioned to accept the weight and weight distribution for uniform mounting deflection. Spring isolators provide a minimum static deflection of 1" and be similar to Mason Industries, Inc., Type SLR, or as approved. Neoprene pads shall be similar to Mason Industries, Inc., Type W, or as approved.
- C. Coordinate with the work of other trades including fuel tanks, pumps, piping, ductwork and accessories as necessary to provide a complete operational system.
- D. Include the installation, local generator circuit breakers, control and monitoring and panels, battery chargers, remote annunciator panels, batteries and racks and other appurtenances to the extent that such appurtenances are not factory installed and wired.
- E. Include panel and control wiring between generators, generator output circuit breakers and disconnect switches.
- F. Include field inter-wiring and power supply and control connections for load bank, batteries, battery chargers, pumps, heaters, float switches, solenoid valves, damper operators and other miscellaneous items as required in accordance with manufacturers wiring diagrams. Such wiring shall include (but not be limited to):
- 1. Wiring between battery and engine control panels and battery chargers and power supplies thereto.
  - 2. Power supply wiring and control wiring for engine jacket water heaters.
  - 3. Power supply wiring and control wiring for fuel pumps, fuel tanks, float switches, valves and other fuel supply system components.
  - 4. Power supply and control wiring for automatic louver damper operators.
  - 5. Emergency stop break glass switch mounted outside generator room and control wiring run to generator control switchgear.

6. "Manual start" switch located in Emergency Electric Switchgear Room and control wiring to generator control switchgear.
  7. Remote annunciator panels mounted where directed complete with power supply and alarm inter-wiring to generator control switchgear.
- G. Include the installation of the load bank, complete with all required power, control, sensing and devices as required to comply with the functional requirements of Part 2 of this Section. Circuitry and devices shall be included - but not limited to - the following:
1. Power circuit connection tapped to the circuit breaker generator control switchgear bus. Tap shall be protected by OCD sized at 125% of load bank rating. Tap conductors shall be sized to match OCD and shall be run in conduit.
  2. Fan resistor control power supply conductors run in conduit from an available 3-pole circuit incorporated as part of a "hot" emergency panel (i.e., panel connected to load side of an ATS).
  3. Load sensing circuitry extension run in conduit from generator current transformers to load bank control panel.
  4. "Normal" power sensing circuitry run in conduit from each ATS to load bank control panel.
  5. Three phase "generator voltage" sensing circuitry run from generator control switchgear to load bank control panel.
  6. "Remote" control panel circuitry extension in conduit to load bank control panel.
  7. Any inter-wiring necessitated by a load bank configuration which separates out equipment items indicated as being integrally mounted.

### 3.4 SITE STARTUP & COMMISSIONING

- A. Provide on-site supervision / technical support for receiving equipment at site, installation and wiring of the system supplied and full commissioning of the system in accordance with this document.
- B. Provide all required fuel for onsite start-up and acceptance testing. At the completion of the acceptance testing the generator manufacturer shall fill the diesel generator fuel tanks to 100% capacity.
- C. Load Bank – Provide a resistive load bank that is capable of providing enough resistive load to provide 100% KW load of the generator for commissioning. The load bank shall be provided with all required Diesel Locomotive Cable for this test. Include all expenses associated with renting, operating, installing, and operating this load bank for the duration of the testing.
- D. COMMISSIONING - The Contractor shall coordinate with and provide all access and manpower required to allow The Commissioner to verify the proper operation of the generator during Testing & Commissioning of the Generator. Refer to Section 26 08 00 "Commissioning of Electrical" for commissioning requirements. As part of commissioning process:
  1. Create a Test Plan of the Diesel Generator Testing included in this specification. Within the Test Plan include a Gant Chart of expected completion of Generator system component.
  2. Create and manage the completion of Pre-Functional, and Functional test forms of the entire generator system. Include the following Pre-Functional, and Functional forms:
    - a. Engine Generator
    - b. Generator.
    - c. Fuel Oil System.

3. Hold at least two meetings to coordinate startup and testing of the generator. Keep meeting minutes and track action items to insure testing schedule is adhered to.
  4. Provide test equipment and accessories to include all required meters to accomplish the testing requirements of this specification.
    - a. Disturbance Analyzer for transient testing.
    - b. Power Meter capable of keeping KVA, KVAR, KW, Volts, Amps, PF.
    - c. Provide all meter leads and accessories to safely testing the generator.
  5. Manage the generator testing for the duration of the planned testing to include the following tasks.
    - a. No load testing alarm testing.
    - b. Generator Enclosure Testing.
    - c. Steady State engine testing.
    - d. Transient Testing.
    - e. Burn in Testing.
  6. Create a testing punch list and identify any items that did not pass the specified testing. Maintain the testing punch list until all items on the list have been resolved. Assist the City of New York in determining the corrective actions required and manage all retests as required.
  7. Provide a final testing report with the following minimum information.
    - a. Executive Summary of the testing.
    - b. Completed Pre-Functional test forms.
    - c. Completed Functional test forms.
    - d. All issues of the Punch Lists to show tracking of the know issues found during testing.
    - e. All metering data.
- E. **MANUFACTURERS STARTUP** - Provide the services of a factory trained diesel generator technician to perform the following diesel generator and enclosure start up service prior to testing and commissioning.
1. Exhaust System Check List
    - a. For leaks
    - b. For exhaust restriction
    - c. For smoke condition
    - d. Heat radiation
    - e. Condensate drains
    - f. For loose hardware and connections
  2. Starting Battery and Control System Check List
    - a. Battery charger voltage before and after the test
    - b. Battery electrolyte level before and after the test
    - c. Specific gravity
    - d. Battery voltage
    - e. Cranking current and voltage levels
  3. Generator System Check List
    - a. Air inlet and output for restriction

- b. Generator winding resistance before the test
  - c. Electrical connection
  - d. Bearing lubrication
- 4. Circuit Breaker Check List
  - a. Automatic start switch
  - b. Panel instrumentation
  - c. Distribution cables
  - d. Circuit Breakers
  - e. Voltage and current transformers
- 5. Operation Without Load Check List
  - a. Starting time
  - b. Coast down time
  - c. Unusual noise during start or stop
  - d. Voltage build up
  - e. Frequency stability during start
  - f. Engine and generator vibration
- 6. Lubrication system Check List
  - a. For leaks
  - b. Engine oil level
  - c. Change engine oil after the 24hour system test
- 7. Cooling System Check List
  - a. For leaks
  - b. For radiator air restriction
  - c. Operation of coolant heater
  - d. Hose and connections
  - e. Coolant level
  - f. Anti-freeze concentration
  - g. Belt condition and tension
  - h. Fan hub, drive pulley, water pump
  - i. Motor operated louvers
  - j. Clean cooling system C flush and add new antifreeze
  - k. Analyze anti-freeze before changing after 36-hour system test
- 8. Air Inlet System Check List
  - a. For leaks
  - b. Air cleaner restrictions
  - c. Generator room ventilation
  - d. Piping and/or ducts
  - e. Clean crankcase breather before and after 36-hour test
  - f. Change air inlet element before and after 36 hour systems tests
- 9. Fuel System Check List
  - a. For leaks
  - b. Day tank size and fuel level
  - c. Governor linkage

- d. Fuel lines and connections
- e. Fuel transfer pump
- f. Water contamination in day tank
- g. Fuel from main tank for analysis
- h. Sample sediments from tanks or separators
- i. Check fuel filters for discoloration

### 3.5 CLEANING

- A. Upon completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

### 3.6 INSTRUCTION

- A. Instruction: Engage a factory-authorized service representative to demonstrate adjustment, operation, and service of system and to instruct the City of New York's service operators as specified below.
  - 1. Conduct a minimum of 8 hours of training.
  - 2. Schedule training with at least 7 days' advance notice.
  - 3. Refer to DDC General Conditions for instruction requirements.

**END OF SECTION 26 32 13**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 26 36 00****TRANSFER SWITCHES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. This Section includes transfer switches rated 600 V and less, including the following:
1. Automatic transfer switches.
  2. Remote annunciation systems.
- B. Related Sections include the following:
1. Section 21 31 13 "Electric-Drive, Centrifugal Fire Pumps" for automatic transfer switches for fire pumps.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.6 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Contactor Transfer Switches:
    - a. Caterpillar; Engine Div.
    - b. Emerson; ASCO Power Technologies, LP.
    - c. Onan/Cummins Power Generation; Industrial Business Group.
    - d. Russelectric, Inc.
    - e. Spectrum Detroit Diesel.
    - f. Or approved equal.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

- A. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.
- B. Tested Fault-Current Closing and Withstand Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
1. Where transfer switch includes internal fault-current protection, rating of switch and trip unit combination shall exceed indicated fault-current value at installation location.
- C. Solid-State Controls: Repetitive accuracy of all settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C.
- D. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.
- E. Electrical Operation: Accomplish by a non-fused, momentarily energized solenoid or electric-motor-operated mechanism, mechanically and electrically interlocked in both directions.
- F. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
1. Limitation: Switches using molded-case switches or circuit breakers or insulated-case circuit-breaker components are not acceptable.
  2. Switch Action: Double throw; mechanically held in both directions.

3. Contacts: Silver composition or silver alloy for load-current switching. Conventional automatic transfer-switch units, rated 225 A and higher, shall have separate arcing contacts.
- G. Neutral Switching. Where four-pole switches are indicated, provide neutral pole switched simultaneously with phase poles.
- H. Neutral Terminal: Solid and fully rated, unless otherwise indicated.
- I. Oversize Neutral: Ampacity and switch rating of neutral path through units indicated for oversize neutral shall be double the nominal rating of circuit in which switch is installed.
- J. Heater: Equip switches exposed to outdoor temperatures and humidity, and other units indicated, with an internal heater. Provide thermostat within enclosure to control heater.
- K. Battery Charger: For generator starting batteries.
  1. Float type rated 10 A.
  2. Ammeter to display charging current.
  3. Fused ac inputs and dc outputs.
- L. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device.
- M. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, either by color-code or by numbered or lettered wire and cable tape markers at terminations. Color-coding and wire and cable tape markers are specified in Division 26 Section "Identification for Electrical Systems."
  1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
  2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
  3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
- N. Enclosures: General-purpose NEMA 250, Type 1, complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

## 2.3 AUTOMATIC TRANSFER SWITCHES

- A. Comply with Level 1 equipment according to NFPA 110.
- B. Switching Arrangement: Double-throw type, incapable of pauses or intermediate position stops during normal functioning, unless otherwise indicated.
- C. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.
- D. Manual Switch Operation: Unloaded. Control circuit automatically disconnects from electrical operator during manual operation.

- E. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval is adjustable from 1 to 30 seconds.
- F. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.
- G. In-Phase Monitor: Factory-wired, internal relay controls transfer so it occurs only when the two sources are synchronized in phase. Relay compares phase relationship and frequency difference between normal and emergency sources and initiates transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer is initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
- H. Motor Disconnect and Timing Relay: Controls designate starters so they disconnect motors before transfer and reconnect them selectively at an adjustable time interval after transfer. Control connection to motor starters is through wiring external to automatic transfer switch. Time delay for reconnecting individual motor loads is adjustable between 1 and 60 seconds, and settings are as indicated. Relay contacts handling motor-control circuit inrush and seal currents are rated for actual currents to be encountered.
- I. Programmed Neutral Switch Position: Switch operator has a programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Pause is adjustable from 0.5 to 30 seconds minimum and factory set for 0.5 second, unless otherwise indicated. Time delay occurs for both transfer directions. Pause is disabled unless both sources are live.
- J. Automatic Transfer-Switch Features:
  - 1. Undervoltage Sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage is adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
  - 2. Adjustable Time Delay: For override of normal-source voltage sensing to delay transfer and engine start signals. Adjustable from zero to six seconds, and factory set for one second.
  - 3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
  - 4. Time Delay for Retransfer to Normal Source: Adjustable from 0 to 30 minutes, and factory set for 10 minutes to automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.
  - 5. Test Switch: Simulate normal-source failure.
  - 6. Switch-Position Pilot Lights: Indicate source to which load is connected.
  - 7. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and emergency-source sensing circuits.
    - a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
    - b. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."
  - 8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.

9. Transfer Override Switch: Overrides automatic retransfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.
10. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
11. Engine Shutdown Contacts: Instantaneous; shall initiate shutdown sequence at remote engine-generator controls after retransfer of load to normal source.
12. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.
13. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods are adjustable from 10 to 30 minutes. Factory settings are for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
  - a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
  - b. Push-button programming control with digital display of settings.
  - c. Integral battery operation of time switch when normal control power is not available.

## 2.4 REMOTE ANNUNCIATOR SYSTEM

- A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:
  1. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
  2. Switch position.
  3. Switch in test mode.
  4. Failure of communication link.
- B. Annunciator Panel: LED-lamp type with audible signal and silencing switch.
  1. Indicating Lights: Grouped for each transfer switch monitored.
  2. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
  3. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.
  4. Lamp Test: Push-to-test or lamp-test switch on front panel.

## 2.5 SOURCE QUALITY CONTROL

- A. Factory test and inspect components, assembled switches, and associated equipment. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 INSTALLATION

- A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- B. Floor-Mounting Switch: Anchor to floor by bolting.
  - 1. Concrete Bases: 4 inches high, reinforced, with chamfered edges. Extend base no more than 4 inches in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems."
- C. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.
- D. Identify components according to Division 26 Section "Identification for Electrical Systems."
- E. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

### 3.3 CONNECTIONS

- A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional fee to the City of New York if necessary to accommodate required wiring.
- B. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."
- C. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

### 3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installation, including connections, and to assist in testing.
  - 2. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
  - 3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 4. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
    - a. Check for electrical continuity of circuits and for short circuits.
    - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
    - c. Verify that manual transfer warnings are properly placed.
    - d. Perform manual transfer operation.

5. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
  - a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
  - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
  - c. Verify time-delay settings.
  - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
  - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
  - f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for 1 pole deviating by more than 50 percent from other poles.
  - g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.
6. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.
  - a. Verify grounding connections and locations and ratings of sensors.

**B. Testing Agency's Tests and Inspections:**

1. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
3. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
  - a. Check for electrical continuity of circuits and for short circuits.
  - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
  - c. Verify that manual transfer warnings are properly placed.
  - d. Perform manual transfer operation.
4. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
  - a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
  - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
  - c. Verify time-delay settings.
  - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
  - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
  - f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for 1 pole deviating by more than 50 percent from other poles.

- a. Verify grounding connections and locations and ratings of sensors.

- C. Coordinate tests with tests of generator and run them concurrently.
- D. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.
- E. Remove and replace malfunctioning units and retest as specified above.
- F. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
  - 1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
  - 2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
  - 3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken and observations after remedial action.

- A. Engage a factory-authorized service representative to instruct the Commissioner's service operators to adjust, operate, and maintain transfer switches and related equipment as specified below. Refer to DDC General Conditions for instruction requirements.
- B. Coordinate this instruction with that for generator equipment.

TRANSFER SWITCHES  
26 36 00 - 8

**SECTION 26 41 13****LIGHTNING PROTECTION FOR STRUCTURE****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Work included in this section: Lightning protection system.

**1.2 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.3 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.4 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.5 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

- B. A national testing laboratory (Underwriters Laboratories or Applied Research Laboratories) shall list the components and provide certification of the lightning protection system installation (inspect and certify) for compliance with applicable standards.
- C. The system shall be the standard product of a manufacturer regularly engaged in the production of lightning protection systems and shall be the manufacturer's latest approved design.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Heary Bros. Lightning Protection Co., Inc., Springville, New York (Basis-of-Design)
  - 2. LightningMaster Corp.
  - 3. Thompson Lightning Protection
  - 4. Or approved equal.

### 2.2 STANDARD

- A. All equipment shall be new, the product of a single manufacturer as outlined above, and of a design and construction to suit the application where it is used in accordance with accepted industry standards.

### 2.3 EQUIPMENT

- A. All components shall be aluminum and of the size, weight and construction to suit the application where used in accordance with requirements for Class I structures.
- B. Roof conductors shall be aluminum, 24 strands 14-gauge, 98,600 circular mils, net weight 110 lbs. / 1000 ft.
- C. Down conductors shall be copper, 29 strands 17-gauge, 65,600 circular mils, net weight 190 lbs./1000ft.
- D. Air terminals shall be solid round aluminum bar 1/2" x 12" minimum and shall project 10" minimum above the object to be protected.
- E. Air terminal bases shall be aluminum with bolt pressure cable connectors and shall be securely mounted with stainless steel screws or bolts.
  - 1. Offset type bases shall be used at parapets and secured with stainless steel screws or anchors.
  - 2. Adhesive type bases shall be secured with an adhesive compound which is compatible with the roofing system. The roofing manufacturer shall approve the adhesive compound.
- F. Ground rods shall be 5/8" x 10'-0" minimum. They shall be connected to the system with a two-bolt copper clamp having a minimum length of 1-1/2" and employing stainless steel cap screws.
- G. Cable fasteners shall be substantial in construction, galvanically compatible with the conductor and mounting surface.

- H. Bonding devices, cable splicers and connectors shall be of aluminum with bolt pressure cable connectors.
- I. Equipment on stacks and chimneys shall be protected from corrosion and sized in accordance with requirements.
- J. Bolts, nuts and screws shall be stainless steel.

## **PART 3 – EXECUTION**

### **3.1 EXECUTION REQUIREMENTS**

- B. Refer to DDC General Conditions for execution requirements.

### **3.2 INSTALLATION**

- A. All equipment shall be installed in a neat workmanlike manner in the most inconspicuous manner possible.
- B. Provide complete cable network on the roof including; air terminals, splices, bonding connectors and cable downleads to ground rods. Down conductors shall run in 1" PVC conduit concealed within the building construction to ground.
- C. The contractor shall furnish and install all necessary PVC conduit and junction boxes.
- D. A bimetal transition fitting shall be used where aluminum roof conductor and copper down conductor are spliced together.

### **3.3 COORDINATION**

- A. Work with other trades to insure a correct, neat and unobtrusive installation.
- B. Assure a sound bond to the main water service and to assure interconnection with other building ground systems, including both telephone and electrical.
- C. Install proper arresters on the power and telephone service as applicable.

### **3.4 COMPLETION**

- A. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for coordination and record drawing Requirements.

**END OF SECTION 26 41 13**

THIS PAGE INTENTIONALLY LEFT BLANK

## **SECTION 26 51 00**

### **INTERIOR LIGHTING**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).

##### **1.2 SUMMARY**

- A. This Section includes light fixtures, lamp module and driver requirements for the following:
  - 1. Interior lighting fixtures:
    - a. Light Emitting Diodes (LEDs)
  - 2. Lighting fixture supports
- B. Refer to other Sections for the following:
  - 1. Section 04 20 00 "Unit Masonry"
  - 2. Section 05 50 00 "Metal Fabrications"
  - 3. Section 05 52 13 "Pipe and Tube Railings"
  - 4. Section 06 40 23 "Interior Architectural Woodwork"
  - 5. Section 09 29 00 "Gypsum Board"
  - 6. Section 09 51 13 "Acoustical Panel Ceilings"
  - 7. Section 26 05 53 "Identification for Electrical Systems"
  - 8. Section 26 05 00 "Common Requirements for Electrical Work"
  - 9. Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables"
  - 10. Section 26 05 33 "Raceway and Boxes for Electrical Systems"
  - 11. Section 26 27 26 "Wiring Devices."
  - 12. Section 26 24 16 "Panelboards"
  - 13. Section 26 29 13 "Enclosed Controllers"
  - 14. Section 26 56 00 "Exterior Lighting"

##### **1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – Construction Waste Management and Disposal
  - 2. Section 01 81 13 – Sustainable Design Requirements For LEED Buildings
  - 3. Section 01 81 19 – Indoor Air Quality Requirements For LEED Buildings
- C. LEED Building Performance Requirements: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 “Indoor Air Quality Management”, where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.5 DEFINITIONS

- A. CCT: Correlated color temperature.
- B. CRI: Color-rendering index.
- C. LER: Luminaire efficacy rating.
- D. Lumen: Measured output of lamp and luminaire, or both.
- E. Luminaire: Complete lighting fixture, including driver housing if provided.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

#### 1.7 SUBMITTALS

- A. General:
  1. Reviews of submittals are to establish general conformance to design intent and do not waive contract requirements. Contractor is responsible for all dimensions, quantities, mounting accessories, methods of construction, and compliance with the Contract Documents.
  2. The contents of the shop drawings shall be prepared by the Manufacturers. Shop drawings prepared solely by the Contractor will not be acceptable.
- B. Product Data: For each luminaire and support component, arranged in order of lighting unit designation. Submit manufacturer’s data on features, accessories, finishes, and the following, in reproducible form:
  1. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters. Submit dimensioned drawings of lighting fixtures.
  2. Details of luminaire attachments and accessories.
  3. Details of installation and construction.
  4. Luminaire materials.
  5. Photometric Data: Supply complete photometric data for each fixture. Photometric reports shall be rendered by an independent testing laboratory developed according to methods of the Illuminating Engineering Society (IESNA) of North America as follows:
    - a. Luminaire description and dimensions

- b. Candela distribution data, presented graphically and numerically in no more than 5 degree increments (5, 10, 15, etc.). Data developed for up and down quadrants normal, parallel and at 22.5, 45, 167.5 degrees to fixture axis if light output is asymmetric.
  - c. Zonal lumens stated numerically in 10 degree increments (5, 15, etc.) and fixture efficiency.
  - d. Luminance table with data presented numerically, showing maximum luminance of the fixture at the shielding angles. Readings should be taken both crosswise and lengthwise in the case of LED fixtures or fixtures with asymmetric distribution.
  - e. Coefficients of utilization table.
  - f. Driver UL listing, volts, input and output wattage, drive current.
  - g. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
- 6. Lamp Module: All manufacturer data to include LED module information, including but not limited to:
  - a. Manufacturer of the LED module with part number or other device identifier.
  - b. LED module drive current, voltage, power.
  - c. LED module lumen depreciation curves, life, CCT, CRI at an ambient temperature of 25 degrees Celsius.
  - d. Board temperature of the LED module installed in the luminaire with proper heat sink, when the luminaire is operating at an ambient temperature of 25 degrees Celsius.
  - e. The color bin, CCT, and color shift variation of the LED module at the operating board temperature.
  - f. Color rendering index at the operating board temperature.
- C. Shop Drawings: Include scalable plans, elevations, sections, details, and attachments to other work:
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 2. Design calculations (as requested), certified by a qualified professional engineer licensed in the state of New York, indicating strength of mechanical connections.
  - 3. Wiring Diagrams: For power, signal, and control wiring.
  - 4. Warranty: Sample of special warranty.
- D. Submittals or shop drawings lacking sufficient detail to indicate clear and complete compliance with contract documents shall be rejected. Include plans, elevations, sections, details, and attachments to other work.
- E. Field quality-control reports.
- F. Provide Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
  - 1. Lighting fixtures
  - 2. Suspended ceiling components
  - 3. Structural members to which suspension systems for lighting fixtures will be attached.
  - 4. Other items in finished ceiling including the following:
    - a. Air outlets and inlets
    - b. Speakers

- c. Sprinklers
- d. Smoke and fire detectors
- e. Occupancy sensors
- f. Access panels
- g. Perimeter moldings

G. Samples: Submit for review one representative sample for each or any lighting fixture required under this Contract:

- 1. The samples must be actual working unit of fixtures to be supplied and shall be submitted complete with cord and plug, wired for 120 volt operation.
- 2. All substitutions shall be provided as samples for review and approval prior to fabrication.
- 3. After sample acceptance, the fixture shall be sent to the project for use as a standard. In the event the submission is rejected, the fixture will be returned to the manufacturer who shall immediately make a new submission which meets the contract requirements.

H. Product Certificates: For each type of ballast for bi-level and dimmer-controlled fixtures, signed by product manufacturer.

#### 1.8 QUALITY ASSURANCE

A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".

B. Equipment Qualifications For Products Other Than Those Specified:

- 1. At the time of submission provide written notice to the Commissioner of the intent to propose an "or equal" for products other than those specified. Make the "or equal" submission in a timely manner to allow the Commissioner sufficient time to review the proposed product, perform inspections and witness test demonstrations.
- 2. The product manufacturer shall have test facilities available that can demonstrate that the proposed products meet the contract requirements.
  - a. Make arrangements with the test facility for the Commissioner to witness test demonstrations. Also obtain the services of the Lighting Manufacturer's Product Manager/Engineer for the proposed product to be present at the test facility. Notify the Commissioner a minimum of 3 weeks prior to the availability of the test facility, and provide at least one alternative date for the testing.
- 3. Provide written certification from the manufacturer that the proposed products are compatible for use with all other equipment proposed for use for this system and meet all contract requirements.

C. All lighting fixtures shall be manufactured, furnished, and installed in compliance with NFPA 70, "National Electrical Code" 2017, and 2014 New York City Construction Codes. All fixtures shall bear the appropriate UL (or ETL) and IBEW identifications.

D. Materials and equipment, as well as workmanship shall conform to the highest commercial standards and shall be as specified and/or as indicated on the drawings. Parts not specifically identified shall be made of materials most appropriate for their intended use.

E. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as

defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing & Calculation Guides.

- F. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- G. Comply with NFPA 70, "National Electrical Safety Code" 2017.
- H. Mockups: Provide interior lighting fixtures for in situ mockups complete with power and control connections; the specific design requirements of several building conditions mandates the necessity of full scale on site mockups prior to final authorization (release) to fabricate.
  - 1. Obtain Commissioner's approval of fixtures for mockups before starting installations.
  - 2. Installation of all luminaire types subject to mockup requirements may not proceed until mockup is accepted by Commissioner.
  - 3. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed work.
  - 4. Approved fixtures in mockups may become part of the completed work if undisturbed at time of Substantial Completion.
  - 5. Mockups of the following fixture types shall be provided by the Contractor in the following configurations:

Type	Location	Magnitude (Extent)
P2	Lobby	2 fixtures (nom. 4'-0" unit) run continuously
P5	Training Room	2 fixtures (nom. 4'-0" unit) run continuously
P9	Reception Desk - toe kick	1 fixture (nom. 12'-0" unit) with mounting track as a complete assembly
P17	Community Room - cove	3 fixtures (nom. 4'-0" unit) run continuously with miter corner as a complete assembly
P18	Lightwell - uplight	3 fixtures (nom. 4'-0" unit) run continuously with miter corner as a complete assembly
P18a	Main Desk Area	3 fixtures (nom. 4'-0" unit) run continuously with miter corner as a complete assembly
P23	Entrance Door	1 fixture with temporary power, DMX controller, Data enabler and cabling as a complete assembly
P25	Reception Desk	2 fixtures (nom. 4'-0" unit) run continuously

- I. National Electrical Manufacturers Association (NEMA): Comply with applicable requirements of NEMA LE 4, "Recessed Luminaires, Ceiling Compatibility" pertaining to recessed luminaires.
- J. Manufacturer Requirements:
  - 1. Experience: The manufacturer providing the material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such similar material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
  - 2. Custom luminaires: Manufacturers shall submit a prototype (pre-fabrication sample) of each fixture for review by the Commissioner. Prototypes shall be sufficiently detailed and

operational to allow evaluation of compliance with the salient features of the specification. Preliminary design or shop drawings shall not be accepted in place of prototype samples.

#### 1.9 INDUSTRY STANDARDS

- A. Applicability of Standards: Except where more explicit or stringent requirements are written into the Contract Documents, applicable construction industry standards have the same force and effect as if found in or copied directly into the Contract Documents. Such industry standards are made a part of the Contract Documents by reference.
  - 1. Referenced standards (standards referenced directly in the contract documents) take precedence over standards that are not referenced but generally recognized in the industry for applicability to the work.
  - 2. Unreferenced standards are not directly applicable to the work, except as a general requirement of whether the work complies with recognized construction industry standards.
- B. Publication Dates: Except as otherwise indicated, where compliance with an industry standard is required, comply with the latest standard in effect as of date of Contract Documents.

#### 1.10 COORDINATION

- A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.
- B. Each fixture shall be labeled with the appropriate circuit description to coordinate with electrical drawings.
- C. Each fixture connected to Emergency power supply shall be provided with a visible (1/4" diameter) red dot on the exposed fixture trim.

#### 1.11 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.
  - 1. Warranty Period for LED Entire Luminaires (fixture components can be field replaceable): Entire fixture shall carry a minimum 1 year warranty from the date of substantial completion.
  - 2. Warranty Period for LED Entire Luminaires (fixture components cannot be field replaceable): Entire fixture shall carry a minimum 5 years warranty from the date of substantial completion.
  - 3. Warranty Period for LED Modules and Drivers: five (5) years from the date of Substantial Completion.

#### 1.12 DELIVERY, STORAGE & HANDLING

- A. Each fixture shall be labeled the appropriate circuit description to coordinate with electrical plans.
- B. Each fixture connected to Emergency power supply shall be provided with a visible (1/4" diameter) red dot on the exposed fixture trim.

- C. Lighting fixtures shall be wrapped for protection during delivery, storage, and handling. Wet or damp wrapping shall be removed, and disposed of, to prevent staining finish.
- D. Deliver materials in manufacturer's original, unopened, protective packaging.
- E. Store materials in original packaging in a manner to prevent soiling and physical damage, prior to installation.
- F. Handle in a manner to prevent damage to finished surfaces.
- G. Where possible, maintain protective covering until installation is complete and remove such coverings as part of final cleanup.

#### 1.13 TECHNICAL & ADMINISTRATIVE REQUIREMENTS

- A. All information identified in the Contract Documents shall be considered to form a complete and integrated specification for lighting fixtures.
- B. Specifications and drawings are intended to convey the salient features, function and character of the fixtures only, and do not undertake to illustrate or set forth every item or detail necessary for the work. Minor details not usually indicated on the drawings nor specified, but that are necessary or normally required for the proper execution, completion, installation and operation of the fixtures, shall be included, the same as if they were herein specified or indicated on the drawings.
- C. The Commissioner shall not be held responsible for the omission or absence of any detail, construction feature, etc. which may be normally required in the production of the lighting fixtures. The full and complete responsibility for accurately purchasing, fabricating and installing the lighting fixtures described herein to the fulfillment of those specifications including compliance with all regulatory bodies (i.e. UL) shall rest solely with the Contractor and the fixture manufacturer.
- D. The Contractor shall be solely responsible for verifying all fixture quantities, lengths and clearances required and shall inform the Commissioner of job conditions at variance with fixtures as specified or detailed which affect installation or location while is made.
- E. The Contractor shall be solely responsible for coordinating and expediting the timely procurement and delivery for all lighting equipment, lamps, ballasts and related components for the project.
- F. Ensure that the lighting fixture manufacturer shall keep on file and make available for review by the Commissioner complete Quality Control and Quality Assurance records for all phases of production for all lighting fixtures to be supplied under this project.

#### 1.14 SUPPLEMENTAL PRODUCTS AND SUBMITTALS

- A. Special Tools:
  - 1. Provide two tools to remove and install each type and size of fasteners on fixtures equipped with vandal resistant fasteners (S-Types).
- B. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.
  - 1. Provide a list of all LED types and modules used on Project, and manufacturers' codes.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Refer to the Lighting Fixture Schedule on the Lighting Drawings.
- B. Subject to compliance with requirements, provide the Basis-of-Design product and manufacturer, or an equivalent product from an approved equal manufacturer, for each lighting fixture type. The Basis-of-Design product and manufacturer for each lighting fixture type, as well as approved equal manufacturers for each lighting fixture type, are provided on the Lighting Fixture Schedule of the Lighting Drawings.

**2.2 GENERAL**

- A. Comply with NEMA LE 4 for recessed fixtures. All recessed fixtures to be installed in insulated ceilings shall be provided with UL listed thermocouple protection.
- B. LED Luminaires: Lighting fixtures shall conform to IES LM-79-08 and LM-80-08 standards. All fixtures shall be RoHS compliant.
- C. Lighting fixtures shall be of rigid construction, dimensionally stable, and shall be assembled with secure fastenings. Ferrous parts shall be protected from corrosion by plating or shall be finished with high reflectance enamel with non-yellowing binder and high pigment to binder ratio, with semi-gloss finish. Ferrous parts shall be prepared for finish by industry standard finishing process (see Finishes). Nonferrous metals (i.e. aluminum) unless otherwise noted be treated with a semi-gloss polyester powder coat enamel finish.
- D. Recessed, surface or pendant lighting fixtures shall be suspended from structural members or ceiling structure members of minimum 1-1/2" channels, by standard bar hangers, or other approved means. Fixture locations shall be coordinated with ceiling patterns. Refer to architectural reflected ceiling plan for exact location of fixtures and architectural rooms finish schedule for ceiling construction details and mounting heights. Provide all structural steel and related supports as required or necessary to properly and safely install and support the fixtures.
- E. Fixture wiring shall be suitable for the temperature rating of the fixture; wiring through LED channels shall be done with Type SFF2 wire U.O.N by manufacturer. Where a junction box is required, to change from branch circuit to fixture wiring, use approved feed through, pre-wired fixture wiring, and install a separate junction box. The junction box shall be fully accessible after installation of covering materials. Where flexible conduit or portable cord is used, a grounding jumper shall be installed. All fixtures shall be grounded. Housings shall be so constructed that all electrical components are easily accessible and replaceable without removing fixtures from their mountings, or disassembling adjacent construction.
- F. All recessed, pendant and surface mounted lighting fixtures unless otherwise noted or directed shall be UL listed for through-wiring and shall be furnished complete with all required integral wiring and all required flexible conditions, pigtails and related accessories necessary for suitable operation and installation.
- G. All materials, accessories, and other related fixture parts shall be new and free from defects which in any manner may impair their character, appearance, strength, durability and function, and be effectively protected from any damage or injury from the time of fabrication to the time of delivery and until final written acceptance of the work by the Commissioner.
- H. Where surface mounted junction boxes are called for, the lighting manufacturer shall provide a canopy cover which completely covers the entire junction box.

- I. Castings: All aluminum, iron or composite casting shall be exact replicas of the approved patterns and shall be free of sand pits, blemishes, scales and rust, and shall be smoothly finished. Tolerance shall be provided for any shrinkage of the metal castings in order that the finished casting will accurately fit in their designated locations. Unless otherwise noted, for cast aluminum components use copper-free 319 or 443 aluminum alloy only. For cast iron components use ASTM Spec A48-83 Class 30 gray iron.
- J. Mounting frames and rings: if ceiling system requires, each recessed fixture shall be furnished with a mounting frame or ring compatible with the ceiling in which they are to be installed. The frames and rings shall be one piece or constructed with electrically welded butt joints and of sufficient size and strength to sustain the weight of the fixture.
- K. Yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels, suitable ceiling members or other structure shall be furnished and installed by the Contractor.
- L. Provide each fixture with LED modules as indicated in the lighting fixture schedule.
- M. Metal Parts: Free of burrs and sharp corners and edges. All sheet metal work shall be free from tool marks and dents.
- N. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
- O. Housings: Rigidly formed, min. no. 20 gauge cold rolled steel weather- and light-tight enclosures that will not warp, sag, or deform in use. Refer to the Lighting Fixture Schedule for specific housing requirements and gauges.
- P. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.
- Q. For steel and aluminum fixtures all screws, bolts, nuts and other fastening and latching hardware shall be cadmium or equivalent plated. For stainless steel fixtures, all hardware shall be stainless steel. Whenever possible all fasteners shall be captive type. Where indicated provide security head Torx center pin tamper resistant fasteners.
- R. Welding shall be in accordance with recommendations of the American Welding Society and shall be done with electrodes and/or methods recommended by the manufacturers of the metals being welded. Welds shall be continuous, except where spot welding is specifically permitted. Welds exposed to view shall be ground flush and dressed smooth. All welds on or behind surfaces which will be exposed to view shall be done so that finished surfaces will be free of imperfections such as pits, runs, splatter, cracks, warping, dimpling, depressions or other forms of distortion or discoloration. All welded surfaces shall be free of weld splatter and welding oxides.
- S. All extruded aluminum fixtures shall be fabricated of 6063-T3 alloy (min. wall thickness .120 unless otherwise noted on the Contract Drawings) and in all cases shall be provided with heavy gauge internal alignment brackets in order to assure tight joints and a clean level and continuous appearance after installation. Unless otherwise noted, all end plates shall be continuously welded, filled and ground prior to application of final paint finishes so as to present a clean, seamless and monolithic appearance. Miter cuts shall be accurate. Joints shall be flush and without burrs. Cuts shall maintain alignment with the light fixture located in its final position.
- T. Exposed fasteners on end plates are prohibited.

- U. All fixtures with removable louvers, lenses, reflectors, refractors, cones or other shielding devices shall be supplied with integral safety chains/cables. Contractor shall be responsible for insuring that all safety chains/cables are securely fastened to shielding device and fixture housing.
- V. Exposed Fasteners: All fasteners at every product and assembly exposed to view or accessible with the inpatient environment shall be security head Torx center pin tamper resistant, and stainless steel.
- W. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- X. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
  - 1. White Surfaces: 92 percent
  - 2. Specular Surfaces: 87 percent
  - 3. Diffusing Specular Surfaces: 83 percent
- Y. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of support materials.
- Z. Factory-Applied Labels: Labels shall be located where they will be readily visible to service staff, but not seen from normal viewing angles when trims/lenses are in place. Equip each fixture with a label, located conspicuously inside of fixture, which states the type of LED module required for the fixture.
- AA. Additional Components: Equip fixtures with the following additional components, as applicable:
  - 1. Additional drivers for night light or emergency light circuits where indicated on drawings.
  - 2. Plaster frames as required for installation of recessed and semi-recessed fixtures.
  - 3. Safety clips for fixtures installed in grid ceilings.
  - 4. End caps for individually mounted fixtures and end of continuous row fixtures.
  - 5. Finishing collar or combination finishing collar/outlet box for surface mounted fixture used with exposed raceway:
    - a. Finishing Collar: Same finish and peripheral dimensions as the fixture base, including provisions for mounting, slots to fit over raceway and of depth to cover outlet box and extend back to ceiling or wall.
    - b. Combination Finishing Collar/Outlet Box: Same finish and peripheral dimensions as the fixture base, gauge or thickness of metal as required by National Electrical Code, including provisions for mounting and knockouts or threaded bosses for entrance of raceway.

## 2.3 SOLID STATE LIGHTING (LED) FIXTURES

### A. General

- 1. All fixtures shall conform with standards prepared by CIE, IES, UL, and other standards organizations as they apply to solid state lighting technologies. Including but not limited to:
- 2. TC2-46 CIE/ISO standards on LED intensity measurements.
- 3. TC2-50 Measurements of the optical properties of LED clusters and arrays.
- 4. TC2-58 Measurements of LED radiance and luminance.
- 5. TC2-63 Optical measurement of High-Power LEDs.
- 6. TC2-64 High speed testing methods for LEDs.
- 7. Luminaire performance claims shall be measured in accordance with the requirements of IEC/PAS 62612: Edition 1: 2009-06. The testing quantity for LED package lamps shall be

a minimum of (20) twenty. The drive current and bin reference should be clearly documented. All manufacturer data to include:

- a. Luminaire efficacy should be calculated from the initial lumen output of the luminaire that has reached thermal stability operating in an ambient temperature of 25 degrees Celsius and based on the total power of the LEDs and driver circuit.
- b. Definition of life shall comply with Clause 10 IEC/PAS 62612. Life shall be based on lumen depreciation and failure and shall consist of an endurance test. It shall be clearly noted which part of life and lumen depreciation has been measured and what part has been calculated or extrapolated.
- c. Lumen depreciation shall be clearly document the length of time a complete LED luminaire provided more than a percentage of the rated luminous flux under standard test conditions. For illuminating luminaires the percentage shall be >70%, indicated as L70 (>70%). For direct view luminaires the percentage should be >50%, indicated as L50.
- d. Thermal Losses: The temperature of the p-n junction of the raw LED (die) (Tj) is to be measured at an ambient temperature of 25 degrees Celsius. In a luminaire the die will be operating at a higher temperature. All performance parameters are to measure the junction temperature and board temperature.
- e. Thermal Protection: All fixtures shall be provided with appropriate heat sink to maintain lamp life. Stated lamp life and output shall be measured and identified and documented with heat sink. Any variations from stated life or output without heat sink shall be clearly identified including junction temperature.

8. Drivers

- a. Constant Current Drivers (non-dimming): All constant current drivers shall be UL 1310 class 2 including short-circuit protection, high-power factor, with either 12v or 24v input, unless otherwise noted. The driver shall operation on the voltage they are connected to, 120 or 277v input power. Variability in output shall not exceed 5% in load or 1% line levels. Driver shall be designed for use in -40 degree Celsius environments with a high temperature tolerance of +60 degrees ambient, 80 degrees Celsius case rating. Total harmonic distortions shall not exceed 20% with a current crest factor of 1.5 maximum. All drivers shall be field replaceable.  
Dimming Drivers: All PWM dimming drivers shall be UL 1310 class 2 including short-circuit protection, high-power factor, with either 12v or 24v input, unless otherwise noted. The light output of the LED shall be controlled either by DC voltage applied to the control input (0-10V) with a maximum of 500 microamps per driver. The control equipment must not impose a voltage greater than 11.0V peak maximum on the driver terminals and the short-term transient voltage must not exceed 14 volts. Control equipment intended to control more than one driver must be capable of sinking the current supplied to the control bus by the maximum number of drivers specified for the control device. The control terminals for the driver shall be isolated from the power lines and suitable for use as Class II terminals. Maximum voltage drop not to exceed 0.2 volts. Variability in output shall not exceed 5% in load or 1% line levels. Driver shall be designed for use in -40 degree Celsius environments with a high temperature tolerance of +60 degrees ambient, 80 degrees Celsius case rating. Total harmonic distortions shall not exceed 20% with a current crest factor of 1.5 maximum.

9. Lamp Module:

- a. LED lamp modules shall be minimum CRI of 70 with tolerances as identified in Clause 7 IEC/PAS 62612.

- b. White LED modules shall be available in 3000K, 3500K, and 4000K as identified in the lighting fixture schedule.

## 2.4 LIGHTING FIXTURE SUPPORT COMPONENTS

- A. Comply with Section 26 05 33 "Raceway and Boxes for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
- C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
- D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gauge
- E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gauge.
- F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
- G. Stems:
  - 1. Each stem shall have a brass or steel swivel, hang straight, or other self-aligning device.
  - 2. Wherever a fixture or its hanger canopy is applied to a surface mounted outlet box a finishing ring shall be utilized to conceal the box.
  - 3. Unless otherwise indicated, all stems shall match in color and finish the color of the fixture which they support.
  - 4. Stems shall be free of clamp marks, scratches and all other visual imperfections.
  - 5. Unless otherwise indicated, stems shall be provided in order to adequately mount and level each fixture run with proper structural support per manufacturer's recommendations.
  - 6. Install pendant lighting fixtures plumb and at a height from the floor as specified on the drawings. In cases where conditions make this impractical, refer to the Commissioner for direction. Use ball aligners and canopies on pendant fixtures unless otherwise noted.
  - 7. Space stems equally spaced every fixture run. If field conditions or fixture construction do not allow for this condition, the installing Contractor shall immediately notify the Commissioner prior to commencement of the work.

## 2.5 FINISHES

- A. Painted surfaces shall be synthetic enamel with acrylic, alkyd, epoxy, polyester or polyurethane base, light stabilized, baked on at 350 degrees Fahrenheit minimum, catalytically or photo-chemically polymerized after application.
- B. Optical white finishes: minimum 92% reflectance (semi-gloss).
- C. Selection: Unless otherwise indicated, all fixture finishes shall be semi-gloss polyester powder coat enamel (color to be selected by Commissioner).
- D. Undercoat: Except for stainless steel all ferrous metal surfaces shall be given a five stage phosphate treatment or other acceptable base bonding treatment before final painting and after fabrication.
- E. Unpainted non-reflecting surfaces shall be satin finished and coated with a baked-on clear lacquer to preserve the finish. Where aluminum surfaces are treated with an anodic process, the clear lacquer coating may be omitted.

- F. Unpainted aluminum surfaces: Finish interior aluminum trims with an anodized coating of not less than 7 mg. per square inch, of a color and surface finish as selected by the Commissioner. Finish exterior aluminum and aluminum trims with an anodized coating of not less than 35 mg. per square inch of a color and surface finish as selected by the Commissioner.
- G. Metal finishes: Provide finishes of the color and type indicated and having the following properties:
  - 1. Protection of metal from corrosion: 5-year warranty against perforation or erosion of the finish from weathering.
  - 2. Color retention: 5-year warranty against fading, staining, or chalking from weathering including solar radiation.
  - 3. Uniformity: Provide finish of uniform thickness and color, free from streaks, stains or orange peel texture.

## 2.6 REFLECTORS

- A. Reflectors, cones or baffles shall be absolutely free of spinning lines, stains, ripples or any marks or indentations caused by riveting to other assembly techniques.
- B. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
- C. All fixtures with removable reflectors shall be supplied with safety chains/cables. Where stem-mounted pendant fixtures are indicated provide a minimum of (3) three cable supports to minimize sway. Cable supports shall be stainless steel woven wire (or equivalent).
- D. Cone flanges shall be formed as an integral part of the cone and shall have identical color and finish as the cone, except as shown. The flange's major surface shall be perpendicular to the cone axis.
- E. The reflecting surface of the cone or reflector shall be tested for proper sealing. Test per ASTM B136-63T. If any stain is visible, the specimen shall not be considered to have been properly sealed. Reflector cones shall be free of manufactured defects. The reflector inner surface shall be free of water spotting and shall maintain a reflectivity ratio of not less than 83% on clear specular finish.
- F. All Alzak parabolic cones shall be guaranteed by the manufacturer against discoloration for a minimum of ten years and in the event of premature discoloration shall be replaced by the manufacturer (including both materials and the expense of labor) at no additional expense to the City of New York.

## 2.7 LENSES, LOUVERS, AND DIFFUSERS

- A. All lenses, diffusers, and shielding media shall be properly and securely mounted within fixture assemblies. All fixtures with removable reflectors, louvers or baffles shall be supplied with safety chains/cables.
- B. All fixtures with removable louvers or other shielding devices shall be supplied with safety chains/cables.
- C. Unless otherwise indicated, all plastic shielding, lenses and diffusers shall be clear 100% UV stabilized virgin acrylic or polycarbonate.
- D. Unless otherwise indicated, all glass shielding, diffusers or lenses shall be clear tempered borosilicate glass. Soda Lime glass is not acceptable. Min. transmittance = 92%.

- E. Optical lenses shall be free from spherical or chromatic aberrations and other imperfections, which may hinder the functional performance of the lenses.
- F. All lenses, louvers or other light diffusing elements shall be removable but positively held so that hinging or other normal motion will not cause them to drop out. Lay-in type lenses and louvers are not acceptable.

## 2.8 MISCELLANEOUS

- A. Where (or if) indicated all remote step-down transformers and drivers shall be properly wired to fixtures to ensure that voltage drop does not exceed 5%, regardless of transformer's or driver's location.
- B. All remote step-down transformers and drivers shall be mounted in approved NEMA type enclosures and only located in areas previously deemed to be readily accessible by the Commissioner's maintenance staff.
- C. All fixture lengths whether straight or curvilinear shall be fabricated based upon the fixture manufacturer's or contractor's field verified dimensions only.
- D. Fixture manufacturer shall coordinate conduit entry locations with installing contractor.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 INSTALLATION

- A. General: Install fixtures at locations indicated on the drawings. Do not scale electrical drawings for exact location of the lighting fixtures; in general, the architectural reflected ceiling plans indicate the proper locations of lighting fixtures, unless otherwise noted on architectural plans. Set level, plumb and square with ceilings and walls unless otherwise indicated. Align luminaires set in continuous rows.
- B. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.
- C. All fixture lengths whether straight or curvilinear shall be fabricated based upon the fixture manufacturer's or contractor's field verified dimensions only.
- D. Temporary Lighting: If it is necessary, and approved by Commissioner, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, and reinstall.
- E. Mounting: Mounting heights specified or indicated are to bottom of fixture for suspended and ceiling mounted fixtures and to center of fixture for wall mounted fixtures. Obtain approval of the exact mounting for lighting fixtures on the job before installation in commenced and, where applicable, after coordinating with the type, style, and pattern of the ceiling being installed.

- F. Remote Mounting of Drivers: Distance between the driver and fixture shall not exceed that recommended by driver manufacturer. Verify with driver manufacturers the maximum distance between driver and luminaire.
- G. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element, where permitted by Code.
  - 1. Install ceiling support system rods or wires for each fixture. Locate not more than 6 inches from lighting fixture corners.
  - 2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
  - 3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.
  - 4. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.
- H. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
- I. Unless otherwise shown on the Contract Drawings, lighting fixtures and/or fixture outlet boxes shall be provided with hangers to adequately support the complete weight of the lighting fixture.
- J. Provide all hangers, rods, mounting brackets, supports, frames, earthquake clips and other equipment normally required for the proper, safe and distortion-free installation in the various surfaces in which they appear. Determine surface types from the architectural drawings.
- K. All pendant mounted lighting fixtures within the same room or area shall be installed plumb, and at a uniform height from the finished floor. Adjustment of desired height (if required) shall be made during the installation phase. Unless otherwise shown on the Contract Drawings, stems and canopies shall be matched to the associated lighting fixtures.
- L. Install reflector cones, baffles, aperture plates, light controlling elements for air handling fixtures and decorative elements after completion of ceiling tiles, painting and general cleanup.
- M. Replace blemished, damaged, or unsatisfactory fixtures as directed by the Commissioner.

### 3.3 COMMISSIONING AND DEMONSTRATION

- A. After system checkout and adjustment, operate the system for the review of the Commissioner and Commissioning Agent. Necessary adjustments or modifications shall be made as required by the Commissioner and Commissioning Agent.

### 3.4 ADJUSTING AND CLEANING

- A. Clean lighting fixtures of dirt and debris upon completion of installation.
- B. Protect installed fixtures from damage during remainder of construction period.
- C. Occupancy Adjustments: Within 12 months of date of Substantial Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.
  - 1. Adjust aimable luminaires in the presence of Commissioner.
  - 2. As/if required, aiming shall be accomplished at night.

**3.5 FIELD QUALITY CONTROL**

- A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to backup power source and retransfer to normal.
- B. Verify that self-luminous exit signs are installed according to their listing and the requirements in NFPA 101.
- C. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

**END OF SECTION 26 51 00**

**SECTION 26 56 00**  
**EXTERIOR LIGHTING**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).

**1.2 SUMMARY**

- A. This Section includes light fixtures, lamps and ballasts requirements for the following:

- 1. Exterior lighting fixtures, with LED modules, components and drivers.
  - a. Light Emitting Diodes (LEDs)
- 2. Fixture mounting shielding & accessories.
- 3. Poles and mounting arms

- B. Refer to other sections for the following:

- 1. Section 04 20 00 "Unit Masonry"
- 2. Section 05 50 00 "Metal Fabrications"
- 3. Section 05 52 13 "Pipe and Tube Railings"
- 4. Section 26 05 53 "Identification for Electrical Systems"
- 5. Section 26 05 00 "Common Requirements for Electrical Work"
- 6. Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables"
- 7. Section 26 05 33 "Raceway and Boxes for Electrical Systems"
- 8. Section 26 27 26 "Wiring Devices."
- 9. Section 26 24 16 "Panelboards"
- 10. Section 26 29 13 "Enclosed Controllers"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – Construction Waste Management and Disposal
  - 2. Section 01 81 13 – Sustainable Design Requirements For LEED Buildings
  - 3. Section 01 81 19 – Indoor Air Quality Requirements For LEED Buildings
- C. LEED Building Performance Requirements: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 “Indoor Air Quality Management”, where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED Building Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED Building Submittal requirements.

#### 1.5 DEFINITIONS

- A. Average Rated Lamp Life (LED): The period of time after which 70 percent of its initial output will have declined which is normally targeted at 50,000 hours.
- B. Fixture/Luminaire: A complete lighting unit. Fixtures/luminaires include lamps, ballasts, drivers, and parts required to distribute the light, position and protect lamps, and connect lamps to the power supply.
- C. CCT: Correlated color temperature.
- D. CRI: Color-rendering index.
- E. LER: Luminaire efficacy rating.
- F. LED: Light Emitting Diode
- G. Pole: Luminaire support structure, including tower used for large area illumination.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

#### 1.7 SUBMITTALS

- A. General:
  1. Reviews of submittals are to establish general conformance to design intent and do not waive contract requirements. Contractor is responsible for all dimensions, quantities, mounting accessories, methods of construction, and compliance with the Contract Documents.
  2. Provide separate submittal product data/shop drawings for each fixture type clearly indicating the fixture type designation per the Contract Documents and all pertinent options and accessories. Do not group similar fixture types together on a single cut sheet. Submittals which do not indicate option data where multiple selections exist will be returned without being reviewed.
  3. The contents of the shop drawings shall be prepared by the Manufacturers. Shop drawings prepared solely by the Contractor will not be acceptable.

- B. **Product Data:** For each luminaire, pole and support component (X series), arranged in order of lighting unit designation. Submit manufacturer's data on features, accessories, finishes, and the following, in reproducible form:
1. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters. Submit dimensioned drawings of lighting fixtures.
  2. Details of luminaire attachments and accessories.
  3. Details of installation and construction.
  4. Luminaire materials.
  5. **Photometric Data:** Supply complete photometric data for each fixture. Photometric reports shall be rendered by an independent testing laboratory developed according to methods of the Illuminating Engineering Society (IESNA) of North America as follows:
    - a. Candela distribution data presented graphically and numerically in no more than 5-degree increments (5, 10, 15, etc.). Data developed for up and down quadrants normal, parallel and at 22.5, 45, 167.5 degrees to fixture axis if light output is asymmetric. Photoelectric relays.
    - b. Zonal lumens stated numerically in 10 degree increments (5, 15, etc.) and fixture efficiency.
    - c. Luminance table with data presented numerically, showing maximum luminance of the fixture at the shielding angles. Readings should be taken both crosswise and lengthwise in the case of LED fixtures or fixtures with asymmetric distribution.
    - d. Coefficients of utilization table.
    - e. Driver UL listing, volts, input and output wattage, drive current.
    - f. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
  6. **Lamp Module:** All manufacturer data to include LED module information, including but not limited to:
    - a. Manufacturer of the LED module with part number or other device identifier.
    - b. LED module drive current, voltage, power.
    - c. LED module lumen depreciation curves, life, CCT, CRI at an ambient temperature of 25 degrees Celsius.
    - d. Board temperature of the LED module installed in the luminaire with proper heat sink, when the luminaire is operating at an ambient temperature of 25 degrees Celsius.
    - e. The color bin, CCT, and color shift variation of the LED module at the operating board temperature.
    - f. Color rendering index at the operating board temperature.
  7. Materials, dimensions, and finishes of poles; details of handholes and wire entries, mast or bracket arms and connection to poles, wind load and deflection, corrosion resistance, and finishes.
  8. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
  9. Anchor bolts for poles.
  10. Manufactured pole foundations.
  11. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
- C. **Shop Drawings:** Include scalable plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  2. Design calculations (as requested), certified by a qualified professional engineer licensed in the State of New York, indicating strength of mechanical connections.
  3. Wiring Diagrams: For power, signal, and control wiring.
  4. Pole and Support Component Certificates: Signed by manufacturers of poles, certifying that products are designed for indicated load requirements in AASHTO LTS-6-2013 and that load imposed by luminaire and attachments has been included in design. The certification shall be based on design calculations by a professional engineer licensed in the state of New York certifying physical weights and dimensions.
  5. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
  6. Methods of field assembly including mounting.
  7. Components, features and accessories.
  8. Warranty: Provide complete manufacturer's warranty information on all products provided. Sample of special warranty. Sample of special warranty.
- D. Qualification Data: For qualified agencies (laboratories) providing photometric data for lighting fixtures.
- E. Submittals or shop drawings lacking sufficient detail to indicate clear and complete compliance with contract documents shall be rejected. Include plans, elevations, sections, details, and attachments to other work.
- F. Field quality-control reports.
- G. Operation and Maintenance Manuals: For luminaires and poles, to include in emergency, operation, and maintenance manuals. Provide a collection of manufacturer recommended maintenance practices for each lighting fixture type including, but not limited to:
1. Tools required.
  2. Acceptable cleaners and recommended cleaning practices.
  3. Replacement parts list.
  4. Manufacturer service department contact information/Qualified Service Agencies.
  5. Submittal Data.
  6. Operation Data.
  7. Intended Operation Narrative.
- H. Samples: Submit for review one representative sample for each or any lighting fixture required under this Contract.
1. The samples must be actual working unit of fixtures to be supplied and shall be submitted complete with cord and plug, wired for 120 Volt operation.
  2. After sample acceptance, the fixture shall be sent to the project for use as a standard. In the event the submission is rejected, the fixture will be returned to the manufacturer who shall immediately make a new submission which meets the contract requirements.
  3. All substitutions shall be provided as samples for review and approval prior to fabrication.

## 1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
1. The product manufacturer shall have test facilities available that can demonstrate that the proposed products meet the contract requirements.

- a. Make arrangements with the test facility for the Commissioner to witness test demonstrations. Also obtain the services of the Lighting Manufacturer's Product Manager/Engineer for the proposed product to be present at the test facility. Notify the Commissioner a minimum of 3 weeks prior to the availability of the test facility and provide at least one alternative date for the testing.
2. Provide written certification from the manufacturer that the proposed products are compatible for use with all other equipment proposed for use for this system and meet all contract requirements.
- B. All lighting fixtures shall be manufactured, furnished, and installed in compliance with "NFPA 70 National Electrical Code" and 2014 New York City Construction Codes. All fixtures shall bear the appropriate UL (or ETL) and IBEW identifications.
- C. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing & Calculation Guides.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. Mockups: Provide exterior lighting fixtures for in situ mockups complete with power and control connections; the specific design requirements of several building conditions mandate the necessity of full scale on site mockups prior to final authorization (release) to fabricate.
  1. Obtain Commissioner's approval of fixtures for mockups before starting installations.
  2. Installation of all luminaire types subject to mockup requirements may not proceed until mockup is accepted by Commissioner.
  3. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
  4. Approved fixtures in mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
  5. Mockups of the following fixture types shall be provided by the Contractor in the following configurations:

Type	Location	Magnitude (Extent)
X1	Entry Plaza	1 fixture with pole, temporary power and cabling as a complete assembly
X2/X2a	Parking Lot	2 fixtures with pole, temporary power and cabling as a complete assembly
X3	South Parking Lot	1 fixture with temporary power and cabling as a complete assembly
X8	Roof Top – Parapet	1 fixture with visor, steel support system, temporary power and cabling as a complete assembly
X10	Entry Plaza – Flag Pole	2 fixtures with mounting bracket, temporary power and cabling as a complete assembly
X11	1 Story Wing	1 fixture with visor, steel support system, temporary power and cabling as a complete assembly

- F. Underwriters Laboratories, Inc. (UL): Comply with applicable UL standards pertaining to exterior lighting equipment.
- G. Manufacturer Requirements:
  - 1. Experience: The manufacturer providing the material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such similar material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
  - 2. Custom luminaires: Manufacturers shall submit a prototype (pre-fabrication sample) of each fixture for review by the Commissioner. Prototypes shall be sufficiently detailed and operational to allow evaluation of compliance with the salient features of the specification. Preliminary design or shop drawings shall not be accepted in place of prototype samples.

#### 1.9 INDUSTRY STANDARDS

- A. Applicability of Standards: Except where more explicit or stringent requirements are written into the Contract Documents, applicable construction industry standards have the same force and effect as if found in or copied directly into the Contract Documents. Such industry standards are made a part of the Contract Documents by reference.
  - 1. Referenced standards (standards referenced directly in the contract documents) take precedence over standards that are not referenced but generally recognized in the industry for applicability to the work.
  - 2. Unreferenced standards are not directly applicable to the work, except as a general requirement of whether the work complies with recognized construction industry standards.
- B. Publication Dates: Except as otherwise indicated, where compliance with an industry standard is required, comply with the latest standard in effect as of date of Contract Documents.

#### 1.10 DELIVERY, STORAGE AND HANDLING

- A. Lighting fixtures shall be wrapped for protection during delivery, storage, and handling. Wet or damp wrapping shall be removed, and disposed of, to prevent staining finish.
- B. Deliver materials in manufacturer's original, unopened, protective packaging.
- C. Store materials in original packaging in a manner to prevent soiling and physical damage, prior to installation.
- D. Handle in a manner to prevent damage to finished surfaces.
- E. Where possible, maintain protective covering until installation is complete and remove such coverings as part of final cleanup.
- F. Package steel & aluminum poles for shipping according to ASTM B 660.
- G. Store poles on decay-resistant-treated skids at least 12-inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.
- H. Retain factory-applied pole wrappings on metal poles until right before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.
- I. Light poles and fixtures shall be wrapped for protection during delivery, storage, and handling. Wet or damp wrapping shall be removed, and disposed of, to prevent staining finish.

**1.11 WARRANTY**

- A. **Manufacturer's Warranty:** Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.
1. **Warranty Period for LED Entire Luminaires** (fixture components can be field replaceable): Entire fixture shall carry a minimum 1 year warranty from date of substantial completion.
  2. **Warranty Period for LED Entire Luminaires** (fixture components cannot be field replaceable): Entire fixture shall carry a minimum 5 years warranty from date of substantial completion.
  3. **Warranty Period for LED Modules and Drivers:** five (5) years from the date of Substantial Completion.
  4. **Warranty Period for Poles:** Repair or replace lighting poles and standards that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less than three years from date of Substantial Completion.

**1.12 TECHNICAL & ADMINISTRATIVE REQUIREMENTS**

- A. All information identified in the Contract Documents shall be considered to form a complete and integrated Specification for Lighting Fixtures.
- B. Specifications and drawings are intended to convey the salient features, function and character of the fixtures only, and do not undertake to illustrate or set forth every item or detail necessary for the work. Minor details not usually indicated on the drawings nor specified, but that are necessary or normally required for the proper execution, completion, installation and operation of the fixtures, shall be included, the same as if they were herein specified or indicated on the drawings.
- C. The Commissioner shall not be held responsible for the omission or absence of any detail, construction feature, etc. which may be normally required in the production of the lighting fixtures. The full and complete responsibility for accurately purchasing, fabricating and installing the lighting fixtures described herein to the fulfillment of those specifications including compliance with all regulatory bodies (i.e.: UL) shall rest solely with the Contractor and the fixture manufacturer.
- D. The Contractor shall be solely responsible for verifying all fixture quantities, lengths and clearances required and shall inform the Commissioner of job conditions at variance with fixtures as specified or detailed which affect installation or location while submission is made.
- E. The Contractor shall be solely responsible for coordinating and expediting the timely procurement and delivery for all lighting equipment, lamps, ballasts and related components for the project.
- F. Ensure that the lighting fixture manufacturer shall keep on file and make available for review by the Commissioner complete Quality Control and Quality Assurance records for all phases of production for all lighting fixtures to be supplied under this project.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Refer to the Lighting Fixture Schedule on the Lighting Drawings.

- B. Subject to compliance with requirements, provide the Basis-of-Design product and manufacturer, or an equivalent product from an approved equal manufacturer, for each lighting fixture type. The Basis-of-Design product and manufacturer for each lighting fixture type, as well as approved equal manufacturers for each lighting fixture type, are provided on the Lighting Fixture Schedule of the Lighting Drawings.

## 2.2 GENERAL

- A. Provide fixtures designed and manufactured specifically for long term outdoor service. Make components, including nuts, bolts, rivets, springs, and similar parts, of corrosion resistant materials or of materials which will assure such resistance.
- B. Provide wet location labeled outdoor fixtures for areas directly exposed to the elements. All upward aiming products shall have a minimum IP rating of 66 (IP66) or otherwise designated in the lighting fixture schedules.
- C. Paint metal parts of fixtures with suitable weather and moisture-resisting paint equal to epoxy-based coatings.
- D. Provide anodized aluminum for aluminum parts of exterior fixtures that are not specified as requiring a painted finish.
- E. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by a NRTL acceptable to 2014 New York City Construction Codes.
- F. Lighting fixtures shall be of rigid construction, dimensionally stable, and shall be assembled with secure fastenings. Ferrous parts shall be protected from corrosion by plating or shall be finished with high reflectance enamel with non-yellowing binder and high pigment to binder ratio, with semi-gloss finish. Ferrous parts shall be prepared for finish by industry standard finishing process (see Finishes). Non-ferrous metals (i.e. aluminum) unless otherwise noted be treated with a semi-gloss polyester powder coat enamel finish. Provide each fixture with lamps as indicated in the lighting fixture schedule.
- G. All materials, accessories, and other related fixture parts shall be new and free from defects which in any manner may impair their character, appearance, strength, durability and function, and be effectively protected from any damage or injury from the time of fabrication to the time of delivery.
- H. For steel and aluminum fixtures all screws, bolts, nuts and other fastening and latching hardware shall be cadmium or equivalent plated. For stainless steel fixtures, all hardware shall be stainless steel. Whenever possible all fasteners shall be captive type. Where indicated provide tamper resistant fasteners.
- I. Underground wiring:
  - 1. Type THWN installed in rigid PVC conduit.
  - 2. Fixture wiring shall be suitable for the temperature rating of the fixture; wiring through LED channels shall be done with Type SFF2 wire unless otherwise noted on Engineer's drawings.
- J. Metal Parts: Free of burrs and sharp corners and edges. All sheet metal work shall be free from tool marks and dents.
- K. Casting: All aluminum, iron or composite casting shall be exact replicas of the approved patterns and shall be free of sand pits, blemishes, scales and rust, and shall be smoothly furnished. Tolerance shall be provided for any shrinkage of the metal castings in order that the finished casting will accurately fit in their designated locations. Unless otherwise noted, for cast aluminum

components use copper-free 319 or 443 aluminum alloy only. For cast iron components use ASTM Spec A48-83 Class 30 gray iron.

- L. Furnish and install yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels or other structure.
- M. Sheet Metal Components: Corrosion-resistant aluminum, unless otherwise indicated. Form and support to prevent warping and sagging.
- N. Welding shall be in accordance with recommendations of the American Welding Society and shall be done with electrodes and/or methods recommended by the manufacturers of the metals being welded. Welds shall be continuous, except where spot welding is specifically permitted. Welds exposed to view shall be ground flush and dressed smooth. All welds on or behind surfaces which will be exposed to view shall be done so that finished surfaces will be free of imperfections such as pits, runs, splatter, cracks, warping, dimpling, depressions or other forms of distortion or discoloration. All welded surfaces shall be free of weld splatter and welding oxides.
- O. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
- P. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- Q. Exposed Fasteners: All fasteners at every product and assembly exposed to view or accessible with the inpatient environment shall be security torx tamper resistant and stainless steel.
- R. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- S. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
- T. Provide each fixture with lamps as indicated in the lighting fixture schedule.
- U. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:
  - 1. White Surfaces: 90 Percent.
  - 2. Specular Surfaces: 87 Percent.
  - 3. Diffusing Specular Surfaces: 75 Percent.
- V. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
- W. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and ballasts. Labels shall be located where they will be readily visible to service staff, but not seen from normal viewing angles when lamps are in place.
- X. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- Y. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

- Z. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
  - 1. Materials: Shall not cause galvanic action at contact points.
  - 2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
  - 3. Anchor-Bolt Template: Plywood or steel.
- AA. Brackets: Provide brackets, cantilevered and without underbrace of the sizes, styles and finishes indicated with straight tubular and section to accommodate the luminaire.

## 2.3 SOLID STATE LIGHTING (LED) FIXTURES

- A. General.
  - 1. All fixtures shall conform with standards prepared by CIE, IES, UL, and other standards organizations as they apply to solid state lighting technologies. Including but not limited to:
  - 2. TC2-46 CIE/ISO standards on LED intensity measurements.
  - 3. TC2-50 Measurements of the optical properties of LED clusters and arrays.
  - 4. TC2-58 Measurements of LED radiance and luminance.
  - 5. TC2-63 Optical measurement of High-Power LEDs.
  - 6. TC2-64 High speed testing methods for LEDs.
  - 7. LED Luminaires: Lighting fixtures shall conform to IES LM-79-08 and LM-80-08 standards. All fixtures shall be RoHS compliant.
  - 8. Luminaire performance claims shall be measured in accordance with the requirements of IEC/PAS 62612: Edition 1: 2009-06. The testing quantity for LED package lamps shall be a minimum of (20) twenty. The drive current and bin reference should be clearly documented. All manufacturer data to include:
    - a. Luminaire efficacy should be calculated from the initial lumen output of the luminaire that has reached thermal stability operating in an ambient temperature of 25 degrees Celsius and based on the total power of the LEDs and driver circuit.
    - b. Definition of life shall comply with Clause 10 IEC/PAS 62612. Life shall be based on lumen depreciation and failure and shall consist of an endurance test. It shall be clearly noted which part of life and lumen depreciation has been measured and what part has been calculated or extrapolated.
    - c. Lumen depreciation shall be clearly document the length of time a complete LED luminaire provided more than a percentage of the rated luminous flux under standard test conditions. For illuminating luminaires the percentage shall be >70%, indicated as L70 (>70%). For direct view luminaires the percentage should be >50%, indicated as L50.
    - d. Thermal losses: The temperature of the p-n junction of the raw LED (die) (Tj) is to be measured at an ambient temperature of 25 degrees Celsius. In a luminaire the die will be operating at a higher temperature. All performance parameters are to measure the Junction Temperature and Board Temperature.
    - e. Thermal protection: All fixtures shall be provided with appropriate heat sink to maintain lamp life. Stated lamp life and output shall be measured and identified and documented with heat sink. Any variations from stated life or output without heat sink shall be clearly identified including Junction Temperature.
    - f. Warranty: Entire fixture shall carry a minimum 5 year warranty.
- 9. Drivers
  - a. Constant current Drivers (non-dimming): All constant current drivers shall be UL 1310 class 2 including short-circuit protection, high-power factor, with either 12v or

24v input, unless otherwise noted. The driver shall operation on the voltage they are connected to, 120 or 277v input power. Variability in output shall not exceed 5% in load or 1% line levels. Driver shall be designed for use in -40 degree Celsius environments with a high temperature tolerance of +60 degrees ambient, 80 degrees Celsius case rating. Total harmonic distortions shall not exceed 20% with a current crest factor of 1.5 maximum. All drivers shall be field replaceable.

- b. Dimming Drivers: All PWM dimming drivers shall be UL 1310 class 2 including short-circuit protection, high-power factor, with either 12v or 24v input, unless otherwise noted. The light output of the LED shall be controlled either by DC voltage applied to the control input (0-10V) with a maximum of 500 microamps per driver. The control equipment must not impose a voltage greater than 11.0V peak maximum on the driver terminals and the short-term transient voltage must not exceed 14 volts. Control equipment intended to control more than one driver must be capable of sinking the current supplied to the control bus by the maximum number of drivers specified for the control device. The control terminals for the driver shall be isolated from the power lines and suitable for use as Class II terminals. Maximum voltage drop not to exceed 0.2 volts. Variability in output shall not exceed 5% in load or 1% line levels. Driver shall be designed for use in -40 degree Celsius environments with a high temperature tolerance of +60 degrees ambient, 80 degrees Celsius case rating. Total harmonic distortions shall not exceed 20% with a current crest factor of 1.5 maximum. All drivers shall be field replaceable.

10. Warranty: Driver shall carry a 5 year warranty.

11. Lamp Module:

- a. LED lamp modules shall be minimum CRI of 70 with tolerances as identified in Clause 7 IEC/PAS 62612.
- b. White LED modules shall be available in 4000°K as identified in the lighting fixture schedule.

## 2.4 LENSES

- A. All lenses, diffusers, and shielding media shall be properly and securely mounted within fixture assemblies. All fixtures with removable reflectors, louvers or baffles shall be supplied with safety chains.
- B. All fixtures with removable shielding devices shall be supplied with safety chains.
- C. Unless otherwise indicated, all plastic shielding, lenses and diffusers shall be clear 100% UV stabilized virgin acrylic or polycarbonate.
- D. Unless otherwise indicated, all glass shielding, diffusers or lenses shall be clear tempered borosilicate glass.
- E. Optical lenses shall be free from spherical or chromatic aberrations and other imperfections, which may hinder the functional performance of the lenses.
- F. All lenses, louvers or other light diffusing elements shall be removable but positively held so that hinging or other normal motion will not cause them to drop out.

## 2.5 FINISHES

- A. Painted surfaces shall be synthetic enamel with acrylic, alkyd, epoxy, polyester or polyurethane base, light stabilized, baked on at 350 degrees Fahrenheit minimum, catalytically or photo chemically polymerized after application.

- B. White finishes minimum 90% reflectance (semi-gloss).
- C. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
- D. Undercoat: Except for stainless steel all ferrous metal surfaces shall be given a five stage phosphate treatment or other acceptable base bonding treatment before final painting and after fabrication.
- E. Unpainted non-reflecting surfaces shall be satin finished and coated with a baked-on clear lacquer to preserve the finish. Where aluminum surfaces are treated with an anodic process, the clear lacquer coating may be omitted.
- F. Unpainted aluminum surfaces: Finish interior aluminum trims with an anodized coating of not less than 7 mg. per square inch, of a color and surface finish as selected by the Commissioner. Finish exterior aluminum and aluminum trims with an anodized coating of not less than 35 mg. per square inch of a color and surface finish as selected by the Commissioner.
- G. Metal finishes: Provide finishes of the color and type indicated and having the following properties:
  - 1. Protection of metal from corrosion: 5-year warranty against perforation or erosion of the finish from weathering.
  - 2. Color retention: 5-year warranty against fading, staining, or chalking from weathering including solar radiation.
  - 3. Uniformity: Provide finish of uniform thickness and color, free from streaks, stains or orange peel texture.
- H. Luminaire finishes: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finishes process and color of pole or support materials.

## 2.6 GENERAL REQUIREMENTS FOR POLE MOUNTED LUMINAIRES

- A. Provide poles of the types and heights indicated. Provide internal raceway for underground power supply, with luminaire support poles base indicated. Provide poles that will carry the indicated supports, luminaires and appurtenances, at the required heights above grade, without excessive deflection or whipping of the luminaire, when subjected to 110-mph winds with a 1.3 gust factor.
- B. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.
- C. Mounting, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
  - 1. Materials: Shall not cause galvanic action at contact points.
  - 2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
  - 3. Anchor-Bolt Template: Plywood or steel.
- D. Mast Arms: Provide steel mast arm, fabricated from 2-inch pipe with span and rise as indicated, and continuously welded to pole attachment plat.
- E. Brackets: Provide brackets, cantilevered and without underbrace of the sizes, styles and finishes indicated with straight tubular and section to accommodate the luminaire.
- F. Pole-Top Tenon: Provide corrosion resistant steel tenon securely fastened to the top of the pole shaft fabricated to accept and rigidly support the luminaire to be mounted thereon.

- G. Furnish and install yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels or other structure. All pole-mounted luminaires shall mount via pole-top tenon to reduce vibration.
- H. Structural Characteristics: Comply with AASHTO.
  - 1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of 110 mph, with a gust factor of 1.3.
  - 2. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.

## 2.7 POLES: ALUMINUM

- A. Aluminum Poles (Refer to Structural Drawings).
- B. Aluminum 6063-T6 alloy, tapered pole with 0.10" to 0.20" per foot rate of taper, designed for 177 km/h (110 MPH) constant velocity wind load per AASHTO, and 3lbf/sq. ft. ice load.
  - 1. Include base template, 4 galvanized (hot-dip) ASTM A153 steel anchor bolts, stainless steel hardware and pole grounding lug, handhole, cast marine-grade, copper-free aluminum A356-T6 alloy anchor base and bolt covers, vibration pad (as shown in Design Plans) and fabricated galvanized steel ASTM A123 tilt base.
  - 2. Include pole tenon to reduce fixture vibration.
  - 3. All aluminum welding shall be performed in the shop, using the inert metal-arc welding process. Filler metal shall conform to the A.W.S. Specification A5.10. Welders shall be properly trained in accordance with A.S.M.E. Section IX or A.W.S. D1.2.
- C. Pole foundations: As indicated.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 PREPARATION

- A. Before installing any Work, lay out the proposed course for the conduits, location of lighting standards, etc. and have same approved.

### 3.3 DELIVERY, STORAGE, AND HANDLING

- A. Lighting fixtures shall be wrapped for protection during delivery, storage, and handling. Wet or damp wrapping shall be removed, and disposed of, to prevent staining finish.
- B. Deliver materials in manufacturer's original, unopened, protective packaging.
- C. Store materials in original packaging in a manner to prevent soiling and physical damage, prior to installation.
- D. Handle in a manner to prevent damage to finished surfaces.
- E. Where possible, maintain protective covering until installation is complete and remove such coverings as part of final cleanup.

### 3.4 INSTALLATION: LUMINAIRES

- A. General: Install luminaires at locations and heights as indicated, in accordance with the manufacturer's written instructions, applicable requirements of NYPD, ANSI C2 and with recognized industry practices to ensure that lighting installation fulfills requirements.
- B. Furnish and install lighting fixtures as noted on the drawings.
- C. Setting and Securing: Set lighting fixtures plumb, square, and level with structure and walls, in alignment with adjacent lighting fixtures, and secure in accordance with manufacturers' directions and approved shop drawings. Conform to the requirements of NFPA 70. Adjust luminaires that require field adjustment or aiming.
- D. Support: Fasten luminaires securely to indicated structural supports; and check to ensure that the required degree of freedom is provided to allow alignment or aiming of the fixtures for indicated light distribution.
  - 1. Mounting, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
- E. Mounting: Mounting heights specified or indicated are to bottom of fixture for suspended, ceiling mounted and wall mounted fixtures. Obtain approval of the exact mounting for lighting fixtures on the job before installation is commenced and, where applicable, after coordinating with the type, style, and pattern of the existing wall and ceiling condition.
- F. Coordination: Communicate with other trades as appropriate to properly interface, schedule and coordinate installation of lighting fixtures with other work.
- G. Grounding of Equipment: Ground non-current-carrying parts of electrical equipment. Where the copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.
- H. Grounding of Equipment Connections: Provide equipment grounding connections using branch circuit equipment and connected sufficiently tight to assure a permanent and effective ground.
- I. Installation of fixture locations shall be in strict accordance with the intent of the contract drawings and approved shop drawings, specifications and drawings.
- J. Adjust photosensors to prevent false operation of relay by artificial light sources.
- K. Clean lighting fixtures of dirt and debris upon completion of installation.
- L. Protect installed fixtures from damage during remainder of construction period.
- M. Fixture locations: Do not scale electrical drawings for exact location of the lighting fixtures. In general, the architectural site/landscape plans indicate the proper locations of lighting fixtures, unless otherwise noted on architectural plans.
- N. Unless otherwise shown on the Contract Drawings, lighting fixtures and/or fixture outlet boxes shall be provided with hangers to adequately support the complete weight of the lighting fixture.
- O. Provide all hangers, rods, mounting brackets, supports, frames, earthquake clips and other equipment normally required for the proper, safe and distortion-free installation in the various surfaces in which they appear. Determine surface types from the Contract Drawings.

- P. Instructions: Each lighting fixture shall be packaged with complete illustration and instructions showing how to install. Install lighting fixtures in strict conformance with manufacturer's recommendations and instructions.
- Q. Rigidly align continuous rows of lighting fixtures for true aligned appearance.
- R. Support all lighting fixtures independently of ductwork or piping.
- S. Splices in internal wiring shall be made with approved insulated "wire nut" type mechanical connectors, suitable for the temperature and voltage conditions to which they are subjected.
- T. All wire utilized for connections to or between individual lamp sockets and lamp auxiliaries (i.e., wires which do not constitute "through circuit" wiring) shall be suitable for temperature, current, and voltage conditions to which it is subjected.
- U. Install reflector cones, baffles, aperture plates, light controlling elements for air handling fixtures and decorative elements after completion of ceiling tiles, painting and general cleanup.
- V. All pendant mounted lighting fixtures within the same area shall be installed plumb, and at a uniform height from the finished floor. Adjustment of desired height (if required) shall be made during the installation phase. Unless otherwise shown on the Contract Drawings, stems and canopies shall be matched to the associated lighting fixtures.
- W. Use fastening methods and materials approved by manufacturer.
- X. Adjust luminaires that require field adjustment or aiming. Where included, adjust photoelectric device to prevent false operation of relay by artificial light sources.
- Y. Where fixtures are wall-mounted and protrude from the wall surface, provide additional structural support within the wall framing to accommodate the extra moment force created by the fixture.
- Z. Adjust aimable lighting fixtures to provide required light intensities.
- AA. Replace blemished, damaged or unsatisfactory fixtures as directed by the Commissioner.

### 3.5 POLE INSTALLATION

- A. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.
- B. Pole installation shall be level and plumb to mounting surface. Follow manufacturers' recommendations and instructions for installations.
- C. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on Drawings:
  - 1. Fire Hydrants and Storm Drainage Piping: 3 feet.
  - 2. Water Gas, Electric, Communication, and Sewer Lines: 3 feet.
  - 3. Existing Trees: 10 feet from tree trunk.
- D. Foundation-Mounted Poles: Mount pole with leveling nuts and tighten top nuts to torque level recommended by pole manufacturer.
  - 1. Use anchor bolts and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
  - 2. Grout void between pole base and foundation. Use non-shrink or expanding concrete grout firmly packed to fill space.

3. Install base covers unless otherwise indicated.
4. Use a short piece of 1/2-inch- (13-mm-) diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.

E. Poles and Pole Foundations Set in Concrete Paved Areas: Install poles with minimum of 6 inch- (150-mm-) wide, unpaved gap between the pole or pole foundation and the edge of adjacent concrete slab. Fill unpaved ring with pea gravel to a level 1 inch (25 mm) below top of concrete slab.

F. Raise and set poles using web fabric slings (not chain or cable).

### 3.6 INSTALLATION OF INDIVIDUAL GROUND MOUNTING LUMINAIRES

A. Install on concrete base with top 4 inches above finished grade or surface at luminaire location. Cast luminaire finish into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Sections 03 30 00 "Cast-in-Place Concrete" and 03 33 00 "Architectural Concrete".

### 3.7 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

B. Steel Conduits: Comply with Section 26 05 33 "Raceways and Boxes for Electrical Systems". In concrete foundations, wrap conduit with 0.010-inch- thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

### 3.8 GROUNDING

A. Ground metal poles and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems".

1. Install a minimum of a 3/4" diameter by 8' copper grounding electrode for each pole, unless otherwise indicated, and installed as indicated on Contract Drawings.
2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

B. Ground nonmetallic poles and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems".

1. Install a minimum of a 3/4" diameter by 8' copper grounding electrode for each pole, unless otherwise indicated, and installed as indicated on Contract Drawings.
2. Install grounding conductor and conductor protector.
3. Ground metallic components of pole accessories and foundations.

### 3.9 RACEWAY AND BOXES

A. Galvanized rigid conduit shall be used under buildings, within five feet of entrances to buildings, in pole foundations, under paved areas and walkways and within 18" horizontal of exterior junction boxes.

B. Provide pull line in empty conduit and duct.

C. Comply with the additional requirements of Section 26 05 33 "Raceways and Boxes for Electrical Systems".

**3.10 IDENTIFICATION**

- A. Provide vinyl tagging with panel source and circuit number on wiring at handhole in each pole and at each exterior box.
- B. Identify each exterior box with one-inch black letters and numbers on white vinyl weatherproof pressure sensitive adhesive labels on the covers.
- C. Identify each pole with three-inch black letters and numbers on white vinyl weatherproof pressure sensitive adhesive labels 6'-6" above grade facing the parking areas or facing the road if the pole is at the road.
- D. Comply with the additional requirements of Section 26 05 53 "Identification of Electrical Systems".

**3.11 CONTRACTOR STARTUP AND REPORTING**

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
- C. Replace fixtures that show evidence of corrosion during project warranty period.
- D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.
- E. Tests: Upon completion of installation of lighting fixtures, and after building circuits have been energized, apply electrical energy to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.
- F. Instruct the City of New York's service staff on the proper operation and service of all products in this specification.

**3.12 FIELD QUALITY CONTROL**

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Illumination Observations:
  - 1. Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
  - 2. Verify operation of photoelectric controls.
- C. Illumination Tests
  - 1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards.
  - 2. Comply with the Sanitation Garage Design Guide.
  - 3. Comply with the following IESNA testing guide(s):
    - a. IESNA LM-5, "Photometric Measurements of Area and Sports Lighting Installations."
    - b. IESNA LM-72, "Directional Positioning of Photometric Data."

- D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

**3.13 COMMISSIONING AND DEMONSTRATION**

- A. After system checkout and adjustment, operate the system for the review of the Commissioner and Commissioning Agent. Necessary adjustments or modifications shall be made as required by the Commissioner and Commissioning Agent.

**3.14 ADJUSTING AND CLEANING**

- A. Clean: Clean lighting fixtures of dirt and debris upon completion of installation. Do not damage finishes or lens or refractor surfaces.
- B. Clean fixtures internally and externally after completion of installation. Use methods and materials recommended by manufacturer.
- C. Protection: Protect installed fixtures from damage during remainder of construction period.

**END OF SECTION 26 56 00**

**SECTION 27 00 00****TELECOMMUNICATIONS CABLING SYSTEMS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Work of this Section consists of cabling systems and related work described herein, and includes but is not limited to the following:

- 1. Telecommunications Cabling Systems

- B. Related Documents and Sections: Examine Contract Documents for requirements that directly affect or are affected by Work of this Section. A list of those Documents and Sections include, but is not limited to the following:

- 1. Contract Drawings.

- 2. Telecommunications Distribution Systems.

- C. All cables, connectors, faceplates, patch panels, patch cords, termination blocks, cross-connects, racks, cabinets, wire management devices, ladder racks, documentation, etc. shall be provided by the Contractor as outlined in this specification and the associated drawings unless stated otherwise.

- D. It is the intent of the drawings and specifications to provide a complete, operating telecommunications system. All telecommunications work necessary to provide such a system shall be performed. Any discrepancies shall be brought to the Commissioner's attention.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

- B. Refer to the following sections:

- 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 "INDOOR AIR QUALITY MANAGEMENT", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.6 CODES, PERMITS AND INSPECTIONS

- A. All telecommunications work shall meet or exceed the latest requirements of all national, state, county, municipal, 2014 New York City Construction Codes, and 2008 National Electrical Code.
- B. All required permits and inspection certificates shall be obtained, paid for, and made available at the completion of the telecommunications work. In the event that no official authority exists which will issue a certificate attesting to the compliance of the telecommunications installation, such a certificate shall be acquired from an independent agency selected by the Commissioner. Inspection and certification fees levied by this agency shall be paid for as part of the telecommunications work.
- C. Any portion of the telecommunications work, which is not subject to the requirements of the 2014 New York City Construction Codes, shall be governed by the National Electrical Code and other applicable sections of the National Fire Code, as published by the National Fire Protection Association.
- D. Installation procedures, methods and conditions shall comply with the latest requirements of the Federal Occupational Safety and Health Administration (OSHA).
- E. All installations shall be in conformance with the latest revisions of ANSI/TIA/EIA-568-C, 569-B, 606 and 607, as well as all associated addendums and telecommunications systems bulletins (TSB's).

## 1.7 CONTRACTOR QUALIFICATIONS

- A. The Contractor shall be fully conversant and capable in the cabling of data, voice and CATV facilities and shall at a minimum possess the following qualifications:
1. Installer shall be properly trained by the proposed manufacturer to install the proposed warranted cabling solution.
  2. Installer shall be properly trained in core alignment fiber optic splicing and connectorization techniques/technologies.
  3. Installer shall be properly trained in the use of fiber optic OTDR, OLS and mechanical splicing techniques.
  4. Installer shall be properly trained the installation of riser cable plant and experienced with cable support techniques, products and splicing techniques.
  5. Installer shall be properly trained in the installation of outside plant cable (both copper and fiber optic) including underground and aerial cable installation and splicing and protection techniques.
  6. Experience in the installation of coaxial cabling for the transmission of cable TV broadcast.
  7. Installer
    - a. The firm shall have at least one RCDD installer to oversee the project.

## 1.8 DEFINITIONS AND INTERPRETATION

- A. As used in the drawings and specifications for the telecommunications cabling work, certain non-technical words shall be understood to have specific meanings as follows regardless of indications to the contrary in other documents governing the telecommunications work:
1. Regardless of their usage in codes or other industry standards, certain words as used in the drawings or specifications for the telecommunications cabling work, shall be understood to have the specific meanings ascribed to them in the following list:
  2. "Accessible Corridor" - A common horizontal pathway that can be approached or entered easily in which telecommunications cables are run until they branch out to individual workstation terminations.
  3. "Administration" - The method for labeling, identification, documentation and usage need to implement moves, additions and changes of the telecommunications infrastructure.
  4. "Assembly" -- A defined set of elements of telecommunications work.
  5. "Backbone" -- Shall refer to the portion of the installation that transmits between

building floors (or between telecommunications rooms). The term "Riser" may also be used interchangeably.

6. "Bonding" - The permanent joining of metallic parts to form an electrically conductive path that will ensure electrical continuity and the capacity to conduct safely any current likely to be imposed.
7. "Bundle" -- Shall refer to multiple cables of similar or dissimilar cable types, as specified. The cables shall be neatly placed and tie wrapped together. The bundle size shall be of practical and manageable proportions.
8. "Cabinet (Telecommunications)" - An enclosure with a hinged cover used for terminating telecommunications cables, wiring and connection devices.
9. "Cable" - An assembly of one or more insulated conductors or optical fibers, within an enveloping sheath.
10. "Cabling" - A combination of all cables, jumpers cords, and connecting hardware.
11. "Category 3, 4, 5, 6, 6" -- Conforming to the guidelines issued as part of ANSI/TIA/EIA-568-B and all associated addendums and bulletins.
12. "Centralized Cabling" - A cabling configuration from the work area to a centralized cross-connect using pull through cables, an interconnect, or splice in the telecommunications room.
13. "Channel" - The end-to-end transmission path between two points at which application-specific equipment is connected.
14. "Circuit" -- Any specific run of circuitry.
15. "Circuitry" -- Any telecommunications work which consists of wires, cables, raceways, and/or specialty wiring method assemblies taken all together complete with associated junction boxes, pull boxes, outlet boxes, joints, couplings, splices and connections except where limited to a lesser meaning by specific description.
16. "Common Equipment Room (Telecommunications): An enclosed space used for equipment and backbone interconnections for more than one tenant in a building or campus.
17. "Computer Room" - An architectural space whose primary function is to accommodate data processing equipment.
18. "Concealed" (as applied to circuitry) -- Covered completely by building materials, except for penetrations (by boxes and fittings) to a level flush with the surface as necessitated by functional or specified accessibility requirements.
19. "Connecting Hardware" - A device providing mechanical cable terminations.

20. "Consolidation Point" - A location for interconnection between horizontal cables extending from building pathways and horizontal cables extending into furniture pathways.
21. "Cross-Connect" - A facility enabling the termination of cable elements and their interconnection or cross-connection.
22. "Cross - Connection" - A connection scheme between cabling runs, subsystems, and equipment using patch cords or jumpers that attach to connecting hardware on each end.
23. "Distribution Frame" -- A system of terminal blocks, patch cords, and backboards that facilitates administration of cross-connect fields for moves and rearrangements.
24. "Data Center" - A building or portion of a building whose primary function is to house a computer room and its support areas.
25. "Demarcation Point" - A point where the operational control or ownership changes.
26. "Earthing" - See grounding.
27. "Electromagnetic Interference" - Radiated or conducted electromagnetic energy that has an undesirable electronic equipment or signal transmission.
28. "Entrance Point" -- Point at which telecommunications cabling enters the building. Where cable enters in conduit that is buried in a concrete floor, the point at which the conduit emerges from the floor is considered the entrance point.
29. "Equipment Cable; Cord" - A cable or cable assembly used to connect telecommunications equipment to horizontal or backbone cabling.
30. "Equipment Distribution Area" - The computer room space occupied by equipment racks or cabinets.
31. "Equipment Room" – An enclosed area or room specifically designated for housing telecommunications terminations and associated electronics.
32. "Equipment Room (Telecommunications)" - An environmentally controlled centralized space for telecommunications equipment that usually houses a main or intermediate cross-connect.
33. "Exposed" (as applied to circuitry) -- Not covered in any way by building materials.
34. "Fiber Optic" - See Optical Fiber.
35. "Ground" - A conducting connection, whether intentional or accidental, between an electrical circuit (e.g., telecommunications) or equipment and the earth, or to some conducting body that serves in place of earth.
36. "Grounding" - The act of creating a ground.

- 37. "Grounding Conductor" - A conductor used to connect the grounding electrode to the building's main grounding busbar.
- 38. "Horizontal Cable" - Refers to the portions of the cable installation that are installed between the telecommunications closets and the work area outlets. The terms "Station Cable" or "Workstation Cable" may also be used.
- 39. "Horizontal Cross-Connect" - A cross-connect of horizontal cabling to other cabling, e.g., horizontal, backbone, equipment.
- 40. "IDF" -- Intermediate distribution frame.
- 41. "IDF Closet" - See "Telecommunications Closet".
- 42. "Identifier" - An item of information that links a specific element of the telecommunications infrastructure with its corresponding record.
- 43. "Infrastructure (Telecommunications)" - A collection of those telecommunications components, excluding equipment, that together provide the basis support for the distribution of all information within a building or campus.
- 44. "Interconnection" - A connection scheme that employs connecting hardware for the direct connection of a cable to another cable without a patch cord or jumper.
- 45. "Intermediate Cross-Connect" - A cross-connect between first level and second level backbone cabling.
- 46. "Link" - A transmission path between two points, not including terminal equipment, work area cables, and equipment cables.
- 47. "Low Voltage" -- Less than 50 volts.
- 48. "MDF" -- Main distribution frame.
- 49. "Main Cross-Connect" - A cross-connect for first level backbone cables, entrance cables, and equipment cables.
- 50. "Media (Telecommunications)" - Wire, cable, or conductors used for telecommunications.
- 51. "Modular Jack" - A female telecommunications connector that may be keyed or unkeyed and may have 6 or 8 contact positions, but not all the positions need be equipped with jack contacts.
- 52. "Multimode Optical Fiber" - An optical fiber that carries many paths of light.
- 53. "Multimode Cable" - A cable having more than four pairs.
- 54. "Normal Work Conditions" -- Locations within building confines which are neither damp, wet nor hazardous and which are not used for air handling.

55. "Optical Fiber" - Any filament made of dielectric materials that guides light.
56. "Optical Fiber Cable" - An assembly consisting of one or more optical fibers.
57. "Pathway" - A facility for the placement of telecommunications cable.
58. "Patch Cord" -- A length of cable that is not installed such that it is easily removable. A patch cord is typically connectorized at both ends.
59. "Patch Panel" -- A passive electronic device at which multiple cables are terminated in individual connectors.
60. "Plenum" - A compartment or chamber to which one or more air ducts are connected and that forms part of the air distribution system.
61. "PBX" - A private telecommunications switching system.
62. "Pull Box" - A housing located in a pathway run used to facilitate that placing of wire or cables.
63. "Raceway" -- Any pipe, duct, extended enclosure, or conduit (as specified for a particular system) which is used to contain wires, and which is of such nature as to require that the wires be installed by a "pulling in" procedure.
64. "Riser" - See "Backbone".
65. "Screen" - An element of a cable formed by a shield.
66. "Screened Twisted-Pair (ScTP)" - A balanced cable with an overall screen.
67. "Service Provider" - The operator of any service that furnishes telecommunications content (transmissions) delivered over access provider facilitates.
68. "Sheath" - See cable sheath.
69. "Shield" - A metallic layer placed around a conductor or group of conductors.
70. "Single-Mode Optical Fiber" - An optical fiber that carrier only one path of light.
71. "Singlemode Optical Fiber" - See single-mode.
72. "Splice" - A joining of conductors, meant to be permanent.
73. "Star Topology" - A topology in which telecommunications cables are distributed from a central point.
74. "Standard" (as applied to wiring devices) -- Not of a separately designated individual type.
75. "Station Cable" -- See "Horizontal Cable".
76. "Subject to Mechanical Damage" -- Exposed within seven feet of the floor in mechanical

rooms, manufacturing spaces, vehicular spaces, or other spaces where heavy items (over 100 pounds) are moved around or rigged as a common practice or as required for replacement purposes.

77. "Telecommunications" - Any transmission, emission, and reception of sings, signals, writings, images, and sounds, that is, information of any nature by cable, radio, optical, or other electromagnetic systems.
78. "Telecommunications Closet" -- The enclosed area or room specifically designated for the routing, termination and/or cross-connecting of telecommunications cable (i.e., backbone cable) to other telecommunications cable and/or equipment (i.e., workstation cables or concentrators/hubs/switches). This may also be referred to as the telephone or communications closet.
79. "Telecommunications Room" - An enclosed architectural space for housing telecommunications equipment, cable terminations, and cross-connect cabling.
80. "Telecommunications Wiring" -- See "Circuitry".
81. "Telecommunications Work" -- All telecommunications work as defined by the telecommunications drawings and specifications.
82. "UPS" - Uninterruptible Power Supply, an auxiliary power unit for telecommunications systems that provides continuous power in the event of a commercial power failure.
83. "Topology" - The physical or logical arrangement of a telecommunications system.
84. "Wireless" - The use of radiated electromagnetic energy (e.g., radio frequency and microwave signals, light) traveling through free space to convey information.
85. "Work Area Outlet" - See "Workstation".
86. "Workstation" or "Workstation Outlet" -- The point of attachment of voice and/or data end user equipment to the cabling system.
87. "Zone Distribution Area" - A space in a computer room where a zone outlet or a consolidation point is located.
88. Where the word "conduit" is used without specific reference to type, it shall be understood to mean "raceway."
89. No exclusion from or limitation in, the symbolism used on the drawings for telecommunications work or the language used in the specifications for telecommunications work shall be interpreted as a reason for omitting the appurtenances or accessories necessary to complete any required system or item of equipment.
90. The drawings for telecommunications work utilize symbols and schematic diagrams that have no dimensional significance. The telecommunications work shall, therefore,

be installed to fulfill the diagrammatic intent expressed on the telecommunications drawings, but in conformity with the dimensions indicated on the final working drawings, field layouts and shop drawings of all trades.

91. Certain details appear on the drawings for telecommunications work that are specific with regard to the dimensioning and positioning of the telecommunications work. These are intended only for general information purposes. They do not obviate field coordination for individual items of the indicated work. Information as to general construction and architectural general construction and architectural features and finishes shall be derived from architectural and structural drawings and specifications only.
92. The use of words in the singular shall not be considered as limiting where other indications denote that more than one item is referred.
93. Ratings of devices, materials and equipment specified without reference to specific performance criteria shall be understood to be nominal or nameplate ratings established by means of industry standard procedures.

#### 1.9 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.10 SUBMITTALS AND SHOP DRAWINGS

- A. Prior to purchasing any equipment or materials, a list of their manufacturers shall be submitted for review.
- B. Prior to assembling or installing the telecommunications work, the following shall be submitted for review:
  1. Catalog information, factory assembly drawings and field installation drawings as required for a complete explanation and description of all items of equipment.
- C. Submit for approval one sample of each of the following:
  1. Each type of cable.
  2. Each type of cable connector.
  3. Each type of wiring device plate, complete with labeling
  4. Each type of patching/cross connecting device.
  5. Each type of protector.
  6. Each type of identification label.
  7. Other items as requested.
  8. Documents will not be accepted for review unless:

- a. They include complete information pertaining to appurtenances and accessories.
- b. They are submitted as a package where they pertain to related items.
- c. They are properly marked with specific service or function and intended location of use within the project (e.g., "backbone cabling", "telecommunications closet").
- d. They are clearly identified or highlighted to indicate all items that are applicable.
- e. They indicate the project name and address along with the Contractor's name, address and phone number.
- f. They are properly marked with external connection identification as related to the project where they consist of standard factory assembly or field installation drawings.

**D. Shop Drawing Review**

- 1. Substitutions of equipment, systems, materials, must be coordinated by the Contractor with his own or other trades which may be involved with the item, such as, but not limited to, equipment substitutions which change telecommunications or electrical requirements, or hanging or support weights or dimensions.
  - 2. The following shop drawings shall be submitted to the Commissioner for review, minimum:
    - a. Coordinated wall field elevations for the main equipment room and each telecommunications closet identifying the location dimensions of all termination hardware provided by the Contractor and all devices provided by other trades.
    - b. Coordinated floor plans of the main equipment room and each telecommunications closet identifying the location dimensions of all racks, cabinets and other equipment provided by the Contractor and by other trades.
    - c. Coordinated ceiling plans of the main equipment room and each telecommunications closet identifying the location dimensions of all ladder rack, light fixtures, sprinkler heads, wall openings, sleeves etc.
    - d. Drawings showing conduit and sleeve allocation and fill.
- E. Include in the telecommunications work the issuing of maintenance and operating instructions for the following specialized equipment.**
- a.
  - b. All electronic equipment provided or installed as part of the telecommunications work.

- c. The issuing of operating instructions shall include of supplying of all original operating and maintenance instruction manuals.
  - d. The issuing of operating instructions shall include the supplying of properly trained installers to demonstrate the operation of specialized equipment.
  - e. The issuing of operating instructions shall include the submission of the name, address and telephone number of the manufacturer's representative and service company for each item of equipment so that service and spare parts can be readily obtained.
  - f. After all final tests and adjustments have been completed, fully instruct the City of New York's staff in all details of operation for equipment installed. Supply properly trained installers to operate equipment for sufficient length of time to assure that the City of New York's staff is properly qualified to take over operation and maintenance procedures. Supply properly trained installers to operate equipment for sufficient length of time as required to meet all required operation and performance tests.
- F. Furnish required number of manuals, in bound form containing data covering capacities, maintenance of operation of all equipment and apparatus. Operating instruction shall cover all phases of control and include the following:
- 1. Performance Criteria: For transmission and other equipment as requested.
  - 2. Parts List: Identifying the various parts of the equipment for repair and replacement purposes.
  - 3. Instruction Books may be standard booklets but shall be clearly marked to indicate applicable equipment.
  - 4. Wiring Diagrams: Generalized diagrams are not acceptable, submittal shall be specifically prepared for this Project.
  - 5. Where applicable, one set of operating and maintenance instructions shall be neatly framed behind glass and hung adjacent to the equipment concerned.

#### 1.11 RECORD DRAWINGS AND AS-BUILT DOCUMENTATION

- A. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for record drawing, coordination drawing, and as-built documentation requirements.
- B. Record drawing and as-built documentation for work in this section shall include, but is not limited to, the following:
  - 1. All telecommunications work installed exactly in accordance with the original design.

2. All telecommunications work installed as a modification or addition to the original design.
3. The dimensional information necessary to delineate the exact location of all circuitry and wiring runs that are concealed as to be untraceable by inspection through the regular means of access established for inspection and maintenance.
4. The numbering information necessary to correlate all telecommunications items (or outlets for same) to the patch panel, end user or head end device to which they are connected.

#### 1.12 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work. In addition, the contractor or subcontractor must be licensed or approved by the manufacturer.
- C. All equipment and materials for permanent installation shall be the products of recognized manufacturers and shall be new.
- D. New equipment and materials shall:
  1. Be Underwriters Laboratories, Inc. (U.L.) labeled and/or listed where specifically called for, or where normally subject to such U.L. labeling and/or listing services.
  2. Be clearly labeled identifying the transmission parameters specified (specifically with reference to Category 6 or higher ratings).
  3. Be without blemish or defect.
  4. Be in accordance with the latest applicable.
  5. Be products that meet with the acceptance of the Commissioner.
- E. All items of equipment or material of one generic type shall be the product of one manufacturer throughout.
- F. Manufacturer's Recommendations: Where installation procedures of any part thereof are required to be in accordance with the recommendations of the manufacturer of the material being installed, printed copies of these recommendations shall be furnished prior to installation. Installation of the item will not be allowed to proceed until the recommendations are received. Failure to furnish these recommendations can be cause for rejection of the material.
- G. Ensure that the installation of all equipment be performed in accordance with manufacturers' specifications. The necessity of special conditions required by a particular manufacturer shall be brought to the attention of the Commissioner prior to the installation of any equipment in

the area concerned.

- H. Provide a complete fit-out of one (1) of the telecommunications IDF room for review by the Commissioner prior to continuing with the installation of other telecommunications closets. The IDF fit-out shall include all cable terminations, blocks, patch panels, frames, labels, etc. Changes or adjustments required in other telecommunications IDF's as a result of the review of the fit-out room shall be the responsibility of the Contractor. The Commissioner shall be given a minimum of one (1) week notice for the review of the room.
- I. Provide a complete fit-out of a standard wall and furniture mounted workstation for review by the Commissioner. The workstation fit-out shall include all connectors, labeling, cable support, etc. Changes or adjustments required in other wall and furniture mounted workstations as a result of the review of the fit-out shall be the responsibility of the Contractor. The Commissioner shall be given a minimum of one (1) week notice for the review of the fit-out area.

#### 1.13 PROJECT MANAGEMENT

- A. Any questions arising during the installation shall be submitted in writing to the Commissioner.

#### 1.14 WARRANTY AND GUARANTEE

- A. Provide a manufacturer's Warranty for a twenty-five (25) year Static, Dynamic, and Applications Warranty on all telecommunications products installed, starting from the date of Substantial Completion.
- B. All telecommunications work shall be guaranteed by the Contractor to be free from defects. Any defective materials or workmanship, as well as damage to the telecommunications work of all trades resulting from same, shall be replaced or repaired as directed for the duration of stipulated guarantee periods.
- C. The duration of the Contractor's guarantee periods following the date of acceptance of the telecommunications work shall be:
  - 1. One (1) year, starting from the date of Substantial completion.
- D. Non-durable items shall be replaced up to the date of substantial completion, such that they shall have had no more than 100 hours of use prior to this date.
- E. Manufacturer's certification shall be submitted attesting to the fact that specified performance and other criteria are met by all items of telecommunications work for which such certification is required.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Propose a solution based upon the warranted cabling solution from the following manufacturers/manufacturers:
1. Leviton/Berk-Tek
  2. Ortronics/Superior Essex
  3. Panduit/General Cable
  4. Or approved equal.
- B. Horizontal outlet cabling and all associated components (i.e. jacks, faceplates, patch panels, patch cords, etc.): shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
1. Leviton/Berk-Tek
  2. Ortronics/Superior Essex
  3. Panduit/General Cable
  4. Or approved equal.
- C. Twisted-pair copper backbone cabling and all associated components (i.e. Cabling and Terminations blocks, etc.) shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
1. Leviton/Berk-Tek
  2. Ortronics/Superior Essex
  3. Panduit/General Cable
  4. Or approved equal.
- D. Fiber optic backbone cabling and all associated components (i.e. Cabling, connectors, enclosures, connector panels etc.) shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
1. Leviton/Berk-Tek
  2. Ortronics/Superior Essex
  3. Panduit/General Cable
  4. Or approved equal.
- E. Coaxial backbone cabling and all associated components (i.e. Cabling and connectors, etc.) shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
1. Leviton/Berk-Tek
  2. Ortronics/Superior Essex
  3. Panduit/General Cable
  4. Or approved equal.

- F. Coaxial Adaptors: Subject to compliance with requirements, provide products by one of the following:
1. Blonder Tongue
  2. Amphenol RF
  3. Pasternack
  4. Or approved equal.
- G. Cable Trays, Drops, and Retaining Posts: Subject to compliance with requirements, provide products by one of the following:
1. CPI Chatsworth
  2. Panduit
  3. Legrand
  4. Or approved equal.
- H. Post Racks, Shelves, and Cable Managers: Subject to compliance with requirements, provide products by one of the following:
1. CPI Chatsworth
  2. Panduit
  3. Legrand
  4. Or approved equal.
- I. UPS and Power Distribution Units: Subject to compliance with requirements, provide products by one of the following:
1. APC
  2. Eaton
  3. Tripplite
  4. Or approved equal.
- J. Non-Continuous Cable Supports: Subject to compliance with requirements, provide products by one of the following:
1. Caddy
  2. Panduit J-Pro
  3. Legrand Cablofil
  4. Or approved equal.
- K. Public Address System Components: Subject to compliance with requirements, provide products by one of the following:
1. TOA
  2. Atlas
  3. SURE
  4. Or approved equal.

## 2.2 HORIZONTAL DATA WORKSTATION UTP CATEGORY 6A CABLING

- A. Horizontal DATA cabling shall be listed for the in a Communications Plenum (CMP listed)
- B. Horizontal DATA cabling shall be 100 ohm, 23 AWG, 4-pair unshielded twisted pair (UTP) cable and compliant with ANSI/TIA/EIA- 568-C.2 for category 6A, UL444.
- C. Shall pass factory tests with a minimum of 2dB of margin for NEXT & PSNEXT and 4dB of margin for ACRF & PSACRF beyond the CAT 6A standard
- D. Violet jacketed Berk-Tek Lanmark 10G2, or equivalent from approved equal manufacturer listed above, for data horizontal outlet cabling.
- E. The color of all horizontal cabling jackets shall be unique for each application type ( i.e., "VIOLET" cable for DATA)
- F. Splicing of copper cabling shall not be accepted.
- G. Have the name of the manufacturer, UL rating, and incremental footage markings indelibly printed on the outermost jacket by the manufacturer.
- H. All terminated horizontal cable shall be terminated on the same transmission performance jack and patch panel as the transmission rate of the cable, for example all category 6A cable links, that require termination, shall be terminated with a category 6A jack on one side and a category 6A patch panel port.

DESCRIPTION	MANUFACTURER	PART NUMBER
Violet Jacketed Lanmark 10G2, 23 AWG, 4-Pair, Plenum Category 6A Cable	Berk-Tek (Basis-of-Design) or approved equal as per Section 2.1B.	10138182

## 2.3 CATEGORY 6A DATA TERMINATION PATCH PANELS

- A. Be rack mountable, 19-inch.
- B. Be made by an ISO 9001 certified manufacturer.
- C. All terminated horizontal Data cables shall be terminated on the same transmission performance jack and patch panel as the transmission rate of the cable, for example all category 6A cable links, that require termination, shall be terminated with a category 6A jack on one side and a category 6A patch panel port.
- D. All Patch Panels shall be a category 6A (Flat Style) 48-Port, 2- RMU, 110 inline patch panel.
- E. Each telecom room shall have outlet port growth of a minimum of 25% and if required, additional unterminated patch panels shall be installed to achieve this percentage.

DESCRIPTION	MANUFACTURER	PART NUMBER
Cat 6A Flush Patch Panel 48-port	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	6A586-U48

#### 2.4 HORIZONTAL WORKSTATION CATEGORY 6A DATA JACK

- A. All horizontal DATA cabling shall be terminated with a category 6A modular eight-pin, eight conductor (8P8C) "RJ45-type" jack and shall be installed utilizing the T568B termination wiring schedule.
- B. DATA UTP jacks shall exceed ANSI/TIA/EIA 568-C.2 component, permanent link, and channel margins, and the IEEE 10BASE-T (802.3an) requirements, as well as the ISO/IEC 11801 2<sup>nd</sup> Edition, Category 6A Component, Class EA standard.
- C. "Violet" colored DATA jacks shall be installed for data applications at the outlet and shall match and terminate the horizontal data cabling.

DESCRIPTION	MANUFACTURER	PART NUMBER
Violet Category 6A Jack (Data Application)	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	6110G-RP6

#### 2.5 HORIZONTAL WORKSTATION COAXIAL CABLING SYSTEM

- A. The horizontal coaxial outlet cable shall be listed for the in a Communications Plenum (CMP listed).
- B. Shall be suitable for CATV applications.
- C. Shall be RG-6 type, quad shielded, 18 AWG solid bare copper cable.
  - 1. For coaxial cable runs over 200ft, a series 11 (RG-11Type) Belden equivalent cable link will be install as a feeder cable and a 10ft series 6 cable link, at the outlet, as the drop cable with a F-81 (RG- 6/U to RG-11/U) adapter interface.
- D. Shall have both ends of each link terminated with a compression F-type connector
  - 1. The compression F-type connector must be compatible with Belden standard coax cable in fit (No loose or undersized connections).
- E. Shall have both ends of each link shall be installed with a "figure 8 type" service loop installed in the ceiling.  
One foot on the outlet or workstation side and twenty feet within the telecom room.

DESCRIPTION	MANUFACTURER	PART NUMBER
Series 6 compression F-type connector	Belden (Basis-of-Design) or approved equal as per Section 2.1E	FS6U
Plenum Series 6 Coaxial Cable	Belden (Basis-of-Design) or approved equal as per Section 2.1E	6339Q8
Series 11 compression F-type connector	Belden (Basis-of-Design) or approved equal as per Section 2.1E	FS11V
Plenum Series 11 Coaxial Cable	Belden (Basis-of-Design) or approved equal as per Section 2.1E	1153A
F-81 (RG-6/U to RG-11/U) Adapter	Blonder Tongue Adapter (Basis-of-Design) or approved equal as per Section 2.1F	GF-81C

## 2.6 WORKSTATION FACEPLATES

- A. All workstation termination hardware, including mounting boxes, faceplates, surface mount raceway, and outlets, shall match the wall surface color as closely as possible (Color to be coordinated with Commissioner before any installation).
1. Face plates for wall outlets shall be Leviton QuickPort Single- Gang wall plates with ID Windows, or an equivalent product from an approved manufacturer listed above.
  2. Be single or double gang, of the same manufacturer, and supplied in colors and finishes coordinated with the Commissioner and NYPD Facilities Construction Department IT/Facilities.
  3. All faceplate ports “Not Used” or that has no module installed shall have a blank module install so that every port has a module installed.
  4. The exact faceplates for floor, surface, and ceiling shall be coordinated and approve in the field before any installation.

DESCRIPTION	MANUFACTURER	PART NUMBER
1-Port Wall phone plate	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	4108W-*SP
2-Port Wall plate	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	42080-2*S

4-Port Wall plate	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	42080-4*S
2-Port surface mount box	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	41089-2*P
Modular Furniture Faceplate	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	49910-***
75 Ohm F-type coax bulkhead modules	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	40831-0B*
Blank module Insert	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	41084B*B

## 2.7 CATEGORY 6A PATCH CORDS

- A. Patching, equipment, and station cords shall be factory manufactured and ETL verified for compliance with Category 6A for channel performance.
- B. Field-manufactured cordage is not permitted, factory terminated to industry standard 8P8C modular plugs at both ends.
- C. Patch cords shall meet ANSI/TIA-568-C.2 Category 6A and ISO 11801 Class E standards for supporting 1000BASE-T transmission over twisted-pair cabling systems up to 100 meters.
- D. The wiring schedule shall match that of patch panels and outlets.
- E. Cordage shall be supplied by the same manufacturer as the modular jacks, patch panels, and connecting/termination.
- F. Furnish and install two (2) Category 6A RJ-45/RJ-45 patch cords for each category 6A DATA port on every outlet type.
  - 1. Half of the DATA patch cords shall BLUE jacketed and shall be installed in the telecommunication room side of the horizontal link. These patch cords shall be provided in varying lengths as indicated to ensure a neat and organized installation. The maximum lengths for patch cord combined lengths on a single circuit shall conform to EIA/TIA-568B. Based on the patch cord allowance indicated above, the Commissioner reserves the right to modify the patch cord lengths provided to ensure a neat and orderly installation. Make recommendations as to the required patch cord lengths to meet these objectives.
  - 2. The second half of DATA patch cords shall BLUE jacketed and shall be located at the telecom outlet/workstation. Furnish and install a 7 foot, Category 6A RJ-45/RJ-45 patch cord at each workstation port. (Must conform to EIA/TIA-T568B).

- G. Patching shall be as directed by the Commissioner after equipment vendor selection.
- H. Each patch cord shall be provided with a unique identifier indicated at each end, minimum.
- I. Prior to purchasing patch cords, it shall be understood that the quantities presented represent an allocation which can be reconfirmed by the Commissioner prior to purchase.
- J. Patching connection records shall be provided by the contractor as specified elsewhere.
- K. All Patch cords shall be neatly dressed and tied using Velcro type cable ties. Patching shall be performed so as to ensure the ability to easily read and access patch panel port identification.
- L. All patch cords shall be manufactured by the same manufacturer as the horizontal structured cabling system.
- M. All patch cords shall be the same data transmission performance rate (i.e. Cat-6A) as the horizontal structured cabling system.

DESCRIPTION	MANUFACTURER	PART NUMBER
Category 6A UTP Patch cord	Leviton (Basis-of-Design) or approved equal as per Section 2.1B	6210G-XXL (Replace XX with length needed in 03, 05, 07, & 10-foot lengths)

## 2.8 FIBER OPTIC INTRA-BUILDING BACKBONE CABLING SYSTEM

- A. The fiber optic intra-building backbone cabling system:
  - 1. Intra-building fiber optic backbone cabling shall be the following type:
    - a. Interlocking armored 12-Strand, TIA OM4 –tight buffered 50/125 nm, 1300nm and 850 nm multimode fiber optic cable.
    - b. Interlocking armored 24-Strand, TIA OM4 –tight buffered 50/125 nm, 1300nm and 850 nm multimode fiber optic cable.
  - 2. Fiber optic backbone cabling shall comply with NEC section 770 and shall be OFNP rated, minimum, unless otherwise noted.
- B. All backbone cabling shall be installed as indicated on the drawings. All work shall be in accordance with the standards identified in this specification and with industry standards.
  - 1. Fiber optic backbone cabling shall be standards compliant with ANSI/ICEA S-104-696; ANSI/TIA- 568-C.3; Telcordia GR-409
- C. All raceways containing fiber optic cable shall be provided with a label "Caution - Fiber Optic Cable" located on the raceway every 20 feet, minimum.

- D. All fiber optic cables shall be provided with strain relief where they enter patch panel housings.
- E. Fiber strands shall terminate with LC pre-polished OM4 connectors.
- F. Terminated fiber strands shall be inserted onto a precision molded 12 LC connector version, with fiber-optic platform adapter plate and installed in a rack-mount enclosure on both sides.
  - 1. Subject to compliance with requirements, provide Leviton Opt-X 1000i Rack-Mount Enclosure or an equivalent product from one of the following:
    - a. Belden
    - b. Ortronics
    - c. Or approved equal.
- G. Furnish (12) twelve 1 meter, duplex (TX/RX) LC to LC, OM3 fiber optic patch cords for each and every backbone cable. Leviton or approved equal part #.

DESCRIPTION	MANUFACTURER	PART NUMBER
Plenum Interlocking armored 12- Strand, TIA OM4 –tight buffered 50/125 nm,	Berk-Tek (Basis-of-Design) or approved equal as per Section 2.1D	PDPK012FB3010/25
Plenum Interlocking armored 24- Strand, TIA OM4 –tight buffered 50/125 nm,	Berk-Tek (Basis-of-Design) or approved equal as per Section 2.1D	PDPK024FB3010/25
LC pre-polished OM4 connectors L.O. Multimode, 50/125 micron, Aqua	Leviton (Basis-of-Design) or approved equal as per Section 2.1D	49991-LLC.
Optical Patch Panel	Leviton (Basis-of-Design) or approved equal as per Section 2.1D	5R2UM-S06
12 Strand multimode LC adapter plate	Leviton (Basis-of-Design) or approved equal as per Section 2.1D	5F100-2QL
1 meter, Duplex LC to LC, OM4 patch cord, 50/125 micron, Aqua Reverse Polarity	Leviton (Basis-of-Design) or approved equal as per Section 2.1D	54DLC-M01

## 2.9 OVERHEAD CABLE TRAY SYSTEM

- A. The runway width shall be 18 inches and gray in color.
- B. Made of 3/8" x 1-1/2" x .065" (9.53 mm x 38 mm x 1.65 mm) wall rectangular steel tubing

- C. Cross members welded at 12" (300 mm) intervals
- D. Underwriters Laboratory Classified for suitability as an equipment grounding conductor only (must remove paint or use ground strap)
- E. Cable runways and accessories shall meet the specifications defined in the NEC and shall be marked for the intended location, application, and grounding.
- F. Cable runways shall be properly bonded/earthed/grounded per manufacturer's instruction and ANSI/NECA/BICSI-607 (2011).
- G. Provide and install all straight sections, vertical and horizontal, 90° bends, T's, and cross sections, supports, and all accessories as shown on the Contract Documents.
- H. Provide and install cable tray runway cable radius drops above all telecom racks or cabinets and every location where cabling is routed through the cable tray rungs.
- I. Provide and install 6-inch high cable retaining post at 2-foot intervals for all cable tray pathways. Installed as per the manufacturer's instructions.
- J. All system components shall be bonded to ground per the J-STD 607 Standard.

DESCRIPTION	MANUFACTURER	PART NUMBER
24" W Cable Tray Section	CPI Chatsworth (Basis-of-Design) or approved equal as per Section 2.1G	10250-124
18" W Cable Tray Section	CPI Chatsworth (Basis-of-Design) or approved equal as per Section 2.1G	10250-118
12" W Cable Tray Section	CPI Chatsworth (Basis-of-Design) or approved equal as per Section 2.1G	10250-112
Runway cable radius drops.	CPI Chatsworth (Basis-of-Design) or approved equal as per Section 2.1G	12100-118
6-inch high Cable Retaining Post	CPI Chatsworth (Basis-of-Design) or approved equal as per Section 2.1G	10596-106

#### 2.10 4 – POST 30" DEEP RACK FOR TELECOMMUNICATIONS ROOMS

- A. 30" Deep Rack Channel with a UL listed 2,000 lbs. loading rating.
- B. Shall have rack-mount unit marks to simplify equipment installation.
- C. Shall be properly bonded/earth/grounded per manufacturer's instruction and ANSI/NECA/BICSI-607 (2011).

- D. Shall be installed with 6" Vertical Cable Managers installed on the sides of the rack as shown on the TC-300 series drawings.
- E. Each Relay rack shall be installed with 2RU Horizontal Cable Mangers as illustrate on the TC-300 series drawings.
- F. Rack #2 in each IT room shall be equipped with a UPS, PDU, and associated equipment as shown on the TC-300 series drawings.

DESCRIPTION	MANUFACTURER	PART NUMBER
Ortronics 30" deep 4 Post MM20 Rack	Ortronics (Basis-of-Design) or approved equal as per Section 2.1H	OR-MM20730ADJ12-B
Ortronics 6" Vertical Cable Manager	Ortronics (Basis-of-Design) or approved equal as per Section 2.1H	OR-MM20VMS706-B
Ortronics Ladder support brackets (used to support 24" Ladder tray above racks)	Ortronics (Basis-of-Design) or approved equal as per Section 2.1H	OR-MM20CRB6H24-B
Ortronics 2RU Horizontal Cable Manger	Ortronics (Basis-of-Design) or approved equal as per Section 2.1H	OR-MM6HMF2RU
Ortronics Vertical Lacing Bars	Ortronics (Basis-of-Design) or approved equal as per Section 2.1H	LBV-45-2
Eaton 12 kw, 6 RU BladeUPS	Eaton (Basis-of-Design) or approved equal as per Section 2.1H	ZC1212608100000
Eaton 3 RU Battery Drawer	Eaton (Basis-of-Design) or approved equal as per Section 2.1H	103005747-6591
Eaton RPM (Rack Power Module)	Eaton (Basis-of-Design) or approved equal as per Section 2.1H	Y03114055100000
Raritan 60-amp PDU	Raritan (Basis-of-Design) or approved equal as per Section 2.1H	PX PX3-5325R-V2
Tripp-Lite PDU	Tripp-Lite (Basis-of-Design) or approved equal as per Section 2.1H	PDUNV

#### 2.11 NON-CONTINUOUS CABLE SUPPORTS (J-HOOKS)

- A. J-Hooks shall be located 5-Feet apart at maximum to adequately support and distribute the cable's weight. The manufacturers for cable loading should be followed.

- B. J-Hooks shall not be overfilled with cabling. Contractor to follow manufacturer's recommendation for fill capacity.
- C. Non-continuous cable supports shall be constructed of a durable material with the ability to manage and support a large number of cables. They shall be suitable for use in air handling spaces and have complete horizontal and vertical 1" bend radius control to help prevent degradation of cable performance. For use above a drop ceiling grid only, all cables that are through an area without a grid shall be run through conduit.
- D. Supports shall meet the specifications defined in the National Electric Code (NEC), and shall be marked for the intended location, application, and grounding as appropriate.

DESCRIPTION	MANUFACTURER	PART NUMBER
J-Hook	Caddy (Basis-of-Design) or approved equal as per Section 2.1J	CATXXHP (XX=as needed sizing)
CAT HP J-Hook Tree	Caddy (Basis-of-Design) or approved equal as per Section 2.1J	Application (Ceiling, Flange, or Wall)
Adjustable Cable Supports	Caddy (Basis-of-Design) or approved equal as per Section 2.1J	CAT 425 (Application)

## 2.12 BONDING, EARTHING, & GROUNDING

- A. The Telecommunications Grounding Busbar (TGB) shall be a tinned solid copper bar, 2 inches high, 10 inches long, and 1/4-inch thick, manufactured with holes evenly spaced horizontally and vertically throughout in accordance with the pattern specified by the current version of TIA-607.
- B. The TGB shall be equipped with isolated mountings that provide a 2-inch standoff from the wall.
- C. The Equipment Bonding Conductors (EBC) shall be at least a #6 AWG stranded conductor with a green insulating jacket.
- D. All bonding lugs shall be permanent two-bolt type. All taps shall be permanent compression type "H" taps.
- E. A vertical copper bus bar shall be provided with each enclosure and rack to serve as an extension of the TGB for equipment within the cabinet. This bus bar shall be:
  - 1. Manufactured from copper alloy.
  - 2. 79 inches by 0.67 inches by 0.05 inches.

3. Pre-punched with mountings for equipment bonding connections that match those on the vertical rail as specified by EIA-310.
  4. Coated with anti-oxidant compound.
  5. Include a hardware kit with rack-installation hardware and screws for bonding equipment to the busbar A brushed or sanded finish A hardware kit for bonding the rack or cabinet to the TGB.
- F. Non-corrosive, non-insulating compound shall be provided for all connections.

DESCRIPTION	MANUFACTURER	PART NUMBER
Copper Compression Tap & Clear Cover	LEVITON (Basis-of-Design) or approved equal as per Section 2.1H	HTAP & HTWC
Copper Compression 2-Hole Long Barrel Lug	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	LCC-W
Telecommunications Main- Grounding Busbar (To be installed in the 1 <sup>st</sup> floor Server room)	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	GB4B1028TPI-1
Telecommunications Grounding Busbar (To be installed in all IDF rooms)	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	GB2B0514TPI-1
Auxiliary Cable Bracket	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	GACB
Telecommunications Equipment Bonding Conductor Kit	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	GJ6xxxUH (xxx denotes length)
Universal Beam Clamp	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	GUBC500-6
Electrostatic Discharge Port Kit	PANDUIT (Basis-of-Design) or approved equal as per Section 2.1H	RGESD

## 2.13 TELECOMMUNICATION OUTLET CABLING

- A. All telecommunication outlet cabling shall be home run from designated telecommunications room to each designated telecommunications outlet location.

- B. Each telecommunications outlet location is indicated on the drawings by a telecommunications outlet identification tag. Provide cabling, jacks, faceplates, labels, testing, etc. as described in this section for each and every location identified by a telecommunications outlet identification tag.
- C. Telecommunication outlet cabling shall be one of the following types:
  - 1. Standard 2-Port Data Outlet
  - 2. Standard 2-Port Data Outlet with TV Outlet
  - 3. Wall Phone Outlet
- D. Outlet Type Cable Configurations
  - 1. A Standard 2-Port Data Outlet consist of:
    - a. Two (2) individual 4 pair category 6A cables.
      - (1) Each category 6A data cable shall be terminated on individual category 6A jacks following the T568 wiring standard at the outlet.
        - (a) Exact faceplate to be coordinated in the field.
      - (2) Each category 6A data cable shall be terminated on individual category 6A patch panel port following the T568 wiring standard at the telecommunication room.
  - 2. A Standard 2-Port Data Outlet with TV Outlet consist of:
    - a. Two (2) individual 4 pair category 6A cables.
      - (1) Each category 6A data cable shall be terminated on individual category 6A jacks following the T568 wiring standard at the outlet.
        - (a) Exact faceplate to be coordinated in the field.
      - (2) Each category 6A data cable shall be terminated on individual category 6A patch panel port following the T568 wiring standard at the telecommunication room.
    - b. One (1) individual quad shielded CATV series 6 coaxial cable (RG-6 type)
      - (a) Exact faceplate to be coordinated in the field.
      - (1) For coaxial cable runs over 180ft, a series 11 cable link will be installed as a feeder cable and a 10ft series 6 cable link, at the outlet, as the drop cable with a F-81 (RG- 6/U to RG-11/U) adapter interface.
      - (2) Both ends of each series 6 coaxial link shall be terminated with a

compression F-type connector. The compression F-type connector must be compatible with the CATV Cable in fit (No loose or undersized connections).

3. Wall Phone Outlet consist of:
  - a. One (1) individual 4 pair category 6 voice cable.
    - (1) Each category 6A cable shall be terminated on individual category 6A jack following the T568 wiring standard at the outlet.
      - (a) Exact Faceplate/surface mount box to be coordinated in the field.
    - (2) Each category 6A cable shall be terminated on individual category 6A patch panel port following the T568 wiring standard at the telecommunication room.
- E. Cabling to furniture mounted workstation outlets shall terminate in faceplates mounted on the furniture system raceway where available. Knockouts in the furniture system raceway shall be provided by the cabling contractor where not included as part of the furniture system. All cabling shall be routed via the furniture system raceway. Coordinate all telecommunications work with the furniture system vendor. All cabling feeds from an outlet box, into the furniture system raceway or surface raceway shall be protected using Leviton, or approved equal listed above, corrugated loom tubing. Where no opening is provided in the furniture raceway by the furniture vendor for entrance of the communications cable into the raceway, it shall be provided for by the cabling contractor. All necessary protection for the cable shall also be provided. Provide the necessary connectors and faceplates (as described elsewhere). The type of faceplate to be used shall be coordinated with the Commissioner for color, finish, etc. Where the furniture system does not contain an integral raceway, and no apparent wire management method is provided, the cabling shall be neatly dressed and concealed installation acceptance shall be based upon review and approval by the Commissioner. Workstation outlets shall be surface mounted using screws or other permanent fastening. Velcro, double sided tape or other adhesive materials are not considered acceptable.
- F. Cabling to wall mounted workstation outlets shall terminate in a single- or double-gang box provided by other trades. Provide the necessary connectors (as described elsewhere) under a single-gang faceplate. The type of faceplate to be used shall be coordinated with the Commissioner for color, finish, etc.
- G. Cabling to floor mounted workstation outlets shall be terminated in a flush or surface mounted poke-thru or service fitting provided by others. All cabling and connectors shall remain within the poke-thru or service fitting housing. Provide the necessary connectors (as described elsewhere) under a faceplate which is coordinated with the poke-thru or service fitting provided. If necessary, modify the blank plates provided with the poke-thru or service fitting in order to accommodate the connectors. All connectors, jacks, ports, etc. shall be provided with blanking or protective covers for protection.
- H. For twisted pair cabling, maintain the minimum number of twists per foot as prescribed for the

particular cable. The twists shall be maintained to within 0.5" of the cable termination.

- I. All twisted pair cables shall terminate in vapor tight, insulating displacement type connectors (IDC).
- J. All terminations for horizontal twisted pair cabling shall conform to the T568B wiring standard. This wiring scheme shall be maintained throughout the installation (i.e. for all workstation outlets, patch panels, etc.), unless otherwise noted.
- K. Horizontal cabling shall be neatly bundled and tie wrapped at 4' intervals, minimum, using nylon tie wraps. Tie wraps shall be rated for use in plenum spaces as required.
- L. If plastic jack icons are available for the specified faceplate, provide an icon for each and every port. The icon type and color shall be as indicated on the drawings or as directed by the Commissioner.
- M. Test each and every telecommunications outlet and provide test documentation according to the testing procedures described elsewhere in this specification.

#### 2.14 PUBLIC ADDRESS SYSTEM

- A. PA Speaker cabling shall be listed for the uses in a Communications Plenum (CMP listed).
- B. PA speaker cabling shall be, 18 AWG, 1-pair stranded bare copper conductors and shall be compliant with NEC and 2014 New York City Electrical Code.
- C. Shall pass all factory tests.
- D. Have the name of the manufacturer, UL rating, and incremental footage markings indelibly printed on the outermost jacket by the manufacturer.
- E. Splicing of copper cabling shall not be accepted.
  - 1. All speaker cable daisy chains from one speaker to the next in the line of speakers, then goes to the IT closet on the floor. The ends of all cables shall terminate in the first Floor Server room. All speaker cable on the second floor go down to the first floor IT / Server Room. All speaker cables on the cellar level go up to the first floor IT / Server room.
  - 2. All Public Address hardware shall be installed in the first floor IT / Server Room in the lockable wall cabinet.

DESCRIPTION	MANUFACTURER	PART NUMBER
1-pair-18 AWG stranded bare copper Plenum-CMP, Speaker Cable	Belden (Basis-of-Design) or approved equal as per Section 2.1B	6300UE

Amplifier	TOA (Basis-of-Design) or approved equal as per Section 2.1K	Model # A-912mk2, P92MK2 or equal, With wattage rating capable of supplying sound to the entire building
Mixer	TOA (Basis-of-Design) or approved equal as per Section 2.1K	To be determined by Amp Selection or equal
Microphones	SURE (Basis-of-Design) or approved equal as per Section 2.1K	450 Series II or equal
Telephone Interface	TOA (Basis-of-Design) or approved equal as per Section 2.1K	L01-S or equal
Microphone Interface	TOA (Basis-of-Design) or approved equal as per Section 2.1K	M-01 or equal
Signal Generator Interface	TOA (Basis-of-Design) or approved equal as per Section 2.1K	S-01S, S-02S or equal
Loud Horn speakers	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	APC-30T or equal
Wall Mounted Baffle Speaker	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	410-8 Baffle with SD-72 Speaker
Recessed Ceiling mounted Speakers	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	SD-72W or equal
Recessed Ceiling mounted Speakers Volume Control	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	SD-72WV or equal
Back Boxes	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	199-8, QS95-8NS or equal
Lockable steel wall Cabinet	Atlas (Basis-of-Design) or approved equal as per Section 2.1K	600-12 or equal

## 2.15 LABELING

- A. Manufacturers: Subject to compliance with requirements, provide Panduit Easy-Mark self-illuminating or Turn-Tell labels, or equivalent products by one of the following:
1. Belden
  2. Ortronics
  3. Or approved equal.
- B. All label printing will be machine generated by labeling software and desktop and hand-held

printers using indelible thermal transfer ribbons or cartridges. Self-laminating labels or turnable vinyl band labels will be used on cable jackets, appropriately sized to the OD of the cable, and placed within view at the termination point on each end. Outlet, patch panel and wiring block labels shall be installed on, or in, the space provided on the device.

1. Data cables shall be identified with self-laminated cable markers that can be rotated for visibility from any angle, and allow repositioning on the cable to align legends for improved aesthetics. (Turnable vinyl band labels )
2. Cabinets, Racks, and equipment shall be identified with thermal transfer printed, die-cut, microcellular foam with a polyester printable surface and high-tack adhesive. (Raised Panel Labels)

## 2.16 MATERIAL

- A. Where the drawings and/or specifications indicate materials to be provided by the Contractor, they shall be provided without deviation. Any conflict with this requirement shall be brought to the Commissioner's attention.
- B. The parts referred to in this document and/or drawings are recommended types. The vendor supplying these parts must supply the same or equivalent parts. The Commissioner reserves the right to examine and approve any and all parts acquired to satisfy the installation requirements, and to reject these parts without penalty if they do not meet with the specifications.

## PART 3 – EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 IDENTIFICATION AND TAGGING FOR TELECOMMUNICATIONS DEVICES

- A. Label individually:
  1. Each and every wire and cable.
  2. Each fiber optic cable and fiber strand.
  3. Each outlet faceplate/termination box (and each jack/port).
  4. Each termination block and patch panel (and each termination).
  5. Each equipment and termination frame, rack and cabinet.
  6. Each wall termination field.
  7. Each junction box used for telecommunications wiring.
  8. Each system (i.e., voice, LAN, etc.) as identified by the Commissioner.

9. Other items as directed.
- B. Develop and submit for approval a labeling system for the cable installation in coordination with the Commissioner. At a minimum, the labeling system shall clearly identify all components of the system: racks, cables, panels and outlets. Missing or unclear nomenclature criteria for the items specified above shall not be construed as a reason not to identify the items and shall be brought to the Commissioner's attention.
- C. Prior to installing any identifying tags, labels or nameplates, submit the following for review and approval. Conform to all revisions by the Commissioner:
  1. Samples of the nomenclature being used for each type of label.
  2. Samples of each type of identifying tag, label or faceplate.
- D. All materials required for labeling shall be provided by the Contractor. All labels shall be permanently adhered, easily visible. Printing on all labels shall be permanent and smudge-proof. All text shall be typed or otherwise machine printed. Handwritten labels will not be accepted.
- E. Wires and cables shall be identified at both ends minimum.
- F. Labels for risers, cables, wires, faceplates, cover plates, etc., shall be provided with textual descriptions provided.
- G. Labels for risers, cables, wires, faceplates, cover plates, etc., shall be provided with bar coding in addition to any textual descriptions provided. The bar coding shall contain the textual information in bar code format. It shall be the contractor's responsibility to ensure that both the text and bar codes are visible, even if two labels are required.
- H. Identification of all equipment frames, racks, cabinets and wall termination fields shall be by means of nameplates showing 1" high white lettering on a black background. Coordinate the exact location of the nameplate with the Commissioner.
- I. Identification of all rack or wall mounted equipment, patch panels, etc. shall be by means of nameplates showing 1/4" high white lettering on a black background fastened in the upper left hand corner of all equipment. An attempt shall be made to place the label in the same location on similar equipment.
- J. For patch panels each port shall be identified on both the front and rear of the patch panel.
- K. Device plates for patch panels and miscellaneous termination hardware whose function is not readily apparent shall be with 1/8" high letters suitably describing the equipment controlled or system served (i.e., Appletalk, Ethernet, etc.).
- L. Identify each outlet box, junction box, and cabinet used in conjunction with empty raceway for wires of a future system by means of indelible markings on the inside denoting the system.
- M. Junction boxes used for telecommunications wiring and located in unfinished spaces (i.e., hung

ceilings, equipment rooms, etc.) shall be clearly identified on the outside as "COMM."

### 3.3 FIRE-STOPPING

- A. Firestopping shall be provided for all penetrations of conduit, wireways, bus ducts, cable trays, etc., through fire-rated walls and floors and other fire-rated separations as follows:
1. Excess space in framed openings through structural floors between conduits and concrete shall be grouted in with concrete to a depth of at least the thickness of the slab plus 2" minimum above the slab.
  2. Conduit penetration through poured concrete or masonry walls shall be grouted in with concrete and provided with tight fitting escutcheon plates on both sides.
  3. Conduit penetrations through fire-rated dry walls shall be with sleeves through the wall fitted with escutcheon plates on both sides with excess openings filled with fire stop material specifically manufactured for the purpose.
  4. Excess space within conduit sleeves or stubs through floor slabs or walls where low voltage/telecommunications cables pass through shall be filled with firestopping material specifically manufactured for the purpose.
  5. Where cable trays pass through fire rated partitions or floors utilize fittings specifically manufactured for this purpose that includes multi-cable framed opening sleeves through the wall or floor and insert modules of firestop material through which the cable passes-all installed in accordance with manufacturer's recommendations. Include all additional components necessary for a complete firestop installation. The total cross sectional area of the firestop frame shall be equal to four (4) times the cross sectional area of the cable tray. The cable tray shall stop on each side of the wall or floor.
  6. Utilize fire-rated fittings, as specified elsewhere for penetrations through floor slabs for supplying floor outlets.
  7. Refer to Section 07 84 10 – "Firestopping" for firestopping system requirements.
- B. All conduits/sleeves used for vertical cable passage shall be sealed utilizing suitable material after the installation of cables as follows:
1. The material shall be non-corrosive to the cable jacket or insulation that it applies to.
  2. The material shall provide for a minimum of three (3) hour fire rating.
  3. The material shall be non-shrinking, waterproof and smoke tight.
  4. The material shall remain flexible and non-hardening.
  5. The material shall be of the type that when installed will not slip through the openings, will stick to the surfaces of the openings and the cable and will not require any pressure to be applied to the cable in order to keep it in place.

6. The material shall be installed in a neat and workmanlike manner and the final installation shall be smooth finished to the top of the sleeve or conduit.
  7. The material shall be easily removable without damaging the cables after being set or cured for at least one week.
- C. All horizontal cable penetrations through rated walls shall be sealed in a manner that will provide a fire rating equal to the wall construction.
- D. Upon completion of the telecommunications work, the Contractor will certify that all openings for the cables satisfactorily sealed and fire stopped.
- E. All materials used for firestopping shall be approved for the purpose and the rating of the wall or floor and all methods employed shall meet with the approval of NYC DOB and FDNY.
- F. Refer to architectural drawings and specifications for all locations of fire rated walls and floors.

### 3.4 MOUNTING HEIGHTS

- A. Heights of all wall mounted outlets shall be in accordance with the following list. (Dimensions are above finished floor unless noted.)
1. Telecommunications outlet in field constructed wall, partition or column unless otherwise specified below -- 18" to centerline. (Refer to architectural drawings for all outlet heights unless otherwise noted on drawings).
  2. Telecommunications outlet in factory fabricated wall or partition, unless otherwise specified below -- Dimension determined by wall or partition construction. (Refer to architectural drawings for all outlet heights unless otherwise noted on drawings).
  3. Telecommunications outlet in telecommunications rooms, mechanical spaces, electric switchboard rooms electric closets -- 5'-0" to centerline. (Refer to architectural drawings for all outlet heights unless otherwise noted on drawings).
  4. Termination blocks in MDF and IDF locations -- 6'-0" to the top of the highest termination block. The clearance between adjacent 110 type termination blocks shall be 3" minimum. (Refer to architectural drawings for all outlet heights unless otherwise noted on drawings).
- B. Heights of all wall mounted outlets shall be in accordance with the architectural drawings and details. Equipment mounting heights shall be in accordance with telecommunications details. Any discrepancies shall be brought to the Commissioner's attention.
- C. Architectural drawings and field instructions issued by the Commissioner take precedence over the above list and shall be adhered to.

### 3.5 SUPPORTS

- A. Support work in accordance with best industry practice and the following.
- B. Include supporting cabinets to floor in IT Closets / IT Server Room.
- C. Supporting cables with strut channel, cable hangers and threaded rod are the responsibility of the Contractor.
- D. Nothing (including outlet, pull and junction boxes and fittings) shall depend on conduits, raceways or cables for support.
- E. Nothing shall rest on, or depend for support on, suspended ceiling media (tiles, lath, plaster, as well as splines, runners, bars and the like in the plane of the ceiling). Vertical members that suspend the ceiling (together with their horizontal bracing that occurs above the ceiling), however, may be used for support.
- F. As a minimum procedure, in suspended ceilings support small runs of circuitry from ceiling suspension members as defined above. Support larger runs of circuitry directly from structural slabs, decks or framing members.
- G. Where support members must of necessity penetrate air ducts, include, in accordance with instructions issued in the field, airtight sealing provisions that allow for a relative movement between the support members and the duct walls.
- H. Include in the telecommunications work channel sills or skids for leveling and support of all floor mounted telecommunications equipment.
- I. Where permitted loading is exceeded by direct application of telecommunications equipment to a slab or deck, include in the telecommunications work proper dunnage as required to distribute the weight in a safe manner.
- J. Fire-resistant, UL Rated, Velcro straps shall be used for securing riser cables. The cable ties shall be laced through the strands of the messenger and secured to the cable to be supported.
- K. All Velcro Wraps / Straps used to support telecommunications cabling shall be of the fire-resistant type. The support rating of the wraps / straps to be used shall be a minimum of twice that of the weight per unit of the cable(s) to be supported.
- L. Riser cabling shall be supported via wall mounted slotted strut channel framing or vertical ladder rack. The framing shall be extended the entire length of the riser shaft (whether or not used entirely by the communications contractor). Vertical members for cable support shall be extended and secured from slab to slab at distances no more than 4' on center. No less than three (3) horizontal cross members shall be fastened to the vertical members using approved system accessories. All framing components shall be 1-1/2" by 1-1/2" minimum perforated >C' channel.

### 3.6 FASTENINGS

- A. Fasten telecommunications work to the building structure in accordance with the best industry practice and the following.

- B. As a minimum procedure, where weight applied to the attachment points is 100 pounds or less, fasten to building elements of:
  - 1. Wood -- with wood screws.
  - 2. Concrete except precast and solid masonry -- with bolts and expansion shields.
  - 3. Hollow construction -- with toggle bolts.
  - 4. Solid metal -- with machine screws in tapped holes or with welded studs.
  - 5. Precast concrete and steel decking or subfloor --with fastenings as specified below for applied weights in excess of 100 pounds.
- C. No more than three (3) riser cables in excess of 0.5" in diameter shall be fastened using one Velcro wrap / strap.
- D. Velcro warps shall be deployed every four (4) feet minimum when fastening telecommunications cables in horizontal cable tray.
- E. Velcro wraps / straps shall be deployed every two (2) feet minimum when fastening telecommunications cables run vertically on a wall or rack.
- F. Velcro wraps / straps fastening multiple small cables shall form a grouping no larger than three (3) inches in diameter.
- G. Fire-resistant, UL Rated Wraps / Straps shall be used for fastening riser cables to vertical cable tray.
- H. All cables shall be grouped and bundled utilizing approved Fire-resistant, UL Rated Wraps / Straps, the best industry practice and the following:
  - 1. Where multiple cables serve a single workstation, the cables shall be tied as a single bundle every four (4) feet, minimum.
  - 2. Horizontal cabling routed in cable tray shall be tied every ten (10) feet, minimum.
  - 3. Cables routed in surface mounted raceways shall be tied and fastened to the raceway using tie anchor mounts secured with screws every two (2) feet, minimum.
  - 4. Cables routed in furniture systems shall be tied at every pedestal location and at least once in between each pair of pedestals, minimum.
  - 5. Cables shall be tied on racks, frame, cabinets, etc., every two (2) feet, minimum.

### 3.7 LOCATING AND ROUTING CIRCUITRY

- A. All circuitry shall be run concealed except that it shall be run exposed:
  - 1. Horizontally at the ceiling and vertically on the walls of telecommunications and

telephone closets and of permanently unfinished spaces which are not assigned to mechanical or electrical equipment.

- B. Concealed circuitry shall be so located that building construction materials can be applied over its thickest elements without being subject to spalling or cracking.
- C. Circuitry run exposed shall be routed parallel to building walls and column lines.
- D. Exposed circuitry located overhead shall be run in a completely accessible manner on the underside of all piping and ductwork.
- E. Circuitry run in suspended ceilings shall be routed parallel to building walls, column lines, etc.
- F. Circuitry shall be routed so as to prevent telecommunications conductors from being subject to high ambient temperature. Minimum clearances from heated lines or surfaces shall be maintained as follows:
  - 1. Crossing where uninsulated-----6"
  - 2. Crossing where insulated-----3"
  - 3. Running parallel where uninsulated--3'-0"
  - 4. Running parallel where insulated --- 6
- G. Circuitry shall not be routed over or under a boiler except where special provisions for wiring through these specific high ambient temperature areas have been indicated.
- H. Circuitry shall not be run in elevator or dumbwaiter shafts, hoistways, and the like.
- I. Circuitry for miscellaneous systems indicated without notation as to location and routing shall be run as per the requirements and notations governing the adjacent telecommunications circuitry.
- J. Under no circumstances shall voice/data wiring pass through electric closets, switchgear rooms, gas meter rooms, mechanical spaces, janitors closets(unless noted), etc.
- K. The distance limitations for the following cable types/systems shall be as follows:
  - 1. 24 AWG maximum distance: 90m.
  - 2. Twisted Pair (4 pr) maximum distance: 90m.
- L. Provide a minimum of 6" clearance between telecommunications cables and fluorescent, neon, incandescent or high intensity discharge fixtures such as mercury vapor lamps.
- M. Provide a minimum of 36" clearance between telecommunications cables and all motors, transformers or other devices with a potentially high electromagnetic interference.

- N. Utilize existing empty conduit, provided by others, for the routing of the telecommunications wiring.
- O. Utilize existing cable tray provided by others for routing of telecommunications wiring.
- P. Utilize the raised floor system provided in special rooms (i.e., computer rooms, etc.) for the routing of the telecommunications wiring. The routing under the raised floor shall be via "accessible corridors."

### 3.8 INSTALLING CIRCUITRY

- A. In runs of conduit or raceway including flexible limit the number of bends between cable access points to a total which does not exceed the maximum specified for the particular system. Where no such maximum is specified, limit the number to two right angle bends or the equivalent thereof.
- B. Each conduit or raceway assigned for telecommunications work shall be provided with a bushed opening.
- C. All conduits entering telecommunications closets and/or equipment rooms shall be provided with bushed openings.
- D. It is the Contractor's responsibility to ensure that the telecommunications cabling is protected from all sharp edges, burrs, etc., in all raceway systems intended for telecommunications cabling.
- E. An attempt shall be made to locate the wall space for terminations on one continuous wall.
- F. At each workstation, the Contractor will cable and install cable connectors for connection to final equipment. The Contractor will cable, connectorize and/or punch down cables on connector blocks furnished and installed in the telecommunications closets serving the various station areas. Riser prebundled or bulk cables will be labeled, connectorized, punched down and cross-connected through a separate set of terminal strips and then routed through inter-floor slots or sleeves. Other outlet locations will be cabled as specified and indicated elsewhere.
- G. The Contractor is responsible for all pulls through conduit, sleeves, etc. of all bundled or individual cables including all labelling and connectorizing at all junctions and terminations. All required connecting blocks will be furnished and installed by the Contractor. Other outlet locations will be cabled and specified as indicated on the drawings.
- H. Each type of cabling media (i.e. fiber, twisted pair, etc.) shall be bundled separately for all horizontal runs unless otherwise specified.
- I. Maintain the manufacturer's recommended minimum bend radius on all cables throughout the installation.
- J. All cables terminated on blocks, patch panels, equipment assemblies, etc., shall be installed in increasing consecutive alphabetical or numerical order, starting from the upper left hand corner of the terminating device, unless otherwise noted.

- K. All cables shall be provided with strain relief such that pulling on the cable jacket will not affect the terminated conductors.

### 3.9 PULLING WIRES INTO CONDUITS AND RACEWAYS

- A. Delay pulling in until the project has progressed to a point when general construction procedures are not liable to injure wires and cables, and when moisture is excluded from raceways.
- B. Utilize nylon snakes or metallic fish tapes with ball type heads to set up for pulling.
- C. In raceways 2" trade size and larger, utilize a pulling assembly ahead of wires consisting of a suitable brush followed by an 85% diameter ball mandrel. Submit certifications that mandrelling has been performed as specified.
- D. Prior to installation, submit evidence that wires are new (in accordance with the definition of "new" as hereinbefore specified).
- E. Leave sufficient slack on all runs of wire and cable to permit the secure connection of devices and equipment.
- F. Include circular wedge-type cable supports for wires and cables at the top of any vertical raceway longer than 20 feet. Also include additional supports spaced at intervals which are no greater than those set forth as industry minimum standard. Supports shall be located in accessible pull boxes. Supports shall be of a non-deteriorating insulating material manufactured specifically for the purpose.
- G. Pulling lubricants shall be products manufactured specifically for the purpose.
- H. Slack on wires and cables located in cabinets and pull boxes shall be formed and set in place in groupings corresponding to their occupancy of raceways. They shall also be arranged, with insulators and supports provided where necessary, such that cable shims or other such temporary expedients do not have to be left permanently in place to prevent the wires and cable from shifting when covers or trims are removed.

### 3.10 SERVICE ENTRANCE TERMINATION AND PROTECTION

- A. A service entrance room (SER) has been provided for the termination and protection of outside services (i.e. local exchange carriers (LEC), CATV, etc.).
- B. It is the responsibility of the contractor to coordinate with the individual vendors and the base building team terminating within the service entrance room and extending service to elsewhere within the building for cable routing and termination locations where it may affect work outlined in the specifications.
- C. Outside cabling shall extend into the building entrance facility not more than 50 feet without termination, protection and/or grounding, unless specifically stated otherwise.
- D. Building entrance telecommunications circuits shall be protected in accordance with Article

800 of the National Electrical Code and best industry practice as outlined in this specification.

- E. A distance of six (6) feet, minimum shall be maintained between any communication circuits and any lightning conductors.
- F. All conductive building entrance cables shall be spliced to the building entrance protector unit fusible links using an approved splice chamber.
- G. Under no circumstances shall a building be served from a protector located in a different building if the cable between the buildings is run exposed.
- H. The building entrance protector units shall be located so as to minimize the length of the drop conductors or the line side of the protectors.

### 3.11 INSTALLING CABLES IN UNDERGROUND CONDUIT BANKS

- A. The telecommunications work required in conjunction with underground conduit banks shall include:
  - 1. Wire and cable as indicated.
- B. Cables shall be installed in accordance with the following:
  - 1. Their splices shall be insulated and waterproofed by use of an encapsulating kit manufactured specifically for the purpose or by plastic tape method specified for splicing under normal telecommunications work conditions. When using the plastic tape method, apply an electric insulating putty under the tape to assure a smooth contour and two coats of glyptol paint over the tape.

### 3.12 INSTALLING CABLES IN CONDUIT BANKS RUN BELOW GRADE SLAB

- A. The telecommunications work required in conjunction with conduit banks run below grade slab shall include:
  - 1. Wires and cables as indicated.
- B. Cables shall be installed in accordance with the following:
  - 1. Their splices shall be insulated and waterproofed by use of an encapsulating kit manufactured specifically for the purpose or by plastic tape method specified for splicing under normal telecommunications work conditions. When using the plastic tape method, apply an electric insulating putty under the tape to assure a smooth contour and two coats of glyptol paint over the tape.

### 3.13 INSTALLING WIRING DEVICES

- A. Install wiring devices in accordance with the following:
  - 1. Telecommunications outlets shall be mounted horizontally or vertically as directed.
  - 2. Provide plates for all wall mounted telecommunications devices.

3. Utilize stanchions flush floor outlet fittings as standard mounting for all floor mounted outlets.
4. Obtain final field instructions from the Commissioner prior to locating devices whose plates flush floor outlet fittings stanchions or visible parts have been specified in materials, colors or finishes which differ.

### 3.14 GROUNDING AND BONDING

- A. Ground all systems and equipment in accordance with best industry practice and the following:
  1. All ground connectors in the main telecommunications equipment rooms and telecommunications closets shall be made to the ground bars provided for that purpose as part of the electrical work.
  2. All metal panels, enclosures, boxes, racks, raceways, etc. in equipment rooms, telecommunications equipment rooms and closets shall be grounded.
  3. Conductors utilized for grounding and bonding shall not be less than #6 AWG and shall have type "TW" or better insulation. Cables used for grounding and bonding shall have green jacket color.
  4. National Fire Protection Agency (NFPA) 70, the National Electrical Code NEC, NFPA 780, the Standard for Installation of Lightning Protection Systems, Telecommunication Industry Association. 2011. ANSI J/STD-607-B, Commercial Building and Bonding Requirements for Telecommunication, and the New York City Fire Department.

### 3.15 TESTING

- A. Before an application for final acceptance of the telecommunications work will be considered, all tests deemed necessary by the Commissioner to show proper execution of the telecommunications work shall have been performed and completed in the presence of the Commissioner. Scheduling of all testing procedures shall be arranged with the Commissioner.
- B. Tests specified to be performed in this document are intended to verify the quality of all cabling. This document also establishes a uniform method of reporting the test results for evaluation by the Commissioner.
- C. All tests are to be performed upon completion of the initial installation.
- D. Performing the indicated tests does not constitute equipment or circuit acceptance.

### 3.16 TEST EQUIPMENT

- A. The equipment indicated below represents test equipment utilized to develop this test specification. Substitute test equipment may be used, upon approval by the Commissioner, provided the same level and quality of testing is performed.
  1. Twisted pair riser cable:
    - a. Testing Product: Independent Technologies Multi pair tester.
    - b. Sperry Instruments

- c. Fluke
      - d. Or approved equal.
  - 2. Twisted pair/coax cables:
    - a. Testing Product: Level IV Fluke DTX Cable Analyzer with all accessories, or an equivalent product from an approved equal listed below:
    - b. JM Test Systems
    - c. Bird
    - d. Or approved equal.
  - 3. Utilize the following accessories as required (refer to manufacturers handbook):
    - a. RJ-45 test module
    - b. 110 Punch Down block adapter kit
- B. Prior to any testing being performed, the Commissioner shall be supplied with a list of test equipment to be used, for his review and approval, if not the equipment identified in this specification. The submittal shall include documentation indicating that the proposed equipment is capable of performing all of the tests as required by this specification.

### 3.17 TESTS TO BE PERFORMED

- A. Tests are to be performed on the following aspects of the telecommunications cabling system:
- 1. From each telecommunications closet (IDF) termination to each and every workstation termination.
- B. All cable runs for which equipment will not initially be attached must be tested to the same level of compliance as all other cabling.
- C. Prior to any acceptance testing being performed, a sample test shall be performed for each series of tests (i.e., copper, fiber, etc.). The sample test shall consist of a regular acceptance test on a few sample cables as selected by the Contractor. The Commissioner shall be given a minimum of one week notice so he may observe the test.
- D. Voice grade cable
- 1. Test equipment: Cable Analyzer with applicable accessories – see TEST EQUIPMENT paragraph of this section.
  - 2. Tests to be performed.
    - a. The following items must be demonstrated:
      - (1) Conductors are electrically continuous between terminations.
      - (2) Conductors are electrically isolated from all other conductors.
      - (3) Conductors contain no shorts to ground.
      - (4) Cables have a properly grounded shield (where applicable) as specified and in accordance with the best industry practice.

- (5) Polarity.
- E. Data grade cable - The tests on this cable shall be the same as for Item D above. In addition, the following test shall be performed on all pairs of a twisted pair cable or pair #1 of a cable greater than 4 pairs.
1. Test equipment: Cable Analyzer with applicable accessories – see TEST EQUIPMENT paragraph of this section.
  2. Tests to be performed:
    - a. The test equipment shall be configured to test the maximum transmission performance for which the cable is rated (i.e., Cat 3 = 10 Mbps, Cat 6 = 100 Mbps).
    - b. The following minimum information shall be provided for each cable and pair to be tested:
      - (1) Length - find the total cable length.
      - (2) Resistance - measured for each cable pair.
      - (3) Noise - measured for each pair at the following frequencies:  
10Hz - 150KHz, 150KHz - 16MHz, 16MHz - 100MHz.
      - (4) Insertion Loss (Attenuation) - measured for each pair at 10MHz.
      - (5) Near End Cross Talk (NEXT) - measure NEXT in dB and the associated frequency.
      - (6) Delay - measured for each pair.
      - (7) Delay Skew - find the delay skew between the fastest and slowest pairs.
      - (8) Attenuation to Crosstalk Ratio (ACR).
      - (9) Power Sum Near End Crosstalk (PSNEXT)
      - (10) Wire map - indicate that the wiring at the near end and far end are as specified.
    - c. For all cables required to meet Category 6 and Category 6 requirements detailed elsewhere in this specification, the following additional information shall be provided for each cable and pair:
      - (1) Equal Level Far End Crosstalk (ELFEXT)
      - (2) Power Sum Equal Level Far End Crosstalk (PSELFEXT)
      - (3) Power Sum Attenuation to Crosstalk Ratio (PSACR)

- (4) Structural Return Loss (SRL)
  - d. During testing (link test), if any failures or marginal pass results occur (a marginal pass is indicated as "\*pass" on the test equipment), the following procedures are to be taken:
  - e. For marginal pass (\*pass) results, the circuit will be retested. If the re-test result is a failure, troubleshoot and correct the problem. If the result is again a marginal pass for any reason other than excess length, troubleshoot and correct the problem as if the result were a failure. If the marginal pass is due to excess length, make every effort to remove slack in the run and re-test.
    - (1) For failure results, re-test and/or troubleshoot to correct the problem. Provide documentation to support the good circuit by providing the test results of that circuit that indicate "pass" (a non-marginal pass).
    - (2) Provide an explanation for each failure for each marginal pass result that has not been resolved, including a description of the steps taken to troubleshoot the circuit and the reason why further corrective action has not been undertaken.
- 3. Fiber optic cable
  - a. Test equipment -- Optical time domain reflectometer (OTDR) with chart recorder.
- 4. Tests to be performed
  - a. A prequalified one hundred (100) foot minimum fiber optic cable containing the same performance parameters of the cable to be tested, shall be connected at the OTDR end of the test setup.
  - b. The OTDR shall be used on each fiber optic strand to identify the following parameters. The below measurements shall be taken at both 850nm and 1300nm using a short pulse width:
    - (1) Length of cable.
    - (2) Discontinuities with the cable/connectors.
    - (3) Areas of localized attenuation.
    - (4) Total loss (dB) from end to end including terminations.
  - c. Cursor and marker distances shall be standardized for fiber optic cables with the same origin and destination for all tests (i.e., main equipment room to telecommunications closet).
  - d. No area of localized attenuation shall be greater than 0.2 dB.
  - e. The OTDR trace should be expanded to fill at least two-thirds to three quarters of the OTDR screen. The input pulse and the end "spike" of the

cable shall both be displayed.

- f. The input pulse and the end "spike" shall be elevated off the bottom of the screen by approximately one division.
- g. Each OTDR trace shall be annotated with information regarding fiber identification and the settings selected on the OTDR.
- h. The OTDR traces shall be maintained as a permanent record for the purposes of maintenance and restoration.

**F. Coaxial cable**

- 1. Test equipment: Cable Analyzer with applicable accessories – see TEST EQUIPMENT paragraph of this section.
- 2. Tests to be performed:
  - a. The following items must be demonstrated:
    - (1) Conductors are electrically continuous between terminations.
    - (2) Conductors are electrically isolated from all other conductors.
    - (3) Conductors contain no shorts to ground.
    - (4) Cables have a properly grounded shield (where applicable) as specified and in accordance with the best industry practice.
- 3. Perform continuity testing upon installation and termination or all infrastructure cabling and provide a cable run sheet indicating the results. Further test may be requested by Commissioner if continuity results are deemed unsatisfactory. Any cable which is determined to not meet performance specifications following continuity testing shall be replaced at no further expense to The City of New York before the system shall be accepted as complete. Continuity test results may not be used to qualify cabling performance specifications or acceptance.
- 4. Testing and Certification of installed and terminated vertical and horizontal cables for Structural Return Loss are based on FCC standard methods of determining SRL. The installed cable infrastructure shall meet or exceed the cable manufacturer's specifications for SRL.

**3.18 CORRECTIVE ACTION**

- A. Any defects or deficiencies discovered in any of the telecommunications work shall be indicated on the test report and be corrected.
- B. Upon completion of testing and problem resolution, all connections tested are to be 100% error free.
- C. Any connections determined to be not correctable shall be indicated at each end of the

termination as "bad" (in red).

### 3.19 EQUIPMENT INSTALLATION AND TESTING

- A. The Contractor shall be available during equipment installation and testing to help isolate faults that may exist in the cabling system installation.
- B. Coordinate with other vendors where necessary to resolve any discrepancies between the cabling system and the vendors' cabling or equipment.

### 3.20 WASTE MANAGEMENT

- A. Separate and dispose of waste in accordance with the DDC General Conditions.

**END OF SECTION 27 00 00**

**SECTION 27 41 00****AUDIO-VIDEO COMMUNICATIONS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
  - 1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 "INDOOR AIR QUALITY MANAGEMENT", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

**1.3 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.4 AV PROJECT REVIEW**

- A. Provide engineering services, fabrication, AV-related low voltage cabling and terminations, installation, instruction, documentation, and one year of warranty coverage for hardware, software, and workmanship in the spaces and subsystems in scope. Provide fully operational systems based on the Contract Documents, whether or not every required interface and component is specifically detailed therein. All engineering services shall be performed by Contractor's professional engineer licensed in the State of New York, and all products of engineering services shall be submitted for review and approval by Commissioner.

**1.5 CONTRACTOR SCOPE OF WORK**

- A. Include in the audiovisual work all necessary supervision and the issuing of all coordination information to any other trades who are supplying work to accommodate the audiovisual installations.
- B. For items of equipment, if any, which are to be installed but not purchased as part of the audiovisual work (i.e., City of New York Supplied Equipment), the audiovisual work shall include:
  - 1. The coordination of their delivery.
  - 2. Their unloading from delivery trucks driven in to any point on the property line at grade level.
  - 3. Their safe handling and field storage up to the time of permanent placement in the project.
  - 4. The correction of any damage, defacement or corrosion to which they may have been subjected.
  - 5. Their field make-up as may be necessary for their proper operation.
  - 6. Included shall be the purchase and installation of any adapters or other wiring terminations as may be necessary to adapt their terminals to the wiring as called for and to the connection methods set forth in these specifications.
  - 7. Provide all power strips required in racks, under tables, in credenzas, and in all other locations where AV equipment is to be plugged in and where the available power wall plate does not have sufficient outlet quantity. Determine the size of the required power strips for each specific location and condition.

**1.6 CODES, PERMITS AND INSPECTIONS:**

- A. All audiovisual work shall meet or exceed 2014 New York City Construction Codes, National Electrical Code, and other applicable sections of the National Fire Code, as published by the National Fire Protection Association.
- B. Installation procedures, methods and conditions shall comply with the latest requirements of the Federal Occupational Safety and Health Administration (OSHA) and the Americans with Disabilities Act (ADA).

**1.7 GUARANTEES AND CERTIFICATIONS:**

- A. All audiovisual work shall be guaranteed to be free from defects. Any defective materials or workmanship, as well as damage to the audiovisual work resulting from the work of all trades, shall be replaced or restored as directed for the duration of stipulated guarantee periods.
- B. The duration of Contractor's guarantee periods following the date of substantial completion of the audiovisual work shall be:
  - 1. One year following the date of substantial completion. This includes one-year warranty coverage by the Contractor if specific furnished products carry less

than one-year warranty by the manufacturer.

- C. When available, all components shall be coordinated and installed as part of a manufacturer's certification program. Where components selected are from different manufacturers and are not covered as part of a single (or multiple) program(s), guarantee all aspects of the audiovisual installation as outlined in this specification and associated drawings for the above stipulated minimum period.
- D. Non-durable items shall be replaced up to the date of substantial completion, such that they shall have had no more than 10 hours use prior to this date.
- E. Prior to substantial completion, certification shall be submitted attesting to the fact that specified performance and other criteria are met by all items of audiovisual work where a particular level of performance is indicated.
- F. All Manufacturers' equipment warranties shall be activated by the Contractor in the City of New York's name and shall commence on the date of substantial completion. In the case of Contractor-modified equipment, the manufacturer's warranty is normally voided. In such cases, provide the Commissioner with a written warranty equivalent to that of the original manufacturer.

#### 1.8 REFERENCES

- A. Reference to "U.L. (Materials Construction) Standards" shall mean the "Standards for Safety," published by Underwriters Laboratories, Inc. (Main Office: 333 Pfingsten Road, Northbrook, Illinois 60062).
- B. Reference to "NEMA Standards" shall mean the "Approved Standards" published by the National Electrical Manufacturers Association (Main Office: 2101 "L" Street, N.W., Washington, D.C. 20037).
- C. Reference to "ANSI Standards" shall mean the standards published by the American National Standards Institute (Main Office: Twenty East Fortieth Street, New York, New York 10016).
- D. Reference to "EIA/TIA Standards" shall mean the standards published by the Electronic Industries Association and Audiovisual Industry Association, 201 Pennsylvania Avenue, N.W., Washington, D.C. 20006.
- E. Reference to "IEEE Standards" shall mean the standards published by the Institute of Electrical and Electronics Engineers.
- F. Reference to "SMPTE Standards" shall mean standards published by the Society of Motion Picture and Television Engineers, 595 West Hartsdale Ave, White Plains, NY 10607.
- G. Except where modified by a specific notation to the contrary, it shall be understood that the indication and/or description of any audiovisual item in the drawings and specifications for audiovisual work carries with it the instruction to furnish, install and connect the item as part of the audiovisual work regardless of whether or not this instruction is explicitly stated.
- H. No exclusion from or limitation in, the symbolism used on the drawings for audiovisual work or the language used in the specifications for audiovisual work shall be interpreted as a reason for omitting the appurtenances or accessories necessary to complete any required system or item of equipment.

- I. The drawings for audiovisual work utilize some symbols and schematic diagrams which have no dimensional significance. The audiovisual work shall, therefore, be installed to fulfill the diagrammatic intent expressed on the audiovisual drawings, but in conformity with the dimensions indicated on the Drawings.
- J. Certain details appear on the drawings for audiovisual work which are specific with regard to the dimensioning and positioning of the audiovisual work. These are intended only for general information purposes. They do not release the Contractor from the requirement for field coordination for individual items of the indicated work with associated trades and field conditions and actual field dimensions.
- K. Information as to general construction and architectural features and finishes shall be derived from structural and architectural drawings and specifications. Exact locations for all Audiovisual Jack plates and built-in devices shall be derived from the Drawings.
- L. The use of words in the singular shall not be considered as limiting where other indications denote that more than one item is referred to.
- M. Ratings of devices, materials and equipment specified without reference to specific performance criteria shall be understood to be nominal or nameplate ratings established by means of industry standard procedures.
- N. It is the intent of the drawings and specifications to provide a complete operating audiovisual system. All audiovisual work necessary to provide such a system shall be performed. Any discrepancies shall be brought to the Commissioner's attention.

**1.9 QUALITY ASSURANCE:**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. All equipment and materials for permanent installation shall be the products of recognized manufacturers and shall be new. Supply the latest model (in the specified series) available, of each piece of equipment.
- C. New equipment and materials shall:
  - 1. Be Underwriters Laboratories, Inc. (U.L.) labeled and/or listed where specifically called for, or where normally subject to such U.L. labeling and/or listing services.
  - 2. Be clearly labeled identifying the power parameters specified.
  - 3. Be without blemish or defect.
- D. All items of equipment or material of one generic type shall be the product of one manufacturer throughout.
- E. Substitutions of Audiovisual Equipment for that shown on the schedules or designated by model number in the specifications may not be considered if the item is not a regular cataloged item shown in the current catalog of the manufacturer.
- F. Manufacturer's Recommendations: Where installation procedures or any part thereof are required to be in accordance with the recommendations of the manufacturer of the material being installed, printed copies of these recommendations shall be furnished prior

to installation. Installation of the item will not be allowed to proceed until the recommendations are received. Failure to furnish these recommendations can be cause for rejection of the material.

**1.10 SUBMITTALS and RESPONSIBILITIES OF THE CONTRACTOR:**

**A. Furnish the following unless otherwise noted in drawings or equipment list:**

1. Flat Panel Displays
2. Video Projectors
3. Control System Processors
4. Touch panels
5. Transmitters and Receivers
6. Misc. AV components necessary for fully functional AV system

**B. Prior to assembling or installing the audiovisual work, the following shall be submitted for review:**

1. Catalog information, factory assembly drawings and field installation drawings as required for a complete explanation and description of all items of equipment.
2. Submit for approval one sample of each of the following:
  - a. Each type of cable if other than that specified.
  - b. Each type of cable connector if other than that specified.
  - c. Each type of jack plate or floor box assembly, complete with labeling, or a full-scale rendering thereof, complete with font-styles and color schemes.
  - d. Each type of patching/cross connecting device, if other than that specified.
  - e. Each type of identification label.
  - f. Other items as requested.
  - g. Pin-to-pin wiring drawings including all field wire pulls and wiring internal to the equipment rack.
  - h. Rack elevation drawings, front and back
  - i. Equipment cabinet shelf arrangements
  - j. Mounting details
  - k. Connector plate layouts

- I. Shop drawings for rack system integration
    - m. Exact locations for all permanently installed devices
- C. Style and color of ceiling speakers or grille cloth, connector plate style and finish, wood grain, stain and finish and any other interior furnishings must have prior approval of the Commissioner.
- D. Documents will not be accepted for review unless:
  - 1. They include complete information pertaining to appurtenances and accessories.
  - 2. They are submitted as a package where they pertain to related items.
  - 3. They are properly marked with the specific system for which they are intended, function, and intended location of use within the project.
  - 4. They are clearly identified or highlighted to indicate all items which are applicable.
- E. Shop Drawing Review by Commissioner
  - 1. The purpose of the review of shop drawings is to maintain the integrity of the design. Unless the Contractor clearly points out changes, substitutions, deletions or any other differences between the submission and the Contract Documents in writing on the Contractor's letterhead, approval by the Commissioner does not constitute acceptance. Except for the products specified herein, it is not to be assumed that the Commissioner has read the text nor reviewed the technical data of a manufactured item proposed by the Contractor, except where the Contractor has pointed out differences between his product and the specified model.
  - 2. Shop drawings should consist of the following:
    - a. Pin to pin system flow diagrams
    - b. Rack elevations – front and rear
    - c. Cable management methods for rack cabling
    - d. Cable pull schedules
    - e. Cable labeling methodology
    - f. Mounting details for any equipment mounted on walls/ceilings including but not limited to projectors, speakers, flat panels, and projection screens. Mounting details are to include specific drawings and model numbers of all parts and pieces involved to attach the equipment to the building structure.
    - g. Faceplate drawings including custom faceplates within floor boxes or wall boxes
  - 3. It is the responsibility of the Contractor to confirm all dimensions, quantities, and the coordination of materials and products supplied by him with other trades. Approval of shop drawings containing errors does not relieve the Contractor from making corrections at his expense.

4. Substitutions of equipment, systems, materials, must be coordinated by the Contractor with his own or other trades which may be involved with the item, such as, but not limited to, equipment substitutions which change audiovisual or electrical requirements, hanging or support weights or dimensions.
- F. Include in the audiovisual work the issuing of operating instructions for the following specialized equipment:
  1. All electronic equipment provided or installed as part of the audiovisual work.
  2. All database software and/or programs.
- G. The issuing of operating instructions shall consist of supplying properly trained installers to demonstrate the operation of specialized equipment. This demonstration shall be performed after the system is installed in the environment, and with external building systems, such as HVAC, on and operating at normal levels. The issuing of operating instructions shall also consist of supplying of all original operating and maintenance instruction manuals.
- H. The issuing of operating instructions shall include the submission of the name, address and telephone number of the manufacturer's representative and service company for each item of equipment so that service and separate parts can be readily obtained, at the Commissioner's option.
- I. After all final tests and adjustments have been completed, fully instruct the City of New York's service operators in all details of operation for the systems installed. Supply properly instructed installers to support system operation for a sufficient length of time to assure that the City of New York's service operators are properly instructed to take over operation and service procedures. Supply qualified installers to oversee the installation for sufficient length of time as required to assist all systems equipment vendors in the operation and performance of systems tests.
- J. Furnish complete documentation, in bound form containing data covering capacities, maintenance and operation of the installed systems and apparatuses. Operating instructions shall cover all phases of control and include the following:
  1. Performance Criteria: For transmission and other criteria as requested.
  2. List of Spares: Recommended for normal service requirements.
  3. Parts List: Identifying the various parts of the installation for service and replacement purposes.
  4. Instruction Books may be standard booklets but shall be clearly marked to indicate applicable equipment.
  5. Wiring Diagrams: Generalized diagrams are not acceptable; submittal shall be specifically prepared for this Project.
- K. Where applicable, one set of riser diagrams and/or floor plans, and system flow diagrams shall be neatly framed behind plexiglass and hung adjacent to the racks concerned.
- L. Schedule of Implementation

1. Any site condition which impedes the timely performance of the Contractor shall be brought to the attention of the Commissioner.
2. Schedule milestones are to include but not be limited to the following:
  - a. Purchase order received.
  - b. Agreed upon equipment ordering date.
  - c. Cutsheet submittals, substitution samples.
  - d. Drawing submittals.
  - e. In-shop fabrication.
  - f. Job site equipment delivery.
  - g. Installation, testing and burn-in.
  - h. Instruction and final punch list completion.
  - i. Turnover and occupancy.

**1.11 DESCRIPTION OF STANDARD AUDIOVISUAL ASSEMBLIES:**

- A. Ensure that the installation of all equipment be performed in accordance with standard manufacturers specifications and installation methods. The necessity of special conditions required by a particular manufacturer shall be brought to the attention of the Commissioner prior to the installation of any equipment in the area concerned.

**1.12 WORK INCLUDED:**

- A. Audiovisual materials and services as described in this AV Specification Section 27 41 00 and on the accompanying Contract Documents.

**1.13 RELATED WORK:**

- A. General Construction Work.
- B. Telecommunications Systems. Contractor must coordinate with the Telecom drawings.
- C. Electrical Specifications. Contractor must coordinate with the Electrical drawings.
- D. Lighting Specifications. Contractor must coordinate with the Lighting drawings.

**1.14 REFERENCES:**

- A. 2014 New York City Construction Codes
- B. National Electrical Code / NFPA 70
- C. Sound System Engineering. Fourth Edition, Don and Carolyn Davis, Howard Sams & Co. The Chapter on "System Installation" is the Contractor's reference for acceptable installation and wiring methods for AV.

- D. Utilize the manufacturer's published recommended installation and termination instructions, methods, and tools for crimp connections and all other termination devices. Submit such instructions to the Electrical trade performing the terminations of any and all low voltage AV signal cables, connectors, Jack plates, etc.
- E. Instrumentation Fundamentals and Applications, Morrison, Wiley Interscience, NY. Reference for grounding and shielding techniques.

## PART 2 - PRODUCTS

### 2.1 EQUIPMENT SCHEDULE

- A. See Audiovisual Systems Equipment Schedule following PART 3 of this Section and prior to the end of this Section, for all basis-of-design products. Subject to compliance with requirements, provide basis-of-design product, or approved equal, for each product type.
- B. Provide shop drawings with a complete list of materials to be used at each location as indicated herein. Shop drawings and materials list must be approved before contractor is allowed to begin any installation work.
- C. Propose a Smart LED 4K UHD TV solution based upon the warranted solution from the following manufacturers:
  - 1. LG
  - 2. Sony
  - 3. Samsung
  - 4. Or approved equal.
- D. Horizontal outlet cabling and all associated components (i.e. jacks, faceplates, HDMI Couplers, HDMI right angle adapters, HDMI patch cords and cables, etc.): shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
  - 1. Leviton/Berk-Tek
  - 2. Ortronics/Superior Essex
  - 3. Panduit/General Cable
  - 4. Comprehensive Connectivity
  - 5. Or approved equal.
- E. Wall Mount for Smart LED 4K UHD TV (Wall mount shall be properly sized for the specific TV size) shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
  - 1. Chief Manufacturing
  - 2. Peerless
  - 3. Church Field
  - 4. Or approved equal.
- E. Audio Visual Equipment Racks (Rack used for the storage of Audio Visual equipment) and all associated components shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the

following:

1. Chief Manufacturing
  2. Ortronics/Legrand
  3. Peerless
  4. Mid Atlantic
  5. Or approved equal.
- F. Audio Visual Equipment and all associated components (i.e. Audio Amplifiers, Matrix switches, Touch Panels, Gateways, IR Extenders and connectors, etc.) shall be products included in one of the following manufacturer's warranted solutions. Subject to compliance with requirements, provide products by one of the following:
1. Crestron
  2. Extron
  3. BiAMP
  4. Xantech
  5. Or approved equal.
- G. Audio Visual Ceiling mounted speakers and all associated components: Subject to compliance with requirements, provide products by one of the following:
1. JBL
  2. Bose
  3. Polk Audio
  4. Yamaha
  5. Or approved equal.
- H. Microphones and wireless microphones: Subject to compliance with requirements, provide products by one of the following:
1. Sennheiser
  2. Sure
  3. AKG
  4. Or approved equal.
- I. Hearing Induction Loop Amplifier and all associated components including Induction Loop Cable and connectors: Subject to compliance with requirements, provide products by one of the following:
1. InLoop
  2. Williams AV
  3. Audioropa
  4. Or approved equal.

### PART 3 – EXECUTION

3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

3.2 WORKMANSHIP AND INSTALLATION PRACTICES

- A. Use professional quality workmanship in all aspects of the installation, including neat and orderly dressing, strain relief and labeling of all cables.
- B. Set up and adjust each variable component of the system using calibrated signal generators and signal analyzers, as may be required, to optimize the gain-structure and overall performance of the system, as per manufacturer's specifications and good system engineering practices. Wherever applicable use the setup and convergence procedures specified by the manufacturer to assure proper adjustment of said components. This includes but is not limited to a complete setup of all video and audio components, monitors, projectors, cameras, recording and playback devices, scan converters, modems, fiber optic components, codecs. In addition all serial and/or parallel device control protocols i.e., RS-232C, RS-485, RS-422 and related data control signals must be tested and conform to industry standards and practices unless specified by the manufacturer of said equipment. Signal Transport i.e. fiber optics, ISDN, wireless, webcasting, satellite transmission reception and all forms not mentioned in this document which appear in the project design must be tested. These setup parameters and results shall be submitted to the Commissioner for review prior to system Acceptance Tests.
- C. The images and sound at any and all selected AV jacks and systems in the facility shall be judged by the Commissioner, to be free of visible ghosting, snow, hum, noise or distortion beyond that which is evident at the source. Professional quality broadcast monitors shall be used as the reference hardware for subjective image tests, using SMPTE and/or AES reference video and audio program material. If signal degradation, as judged by the Commissioner, is evident anywhere in the system, make such adjustments as required to eliminate such signal degradation, at no further expense to the City of New York, if the signal degradation is outside of the expected performance of the installed components, and due to a deficiency in the workmanship, installation, or setup practices of the Contractor.
- D. Test each and every component and jack plate location of the system once installed, in the presence of the Commissioner, if so requested, to provide visual and measured proof of performance at any one or more selected locations in the facility. Demonstrate all functions of the system.
- E. All equipment, except portable equipment, shall be fixed firmly in place. Equipment cabinets and mounts shall be square and plumb, and fastenings and supports shall be adequate to support their loads with a safety factor of at least three, and as specified elsewhere in this document.
- F. Take whatever steps are necessary to prevent hum or interference from electromagnetic and electrostatic fields, to supply adequate ventilation in equipment cabinets, to prevent equipment vibration and to install equipment so as to provide maximum safety to the operator. In the case of interference determined to be caused by building systems or building ground, document the problem to the Commissioner for resolution with the project team.
- G. All wiring and termination shall be in strict conformity with 2014 New York City Construction Codes. Low voltage audio, video, and control wiring and connections shall be in conformance with those rules and practices as stipulated in "Sound System Engineering,

Second Edition” by Don and Carolyn Davis (Howard Sams and Co.), and in accordance with good industry standard practices.

- H. Isolated Terminal blocks and connector panels should be provided in all equipment cabinets and wiring boxes for incoming and outgoing cables. Terminal blocks shall be labeled with engraved laminated plastic legends fixed in place with a suitable permanent adhesive. “Dymo-Labels” and similar semi-permanent labeling will not be acceptable anywhere in the facility. All conductors shall either be marked with approved pressure sensitive tags or identified by color code. When color coding is employed in lieu of tagging, a cable schedule shall be prepared on 8 ½" x 11" acid-free paper or vellum, inserted into a suitable transparent holder and the schedule shall be hung inside the cabinet or box. Copies of the schedule shall be included in the As-built file.
- I. Perform all work in a neat and workmanlike manner. He/she shall assign workmen to the job in numbers sufficient to meet the schedule commitments and insofar as it is reasonable, the same person shall remain in charge of the work from its inception until completion.
- J. Connector panels shall be inset at least 3" from the rear plane of the rack to allow cable management and strain relief without extending beyond the rear plane of the rack. Cable organizers should be used on the rear of the rack to distribute in a neat and orderly fashion all cables to the appropriate connector panel or AV Component. Rear rack rails should be inset to accommodate the connector panels. All cables shall be strain- relieved. All cable bundles within or on the racks shall be use Velcro wire loops at least every 6", or as appropriate. No wire ties shall be used, so as to prevent crimping or damage of internal conductors.
- K. Cables should always be home runned from one connection to another connection with no barrels or terminal blocks unless specified in the design or unless approved by the Commissioner.
- L. Any rooms or spaces which have movable/portable furniture shall have all AV cables terminated in the floor box/wall box. No cables shall be run through grommet holes in floor boxes or wall boxes if the associated furniture is movable and/or reconfigurable. All cables must have disconnects if furniture is not permanent.
- M. Submit shop drawings showing full-scale connector panels and their labels, prior to fabrication, for approval.
- N. Provide all rack hardware and accessories as needed for completely finished racks. This includes, but is not limited to, shelves, blank panels, vent panels, side panels, power distribution hardware (approved by 2014 New York City Electrical Code), and all other accessories. There shall be no open spaces visible on the front plane of the racks. All rack mounted monitors will be provided with rack mounts providing custom fit equipment-surrounds without visible gaps. Where required due to equipment heat dissipation, intake and exhaust fans shall be provided for each rack.
- O. Submit, for approval, front-view elevations and rear-view elevations of racks showing hardware location and wiring scheme, prior to assembly.
- P. Provide all AV Jack plates with connectors as indicated by function on the drawings. Submit for approval, prior to fabrication, full-scale drawings of each type of jack panel. Each connector shall have engraved labels which are keyed to the As-built set of drawings.

- Q. Where applicable, manufacture connector panels for the inside of the floor boxes, with an electrically isolated connector for each cable entering or leaving the box. The connectors shall be permanently labeled as to function and/or wire number, keyed to the As-Built Drawings.
- R. Adjust each variable parameter of each computer interface in each room to optimize signal quality when viewed on displays in the facility. These adjustments include, but are not limited to, “peaking” controls, horizontal and vertical centering, gain controls, dip-switch settings, etc., as to optimize performance of the interfaces, and to name and program pre-sets for each anticipated type of user-provided computer.
- S. During the course of the project and installation, develop a completion list of non-completed tasks required to execute final sign off of the Systems.
- T. Submit, for approval, an Acceptance Test Approval Form to be used during System Acceptance Tests
- U. Warehouse all equipment included in the Bid Specification, as required, until such time as appropriate to install such equipment at the job site.
- V. Schedule an Acceptance Test with the Commissioner. During that process, take the Commissioner to each and every part of the system and prove to the satisfaction of the Commissioner that all systems are installed in accordance with the AV Specifications, and that all systems are operating normally. If there are non-acceptable elements of the installation, as determined by the Commissioner, immediately schedule restoration and modification as will be needed to bring the Systems into accord with the Specification, at no further expense to the City of New York.

**3.3 INSTRUCTION:**

- A. At its discretion the Commissioner may assign one or more service operators to participate with the Contractor during installation of the AV System. In this case, without delay of the work, familiarize the Commissioner and the City of New York’s service operators with the system's components and installation.
- B. During initial tests and adjustments, permit the City of New York’s service operators to observe and shall explain, when feasible, the significance of each test.
- C. Instruction shall not be deemed completed until the Commissioner has determined that the City of New York’s service operators are adequately instructed to operate the system and to perform routine service.

**3.4 COORDINATION:**

- A. Refer to the DDC General Conditions and Section 01 32 34 “Computer Aided Design Coordination” for coordination and record drawing Requirements.
- B. The audio-visual communications trade shall coordinate and cooperate with other trades to ensure satisfactory work progress. If minor moves or changes are necessary to accommodate other equipment, with or at the Commissioner’s request, such changes shall be made without claim for additional payment.
- C. When an AV system interfaces with other equipment, such as floor boxes, provide equipment cabinets and boxes readily identifiable terminal strips or connector plates to which interfacing

cables may be connected. Coordinate with other suppliers to ensure the appropriateness of the interface.

**3.5 IDENTIFICATION AND TAGGING FOR AUDIOVISUAL DEVICES:**

- A. Incorporate all electrical trade field cable numbers and all in-rack numbers as part of the as-built documents. Identify discrete identification numbers for all AV devices which includes, but is not limited to:
  - 1. Each and every audiovisual cable.
  - 2. Each fiber optic cable and fiber strand associated with AV.
  - 3. Each AV junction box.
  - 4. Each termination block and patch panel (and each termination -- front and rear as applicable).
  - 5. Each equipment termination frame and cabinet.
  - 6. Each raceway and junction box used for audiovisual wiring.
  - 7. Other items as directed by Commissioner.
- B. The nomenclature used to identify cables, blocks, equipment, etc. shall be as approved by the Commissioner. Missing or unclear nomenclature criteria for the items specified above shall not be construed as a reason not to identify the items and shall be brought to the Commissioner's attention.
- C. Provide all materials required for labeling. All labels shall be permanently adhered, easily visible and shall be smudge-proof. All text shall be typed (not handwritten). All cables shall be labeled at both ends minimum.
- D. Identification of all equipment, racks, bulkheads, patch panels, systems, etc. shall be by means of engraved lamacoid (or approved equivalent) nameplates showing 1/4" high white lettering on a black background fastened in the upper left hand corner of all equipment, where feasible. An attempt shall be made to place the label in the same location on similar equipment. Submit for approval by the Commissioner any nameplates intended for application to AV equipment prior to attaching any nameplates.
- E. Identification for the wires and cables shall be by means of wrap around "brady" type labels, or approved equivalent.
- F. Device plates for patch panels, miscellaneous termination hardware, electronic equipment (i.e., controllers, multiplexers, etc.) whose function is not readily apparent shall be engraved with 1/8" high letters suitably describing the equipment controlled or system served.
- G. Identify each outlet box, junction box, and cabinet used in conjunction with empty raceway for wires of a future system by means of indelible markings on the inside denoting the system.
- H. Prior to installing identifying tags and nameplates, submit their nomenclature for approval. Conform to all re-visions issued by the Commissioner.

- I. Junction boxes used for audiovisual wiring and located in unfinished spaces (i.e., hung ceilings, equipment rooms, etc.) shall be clearly identified on the outside as per EIA/TIA-606 Standards unless specified otherwise.
- J. All labeling and identification information shall be provided as part of the As-built drawings as specified elsewhere.
- K. All AV devices with serial numbers shall be labeled. All phones installed in meeting rooms shall be labeled with the phone number, based on label types and locations (to be provided).

### 3.6 CABINETS AND ENCLOSURES:

- A. When fed from above, a smooth grommited hole (sized as required and no less than 2" inside diameter) shall be provided in the top back corner of the equipment cabinet opposite the electrical plug strip in the cabinet (if any). The opening shall be provided with a non-conducting grommet so as to protect the cable from any sharp edges.
- B. All rack mounted equipment which can be serviced from the front side of the rack shall include rack rails or similar and provide cable service loops to extend equipment outward for service without disconnection or removal.
- C. Cabling run in equipment cabinets shall be routed vertically and horizontally in a squared-off manner. The cables shall be secured to the cabinet framing members with color coded Velcro cable ties or approved equal. All cables connected to an item of equipment or patch panel shall approach the device from the door hinge side of the cabinet (i.e., right or left). The cables shall be neatly bound and dressed, with strain relief on each and every cable. All rack mounted equipment which can be serviced from the front side of the rack shall include rack rails or similar and provide cable service loops to extend equipment outward for service without disconnection or removal. Provide black cable "Snakeskin" mesh braided cable sleeve to encase any cable bundles that are exposed to view at tabletop locations and at other locations where neat dressing of cables is appropriate. There shall be no visible multi-cable runs or umbilicals without the use of braided cable sleeve. Take measures to prevent fraying or damage to both ends of the cable mesh using a method to be approved by the Commissioner prior to deployment.
- D. Where the rack is movable, provide a cable loop of sufficient length as to provide access to the rear of the rack for maintenance, by moving the rack perpendicular to its normal position, for full access to the rear of the rack. There shall be strain relief for any and all cables which are part of a movable rack cable loop.
- E. Where possible, for cabinets placed on raised floor tiles, coordinate with the raised floor contractor to ensure that tile openings are properly sized, located and are edge cut to facilitate the removal of the tile after cable is installed. Verify the ability to remove tiles in the front and rear of cabinets to ensure access under the cabinet.
- F. Forced air ventilation shall be provided for each rack by the Contractor, unless otherwise noted, of sufficient CFM rating as to adequately cool the AV equipment mounted in the rack.
- G. Two 20 amp plug strips with outlets mounted 6" on center shall be provided as part of the cabinet. The plug strips shall be mounted in the rear of the cabinet opposite the rear door hinge. The plug strips shall be suitable for hard wiring to electrical junction boxes. Final connection will be by others.

- H. Equipment/patch panel mounting rails within cabinets shall be adjustable from front to back within the cabinet.
  - I. Cabinets located on a raised floor shall be positioned so as to cover a single tile (where possible).
  - J. Cabling which runs between cabinets shall be via the raised floor (where available unless specified otherwise). Coordinate AV trade with the raised access flooring trade. Generally, the front plane of the rack(s) shall be within 2" of the floor's T-bar support structure. Cables run between cabinets with no raised floor shall be run at the top or bottom along the back of the cabinet.
  - K. A minimum of 2-6" clear shall be maintained in front and behind cabinets. Cabinet doors shall open toward the nearest wall when the cabinet is located within 5'-0" of the wall.
  - L. Where multiple runs of small diameter cabling are installed vertically within cabinet enclosures (i.e., between patch panels and/or equipment), they shall be run in panduct L or C type raceway fastened to cabinet framing members. Raceways shall be sized as required.
  - M. For racks located on raised floors, coordinate with the raised floor vendor to ensure proper sized openings are provided and located in the raised floor tile for unobstructed routing of the cabling.
  - N. Cabling for connection to rack mounted patch panels and equipment shall be dressed such that the labeling of the patch panels and/or equipment is readily visible and access to said items is not obstructed.
  - O. Each rack shall be provided with an equipment ground assembly.
  - P. For items of equipment which are indicated as being rack mounted and for which no rack mounting hardware is available, a fitted rack mounted equipment shelf shall be provided, providing for no visible gaps adjacent to the mounted hardware. Custom fitted rack mounts shall be by Middle-Atlantic Products, CPI Chatsworth, Panduit, or approved equal.
  - Q. Horizontal wire management panels shall be provided as necessary to ensure a neatly dressed installation.
- 3.7 MOUNTING HEIGHTS:
- A. Heights of all wall mounted outlets and other AV devices shall be in accordance with the Drawings.
- 3.8 SUPPORTS:
- A. Support work shall be in accordance with best industry practice and shall be plumb and true.
- 3.9 FASTENINGS:
- A. Fasten audiovisual work to the building structure, where applicable, in accordance with the best industry practice and with a safety factor of at least three.
- 3.10 TESTING:
- A. Where applicable the following test devices shall be used:

- B. Audio Tests
  - 1. Distortion Analyzer
  - 2. Audio/Video Oscilloscope
  - 3. Volt Meter
  - 4. Audio Signal Generator
  - 5. Sound Pressure Level Meter
  - 6. Audio analyzer by TEF, MLSSA, QuantAsylum, or approved equal.
- C. Video Tests
  - 1. Dual-input Waveform Monitor
  - 2. Vectorscope
  - 3. Video Pattern Generator and SMPTE bars
  - 4. SMPTE Test Tapes
  - 5. Computer test-signal generator
  - 6. Broadband video sweep generator
  - 7. Broadband video spectrum analyzer
  - 8. QuantumData 780, or an equivalent product by Murideo, Sequoia Technology, or approved equal.
- D. Data and Digital Signals
  - 1. Data capture.
  - 2. BER testing.
  - 3. Timing-reclocking ttr
  - 4. Bit rate verification.
  - 5. Fluke Linkrunner, or an equivalent product by JM Test Systems, Bird, or approved equal.
- E. Deliver the rack portion of the AV System pre-wired and pre-tested.
- F. Provide all setup and performance tests.
- G. Prior to system acceptance completely set up and test the systems as a whole to confirm that overall performance meets the expected performance based on equipment specifications and proper interfacing and gain structuring techniques.

- H. If subjective performance is deficient as far as signal-to-noise, Total Harmonic Distortion, and gain-before-feedback, for the audio subsystems, the Commissioner will require objective tests. For video subsystems, image sharpness, contrast, focus, and convergence will be considered. Objective tests will be required if image quality is deficient from expected product specifications and the system as a whole, as determined by the Commissioner.
- I. Time and skilled installers must be allocated as part of the Contractor's scope to perform off-line setup configurations and level adjustments for each system, and on-line tests with installers at far end sites and the near end site (for audio and videoconferencing) for final adjustments.
- J. After setup, all levels of each pot, as well as nominal meter ranges shall be clearly documented in the technical manual for that room. In addition, where feasible, and only after on-line successful tests, pots and levels that can be marked on the hardware itself shall be so marked.

**3.11 TEST EQUIPMENT:**

- A. Prior to any testing being performed, the Commissioner shall be supplied with a list of test equipment to be used, for his review and approval. The submittal shall include documentation indicating that the proposed equipment is capable of performing all of the tests required to execute the successful installation and certification of the AV systems.

**3.12 TESTS TO BE PERFORMED:**

- A. Tests are to be performed on the following aspects of the audiovisual system for large venues with speech reinforcement systems:
  - 1. Raw unequalized house curve through program speakers using pink noise
  - 2. Ambient noise measurements placed on NC template
  - 3. RT60 reverberation time
  - 4. Gain structure chart showing measured levels at each and every variable gain point through the system. This will be submitted as the reference setup for the system upon system completion.
  - 5. Available headroom before clipping for each input stage. This information may be placed on the gain structure chart.
  - 6. Feedback Stability Margin for speech reinforcement system, which should be at least 6 dB.
- B. Video Format Types - Which may be part of the design include but are not limited to; Composite and Component Analog Video, Serial and Parallel Digital Video, HDBaseT, Standard Definition all various formats of High Definition Video. Computer generated RGB or DVI or Displayport formats and resolutions.
- C. New Formats and Emerging Signal Types - It shall be the responsibility of the Contractor to be fully experienced in new and emerging forms of video delivery protocols as it relates to video systems used in the design. This includes but is not limited to MPEG and similar streaming video as well as media transfertypes, i.e. IEEE 1394, USB, SCSI or any

additional types of media transfer protocols not described herein. The Contractor should have a full understanding of the process of encoding and decoding various formats.

**D. Video/Audio and Data Testing**

1. All Video/Audio and Data Testing shall be done using the prescribed test equipment outlined in section 3.10 and may include additional test components offered by the Contractor. It is the responsibility of the Contractor to provide all test equipment electronics, harnesses and adapters to perform tests. All Contractor Test equipment must bear the latest calibration sticker issued by that device's manufacturer or manufacturer approved calibration service.

**E. Video Signal Distribution and Timing - (All Formats)**

1. All video systems shall conform to the required proper testing of all aspects of the video signal and the related format. Testing parameters shall where applicable conform to the specified videoformat standard(s) for analog and digital Formats.
2. Signal distribution adjustments shall include unity gain where applicable to achieve a proper signal amplitude for video, pulse and audio signals. Signal distribution adjustments shall also include Gain and Equalization adjustments for cable length compensation where required. This includes proper cable lengths and equipment adjustments to ensure correct horizontal and sub-carrier timing and reclocking for digital formats. No equipment shall use input video auto-timing unless approved by the Commissioner. No devices shall use AGC for gain control unless approved by the Commissioner. All devices which are deemed as part of the clause include but are not limited to;
  - a. Cameras, Video Recording Devices, Distribution Amplifiers, A to D and D to A converters, Signal generators, Frame Synchronizers, Time Base Correctors, Routers, Standards Converters, Transcoders, Fiber Optics, and Video Processors.
3. All Video testing must conform to the guidelines set forth by SMPTE, NTSC, AES, EIA, IEEE, FCC, and ASTC where applicable.
4. All signal testing and optimization shall be made on short haul systems and long haul systems end to end when applicable.

**F. Color Video Monitors and Projectors:** Where appropriate as reference or for system testing, the color video monitors shall be of broadcast grade and capable of displaying the signal format and/or additional formats being used. . This includes but is not limited to all analog and digital, composite and component video formats. Standard and high definition resolutions. All additional resolutions. Monitors where appropriate shall provide cross pulse and under-scan features for testing purposes. Monitors should have blue only feature for color phase (hue) calibration.

1. Calibration: All Color Video Monitors/Projectors shall be calibrated with test generated signals including SMPTE Color Bars to adjust setup, brightness and colorimetry.
2. Computer monitors shall be calibrated using appropriate computer test signals or using the display or video graphics adapter manufacturers LUT (lookup table) or calibration application.

3. Convergence, linearity and geometry should be observed for defect and corrected during installation unless mechanical defect warrants manufacturer servicing.
4. Other Display Devices:
  - a. Computer LCD displays: All LCD displays shall be sized according to the ergonomic integration into the end users work environment. LCD displays shall be calibrated using appropriate computer test signals or using the display or video graphics adapter manufacturers LUT (lookup table) or calibration application.
  - b. All panels should be observed for defect such as excessive "dead pixels" and returned to the manufacturer for servicing or replacement.

**3.13 RECORD OF TEST RESULTS:**

- A. A record of all required tests shall be provided to the Commissioner. The information shall be maintained as permanent record for the purposes of maintenance and restoration.
- B. A brief description outlining the test equipment used and a single line diagram indicating the test setup shall be provided to the Commissioner for his review. The level of description should be sufficient enough to allow an individual who is not familiar with the specific test equipment to recreate any portion of the test.
- C. Test results to be provided shall contain the following minimum information:
  1. For all similar tests include:
    - a. Project name
    - b. Description of test
    - c. Source origin
    - d. Source destination
    - e. Cabling Scheme to be determined by Commissioner.
    - f. Cable pair/strand
    - g. Test date
    - h. Tester (individual responsible for conduct of the test)
    - i. Page of.
    - j. Levels of signal, and reference of dB ratio
    - k. Settings of all pots on equipment
    - l. Graphs and observations
- D. All test results shall be provided in the following formats:

1. Printed (3 bound copies)
  2. Permanent digital format as dictated by client.
  3. The test equipment shall have the ability to record test results to a printer or memory for printing later. Submitting of these printed test forms is preferred in lieu of handwritten forms.
  4. The test results are required to be submitted electronically per instruction from the Commissioner to associate the information with a cable database.
- E. A copy of the test results in both electronic and printed formats shall be provided to the Commissioner for review and record.
- 3.14 CORRECTIVE ACTION:
- A. Any defects or deficiencies discovered in any of the audiovisual work shall be indicated on the test report and be corrected, at no further expense to the City of New York.
  - B. Upon completion of testing and problem resolution, all connections tested are to be 100% error free.
  - C. Any connections determined to be not correctable shall be indicated at each end of the termination as "bad" (in red).
  - D. For those systems requiring specialized setup and or skills, coordinate prior to delivery a certified onsite engineer licensed in the state of New York to certify the proper installation, programming and testing of the said equipment or system at no additional expense to The City of New York. If the equipment is delivered, installed and requires the attention of additional installers to configure, program and or test it, then the City of New York is not responsible for any additional charges unless approved by the Commissioner.
1. Systems which may require such specialized assistance include but are not limited to:
    - a. Cameras, Automated switching, Computer based Video/Audio Systems, Video/Audio/Data Routers, Router Control Systems, Fiber Optic Systems, Machine Control, Graphics/Digital Audio/NLE Workstations, Intercom, Telecommunications systems and Computer Networked Systems, Projectors, automatic microphone systems, KVM systems, etc.
- 3.15 EQUIPMENT INSTALLATION AND TESTING:
- A. Be available during equipment installation and testing to help isolate faults which may exist in the cabling system installation.
  - B. Coordinate with other vendors where necessary to resolve any discrepancies between the cabling system and the vendors cabling or equipment.
- 3.16 AUDIO PERFORMANCE CRITERIA:
- A. Definition of terms: The "Audio System Performance Criteria" set forth in this section will define the parameters of acceptable performance of the Audio System.

- B. The attributes of system performance are divided into two sets of criteria: Subjective and Objective Criteria.
- C. Subjective Audio Performance Criteria: The Contractor is required to use subjective listening tests to determine if the system will meet the expected performance criteria, as well as the objective requirements of high quality audio installations. The Contractor must subjectively evaluate the system in terms of frequency response, intelligibility, loudness, and noise transmission. Listening test should be performed while the system is transmitting typical audio material (including speech) and operating at nominal level.
- D. All audio systems should fall within the specified ranges stated in this specification.
- E. Any signal level adjustment is to be made such that it does not alter the signal integrity of any other system.
- F. Objective Audio Performance Criteria:
  - 1. It is the Contractor's responsibility to assure the audio system operates within standard audio system performance criteria, whether or not the criteria are explicitly delineated herein.

G. Electro-acoustic Signal to Noise:

The following are expected Electro-acoustic signal to noise ratios for various systems: Program Systems 20-26 dB

Amplified Speech System (NOM=1)	20-26 dB
Amplified Speech System (NOM=2)	17-23 dB
Amplified Speech System (NOM=4)	15-21 dB
Mix Minus System (NOM=3)	1-13 dB
Conference System	15-20 dB

Video Conference System	15-20 dB
-------------------------	----------

Studio Systems	40-45 dB
----------------	----------

- H. It is expected that Electro-acoustic Signal to noise test will be conducted in the following manner:
  - 1. Electro-Acoustic System Signal to Noise Test:
    - a. Reading A: Measure the ambient sound pressure level with a sound Level meter (wide band A weighted). Note readings at various points in the room. Also note any points in the room that result in measured changes greater than + or - 3 dB S.P.L.
      - (1) Room Ambient Noise Level: The maximum acceptable ambient noise level for audio rooms under this specification is NC 35 (Noise Criteria) This translates to a wide band A weighted noise floor of 46 dB SPL.
    - b. Introduce nominal sound into the room using the specified system components.

(1) (Audio conference system, mic system, program system).

- c. Reading B: Measure sound in the room using the sound level meter (A weighted). Note the level readings at the same points as the ambient test.
- d. Subtract reading A from reading B. This is the Electro-Acoustic Signal to Noise Ratio for that system.

I. Audio Bandwidth:

The audio systems to be installed in this project are to have the following minimum bandwidth(s): The bandwidth of a system is measured as + or - 3dB of the Audio frequency bandpass.

Program Systems (no subwoofer)	40-20kHz
Program systems (subwoofer)	20-20kHz
Amplified Speech System	150-15kHz
Mix Minus System	300-15kHz
Audio Conference System	300-7kHz
Video Conference System	300-7kHz
Studio Systems	20-20 kHz

J. Signal to noise:

- 1. It is the Contractors responsibility to provide electronic systems that have a minimum electronic signal to noise ratio of -55 dB, unless otherwise specified herein. For studio systems the overall minimum signal to noise ratio is 65 dB.

K. Total Harmonic Distortion:

- 1. The Audio systems are to have the following maximum distortion levels:
- 2. Program Systems (no subwoofer) 0.5%
- 3. Amplified Speech System 0.5%
- 4. Mix Minus System 0.5%
- 5. Audio Conference System 1.0%
- 6. Video Conference System 1.0%
- 7. Studio Systems 0.2%

L. Overall System Headroom:

- 1. It is the responsibility of the Contractor to set up the system to meet the following minimum headroom requirements:

Program Systems	10 dB
Amplified Speech System	15-20dB
Mix Minus System	6-12dB
Audio Conference System	3dB
Video Conference System	3dB
Studio Systems	24dB

**M. Level Matching:**

It is the responsibility of Contractor to verify the proper level matching of system components. The components are to operate within the sensitivity specification provided by the manufacturer.

**N. Mismatching of levels:**

1. Any level mismatching between system components defined in this design is the responsibility of the Contractor to recognize and correct in the submission drawings at no expense to the City of New York.
2. Any level mismatch caused by the substitution of equipment is the responsibility of the Contractor to recognize and correct.
3. Any level mismatch caused by the addition or substitution of City of New York furnished equipment is to be presented to the Commissioner within one week of the identification of the manufacturer and model number of City of New York supplied equipment. The Contractor will present the proper interface solution, purchasing expense of, and availability of the device(s).

**O. Field verifications:**

1. It is the Contractor's responsibility to notify and recommend solutions to the Commissioner if for any reason the Audio System Performance Criteria cannot be met due to changes in field conditions, equipment, or additional requirements of the system or if these changes render the performance criteria to be insufficient. The Commissioner reserves the right to alter the performance criteria to meet changing field or system conditions.

**P. See Audiovisual Systems Equipment Schedule below, as referred to by Part 2 of this section. All products from specific manufacturers listed in schedule are the Basis-of-Design product. For each product, subject to compliance with requirements, provide either the Basis-of-Design product or an equivalent product from an approved manufacturer listed above – see Paragraphs 2.1 D through 2.1 I.**

Audiovisual Systems Equipment Schedule May 21 <sup>st</sup> , 2019					
ROOM NUMBER	LOCATION NAME	DESCRIPTION	MANUFACTURER	PART NUMBER	COUNT
Cellar Level					
003	Stress Reduction Room	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
1 <sup>ST</sup> Floor					
100-D	Main Desk - Lobby	32" Class LED, 1080P, Smart HDTV	SAMSUNG, or approved equal	N5300	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
100L	Lobby – Reception Desk	Hearing Induction Loop Amplifier	InLoop, or approved equal	Commercial InLoop 3000	1
		Direct Burial Induction Loop Cable		TBD Based on contractor site survey	1
		Microphone (Counter wired)	SENNHEISER, or approved equal	TBD	1
102-C	Operations Supervisor / Admin Lieutenant	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1

		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
		PRO AV/IT Series High speed 50' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-50PROBLK	1
103	Community Room	LG-75" Class LED, Smart 4K UHD	LG, or approved equal	UK6570PUB	1
		X-Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	XCB1U	1
		S1 Rack, 20U, 23" Deep	Chief Manufacturing, or approved equal	NS1F2023	1
		3-Series 4K Digital Media - Presentation System 350	CRESTRON, or approved equal	DMPS3-4K-350-C	1
		AVIA 8-Channel Power Amplifier	CRESTRON, or approved equal	AMP-8150	1
		Wireless Microphone Receiver	SENNHEISER, or approved equal	SL Rack Receiver DW	1
		Podium Microphone	SENNHEISER, or approved equal	SL Tablestand 133-s DW	1
		Hand Held Microphone	SENNHEISER, or approved equal	SL Handheld DW	1
		JBL Control Ceiling Speakers	JBL, or approved equal	Control 26CT	6
		Hearing Induction Loop Amplifier	InLoop, or approved equal	Commercial InLoop 9000	1
		InfiNET EX & ER wireless Gateway	CRESTRON, or approved equal	CEN-GWEXER	1
		8.7" Wireless Touch Screen	CRESTRON, or approved equal	TST-902	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	2

		PRO AV/IT Series High speed 50' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-50PROBLK	3
		4-Port Wall plate	Leviton or approved equal	42080-4*S	2
		HDMI Feedthrough QuickPort Connector, White Housing	Leviton or approved equal	40834-W	2
		HDMI Female to Right Angle Male - Upward Position	Comprehensive Connectivity, or approved equal	HDF-RAMU	2
		Direct Burial Induction Loop Cable		TBD Based on contractor site survey	1
		Dinky Link Surface Mount Standard IR Receiver	Xantech, or approved equal	DL25K	1
109	Platoon Commander	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
		PRO AV/IT Series High speed 35' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-35PROBLK	1
110	Patrol Supervisor Admin	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
		PRO AV/IT Series High speed 35' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-35PROBLK	1

111	Executive Officer	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
		PRO AV/IT Series High speed 35' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-35PROBLK	1
113	Commanding Officer	LG-49" Class LED, Smart 4kUHD	LG, or approved equal	UJ6200	1
		Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	LTM1U	1
		PRO AV/IT Series High speed 6' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-6PROBLK	1
		PRO AV/IT Series High speed 35' HDMI	Comprehensive Connectivity, or approved equal	HD-HD-35PROBLK	1
115	Muster / Community Training Room	LG-75" Class LED, Smart 4kUHD	LG, or approved equal	UK6570PUB	2
		X-Large Fusion Micro- Adjustable Fixed Wall Display Mount	Chief Manufacturing, or approved equal	XCB1U	2

**END OF SECTION 27 41 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 28 00 00****SECURITY SYSTEMS****PART 1 – GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. For telecommunication and cabling systems – Section 27 00 00 “Telecommunication and Cabling Systems”

**1.2 SUMMARY****A. Section includes:****1. Security System (SS).**

- B. The intent of this document is to provide the design specification for furnishing Intercom System (IC), Closed Circuit TV (CCTV) System, Prisoner Cell Alarm system and Door Alarm System. The security system (SS) described in this specification shall be functionally operational for monitoring and control of the premises. The entire security system shall include, but not be limited to the following:

**1. Prisoner Cell Alarm System**

- a. Control Panel
- b. Keypad
- c. Pull Cords
- d. Pull Switches
- e. Pull Cords Wall Rings
- f. Pull Cord Connectors
- g. Siren/Strobe
- h. Power Supply

**2. Door Alarm System**

- a. Control Panel
- b. Door Contacts
- c. Power Supply

3. Emergency Door Control System
  - a. Electromagnetic Locks
  - b. Power Supplies
  - c. Push Button
4. CCTV System (Color)
  - a. CCD cameras with lenses: PoE IP cameras, indoor, outdoor.
  - b. Connection to the central NYPD Video Management and Recording System (Genetec)
5. Power Injectors
  - a. Housings.
  - b. Mounts.
  - c. Surge Suppressors (for exterior cameras)
6. Network Switches
7. Intercom System
  - a. Wall Mount Master Unit
  - b. Wall Mount Security Grade slave units
  - c. Power Supply
8. Cables and Wires
9. Card Access System

### 1.3 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 19 "INDOOR AIR QUALITY MANAGEMENT", where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.6 SUBMITTALS

- A. Submittals, approvals and documentation deliverables.
  1. Prior to the start of installation, submit the following for approval:
    - a. General description of operation.
    - b. Technical specification data sheets for all items included in this specification.
    - c. Samples of all exposed equipment and mounting hardware.
    - d. Shop drawings showing wiring diagrams, installation and mounting methods and details, point-to-point termination schedules. All drawings shall be fully dimensioned.
  2. Prior to start of testing, submit for approval the methodology for factory and site testing to be used including sample data sheets.
  3. Prior to start of instruction, submit syllabus and course outline for approval. Coordinate with security department for scheduling.
- B. Computer system documentation (3 copies). Include configuration diagrams, as-built capacities, field expansion capabilities, operating system and software configuration. Include fully documented application software manual(s).
- C. Evidence that the design, manufacture and testing of the components of the systems and sub-systems that are not manufactured by the supplier shall be in accordance with the specifications.

#### 1.7 WARRANTY

- A. Warrant the installed system to be free of defects of materials and workmanship for a period of one (1) year following substantial completion.

#### 1.8 INSTRUCTION

- A. Instruct a minimum of 6 operators for system operation. Each operator shall be instructed for a

total of 24 hrs. each. The instruction shall be provided by a professional engineer licensed in the State of New York on behalf of the contractor. In addition to Operator instruction, provide instruction to Security Management and Facilities operators employed by the City of New York. Each Security and Facilities Management operator shall be instructed for a total of 16 hours each.

1. Provide each operator with complete, printed operating instructions and brief sub-system description in manual or handbook form.
2. Provide Video Recording of the instruction session and associated documentation (Alternate).
  - a. Provide three (3) copies.
3. Provide two distinct instruction sessions, Operator and Management, with minimum instruction time of 40 hrs. Sessions shall be scheduled to suit the requirements of the City of New York's service operators and may be scheduled at any time from the award of the contract to the end of the guarantee period at the Commissioner's request. Also at the Commissioner's request, one or both instructing sessions may be scheduled at the contractor's office.
4. The City of New York's service operators shall be instructed in preventive services for all Video Intercom, Card Access and CCTV Equipment.

#### 1.9 DELIVERY, STORAGE AND HANDLING

- A. Expenses of all shipping to the site, and of all unusual storage requirements, shall be borne by the Contractor. It shall be the responsibility of the Contractor to make appropriate arrangements and to coordinate for the proper acceptance, handling, protection, and storage of equipment so delivered.
- B. Movement of material, either at the time of delivery or subsequently, shall be the sole responsibility of the contractor. All expenses associated with this movement shall also be the responsibility of the contractor.
- C. Safely store all equipment. In the event of equipment disappearance from the site, bear full responsibility for all expenses associated with equipment replacement at no additional expense to the City of New York.

#### 1.10 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work. In addition, the contractor or subcontractor must be licensed or approved by the manufacturer.
- C. All equipment provided shall be new and shall meet or exceed the latest published specifications of the manufacturer in all respects.
- D. Contractor to provide the latest model/revision of a specified piece of equipment.
- E. Obtain detailed instructions for installation from manufacturer of each product.

## 1.11 SEQUENCING AND SCHEDULING

- A. Prior to installation of any equipment, advise and coordinate with the Commissioner.
- B. Provide a schedule listing of activities including employee allocation and material procurement that demonstrates the plan to meet the construction schedule. This schedule shall include the number of employees to be assigned and duration required for each phase. After award of the contract, the schedule shall be updated to show any operational conflicts which shall be coordinated and approved by the Commissioner before implementation.

## PART 2 - PRODUCTS

### 2.1 GENERAL

#### A. Material

- 1. Wire (see riser diagram drawings)
  - a. Provide wire in accordance with security drawings
  - b. Emergency power shall be provided by others to a Junction Box at each location shown on security drawings.
- 2. Identification and Tagging
  - a. All cables, wires, terminal blocks and terminals shall be identified by labels, tags or other permanent markings.
  - b. All markings shall clearly indicate the function, source and destination, polyolefin of each wire. Use wire markers for each wire.
  - c. All terminal points shall be appropriately labeled.

#### B. Security Software

- 1. Security applications software shall be a standard off-the-shelf product of the SS system manufacturer and shall be supplied complete with necessary user license(s) and manufacturer's documentation.
- 2. Perform all necessary modifications and programming of the security software, including any interface with existing database(s).
- 3. All data retrieval and transfers with existing databases shall be on line in real time.

#### C. Security Hardware

- 1. System and system equipment shall be listed, labeled or approved by applicable standards of Underwriters Laboratories, Inc.
- 2. Equipment Enclosures
  - a. All enclosures for equipment supplied under this specification shall be lockable and protected against tampering by being equipped with tamper switches or triggering mechanisms electrically compatible with the alarm system.

- b. All controls, which affect the sensitivity of the units, shall be located inside the tamper resistant enclosure.
- c. Keylocks or key operated switches used to protect enclosures shall have Underwriter's Laboratories listed locking cylinders.

**D. Security Systems Power Requirements**

- 1. Refer to security drawings for locations of the electrical junction boxes and receptacles, number and size of the electrical circuits.

**E. Uninterruptible Power Supply (UPS)**

- 1. The unit shall be uninterruptible power supply designed for rack mounting in a standard 19" EIA rack mount assembly and tower, where required. It is also possible that a central system will provide UPS capability throughout the facility.
- 2. The run time shall be 34.3 minutes at half load and 9.7 minutes at full load.
- 3. The unit shall include RS232 Interface port.
- 4. The unit shall support following features: Automatic Self Test, Automatic Voltage Regulation (AVR), Hot Swap Batteries, Intelligent Battery Manager, Network Grade line conditioner, Overload Indicator, Replace Batt Indicator, Scalable Run Time, User Replaceable batteries.
- 5. Output: (8) 120 VAC outputs, (6) outputs for field UPS connection type shall be NEMA 5-15R
- 6. The unit shall include surge protection and filtering.
- 7. Operating environment: 32-104°F,
- 8. The unit shall comply with CSA, FCC A, UL 1778.
- 9. See security drawings for UPS size and model for Equipment Cabinet.
- 10. Manufacturer: Subject to compliance with requirements, provide APC No.: SUA2200 (for reception desk and security desk) or an equivalent product by one of the following:
  - a. Eaton
  - b. Triplite
  - c. Or approved equal.

**F. Network Equipment**

- 1. General
  - a. All network equipment shall support the following standards:
    - (1) Safety certification: UL1950, IEC 60950, CSA-C22.2 No. 950, AS/NZA

3260, 21CFR 1040, EN60825-1, IEC 60825-1, TS-001.

- (2) EMC Compliance: China EMC certification, EN55022, FCC (CFR 47, Part 15) Class A, CISPR22; EN 55024; CISPR22; AS/NNZS 3548; VCCI, CE Marking, NEBS Level 3; ETSI ETS-300386-2
- (3) IEEE Compliance: 802.1d - Bridging, 802.1p.q - VLAN tagging, 802.1s - Per VLAN Group Spanning Tree Protocol, 802.1w - Rapid Spanning Tree Protocol, 802.1x - Identity-Based Networking Services (IBNS); 802.3 - 10BASE-T, 10BASE-FL; 802.3ab - 1000BASE-T; 802.3ad - Link aggregation; 802.3ae - 10 Gigabit Ethernet; 802.3af - Power over Ethernet (PoE); 802.3u - 100BASE-TX, 100BASE-LX
- (4) Environmental: Reduction of Hazardous Substances (ROHS) 5
- (5) Telco: Common Language Equipment Identifier (CLEI) code
- (6) Warranty: Limited lifetime warranty

2. PoE Switch (located in IDF rooms)

- a. The unit shall be a 48 port fixed-configuration model that provides wire-speed Fast Ethernet and Gigabit Ethernet connectivity.
- b. The unit shall include built-in (2) Gigabit Ethernet port that accommodates GBIC/SFP transceivers, (2) 10/100/1000 ports and (48) 10/100 ports.
- c. The unit shall include 802.3af Class 3 Power over Ethernet (PoE) for each port.
- d. The unit shall support wide range of authentication methods, data encryption technologies, and NAC based on users, ports and MAC addresses.
- e. The unit shall support 802.1S/W that enables standard based fault tolerance, load balancing and rapid recovery.
- f. The unit shall support Per VLAN Spanning Tree Plus (PVST+) that increases available bandwidth by allowing traffic on redundant links.
- g. The unit shall support QoS (Quality of Services). Shall allow network control list (ACLs) and multicast services.
- h. The power shall not exceed 470W.
- i. Sole sourcing: PoE switches shall be sourced from the same manufacturer as that of Layer 2, 3 switches.
- j. System integration: PoE switches shall be fully compatible and integrated with full functionality to NYPD's existing Cisco centralized network infrastructure. Coordinate compatibility requirements with Commissioner.
- k. Manufacturer: Subject to compliance with requirements, provide Cisco. Model No.IE4000, or Catalyst 9400 (48 port PoE).

3. Layer 2, 3 Switch

- a. The unit shall be an intelligent, multilayer, modular switch and router.
- b. The unit shall have stackable chassis with rear access power supply.
- c. The chassis shall include redundant Supervisor Engine 32.
- d. The unit shall support the following ports and modules:
  - (1) Gigabit Ethernet SFP (Small Factor Pluggable) – 4 ports
  - (2) 10/100/1000 Ethernet – 24 PoE ports
- e. The unit shall meet or exceed the following performance specifications:
  - (1) Onboard Memory (DRAM) - 4GB
  - (2) Flash memory – 2 Gb
  - (3) Total Bandwidth – up to 176 Gbps
  - (4) Total routed ports – up to 208
  - (5) MAC addresses supported –32,000 effective
  - (6) IP v4 Routes supported – 24,000
  - (7) VLAN – 4000 maximum
- f. Power consumption shall be – 750 Watt 120 VAC.
- g. Sole sourcing: Layer 2, 3 switches shall be sourced from the same manufacturer as that of PoE switches.
- h. System integration: Layer 2, 3 switches shall be fully compatible and integrated with full functionality to NYPD's existing Cisco centralized network infrastructure. Coordinate compatibility requirements with Commissioner.
- i. Manufacturer: See security drawings for switch basis-of-design models for each location. Subject to compliance with requirements, provide Cisco Catalyst Model C9404R (48 port PoE).

**G. Surge Protector and/or Power injector**

- 1. The unit shall be Power Over Ethernet Power/Video/Data surge protection device.
- 2. The unit shall be able to protect power, video and data on fixed or PTZ cameras
- 3. The unit shall include RJ45 connector with external grounding screw.
- 4. The unit shall be able to maintain Ethernet data speed without signal degradation.
- 5. The unit shall comply with IEEE Std. 802.3af and 802.3at for PoE.
- 6. The protector shall be available as a single device or 12-Port, 2U rack mount.

7. The unit shall meet the following specifications:
  - a. Connection - RJ-45 In/Out
  - b. Pinout - all 8 pins shall be protected
  - c. Data Rate: 100 mbps (100Base-T)
  - d. Maximum continuous current: 1.5 amp
  - e. Dissipation: 3000 W/pair
  - f. Protection mode: Line-Ground (All)
  - g. Operating temperature: -40°F - 158°F (-40°C - 70°C)
  - h. Maximum Humidity: 95% non-condensing
  - i. Dimensions: 1.7" x 3" 1.2" (43mm x 76mm x 30mm)
  - j. Housing shall be ABS
  - k. Warranty: 10 years Limited
8. Manufacturer: Subject to compliance with requirements, provide Ditek Model No. DTK-MRJPOE, or an equivalent product by one of the following approved manufacturers:
  - a. AXIS,
  - b. Littelfuse,
  - c. Or approved equal.

## 2.2 PRISONER CELL ALARM

### A. Control Panel

1. The unit shall be a digital alarm control communicator designed to transmit a digital signal through telephone line.
2. The unit shall be listed by UL for NFPA 72 applications, Central Station, Local, Police Connect, Bank Safe and Vault, Mercantile Safe and vault and Grade A Household.
3. The unit shall support initiating and indicating modules and command centers.
4. The unit shall meet the following requirements:
  - a. 8 Hybrid zones on-board (hardwire or wireless), including 2 2-wire fire zones
  - b. Up to 16 EOL zones with multiplexing (zones from RP1CAe2 alpha keypads or multiplex expansion modules)
  - c. Uses 4-or 8-zone expansion modules

- d. Up to 16 users
  - e. Supports choice of up to 7 Gemini keypads,
  - f. 256 event logging
  - g. 3 outputs
  - h. Interior bypass group
  - i. Event log with open/close suppression
  - j. Phone-In Interface Module
  - k. Includes transformer
5. The control panel shall meet the following specifications requirements
- a. Input Power 16.5VAC via Class 2 Plug-in 20 VA transformer
  - b. Aux & remote power 12Vdc regulated
  - c. 500 mA standby current rating with 20VA transformer, supplied
  - d. 650 mA standby current rating with optional 40VA trans.
  - e. Alarm current 2A
  - f. Loop Resist. 300 ohm max.; 50 ohm max for 2-wire fire
  - g. Burg. Voltage Output -1; programmable negative outputs -2
  - h. Operating temp. 0-49 degrees C.
  - i. Communication formats: Ademco Point ID, Silent Knight Fast/Slow, Radionics Fast/Slow, Universal High Speed, SIA and Pager.
  - j. Manufacturer: Subject to compliance with requirements, provide Napco/Gemini Model GEM-P1632 (Basis-of-Design), or an equivalent product by one of the following:
    - (1) Interlogix
    - (2) Honeywell
    - (3) Or approved equal.

**B. Keypad**

- 1. The unit shall be a Deluxe 32-character keypad
- 2. The keypad shall include:
  - a. Backlit, menu-driven, dual-line display

- b. Custom alphanumeric zone directory
  - c. Built-in 4 Zone expansion module
  - d. Display of wireless transmitter signal strength 1-10
  - e. EZ Keypad Programming2 with actual Q&A's to step through configuration
  - f. New intuitive, stay & away ease-of-use buttons, for easy one button arm and easy "instant" (hold-down) with the GEMK1CA.
  - g. Large soft touch backlit keys with tone
  - h. Backlit displays for easy reading
  - i. Wireless transmitter signal strength indication
  - j. Decor friendly soft white design
  - k. Fire, police and auxiliary programmable panic keys
  - l. Fingertip reference chart
3. Manufacturer: Subject to compliance with requirements, provide Napco/Gemini. Model GEMK1CA (Basis-of-Design), or an equivalent product by one of the following:
- a. Interlogix
  - b. Honeywell
  - c. Or approved equal.

**C. Pull Cord**

- 1. The unit shall be a high quality vinyl coated wire center cable.
- 2. The wire center shall be performed galvanized 3/32" aircraft cable.
- 3. The overall diameter shall be 3/16", size #6D, color shall be available in red, green, yellow and blue.
- 4. Manufacturer: Subject to compliance with requirements, provide Trans-Lite (Basis-of-Design) Model XE-99009 (pull cord), AE-18858 (pull cord connectors), DE-99043 (wall rings), or equivalent products from one of the following:
  - a. Mircom
  - b. Cornell
  - c. Or approved equal.

**D. Pull-cord Switch**

- 1. The unit shall be a high quality wall mounted, slow action, of small design

switch with pull wire function.

2. The switch shall meet the following specification requirements:
  - a. Enclosure: aluminum die-cast powder coated
  - b. Cover: steel, powder-coated
  - c. Degree of protection IP 65 to IEC/EN 60529
  - d. Contact material silver
  - e. Switching elements change-over contact with double break, galvanically separated contact bridges
  - f. Switching system - slow action
  - g. Connection screw connection terminals
  - h. Cable cross-section - max. 2.5 mm<sup>2</sup> (incl. conductor ferrules)
  - i. Cable entry 1 x M16 x 1.5
  - j. U imp - 4 kV
  - k. U I - 400 V
  - l. Current - 4 A
  - m. Utilization category AC-15
  - n. I e /U e - 4 A/400 VAC
  - o. Max. fuse rating - 4 A gG/gN fuse
  - p. Ambient temperature –20 °C ... +80 °C
  - q. Mechanical life - > 1 million operations
  - r. Operation cycles - 3600/h
  - s. Actuating force - max. 40 N
  - t. Features - pull-wire function
3. Manufacturer: Subject to compliance with requirements, provide Steute. Model ES 51Z (Basis-of-Design), or an equivalent product from one of the following:
  - a. Trans-lite
  - b. Mircom
  - c. Or approved equal.

**E. Siren/Strobe**

1. The unit shall be an indoor/outdoor 25 watt dual tone armored siren with amber strobe.
2. The unit shall be enclosed in rust-free aluminum die-cast housing.
3. The unit shall be mounted directly to the wall or 4" x 4" square back box.
4. The unit shall meet the following specifications:
  - a. Input voltage: 12 VDC
  - b. Current draw: 1.31 Amps
  - c. Operating voltage range: 9.6-14.4 VDC
  - d. Strobe
    - (1) Flash rate: 20-100 times/minute
    - (2) Candle power - 60,000 candles
  - e. Siren
    - (1) Sound Output – 127 bDA
    - (2) Tamper Contact capacity – 0.3A @ 12V DC
  - f. Operating Temperature: -4°F - 140°F (-20°C - 60°C)
5. Manufacturer: Subject to compliance with requirements, provide Amseco Model SSX-81SA (Basis-of-Design), or an equivalent product from one of the following:
  - a. Gentex
  - b. Amseco
  - c. Or approved equal.

**F. Power Supply**

1. 12 VDC Power Supply
  - a. The unit shall be a multi-output power supply/charger that converts a 115VAC/60Hz input into four (4) Class 2 Rated 12VDC or 24VDC power- limited outputs.
  - b. The unit shall meet the following specifications:
    - (1) Input: 115VAC, 60Hz, 3.5 amp, Input fuse rated @ 3.5 amp/250V.
    - (2) Output:
      - (a) 12VDC or 24VDC selectable output.

- (b) 12VDC @ 4 amp or 24VDC @ 3 amp supply current.
- (c) Four (4) Class 2 Rated fuse protected power- limited outputs.
- (d) Outputs are rated @ 3.5 amp.
- (e) Filtered and electronically regulated outputs.
- (f) Short circuit and thermal overload protection.
- c. Battery Backup:
  - (1) Built-in charger for sealed lead acid or gel type batteries.
  - (2) Automatic switch over to stand-by battery when AC fails.
  - (3) Maximum charge current 0.7 amp.
- d. Supervision:
  - (1) AC fail supervision (form "C" contacts).
  - (2) Notification trigger is selectable for 30 seconds (factory set) or 6 hours.
  - (3) Low battery supervision (form "C" contacts).
  - (4) Battery presence supervision (form "C" contacts).
- e. Visual Indicators:
  - (1) AC input and DC output LED indicators.
- f. Electrical:
  - (1) Operating temperature: 0° C to 49° C ambient. (2) 24.57 or 36.85 BTU/Hr.
  - (3) System AC input VA requirement: 402.5VA.
- g. Mechanical:
  - (1) Enclosure Dimensions (H x W x D approx.): 13.5" x 13" x 3.25"  
(342.9mm x 330.2mm x 82.55mm)
  - (2) Accommodates up to two (2) 12VDC/7AH batteries.
  - (3) Product weight (approx.): 7.3 lbs. (3.31 kg).
  - (4) Shipping weight (approx.): 8.4 lbs. (3.81 kg).

- h. Agency Approvals
  - (1) UL 294 UL Listed for Access Control System Units.
  - (2) UL 603 UL Listed Standard for Power Supplies for Use with Burglar Alarm Systems.
  - (3) UL 1069 UL Listed Hospital Signaling and Nurse Call Equipment.
  - (4) UL 1481 UL Listed Standard for Safety for Fire Protective Signaling Systems.
- i. Manufacturer: Altronix. Model AL600ULACMCB8 – no substitutions allowed.

## 2.3 EMERGENCY DOOR CONTROL SYSTEM

### A. Electromagnetic Lock

- 1. The unit shall be electromagnetic lock with 1,200 pounds of pull-apart holding force.
- 2. The unit shall have a Lifetime replacement warranty
- 3. The unit shall meet the following specifications:
  - a. Power consumption of 400mA @ 12VDC & 200mA @ 24VDC
  - b. Dual voltage, 12 VDC or 24 VDC, field switch selectable.
  - c. Bondstat standard
  - d. Instant release circuit, no residual magnetism
  - e. Surface mounts using only a drill and allen wrench
  - f. Fully sealed electronics, tamper proof & weather proof
  - g. Mounted using steel machine screws into blind finishing nuts
  - h. Architectural brushed stainless steel finish
  - i. Polished brass, clear anodized, & polished stainless finish dress covers available
  - j. Hardware accessories shall include brackets, housings, and dress covers as needed for every opening type
  - k. Shall include ten feet of jacketed stranded conductor
  - l. Lock and strikes plated to provide corrosion resistance
  - m. The lock shall be Fail Safe
  - n. The lock shall be UL listed

4. Manufacturer: Securitron. Model V2M1200 DB – no substitutions.

**B. Push Button**

1. The Push Button shall be 30.5 mm, Heavy-Duty, Assembled Push-Pull Unit.
2. The unit shall meet the following specifications:
  - a. Lamp Voltage - 120 VAC
  - b. Actuator - Standard
  - c. Actuator Color - Red
  - d. Light Unit Type - LED, full voltage
  - e. Light Unit Voltage - 120 VAC
  - f. Bus Material - Plastic
  - g. Number Of Positions - Two-position
  - h. Type - 30.5 mm, Heavy-Duty
  - i. Operating Mode - Maintained push and pull
  - j. Contact Configuration - 1NO-1NC
  - k. Size - 40 mm
  - l. Rating - NEMA 3, 3R, 4, 4X, 12, 13
  - m. Series - 10250T
  - n. Illumination - Illuminated
  - o. Certifications: CSA Certified, UL Listed
3. Manufacturer: Eaton/Cutter Hummer. Model 10250T597LRD2A-1X. No substitutions allowed.

**C. Power Supply**

1. The unit shall be a power supply with a constant output rating at both 12v and 24v settings, universal 120 VAC to 240 VAC input, and polarized option board connectors.
2. The unit shall include fire alarm interface board mounting that allows outputs to be configured as switched (power cut) or unswitched (power continues) when signal is provided.
3. The power supply shall meet the following specifications:
  - a. Input voltage 120/240 VAC, 50/60 Hz, universal input

- b. Output voltage 4A @ 12 or 24 VDC
- c. Field selectable with jumper Switching supply, 5% regulation, 240mVpp max ripple
- d. Enclosure Grey/baked enamel 14" x 12" x 4" (H x W x D), Eight 1/2 " x 3/4 " knockouts,  
  
NEMA Grade 1, Hinged cover with lock down screws.
- e. Operating temperature 32° - 120°F (0° - 49°C)
- f. Certifications ANSI/UL 294
  - (1) ULC-S318
  - (2) RoHS
  - (3) FCC Part 15
  - (4) Class 2
- g. Boards included:
  - (1) 900-BBK: Battery backup kit (backup board plus battery pack)
  - (2) 900-FA: Plug-in fire alarm (must be installed on option boards)
  - (3) 900-4R \* : 4 Relay output board or 900-8F \* : Fused, 8 zone option board
- h. AC primary fuse size 4A, 250v, 5 x 20mm SLOW-BLOW
- i. Battery fuse size 7.5A 32v ATO blade style
- j. DC output protection Overload protection - current limited foldback circuit
- k. Indicators LED indicators:
  - (1) AC input (visible on outside of enclosure)
  - (2) DC output
  - (3) Isolated SPDT contacts to monitor AC power status
- l. Weight (power supply) Approx. 9.0 lbs
- m. Weight (each battery) 4.0 lbs
- n. AC input termination 3 position terminal block with protective cover.  
Wire capacity: 10 AWG max.
- o. DC output termination 2 position terminal block with wire capacity: 12 AWG max.

- p. Option board connectors 2
  - q. Fire alarm board connector Yes (requires connection on option board)
  - r. Keylock – yes
  - s. Shall include 900-BAT: Backup battery pack
4. Manufacturer: Schlage. Model PS904 – no substitutions allowed.

## 2.4 DOOR ALARM SYSTEM

### A. Alarm Control panel

- 1. The unit shall be a Multi-Zone Annunciators that can be used as "stand alone" annunciators or interface with any other control panel via communication bus. Slave configurations are also available for all models.
- 2. Each zone shall have a green LED for status, a red LED for alarm memory, a yellow LED for shunt and a zone control button for acknowledge, reset and bypass functions.
- 3. Zone and common input and output type, timers and other features shall be programmable with easy to use free software.
- 4. The panel shall meet the following specifications:
  - a. Mounting - recessed
  - b. Size - 4 1/2" x 4 1/2" x 2"
  - c. Color - stainless steel faceplate
  - d. Power - requires 12 VDC power supply
  - e. Inputs
    - (1) Normally closed, normally open
    - (2) High Security multi-state end-of-line resistor Loop (color coded)
  - f. Outputs
    - (1) One open collector output per zone rated at 24 VDC, 100 mA (color coded)
  - g. Other: Four Auxiliary Control Inputs and 2 Common Zone Outputs may be programmed for a variety of functions
- 5. Manufacturer: Flair Electronics. Model 531 BC or approved equal.

### B. Door Contacts

- 1. Housing of ABS fire retardant plastic (coordinate color with Commissioner)

durable material. Provide reasonable protection against moisture and dust.

2. Operating gap between faces of switch housing and the magnet housing to be sized to accommodate installation variances and field conditions.
3. Contact shall contain a hermetically sealed magnetic reed switch rated for 10,000,000 cycles.
4. Wire shall be 22 gauge 4 conductor up to a maximum run of 5,000 ft. Home run each window and door to control panel, as specified on the security riser diagram.
5. Contact and magnet shall be drill mounted on metal and sealed with suitable adhesive.
6. Devices shall have End of line Resistor (EOLR) at the last device of each zone to provide zone supervision.
7. Manufacturer: Interlogix/UTC Model # Door Contact Recessed 1076D-N (1078C), Magnet for Hollow Core Door 1840-N, Door Contact Surface Mount 1045T, Door Contact Armored Cable 2507AD-L, Overhead Door Contact Potter ODC-59 - no substitutions allowed.

- C. Power Supply. Provide Altronix model AL600ULACMCB8 – no substitutions allowed. See power supply specifications for Prisoner Alarm System.

## 2.5 INTERCOM SYSTEM

### A. Master station

1. The intercom system shall be of an open voice, selective calling type with selector switches for each station.
2. System shall be fully intermixable with other masters or sub stations of the same series. Master station shall be simplex operation, with hands free reply from the responding station.
3. Master station shall be equipped with station selector switches, OFF button for standby mode, TALK button for simplex operation, and PRIV (privacy) button to block unauthorized monitoring.
4. An All Call button shall be provided for initiation of an announcement throughout the system when the All Call Adaptor or Chime & Music Center is included in the system.
5. Voice volume control shall adjust transmit and receive volume at the calling master station, and a call tone volume control shall be located beneath the operation plate.
6. A call from a sub or door shall be annunciated by a momentary electronic call tone, and the corresponding station LED shall light for approximately 20 seconds. The LED shall not light if a master station calls another master station. LEDs above selector buttons shall illuminate when the station button is pressed at the calling master. The Occupied LED shall light to indicate that the system is in use, and the Off LED shall light on the unit that has a station selected.
7. Master station shall flush mount into a wall. An optional backbox (BBX-1E) shall

be available for ease of installation. Sub stations shall be available in the following configurations:

- a. (1) surface or flush mount styles, with or without privacy;
  - b. (2) surface mount with three call buttons, with or without privacy;
  - c. (3) weather resistant door stations in surface or flush mount styles, mounted on or in standard 1-gang or 2-gang boxes; and (4) vandal proof style, indoor or outdoor models.
8. Optional equipment shall be available to provide chime from up to three door stations, All Call from a master station, and background music distribution to all or selected sub or master stations in the system.
  9. Wiring shall be multiple conductors with an overall shield inside a single jacket, including eight (8) common wires, plus one (1) individual wire per station in the system between masters. Maximum 12 conductors. Wiring to sub stations shall be two (2) conductors in a 1-master system, or three (3) conductors in a system with two or more masters, or when All Call is included.
  10. Manufacturer: Subject to compliance with requirements, provide products by one of the following:
    - a. Aiphone. Model LEF-3 (master station) (Basis-of-Design) or equivalent product from one of the following:
    - b. Siedle
    - c. Comelit
    - d. Or approved equal.
  11. Provide manufacturer's power supply for all products as required.

**B. Wall Mount Slave Station**

1. The unit shall be a vandal and weather resistant sub stations constructed of 12 gauge stainless steel.
2. The station shall be flush mounted into a standard 2-gang box, or surface mounted into the SBX-2G.
3. Each unit shall include tamper proof screws and a tool for installation.
4. The station shall have a stainless steel mechanical call button or red mushroom type button.
5. Communication at the master is push-to-talk or handset, and communication at the sub is hands free.
6. The slave station shall meet the following specifications:
  - a. Power Source: Supplied by master

- b. Speaker: 20 ohms, 2 -1/2" diameter, water and puncture resistant, 2.5 oz. ceramic magnet
  - c. Call Button: Mechanical SPST switch, stainless steel or Red mushroom SPST switch
  - d. Faceplate: 12 gauge stainless steel
  - e. Calling: Mono-electronic tone at master while call button is pressed, plus LED for 20 seconds (LED available on multiple-call masters only)
  - f. Communication: Hands free at sub. Master is push-to-talk, release-to-listen.
  - g. Mounting: Flush mount into a 2-gang box or surface mount
  - h. Mounting Hardware: 6x32 T-10 TORX tamper proof screws (tool supplied)
  - i. Terminations: Color-coded prewired pigtails
  - j. Wiring: Shielded cable is recommended. 3 Conductor shall be used for homerun wiring.
  - k. Wiring Distance: 650' w/ 22AWG; 1600' w/18AWG
  - l. Dimensions: 4-11/16"H x 4-11/16"W x 2"D
7. Wall Mount Slave Station Basis-of-Design: Subject to compliance with requirements, provide wall mount slave station by Aiphone, Model LE-SS (Basis-of-Design) or equivalent product from one of the following:
- a. Siedle
  - b. Comelit
  - c. Or approved equal.
8. Manufacturer of slave stations shall be same as that of Master station listed above under 2.5 A.

## 2.6 CLOSED CIRCUIT TELEVISION SYSTEM (CCTV)

### A. Scope

- 1. It is the intention of these specifications to set forth the minimum requirements for the performance of an integrated CCTV System which can provide adequate and reliable surveillance. In all details not specifically stated herein, it is understood that the equipment shall meet or exceed those requirements of the Electronic Industries Association (EIA) and the Underwriter Laboratories (UL) which are current at the time of the award or installation.
- 2. The CCTV System shall be designed and constructed as an IP based integrated highly reliable Surveillance and Alarm Assessment System. NYPD is using a centralized Genetec VMS for storing video recording off-site as well as for administering and controlling each individual camera. The contractor's responsibility shall be to furnish

and install the specified cameras, procure the necessary licenses (from Genetec or from NYPD inventory, as directed by NYPD), and coordinate with NYPD for the initial configuration and aiming of the cameras. The system shall consist of:

- a. IP Cameras
- b. Lenses.
- c. Camera enclosures.
- d. Camera mounts.
- e. Power supplies.
- f. Video Monitoring Workstations.

**B. Cables**

1. Protect the cables from kinks and do not subject it to bends of less than eight (8) inches radius.
2. Where required by code, plenum cable shall be provided.
3. CAT 6 cables shall be provided for IP cameras.
4. All data cables serving CCTV cameras shall be black in color.

**C. Identification and Tagging**

1. All cables, wires, terminal blocks and terminals shall be identified by labels, tags or other permanent markings.
2. Markings shall clearly indicate the function, source and destination of all cabling, wiring and terminals.

**D. Network Video Recorder (NVR) – Integrate CCTV system with NYPD's existing centralized network video recorder system located off-site. The existing network video recorder system is Genetec VMS. Coordinate system requirements with Commissioner to provide a CCTV system that is fully integrated and connected with the existing video recorder system.**

**E. CCTV Camera**

1. Standards, Regulations & Recognitions
  - a. The camera shall be backed by a minimum of three years manufacturer warranty.
  - b. The manufacturer shall provide the option of extended warranty for the camera. The optional extended warranty shall be available in two-year extension blocks for a total warranty period of maximum five years.
  - c. The camera shall meet product safety standards as defined in IEC/EN/UL 60950-1

- d. The camera shall meet product safety standards as defined in IEC/EN/UL 60950-22
- e. The camera shall meet ISO/IEC 14496-10 MPEG-4 Part 10, Advanced Video Coding (H.264)
- f. The camera shall meet ISO/IEC 14496-2 (Profiles ASP and SP) (MPEG-4 Part 2)
- g. The camera shall meet SMPTE 296M (HDTV 720p)
- h. The camera shall meet SMPTE 274M (HDTV 1080p)
- i. The camera shall meet ONVIF Profile S or ONVIF Version 1.01 or higher as defined by the ONVIF organization.
- j. The camera shall carry the following EMC approvals:
  - (1) EN55022 Class B
  - (2) EN55024
  - (3) FCC Part 15 - Subpart B Class A + B
  - (4) VCCI Class B
  - (5) C-tick AS/NZS CISPR22 Class B
  - (6) ICES-003 Class B
  - (7) KN22 Class B
  - (8) KN24
- k. The camera shall meet the following standards:
  - (1) IEEE 802.3af/802.3at (Power over Ethernet)
  - (2) IEEE 802.1X (Authentication)
  - (3) IPv4 (RFC 791)
  - (4) IPv6 (RFC 2460)
  - (5) QoS – DiffServ (RFC 2475)
- l. The camera shall meet the following mechanical environmental standards:
  - (1) IEC 60529 IP66/67
  - (2) NEMA 250 Type 4X
  - (3) IEC/EN 62262 IK10+ (50 J)

- (4) ISO 20653 IP6K9K
    - (5) IEC 60068-2-1
    - (6) IEC 60068-2-2
    - (7) IEC 60068-2-6
    - (8) IEC 60068-2-14
    - (9) IEC 60068-2-27
    - (10) IEC 60068-2-60
    - (11) IEC 60068-2-78
  - m. The camera shall meet the following Railway environmental standards (1) EN 50121-4
  - (2) IEC 62236-4
2. Mechanics & environmental
- a. The camera enclosure shall include the following:
    - (1) Vandal resistant aluminum and polycarbonate body providing encapsulated electronics
    - (2) clear transparent cover
    - (3) Fitted with a dehumidifying membrane
    - (4) The camera enclosure shall provide the ability to adjust the camera modules angle with -5 to 90° tilt, 360° pan and 95° rotation while maintaining an image that is not interfered by the camera housing.
  - b. The camera shall operate in a temperature range of -40°C to +60°C (-40°F to +140°F).
  - c. The camera shall operate in a humidity range of 10-100% RH (condensing).
3. Sensors & optics
- a. The camera shall be equipped with an IR-sensitive progressive scan sensor.
  - b. The camera shall be fitted with a megapixel lens providing automated iris functionality with P-Iris control and provide remote zoom and focus functionality.
  - c. The camera shall provide images down to:
    - (1) Lens 9 mm - HDTV 1080p 25/30 fps with WDR-Forensic Capture: Color 0.18 lux,

B/W 0.04 lux

- (2) Lens 9 mm - HDTV 1080p 50/60 fps: Color 0.36 lux, B/W 0.08 lux
- (3) Lens 22 mm - HDTV 1080p 25/30 fps with WDR-Forensic Capture: Color 0.28 lux,

B/W 0.06 lux

- (4) Lens 22 mm - HDTV 1080p 50/60 fps: Color: 0.56 lux, B/W:0.11 lux

4. Image Control

- a. The camera shall incorporate Automatic and Manual White Balance.
- b. The camera shall incorporate automatic and manually defined exposure zones.
- c. The camera shall support a configurable shutter in the range from 1/142850 s to 2 s in HDTV 1080p 25/30 50/60 fps mode.
- d. The camera shall support a configurable shutter in the range from 1/142850 s to 2 s in WUXGA (1920x1200) 25/30 fps mode.
- e. The camera shall incorporate capture mode with the following settings:
  - (1) HDTV1080p (1920 x 1080) with WDR: 25/30 fps with power line frequency 50/60 Hz
  - (2) HDTV1080p (1920 x 1080) without WDR: 50/60 fps with power line frequency 50/60 Hz
  - (3) WUXGA(1920 x 1200) without WDR: 25/30 fps with power line frequency 50/60 Hz
- f. The camera shall provide backlight compensation.
- g. The camera shall allow for rotation of the image in steps of 90°
- h. The camera shall incorporate a function for optimization of low light behavior.
- i. The camera shall incorporate a function for Electronic Image Stabilization (EIS) for real-time image stabilization.

5. Video

- a. The camera shall provide simultaneous Motion JPEG and H.264 video streams.
- b. The camera shall be designed to provide at least two video streams in HDTV 1080p (1920x1080) at up to 60 frames per second (60Hz mode) or 50 frames per second (50Hz mode).
- c. The camera shall support Baseline Profile H.264 encoding with motion estimation in up to 60 fps (60Hz), 50 fps (50Hz) in HDTV 1080p resolution.

- d. The camera shall support Main Profile H.264 encoding with motion estimation and context- adaptive binary arithmetic coding (CABAC) in up to 60 fps (60Hz), 50 fps (50Hz) in HDTV 1080p resolution.
  - e. The camera shall support High Profile H.264 encoding with motion estimation up to 50/60 fps in up to 60 fps (60Hz), 50 fps (50Hz) in HDTV 1080p resolution.
  - f. The camera shall provide video in landscape format 4:3 and 16:9 as well as corridor format 3:4 and 9:16.
  - g. The H.264 implementation shall include both unicast and multicast functionality and support Maximum Bit Rate (MBR) as well as Variable Bit Rate (VBR).
6. Audio
- a. The camera shall support two-way full duplex audio.
7. Input sources:
- a. External microphone (balanced/unbalanced)
  - b. External line device
8. Output sources:
- a. External line device
9. Encoding
- a. The camera shall support:
    - (1) AAC LC at 8/16 kHz
    - (2) G.711 PCM at 8 kHz
    - (3) G.726 ADPCM at 8 kHz
10. Connectors
- a. The camera shall be equipped with a RJ45 10BASE-T/100/BASE-TX PoE Ethernet port or higher.
  - b. The camera shall be equipped with two configurable inputs/outputs, configurable for in- or output functionality.
  - c. The camera shall be equipped with a 3.5mm connector for Line out.
  - d. The camera shall be equipped with a 3.5mm connector for Line/Mic In.
11. PTZ functionality
- a. The camera shall incorporate guard tour functionality.

- b. The camera shall incorporate preset positions functionality.
  - c. The camera shall provide 3x optical and 2x digital zoom with 9 mm lens.
  - d. The camera shall provide 2.4x optical and 2x digital zoom with 22 mm lens.
  - e. The camera shall provide control queue functionality.
  - f. The camera shall provide On-Screen Directional Indicator (OSDI) functionality.
12. Event functionality
- a. The camera shall be equipped with an integrated event functionality, which can be triggered by:
    - (1) Live Stream Accessed
    - (2) Tampering
    - (3) Video Motion Detection
    - (4) Audio Detection
    - (5) Day/Night Mode
    - (6) External Input
    - (7) Temperature
    - (8) Schedule
    - (9) Manual Trigger/Virtual Inputs
    - (10) PTZ functionality
    - (11) Embedded third party applications
    - (12) Edge storage disruption detection
  - b. The cameras response to a triggered event shall include:
    - (1) Send notification, using HTTP, HTTPS, TCP or email
    - (2) Send images, using FTP, HTTP, HTTPS, network share or email
    - (3) Send video clip, using FTP, HTTP, HTTPS, network share or email
    - (4) Day/Night Vision Mode
    - (5) Play Audio Clip
    - (6) Activate External Output
    - (7) Send SNMP trap message

- (8) PTZ control functionality
  - (9) WDR Mode
  - (10) Recording to local storage and/or network attached storage
- 13. Storage
  - a. The camera shall be equipped with a video buffer for saving pre- and post-alarm images and shall have a microSD-card slot to support local storage of video.
  - b. The camera shall support SD/SDHC/SDXC UHS-I, memory up to 64 GB, speed class 10.
  - c. The camera shall support recording to network attached storage.
- 14. Other functionality
  - a. The camera shall include a customizable pixel counter functionality, identifying the size of objects in number of pixels.
  - b. The camera shall provide text overlay ability, including date and time.
  - c. The camera shall have the ability to apply a graphical image as an overlay image in the video stream.
  - d. The camera shall have the ability to apply privacy masks in the video stream
- 15. Network functionality
  - a. The camera shall support both static IP addresses and addresses from a DHCP-server.
  - b. The camera shall support both IPv4 and IPv6.
  - c. The camera shall incorporate support for Quality of Service (QoS).
  - d. The camera shall incorporate support for Bonjour.
  - e. To secure access to the unit as well as provided content, the camera shall support HTTPS, SSL/TLS.
  - f. The camera shall support IEEE 802.1X authentication.
  - g. The camera shall provide centralized certificate management, with both pre-installed CA certificates and the ability to upload additional CA certificates. The certificates shall be signed by an organization providing digital trust services.
  - h. The camera shall support IP address filtering and include at least three different levels of password security.
  - i. The camera shall support time synchronization via NTP server.

16. Power
  - a. The camera shall accept Power over Ethernet IEEE 802.3af/802.3at Type 1 Class 3.
17. Maintenance & service
  - a. The camera shall provide a log file, containing information about all users connecting to the unit since last restart. The file shall include information about connecting IP address and the time of connecting.
  - b. The camera shall be monitored by a Watchdog functionality, which shall automatically re- initiate processes or restart the unit if a malfunction is detected.
  - c. The camera shall send a notification when the unit has re-booted and all services are initialized.
18. API & applications
  - a. The unit shall contain a built-in web server making video, audio and configuration available in a standard browser environment using HTTP.
  - b. The camera shall be fully supported by open and published API (Application Programmers Interface) providing necessary information for integration of functionality into third party applications.
  - c. The camera shall allow for applications developed by third parties to be uploaded into the camera, and the camera vendor shall provide compatibility tools to verify the stability and performance of the applications.
  - d. The camera shall conform to ONVIF Profile S or ONVIF Version 1.01 or higher as defined by the ONVIF organization and be upgradable at any time.
19. Manufacturer: Axis Communications. Models Q3515-LV 9mm, Q3515-LVE 9mm, Q8414-LVS, Q6155-E 60Hz, Q6000-E MK II, and P3225-LV MK II (See drawing TAC-405 for details). No substitutions allowed.

**F. CCTV PC**

1. The VMS Display workstation:
  - a. Intel Core i7-4790 Processor (Quad Core, 8MB, 3.60GHz w/HD4600 Graphics)
  - b. Operating System: Microsoft Windows 10 Professional.
  - c. RAM:8 GB DDR2 533 MHZ Memory
  - d. Hard Disk:120 MB for software installation; minimum 30 GB for data storage
  - e. Ethernet card TCP/IP 10/100 Base-T or higher

- f. Miscellaneous: AGP 8X (0.8) or AGP 4X (0.8V/1.5V) support
  - g. Video Card: High performance PCI Express x16 graphics card supporting DirectX 9.0 and dual independent monitors. At least 512 MB of high speed graphics memory.
  - h. DVD: DVD playback requires DVD drive
  - i. The workstation needs NYPD Finest 2.0 image & Genetec VMS installed.
- 2. Monitor:
  - a. UltraSharp 21.5-inch VGA 1600 X 1200 or higher resolution flat panel LCD monitor with 24 bit color support.
  - b. Dot pitch/Pixel Pitch shall 0.255mm
  - c. The Video Bandwidth shall be 162 MHZ
  - d. Image aspect ratio shall be 4:3
  - e. Image contrast ration shall be 800:1
  - f. Power consumption - 75 Watt (7) The size shall be 17.5"W x 7.6"D x 14.4"H
  - g. Manufacturer: Dell, HP, Viewsonic, or approved equal.
- 3. All-In-One PC (For Exterior Cameras)
  - a. The unit shall be a desktop All-in-One PC.
  - b. The unit shall meet the following specifications:
    - (1) Processor: Intel Core i5-6500 Processor (Quad Core, 6MB, 4T, 3.2GHz, 65W)
    - (2) Operating System: Windows 10 Professional English, French, Spanish 64bit.
    - (3) Display: XX IN WLED Full-HD AIO Non-Touch Display
    - (4) Memory1: 4GB (1x4G) 1600MHz DDR3L Memory
    - (5) Hard Drive: 2.5 inch 500GB 7200rpm Hard Disk Drive
    - (6) Graphics Card: Intel Integrated Graphics
    - (7) Optical Drive: 8x DVD+/-RW 9.5mm Optical Disk Drive.
    - (8) Keyboard: Dell KB216 Wired Keyboard English Black
    - (9) Mouse: Dell MS116 Wired Mouse Black
    - (10) Wireless: Intel Dual Band Wireless 8260 (802.11ac) + Bluetooth

- (11) Warranty: 3 Years Hardware Service with Onsite Service After Remote Diagnosis
- (12) Dimensions: Height: 52.78 cm (20.78") x Width: 36.3 cm (14.29") x Depth: 6.35 cm (2.5")
- (13) Weight: 6.341kg (13.98lbs)
- (14) Slots: Supports optional optical disc drive and standard media card reader 1 M.2 connector (Wi-Fi Card)
- (15) Ports:
  - (a) 4 – USB 3.0 (2 side, 2 rear)
  - (b) 2 – USB 2.0 (rear)
  - (c) HDMI 1.4
  - (d) Display Port 1.2
  - (e) RJ-45
  - (f) 1 Universal Headset (Side)
  - (g) Line-out 1 Rear
- (16) Chassis: 1 internal 2.5"
- (17) Regulatory:
  - (a) Product Safety, EMC and Environmental Datasheets

c. Manufacturer: Dell, HP, Lenovo, or approved equal.

## 2.7 Card Access System (ACS)

### A. Scope

- 1. It is the intention of NYPD to use Lenel OnGuard as the Card Access Control system for those doors/gates that will be controlled by a card access system. Initially, the scope addresses only the IT rooms and a specific gate. In all details not specifically stated herein, it is understood that the equipment shall meet or exceed those requirements of the Electronic Industries Association (EIA) and the Underwriter Laboratories (UL) which are current at the time of the award or installation.
- 2. The Card Access System (ACS) shall be designed and constructed and integrated into the NYPD Lenel Enterprise System consisting of:
  - a. CARD ACCESS SYSTEM – No substitutions.

Network Intelligent Controller	Lenel LNL-3300
--------------------------------	----------------

Dual Reader Interface Module	Lenel LNL-1320
Input control module (if necessary)	LNL-1100
Ethlan Micro board 10/100MBPS	Lenel LNL-ETHLAN-MICR On Board 10/100Mbps Ethernet
HID RP 40 Card Reader	HID RP 40 # 920NWNNEKE054W (#ICE0458)
Request-to-Exit Motion Detector	Bosch DS 150i
Request-to-Exit Release Button	Alarm Controls TS2-2
Cabinet w/Power Supply	Lenel LNL-600ULX-4CB6
Cabinet w/Relay Power Supply	Alronix AL600ULACMCB8
Door Contact recessed	Interlogix United Technologies Model # 1076D-N (1078C)
Magnet for Hollow Core Door	Interlogix United Technologies Model # 1840-N
Door Contact surface mount	Interlogix United Technologies Model # 1045T
Door Contact Armored Cable Surface Mount	Interlogix United Technologies Model # 2507AD-L
Overhead Door Contact	Potter ODC-59 Series
Battery	Yuasa Battery # N5P-12
Access control Flexible cable (Plenum)	West Penn AC251822BYE1000

b. MAGNETIC DOOR LOCKS - No substitutions.

Magnetic Lock	Securitron V2M1200DB
Three Piece "Z" Bracket	Securitron Z-V2M1200
Power Supply	Schlage PS904
Push Button	Cutter Hammer 10250T597LRD2A-1X 30.5 mm, Heavy-Duty, Assembled Push-Pull Unit, Red Standard Operator, 2 Position, Operating Mode: Maintained Push, Maintained Pull, 40 mm, LED Illuminated, 120 VAC, 1NO, 1NC

c. DOOR CONTACTS – No substitutions.

Door Contact recessed	Interlogix United Technologies Model # 1076D-N (1078C)
Magnet for Hollow Core Door	Interlogix United Technologies Model # 1840-N
Door Contact surface mount	Interlogix United Technologies Model # 1045T
Door Contact Armored Cable Surface Mount	Interlogix United Technologies Model # 2507AD-L
Overhead Door Contact	Potter ODC-59 – no substitutions allowed.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 MAINTENANCE DATA AND OPERATING INSTRUCTIONS

A. Description

1. Prepare data in the form of an instructional manual.
2. Contents: Prepare a Table of Contents for each volume, with each Product or system description identified, in three parts as follows:
  - a. Part 1: Directory; listing names, addresses, and telephone numbers of Commissioner, Contractor, and major equipment suppliers.
  - b. Part 2: Operation and maintenance instructions, arranged by system and subdivided by specification section. For each category, identify names, addresses, and telephone numbers of suppliers.
  - c. Identify the following: Significant design criteria.
    - (1) Equipment Tests
    - (2) Parts list for each component.
    - (3) Operating instructions.
    - (4) Maintenance instructions for equipment and systems.
  - d. Part 3: Project documents and certificates, including the following:
    - (1) Shop drawings and product data.
    - (2) Card reader and door contacts open and close reports.
    - (3) List of all active devices (card reader, contacts, motion detectors, glass break detectors).

- (4) Certificates.
- (5) Photocopies of warranties.
- (6) Photocopies of bonds.

**B. Contents, Each Volume**

- 1. Table of Contents: Provide title of project; names, addresses, and telephone numbers of Commissioner, Sub-consultants and contractor with name of responsible parties; schedule of products and systems, indexed to content of the volume.
- 2. For each Product or System: List names, addresses and telephone numbers of suppliers, including local source of supplies and replacement parts.
- 3. Product Data: Mark each sheet to clearly identify specific products and component parts, and data applicable to installation. Delete inapplicable information.
- 4. Drawings: Supplement product data to illustrate relations of components parts of equipment and systems, to show control and flow diagrams. Do not use Project Record Documents as maintenance drawings.
- 5. Narrative Text: As required to supplement product data. Provide logical sequence of instructions for each procedure, incorporating manufacturer's instructions.
- 6. Warranties.
- 7. Bonds.

**C. Manual for Equipment and Systems**

- 1. Each item of Equipment and Each system: Include description of unit or system, and component parts. Identify function, normal operating characteristics, and limiting conditions. Include performance curves, with engineering data and test, and complete nomenclature and model number of replaceable parts.
- 2. Include color coded wiring diagrams as installed.
- 3. Operating Procedures: Includes start-up, break-in and routine normal operating instructions and sequences. Include regulation, control stopping, shut-down and emergency instructions. Include summer, winter, and any special operating instructions.
- 4. Maintenance Requirements: Include routine procedures and guide for preventative maintenance and troubleshooting, disassembly restoration, and reassembly instructions, and alignment, adjusting, balancing, and checking instructions.
- 5. Provide servicing schedule for all recording equipment.
- 6. Include manufacturers printed operation and maintenance instructions.
- 7. Include sequence of operation by controls manufacturer.
- 8. Provide original manufacturer's parts list, illustrations, assembly drawings, and

diagrams required.

9. Provide control diagrams by controls manufacturer as installed.
10. Provide list of original manufacturers; spare parts, current prices, and recommended quantities to be maintained in storage.
11. Include test reports as specified in Section 3.7.
12. List additional requirements specified in individual Product specification sections.
13. Provide a listing in Table of Contents for design data, with tabbed dividers and space for insertion of data.

**D. Instruction**

1. Before final inspection, instruct The City of New York's designated service operators in operation, adjustment and maintenance of products, equipment, and systems, at agreed upon times.
2. For equipment requiring seasonal operation, perform instruction for other seasons within six months.
3. Use operation and maintenance manuals as basis for instruction. Review contents of manual with service operators in detail to explain all aspects of operation and service.
4. Prepare and insert additional data in Operation and Maintenance manual when needed as the need for such data becomes apparent during instruction.

E. After all final tests and adjustments have been completed, fully instruct the proper City of New York's service operators in all details of operation for equipment installed. Supply properly trained installers to operate equipment for sufficient length of time to assure that The City of New York's service operators are properly instructed to take over operation and service procedures. Supply properly trained installers to operate equipment for sufficient length of time as required to meet all required performance tests.

F. Furnish required number of manuals, in bound form containing data covering capacities, maintenance of operation of all equipment and apparatus. Operating instruction shall also include the following:

1. Parts List: Identifying the various parts of the equipment for restoration and replacement purposes.
2. Instruction Books may be standard booklets but shall be clearly marked to indicate applicable equipment.
3. Wiring Diagrams: Generalized diagrams are not acceptable, submittal shall be specifically prepared for this Project.

G. Where applicable, one set of operating and maintenance instructions shall be neatly framed behind glass and hung adjacent to the equipment concerned.

**3.3 GENERAL REQUIREMENTS**

- A. Installation shall include the delivery, storage, setting in place, fastening to the building structure, interconnection of the system components, alignment, adjustment and all other work, whether or not expressly specified which is necessary to result in a tested and operational system.
- B. All installation practices shall be in accordance with, but not limited to, the specifications and drawings. Installation shall be performed in accordance with requirements and recommendations of the National Electrical Code and 2014 New York City Electrical Code.
- C. During the installation and up to the date of substantial completion, the protect finished and unfinished work against damage or loss. In the event of such damage or loss, replace or restore such work at no expense to the City of New York.
- D. All equipment shall be firmly secured in place unless requirements of portability dictate otherwise. Fastenings and supports shall be adequate to support their loads with a safety factor of at least three.
- E. All boxes, equipment, etc., shall be plumb and square. The Contractor must take such precautions that are necessary to prevent and guard against electromagnetic and electrostatic hum, to supply adequate ventilation and to install the equipment to provide reasonable safety for the operator.
- F. In the installation of equipment and cables, considerations shall be given not only to operational efficiency, but also to overall aesthetic factors.
- G. Electrical work should be installed to specifications. All security wiring shall be concealed or in conduit as noted.
- H. Supply and install all fittings and accessories, required for proper, safe and reliable operation of the system whether or not they are specified.
- I. No exposed equipment shall be installed without the Commissioner's approval of design, finish and mounting details.

#### 3.4 CABLE INSTALLATION

- A. All circuits shall be protected to avoid interruption of service due to short-circuiting or other conditions which might adversely affect the connected devices. Each individual signaling circuit shall be classified as a circuit pair.
- B. All cabling run in ceiling cavities shall be neatly strapped, dressed and adequately supported every 8-10 feet. Cable installation shall conform to good engineering practices and to the standards of the most current National Electrical Code.
- C. Cables shall be terminated with the proper connector required for the associated operation of the equipment to which it is connected. Screw terminal blocks shall be furnished for all cables which interface with racks, cabinets, consoles or equipment modules. Wire shall be interfaced with screw terminal blocks through the use of spade lugs installed on the cable with an installation tool specifically recommended by the manufacturer of the lug. Evidence of the installation of cables and wires without the appropriate connectors, spade lugs and tools shall be sufficient cause for rejection of the work and reinstallation of the cables or wires.
- D. Where cables or wires require soldering, the soldering shall be done using rosin core solder and controlled temperature soldering equipment. Evidence of solder joints not made with rosin

core solder or with non- temperature controlled tools shall be sufficient cause for rejection of the work and resoldering of all connections.

- E. Every cable or wire shall be labeled or coded at each end. Each terminal of each field terminal strip shall be permanently labeled or coded to show the zone, instrument or item served. Terminal blocks shall be numbered by circuit pairs, such as 1 to 25, 26 to 50, etc.
- F. All cables within a rack, console or junction box shall be grouped according to the signals being carried to reduce signal contamination. Separate groups should be formed for the following:
  - 1. Power cables.
  - 2. Video cables and audio cables carrying signals less than 2.0 volts, peak-to-peak.
  - 3. Audio cables carrying signals between 2.0 volts and 24 volts, peak-to-peak, security monitoring cables carrying signal under 5 volts, peak-to-peak.
  - 4. Audio cables carrying signals above 24 volts, peak-to-peak, and local control system cables carrying signals under 24 volts, current limited to under 5 amperes.
- G. All security cables shall be in conduit if routed through an exposed ceiling. Under no circumstances shall cables be exposed in the finished area.
- H. Coaxial cables shall be run in continuous lengths except for terminations. No splices shall be permitted in any conduit run.
  - 1. All coaxial cables shall be terminated with "BNC" twist-on type. Connector crimp type connector are not acceptable.
  - 2. Provide connectors by Cambridge, Belden (PPC), TE Connectivity, or approved equal.
  - 3. Install all wiring in such a fashion to avoid interference from electrically induced interference.
- I. All conduit support shall be as required.
- J. Shielded conductors shall be installed in separate steel conduits and shall not occupy the same enclosure with unshielded conductors. Shielded conductors may be grouped together.
- K. Where shielded conductors enter a panel or enclosure, and where power wiring exists, provision shall be made to provide physical isolation of signal and power conductors. Install sleeve on shield grounds in panels. Conduit connections shall be made to assure no interaction between power and signal circuits.
- L. Electrical self-stripping tap and pigtail connectors shall be tin plated brass "U" element contact. Connectors shall be 3M Brand Scotchlok 567 to 577., or an equivalent product by Grote, Hillman, or approved equal.

### 3.5 GROUNDING

- A. A single system ground point shall be established for the system. This shall consist of a single grounding point to which all grounds shall be connected.
- B. The system ground shall be located in the base of the security equipment racks. It shall consist

of copper bar sufficient in size to accommodate the required grounds.

- C. The system ground is to be connected to the local ground bus by conductors which have not more than 0.1-ohm total resistance. Under no conditions shall AC neutral either in a power panel or in receptacle outlets be used for a reference ground.
- D. Provide R.F. shielding and R.F. filtering for all systems and components to ensure no interaction with potential R.F. systems in proximity to the site.

### 3.6 FINISHES

- A. Equipment finishes shall be manufacturer's standard unless otherwise noted in the specification. All finishes, whether standard or custom, shall be submitted to the Commissioner for approval prior to fabrication.

### 3.7 TESTING

- A. When the Contractor has completed his own system tests and when the system record documents, including drawings, operation and maintenance manuals, are complete, the Commissioner is to be notified that the system fulfills the specifications and is ready for acceptance testing.
  - 1. Provide written documentation describing the total system test methodology for review and approval prior to commencement of system test including:
    - a. Remote devices including door contacts, card readers, door hardware, multiplex panels and all related remote security devices.
    - b. Communications system including intercom and video intercom components.
    - c. Power supplies.
    - d. Panic alarm system including glass break sensors, sirens, panic buttons and all related security devices.
  - 2. Provide a minimum of (3) qualified installers during the test period.
  - 3. Provide the required test equipment to perform a complete systems test.
- B. Approved English software packages shall be entered into the security computer systems and be debugged. Document and enter the initial database into the system. Provide the necessary blank forms with instruction to the Commissioner to fill-in all the required data information that will make up the database. The database shall then be reviewed by the contractor and entered into the system. A copy of the document and a copy of the recorded database on a diskette shall be made available for review on a later date. Prior to full operation, a complete demonstration of the computer real-time functions shall be performed in the presence of the Commissioner. A printed validation log shall be provided as proof of operation for each software application package. In addition, a point utilization report shall be furnished listing each point, the associated programs utilizing that point as an input or output and the programs which that point initiates.
- C. Upon satisfactory on-line operation of the system software, the entire installation including all subsystems shall be inspected. Perform all tests, furnish all test equipment and consumable supplies necessary and perform any work as required to establish performance levels for the

system in accordance with the specifications. Each device shall be tested as a working component of the completed system. All system controls shall be inspected for proper operation and response. The scope of the inspection work shall include, but not be limited to, the following:

1. Document all measured values and control settings for the system. These values and settings shall be recorded in the operation and maintenance manuals and shall be made available at the time of acceptance testing, following the indicated testing procedures.
  2. Check each system including all inputs and outputs for compliance with the performance standards.
    - a. Test shall demonstrate the specified response time of card readers during simulation of specified maximum access control request load on system.
    - b. Function all remote sensors for proper operations and testing of all wiring. The test shall include operating each device as it should operate in normal usage. No operations are to be simulated for this test.
  3. Check each control and monitoring function from all origination points to all controlled locations for proper operation.
  4. Adjust each piece of equipment as required for optimum quality and to meet the manufacturer's published specifications.
  5. Check to ensure that all systems are free from spurious oscillation and radio frequency pickup both in the absence of any input signal and also when the system is driven to full output.
  6. Establish tentative normal settings for all systems controls. All setup controls shall be adjusted for optimum system performance and shall be marked for reference.
  7. Demonstrate the power-up and power-down procedure for each system. These procedures shall be documented and then incorporated into the systems operation manual.
- D. All tests shall be documented by the Contractor and shall be witnessed by the Commissioner. Following the system test and inspection, the Commissioner shall prepare a list of any outstanding work, which must be completed by the Contractor prior to issuance of the certificate of substantial completion.
- E. Upon receipt of the Contractor's notice that all punch list items from previous inspections are complete, the Commissioner shall reinspect the work for final acceptance. Provide all test equipment, materials and installers as required to assist in final acceptance. The final acceptance test shall consist of the following:
1. Verify that all record documentation is complete.
  2. The operation of all system and equipment shall be demonstrated by the Contractor to comply with the contract documents. Both subjective and objective tests may be required of the Contractor by the Commissioner to determine compliance with the specifications.
- F. Upon completion of the reinspection, the Commissioner shall either accept the system as being

substantially complete or advise the Contractor of work not completed or obligations not fulfilled as required for final acceptance. If necessary, the entire procedure shall be repeated.

- G. The inspections and tests may be suspended at the option of the Commissioner if it is his opinion that major components of the system are defective. Be available at the job site to make adjustments and restorations and take corrective action during the tests.
- H. The system shall be accepted as complete when all base contract work has been completed and all remedial work is performed and all documentation is complete, accurate and accepted, and the City of New York's service operators have received the specified instructions.
- I. Complete logs of tests shall be retained by the Contractor for inspection and review at any time after the testing has started. Upon final completion of system tests the log records shall be submitted.
- J. Submit detailed test check list and descriptive methodology for approval at least 4 weeks prior to start of test.
- K. Field Tests:
  - 1. Complete field tests shall be performed on all sub-systems. Each individual function shall be tested and proven correct in function and response a minimum of two times with not less than two-month time between individual tests.
  - 2. Provide the services of fully qualified technicians. Tests shall be performed after the system is adjusted and operating in accordance with specification requirements.

### 3.8 EQUIPMENT IDENTIFICATION

- A. Each major piece of equipment shall be provided with a permanently engraved or embossed metal identification tag. The tag shall include the following information:
  - 1. Name of manufacturer.
  - 2. Manufacturer's equipment description.
  - 3. Serial number and model number.
  - 4. Voltage and current rating.

**END OF SECTION 28 00 00**

**SECTION 28 08 00****COMMISSIONING OF ELECTRONIC SAFETY AND SECURITY****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]

**1.2 SUMMARY**

- A. This section includes commissioning process requirements for Electronic systems, assemblies, and equipment.
- B. Related Sections:
  - 1. DDC General Conditions Section "General Commissioning Requirements" for general commissioning process requirements.

**1.3 DESCRIPTION**

- A. Commissioning is a systematic process of confirming that all building systems perform interactively according to the Commissioner's Project Requirements and the Basis of Design and continuing through construction, acceptance and the warranty period with actual verification of performance.
- B. The Commissioning process does not take away from or reduce the responsibility of the installing contractors to provide a finished and fully functioning product.
- C. The CxA directs and coordinates the commissioning activities and reports to the Commissioner. All members in the construction process work together to fulfill their contracted responsibilities and meet the objectives of the Commissioner's Project Requirement's as detailed in the Contract Documents.

**1.4 DEFINITIONS**

- A. Refer to DDC General Conditions Section "General Commissioning Requirements" for definitions.

**1.5 SUBMITTALS**

- A. Refer to DDC General Conditions Section "General Commissioning Requirements" for CxA's role.

- B. Refer to DDC General Conditions Section “Submittals” for specific requirements. In addition, provide the following:
- C. Certificates of readiness
- D. Certificates of completion of installation, prestart, and startup activities.
- E. O&M manuals
- F. Test reports

## **1.6 QUALITY ASSURANCE**

- A. Test Equipment Calibration Requirements: Contractors will comply with test manufacturer’s calibration procedures and intervals. Recalibrate test instruments immediately after instruments have been repaired resulting from being dropped or damaged. Affix calibration tags to test instruments. Furnish calibration records to CxA upon request.

## **1.7 COORDINATION**

- A. Commissioning Kick-Off Meeting – Construction Team: Contractors will attend a meeting of the Commissioning Team, chaired by the CxA, to review the scope of commissioning process activities and the Commissioning Plan with discussions on milestones, activities, and assignments of responsibilities. The flow and type of documents and the amount of submittal data given to the CxA will be determined. Meeting minutes will then be distributed to all parties by the CxA.
- B. Commissioning Meetings: Contractors will attend coordination meetings with the Commissioning Team, chaired by the CxA, to review progress on the Commissioning Plan, construction deficiencies, scheduling conflicts, and to discuss strategies and processes for upcoming commissioning process activities.
- C. Miscellaneous Construction Meetings: The CxA attends selected planning and job-site meetings in order to remain informed on construction progress and to update parties involved in the commissioning process.
- D. Pre-testing Meetings: Contractors will attend pretest meetings with the Commissioning Team, chaired by the CxA, to review startup reports, pre-test inspection results, testing procedures, testing personnel and instrumentation requirements, and manufacturers’ authorized service representative services for each system, subsystem, equipment, and component to be tested.
- E. Testing: Contractors will coordinate with testing personnel and agencies for timing and access for CxA to witness test.
- F. Manufacturers’ Inspection and Startup Services: Contractors will coordinate services of manufacturers’ inspection and startup services.
- G. Testing, Adjusting and Balancing: Contractors will coordinate with plan and schedule for testing, adjusting and balancing for timing and access for CxA to witness process.

## **PART 2 - PRODUCTS**

### **2.1 TEST EQUIPMENT**

- A. All standard testing equipment required to perform startup, initial checkout and functional performance testing shall be provided by the Contractor for the equipment being tested. For example, the contractor shall ultimately be responsible for all standard testing equipment for the electronic systems in Division 28. A sufficient quantity of two-way radios shall be provided by each contractor.
- B. Special equipment, tools and instruments (specific to a piece of equipment and only available from vendor) required for testing shall be included in the base bid price to the The City of New York and left on site, except for stand-alone data logging equipment that may be used by the CxA.
- C. Proprietary test equipment and software required by any equipment manufacturer for programming and/or start-up, whether specified or not, shall be provided by the manufacturer of the equipment. Manufacturer shall provide the test equipment, demonstrate its use, and assist in the commissioning process as needed. Proprietary test equipment (and software) shall become the property of the The City of New York upon completion of the commissioning process.
- D. Data logging equipment and software required to test equipment will be provided by the CxA, but shall not become the property of the The City of New York.
- E. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified in the Specifications. If not otherwise noted, the following minimum requirements apply: Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5°F and a resolution of + or - 0.1°F. Pressure sensors shall have an accuracy of + or - 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.

## **PART 3 - EXECUTION**

### **3.1 GENERAL DOCUMENTATION REQUIREMENTS**

- A. With assistance from the installing contractors, the CxA will prepare Pre-Functional Checklists for all commissioned components, equipment, and systems
- B. Red-lined Drawings: The contractor will verify all equipment, systems, instrumentation, wiring and components are shown correctly on red-lined drawings. Preliminary red-lined drawings must be made available to the Commissioning Team for use prior to the start of Functional Performance Testing. Changes, as a result of Functional Testing, must be incorporated into the final as-built drawings, which will be created from the red-lined drawings. The contracted party, as defined in the Contract Documents will create the as-built drawings.
- C. Operation and Maintenance Data: Contractor will provide a copy of O&M literature within 45 days of each submittal acceptance for use during the commissioning process for all commissioned equipment and systems. The CxA will review the O&M literature once for conformance to project requirements. The CxA will receive a copy of the final approved O&M literature once corrections have been made by the Contractor.

- D. Demonstration and Instruction: Contractor will provide demonstration and instruction as required by the specifications. A complete instruction plan and schedule must be submitted by the Contractor to the CxA four weeks (4) prior to any instruction. An instruction agenda for each instruction session must be submitted to the CxA one (1) week prior the instruction session

### **3.2 CONTRACTOR'S RESPONSIBILITIES**

- A. Perform commissioning tests at the direction of the CxA.
- B. Attend construction phase controls coordination meetings.
- C. Participate in Electronic systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the CA.
- D. Provide information requested by the CxA for final commissioning documentation.
- E. Include requirements for submittal data, operation and maintenance data, and instruction in each purchase order or sub-contract written.
- F. Prepare preliminary schedule for Electronic system orientations and inspections, operation and maintenance manual submissions, instruction sessions, equipment start-up and task completion for The City of New York. Distribute preliminary schedule to commissioning team members.
- G. Update schedule as required throughout the construction period.
- H. Assist the CxA in all verification and functional performance tests.
- I. Provide measuring instruments and logging devices to record test data, and provide data acquisition equipment to record data for the complete range of testing for the required test period.
- J. Gather operation and maintenance literature on all equipment, and assemble in binders as required by the specifications. Submit to CxA 45 days after submittal acceptance.
- K. Coordinate with the CxA to provide 48-hour advanced notice so that the witnessing of equipment and system start-up and testing can begin.
- L. Notify the CxA a minimum of two weeks in advance of the time for start of the testing and balancing work. Attend the initial testing and balancing meeting for review of the official testing and balancing procedures.
- M. Participate in, and schedule vendors and contractors to participate in the instruction sessions.
- N. Provide written notification to the CM/GC and CxA that the following work has been completed in accordance with the contract documents, and that the equipment, systems, and sub-system are operating as required:
  - 1. Fire Alarm System
- O. The equipment supplier shall document the performance of his equipment.
- P. Provide a complete set of red-lined drawings to the CxA prior to the start of Functional Performance Testing.

- Q. Equipment Suppliers
1. Provide all requested submittal data, including detailed start-up procedures and specific responsibilities of the The City of New York, to keep warranties in force.
  2. Assist in equipment testing per agreements with contractors.
  3. Provide information requested by CxA regarding equipment sequence of operation and testing procedures.
- R. Refer to DDC General Conditions Section “General Commissioning Requirements” for additional Contractor responsibilities.

### **3.3 CxA'S RESPONSIBILITIES**

- A. Refer to DDC General Conditions Section “General Commissioning Requirements” for CxA’s Responsibilities.

### **3.4 TESTING PREPARATION**

- A. Certify in writing to the CxA that Electronic systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.
- B. Certify in writing to the CxA that Electronic instrumentation and controls have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.
- C. Certify in writing that testing procedures have been completed and that testing reports have been submitted, discrepancies corrected, and corrective work approved.
- D. Place systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
- E. Inspect and verify the position of each device and interlock identified on checklists.
- F. Check safety cutouts, alarms, and interlocks with building automation, smoke control and life-safety systems during each mode of operation.
- G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the CxA.

### **3.5 GENERAL TESTING REQUIREMENTS**

- A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of the CxA.
- B. Scope of Electronic testing shall include the entire Electronic system installation, from the incoming power equipment throughout to each peripheral and end device. Testing shall include measuring, but not limited to resistance, voltage, and amperage of system(s) and devices.
- C. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

- D. The CxA along with the contractor and other contracted subcontractors, including the fire alarm Subcontractor shall prepare detailed testing plans, procedures, and checklists for Electronic systems, subsystems, and equipment.
- E. Tests will be performed using design conditions whenever possible.
- F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
- G. The CxA may direct that set points be altered when simulating conditions is not practical.
- H. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- I. If tests cannot be completed because of a deficiency outside the scope of the Electronic system, document the deficiency and report it to The City of New York. After deficiencies are resolved, reschedule tests.
- J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

### **3.6 ELECTRICAL SYSTEMS, SUBSYSTEMS, AND EQUIPMENT TESTING PROCEDURES**

- A. Equipment Testing and Acceptance Procedures: Testing requirements are specified in individual Division 28 sections. Provide submittals, test data, inspector record, infrared camera or special equipment and certifications to the CA.
- B. Electronic Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Division 28 Sections "Instrumentation and Control" and "Sequence of Operations"; Assist the CxA with preparation of testing plans.
- C. Fire Detection and Alarm System Testing: Provide technicians, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.
- D. The work included in the commissioning process involves a complete and thorough evaluation of the operation and performance of all components, systems and sub-systems. The following equipment and systems shall be evaluated:
  - 1. Fire Detection and Alarm System

### **3.7 DEFICIENCIES/NON-CONFORMANCE, RETESTING, FAILURE DUE TO MANUFACTURER DEFECT**

- A. Refer to DDC General Conditions Section "General Commissioning Requirements" for requirements pertaining to deficiencies/non-conformance, retesting, or failure due to manufacturer defect.

### **3.8 APPROVAL**

#### **A. Deficiencies/Non-Conformance**

1. The CxA will record the results of the functional test on the test form. All deficiencies or non-conformance items shall be noted and reported to the Commissioner and Contractors on a standardized form.
2. The Contractor shall respond to new deficiencies within five (5) business days. The response shall either indicate the issue will be corrected with anticipated date of completion indicated or the response should clearly indicate why the Contractor disputes the claim while referencing the contract document in dispute or request further information to clarify the concern.
3. Corrections of minor deficiencies identified may be made during the tests at the discretion of the CxA.
4. Every effort will be made to expedite the testing process and minimize unnecessary delays, while not compromising the integrity of the procedures.
5. As tests progress and a deficiency is identified, the CxA discusses the issue with the executing Contractor.
6. When there is no dispute on the deficiency and the Contractor accepts responsibility to correct it, the CxA documents the deficiency and the Contractor's response and intentions or corrections. The CxA and Contractor then proceed to another test or sequence. Once the Contractor corrects the deficiency, the test is rescheduled and repeated in the anticipation of correct operation or function.
7. When there is a dispute about a deficiency, regarding whether it is a deficiency or who is responsible, the CxA documents the deficiency and the Contractor's response. The deficiency is then forwarded to parties assumed to be responsible for the deficiency. Resolutions are made at the lowest management level possible. Other parties are brought into the discussion as needed. Final interpretive authority is with the Commissioner. Final acceptance authority is with the Commissioner and CxA. The CxA will then document the resolution process. Once the interpretation and resolution have been decided, the appropriate party corrects the deficiency. The CxA then reschedules the test as stated in the section above.

#### **B. Failure due to Manufacturer Defect**

1. If 10% or three, whichever is greater, of identical pieces (size alone does not constitute a difference) of equipment fail to perform to the Contract Documents (mechanically or substantively) due to manufacturing defect, not allowing it to meet its submitted performance spec, all identical units may be considered unacceptable only by the Commissioner. In such case, the Contractor shall provide the Commissioner with the following.
  - i. Within one week of notification from the Contractor the manufacturer's representative shall examine all other identical units making a record of the findings. The findings shall be provided to the Commissioner within two weeks of the original notice.
  - ii. Within two weeks of the original notification, the Contractor or manufacturer shall provide a signed and dated, written explanation of the problem, cause of failures, etc. and all proposed solutions which shall include full equipment submittals. The proposed solutions shall not significantly exceed the specification requirements of the original installation.
  - iii. The Commissioner will determine whether a replacement of all identical units or a repair is acceptable.
  - iv. Two examples of the proposed solution will be installed by the Contractor and the Contractor will be allowed to test the installations for up to one week, upon which the Commissioner will decide whether to accept the solution.
  - v. Upon acceptance, the Contractor and/or manufacturer shall replace or repair all identical items, at their expense and extend the warranty accordingly, if the original equipment warranty had begun. The replacement/repair work shall proceed with reasonable speed beginning within one week from when parts can be obtained.

### **3.9 DEFERRED TESTING**

- A. Unforeseen Deferred Testing – If any check or test cannot be completed due to the building structure, required occupancy condition or other deficiency, execution of checklists and functional testing may be delayed upon approval of the Commissioner. These tests will be conducted in the same manner as the seasonal tests, as soon as possible. Services of necessary parties will be negotiated.

### **3.10 MANUFACTURER’S MANUALS**

- A. The Operation and Maintenance Manuals shall conform to Contract Documents requirements as stated in DDC General Conditions.
- B. Refer to DDC General Conditions Section “General Commissioning Requirements” for the AE and CxA roles in the Operation and Maintenance Manual contribution, review and approval process.

### **3.11 INSTRUCTION OF NEW YORK CITY PERSONNEL**

- A. The Contractor shall be responsible for instruction coordination, scheduling, and ultimately for ensuring that instruction is completed.
- B. The CxA shall oversee the instruction of the City of New York for commissioned equipment and systems.
  - 1. The CxA shall interview the City of New York to determine the special needs and areas where instruction will be most valuable. The Commissioner and CxA shall decide how rigorous the instruction should be for each piece of commissioned equipment. The CxA shall communicate the results to the Contractor, who will in turn communicate to the subcontractors and vendors who also have instruction responsibilities.
  - 2. In addition to these general requirements, the specific instruction requirements of the City of New York by Contractors, subcontractors and vendors are specified in the individual sections listed in Section 1.2 – SUMMARY.
  - 3. Each Sub and vendor responsible for instruction will submit a written instruction plan to the Contractor for review and approval prior to instruction. The Contractor will submit one comprehensive instruction plan to the CxA and the Commissioner.
  - 4. The plan will be reviewed by the CxA and the Commissioner. Comments pertaining to its deficiencies will be forwarded to the Contractor. The instruction plan will be rewritten until approved by the CxA and the Commissioner. The final approved instruction plan will cover the following elements:
    - a. Equipment (included in instruction)
    - b. Intended audience
    - c. Location of instruction
    - d. Objectives
    - e. Subjects covered (description, duration of discussion, special methods, etc.)
    - f. Duration of instruction on each subject
    - g. Qualified instructor for each subject
    - h. Instructor qualifications
    - i. Methods (classroom lecture, video, site walk-through, actual operational demonstrations, written handouts, etc.)

5. For the primary equipment, the Controls Subcontractor shall provide a discussion of the control of the equipment during the instruction conducted by each subcontractor or vendor.
6. Instruction documentation shall include the following items:
  - a. Copy of the instruction plan, including schedule, syllabus, and agenda.
  - b. Copy of the Commissioner's Project Requirements.
  - c. Copy of the Basis of Design.
  - d. Compiled operations manuals.
  - e. Compiled maintenance manuals.
  - f. Completed manufacturer instruction manuals.
  - g. Red-lined drawings.
  - h. Other pertinent documents.
7. The CxA develops criteria for determining that the instruction was satisfactorily completed, including attending some of the instruction, etc. The CxA recommends approval of the instruction to the Commissioner using a standard form. The Commissioner signs the approval form/letter template.
8. At one of the instruction sessions, the CxA presents a presentation discussing the use of the blank functional test forms for re-commissioning equipment
9. Videotaping of the instruction sessions in DVD format will be provided by the CxA

### **3.12 FUNCTIONAL BUILDING SYSTEMS DEMONSTRATION TEST (72 HOURS)**

- A. Refer to Addendum to the General Conditions Section "General Commissioning Requirements" for requirements pertaining to 72-Hour Functional Building Systems Demonstration Testing.

**END OF SECTION 28 08 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 28 31 11****FIRE ALARM INTEGRATED AUDIO/VISUAL EVACUATION SYSTEM****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Related Sections:
  - 1. Section 07 84 10 "Firestopping"
  - 2. Section 08 70 00 "Finish Hardware"
  - 3. Division 21 Fire Suppression
  - 4. Division 23 Heating Ventilating and Air Conditioning Monitoring & Control (HVAC).
  - 5. Division 26 Electrical, Section 260500 Common Work Results for Electrical

**1.02 SUMMARY**

- A. Section Includes:
  - 1. This specification describes an addressable Fire Detection and alarm signaling system. The control panel shall be intelligent device addressable, analog detecting, low voltage and modular, with digital communication techniques. The features and capacities described in this specification are required as a minimum for this project.
  - 2. The system shall be in full compliance with 2014 New York City Construction Codes and the New York City Fire Department's standards and regulations.
  - 3. The system shall include all required hardware, raceways, interconnecting wiring and software to accomplish the requirements of this specification and the contract drawings, whether or not specifically itemized herein.
  - 4. The system as specified shall be supplied, installed, tested and approved by the New York City Fire Department, and turned over to the Commissioner in an operational condition.
  - 5. In the interest of job coordination and responsibilities, the installing contractor shall contract with a single supplier for fire alarm equipment, engineering, programming, inspection and tests, and shall be capable of providing a "UL Listing Certificate" for the complete system.

**1.03 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Adhesives, sealants, paints and coatings used for the work of this section shall meet the Volatile Organic Compound (VOC) limits specified in Section 01 81 13.13 – "Volatile Organic Compound (VOC) Limits for Adhesives, Sealants, Paints and Coatings for LEED Buildings" where applicable. Certification of VOC content shall be in accordance with the LEED Building Submittals requirements of this section.

#### 1.04 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.05 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.06 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

#### 1.07 DEFINITIONS

- A. Broadcast Media: The speakers, radio, cell phone, and other media that will carry the selected message to the selected audience.
- B. FACP: Fire alarm control panel.
- C. NAC: Notification Appliance Circuit. A circuit used to monitor and activate notification appliances or devices.
- D. FM: FM Global (Factory Mutual).
- E. NFPA: National Fire Protection Association. Definitions in NFPA 72 apply to fire alarm terms used in this Section.
- F. NICET: National Institute for Certification in Engineering Technologies.
- G. UL: Underwriters Laboratories.
- H. VESDA: Very Early Smoke-Detection Apparatus.
- I. NYFD: New York City Fire Department

#### 1.08 SYSTEM DESCRIPTION

- A. The system shall be a complete, electrically supervised fire detection and notification system, with a microprocessor based operating system having the following capabilities, features, and capacities:

1. The local system shall provide status indicators and control switches for all of the following functions:
  - a. Audible and visual notification alarm circuit zone control.
  - b. Status indicators for sprinkler system water-flow and valve supervisory devices.
  - c. Any additional status or control functions as indicated on the drawings, including but not limited to; emergency generator functions, fire pump functions, door unlocking and security with bypass capabilities.

#### 1.09 PERFORMANCE REQUIREMENTS

- A. General Performance: Comply with NFPA 72 and all contract documents and specification requirements.
- B. All interconnections between this system and the monitoring system shall be arranged so that the entire system can be UL-Certificated.
- C. System shall be a complete, supervised, non-coded, addressable multiplex fire alarm system conforming to NFPA 72.
- D. The system shall have Class A circuits for each floor. The system shall operate in the alarm mode upon actuation of any alarm initiating device. The system shall remain in the alarm mode until all initiating device(s) are reset and the fire alarm control panel is manually reset and restored to normal.
- E. The system shall be capable of the following configurations. Both configurations are permitted on the same network.
  1. The system shall support up to 252 addressable devices, which may be divided in any ratio on one, two, three, or four separate, isolated Class B circuits.
  2. The system shall support two loops of 252 addressable devices, each of which may be divided in any ratio on one, or two, isolated Class A circuits.
- F. The system shall have an optional digital alarm communication transmitter.
- G. The system shall provide an off-normal warning prior to reset for all active devices.
- H. The system shall be capable of remote monitoring via a software system that provides a graphical representation of the fire alarm control panel at a remote PC when connected via Ethernet to the system. The display will show the exact state of the panel, including blinking LEDs, and with menu buttons for control.
- I. The system shall be capable of being configured via a PC Tool.
- J. The system shall provide the following functions and operating features:
  1. The FACP and auxiliary power panels shall provide power, annunciation, supervision and control for the system.
  2. Provide Class A initiating device circuits.
  3. Provide two Class A notification appliance circuits. Arrange circuits to allow individual, selective, and visual notification by zone. Notification appliance circuits shall be zoned to correspond with the building fire barriers and other building features.
  4. Audibles shall be synchronized throughout the entire building.
  5. Provide electrical supervision of the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control panel.

- K. The system shall provide a field test function where one person can test the complete system or a specific area while maintaining full operational function of other areas not being tested. Alarms, supervisory signals, trouble signals shall be logged in system history during the walk-test.
- L. Alarm functions shall override trouble or supervisory functions. Supervisory functions shall override trouble functions.
- M. Fire alarm signal initiation shall be by one or more of the following devices:
  - 1. Manual pull station
  - 2. Heat detector
  - 3. Addressable area smoke detectors
  - 4. Addressable Multi-criteria, dual optical smoke detectors
  - 5. Addressable Multi-criteria smoke detectors with built-in Carbon Monoxide (CO) sensor
  - 6. Standard Addressable Duct smoke detector
  - 7. Specialized Duct Smoke detector
  - 8. Projected beam detector
  - 9. Automatic sprinkler system water flow switch.
- N. Activation of any system fire, security, supervisory, trouble, or status initiating device shall cause the following actions and indications at all network Person Machine Interfaces using an LCD display with multiple detail screens.
  - 1. Fire Alarm Condition:
    - a. Sound an audible alarm and display a custom message defining the building in alarm and the specific alarm point initiating the alarm on an LCD display.
    - b. Log into the system history archives all activity pertaining to the alarm condition.
    - c. Sound the ANSI 117-1 signal with synchronized audible notification appliances and synchronized strobes throughout the facility.
    - d. Audible signals shall be silenced from the fire alarm control panel by an alarm silence switch. Visual signals shall be programmable to flash until system reset or alarm silencing, as required.
    - e. A signal dedicated to sprinkler system water flow alarm shall not be silenced while the sprinkler system is flowing at a rate of flow equal to a single head.
    - f. Activation of any smoke detector in the elevator lobby or the elevator equipment room shall, in addition to the actions described, cause the recall of the elevator to the 1<sup>st</sup> floor and the lockout of controls. In the event of recall initiation by a detector in the first floor lobby, the recall shall be to the alternate floor as determined by the NYFD.
    - g. Where indicated on drawings heat detectors in elevator shaft and machine rooms shall activate an elevator power shunt trip breaker. The heat detectors shall be rated at a temperature below the ratings of the sprinkler heads in respective locations to insure that the power shall be shut off before activation of sprinkler system.
    - h. System operated duct detectors as per local requirements shall accomplish HVAC shut down.
    - i. Door closure devices shall operate by floor or by local requirements.
  - 2. Supervisory Condition:
    - a. Display the origin of the supervisory condition report at the local fire alarm control panel LCD display.
    - b. Activate supervisory audible and dedicated visual signal.
    - c. Audible signals shall be silenced from the control panel by the supervisory acknowledge switch.

- d. Record within system history the initiating device and time of occurrence of the event.
- 3. Trouble Condition
  - a. Display at the local fire alarm control panel LCD display, the origin of the trouble condition report.
  - b. Activate trouble audible and visual signals at the control panel and as indicated on the drawings.
  - c. Audible signals shall be silenced from the fire alarm control panel by a trouble acknowledge switch.
  - d. Trouble conditions that have been restored to normal shall be automatically removed from the trouble display queue and not require operator intervention. This feature shall be software selectable and shall not preclude the logging of trouble events to the historical file.
  - e. Trouble reports for primary system power failure to the master control shall be automatically delayed for a period of time equal to 25% of the system standby battery capacity to eliminate spurious reports as a result of power fluctuations.
  - f. Record within system history, the occurrence of the event, the time of occurrence and the device initiating the event.
- O. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

#### 1.10 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories. Complete manufacturer's catalog data including supervisory power usage, alarm power usage, physical dimensions, and finish and mounting requirements.
- B. Power calculations. Battery capacity calculations. Battery size shall be a minimum of 125% of the calculated requirement. Provide the following supporting information:
  - 1. Supervisory power requirements for all equipment.
  - 2. Alarm power requirements for all equipment.
  - 3. Power supply rating justification showing power requirements for each of the system power supplies. Power supplies shall be sized to furnish the total connected load in a worst-case condition plus 25% spare capacity.
  - 4. Voltage drop calculations for wiring runs demonstrating worst-case condition.
  - 5. NAC circuit design shall incorporate a 15% spare capacity for future expansion.
- C. Submit manufacturer's requirements for testing Signaling Line Circuits and device addresses prior to connecting to control panel. At a minimum the following tests shall be required; device address, the usage (Alarm, Supervisory etc.), environmental compensation, temperature ratings for thermal detectors and smoke detector sensitivities. This requirement shall need approval before any wiring is connected to the control panel.
- D. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 2. Wiring Diagrams: For power, signal, and control wiring.
  - 3. Complete drawings covering the following shall be submitted by the contractor for the proposed system:

- a. Floor plans showing all equipment and raceways, marked for size, conductor count with type and size, showing the percentage of allowable 2014 New York City Electric Code fill used.
  - b. Provide a fire alarm system function matrix as referenced by NFPA 72, Figure A-7-5.2.2 (9). Matrix shall illustrate alarm input/out events in association with initiation devices. Matrix summary shall include system supervisory and trouble output functions. Include any and all departures, exceptions, variances or substitutions from these specifications and/or drawings.
- E. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
- 1. Light fixtures.
  - 2. HVAC registers
  - 3. Fire protection equipment interfaces
  - 4. Special suppression system interfaces
- F. Source quality-control reports.
- G. Field quality-control reports.
- H. Operation and Maintenance Data: For all fire alarm equipment, to include in operation and maintenance manuals.
- I. Software and Firmware Operational Documentation:
- 1. Software operating and upgrade manuals.
  - 2. Program Software Backup: On magnetic media or compact disk, complete with data files.
  - 3. Device address list.
  - 4. Printout of software application and graphic screens.
- J. Warranty: Sample of special warranty.

#### 1.11 QUALITY ASSURANCE

- A. Manufacturer Qualifications: The publications listed below form a part of this publication to the extent referenced. The publications are referenced in the text by the basic designation only. The latest version of each listed publication shall be used as a guide.
- 1. FM Global (Factory Mutual (FM)):FM Approval Guide
  - 2. National Fire Protection Association (NFPA)
    - a. NYC National Electrical Code 2014
    - b. NYC National Fire Alarm Code 2014
    - c. NYC Standard For The Installation of Air Conditioning and Ventilating Systems
    - d. NYC Life Safety Code 2014
    - e. NYC Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment
  - 3. Underwriters' Laboratories, Inc. (UL) equipment standards, Latest Edition
    - a. UL Fire Protection Equipment Directory
    - b. UL Electrical Construction Materials Directory
    - c. UL 38 – Manually Actuated Signaling Boxes for Use with Fire Protection Signaling Systems
    - d. UL 228 – Door Holding Devices
    - e. UL 268 - Smoke Detectors for Fire Protective Signaling Systems
    - f. UL 268A - Smoke Detectors for Duct Application

- g. UL 464 - Audible Signal Appliances
  - h. UL 497A – Secondary Protectors for Communications Circuits
  - i. UL 521 - Heat Detectors for Fire Protective Signaling Systems
  - j. UL 864 - Control Units for Fire Protective Signaling Systems
  - k. UL 1283 – Electromagnetic Interference Filters
  - l. UL 1449 - Transient Voltage Surge Suppressors
  - m. UL 1971 - Signaling Devices for the Hearing Impaired
  - n. UL 2075 – Gas and Vapor Detectors and Sensors
  - o. UL 2572 – Mass Notification Systems
  - 4. Building Code
    - a. NYC Building Code 2014
    - b. NYC Fire Code 2014
  - 5. New York City Building Codes as adopted and/or amended by NYPD, ADA, and/or NY State equivalency standards as adopted by NYFD.
  - 6. New York Fire Department.
  - 7. NYC-MEA
  - 8. The manufacturer shall have a minimum of 15 years production experience in the manufacture and design of high sensitivity aspiration-type smoke detection systems.
  - 9. ISO 9002
- B. Supplier Qualifications
- 1. The manufacturer of the supplied products must utilize multi-channel product distribution on a national basis to be considered for this bid. The manufacturer must have factory branches as well as independent distributors to allow the end user with the ability to utilize factory educated and authorized competitive service providers after system installation and commissioning.
  - 2. Provide the services of a factory educated and certified representative or technician, experienced in the installation and operation of the type of system provided. The representative shall be a professional engineer licensed in the State of New York.
  - 3. The technician shall supervise installation, software documentation, adjustment, preliminary testing, final testing and certification of the system. The technician shall provide the required instruction to The City of New York's personnel in the system operation and maintenance.
  - 4. The suppliers shall furnish evidence they have an experienced service organization, which carries a stock of spare and parts for the system being furnished.
  - 5. The equipment supplier shall be authorized and educated by the manufacturer to calculate, design, install, test, and maintain the air sampling system and shall be able to produce a certificate stating such upon request.
- C. Installer Qualifications:
- 1. The Contractor's installer shall enlist the services of a professional engineer licensed in the State of New York to assist in provision of the systems specified by this section. All work products of the Contractor's Engineer shall be submitted to Commissioner for review and acceptance.
  - 2. The Contractor's installer shall be properly instructed in accordance with UL for certifying fire alarm systems.
- D. Testing Agency Qualifications: Qualified for testing indicated.
- E. Source Limitations for fire alarm equipment: Obtain fire alarm equipment from single source.
- F. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.
3. Combustion Characteristics: ASTM E 136.

G. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Pre-installation Conference: Conduct conference at Project site.

#### 1.12 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to project site in original, unopened packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, and shelf life if applicable.
- B. Store materials inside, under cover, above ground, and kept dry and protected from physical damage until ready for use. Remove from site and discard wet or damaged materials.

#### 1.13 PROJECT CONDITIONS

- A. Installed products or materials shall be free from any damage including, but not limited to, physical insult, dirt and debris, moisture, and mold damage.
- B. Environmental Limitations: Do not deliver or install products or materials until spaces are enclosed and weather-tight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

#### 1.14 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace fire alarm equipment that fail(s) in materials or workmanship within specified warranty period.
  1. Warranty Period: 1 year from date of Substantial Completion.

#### 1.15 SERVICE AGREEMENT

- A. Technical Support: Beginning with Substantial Completion, provide software support for 1 year.
- B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.
  1. Provide 30 days' notice to the Commissioner to allow scheduling and access to system and to allow the Commissioner to upgrade computer equipment if necessary.

#### 1.16 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

### PART 2 - PRODUCTS

## 2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  - 1. Siemens Building Technologies (Basis-of-Design).
  - 2. Edwards, A Division of UTC Fire and Security.
  - 3. Notifier: a Honeywell company (onyx).
  - 4. Cerberus Pyrotronics (Fire Findor XLSV).
  - 5. Or approved equal.
- B. All products provided in this section shall be sole sourced from any single approved manufacturer listed above. Throughout this section, product requirements are given with reference to the Basis-of-Design manufacturer. If using product from a non-Basis-of-Design manufacturer, provide an equivalent product from an approved equal manufacturer for each product listed.

## 2.02 CONTROL PANEL

- A. Model: Provide Siemens Desigo Fire Safety FC and FV 2025, or equivalents from approved equal manufacturer listed above.
- B. The fire alarm control panel shall be microprocessor based using multiple microprocessors throughout the system providing rapid processing of smoke detector and other initiation device information to control system output functions.
- C. There shall be a watchdog circuit, which shall verify the system processors and the software program. Problems with either the processors or the system program the panel shall activate a trouble signal and reset the panel.
- D. The system modules shall communicate with an RS 485 network communications protocol. All module wiring shall be to terminal blocks.
- E. The fire control panel system shall be capable of the following configurations.
  - 1. The system shall support up to 252 addressable devices, which may be divided in any ratio on one, two, three, or four separate, isolated Class B circuits.
  - 2. The system shall support 252 addressable devices, each of which may be divided in any ratio on one, or two separate, isolated Class A circuits.
- F. The fire control panel system shall be capable of the following configurations. Both configurations are permitted on the same network.
  - 1. The system shall support up to 504 addressable devices, which includes a second SLC configuration and each may be divided in any ratio on one, two, three, or four separate, isolated Class B circuits.
  - 2. The system shall support 504 addressable devices, each of which includes a second SLC configuration and each may be divided in any ratio on one, or two separate, isolated Class A circuits.
- G. The system shall be capable of supporting unshielded wiring applications.
- H. The system shall be compliant with the requirements of NFPA 720 as a Carbon Monoxide Detection Control Unit and shall meet the UL 2075 listing requirements. All inputs from CO sensors shall be indicated visually and audibly at the control panel. CO sensor inputs shall be distinct and descriptively annunciated from other signals.

- I. System Components:
  1. The System Periphery board shall be capable of 252 intelligent devices distributed between one, two, three, or four Class B SLC circuits. Any trouble on one circuit shall not affect the other circuit. This module controls the signaling from the initiation devices reporting alarms and troubles to the control panel. This module shall also provide the signaling to the field devices for the controlling the output of specific initiation devices. The onboard microprocessor provides the periphery board with the ability to function even if the main microprocessor fails. LED's on the board shall provide annunciation for the following; Power, Gnd. Fault, Alarm, Trouble. This board is integral to the system. The board shall be model number FCI2016-U1, or equivalent from approved equal manufacturer listed above.
  2. The system periphery board shall be capable of supporting two system drivers of 252 intelligent devices distributed between one, two, three, or four Class B SLC circuits, for a total panel capacity of 504 addressable devices. Any trouble on one circuit shall not affect the other circuit. This module controls the signaling from the initiation devices reporting alarms and troubles to the control panel. This module shall also provide the signaling to the field devices for the controlling the output of specific initiation devices. The onboard microprocessor provides the periphery board with the ability to function even if the main microprocessor fails. LED's on the board shall provide annunciation for the following: Power, Gnd. Fault, Alarm, and Trouble. This board is integral to the system. The board shall be model number FCI2017-U1, or equivalent from approved equal manufacturer listed above.
  3. The Signal Line Circuits (SLC) shall be tested for opens, shorts and communications with all addressable devices installed before connection to the control panel. Systems without this capability shall have a test panel installed for initial testing to eliminate any possible damage short term or long term to the control panel. After initial testing replace the test panel and proceed with complete testing.
  4. The standard Operator Interface shall have the ability to view events, acknowledge, silence, and reset the system and any networked Fire Safety control panels, when configured as a global PMI. The standard operator interface can acknowledge, silence, and reset panels via Global PMI.
  5. The LED Operator Interface shall have the ability to view events, acknowledge, silence, and reset the system and any networked Fire Safety control panels, when configured as a global PMI. Additionally, the operator interface provides twelve multicolored configurable LEDs for annunciating system status
  6. The System Periphery Board shall contain 2 Class B NAC circuits rated at 3 amps each with power-limited outputs. The zones shall be isolated and independently supervised. There shall be at least 6 unique codes/signals for each circuit based on system logic. These signals shall be Temporal Code 3 (Evacuation), Steady (Such as "Recall"), Temporal Code 3 (for CO alarms), March Time 120ppm, March Time 60ppm, and March Time 30ppm. The card shall have the following LED's to provide trouble shooting and annunciation; Power, Gnd. Fault, Zone Activation or Trouble. This functionality shall be integral to the system. The card shall be model number FCI2016-U1/FCI2017-U1, or equivalent from approved equal manufacturer listed above.
  7. The control panel shall be equipped with four Form C relays for alarm, trouble, supervisory, and programmable output. The system shall provide the mounting of all system cards, field wiring, and panel's inter-card wiring. All power limited field wiring shall be separated from all non-power limited internal wiring. The card shall be model number FCI2016-U1/FCI2017-U1, or equivalent from approved equal manufacturer listed above.
- J. System response time from alarm to output shall be an average of three (3) seconds.

- K. All system cards and modules shall have Flash memory for downloading the latest module firmware.
- L. Passwords:
  - 1. Technician Level Password - There shall be a 4-character password that a user must enter into the control panel in order to perform such maintenance- and control-related functions at the panel as:
    - a. Arming and disarming devices.
    - b. Activating, deactivating or modifying detector ASD and sensitivity settings.
    - c. Activating and deactivating the History Log function and deleting obsolete entries.
    - d. Changing the system time and date.
  - 2. Maintenance Level Password - There shall be a 4-character password that a user must enter into the control panel in order to access the panel's reporting functions and walktest functions.
  - 3. Acknowledge Silenceable Reset Access - There shall be a key required to open a locked cabinet that a system user must use in order to acknowledge events, turn silenceable audibles and visuals on and off, and perform panel resets.
- M. Degrade Mode Alarm Activation:
- N. Software Modifications: The system structure and software shall place no limit on the type or extent of software modifications on-site. Modification of software shall not require power-down of the system or loss of system fire protection while modifications are being made. Systems that require the use of external programmers or change of EPROMs are not acceptable.
- O. Logic: The fire alarm system shall support generic functions that deal with binary states (True/False, high/low), and produce desired outputs from one or more binary inputs (for example, alarm outputs from detector or manual station inputs). AND, OR, NOT, Any N, Latches, Start Timer, Delay Timer, Restart Timer are generic functions. Generic functions can be used as inputs to other function. The system shall support 500 logic functions.
- P. History: The system shall store 2000 events in history. Trouble warnings will occur when the History buffer is full.
- Q. Reports:
  - 1. The system shall have the ability to provide configuration, status, queue and history reports.
  - 2. Configuration reports shall provide the following information:
    - a. Custom Messages
    - b. Database Information
    - c. Entity Type
    - d. Zone usage
    - e. Device Category
    - f. Firmware revision
  - 3. Status reports shall provide the following information:
    - a. Disarmed cards and devices
    - b. ASD settings
    - c. Sensitivity in %/foot
    - d. Alarm threshold in %/foot
    - e. Temperature in degrees F.
    - f. Walktest
  - 4. Queue reports shall provide the following information:
    - a. Alarm events with custom message and event time

- b. Gas alarm events with custom message and event time
  - c. Supervisory events with custom message and event time
  - d. Trouble events with custom message and event time
  - e. Status events with custom message and event time
  - f. Information events
5. History reports shall provide Address, History Type, Description, Time & Date and Custom Message. The following event types shall be reported:
- a. Alarm events
  - b. Gas alarm events
  - c. Supervisory events
  - d. Status changes
  - e. Alarm verification
  - f. Output activation from logic
  - g. System Reset
  - h. Event Acknowledgements
  - i. Block Acknowledgements
  - j. Audible Silence System Flag Changes
  - k. Sensitivity Changes
  - l. Arm / Disarm Commands
  - m. Arm / Disarm By Logic
  - n. Manual Output Overrides
  - o. Output Overrides By Logic
  - p. Time Changes
  - q. Menu Logins
  - r. ASD Changes
  - s. Walktest
  - t. Device Input to Logic Activations/Deactivations

## 2.03 POWER SUPPLY

- A. The system Power Supply FP2011-U1, or equivalent from approved equal manufacturer listed above shall be a 170 Watt, 6-amp that provides 24VDC power for system operation. The power supply shall be filtered and regulated. The power supply provides power for all system operation, including signaling line circuits, notification appliance circuits, auxiliary power, battery charger, and all optional modules. The power supply shall be rated for 120/240 VAC 50/60 Hz.
- B. The system Power Supply FP2012-U1, or equivalent from approved equal manufacturer listed above, shall be a 300 Watt, 9-amp that provides 24 VDC power for system operation. The power supply provides power for all system operation, including signaling line circuits, notification appliance circuits, auxiliary power, battery charger, and all optional modules. The power supply shall be rated for 120/240 VAC 50/60 Hz.
- C. The battery charger shall be able to charge the system batteries up to 100 AH batteries. Battery charging shall be microprocessor controlled and programmed to select battery sizes.
- D. Transfer from AC to battery power shall be instantaneous when AC voltage drops to a point where it is not sufficient for normal operation.

## 2.04 SYSTEM ENCLOSURE

- A. Provide the enclosure as specified. Provide the color as to the 2014 New York City Construction Codes and FDNY requirements.

- B. Provide three-height-unit backbox as part of the manufacturer's system hardware for use with system enclosures. Each backbox is used to fasten the device with an outer door.

## 2.05 GRAPHIC ANNUNCIATOR

- A. Provide the Siemens model FT2007-U1 LED driver, or equivalent from approved equal manufacturer listed above, for use with custom graphic annunciators. Provide outputs for 32 zones including Alarm, Supervisory, and Trouble per zone. Also included shall be outputs for seven (7) system status indicators. 16 input points shall be provided. These inputs points shall be programmable as generic zone inputs, or as system inputs (reset, silence/unsilence, acknowledge, or lamp test) which allows specified functionality from a remote graphic annunciator. Programming the LED driver shall be integral to the manufacturer's Fire Safety programming tool.

## 2.06 REMOTE ANNUNCIATOR

- A. LCD Annunciator Panel: Provide FT2014/FT2015 LCD remote annunciator(s), or equivalent from approved equal manufacturer listed above, as indicated on the drawings. The remote annunciator shall provide visual indication of all system status changes including alarm, supervisory, trouble, and system status. Display shall include text descriptions as programmed at the main panel for all device status and system status. The remote annunciator shall provide key-lock switch protected functionality including reset, signal silence/un-silence, and acknowledge. The annunciator panel shall be available in both red and black housings.

## 2.07 INTELLIGENT INITIATING DEVICES

- A. General
  - 1. All initiation devices shall be insensitive to initiating loop polarity. Specifically, the devices shall be insensitive to plus/minus voltage connections.
- B. Smoke Detectors – Standard:
  - 1. Model: Siemens Standard Addressable H-Series, or equivalent from approved equal manufacturer listed above.
  - 2. The detector shall be guaranteed in writing not to false alarm when configured by the factory educated certified technician. The detector must provide up to 11 different environmental algorithms that allow the detector to provide superior false alarm immunity without the need for additional alarm verification delays.
  - 3. The detector shall have a multicolor LED to streamline system maintenance/inspection by plainly indicating detector status as follows: green for normal operation, amber for maintenance required, red for alarm.
  - 4. The multi-criteria smoke detector shall be an intelligent digital photoelectric detector with a programmable heat sensor. Detectors shall be listed for use as open area protective coverage, in duct installation, and sampling assembly installation and shall be insensitive to air velocity changes. The detector communications shall allow the detector to provide alarm input to the system and alarm output from the system within four (4) seconds. So as to minimize the effort required by the installing and maintenance technician to appropriately configure the detector to ensure optimal system design, the detectors shall be programmable as application specific. Application settings shall be selected in software for a minimum of eleven environmental fire profiles unique to the devices installed location.
  - 5. The detector shall be designed to eliminate the possibility of false indications caused by dust, moisture, RFI/EMI, chemical fumes, and air movement while factoring in conditions

- of ambient temperature rise, obscuration rate changes and hot/cold smoke phenomenon into the alarm decision to give the earliest possible real alarm condition report.
6. The intelligent smoke detector shall be capable of providing three distinct outputs from the control panel. The outputs shall be from an input of smoke obscuration, a thermal condition or a combination of obscuration and thermal conditions. The detector shall be designed to eliminate calibration errors associated with field cleaning of the chamber.
  7. The detector shall support the use of a relay, or LED remote indicator without requiring an additional software address. Low profile, white case shall not exceed 2.5 inches of extension below the finish ceiling.
  8. For the detector where required, there shall be available a locking kit and detector guard to prevent unauthorized detector removal.
  9. The smoke detector shall be model number HFP-11.
  10. Where required, there shall be available a programmable remote lamp configurable to remotely duplicate the on-board LED status of another system device. It shall be model ILED-H.
- C. Smoke Detectors:
1. Model: Siemens S-Line Addressable FDOO-Series, or equivalent from approved equal manufacturer listed above.
  2. The detectors shall be guaranteed in writing not to false alarm when configured by the factory educated certified technician. The detectors must provide at least 19 different environmental algorithms that allow the detector to provide superior false alarm immunity without the need for additional alarm verification delays.
  3. The detectors shall have a tri-color LED to streamline system maintenance/inspection by plainly indicating detector status as follows: green for normal operation, amber for maintenance required, red for alarm.
  4. Detectors shall utilize state of the art forward/backward light scattering technology, with improved detection for smoldering and flaming fire signatures. The detectors shall replace the need for ionization detectors due to improved response characteristics to flaming fires.
  5. When required, the detectors shall incorporate an addressable Carbon Monoxide (CO) sensor. The CO sensor shall be selectable as an input to the multi-criteria fire detector algorithm and as an independent life-safety CO gas detector (in compliance with NFPA 720).
  6. Detectors shall provide pre-alarm signal at 0.2% obscuration/ft. and a full alarm at 1.0% obscuration/ft. to meet the performance requirements of National Fire Protection Association Standard 76, Fire Protection of Telecommunications Facilities as a Very Early Warning Fire Detector (VEWFD).
  7. The forward/backward light scattering technology shall provide improved immunity to spurious activation (deceptive phenomena). The detectors shall have a "No False Alarm Guarantee".
  8. The detectors shall be RoHS-compliant: it shall meet standards for Reduction of Hazardous Substances (RoHS) by reduction in lead content and other restricted substances.
  9. The multi-criteria detector with CO input shall be UL 2075 compliant as a gas and vapor detector.
  10. The multi-criteria fire detectors shall be an intelligent digital photoelectric detector with a programmable heat detector. Detectors shall be listed for use as open area protective coverage, in-duct installation and sampling assembly installation and shall be insensitive to air velocity changes. The detectors' communications shall allow the detectors to provide alarm input to the system and alarm output from the system within four (4) seconds. So as to minimize the effort required by the installing and maintenance technician to appropriately configure the detector to ensure optimal system design, the detectors shall be programmable as application specific. Application settings shall be

selected in software for a minimum of 19 environmental fire profiles unique to the devices installed location.

11. The detectors shall be designed to eliminate the possibility of false indications caused by dust, moisture, RFI/EMI, chemical fumes and air movement while factoring in conditions of ambient temperature rise, obscuration rate changes and hot/cold smoke phenomenon into the alarm decision to give the earliest possible real alarm condition report.
12. The detectors shall be UL listed for operation in a 95% relative humidity (RH) environment.
13. The detectors shall be designed to eliminate calibration errors associated with field cleaning of the chamber.
14. The detectors shall support the use of a relay, or LED remote indicator without requiring an additional software address. Low profile, white case shall not exceed 2.5 inches of extension below the finish ceiling.
15. The detectors shall support the use of an ambient temperature warning signal at the panel. This temperature shall be user-configurable for the set temperature of the warning and the event type generated by the warning. This event can be used to trigger system logic.
16. The multi-criteria detector with CO sensor shall support the use of an ambient Carbon Monoxide (CO) warning signal at the panel. This ambient CO level shall be user-configurable in parts per million (PPM) for the set threshold of the warning and event type generated by the warning. This event can be used to trigger system logic.
17. For the detectors where required, there shall be available a locking kit and detector guard to prevent unauthorized detector removal.
18. UL Listed as "direct in-duct" mounting.
19. Available models:
  - a. FDOOT441. Multi-Criteria incorporating 2 Optical sensors and 2 Thermal sensors with an operating temperature range of 32°F to 120°F. Nineteen selectable profiles. Polarity insensitive installation wiring. Three color LED.
  - b. FDOOTC441. Multi-Criteria incorporating 2 Optical sensors, 2 Thermal sensors, and Carbon Monoxide sensing technologies with an operating temperature range of 32°F to 120°F. Twenty-Five selectable profiles. Polarity insensitive installation wiring. Three color LED. CO sensor may be programmed as part of the multi-criteria or may be an independent CO detector.

**D. Smoke Detectors:**

1. Model: Siemens C-Line Addressable FD-Series, or equivalent from approved equal manufacturer listed above.
2. The smoke detectors must provide at least 3 environmental parameter sets to assist in device sensitivity configuration.
3. The detectors shall have a tri-color LED to streamline system maintenance/inspection by plainly indicating detector status as follows: green for normal operation, amber for maintenance required, red for alarm.
4. The detector shall be RoHS-compliant: it shall meet standards for Reduction of Hazardous Substances (RoHS) by reduction in lead content and other restricted substances.
5. The detectors shall be UL listed for operation in a 95% relative humidity (RH) environment.
6. The detectors shall be designed to eliminate calibration errors associated with field cleaning of the chamber.
7. The detectors shall support the use of a relay, or LED remote indicator without requiring an additional software address. Low profile, white case shall not exceed 2.5 inches of extension below the finish ceiling.
8. For the detectors where required, there shall be available a locking kit and detector guard to prevent unauthorized detector removal.

9. Available models:
  - a. FDOT421. Multi-Criteria incorporating 1 Optical sensor and 1 Thermal sensor with an operating temperature range of 32°F to 100°F. Available in four parameter sets. Polarity insensitive installation wiring. Three color LED.
  - b. FDO421. Photoelectric Smoke detector with an operating temperature range of 32°F to 120°F. Available in three parameter sets. Polarity insensitive installation wiring. Three color LED.
- E. Heat Detectors – Addressable
  1. Thermal Detectors shall be rated at 135 degrees fixed temperature and 15 degrees per minute rate of rise. Detectors shall be constructed to compensate for the thermal lag inherent in conventional type detectors due to the thermal mass, and alarm at the set point of 135 degrees Fahrenheit. The choice of alarm reporting as a fixed temperature detector or a combination of fixed and rate of rise shall be made in system software and be changeable at any time without the necessity of hardware replacement.
  2. The detectors furnished shall have a listed spacing for coverage up to 2,500 square feet and shall be installed according to the requirements of NFPA 72 for open area coverage. The thermal detector shall be model number HFPT-11 or equivalent from approved equal manufacturer listed above.
  3. Model FDT421 heat detector, or equivalent from approved equal manufacturer listed above, shall have the following temperature settings:
    - a. Fixed temperature at 135°F, 145°F, 155°F, 165°F, 174°F
    - b. Rate of Rise at 15°F/ min (8.3°C) at 135°F (57°C)
    - c. Rate of Rise at 15°F/ min (8.3°C) at 174°F (79°C)
    - d. Low temperature warning at 40°F (4.4°C)
- F. Duct Smoke Detectors – Addressable
  1. For duct detector applications, the smoke detector shall be an intelligent digital photoelectric detector. Detectors shall be listed for use as open area protective coverage, in duct installation and sampling assembly installation and shall be insensitive to air velocity changes.
  2. The detector communications shall allow the detector to provide alarm input to the system and alarm output from the system within four (4) seconds. The detector shall be mounted in a duct detector housing listed for that purpose. The duct detector shall support the use of a remote test switch, relay or LED remote indicator. The duct detector shall be supplied with the appropriate sampling tubes to fit the installation.
  3. Where duct detectors are exposed to the weather a weatherproof enclosure shall be available. A NEMA-3R and NEMA-4X option shall be available. The duct housing cover shall include a test port for functional testing of the detector without cover removal. The duct housing shall include a cover removal switch capable of indicating cover removal status to the fire alarm control panel.
  4. The intelligent duct detector shall have a model number from the FDBZ-Series or equivalent from approved equal listed above. Where required there shall be available a duct housing with an on-board relay. Also where required, there shall be a standalone housing available with its own power supply and test/reset switch that does not require connection to a fire alarm control panel. It shall be model FBZ492-PR.
  5. Duct smoke detector housing shall allow use in duct systems with air velocity ranging from 100 to 4,000 feet per minute, within temperature ranges of 32°F to 120°F per minute, and with relative humidity ranging from 0 to 95%.
  6. Duct Housings and Accessories:
    - a. FDBZ492 Global Air Duct Housing for Conventional and Addressable Detectors or equivalent from approved equal manufacturer listed above.
    - b. FDBZ492-R Global Air Duct Housing for Addressable P2 Detectors with Relay Application or equivalent from approved equal manufacturer listed above.

- c. FDBZ492-R Global Air Duct Housing for Conventional Detectors with Relay Application or equivalent from approved equal manufacturer listed above.
  - d. FDBZ492-PR Global Air Duct Housing for Conventional Detectors with Relay Application and Built-in Power Source or equivalent from approved equal manufacturer listed above.
  - e. FDBZ-WP Weather-Proof housing to accommodate all versions of Global Air Duct Housings or equivalent from approved equal manufacturer listed above.
  - f. FDBZ-RTL Remote Test Lamp for Conventional Detectors or equivalent from approved equal manufacturer listed above.
- G. Detector Bases – Addressable
- 1. Detector bases shall be low profile twist lock type with screw clamp terminals and self-wiping contacts. Bases shall be installed on an industry standard, 4" square or octagonal electrical outlet box.
  - 2. Multi-Criteria Fire Detector Model FDOOTC441 or equivalent from approved equal listed above shall be listed as providing CO detection in duct application.
  - 3. The model number for the standard base shall be DB-11 - 6" Version or equivalent from approved equal manufacturer listed above.
  - 4. The model number for the standard base shall be DB-11E - 4" Version or equivalent from approved equal manufacturer listed above.
  - 5. Device capable of generating a 3,000 Hz tone that provides a signal up to 85dBA at 10 feet (3.1m) for localized annunciation. With the exception of the 520Hz low frequency square wave, the device shall meet the requirements of UL464. When used with a Fire Safety intelligent detector, Device shall have option of being powered directly from a signal line circuit (SLC) in a two-wire configuration. All device bases shall be capable of sounding simultaneously, individually or in any combination depending upon the system configuration.
  - 6. The model ABHW-4S or equivalent from approved equal listed above is a UL / ULC Listed supplementary smoke-detection device that meets or exceeds the 85dB at 10 ft. (3.1m) audibility requirement, including the low-frequency requirement of 520 Hz for 'Sleeping Areas'. The ABHW-4S shall meet the requirements of UL464. All model ABHW-4S bases are capable of sounding simultaneously, individually or in any combination: it is based upon the detector type, and when it used and configured with a compatible FACP.
- H. Manual Pull Stations – Addressable
- 1. Provide addressable manual stations where shown on the drawings, to be flush or surface mounted as required. Manual stations shall contain the intelligence for reporting address, identity, alarm and trouble to the fire alarm control panel. The manual station communications shall allow the station to provide alarm input to the system and alarm output from the system within less than four (4) seconds.
  - 2. The manual station shall be equipped with terminal strip and pressure style screw terminals for the connection of field wiring. Surface mounted stations where indicated on the drawings shall be mounted using a manufacturer's prescribed matching red enamel outlet box.
  - 3. The double action pull station shall be model number HMS-D, or equivalent from approved equal manufacturer listed above.
  - 4. Where required, there shall also be available pull stations with break glass, capable of explosion proof installation, capable of weatherproof installation, reset key operation, and metal housings.
- I. Addressable Interface Devices
- 1. Addressable Interface Devices shall be provided to monitor contacts for such items as water-flow, tamper, and PIV switches connected to the fire alarm system. These interface devices shall be able to monitor a single or dual contacts. An address will be

- provided for each contact. Where remote supervised relay is required the interface shall be equipped with a SPDT relay rated for 4 amps resistive and 3.5 amps inductive. The addressable interface modules shall be model number HTRI or FDCIO Series, or equivalents from approved equal manufacturer listed above.
2. Where needed, a Conventional Zone Module shall connect to the Signal Line Circuit, which will allow the use of conventional initiation devices. This module shall have the ability to support up to 15 conventional smoke detectors and an unlimited number of contact devices. This module shall also be capable of monitoring Linear Beam detectors and conventional Flame detectors. Where required, there shall be an intrinsically safe detection solution for NEMA defined intrinsically safe installations (model DI-3IS with ISI-1, or equivalents from approved equal manufacturer listed above) compatible with the conventional zone module. The module shall be model HZM, or equivalent from approved equal manufacturer listed above.
  3. Single Device Damper Monitoring and Control: A single HTRI switch input, or equivalent from approved equal manufacturer listed above, shall be able to monitor all 3 states of a damper – open, closed, and in transit. A single device shall be able to fully control a damper (through the relay connected to the motor control) while also using its switch input for monitoring all 3 states of the damper.
  4. Model FCIO422 addressable input/output module, or equivalent from approved equal manufacturer listed above, shall be insensitive to polarity and shall have capability for up to 4 separate inputs (Class B) or 2 separate Class A inputs and 4 separate outputs (Class B).
  5. Model HCP addressable control point shall provide remote, independent control of any of the following:
    - a. A notification appliance circuit (NAC)
    - b. A telephone zone
    - c. A speaker zone.
    - d. Door hold open devices: The fire door holder shall be a Fire Safety Model SDH-X-D or equivalent from approved equal manufacturer listed above. The unit shall operate in conjunction with the Fire Safety Fire Detection System to provide automatic release of the door when fire or smoke is detected by the system. The unit shall be listed by Underwriters' Laboratories, Inc. The door holder shall be wired to the Fire Safety Fire Alarm Equipment in an accordance with 2014 New York City Electrical Code wiring practice.

## 2.08 DEVICE PROGRAMMING UNIT

- A. Device Programming Unit: The programming tool shall program the intelligent devices with addresses. The unit shall test the device to respond to its address. Dipswitches and rotary switches shall not be acceptable. The programmer shall be model DPU with carrying case.

## 2.09 NOTIFICATION APPLIANCES

- A. Series LFS – Low Frequency Sounders
  1. Notification appliances shall be Siemens Series LFS sounders, or equivalent from approved equal manufacturer listed above.
  2. Sounders shall be UL Listed under Standard 464 to meet the NFPA 72 (Fire) and NFPA 720 (CO Life Safety) requirements for sleeping rooms.
  3. Low profile sounder-only design.
  4. Selectable Tones (Temporal 3, Temporal 4, or Continuous)
  5. Sounders capable of synchronized coded output from fire alarm control panel (FACP) notification appliance circuit when set to "Continuous"
- B. Strobes

1. Visual-notification appliances shall be Series ST Strobe Appliances, or equivalent from approved equal manufacturer listed above.
2. The Series ST shall meet and be listed for UL Standard 1971 (Emergency Devices for the Hearing-Impaired) for Indoor Fire Protection Service
3. Strobe shall be listed for indoor use, and shall meet the requirements of FCC Part 15 Class B
4. Strobe appliances shall produce a flash rate of one (1) flash per second over the Regulated Voltage Range and shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens.
5. All inputs shall be compatible with standard, reverse polarity supervision of circuit wiring by a Fire-Alarm Control Panel (FACP).
6. Strobe Plates, when installed, shall be the ST-MC-RETRO Strobe Plate, or equivalent from approved equal manufacturer listed above, and shall have the same electronic circuitry as the device strobe.
7. The Strobe shall be of low-current design.
8. The strobe intensity shall have field-selectable settings and shall be rated per UL Standard 1971 for 15/30/75/95cd or 115/177cd for ceiling mount where Multi-Candela appliances are specified.
9. The selector switch for selecting the candela shall be tamper resistant.
10. The appliance shall be compatible with the DSC sync modules, FireFinder XLS panel, FC2005, FC2025-2050, FV2025-2050, or PAD-3/4 power supply, or equivalents from approved equal manufacturer listed above, with built-in sync protocol when synchronization is required.
11. The strobes shall not drift out of synchronization at any time during operation.
12. If the sync module or Power Supply fails to operate, (i.e. - contacts remain closed), the strobe shall revert to a non-synchronized flash rate.
13. The strobes shall be designed for indoor surface of flush mounting.
14. The Strobe Appliances shall incorporate a Patented, Integral Strobe Mounting Plate that shall allow mounting to single-gang, double-gang, 4-inch square, 100mm European type back boxes, or a Surface Back box.
15. The Multi-Candela or Single-Candela Strobe Plate shall mount to either a standard, 4-inch square back box for flush mounting, or shall mount to the SBL2S back box for surface mounting.
16. All notification appliances shall be backward compatible.

**C. Horn/Strobes**

1. Audible / visual notification appliance shall be Series HS Horn Strobe and standalone Horn Appliances or equivalents from approved equal manufacturer listed above.
2. Horn Strobe and standalone Horn Appliances shall meet and be listed for:
3. UL Standard 1971 (Emergency Devices for the Hearing-Impaired for Indoor Fire Protection Service)
4. Standard 464 (Fire Protective Signaling)
5. Horn strobe shall be listed for indoor use and shall meet the requirement of FCC Part 15 - Class B
6. All inputs shall be compatible with standard reverse polarity supervision of circuit wiring by the Fire Alarm Control Panel (FACP)
7. Horn Strobe and standalone Horn Appliances shall have a minimum of three (3) field selectable setting for dBA levels, and shall have a choice of continuous or temporal (Code 3) audible outputs
8. Horn Strobe shall be of low-current design
9. Strobe portion of the appliance shall produce a flash rate of one (1) flash per second over the Regulated Input Voltage Range, and shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens.
10. Strobe intensity, where Multi-Candela appliances are specified, shall have field-selectable settings, and shall be rated per UL Standard 1971 for:

- a. 15/30/75/110cd
- b. 135/185cd
- 11. The selector switch for selecting the candela setting shall be tamper resistant
- 12. Synchronization is possible when using the DSC sync modules, FireFinder XLS panel, FC2005, FC2025-2050, FV2025-2050, or PAD-3/4 power supply, or equivalent from approved equal manufacturer listed above, with built-in sync protocol
- 13. The strobes shall not drift out of synchronization at any time during operation.
- 14. The strobes shall revert to a non-synchronized flash-rate, if the sync module or Power Supply should fail to operate (i.e. – contacts remain closed)
- 15. All notification appliances shall listed for Special Applications:
  - a. Strobes are designed to flash at 1-flash-per-second minimum over their “Regulated Input Voltage Range”
- 16. All candela ratings represent minimum-effective Strobe intensity, based on UL Standard 1971

**D. Input Voltage Range**

**2.10 DIGITAL COMMUNICATOR**

- A. The Multi-Point Digital Alarm Communicator FCA2015-U1, or equivalent from approved equal manufacturer listed above, shall be UL864 listed to provide point identification of alarm, supervisory, security and trouble events to a Central or Remote Receiving Station. The DACT shall support the following:
  - 1. Ademco Contact ID or SIA protocol
  - 2. Ademco Contact ID selection shall provide the ability to transmit events for up to 999 individual zones
  - 3. SIA selection shall provide the ability to transmit events for up to 10000 individual points
  - 4. Programming of accounts and phone numbers
  - 5. Dual phone line interface
  - 6. Line fault monitoring.
  - 7. Automatic 24-hour test
  - 8. The DACT supports configurable alarm, alarm restoral, trouble, trouble restoral, supervisory, supervisory restoral and reset events.
  - 9. The DACT supports Ademco Contact ID alarm event codes for general alarm, smoke detector alarm, waterflow alarm, duct alarm, and manual alarm events.
  - 10. Optionally, the DACT can be programmed to report events by event queue only.

**PART 3 - EXECUTION**

**3.01 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.02 EXAMINATION**

- A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.03 INSTALLATION**

- A. Perform work in accordance with the requirements of NFPA 70, NFPA 72 and NECA 1-2006, Standard of Good Workmanship in Electrical Contracting.

- B. Fasten equipment to structural members of building or metal supports attached to structure, or to concrete surfaces.
- C. In the event that limited energy cable installation is allowed, all cable runs shall be run at right angles to building walls, supported from structure at intervals not exceeding 3 feet and where installed in environmental air plenums, be rated for such use and tied/supported by components listed for environmental air plenums installation.
- D. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Conceal raceway and cables except in unfinished spaces.
- E. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
- F. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.
- G. Provide primary power for each panel from normal/ emergency panels as indicated on the Electrical Power Plans. Power shall be 120 VAC service, transformed through a two-winding, isolation type transformer and rectified to low voltage DC for operation of all circuits and devices.

#### 3.04 BOXES, ENCLOSURES AND WIRING DEVICES

- A. Boxes shall be installed plumb and firmly in position.
- B. Extension rings with blank covers shall be installed on junction boxes where required.
- C. Junction boxes served by concealed conduit shall be flush mounted.
- D. Upon initial installation, all wiring outlets, junction, pull and outlet boxes shall have dust covers installed. Dust covers shall not be removed until wiring installation when permanent dust covers or devices are installed.
- E. "Fire alarm system" decal or silk-screened label shall be applied to all junction box covers.

#### 3.05 CONDUCTORS

- A. Each conductor shall be identified as shown on the drawings at each with wire markers at terminal points. Attach permanent wire markers within 2 inches of the wire termination. Marker legends shall be visible.
- B. All wiring shall be supplied and installed in compliance with the requirements of the 2014 New York City Electric Code, NFPA 70, Article 760, and that of the manufacturer.
- C. Wiring for strobe and audible circuits shall be a minimum 14 AWG, signal line circuits minimum 18 AWG twisted.
- D. All splices shall be made using solder-less connectors. All connectors shall be installed in conformance with the manufacturer recommendations.

- E. Crimp-on type spade lugs shall be used for terminations of stranded conductors to binder screw or stud type terminals. Spade lugs shall have upset legs and insulation sleeves sized for the conductors.
- F. The installation contractor shall submit for approval prior to installation of wire, a proposed color code for system conductors to allow rapid identification of circuit types.
- G. Wiring within sub panels shall be arranged and routed to allow accessibility to equipment for adjustment and service.

### 3.06 DEVICES

- A. Relays and other devices to be mounted in auxiliary panels are to be securely fastened to avoid false indications and failures due to shock or vibration.
- B. Wiring within panels shall be arranged and routed to allow accessibility to equipment for adjustment and maintenance.
- C. All devices and appliances shall be mounted to or in an approved electrical box.

### 3.07 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."
- B. Permanently label or mark each conductor at both ends with permanent alphanumeric wire markers.
- C. A consistent color code for fire alarm system conductors throughout the installation.

### 3.08 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Testing General:
  - 1. All Alarm Initiating Devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.
  - 2. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized. Resistance, current and voltage readings shall be made as work progresses.
  - 3. The acceptance inspector shall be notified before the start of the required tests. All items found at variance with the drawings or this specification during testing or inspection by the acceptance inspector shall be corrected.
  - 4. Test reports shall be delivered to the acceptance inspector as completed.
  - 5. All test equipment, instruments, tools and labor required to conduct the system tests shall be made available by the installing contractor. The following equipment shall be a minimum for conducting the tests:
    - a. Ladders and scaffolds as required to access all installed equipment.
    - b. Multi-meter for reading voltage, current and resistance.
    - c. Two-way radios and flashlights.

- d. A manufacturer recommended device for measuring air flow through air duct smoke detector sampling assemblies.
- e. Decibel meter.
- f. In addition to the testing specified to be performed by the installing contractor, the installation shall be subject to test by the acceptance inspector.

### 3.09 ACCEPTANCE TESTING

- A. A written acceptance test procedure (ATP) for testing the fire alarm system components and installation will be prepared by the Contractor's professional engineer licensed in the State of New York in accordance with NFPA 72 and this specification. The contractor shall be responsible for the performance of the ATP, demonstrating the function of the system and verifying the correct operation of all system components, circuits, and programming.
- B. A program matrix shall be prepared by the installing contractor referencing each alarm input to every output function affected as a result of an alarm condition on that input.
- C. The installing contractor prior to the ATP shall prepare a complete listing of all device labels for alphanumeric annunciator displays.
- D. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests shall be witnessed by the Commissioner and test results recorded for use at the final acceptance test.
- E. Preliminary Testing: Conduct preliminary tests to ensure that all devices and circuits are functioning properly. After preliminary testing is complete, provide a letter certifying that the installation is complete and fully operable. The letter shall state that each initiating and indicating device was tested in place and functioned properly. The letter shall also state that all panel functions were tested and operated properly. The Contractor and an authorized representative from each supplier of equipment shall be in attendance at the preliminary testing to make necessary adjustments.
- F. Final Acceptance Test: Notify the Commissioner in writing when the system is ready for final acceptance testing. Submit request for test at least 14 calendar days prior to the test date. A final acceptance test will not be scheduled until megger test results, the loop resistance test results, and the submittals required in Part 1 are provided to the Commissioner. Test the system in accordance with the procedures outlined in NFPA 72.
  - 1. Verify that the control unit is in the normal condition as detailed in the manufacturer's operating and maintenance manual.
  - 2. Test each initiating and indicating device and circuit for proper operation and response. Disconnect the confirmation feature for smoke detectors during tests to minimize the amount of smoke or test gas needed to activate the detector.
  - 3. Test the system for all specified functions in accordance with the contract drawings and specifications and the manufacturer's operating and maintenance manual.
  - 4. Visually inspect all wiring.
  - 5. Verify that all software control and data files have been entered or programmed into the FACP.
  - 6. Verify that Shop Drawings reflecting as-built conditions are accurate.
  - 7. Measure the current in circuits to assure that there is the calculated spare capacity for the circuits.
  - 8. Measure voltage readings for circuits to assure that voltage drop is not excessive.
  - 9. Measure the voltage drop at the most remote appliance on each notification appliance circuit.

- G. The acceptance inspector shall use the system record drawings in combination with the documents specified in this specification during the testing procedure to verify operation as programmed. In conducting the ATP, the acceptance inspector shall request demonstration of any or all input and output functions. The items tested shall include but not be limited to the following:
1. System wiring shall be tested to demonstrate correct system response and correct subsequent system operation in the event of:
    - a. Open, shorted and grounded signal line circuits.
    - b. Open, shorted and grounded notification circuits.
    - c. Primary power or battery disconnected.
  2. System notification appliances shall be demonstrated as follows:
    - a. All alarm notification appliances actuate as programmed
    - b. Audibility and visibility at required levels.
  3. System indications shall be demonstrated as follows:
    - a. Correct message display for each alarm input at the control display.
    - b. Correct annunciator light for each alarm input at each annunciator and graphic display as shown on the drawings.
    - c. Correct history logging for all system activity.
  4. System off-site reporting functions shall be demonstrated as follows:
    - a. Correct zone transmitted for each alarm input
    - b. Trouble signals received for disconnect
  5. Secondary power capabilities shall be demonstrated as follows:
    - a. System primary power shall be disconnected for a period of time as specified herein. At the end of that period, an alarm condition shall be created and the system shall perform as specified for a period as specified.
    - b. System primary power shall be restored for forty-eight hours and system-charging current shall be normal trickle charge for a fully charged battery bank.
    - c. System battery voltages and charging currents shall be checked at the fire alarm control panel.
- H. VESDA System Tests
1. The contractor shall allow for the manufacturer's representative to attend commissioning of the entire installation in the presence of the Commissioner.
  2. All necessary instrumentation, equipment, materials and labor shall be provided by the Contractor.
  3. The Contractor shall record all tests and system calibrations and a copy of these results shall be retained on site in the System Log Book.
  4. System Checks
    - a. Visually check all pipes to ensure that all joints, fittings, bends, sampling points, etc., comply with the Specification.
      - a. Check the system to ensure the following features are operational and programmed in accordance with the specification.
      - b. Alarm threshold levels
      - c. Detector address
      - d. Time and date
      - e. Time delays
      - f. Air flow fault thresholds
      - g. External button operable (Reset/ Isolate)
      - h. Referencing
    - b. Units set to U.S. /S.I.
    - c. Check to ensure that all ancillary warning devices operate as specified.
    - d. Check interconnection with Fire Alarm Control Panel to ensure correct operation.
  5. Tests
    - a. Introduce Smoke into the Detector Assembly to provide a basic functional test.

- b. Introduce smoke to the least favorable Sampling Point in each Sampling Pipe. Transport time is not to exceed two minutes.
- c. Activate the appropriate Fire Alarm zones and advise all concerned that the system is fully operational. Fill out the log book and commissioning report accordingly.
- d. If more than two bar graph divisions illuminate under normal conditions (no smoke), review event log for two (2) weeks from date of commissioning and make appropriate adjustments to the alarm and delay thresholds.

### 3.10 DOCUMENTATION

- A. System documentation shall be furnished to the Commissioner and shall include but not be limited to the following:
  - 1. Refer to the DDC General Conditions and Section 01 32 34 "Computer Aided Design Coordination" for coordination and record drawing Requirements.
  - 2. System operation, installation and maintenance manuals.
  - 3. System matrix showing interaction of all input signals with output commands.
  - 4. Documentation of system voltage, current and resistance readings taken during the installation, testing and ATP phases of the system installation.
  - 5. System program showing system functions, controls and labeling of equipment and devices.

### 3.11 PROTECTION

- A. Remove and replace devices and panel components that are wet, moisture damaged, or mold damaged.

### 3.12 DEMONSTRATION

- A. Instructor: Include in the project the services of an instructor, who shall have received specific education from the manufacturer for the instruction of other persons regarding the inspection, testing and maintenance of the system provided. The instructor shall instruct the employees designated by the Commissioner, in the care, adjustment, maintenance, and operation of the fire alarm system.
- B. Instruction sessions shall cover all aspects of system performance, including system architecture, signaling line circuit configurations, sensor and other initiating device types, locations, and addresses, fire alarm control panel function key operation, and other functions as designated by the Commissioner.
- C. Required Instruction Time: Provide 16 hours of instruction after final acceptance of the system. The instruction shall be given during regular working hours on such dates and times as are selected by the Commissioner. The instruction may be divided into two or more periods at the discretion of the Commissioner. One instruction session shall be videotaped by the contractor. Videotapes shall be delivered to the Commissioner.
- D. Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the FACP. The card shall show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory and trouble. The instructions shall be approved by the Commissioner.

- E. Comprehensive system troubleshooting instructions shall be provided for a single individual designated by the Commissioner. This session shall be separate and distinct from the above described sessions.
- F. All instruction sessions shall be conducted following final system certification and acceptance. Three additional instruction sessions shall be provided for all security personnel on all shifts six months after final system certification.
- G. All instruction sessions shall be conducted by an authorized fire alarm system distributor representative, who has received specific instruction from the manufacturer for the instruction of other persons regarding the inspection, testing, and maintenance of the system provided.

**END OF SECTION 28 31 11**

**SECTION 31 00 00****EARTHWORK****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 03 30 00 – Cast In Place Concrete
- C. Section 07 10 00 – Foundation Waterproofing
- D. Section 31 50 00 – Excavation Support and Protection
- E. Section 31 61 00 – Footings
- F. Section 31 68 00 – Foundation Soil Anchor

**1.2 SUMMARY**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the excavation, foundation construction, filling and grading as shown on the Drawings and specified herein including, but not limited to the following:
  - 1. Removal of existing pavements, curbs, utilities, and former foundation walls, pile caps, grade beams etc., designated for removal; relocation of fence and fence posts when necessary and other structures encountered or left by wreckers, old walls, rubble, etc.
  - 2. All excavation of earth, concrete, construction debris, uncontrolled fill, remnants of foundations, and other materials to the bottom of foundation subgrades, pile caps, foundation, walls, pits and slabs as required and indicated on drawings.
  - 3. Excavation, filling and rough grading of site area at adjacent structures and roadways as required and within the Contract Limit Line.
  - 4. Excavation, filling, grading and compacting to required elevations for all floors and slabs on grade.
  - 5. Excavation, filling, grading and compacting to required elevations for appurtenances and site work.
  - 6. Pumping and dewatering as required for work of this section and foundation work (elevator pits, etc.).
  - 7. Excavation and trenching for mechanical trades, including but not limited to all plumbing, heating, water, gas and electric within the buildings as shown or required by the drawings; backfilling same with clean fill as described hereinafter, and thoroughly compacting to "Rough Grading" elevations.
  - 8. Providing additional approved suitable material for filling and rough grading.
  - 9. Legal disposing, off the site of surplus excavated materials unsuitable for filling or backfilling. Refer to environmental specifications.
  - 10. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.

**1.3 REFERENCES**

- A. All work and materials under this section shall conform to the latest revision of the following standard specifications, where not otherwise required by the Contract Documents.

- B. All work shall comply with the requirements of the the 2014 Construction Codes of the City of New York, requirements of the New York State Department of Labor, requirements of Occupational Safety and Health Administration (OSHA), requirements of New York State Department of Health (NYSDOH), requirements of the New York State Department of Environmental Conservation (NYSDEC), requirements of the New York City Department of Environmental Protection (NYCDEP), requirements of the New York State Department of Transportation (NYSDOT), requirements of New York City Department of Transportation (NYCDOT), and requirements and drawings approved by the Long Island Rail Road (LIRR).
- C. The following publications form a part of this Specification to the extent indicated by the specific citations in other paragraphs of this Specification. In case of conflict, the particular requirements of this Specification shall govern, unless indicated otherwise.
  - 1. American Society for Testing and Materials (ASTM) and American Association of State and Highway Transportation Officials (AASHTO) Publications:
  - 2. 2014 New York City Building Code.
  - 3. Geotechnical Engineering Report for 116th Precinct Station House, Queens, New York, prepared by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C., dated 15 December 2017.
  - 4. Remedial Action Plan for NYPD 116th Precinct State House, Queens, New York, CEQR No. 18NYPD02Q, prepared by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C., dated 22 April 2019.

#### 1.4 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

#### 1.5 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 SUBMITTALS

- A. Test Reports: Submit the following information for each source of each material submitted for review and comment by the Commissioner:
  - 1. Test reports on borrow material as follows:
    - a. Particle size analysis in accordance with ASTM D 422 (sieve only).
    - b. Soil classification in accordance with ASTM D 2487
    - c. Moisture content in accordance with ASTM D 2216
    - d. Modified Compaction Curve in accordance with ASTM D 1557.

2. Include data for all samples indicating the exact location and methods of transportation and placement of all materials.
3. Submit a 5-lb (minimum) sample of each borrow material proposed for use as general fill, drainage fill and controlled fill.

- B. Catalog Cuts: Submit catalog cuts and manufacturer's literature for compaction equipment, and waterproofing.
- C. Certification For Examination of Site and Records: Before proceeding with the Work, submit certification in an acceptable form, signed by the Contractor, stating that careful examination has been made of the site, existing structures, existing adjacent structures, records of utility lines, boring records, soil samples, geotechnical report, the Drawings, and all other Contract Documents.

#### 1.8 TESTING AGENCY

- A. Testing Agency: The City of New York will engage a qualified testing agency to perform Special Inspections.
- B. Refer to Section 01 40 00 "Quality Requirements", Article 1.9, of the DDC General Conditions, for additional information regarding Special Inspections.

#### 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Field Testing of Fill Areas: Prepared fill lifts will be tested and approved by the Commissioner before construction of any further work thereon. Inspection and test of subgrades and fill layers will be taken as follows:
  1. Below building slabs and pit areas: For each compacted fill layer, make 1 field density test for every overlaying 2,500 sq-ft of building slab-on-grade or paved area-on-grade, but not less than three tests per lift. Perform field density tests in accordance with ASTM D 2922.
  2. Foundation wall backfill: Take at least three field density tests in accordance with ASTM D 2922 at locations and elevations as directed by the Commissioner.
- C. Codes and Permits:
  1. Procure and pay for all permits and licenses required to complete the work of this Section.
- D. Special Inspection:
  1. Before commencing work of this Section, meet with the Commissioner, and other concerned entities. Review the excavation and earthwork procedures and responsibilities including testing and inspection procedures and requirements. Notify participants at least 3 working days prior to convening conference. Record discussions and agreements and furnish a copy to each participant.

#### 1.10 PROJECT CONDITIONS

- A. The Contractor, by careful examination, shall inform himself as to the nature and location of the work; the confirmation of the ground, the nature of the subsurface conditions; the locations of the groundwater table; the character, quality and quantity of the materials to be encountered; the character of the equipment and facilities needed preliminary to and during the execution of the work; and all other matters which can be in any way affect the work.

- B. Borings are available for the Contractor's review. Neither The City of New York nor the Commissioner make predictions or representations regarding the character or extent of soil, rock, or other subsurface conditions to be encountered during the work. The Contractor shall make his own deductions of the subsurface conditions which may affect the methods or expenses of construction of the work hereunder. Additional borings and other exploratory operations may be performed by the Contractor, at the Contractor's option, and following the Commissioner's approval. No change in the Contract Sum will be authorized for such additional exploration undertaken by the Contractor.
- C. Soil samples taken from the borings are available for the Contractor's inspection.
- D. Existing Utilities: Locate existing underground utilities in and beyond the areas of work. If utilities are indicated to remain in place, provide adequate means of support and protection during the work.
  - 1. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with the Commissioner and utility companies in keeping respective services and facilities in operation. Restore damaged utilities to the satisfaction of utility owner.
  - 2. Do not interrupt existing utilities serving facilities occupied by The City of New York or the adjacent properties, during occupied hours, except when permitted in writing by the Commissioner and then only after acceptable temporary utility services have been provided. Provide a minimum of 48-hour notice to the Commissioner, and receive written notice to proceed before interrupting any utility.
  - 3. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.
- E. Examine drawings to determine the sequence of operations and relation to work of other trades. Start of work will signify acceptance of field conditions and will acknowledge coordination with other trades.
- F. Comply with the safety regulations of NYCDEP and the 2014 New York City Construction Codes, as well as those of Occupational Safety and Health Administration (OSHA).

#### 1.11 PROTECTION

- A. The project site is an urban area. The work shall be executed so that no damage or injury will occur to the existing public and adjoining or adjacent structures, Long Island Railroad structure, streets, paving, sewers, gas, water, electric or any other pipes. Should any damage or injury caused by the Contractor, or anyone in Contractor's employ, or by the work under this Contract occur, the Contractor shall, at their own expense, restore such damage.
- B. The above shall also include the protection of all existing utilities (including sewers, water lines, electrical lines, and telecommunication lines) to remain in use within and adjacent to the area affected by the work of this project.
- C. Monuments, benchmarks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, have them replaced at no additional expense to The City of New York.

#### 1.12 SUBSURFACE STRUCTURES AND UTILITIES

- A. The Contractor shall become acquainted with the existence and location of all surface and subsurface structures and utilities within the project area and beneath the surrounding streets. Contractor shall not damage any of those that are to remain and shall leave them accessible and make the necessary provision by sheeting, hanging, supporting or other means necessary to

obtain this result, subject to the approval of the New York City Department of Buildings and Department of Transportation, and the utility companies involved.

#### 1.13 ERRORS IN DEPTH

- A. In the event that any part of the excavation is carried, through error, beyond the depth and the dimensions indicated on the drawings or called for in the specifications, then the Contractor, at his own expense, shall furnish and install gravel, stone, or concrete fill with which to fill to the required level at all locations, subject to approval of the Commissioner.

#### 1.14 DESIGN AND MAINTENANCE OF TEMPORARY WORK

- A. Temporary work (other than Support of Excavation) shall be planned and installed so that the permanent work can be conveniently and adequately erected. Contractor shall be responsible for the adequacy of temporary work.
- B. Temporary work shall be maintained in good condition.
- C. Temporary work shall be changed, shifted, rebuilt, etc., as needed to suit the conditions of the permanent work.

#### 1.15 DEFINITIONS

- A. Wherever the word “excavating”, “excavate”, “excavation”, “carried down”, “remove”, etc., are used, they shall be taken to include the removal of all existing work, including brickwork, rubble work, former foundation remnants rubbish, earth, as well as rock, boulders, steel grillages and concrete and all other materials and obstructions encountered; they shall also be taken to include all sheet piling, bracing, pumping, and all operations and items needed for the proper execution of the work. Excavation is considered unclassified.
- B. Where the words “finished grades,” “finished grade lines,” or “future finished grades,” appear in these specifications, they shall be taken to mean the finished elevations as indicated on the drawings.
- C. Rough grading consists of cutting or filling to the elevation established on the Contract Drawings.

### PART 2 - PRODUCTS

#### 2.1 MATERIALS

- A. All fill and backfill shall be material classified as controlled fill by the 2014 New York City Construction Codes. Composition shall consist of angular sands and gravels. Flat structured material such as mica (the main component of “mole” rock) falling into the acceptable gradation or other material affecting the permeability and structural characteristics of sand material shall not be permitted.
- B. Controlled Fill: Controlled fill material shall consist of well-graded sand, gravel, crushed rock, or a mixture of these, or equivalent materials with a maximum of 10 percent passing the #200 sieve, as determined from the percent passing the #4 sieve.
- C. Drainage Fill: Clean natural ¾-inch crushed stone (recycled concrete shall not be used as drainage fill) having the following gradations:

Sieve Size	%Passing by Weight
2 inch	100

¼ inch	25 to 60
No. 40	5 to 40
No. 200	0 to 5

- D. General Fill: Shall have no more than 20% by weight of stones or masonry debris, containing no stones or other materials greater than 4 inches in any dimension and contain less than 50% by weight materials finer than No. 200 mesh sieve.
- E. Fill for utility trenches shall meet the criteria given for structural fill and shall not contain sharp, angular pieces and pieces larger than 2 inches in any dimension.
- F. Before bringing any fill to the site, submit the source for approval by the Commissioner, in accordance with Section 1.7 of this specification.
- G. All fill materials (structural, granular, and general fill) required shall be free from wood, debris, combustible materials, vegetable matter or any material subject to decay or disintegration. Fill material shall not be contaminated.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.
- B. Refer to the Remedial Action Plan for provisions regarding the management and disposal of impacted on-site soils.

#### 3.2 PREPARATION OF PROJECT SITE

- A. Notify the Commissioner and the Long Island Railroad before the start of work.
- B. Install all necessary protective equipment, structures such as fences, signs, scaffolding, etc. before the start of work.
- C. Remove all existing structures, utilities, pavement in accordance with the Contract Documents.
- D. Protect all utility lines, which are not to be abandoned. Contractor shall be responsible for any damage to utilities that may occur.
- E. Perform test pits alongside each of the adjacent buildings to determine the extent and depth of the below-grade space and the foundation type.

#### 3.3 SITE DRAINAGE, PUMPING, AND DEWATERING

- A. The Contractor shall assume the responsibility for site drainage and shall maintain such drainage during the life of this contract in a manner so as not to adversely affect adjacent areas and structures.
- B. Provide adequate pumps, or other equipment, appurtenances, power, drains, materials and labor necessary to excavation continuously dry during excavation, foundation construction, and backfilling and at such other times as the progress of the work may demand or as necessary to ensure safety to the structure shall be provided.

- C. All pumping both inside and outside the areas of the building shall be performed, continued and maintained as required for the completion of all work, including the work of the mechanical trades, throughout the contract.
- D. Manage runoff to limit the impact on construction.
- E. The dewatering system or systems shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground from below the bearing level and shall not influence the stability of surrounding areas. The facilities needed to eliminate loss of ground shall be included.
- F. Do not use any portion of the building foundation units or any part thereof as a sump for drainage resulting from pumping in any other area. Do not conduct water to other adjacent or nearby public or private properties.

### 3.4 GENERAL EXCAVATION

- A. The excavation shall be unclassified and shall comprise and include the satisfactory removal and legal disposal of all materials encountered regardless of the nature of the materials and shall be understood to include, boulders, earth, hardpan, miscellaneous fill, foundations, demolition debris from on-site buildings, structures, slabs, walls, utilities, pavements, curbs, piping, and debris.
- B. All excavation shall extend to the depths of the form and size required for the installation of the work as indicated on the drawings.
- C. Excavation shall be to required elevations for the bottom of pile caps, floors pits, slabs, walls, etc. Excavation shall be made to a depth that will allow installation of the full depth of concrete slabs, sub-base, and waterproofing as shown on drawings with a 1-inch tolerance. Excavation lines shall provide sufficient clearance for the proper execution of all concrete work including allowances for formwork, shoring, and inspection.
- D. A 3-inch-thick concrete mud-slab shall be required on all surfaces that will require horizontal waterproofing. All vertical surfaces to receive "blind-side" waterproofing shall require a flat/rigid substrate.
- E. The bottom of excavations shall be leveled off and graded to receive foundations, slabs, pits, trenches, and grade beams.
- F. Any impacted soils encountered shall be stockpiled on-site and disposed off-site in accordance with the Remedial Action Plan.

### 3.5 EXCAVATION FOR BUILDING SLABS AND STRUCTURAL MEMBERS

- A. Subgrades of building slabs and structural members including framed slabs and grade beams shall be approved by the Commissioner before proceeding with their construction. Subgrades resulting from excavation shall be free of unsuitable material (fill, loose rock pieces, organics, debris, etc.) as judged by the Commissioner.
- B. Unauthorized Excavation: Excavations performed below the elevations shown or specified, shall be filled and compacted as hereinafter specified, at no additional expense.
- C. Authorized Additional Excavation: Where the Commissioner determines that the bearing material encountered is unsuitable, remove the unsuitable bearing material. The removed material shall be replaced with controlled fill or concrete as directed by the Commissioner.

### 3.6 PROOFROLLING

- A. Before backfilling, all excavations should be proofrolled using a minimum 3-ton roller. Any loose areas identified by proofrolling should be removed and replaced with controlled fill in accordance with Section 3.07.

### 3.7 FILLING, GRADING, AND COMPACTING

- A. Filling and backfilling shall not be performed until work has been accepted by the Commissioner. All wood, paper, and other deleterious materials shall be cleaned out from excavations before backfilling.
- B. The filling or backfilling within the area of the building shall be done so that there will be no void spaces below floors and bottoms of pits and trenches, unless otherwise noted
- C. General: Material for fill and backfill shall be Controlled Fill as herein specified under Part 2 of these specifications. The material may be obtained from borrow sources and shall be free of any contamination.
- D. Placing: Place fill in horizontal 12-inch-thick maximum loose layers to produce a uniform thickness of the material. Start placement in the deepest area and progress approximately parallel to the finished grade. Do not place fill where free water is standing, on frozen subsoil or on surfaces that have not been approved.
- E. Compacting: Compact each layer of fill with the appropriate equipment listed below in this Article to achieve as a minimum the following percentages of maximum density at optimum moisture when tested in accordance with ASTM D1557:

LOCATION	% MAX. DENSITY
Under Building Slab-on-Grade	95
Under Paved Areas	95
Under Structural Members and Structural Slabs	92
Behind Foundation Walls	95

- F. Building Slabs with Foundation Anchors and Utilities - Compact each 12-inch-thick lift of the general fill with a minimum six overlapping passes with a 3-ton vibratory roller compactor in open areas. Use a 1-ton walk behind roller compactor to the extent possible in areas that preclude access by a 3-ton compactor. Use a plate tamper in and around penetrations, small restrictive areas, or any other areas not accessible to the 1-ton roller compactor.
- G. Compaction Equipment: Granular fills (sand, gravel, friable earth) shall be compacted with a vibratory plate compactor not less than 0.5 ton in static weight to the extent possible. A jumping jack shall be used in and around penetrations, small restrictive areas, or any other areas not accessible to the roller or heavy plate compactor.
- H. Backfilling against Foundation Walls: After completion of foundation walls and removal of forms, clean the excavation of all trash and debris before application of waterproofing and/or vapor barrier and placement of backfill.
- I. Do not backfill against foundation or basement walls until completion of supporting floor construction to top of backfill or first level above the top of backfill, unless adequate temporary shoring is provided.

- J. If Contractor elects to backfill against foundation or basement walls prior to completion of supporting floor slabs, these walls shall be shored. Temporary shoring shall be designed by a professional engineer licensed in the State of New York retained by the Contractor. Shoring engineering services and calculations shall be submitted to the Commissioner for review and approval.
- K. In placing backfill, take special care to prevent wedge action, eccentric loading or overloading of the structure by equipment used for compacting backfill material, and to prevent damage to waterproofing on walls. Where subsoil drainage systems are installed, place backfill to prevent any damage to the systems. Any damage to waterproofing or drainage systems caused by backfilling or excavation operations shall be corrected or replaced by the Contractor at his own expense.
- L. Additional backfilling required to bring fill to the finished subgrades shown shall be done by the Contractor only after the concrete walls or piers, against which the backfilling is done, have attained their full design strength, have been braced and the written permission to backfill is obtained from the Commissioner. If fill is required on both sides of a wall, it shall be brought up simultaneously and evenly on both sides.
- M. Do all filling necessary to bring the ground surfaces to the required levels for floors, pits, and areaways as shown on the drawings.
- N. Any surplus materials shall be removed from the site and legally disposed in accordance with the Remedial Action Plan. Should additional material be required for the placing of backfill, other than material obtained from the site, obtain and deliver and place accepted backfill material as required.

### 3.8 FIELD QUALITY CONTROL

- A. The Commissioner shall review all laboratory test results and submitted reports specified in this Section.
- B. The Commissioner will interpret the tests, state in each report whether or not the test specimens and results comply with all requirements of the Contract Documents and note any deviations.
- C. The Commissioner will identify when and where samples are to be obtained for testing.
- D. Collect samples and forward them to the Testing Agency. Testing Agency will submit the following laboratory test reports to the Commissioner.
  - 1. Laboratory results conducted on each type of borrow and fill material:
    - a. Gradation Analysis – ASTM D 422.
    - b. Atterberg Limits – ASTM D 4318.
    - c. Modified Moisture Density Curve Determination – ASTM D 1557.
  - 2. The Commissioner will review for conformance of materials to be used for fills, based on the gradations given in these specifications.
- E. Engineering Inspection:
  - 1. All engineering inspections shall comply with the requirements of the 2014 New York City Building Code.
  - 2. Building Slab Subgrades: the Testing Agency shall inspect subgrades for all building slabs and footing elements. No pavement, slab, or footing shall be constructed unless the subgrade is approved by the Testing Agency.

3. Proofrolling: Proofrolling operations shall be inspected by the Testing Agency.
4. Backfilling and Compaction: The Testing Agency shall verify the densities of the fill placed. The Testing Agency shall take field density tests of the fill placed and shall report to the Commissioner. No fill shall be placed without inspection and approval of the Commissioner. The testing agency will take field tests (in accordance with ASTM D 2922) of the subgrade for every 2,500 sq-ft, but not less than three tests per lift in each area, and a minimum of three tests for every compacted soil lift behind foundation walls.

### 3.9 CLEAN-UP AND DISPOSAL

- A. All excess material including, earth, rock, fill, shall be removed from the site and legally disposed of in accordance with the DDC General Conditions and the Remedial Action Plan.
- B. All lumber, forms and metal work shall be removed immediately after completion of local areas. The Contractor shall be responsible for removal of all debris produced by work to this section from the site.
- C. Sidewalk and streets adjoining the property shall be broom cleaned and free of debris, rubbish, trash and obstructions of any kind caused by the work of this Section.

### 3.10 MONITORING EXISTING STRUCTURES

- A. Monitoring Requirements – The adjacent buildings shall be monitored as follows:
  1. Vertical and Lateral Displacements –
    - a. Before starting work, the Contractor's Professional Engineer licensed in the state of New York and Land Surveyor license in the state of New York shall check and verify governing dimensions and elevations, survey conditions of adjoining properties, and record any prior settlement or cracking of structures, pavements, and other improvements. Video all adjacent structures prior to the beginning of any construction activities.
    - b. Install a minimum of 5 lateral and vertical reference points (on the upper third and the lower third of each building face) on each building abutting the site. In addition, provide reference points at the ground surface, all-around the excavation perimeter, at 25 feet on-center. All monitoring locations shall be subject to review by the Commissioner.
    - c. The monitoring points shall be established by the Contractor's Professional Land Surveyor licensed in the State of New York, and referenced to a fixed off-site benchmark. Video all monitoring points prior to the beginning of any construction activities.
  2. Ground Vibrations –
    - a. The vibration monitoring locations shall be selected by the Commissioner.
    - b. The seismographs will be provided by, and the monitoring performed by the Testing Agency.
    - c. Monitoring shall be performed before the start of work to obtain ambient levels, and daily during excavation and foundation construction work. Written reports summarizing the monitoring results shall be submitted to the Commissioner for review.
- B. Frequency and Reporting
  1. Vertical and Lateral Displacements - Monitoring shall be performed twice on a weekly basis during any excavation support or foundation work. Readings shall be taken to nearest

0.005 ft. Written reports summarizing the monitoring results shall be submitted by the Contractor's Professional engineer licensed in the State of New York to the Commissioner for review on a weekly basis. The reports shall be submitted in both electronic copies and hard copies. The reports shall include the raw data points as well as graphs and tables summarizing the monitoring data.

2. Ground Vibrations – The ground vibrations caused by the foundation work, bracing and foundation installation operations shall be monitored continuously with threshold-type seismographs capable of measuring ground movements to 0.02 in/sec. Written reports summarizing the monitoring results shall be submitted by the Contractor's Professional engineer licensed in the State of New York to the Commissioner for review on a weekly basis.

**C. Threshold**

1. Vertical and Lateral Displacements –
  - a. The maximum allowable movements of the adjacent buildings and structures shall be 1/4 inches for horizontal movement and 1/4 inches for vertical movements. The action thresholds shall be three consecutive readings of 1/16 inch of movement, or one confirmed reading of 1/8 inch.
  - b. The maximum allowable movements of the adjacent pavement or ground shall be 1 inch for horizontal movement and 1/2 inches for vertical movements. The action thresholds shall be one half of the maximum allowed movement.
2. Ground Vibrations – The maximum allowable ground vibration immediately adjacent to any of the adjacent structures is 0.5 in/sec.

**D. Action Items**

1. Any movement exceeding the above criteria will be reported immediately to the Commissioner. Work in the immediate area will cease.
2. On exceeding any of the established thresholds, all work will be stopped until the adjacent structure/building in question is inspected and evaluated by the Contractor's Professional Engineer and the Commissioner, to confirm its structural integrity. Modify procedures as required to maintain vibrations and movements within established thresholds. If required, submit a corrective plan of action prior to continuing work. The Contractor shall restore any damage to the structures at his own expense and to the satisfaction of the Commissioner.
3. The Contractor may establish additional monitoring points on the existing adjacent structures, subject to the building owner's approval, to adequately monitor and otherwise keep himself informed of the structures' conditions during the work.
4. Restore, to the satisfaction of the Commissioner, by restoration, replacement, or otherwise, the portions of buildings, or their contents, altered by the Contractor in furtherance of his excavation support work. Restoration shall be completed to the conditions which existed prior to the start of work.

**END OF SECTION 31 00 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 31 10 00****SITE CLEARING, REMOVALS AND PREPARATION****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).
- B. Section 31 00 00 – Earthwork
- C. Section 31 25 00 - Soil Erosion and Sediment Control
- D. Section 33 02 00 - Protection of Existing Utilities

**1.2 SECTION INCLUDES**

- A. Miscellaneous site clearing including removal of trees, asphalt, concrete, curbs, rails, fences, storage containers, storage tanks, and mobile trailers in preparation for site improvements.
- B. Protection of existing utilities.
- C. Disconnection and capping or removal of identified utilities and in-service unidentified utilities encountered.
- D. Backfilling voids in subgrade created as a result of removals.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS.
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

**1.5 ENVIRONMENTAL REQUIREMENTS**

- A. Construct erosion control systems as shown on the plans or as directed by the Commissioner to protect adjacent properties and water resources from erosion and sedimentation.

**1.6 JOB CONDITIONS**

- A. Variations or discrepancies in actual site conditions at the commencement of work under this contract shall be brought to the attention of the Commissioner prior to the commencement of any site work.

**PART 2 - PRODUCTS****2.1 Not applicable****PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 PREPARATION**

- A. Verify that construction phasing and clearing limits are clearly tagged, identified and marked.

**3.3 PROTECTION**

- A. Locate and identify existing utilities that are to remain and protect them from damage as indicated on the Contract Drawings.
- B. Conduct operations with minimum interference to public or private access ways and facilities. Maintain access and egress at all times and clean or sweep any roadways daily or as required by the 2014 New York City Construction Codes and the New York City Department of Transportation. At such times as deemed necessary by The City of New York, dust control shall be provided in accordance with specification Section 31 25 00 – Soil Erosion and Sediment Control.
- C. Protect benchmarks, property corners and all other survey monuments from damage or displacement. If a marker needs to be removed it shall be referenced by a Land Surveyor registered in the State of New York and replaced, as necessary, by the same at no additional expense to The City of New York.
- D. Provide traffic control as required, in accordance with the U.S. Department of Transportation "Manual of Uniform Traffic Control Devices" and New York City Department of Transportation requirements.

**3.4 CLEARING AND REMOVAL**

- A. Clear areas required for access to site and execution of work.

- B. Unless otherwise indicated on the Contract Drawings, improvements or obstructions interfering with installation of new construction shall be removed completely. Backfill shall be conducted with suitable on-site fill material or suitable imported material placed and compacted as per Section 31 00 00 - Earthwork.
- C. Existing utilities to be removed/abandoned shall be properly disconnected in accordance with the applicable utility. Provide the utility and The City of New York two weeks of prior notice, in writing, before the work is to commence to schedule and coordinate disconnect of utility with other surrounding functions.
  - 1. Utilities indicated to be removed shall be removed completely including all pipe and structures foundations. Trenches shall be backfilled and compacted in accordance with the specifications or as directed by the Commissioner.
  - 2. Utilities indicated to be abandoned shall be left in place unless directed otherwise by the Commissioner.

### 3.5 DISPOSAL OF MATERIALS

- A. No burning of any material, debris or trash on site or off site will be allowed.
- B. Transport site debris, rubbish and other materials with appropriate vehicles, and legally dispose of off-site to areas approved by the Commissioner.

**END OF SECTION 31 10 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 31 25 00****SOIL EROSION AND SEDIMENT CONTROL****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).
- B. Section 31 10 00 – Site Clearing, Removals and Preparation
- C. Section 31 00 00 – Earthwork
- D. Storm Water Pollution Prevention Plan (SWPPP) prepared by Langan Engineering, Surveying, Landscape Architecture, and Geology, D.P.C.

**1.2 SUMMARY**

- A. Provide all labor, materials, equipment and services to implement all erosion and sediment control practices and procedures as indicated in the Contract Documents.
- B. Inspect and maintain all erosion and sediment control practices weekly, prior to anticipated rainfall events, and after rainfall events. Needed restorations shall be made immediately.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 REFERENCES:**

- A. New York State Department of Environmental Conservation (NYSDEC) Standards and Specifications for Erosion and Sediment Control, latest revision.
- B. United States Department of Environmental Protection Agency (EPA) Document No. EPA 832/R-92-005, "Storm Water Management for Construction Activities", Chapter 3, latest revision.
- C. New York City Building Code, 2014 edition.

**1.6 ENVIRONMENTAL REQUIREMENTS**

- A. Protect adjacent properties and water resources from erosion and sediment damage throughout construction in accordance with the Soil Erosion and Sediment Control Plan and NYSDEC standards. The Contractor shall be responsible for administering the Plan.
- B. Discharge from dewatering operations shall not be directed to surface waters. Discharge from dewatering operations shall be per DDC General Conditions.

**1.7 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.8 SUBMITTALS**

- A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:
  - 1. Product Warranty
  - 2. Product Data
- B. All calculations and shop drawings shall be signed and sealed by a Professional Engineer registered in the State of New York and submitted to the Commissioner for review.

**1.9 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.10 DELIVERY, STORAGE AND HANDLING**

- A. Store materials in designated areas and as recommended by the manufacturer to protect against the elements, direct exposures, and damage.
- B. Furnish erosion control blankets, jute mesh and geotextile fabric in rolls with suitable wrapping to protect against moisture and extended ultraviolet exposure prior to placement.

**1.11 WARRANTY**

- A. Erosion control material shall have a warranty for use and durable condition for project specific installations.
- B. Temporary erosion control materials shall carry a minimum eighteen (18) month Manufacturer's warranty from date of substantial completion.

- C. Permanent erosion control materials shall carry a minimum three (3) year Manufacturer's warranty from date of substantial completion.

## PART 2 - PRODUCTS

### 2.1 SILT FENCE

- A. Silt fence posts: wood, steel, or an approved synthetic material, with a minimum length of three (3) feet. Hardwood posts shall have a minimum cross sectional area of 3.5 square inches. Steel posts shall be standard T and U sections weighing not less than 1.00 pounds per linear foot.
- B. Silt fence fabric: Fabric shall meet or exceed the following specifications:

PROPERTY	UNIT	TEST METHOD	MIN. ACCEPTABLE VALUES
Grab Tensile Strength	lbs.	ASTM D4632	110
Elongation at Failure	%	ASTM D4632	20
Puncture Strength	lbs.	ASTM D4833	60
Mullen Burst Strength	PSI	ASTM D 3786	300
Flow Through rate	(gal./min.sf)	ASTM D 4491	25
Equivalent Opening Size		US Std. Sieve ASTM D 4751	40-80
Ultraviolet Radiation Stability	%	ASTM D 4355	70

- C. Wire Fence: Minimum 14 gage with a maximum six-inch mesh opening.

### 2.2 STRAW BALE DIKE

- A. Hay or straw bales: New straw that shall be either wire bound or nylon string tied.
- B. Bale stakes: Rebar, steel pickets, or 2-inch x 2-inch hardwood stakes.

### 2.3 STABILIZED CONSTRUCTION ENTRANCE

- A. Stone aggregate: 1-inch to 4-inch clean stone or reclaimed or recycled concrete.
- B. Geotextile: woven or non-woven fabric consisting only of continuous chain polymeric filaments or yarns of polyester. The fabric shall be inert to commonly encountered chemicals, hydro-carbons, mildew, rot resistant, and conform to the fabric properties shown:

PROPERTY	UNIT	TEST METHOD	Light duty* Roads Grade Subgrade	Heavy duty** Haul Roads Rough Graded
Grab Tensile Strength	lbs.	ASTM D1682	200	220
Elongation at Failure	%	ASTM D1682	50	60
Puncture Strength	lbs.	ASTM D751	40	125
Mullen Burst Strength	PSI	ASTM D3786	190	430
Equivalent Opening Size		US Std. Sieve CW-02215	40-80	40-80
Aggregate Depth	(inches)	-	6	10

1. \*light duty roads: Area sites that have been graded to subgrade and where most travel would be single axle vehicles and an occasional multi-axle truck. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. Trivera Spunbound 1115
  - b. Mirafi 100X
  - c. Typar 3401
  - d. Or approved equal.
2. \*\*heavy duty roads: Area sites with only rough grading, and where most travel would be multi-axle vehicles. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. Trevira Spunbound 1135
  - b. Mirafi 600X
  - c. Typar 3801
  - d. Or approved equal.

#### 2.4 FILTER FABRIC INLET PROTECTION:

- A. Filter Fabric: Fabric shall be a woven polypropylene geotextile and sewn by a double needle machine using a high strength nylon thread. Fabric shall be manufactured to fit the drainage inlet.

PROPERTY	UNIT	TEST METHOD	MIN. ACCEPTABLE VALUES
Grab Tensile Strength	lbs.	ASTM D4632	110
Grab Elongation	%	ASTM D4632	10-15
Puncture Strength	lbs.	ASTM D4533	900
Trapezoidal Tear	lbs.	ASTM D4533	65-90
Flow Through rate	(gal./min.sf)	ASTM D 4491	66
Equivalent Opening Size	US Sieve	ASTM D 4751	30
Ultraviolet Radiation Stability	%	ASTM D 4355	96
Permittivity	sec-1	ASTM D-4491	0.862

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 PREPARATION

- A. Review site conditions and Contract Drawings prior to the commencement of demolition, earth moving activities or excavation.
- B. Notify the Commissioner prior to the commencement of work. Any proposed deviation from the Contract Drawings must be submitted to the Commissioner in writing 72 hours prior to commencing work.

- C. Install erosion and sediment controls for each work area prior to commencement of work within that work area. Comply with NYSDEC standards and specifications.
- D. Perform all erosion and sediment controls in accordance with the Contract Drawings.

### 3.3 SILT FENCE

- A. Silt Fence shall be placed as close to disturbed area as possible, but at least 10 feet from the toe of a slope steeper than 3H:1V. The area beyond the fence must be undisturbed or stabilized. The type of silt fence specified for each location on the plan shall not exceed the maximum slope length and maximum fence length requirements shown in the following table:

Slope	Steepness	Slope Length/Fence Length (ft.)		
		Standard	Reinforced	Super
<2%	< 50:1	300/1500	N/A	N/A
2-10%	50:1 to 10:1	125/1000	250/2000	300/2500
10-20%	10:1 to 5:1	100/750	150/1000	200/1000
20-33%	5:1 to 3:1	60/500	80/750	100/1000
33-50%	3:1 to 2:1	40/250	70/350	100/500
>50%	> 2:1	20/125	30/175	50/250

- B. Maximum allowable slope length and fence length will not exceed the limits shown in the Design Criteria for the specific type of silt fence used; Maximum allowable ponding depth of 1.5 feet behind the fence. Given that erosion would occur in the form of sheet erosion and there is no concentration of water flowing to the barrier; Soil conditions allow for proper keying of fabric, or other anchorage, to prevent blowouts.
- C. Locate silt fence at the toe of slopes and at ground level throughout its length. Drive posts securely at least 16-inches into the ground on the down slope side of the trench. Set post spacing a maximum of ten (10) feet apart. Adjust spacing to place posts at low points along fence line.
- D. Fasten support wire fence to upslope side of posts, extending six inches below grade. Attach continuous length of fabric to upslope side of fence posts. Avoid joints, particularly at low points in the fence line. Fasten fabric securely to support posts where joints are necessary and overlap to the next post. Place the fabric in the trench so the bottom folds across the bottom of the trench.
- E. Inspect silt fences weekly and after each rainfall event. Remove any sediment deposits found promptly to provide adequate storage volume for the next rain and reduce pressure on the fence. Do not undermine the silt fence during clean out. Replace fabric that is torn, decomposed, or in any way becomes ineffective, immediately without additional expense to The City of New York.
- F. In addition to procedure summarized above, refer to installation and service requirements outlined in the Contract Drawings.

### 3.4 STRAW BALE DIKE

- A. Use straw bale dikes subject to the following conditions:

Slope Steepness	Maximum Length (ft.)
2H:1V	25

3H:1V	50
4H:1V	75
5H:1V or flatter	100

- B. Do not exceed ¼ acre drainage area for overland flow per 100-feet of straw bale dike with silt fence, with maximum ponding depth of 1.5 feet behind the fence. Given that erosion would occur in the form of sheet erosion and that there is no concentration of water flowing to the barrier.
- C. Excavate the area to accommodate placement of straw bales which are to be embedded in the soil a minimum of four inches, and placed so the string or wire is horizontal. Place bales in a row with ends tightly abutting the adjacent bale. Anchor the bales securely by driving two stakes or rebar through each bale to a minimum depth of 1.5 to 2 feet into the ground. Drive the first stake in each bale toward the previously laid bale to force the bales together. Drive stakes flush with the top of the bale.
- D. Inspect straw bales weekly and after each rainfall event, restore or replace promptly as needed. Remove accumulations of sediment trapped by straw bale filters regularly. Remove temporary straw bales from the site at the conclusion of construction. Restore the areas where the straw bales were installed to match the surrounding area. Restoration may include, but is not limited to, seeding and establishing the lawn area.
- E. In addition to procedure summarized above, refer to installation and maintenance requirements outlined in the SWPPP and on the Contract Drawings.

### 3.5 STABILIZED CONSTRUCTION ENTRANCE

- A. Install stabilized construction entrances at any point where traffic will be entering or leaving a construction site to or from a public-right-of-way, street, alley, sidewalk, or parking area.
- B. Install and maintain a minimum stone thickness of 6-inches.
- C. The stabilized construction entrance width shall be twelve feet minimum but not less than the full width of points of where ingress or egress occurs. The stabilized construction entrance shall be a minimum width of 24-feet if there is only one entrance to the site.
- D. The length of the stabilized construction entrance shall be 50-feet minimum.
- E. Place geotextile over the entire area to be covered with aggregate.
- F. Provide piping of surface water under entrance as required. If piping is impossible, a mountable berm with 5:1 slopes will be permitted.
- G. Maintain the entrance in a condition which will prevent tracking of sediment onto public-right-of-way or streets. This may require periodic top dressing with additional aggregate. Remove all sediment spilled, dropped, or washed onto public right-of-way immediately.
- H. Clean wheels, when required, to remove sediment prior to entrance onto public right-of-way. Perform washing, when required, on an area stabilized with aggregate, which drains into an approved sediment trapping device. Prevent all sediment from entering storm drains, ditches and watercourses.
- I. In addition to procedure summarized above, refer to installation and maintenance requirements outlined in the SWPPP and on the Contract Drawings.

### 3.6 FILTER FABRIC DROP INLET PROTECTION

- A. Install inlet protection at all existing, temporary, and new catch basins located within the disturbed work area.
- B. Space support stakes evenly around the inlet a maximum of three (3) feet apart. Drive support stakes a minimum of 18-inches below grade. Bridge spans greater than three (3) feet with the use of wire mesh behind the filter fabric for support.
- C. Drive support stakes close to the inlet so any overflow drops into the inlet and not on the unprotected soil.
- D. Cut filter fabric from a continuous roll to eliminate joints. Overlap joints, if needed, to the next stake. Extend filter fabric a minimum of one (1) foot below grade and backfill. Securely fasten fabric to the support stakes and frame.
- E. Do not extend filter fabric more than 1.5 feet above the inlet crest unless reinforced.
- F. Install wooden frame completely around the crest of the fabric for overflow stability.
- G. Inspect the fabric barrier after each rain event and restore as needed. Remove sediment from the pool area as necessary with care not to undercut or damage the filter fabric.
- H. In addition to procedure summarized above, refer to installation and maintenance requirements outlined in the SWPPP and on the Contract Drawings.

### 3.7 EROSION CONTROL BLANKET

- A. Place erosion control blankets on any disturbed slopes with grades from 1H:1V to 3H:1V.
- B. Excavate and grade the areas to receive the erosion control blanket. Install seed per the manufacturer's recommendation.
- C. Roll blankets down or horizontally across the slope. Unroll blanket with the appropriate side against the soil surface.
- D. Secure all blankets to the soil surface by placing staples in appropriate locations as shown in the staple pattern guide provided by the manufacturer.
- E. Staple the edge of parallel blankets with a four (4) inch overlap.
- F. Splice consecutive blankets, if necessary, across the slope and place over end (shingle style) with a three (3) inch overlap.
- G. Anchor the blankets as follows:
  - 1. Anchor the blanket at the top of the slope in a 6-inch deep x 6-inch wide trench with approximately twelve (12) inches of blanket extended beyond the upslope portion of the trench.
  - 2. Backfill and compact the trench after stapling.
  - 3. Apply seed to compacted soil and fold the remaining twelve (12) inch portion of the blanket back over seeded and compacted soil.
- H. Maintain and inspect the erosion control blankets per the manufacturer's recommendations.

- I. In addition to procedure summarized above, refer to installation and maintenance requirements outlined in the SWPPP and on the Contract Drawings.

### 3.8 TEMPORARY STOCKPILE

- A. Secure PVC sheeting in place with tie downs and/or weights such as sand bags at the end of each workday and during adverse weather conditions.
- B. Construct stockpiles so that the height does not exceed fifteen (15) feet. Side slopes shall not be steeper than 2H:1V.
- C. Contain all stockpiles with hay bales and silt fence placed continuously around the perimeter.
- D. Apply temporary seeding to all stockpiles which will be inactive for twenty (20) days or longer.
- E. Maintain stockpiles in accordance with DDC General Conditions and NYCDEP regulations.
- F. In addition to procedure summarized above, refer to installation and maintenance requirements outlined in the SWPPP and on the Contract Drawings.

### 3.9 EROSION CONTROL IMPLEMENTATION

- A. Place erosion control systems in accordance with the staging and features outlined in the Contract Drawings.
- B. Follow construction phasing in the sediment control plans to limit the surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and embankment operations.
- C. Incorporate all permanent erosion control features into the project at the earliest practical time to minimize the need for temporary controls.
- D. Properly construct, stabilize, and maintain all temporary and permanent erosion and sedimentation control measures and related items.
  1. Perform general inspection of sediment and erosion controls at end of each work day, and assure that controls are in good condition before leaving.
  2. Perform detailed inspection of all sediment and erosion controls at least once every seven days and within 24 hours after each rainfall of more than one half (0.5) inch.
  3. Perform any needed maintenance and restorations, and add measures as needed to control erosion and sediments.
  4. Remove accumulated sediments from sediment traps and behind silt fences before they reach 50% of capacity. Dispose of sediments in upland area, stabilized to prevent further erosion or sedimentation.
  5. Maintain written records of all inspections, maintenance and restorations, and submit copies of the written reports to the Commissioner at the end of each month of work.
- E. Replace at own expense any control measure that is not functioning properly as directed by the Commissioner.
- F. Install inlet protection on all new catch basins immediately upon construction of catch basins.
- G. Implement dust control measures during construction. Minimize dust clouds by watering down construction area or other approved methods as required.

- H. Secure a tarp over materials in all construction vehicles hauling materials either into or out of the construction area to prevent sediment pollution of public roadways.
- I. Design erosion and sediment controls specific to the site in accordance with the NYSDEC Standards, which are more stringent than the EPA Standards.

### 3.10 NON-STORMWATER DISCHARGE CONTROLS

- A. Groundwater encountered within excavations shall be disposed per DDC General Conditions.
- B. Cleaning water for construction vehicles and equipment shall be diverted to the temporary and approved erosion and sediment control measures. Chemicals and detergents shall not to be used.
- C. Coordinate with the Commissioner to identify areas on-site for construction vehicle transit (i.e. – haul roads, contractor trailers and parking areas, etc.) or equipment staging which shall be monitored and where runoff can be controlled.
- D. Water used for dust control measures shall be applied using appropriate quantities and equipment. No chemical additives shall be used.
- E. Water main flushings, hydrostatic test water, fire test water, and chlorination test water shall be directed to the control measures on the site. Turbid water is to be detained to allow sufficient sedimentation time (minimum of 24 hours). Chlorinated water is to be detained until the water is de-chlorinated (minimum of 24 hours).
- F. Concrete trucks shall be washed out in an area approved of by the Commissioner. Designate wash-out areas with proper signage. Locate a concrete wash-out box near the concrete trucks to prevent concrete residue from being washed off-site. Wash-out containers can be pre-fabricated or constructed on-site out of plywood and plastic sheeting. All runoff from wash-out activities shall be directed to the on-site control measures. Discarded cementitious materials shall be removed and disposed off-site.
- G. Building washing or parking lot cleaning water (where no spills or leaks of toxic or hazardous materials have occurred) that may enter the storm drainage system shall not contain chemicals or detergents.

### 3.11 REMOVALS

- A. Maintain erosion and sediment control devices within each work area until final stabilization of that work area.
- B. “Final stabilization” shall mean that all soil disturbance activities have ceased and a uniform, perennial vegetative cover with a density of eighty (80) percent over the entire pervious surface has been established; or other equivalent stabilization measures, such as permanent landscape mulches, rock rip-rap or washed/crushed stone have been applied on all disturbed areas that are not covered by permanent structures, concrete or pavement.
- C. Remove erosion and sediment control devices in accordance with the DDC General Conditions.

**END OF SECTION 31 25 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 31 50 00****EXCAVATION SUPPORT AND PROTECTION****PART 1 – GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 03 30 00 – Cast-in-Place Concrete
- C. Section 07 10 00 – Foundation Waterproofing
- D. Section 31 68 00 – Foundation Soil Anchor
- E. Section 31 00 00 – Earthwork

**1.2 SUMMARY**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the design and installation of excavation support, protection and monitoring of adjacent structures as shown on the contract documents and specified herein including, but not limited to the following:
  - 1. Design and installation of soldier pile and lagging to prevent any damage to existing structures, buildings, walls, street paving, utilities adjacent to new construction and in the vicinity of the new construction.
  - 2. Performing exploratory test pits to determine conditions of existing adjacent foundations and utilities.
  - 3. Review drawings of existing adjacent buildings.
  - 4. Protection and monitoring of adjacent buildings, streets, and utilities.
  - 5. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.
  - 6. Removal of piling and bracing, as required.
  - 7. Monitoring of adjacent structures and berms, in accordance with this specification and the 2014 New York City Building Code.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

## 1.5 REFERENCES

- A. The latest revision of the following standard specifications, where not otherwise required by the Contract Documents:
  - 1. ASTM A36 Standard Specification for Carbon Structural Steel.
  - 2. ASTM A252 Standard Specification for Welded and Seamless Steel Pile Piles.
  - 3. ASTM C109 - Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in or 50-mm Cube Specimens).
  - 4. ASTM A615 – Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
- B. Field Reference Manual: Specifications for Structural Concrete, ACI 301, with Selected ACI and ASTM References, SP 15. Contractor shall keep at least one full copy in the field office at all times.
- C. 2014 New York City Building Code Requirements for Structural Concrete, ACI 318 and Commentary, ACI 318R (referred to hereafter as ACI Code).
- D. Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete, ACI 211.1.
- E. Guide for Measuring, Mixing, Transporting and Placing Concrete, ACI 304.
- F. Recommended Practice for Evaluation of Strength Test Results of Concrete, ACI 214.
- G. All work shall comply with the requirements of the 2014 New York City Construction Codes and and the New York City Department of Environmental Protection.
- H. Geotechnical Engineering Report – 116th Precinct Station House, Queens, New York, prepared by Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C., dated 15 November 2018.

## 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

## 1.7 SUBMITTALS

- A. Unless otherwise indicated, transmit all submittals to the Commissioner for review and acceptance before proceeding with ordering, fabricating, or any other work of this Section. Submittal review will be of the concept only and shall not in any way diminish or limit the Contractor’s responsibility for the performance and quality of the work of this Section and the protection of existing structures.
- B. The Contractor’s Professional Engineer licensed in the State of New York shall prepare an outline of the Contractor’s construction methods and step-by-step procedures together with plans and details of the excavation support system to satisfy the 2014 New York City Building Code requirements and approved drawings. This shall be coordinated with the relevant submittals identified in Section 31 00 00 “Earthwork” and shall be submitted and reviewed by the Commissioner for the concept before submittal of the shop drawings.

- C. The Contractor shall supersede the Commissioner as the applicant for the support of excavation work.
- D. Plans and Shop Drawings: Support of Excavation (SOE) Drawings in the Contract Documents are for the purpose of filing and have been provided for reference only. The Contractor must prepare and submit plans and shop drawings for all items in this Section and shall supersede the Commissioner for the Support of Excavation. The design plans and shop drawings shall be submitted signed and sealed by the Contractor's Professional Engineer licensed in the State of New York. Contractor shall obtain DOB approval of these plans.
  - 1. Excavation Support – Provide calculations, plans, and shop drawings that show the limits and layout of the excavation support system. Provide representative sections for each side of the excavation that include calculations, structural details of the SOE wall, and embedment depth. Provide elevations that give the location and identification of all lateral bracing elements.
    - a. Excavation side stabilization plan, details and calculations including but not limited to sheeting and bracing.
    - b. Adjacent footing bearing strata stabilization plan.
    - c. Adjacent property and structures protection and monitoring plan. Show in a detailed and scaled plan locations of survey control point locations.
    - d. The grout mix design and procedures the Contractor intends to use for grouting of the bolts and anchors.
    - e. Submit original manufacturer's certificates for all materials as specified herein.
- E. Monitoring of Existing Structures: Submit the monitoring plan specified herein at least two weeks before proceeding with the work. Submit monitoring results as specified herein within two days after completing the monitoring work.
- F. Certification For Examination of Site and Records: Before proceeding with the Work, submit certification in an acceptable form, signed by the Contractor, stating that careful examination has been made of the site, existing structures, existing adjacent structures, records of utility lines, test boring records, soil samples, geotechnical report, the Drawings, and all other Contract Documents.
- G. Procedures and methods shall be used to ensure safety and stability of all adjacent structures, as well as identification of the entity that will sign the DOB TR-forms as the responsible party for the Structural Stability of the adjacent buildings.

#### 1.8 PROJECT CONDITIONS

- A. The Contractor, by careful examination, shall inform themselves as to the nature and location of the work; the conformation of the ground, the nature of the subsurface conditions; the locations of the groundwater table; the character, quality and quantity of the materials to be encountered; the character of the equipment and facilities needed preliminary to and during the execution of the work; and all other matters which can be in any way effect the work.
- B. Borings are available for the Contractor's review. The City of New York makes no predictions or representations regarding the character or extent of soil, rock, or other subsurface conditions to be encountered during the work. The Contractor shall make their own deductions of the subsurface conditions which may affect the methods or expense of construction of the work hereunder, and agrees that he will make no claims for additional compensation should he find conditions during the progress of the work different from those as the Contractor calculated and/or anticipated. Additional borings and other exploratory operations may be performed by Contractor, at the Contractor's option and following the Commissioner's approval. No change in the Contract Sum will be authorized for such additional exploration undertaken by the Contractor.

- C. Soil samples taken from the borings are available for the Contractor's inspection.
- D. Existing Utilities: Locate existing underground utilities in and beyond the areas of work. If utilities are indicated to remain in place, provide adequate means of support and protection during the work.
  - 1. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with Commissioner and utility companies in keeping respective services and facilities in operation. Restore damaged utilities to satisfaction of utility owner.
  - 2. Do not interrupt existing utilities serving facilities occupied by The City of New York or adjacent properties, during occupied hours, except when permitted in writing by the Commissioner and then only after acceptable temporary utility services have been provided. Provide minimum of 48-hour notice to the Commissioner, and receive written notice to proceed before interrupting any utility.
  - 3. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.
- E. Examine drawings to determine sequence of operations, and relation to work of other trades. Start of work will signify acceptance of field conditions and will acknowledge coordination with other trades.
- F. Compliance with all federal, state and local environmental and health and safety regulators, including but not limited to Occupational Safety and Health Administration (OSHA).

#### 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. Contractor Qualifications: The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
- C. Design Supervision: For support of excavation, retain the services of a Professional Licensed Engineer licensed in the State of New York who shall design and supervise installation of all work of this Section. The Contractor's Professional Engineer shall sign, seal and submit all relevant New York City Building Department Technical Report forms.
- D. Surveying and Monitoring: The City of New York shall engage and assign survey and monitoring work of this Section to a Professional Land Surveyor licensed in the State of New York. The results of all monitoring work of this Section shall be made immediately available to the Commissioner. Adjacent buildings shall be monitored by the Contractor at least twice per week for vertical and horizontal movements during all work.
- E. Special Inspection:
  - 1. The Special Inspection Agency, hired by the City of New York, shall be solely responsible for providing special inspection for all sheeting, shoring, and bracing work.
  - 2. Before commencing work of this Section, meet with the Commissioner, and other concerned entities. Review the sheeting and bracing procedures and responsibilities including testing and inspection procedures and requirements. Notify participants at least three working days before convening conference. Record discussions and agreements and furnish a copy to each participant.

- F. Monitoring of Excavation Support System: Engage and assign survey and monitoring work of this Section to a Professional Land Surveyor licensed in the State of New York. The results of all monitoring work of this Section shall be made immediately available to the Contractor's Professional Engineer responsible for the engineering supervision of the work specified herein and to the Commissioner.
- G. Codes and Permits:
  - 1. Comply with the 2014 New York City Building Code, and requirements of the New York City Department of Environmental Protection.
  - 2. All labor, materials, equipment and services necessary to make the work comply with such requirements shall be provided without additional expense to the City of New York.
  - 3. Procure and pay for all permits and licenses required to complete the work of this Section.

#### 1.10 PROTECTION

- A. There are sensitive buildings adjacent to, and within the vicinity, of the site. The work shall be executed so that no damage or injury will occur to the existing public and adjoining or adjacent structures, streets, paving, sewers, gas, water, electric or any other pipes. Should any damage or injury caused by the Contractor, or anyone in Contractor's employ, or by the work under this Contract occur, the Contractor shall, at own expense, restore such damage and shall assume all responsibility for such injury.
- B. The above shall also include the protection of all existing utilities (including sewers, water lines, electrical lines and telecommunication lines) to remain in use within and adjacent to the area affected by the work of this project.
- C. Monuments, benchmarks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, replace them at no additional expense to the City of New York.

#### 1.11 PRE-CONSTRUCTION CONDITIONS DOCUMENTATION

- A. A pre-construction conditions documentation of the adjacent structures (including the LIRR station and track south of the site) shall be performed before the start of the excavation.
- B. The Contractor may perform, if he wishes, his own conditions verification survey and shall submit any findings that differ from the City of New York's as specified herein.

### PART 2 – PRODUCTS

#### 2.1 MATERIAL

- A. Provide suitable sheeting, bracing, and soil support materials which will withstand loads imposed without movement. Materials shall be kept in serviceable condition at all times. The Contractor should refer to the support of excavation drawings for the sizes of the elements.
- B. Steel soldier piles shall conform to ASTM A-992 Grade 50.
- C. Miscellaneous Steel shall conform to ASTM A-572 Grade 50.

### PART 3 – EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 GENERAL

- A. Excavation support shall be constructed in accordance with the 2014 New York City Building Code requirements.
- B. Install soldier piles to permit excavation to the required foundation subgrade as required to install the slabs and pits.
- C. Excavation support shall be adequate to resist earth and hydrostatic pressures and lateral pressures due to surcharge loads, to prevent displacement of the adjacent ground; and to prevent loss of support or damage to buildings, utilities, sidewalks, and streets. Lateral loads created from adjacent buildings, cranes and/or street loads shall be included in the design.
- D. During the excavation work specified in Section 31 00 00 - Earthwork, if additional locations may require sheeting and bracing based on the Contractor's construction methods and procedures, then provide such additional supports at no additional expense to the City of New York. Such additional supports shall be designed and constructed in accordance with the requirements of this Section, as per the Contract Documents.
- E. Excavation support and bracing may be removed, left in place, or cut as approved by the Commissioner. Any material that affects finished construction shall be removed. Carefully remove materials such that no loss of support occurs beneath areas adjacent to the sheeting. Any material left in place must be removed not less than four-ft below finish grade. Sheeting and bracing material removed from the excavation shall be immediately removed from the site and lawfully disposed of.

### 3.3 SOIL EXCAVATION SUPPORT

- A. Temporary excavation walls shall be provided along the sides of excavations in soil where the overburden exceeds 4 feet, and any other material not self-supporting as defined by the plans or a plan by the Contractor's Professional Engineer licensed in the State of New York.
- B. Excavation adjacent to the temporary wall shall not exceed a depth of 2 feet below the point of lateral support to be installed. Lateral support shall be installed and preloaded before continuing excavation.
- C. Provide all support system components needed to ensure the proper installation of work and to protect adjacent structures, streets, paving, utilities, etc.
- D. Subgrade preparation for heel blocks shall be by subgrade preparation procedures outlined in Specification Section 31 00 00 – Earthwork. Subgrades to be maintained in a firm and dry state during construction.
- E. Sides of the site shall be protected against cave-in and movement of soil at all times.
- F. Install all corner bracing and rakers at the same elevation level before jacking them one by one to the specified prestressing force.
- G. The above work shall be carried out in such a manner as not to interfere with the progress of the work under this Contract. If it is found necessary to change the position of the shoring, bracing, spurs, walers, rakers, or other items to permit the construction work to proceed, do this work at no additional expense to the City of New York.
- H. At the completion of the work, remove all shoring, bracing, spurs, rakers and other items and remove same from the project premises when directed by the Commissioner.

- I. Where temporary bracing is required to withstand earth pressures, the backfill shall not be placed until after temporary bracing has been installed. If portions of the ground floor must be placed and have reached sufficient strength for the design of any portion of the foundation to withstand their required lateral load, backfilling shall not be placed until this work has been performed and the concrete reaches its necessary strength.

### 3.4 PROTECTION OF ADJACENT STRUCTURES, STREETS AND UTILITIES

- A. The work shall be executed so that no damage or injury will occur to the existing public and adjoining or adjacent structures, streets, paving, sewers, or utilities. Should any damage or injury caused by the Contractor, or anyone in Contractor's employ, or by the work under this Contract occur, the Contractor shall, at own expense, restore such damage and shall assume all responsibility for such injury.
- B. Monuments, benchmarks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, have them replaced.
- C. The adjacent and surrounding structures, streets, utilities shall be protected and monitored during the work described herein. Excavation work shall be restricted to hours indicated by the Commissioner.

### 3.5 MONITORING

- A. Monitoring of Excavation Support System: Install reference points at a maximum spacing of 25-ft on-center around the entire perimeter of the excavation to properly monitor the ground movements behind the excavation support system. As the excavation proceeds, install points on the soldier pile to measure potential lateral deflection. These locations shall be subject to review by the Commissioner. Reference points shall also be installed on all adjacent buildings.
  1. The monitoring points shall be established by the Contractor employing a Professional Land Surveyor licensed in the State of New York, and referenced to a fixed off-site benchmark. The Contractor's vibration monitoring plan shall be submitted to the Commissioner for review and acceptance.
  2. Monitoring of the excavation support system and buildings shall be performed twice a week during any sheeting, bracing, and excavation work. Readings shall be taken to nearest 0.005 ft. Written reports summarizing the monitoring results shall be submitted by the Contractor's Professional Engineer licensed in the State of New York for review and acceptance by the Commissioner.
- B. Monitoring of Adjacent Buildings: Conduct crack monitoring of all adjacent buildings. Implement vibration monitoring and façade survey monitoring (lateral displacement and settlement) at all adjacent buildings within a 90-ft radius of the site. The Contractor will receive monitoring reports on a weekly basis and will be notified when threshold are exceeded. Monitor all adjacent buildings for movement as per this specification section.
- C. Alert levels: should any of the following magnitudes of movement be detected, immediately take remedial action and advise the Commissioner.
  1. The maximum allowable movements of the adjacent buildings and structures shall be 1/4 inch for horizontal movement and 1/4 inch for vertical movements. The action thresholds shall be three consecutive readings of 1/16 inch of movement, or one confirmed reading of 1/8 inch.
  2. The maximum allowable movements of the adjacent pavement or ground shall be 1 inch for horizontal movement and 1/2 inch for vertical movements. The action thresholds shall be one half of the maximum allowed movement.

3. Ground vibrations - The limit for ground vibration peak particle velocity is 2.0 ips for frequencies from 40 Hz to 100 Hz. For frequencies below 40 Hz, vibration limits are 0.75 ips and 0.5 ips, with graphical transition lines equivalent to constant displacements.
4. Water level - The limit for fluctuation in water level is a 2-foot increase or decrease in any measurement after pumping has stabilized at any temporary subgrade during excavation.

**D. Exceedance Action Plan**

1. If any monitoring measurement exceeds allowable limits, the Commissioner shall be notified and the following actions shall be taken.
  - a. The Contractor will immediately stop work in the vicinity of the exceedance.
  - b. Inspect the building (or portions thereof) for potential damage. Inspections shall be made by the City of New York's special inspection engineer for structural stability, the Contractor's engineer, and the Commissioner.
  - c. Immediate notification to DOB and the Commissioner in case of damage or unsafe condition.
  - d. Excavation and foundation construction procedures shall be re-assessed as necessary to maintain vibration levels and movements within acceptable limits.
  - e. Work stoppage to assess excavation methods and to inspect the buildings identified herein for damage is at the Commissioner's discretion.
  - f. Develop alternate methods and procedures, subject to the review and approval of the Commissioner.
  - g. Resume work using the agreed upon alternative method.
  - h. DOB will be notified of events that exceed allowable limits and of corrective measures implemented to maintain acceptable limits.

- E. Restore, to the satisfaction of the Commissioner, the portions of buildings, or their contents, altered by the Contractor in furtherance of his sheeting, and bracing work. Restoration shall be completed to the conditions which existed before the start of work.

**3.6 FIELD QUALITY CONTROL**

- A. Concrete: Retain a certified testing agency to take samples of the concrete. A minimum six grout cylinders per batch shall be taken to determine the compressive strength of the concrete.
- B. Excavation Support: The Special Inspection Agencies, retained by the City of New York, shall be responsible for the inspections of all excavation supports.
- C. Adjacent Building Monitoring: The Contractor shall be responsible for establishment and monitoring of all of the survey control points. Survey results shall be reported to the Commissioner 24 hours following the survey.

**3.7 CLEAN-UP**

- A. All excess material shall be removed from the site and legally disposed.
- B. All lumber, forms and metal work shall be removed immediately after completion of local areas. Remove all debris produced by work to this section from the site.
- C. Sidewalk and streets adjoining the property shall be broom cleaned and free of debris, rubbish, trash and obstructions of any kind caused by the work of this Section.

**END OF SECTION 31 50 00**

## **SECTION 31 61 00**

### **FOOTINGS**

#### **PART 1 - GENERAL**

##### **1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract City of New York Standard Construction Contract.

##### **1.2 SUMMARY**

- A. The work covered by this Section shall include all labor, material, equipment, permits, engineering and other services necessary for the fabrication and installation of footings and related work, complete, in accordance with the Drawings and as specified herein.

##### **1.3 RELATED WORK SPECIFIED IN OTHER SECTIONS**

- A. Concrete Submittals Section 03 30 00
- B. Concrete Quality Control Section 03 30 00
- C. Cast-in-Place Concrete Section 03 30 00
- D. Concrete Reinforcement and Embedded Assemblies Section 03 20 00
- E. Structural Steel Section 05 12 00
- F. Thermal and Moisture Protection Division 7
- G. See Drawings for locations, sizes, top elevations, and details. See Geotechnical Report for general soil conditions.

##### **1.4 CODES AND STANDARDS**

- A. 2014 New York City Building Code: Footing work shall conform to the requirements of the 2014 New York City Building Code identified on the structural General Notes, and OSHA requirements, except where more stringent conditions or criteria occur in the standards referenced below and on the Drawings.
- B. Standards:
  - 1. ACI 117 – Standard Specifications for Tolerances for Concrete Construction and Materials.
  - 2. ACI 301 – Standard Specifications for Structural Concrete.
  - 3. ACI 315 – Details and Detailing of Concrete Reinforcement.
  - 4. ACI 318 – Building Code Requirements for Reinforced Concrete.
  - 5. American Concrete Institute “Manual of Concrete Practice”, various committee reports as referenced herein.

6. American Society for Testing and Materials "ASTM Standards in Building Codes", various standards as referenced herein.
7. AWS D1.4 – Structural Welding Code-Reinforcing Steel.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.6 SUBMITTALS

- A. Required submittal items are listed here; see below for detailed requirements. Do not submit items not requested.

1. Submittal Schedule
2. Footing Construction Methods
3. Installer Qualifications
4. Shop drawings
5. Construction Log
6. Contractor's Survey Report
7. Submittals required by Related Documents
8. Mill Certificates
9. Concrete Testing Agency Reports
10. Product Data

- B. Detailed submittal requirements: See below for specific requirements for each required submittal.

1. Submittal Schedule: See Section 03 30 00 "Cast-in-Place Concrete"
2. Footing Construction Methods: Submit for record, footing construction procedures developed by the Footing Contractor.
3. Installer Qualifications: Submit proof of qualifications as stated in the CONTRACTOR QUALIFICATIONS section of this Specification.
4. Shop drawings in accordance with 03 20 00 and 03 30 00, and as noted.
  - a. Concrete mix designs in accordance with Section 03 30 00 "Cast-in-Place Concrete".
  - b. Footing reinforcement in accordance with Section 032000 "Concrete Reinforcement and Embedded Assemblies".
  - c. Footing layout drawing showing the location of each footing (with respect to building gridlines), size and depth of footing, and top of footing elevation.
5. Construction Log: Testing Agency shall document, sign, and submit for record, a record of each footing construction, including:
  - a. Footing designation, top and where possible bottom elevation, and size of footing.
  - b. Size, length, and location of installed reinforcement.
  - c. Deviation of centerline plan location.
  - d. Actual allowable soil bearing capacity
  - e. Inspection and testing
  - f. Method of concrete placement, time of beginning and ending concrete discharge for each truck, (including any delays in concreting and location of construction joints in shafts) and any deviation from planned construction methods.
  - g. Volume of concrete supplied to footing and ratio of actual volume to theoretical volume.

6. Contractor's Survey Report: Submit for record plans sealed and signed by a Professional Surveyor licensed in the state of New York, indicating as built plan locations of footing centerlines (with respect to building gridlines), top and where possible bottom elevations, and identifying deviations of footing centerlines from design plan locations. Footings that are outside of specified tolerances shall be specifically identified on the plan.
7. Submittals required by Related Documents.
8. Mill Certificates: Per Specification section 03 20 00 "Concrete Reinforcement and Embedded Assemblies", submit for record certified reports for physical and chemical properties of following materials:
  - a. Reinforcement bars.
9. Concrete Testing Agency Reports: Submit for record
  - a. Reports of field observations.
  - b. Reports of field quality control tests, as related to concrete and reinforcement.
  - c. Immediately notify the Commissioner of any deviations from the Drawings.
10. Product Data: Submit for record for each type of product identified in Part 2. Product Data shall be clearly marked to indicate all technical information which specifies full compliance with this section and Contract Documents, including published installation instructions and ICC reports, where applicable, for products of each manufacturer specified in this section.
  - a. Refer to DDC General Conditions for submittal process and requirements
  - b. Refer to Section 03 30 00 – "Cast-in-Place Concrete" for additional submittal requirements related to concrete trades.

#### 1.7 DELIVERY, STORAGE AND HANDLING

- A. In accordance with Section 03 20 00 "Concrete Reinforcement and Embedded Assemblies" and 03 30 00 "Cast-in-Place Concrete".

#### 1.8 PROJECT SITE CONDITIONS

- A. Geotechnical Information: Contractor to examine site, records of test borings, soil samples, and Geotechnical Reports that are available in the Contract Documents. Soil boring test results are provided by The City of New York for information, and are not guaranteed to represent conditions that are present at footing locations. Soil boring test results are not intended as representations or warranties of the continuity of the reported conditions. It is expressly understood that The City of New York will not be responsible for interpretation or conclusions drawn by Contractor from the Geotechnical Report. At no additional expense to The City of New York, evaluate the available data and provide additional test borings and other investigations as necessary for installing footings.
- B. Site Survey: Survey of site, existing utilities, and existing construction available from The City of New York represent conditions known to The City of New York.

#### 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. See Section 03 30 00 "Cast-in-Place Concrete".

- C. The Contractor's Geotechnical Engineer shall be properly trained to perform the type of work required by the Project. The Contractor's Geotechnical Engineer shall be a Licensed Geotechnical Engineer in the state of New York. The engineer shall develop a site dewatering plan and advise on footing construction techniques, including assistance in the development of construction procedures and the development of solutions to construction problems.

#### 1.10 TESTING AGENCY

- A. Testing Agency: The City of New York will engage a qualified testing agency to perform Special Inspections.
- B. The Contractor shall be responsible for, and bear all expenses associated with the filing and securing of approvals, if any, for Form TR3: Technical Report Concrete Design Mix, including, but not limited to, engaging the services of a New York City licensed Concrete Testing Lab for the review and approval of concrete design mix, testing, signatures and professional seals, etc., compliant with NYC Department of Buildings requirements, for each concrete design mix.
- C. Refer to Section 01 40 00 "Quality Requirements", Article 1.9, of the DDC General Conditions, for additional information regarding Special Inspections.

#### 1.11 QUALITY ASSURANCE BY TESTING AGENCY

- A. Source Quality Control
  - 1. See Section 03 30 00 "Cast-in-Place Concrete".
- B. Field Quality Assurance
  - 1. See 03 30 00 "Cast-in-Place Concrete" for general requirements.
  - 2. Contractor's Responsibilities
    - a. Examine the areas and conditions under which footings are to be installed. Notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in an acceptable manner.
    - b. Furnish complete sets of approved shop drawings and other submittals to the Commissioner and Testing Agency.
    - c. Furnish notifications to the Commissioner and Testing Agency, with at least 24 hour advance notice of start of pouring each footing.
    - d. Provide access for the Commissioner, Contractor's Testing Agencies, and Testing Agency. Provide concrete materials for sampling and testing.
    - e. Furnish storage facilities for material samples, in accordance with ACI Standard Practice.
    - f. Coordinate with the Testing Agency and Commissioner.
    - g. Provide additional inspection and testing resulting as a consequence of following:
      - 1) Lack of adequate evidence that work is in compliance with this Specification
      - 2) Work performed with improper supervision
      - 3) Work performed without prior notice
      - 4) Work performed contrary to Drawings and Specifications.
  - 3. The Testing Agency shall perform the following tests and inspections, evaluate test results, and review compliance of the Contractor's work with Contract Documents and prepare and submit reports:

- a. Review Contractor's proposed footing installation methods, sequences, and procedures.
  - b. Verify bearing stratum and bearing capacity of each footing; verify levelness of footing end bearing surface.
  - c. Determine final bearing elevation at each footing location.
  - d. Observe, record, and report footing as-built plan location, footing size and final elevations of bottom (where possible) and top of completed footings.
  - e. Coordinate with the Commissioner.
4. Testing Agency shall conduct the following tests and inspections of the Contractor's work during construction and prepare and submit reports:
  - a. Inspection of Batch Plant: As required to ensure that concrete delivered to job complies with Specifications and design mix. Batch plant inspection shall be required once at start of job and thereafter if concrete falls below Specifications.
  - b. Inspection of Reinforcement: Provide continuous visual inspection of site fabrication. Record the steel reinforcement bar sizes, grade, length, and number of bars.
  - c. Inspection of Concrete and Reinforcement Placement: Provide continuous visual inspection of installation of reinforcement and concrete placement including verification of laitance removal at top of footings.
  - d. Check ready mix delivery tickets for correct concrete mix design number. Record batch to placement time. Check slump, temperature, and batch to placement time for each set
  - e. Slump Tests: ASTM C143. Make 1 test from each truck.
  - f. Concrete Compressive Strength Tests: Testing Agency will take a minimum of one sample set of concrete cylinders per 20 cubic yards of concrete. See Section 03 30 00 "Cast-in-Place Concrete" for requirements. Cure cylinders to simulate same curing conditions as concrete in footings. Reports of cylinder tests shall state footing location(s), laboratory or site curing, compression strength, type of fracture, age at testing, concrete supplier, mix specification strength, any other pertinent information, test results, and conclusions.
  - g. Additional Tests: Perform additional testing if, in the opinion of the Commissioner, concrete of poor quality has been placed based on cylinder strengths below Specification requirements or visual defects. Tests may be compression tests on cored cylinders, ASTM C42, and load tests as outlined in ACI 318, or as directed by the Commissioner. Complete continuous coring of footings will be required, at Contractor's expense, where verification of quality of concrete is not otherwise attainable.

#### 1.12 QUALITY CONTROL BY CONTRACTOR

- A. See Section 03 30 00 "Cast-in-Place Concrete".

#### 1.13 OBSERVATIONS BY COMMISSIONER

- A. See Section 03 30 00 "Cast-in-Place Concrete".

#### 1.14 PERMITS AND WARRANTY

- A. Permits: See Section 03 30 00 "Cast-in-Place Concrete".

1. Drawings and calculations prepared by the Contractor's Licensed Professional Engineer in the state of New York for temporary shoring and/or earth retention shall be submitted to the Commissioner and the New York City Department of Buildings for review.

- B. Warranty: See Section 03 30 00 "Cast-in-Place Concrete".

#### 1.15 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Flyash: Concrete shall incorporate flyash as a replacement for at least 20% (by weight) of the Portland cement. All design mixes are subject to review and approval by the Commissioner.
  2. Recycled Content: Metal materials, products, anchors, framing, and accessories shall contain a minimum of 35% (75% for structural and reinforcing steel) combined pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification of recycled content shall be in accordance with the LEED Building Submittals requirements of this Section.

#### 1.16 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

### PART 2 - PRODUCTS

#### 2.1 CONCRETE

- A. See Section 03 30 00 "Cast-in-Place Concrete"

#### 2.2 REINFORCEMENT

- A. Section 03 20 00 "Concrete Reinforcement and Embedded Assemblies"

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 PROTECTION OF EXISTING UTILITIES AND STRUCTURES

- A. Before installing footings adjacent to known existing utilities, notify Commissioner and utility company to ensure that protective work will be coordinated and performed by Contractor in accordance with requirements of the Commissioner and the utility company. If any existing service lines, utilities, and utility structures to remain in service are uncovered or encountered during work, protect the uncovered element from damage and provide support where necessary.
- B. Should uncharted or incorrectly charted piping or other utilities be encountered during footing excavation, immediately notify the Commissioner and utility company. Cooperate with the Commissioner and utility company in keeping their respective services, utilities and facilities in operation. Restore damaged utilities to entire satisfaction of the Commissioner and utility company concerned.
- C. Do not interrupt existing utility service facilities occupied and used by The City of New York, or owners of other properties adjacent or near to the project site, including properties directly to the east, west, south, and to the north on the opposite side of North Conduit avenue, except when permitted in writing by the Commissioner and then only after acceptable temporary utility services have been provided.
- D. Protect structures, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, vibration, and other hazards created by footing operations.

### 3.3 SITE DEWATERING

- A. Before installing footings, provide site dewatering based on the Contractor's site dewatering plan.
- B. Provide and maintain pumping equipment to keep excavations free of water before placing concrete. If excessive water is encountered and drilling operations must be halted, consult the Contractor's Geotechnical Engineer and the Commissioner before using alternative methods of construction.
- C. If excessive seepage is coming in from below the bottom of the footing excavation, removal by pumping within the excavation is inappropriate, as this may loosen the bearing soils and reduce the bearing soil capacity; therefore, an alternate means of dewatering will be required.

### 3.4 GENERAL FOOTING EXCAVATION

- A. Tolerances: Plan location tolerance is 2% of footing dimension but no greater than 2 inches (50 mm), whichever is greater, If indicated tolerances are exceeded, see "Footing Corrective Measures" in Part 3.
- B. Forming Sides of Footings:
  - 1. Provide forms for footings and grade beams if soil or other conditions are such that earth trench forms are unsuitable.
  - 2. When trench forms are used, provide an additional 1" (25 mm) of concrete on each side of the minimum design profiles and dimensions indicated.
- C. Cleanup of Footing Bottom: Excavate bottom to a level plane. Remove loose materials or free water as determined by Testing Agency.
- D. Bottom of adjacent footings that are at different elevations should never result in an excavation slope between footings greater than 1.0 vertical to 1.5 horizontal unless otherwise noted in the

drawings or geotechnical report. If steeper slopes occur, the EOR should be notified before any concrete is placed.

### 3.5 ADDITIONAL EXCAVATION AND FOOTING DEPTH

- A. Do not excavate below elevations noted by contract documents without prior review by the Commissioner.
- B. Where the Testing Agency determines that soil encountered at design bearing elevation is not capable of providing minimum design bearing capacity, perform additional excavation as recommended by the Testing Agency.
- C. If obstructions are encountered that interfere with new construction, remove such existing elements or develop corrective methods. Propose corrective actions and their recommendations in writing and submit them for review by the Commissioner. Efforts shall be made to address obstructions at no additional expense to The City of New York.

### 3.6 DISPOSAL OF EXCAVATED MATERIALS

- A. Dispose excavated materials off site in a manner that will not interfere with other construction activities. Keep construction site at all times clean and free of soil and other debris that could affect progress of other construction activities.

### 3.7 FOOTING REINFORCEMENT

- A. Fabrication in accordance with 03 20 00 "Concrete Reinforcement and Embedded Assemblies" from approved shop drawings.

### 3.8 FOOTING BEARING STRATA

- A. Footing Bearing Stratum Criteria and Verification
  - 1. Footings shall be founded on soil strata with bearing capacity indicated on Drawings. Footings shall not be excavated until test results by Testing Agency confirm allowable bearing values indicated on Drawings, but shall be excavated immediately thereafter.
  - 2. Each footing bearing strata must be inspected and be acceptable to Testing Agency before placing concrete
  - 3. Footing excavations to acceptable bearing strata shall not be left exposed to weather for more than 48 hours before footing concrete is placed.
  - 4. At no time before or after footing concrete is placed shall the soil below the footing be allowed to freeze. Adequate freeze protection must be sufficient depth to provide adequate frost protection per the geotechnical report.

### 3.9 CORRECTIVE MEASURES

- A. If unforeseen field conditions require corrective installation methods, immediately notify the Commissioner.
  - 1. Where a change to the construction installation method result in an as-built footing in compliance with the Contract Documents, submit installation method for record.
  - 2. Where the as-built footing does not meet the design intent of the Contract Documents. Propose corrective actions and their recommendations in writing and submit them for review by the Commissioner.

If footings are installed outside allowable tolerances, develop and provide corrective methods including calculations based on actual locations of footings, taking into account eccentricity between final centerline of footing and design location of column centerline. Propose corrective actions and their recommendations in writing and submit them for review by the Commissioner. Relevant calculations shall be included with the submitted proposal of corrective actions and shall be sealed and signed by Contractor's Engineer licensed in the state of New York.

**END OF SECTION 31 61 00**

THIS PAGE INTENTIONALLY LEFT BLANK

## SECTION 31 68 00

### FOUNDATION SOIL ANCHOR

#### PART 1 - GENERAL

##### 1.1 RELATED DOCUMENTS

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 03 30 00 – Cast in Place Concrete
- C. Section 07 10 00 – Foundation Waterproofing
- D. Section 31 00 00 – Earthwork
- E. Section 31 50 00 – Excavation Support and Protection

##### 1.2 SUMMARY

###### A. Section includes:

- 1. Excavation and drilling associated with pile foundations and installation of drilled piles at the locations shown in the drawings, and having design axial compressive capacities (service load) as indicated and as located on the latest drawings. Respective design capacities are as indicated below.
- 2. Double-corrosion protected permanent soil anchors at the locations and of the capacities indicated in the drawings. Respective design capacities are as indicated below.

Type	Tensile Capacity (kips)	Drill hole (inches)	Threaded Bar Diameter	Free Length (feet)	Bond Length (feet)	Grout Strength (psi)
RA-1	50	6	1"	10	25	4,000
RA-2	100	6	1-3/8"	10	35	4,000

- 3. Soil anchors shall consist of vertical drilled, grouted and post-tensioned elements utilized to provide uplift resistance against dynamic loads, wind loads, and hydrostatic pressures.
- 4. Actual bond and free-stressing lengths shall be determined by the Contractor's Professional Engineer Licensed in the State of New York based upon the anchor design capacity with calculations submitted to the Commissioner for review.
- 5. Soil anchor location survey and identification plan.
- 6. As-built drawings.

### 1.3 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

### 1.4 LEED BUILDING SUBMITTALS

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

### 1.6 SUBMITTALS

- A. Submit permanent anchor shop drawings, calculations, and data signed and sealed by a Professional Engineer licensed in the State of New York, a minimum of 14 days before fabrication or commencement of installation work. The shop drawings shall include as a minimum:
  - 1. Provide the means and methods statement for the stabilization of subgrade before the soil anchor installation.
  - 2. The Contractor's detailed permanent anchor layout and identification plan.
  - 3. The proposed jacking forces at lock-off required to achieve the specified design loads. Provide supporting calculations that show the estimated seating losses and long-term creep losses after lock-off.
  - 4. The numbering system of the anchors and the locations of the anchors the Contractor intends to Performance Test.
  - 5. The grout mix design and procedures the Contractor intends to use for grouting of the anchor.
  - 6. The complete section detail of the double-corrosion protected anchor assembly from head to tip with all appurtenant dimensions and details, including but not limited to, lower anchorage corrugated sheathing and smooth upper sheathing, centering devices, anchor head details, etc.
  - 7. Plan and procedures for anchor placement, grouting.
  - 8. Procedure for tensioning anchor bar including tensioning sequence. Include method of measuring loads and elongation of anchor bar during jacking and certified calibration chart for the pump/pressure gauge/jack assembly.

- B. Submit results of all tests including applied load charts no later than 24 hours after each test. The submittal shall be signed and sealed by a Professional Engineer licensed in the State of New York.
- C. Submit original manufacturer's certificates for all materials as specified herein.

#### 1.7 REFERENCES

- A. All work and materials under this section shall conform to the latest revision of the following standard specifications, where not otherwise required by the Contract Documents.
  - 1. "Recommendations for Prestressed Rock and Soil Anchors," Post-Tensioning Institute, latest edition.
  - 2. ASTM A 722 Specifications for Uncoated High-Strength Steel Bars for Pre-Stressing Concrete.
  - 3. ASTM A 572 Specifications for Structural Steel.
  - 4. ACI-318 latest edition-Building Code Requirements for Structural Concrete.
  - 5. Geotechnical Engineering Report for 116th Precinct Station House, Queens, New York, prepared by Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C., dated 15 November 2018.

#### 1.8 PROJECT CONDITIONS

- A. Soil samples taken from the borings are available for the Contractor's inspection.
- B. The Contractor, by careful examination, shall inform himself as to the nature and location of the work; the confirmation of the ground, the nature of the subsurface conditions; the locations of the groundwater table; the character, quality and quantity of the materials to be encountered; the character of the equipment and facilities needed preliminary to and during the execution of the work; and all other matters which can be in any way affect the work.
- C. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of the site of the work. Secure in advance any transportation permits as may be required.
- D. Existing Utilities: Locate existing underground utilities in and beyond the areas of work. If utilities are indicated to remain in place, provide adequate means of support and protection during the work.
  - 1. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with Commissioner and utility companies in keeping respective services and facilities in operation. Restore damaged utilities to the satisfaction of utility owner.
  - 2. Do not interrupt existing utilities serving facilities occupied by The City of New York or the adjacent properties, during occupied hours, except when permitted in writing by the Commissioner and then only after acceptable temporary utility services have been provided. Provide a minimum of 48-hour notice to the Commissioner, and receive written notice to proceed before interrupting any utility.
  - 3. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.

- E. Examine drawings to determine the sequence of operations, and relation to work of other trades. The start of work will signify acceptance of field conditions and will acknowledge coordination with other trades.

## 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. Contractor Qualifications: The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
- C. Retain a registered Professional Engineer Licensed in the State of New York to engineer all soil tie-down anchor work. The Contractor's engineer shall sign and seal all submittals related to soil tie-down anchors and shall be present at all meetings associated with this work. All work products of the Contractor's engineer shall be submitted to the Commissioner for review and acceptance prior to incorporation into the work.
- D. Quality Control Inspection:
  - 1. The Contractor's permanent anchor installation and tensioning work shall be subject to all required special inspections.
  - 2. The Contractor shall have the sole responsibility for coordinating his work with the Commissioner to assure that all tests and inspection procedures required by the Contract Documents are properly provided. Cooperate fully with the Commissioner and the inspector in the performance of their work.
    - a. The Commissioner will keep records, including items completed each day, job and weather conditions, a log of each permanent soil tie-down anchor, depth and size of the drill hole, grouting of the hole, and any other pertinent construction details. Cooperate and assist the Commissioner in the making of these records.
    - b. The Contractor will notify the Commissioner promptly of any part of the work of this section not in compliance with these specifications.
  - 3. Testing Service: Employ a testing laboratory to perform material testing on the grout for the permanent anchors with the results of all tests submitted to the Commissioner for review. The City of New York will employ an independent testing laboratory to perform any special inspections, as required.
  - 4. Materials and installed work may require testing at any time as work progresses. Allow free access to material stockpiles and facilities. Re-testing of rejected materials and installed work shall be Contractor's responsibility and shall be done at their expense.

## PART 2 - PRODUCTS

### 2.1 PERMANENT ANCHORS

- A. Soil-anchor hole-diameter shall be 6 inches minimum.
- B. Soil anchor reinforcement shall be permanent double-corrosion protected Dywidag-threadbars manufactured by Dywidag Systems International, Inc., or approved equivalent product from one of the following:
  - 1. Contech Systems

2. Williams Form Engineering Corp
  3. Or approved equal.
  4. Anchor reinforcement shall made of steel conforming to ANSI/ASTM A722 Grade 150.
  5. Anchor design capacities shall be 50 kips for 1-inch-diameter thread bars, and 100 kips for 1-3/8-inch-diameter threaded bars, or as shown on the Drawings.
  6. The coupler is to be per the manufacturer's recommendations. Splicing is not permitted. Anchors shall be unkinked and free of nicks or injurious defects that interrupt the continuity of the corrosion protection materials and the steel bar encased within it.
- C. The anchors shall be furnished complete with all components and accessories, including but not limited to double corrosion protected threaded bars, bearing plates, washers, gaskets, nuts, steel tubes, grout sleeves, grout pipes, smooth and corrugated sheaths, and mastic corrosion inhibitor.
- D. Anchorage lengths shall be as follows:
1. Bond Length – The bond length of the anchors shall be a minimum of 25 feet (for 50-kip anchors) and 35 feet (for 100-kip anchors) into the Building Code Class 3b or better granular material.
  2. Free Stressing Length – The free-stressing length of the anchors shall be a minimum of 10 feet below the excavation subgrade.  
Actual bond and free-stressing lengths shall be determined by the Contractor's Professional Engineer based upon the anchor design capacity with calculations submitted to the Commissioner for review.
- E. Bearing plates, washers, and nuts shall conform to ANSI/ASTM F-432 and shall be galvanized.
- F. Nuts shall be the hexagonal head, heavy-duty type conforming to ASTM A-325 and shall be galvanized.
- G. Furnish certified copies of mill reports for each test and copies of certificates for each lot showing the nominal size, area, weight per linear foot, Guaranteed Ultimate Tensile Strength (GUTS), yield strength, modulus of elasticity, total elongation and other physical properties of the threaded bar material required for the design, inspection and installation of the anchors. Elongation tests shall be specified in ASTM Designation A421 and A416. Mill reports, certificate and test results shall be submitted to the Commissioner not less than seven days before installation.

## 2.2 GROUT

- A. Cement grout to be used for grouting the permanent double corrosion protected anchor into the drill hole shall be proportioned to satisfy the requirements of ACI Standard 318 Section 18.16. When tested by U.S. Army Corps of Engineers guideline CRD-C81-64, Method of Test for Expansion of Grout Mixtures, the mix shall have an expansion of 3 percent, and no bleeding shall be evident.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 DRILLING

- A. Soil Anchorage - The anchorage length of each soil tie-down anchor shall equal or exceed the minimum free stressing length plus bond length specified in Paragraph 2.1.C above.
  - 1. The anchor free stressing length into the soil shall be considered to start at the bottom of the mat foundation.
  - 2. The anchorage diameter shall be at least 6 inches. Holes shall be kept clean until the soil anchors are installed.
- B. Rejection of Holes: Holes rejected because of non-conformance to alignment tolerances or because they intercept other holes shall be filled with grout and another hole shall be drilled at the Contractor's expense. The Commissioner will select the location of the replacement hole.

### 3.3 ANCHOR PLACEMENT

- A. Each anchor hole shall be cleaned of all drill cuttings, sludge, and debris before the anchor is inserted and grouted.
- B. Anchors shall be placed with double corrosion protection according to the manufacturer's specifications.
- C. Centralizers, spacers or other suitable centering devices shall be placed at maximum 10-ft intervals or in a sufficient number to ensure adequate grout cover over the soil anchor assembly throughout the entire anchor length. Centralizers and spacers may be made of any material, (except wood) not deleterious to the pre-stressing steel or PVC sheathing, and shall be in accordance with the manufacturer's recommendations.
- D. A smooth plastic tubing, fitting snugly over the corrugated sheathing, shall be provided in the free stressing length and shall guarantee unobstructed elongation during stressing.
- E. Anchor centerlines shall be normal to the bearing plates.
- F. No welding shall be allowed in the vicinity of the soil anchors.

### 3.4 GROUTING

- A. Anchors shall be grouted with cement grout having a minimum 28-day strength of 4,000 psi.
  - 1. Grout from the bottom of the hole to the top of the ground surface until uncontaminated grout returns to the surface.
  - 2. Grout shall be pumped into the drill hole before soil tie-down anchor insertion into the hole.

### 3.5 ANCHOR STRESSING AND TESTING EQUIPMENT

- A. All stressing and testing shall be carried out using a center hole hydraulic jack and pump system.
- B. The ram travel of the jack shall be long enough to permit a minimum anchor elongation equal to the theoretical elastic elongation of the bond length and free stressing length at 80 percent of the maximum travel of the ram. If stressing is performed in increments of load, the ram travel shall be long enough to permit the theoretically computed anchor elongation of the bond length and free stressing length under each load increment at 90 percent of the maximum travel of the ram.

- C. The hydraulic pump must be capable of fully applying each load increment in less than 2 minutes but without transmitting dynamic or impact loads to the anchor.
- D. The hydraulic jack and pressure gauge shall be calibrated as a set. Proof of calibration must be submitted to the Commissioner for review and approval two weeks before use.
- E. The pressure gauge dial face shall be scribed such that the smallest graduation is not greater than 100 psi.

Elongation of the anchor shall be measured with a dial gauge fixed to a tripod or some other support device at a sufficient distance from the anchor so as not to be affected by the load being applied to the anchor. The dial gauge should permit reading to a minimum accuracy of 0.001 inches. The maximum elongation of the threaded bar shall be less than 90% of the full travel of the dial gauge ram.

### 3.6 ANCHOR TESTING - PERFORMANCE TESTING

- A. Performance testing should be performed on 10 percent of the permanent anchors. Until Performance testing is completed and approved, no additional anchors shall be installed, except at the Contractor's risk. Drilling of anchor holes may proceed. All anchors shall be tested before the mat foundation is constructed. It is the contractor's means and methods to successfully transfer the test load to subgrade so that settlement will not be an issue.
- B. The 10 percent of anchors to be performance tested shall be drilled at the locations, chosen by the Contractor and shown on the shop drawings. Locations are subject to the approval of the Commissioner.
- C. The performance testing shall be performed after the grout has attained the minimum compressive strength.
- D. Performance testing shall proceed by cyclically and incrementally loading and unloading the anchor as follows:
  - 1. Definition:
    - a. P = Design Loads as shown in the Contract drawings.
    - b. AL = Load necessary to maintain alignment of stressing and testing equipment.
  - 2. Loading Schedule:
    - a. AL, 0.25P.
    - b. AL, 0.25P, 0.5P.
    - c. AL, 0.25P, 0.5P, 0.75P.
    - d. AL, 0.25P, 0.5P, 0.75P, 1.0P.
    - e. AL, 0.25P, 0.5P, 0.75P, 1.0P, 1.2P.
    - f. AL, 0.25P, 0.5P, 0.75P, 1.0P, 1.2P, 1.33P.
- E. Each load step shall be held for a minimum of 1 minute or until the rate of movement is less than 0.001 inches per minute. At the 1.33P load, a creep test shall be performed by holding the load constant and recording movement readings at 1, 2, 3, 4, 5, 6, and 10 minutes. If the total creep movement between 1 and 10 minutes exceeds 0.04 in, the test load will be maintained for an additional 50 minutes. Whereupon, the movements will be recorded at 20, 30, 40, 50, and 60

minutes. Upon completion of creep test, reduce load and lock-off as specified herein in Section 3.8.

### 3.7 ANCHOR STRESSING - PROOF TESTING

- A. Every anchor, except the Performance-tested anchors, shall first be Proof-tested. It is the contractor's means and methods to successfully transfer the test load to the subgrade so that settlement will not be an issue.
- B. Proof testing shall proceed by incrementally loading the anchor as follows:
  - 1. Loading Schedule:
    - a. AL, 0.25P, 0.5P, 0.75P, 1.0P, 1.2P, 1.33P.
- C. Each load step shall be held for a minimum of 1 minute or until the rate of movement is less than 0.001 inches per minute. At the 1.33P load, a creep test shall be performed by holding the load constant and recording movement readings at 1, 2, 3, 4, 5, 6, and 10 minutes. If the total creep movement between 1 and 10 minutes exceeds 0.04 in, the test load will be maintained for an additional 50 minutes. Whereupon, the movements will be recorded at 20, 30, 40, 50, and 60 minutes. Upon completion of creep test, reduce load and lock-off as specified herein in Section 3.8.
- D. Proof testing of the anchors may be performed before or after the construction of the foundation footing. However, if the Contractor elects to perform proof testing after the footing has been constructed, he does so at his own risk and will be required to replace any anchor that does not meet the acceptance criteria given in Section 3.7. This includes, but is not limited to any and all modifications to the pile cap to accept the replacement anchor.
- E. After the soil anchor grout has had an adequate setting time to attain a minimum design compressive strength, tension the anchor in accordance with the approved shop drawings and the following test procedures and requirements.

### 3.8 ACCEPTANCE CRITERIA

- A. Acceptance criteria at the maximum specified test load of 133% of the design load are as follows:
  - 1. The total movement measured at the anchor head shall be at least 80 percent of the theoretical elastic elongation of the total free stressing length.
  - 2. The total movement measured at the anchor head shall be less than the theoretical elastic elongation of the anchor length measured from the head of the jack to the center of the bond length.
  - 3. The creep movement measured at the anchor head under the maximum specified test load shall be less than 0.04 inches between the 1-minute and 10-minute readings. If this value is exceeded, then the total creep movement within the period of 6 and 60 minutes shall not exceed 0.08 inches.
- B. If any permanent anchor fails to meet acceptance criteria, re-test the anchor and determine the actual capacity which will produce the acceptance criteria. Additional anchors would then be installed in accordance with these specifications at a location specified by the Commissioner and tested to verify if the total capacity of the anchors exceeds the specified transfer load. No payment shall be made for additional anchors, anchor testing or any necessary structural connections. The expenses of all structural redesign and review shall be entirely borne by the Contractor.

**3.9 LOCK-OFF AND LIFT-OFF ANCHOR TESTING**

- A. All Performance-tested anchors shall be reloaded to the specified 133% of the design load and then reduced to the submitted approved lock-off load as specified below.
- B. The lock-off load for the specified as shown on the foundation drawing, but not more than 133% of the design load. The tensioning process shall be so conducted that the applied load and the elongation of the anchor may be measured at any time. The zero point for measurement of anchor elongation shall be established by the application of an initial alignment load equal to 10% of the specified transfer load. During the tensioning of each anchor, records shall be kept of gauge pressure and of anchor elongation at each specified jacking force. The anchor elongation shall be measured using a dial gauge capable of measuring to 0.001 inches.
- C. Pressure gauges shall be checked every week and at any time that there are indications of erratic results, the pressure gauge shall be checked against a master gauge, which shall be kept on site for this purpose. All tensioning shall be done in the presence of the Commissioner.
- D. Immediately after the lock-off, make a lift-off test for each anchor to confirm the transfer load. If the load in an anchor under check as determined by lift-off, is within five percent of the lock-off load, the anchor shall be deemed acceptable. If such load loss is greater than five percent of the lock-off load, the anchor shall either be rejected or subjected to re-stressing and further checking as directed by the Commissioner. The anchor, if rejected, shall be unloaded, the anchor head recession filled in with grout and a replacement anchor shall be installed as directed by the Commissioner at no additional expense to the City of New York.

**3.10 QUALITY CONTROL**

- A. The City of New York will retain a Special Inspection agency to perform special inspection of the installation of all the permanent soil tie-down anchors, including drilling, grouting, and anchor testing.
- B. The Commissioner will review all submittals related to the materials, installation, and testing of the soil tie-down anchor before the start of work.
- C. Cooperate with the Commissioner in the performance of the required tests.
- D. Replace all anchors that that are rejected by the special inspection.

**3.11 FINISHING**

- A. Permanent protection of the soil tie-down anchor head against corrosion shall be provided in accordance with the manufacturer's specifications. Fill recessed area around satisfactorily tested anchor with non-shrink cement grout. Submit anchor head corrosion protection materials and procedures to the Commissioner for approval as part of the shop drawing submittal.

**END OF SECTION 31 68 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 32 05 16****AGGREGATE MATERIALS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes:

1. Aggregate materials for precast concrete unit paving.
2. Aggregate material for compacted base courses.

B. Related Sections:

1. Section 03 30 00 "Cast-in-Place Concrete"
2. Section 03 33 00 "Architectural Concrete"
3. Section 03 48 00 "Precast Concrete Specialties"
4. Section 32 14 13 "Precast Concrete Unit Paving"
5. Section 32 91 13 "Soil Materials"
6. Section 32 91 19 "Landscape Grading"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 REFERENCES**

- A. NYSDOT Standard Specifications (latest edition), Section 300 - Bases and Subbases, Section 703 - Aggregates.

- B. NYSDOT Standard Specifications (latest edition) section 203-3.12 compaction.
- C. AASHTO - M147 - Materials for Aggregate and Soil-Aggregate.
- D. ASTM C136 - Method for Sieve Analysis of Fine and Coarse Aggregates.
- E. ASTM D2487 - Classification of Soils for Engineering Purposes
- F. ASTM D1557 - Test Methods for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures.
- G. ASTM D2167 - Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method.
- H. ASTM D2922 - Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
- I. ASTM D3017 - Test Methods for Moisture Content of Soil and Soil-Aggregate Mixtures.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 SUBMITTALS

- A. Test Reports, Gradation and Mechanical Analysis, and Samples.
- B. Submit gradation and material analysis for all types of aggregate materials to Commissioner for approval prior to ordering or delivering to site.
- C. Materials Source: Submit name of imported materials suppliers to Commissioner.
- D. Samples: Submit 1 lb. sample in sealed plastic bags labeled with source of all aggregates used as finish materials. Sample shall be typical of the lot of material to be delivered and installed on the site; provide an accurate indication of color, texture, and makeup of the material.

#### 1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Deliver, handle, and store materials in accordance with manufacturer's instructions.
- C. Every effort shall be made to maximize postindustrial/post-consumer recycled content. Certification of recycled content shall be in accordance with the Submittal Requirements herein.

### PART 2 - PRODUCTS

#### 2.1 AGGREGATE MATERIALS

- A. Aggregates for precast unit paver system: properly graded, non-frost susceptible crushed stone conforming to the following size and gradation requirements:

1. The granular base course aggregate material shall meet the requirements of the latest edition of the NYS Department of Transportation Standard Specification Section 304 "Subbase Course". Composition of the base course shall be Type 4 Subbase as indicated in the following table:

<u>Passing Sieve (Dry Analysis)</u>	<u>Percent Passing by Weight</u>
2"	100%
1/4"	30-65%
1/8"	75-90%
No. 40	5-40%
No. 200	0-10%

2. The granular leveling bed material for unit pavers shall be crushed bluestone screenings, free from clay lumps, organic or other deleterious material. Fines shall be evenly mixed throughout the aggregate. Screenings shall be graded within the following limits:

<u>Passing Sieve (Dry Analysis)</u>	<u>Percent Passing by Weight</u>
1/4"	100%
No. 4	90-100%
1/8"	75-90%
No. 20	30-50%
No. 40	20-40%
No. 80	10-25%
No. 200	5-15%

- B. Aggregate Material for compacted base course shall be clean crushed trap rock or ledgerstone conforming to the following limits:

<u>Passing Sieve (Dry Analysis)</u>	<u>Percent Passing by Weight</u>
2"	100%
1/4"	30-75%
No. 40	5-40%
No. 200	0-10%

- C. Recycled Concrete Aggregate (RCA) will not be accepted as base or setting courses for pavements, aggregates borders, strips or other site elements.
- D. Bank run gravel and rounded sands shall be rejected for use as aggregate materials.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Verify substrate has been inspected, gradients and elevations are correct, including crowns and cross sections, and is dry.

### 3.3 STOCKPILING

- A. Stockpile materials on site as needed at locations designated by the Commissioner.
- B. Stockpile in sufficient quantities to meet Project schedule and requirements.
- C. Separate differing materials with dividers or stockpile apart to prevent mixing.
- D. Direct surface water away from stockpile site so as to prevent erosion or deterioration of materials.

### 3.4 STOCKPILE CLEANUP

- A. Remove stockpile, leave area in a clean and neat condition. Grade site surface to prevent standing surface water.

### 3.5 PREPARATION

- A. Correct irregularities in substrate gradient and elevation by scarifying, reshaping, and re compacting.
- B. Do not place fill on soft, muddy, or frozen surfaces.
- C. Proof roll sub-grade thoroughly using a 10-ton roller with two passes, the second pass perpendicular to the first.

### 3.6 AGGREGATE PLACEMENT

- A. Place aggregate sub-base on the prepared sub-grade in layers of uniform thickness, conforming to the cross-section and thickness indicated on the plans. Maintain the optimum moisture content for compacting the aggregate sub-base during placement operations.
- B. When a compacted aggregate sub-base course is shown to be 6" thick or more, place the material in equal layers, except no single layer more than 8" or less than 3" in thickness when compacted.
- C. Level and contour surfaces to elevations and gradients indicated. Place in such a manner to minimize segregation. No aggregate sub-base shall be placed under adverse weather conditions.
- D. Compact and roll each layer of aggregate sub-base course to 95% maximum density.
- E. All compaction requirements shall be in accordance with NYSDOT Standard Specification section 203-3.12. The depth of each sub-base course shall not exceed the compactor's capability. Each compactor lacking the original manufacturer identification plates, or with altered or illegible plates, will not be recognized as acceptable compaction equipment and shall be removed from the site.
- F. Add small quantities of fine aggregate to coarse aggregate as appropriate to assist compaction.
- G. Add water to assist compaction. If excess water is apparent, remove aggregate and aerate to reduce moisture content.

- H. Use mechanical tamping equipment in areas inaccessible to compaction equipment.
- I. When the pavement sub-base becomes mixed with the sub-grade or any other material, it shall be removed and replaced with the appropriate material. The movement of any traffic over the fine graded aggregate sub-base is not recommended. When damage or contamination occurs, it must be restored before paving begins.

### 3.7 TOLERANCES

- A. Fine grading of the pavement sub-base finish course shall not vary more than 1/2 inch above or below true grade at any point.
- B. Scheduled Compacted Thickness: Within 1/4 inch.
- C. Flatness: Maximum variation of 1/2 inch measured with a 10-foot straight edge.

### 3.8 FIELD QUALITY CONTROL

- A. Quality Control Testing during construction: Allow testing service to inspect, test and approve each aggregate sub-base layer before further backfill or construction work is performed. Testing service shall review and test material and determine optimum moisture at which maximum density can be obtained in accordance with ASTM D 1557, modified proctor.
- B. Field Compaction testing will be performed in accordance with ASTM D1556 (sand cone method), ASTM D2167 (rubber balloon method), or ASTM D2922 (nuclear method).
- C. If tests indicate work does not meet specified requirements, remove work, replace and re-test.
- D. Frequency of Tests: Make at least one field density test for each layer of aggregate sub-base every 2,000 sq. ft.

### 3.9 WASTE MANAGEMENT

- A. Separate and dispose of waste in accordance with the DDC General Conditions.

**END OF SECTION 32 05 16**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 32 12 16****ASPHALTIC PAVING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 32 13 15 - Concrete Curbs and Pavement
- C. Section 32 17 23 – White Pavement Markings

**1.2 SUMMARY**

- A. Section includes:
  - 1. Provide material, labor, equipment, and services required to install asphaltic concrete paving and related work within the lot lines as shown on Drawings.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 SUBMITTALS**

- A. The Contractor must provide the following submittals to the Commissioner for all work in this section:
  - 1. Material Certificates
  - 2. Product Warranty
  - 3. Product Data
  - 4. Manufacturer's Certificate

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Regulatory Requirements
  - 1. Work of this Section shall comply with the requirements of the 2014 NYC Building Code, the NYC Department of Buildings, the NYC Department of Environmental Protection, and the New York City Department of Transportation.
  - 2. Requirements for asphaltic concrete, including, but not limited to handling, equipment, transportation etc., not specified herein shall conform to the more stringent of the New York City Department of Highway Standard Specifications, New York State Department of Transportation Standard Specifications, and AASHTO "Standard Specification for Transportation, Materials, Methods of Sampling and Testing".

**1.8 REFERENCES**

- A. References and industry standards listed in this Section are applicable to the Work. Unless more restrictive criteria or differing requirements are explicitly stated in the Specifications, or mandated by governing codes or regulations, the recommendations, suggestions, and requirements described in the referenced standards shall be deemed mandatory and applicable to the Work.
- B. Standard Specifications - New York City Department of Transportation Bureau of Highway Operations.
- C. Construction Specifications for Asphaltic Concrete and Other Plant-Mix Types - The Asphalt Institute, Fourth Edition.
- D. Standard Specifications - Construction and Materials - New York State Department of Transportation.
- E. American Society of Testing and Materials (ASTM)
- F. American Association of State Highway and Transportation Officials – "Standard Specification for Transportation, Materials, Methods of Sampling and Testing".

**1.9 DEFINITIONS**

- A. Subbase: Either the compacted subgrade or compacted aggregate base that is to receive the base course.
- B. Base Course: Asphaltic concrete mixture, usually referred to as plant-mix (described by the term binder mixture by NYCDOT), that is used as a base for the final asphaltic wearing surface when a Portland cement concrete base is not used.

- C. Surface Course: Final asphaltic concrete wearing surface, usually referred to as surfacing mix (described by the terms fine or extra fine asphaltic concrete mixture by NYCDOT), placed over plant-mix or Portland cement concrete base.

## 1.10 ENVIRONMENTAL REQUIREMENTS

- A. Asphaltic Concrete:
  - 1. Do not install asphaltic concrete paving when there is frost on the subbase or base; when the subbase or base is wet; or when the air temperature is 40°F or below.
  - 2. Materials containing frost will be rejected.
- B. Prime coat: Apply prime coat when air temperature is above 50°F and when temperature has not been below 35°F for 12 hours immediately prior to application. Do not apply when subbase is wet.
- C. Tack coat: Apply tack coat when air temperature is above 50°F and when temperature has not been below 35°F for 12 hours immediately prior to application. Do not apply unless base is completely dry.
- D. Pavement Sealer: Apply sealer under conditions similar to prime and tack coats.
- E. Joint Sealer: Apply joint sealer when air and substrate temperatures are above 40°F and rising for 12 hours after application.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Asphaltic Concrete: Materials shall comply with Section 3.01 of NYCDOT Standard Specifications for each item.
- B. Prime Coat: Cut-back asphalt type, AASHTO M82, (ASTM D2027) MC-30, MC-70 or MC-250.
- C. Tack Coat: Emulsified Asphalt; AASHTO M140 (ASTM D977) or M208 (ASTM D2397); SS-1h, CSS-1 or CSS-1h, Diluted with one part water to one part emulsified asphalt.
- D. Pavement Sealer: Polymer modified asphalt emulsion sealer meeting ASTM D2939, D140, D244, and D529; containing no coal tar, and less than 10 grams per liter of volatile organic compounds.
  - 1. Neyra Jennite AE polymer modified asphalt sealer
  - 2. VelveTop PM Polymer Modified Asphalt Sealer
  - 3. SealMaster Polymer-Modified Masterseal Sealer
  - 4. Or approved equal
- E. Reflective Cracking Membrane:
  - 1. Woven or Non-woven polypropylene fabric pre-coated with a rubberized adhesive base at least 18" in width used for preventing cracks in substrate emanating through the asphalt topping.
  - 2. Product:
    - a. Petrotac by Amoco Fabrics and Fibers Co., with Celotex primer

- b. Polyguard NW 75 by Polyguard Products, Inc., with 650 RC Liquid Adhesive and Mastic to prime surface.
- c. Bituthene S-5300 by W.R. Grace & Co
- d. Or approved equal

F. Joint Sealer: Cold-applied low modulus pourable two-component sealant comprised of polymeric compounds compatible for both Portland cement concrete and asphaltic concrete surfaces providing a flexible, rubber-like finish. Material shall not become brittle to temperatures as low as -20°F.

## 2.2 EQUIPMENT

- A. Provide proper compaction equipment to properly compact asphaltic concrete pavement.

## 2.3 MIXES

- A. Bituminous material shall come from one source only.
- B. Bitumen and aggregate composition shall be plant mixed entirely.
- C. Composition:
  - 1. Aggregate:

Percent Passing by Weight of Aggregate

Sieve Size	Surface Course (NYCDOT Extra Fine Surfacing Mix)	Surface Course (NYCDOT Fine Surfacing Mix- NYS Type 7F)	Base Course (NYC Binder- mix – NYSDOT Type 3)	Variation from Job Mix Formula* (Fine and Binder mix only)
1 1/2"	-	-	100	-
1"	-	-	95-100	-
1/2"	100	100	70-90	+6 (bin. mix only)
3/8"	98-100	-	-	-
1/4"	-	90-100	48-74	+7 (bin. mix only)
1/8"	-	45-70	32-62	+7 (+6 for fine)
No. 4	70-90	-	-	-
No. 8	38-65	-	-	-
No. 20	-	15-40	15-39	+7
No. 40	-	8-27	8-27	+7
No. 50	6-25	-	-	-

No. 80	-	4-16	4-16	+4
No. 200	2-8	2-6	2-8	+2

\*This is the tolerance from the approved job mix, but may never be out of the accepted range

2. Asphaltic Cement (Bitumen)

Percent Bitumen by Total Weight Job Mix Formula*	Variation from Mix	Soluble in Chloroform
Plant-mix	4.5-6.5	+.4
Fine Surfacing	5.8-7.0	+.4
Extra Fine Surfacing Mix	5.0-8.0	-

D. Penetration grade of the asphaltic cement shall be 85-100.

E. The Contractor has the option to provide either the fine or extra-fine surfacing mix.

2.4 SOURCE QUALITY CONTROL

A. Inspection

1. The Contractor will assign an inspector at the plant to ensure that the mix provided is that of the design mix.
2. Provide the inspector with any required testing apparatus to ensure conformance.
3. Notify the Commissioner 72 hours in advance of each asphaltic concrete placement so that the inspector can cover the work at the plant.

B. Testing:

1. The Testing Laboratory will determine the maximum theoretical density of each mix in accordance with ASTM D2041 and do an extraction and gradation test from samples obtained in the field.

PART 3 - EXECUTION

3.1 EXECUTION REQUIREMENTS

A. Refer to DDC General Conditions for execution requirements.

3.2 EXAMINATION

A. Verify that all grades and/or concrete slabs onto which asphaltic concrete is to be placed are at the required levels prior to placement. Verify that all miscellaneous concrete work has been installed. Notify the Commissioner in writing of conditions that will interfere with the proper completion of this Work. Do not begin work until all improper conditions are remedied. Installation of aggregate subbase is described in Section 31 00 00 - Earthwork.

3.3 PREPARATION

A. Protection:

1. Provide tarpaulins for use during conditions such as rain, chilling winds or unavoidable delay to cover and protect paving materials.
2. Protect pavement from debris and damage from equipment and other work.
3. Exercise care in applying bituminous materials to avoid smearing of adjoining concrete surfaces. Clean surfaces of bituminous materials when smearing occurs.

**B. Surface Preparation:**

1. Remove all loose and foreign materials before proof rolling and application of herbicide and prime coat.
2. Proofroll prepared subbase surface to check for unstable areas and areas requiring additional compaction.
3. Do not begin paving work until deficient subbase areas have been corrected and are ready to receive paving.
4. Subbase shall be dry and free from any standing water.
5. Apply weed control agent in accordance with manufacturer's recommended dosages and application instructions. Apply to compacted, dry subbase prior to application of prime coat.
6. Apply prime coat at rate of 0.20 to 0.50 gal per sq yd over compacted subbase. Apply material to penetrate and seal, but not flood, surface. Cure and dry as long as necessary to attain penetration and to allow for evaporation of volatiles.
7. Asphaltic concrete placed on Portland cement concrete pavements or existing asphaltic concrete pavement:
  - a. Any joints (expansion, contraction, construction, etc.) in the base shall be covered with the reflective cracking membrane.
  - b. The surface onto which the membrane is placed shall be dry and free of debris. Clean joints over 1/8" wide by pneumatic means and fill with asphaltic joint filler.
  - c. Prime surface to receive membrane as specified by the membrane manufacturer. Place the membrane in strict accordance with the manufacturer's instructions. Ends shall be overlapped 4" to 6".
  - d. Placement of the surface course shall closely follow membrane laydown. Do not place more membrane than can be overlaid that working day.

### 3.4 WOOD FORMS

- A. Provide temporary wood forms at perimeter of areas to be paved where permanent side supports (i.e., curbs, gutters or edgings) have not been constructed. Forms are to remain in place until surface course has been thoroughly rolled and compacted to required thickness.
- B. Form out areas to be depressed, such as high jump pits, etc.
- C. Oil wood forms before placing any paving materials against them. Stake forms securely to line and grade, using at least 3 bracing stakes or pins to each ten feet of length, to properly resist pressure and impact of roller without springing form.
- D. Forms are to rest firmly upon the thoroughly compacted subbase through their entire length.
- E. Clean and re-oil forms each time before reuse.

### 3.5 PLACEMENT

- A. General:

1. Prior to installation of pavement, verify all miscellaneous concrete items have been installed.
2. Establish and maintain required lines and elevations.
3. Place asphaltic concrete mixture on prepared surface, spread and strike-off. Spread mixture at the temperature required by Table 404-1 of the NYSDOT Standard Specification. Place inaccessible and small areas by hand. Place each course to required grade, cross-section, and compacted thickness.
4. Begin rolling when mixture will bear roller weight without excessive displacement. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.
5. After final compression, field density shall be not less than 92% of the theoretical maximum density as determined by ASTM D2041.

**B. Asphaltic Concrete Base Course - Plant-Mix:**

1. Provide plant-mix base unless Portland cement concrete base is shown on Drawings or specified herein.
2. Spread sufficient plant-mix to develop a uniform 4" thickness after rolling and compaction.
3. Sprinkle with clean water and compact with a vibratory 10-ton or greater roller. Smaller weight rollers may be required due to load prohibitions on existing structures. Provide multiple rollers for large areas. In areas where the use of a roller is impracticable, heavy mechanical tampers may be used to consolidate the material. Laydown temperature of mixture shall be adjusted to take into account the longer time of the many multiple passes required by smaller compactors or mechanical tampers to achieve the required density. Refer to NYCDOT Standard Specifications for other requirements.

**C. Asphaltic Concrete Surface Course - Surfacing Mix:**

1. Prior to placement of surface course, apply tack coat to contact surfaces of previously constructed asphaltic or Portland cement concrete and surfaces abutting or projecting into asphaltic concrete pavement. Distribute at rate of 0.05 to 0.15 gal per sq yd of surface. Allow to dry until at proper condition to receive paving.
2. Place surface course over base only when base is dry and free from standing water.
3. Spread in loose layer and of such depth to result in a uniform course having the thickness of 1 1/2" after compaction and rolling (1" for surface course over concrete base).
4. Compact the material with approved roller to a smooth even surface and to the levels indicated.
5. Roller shall be a minimum 10-ton tandem type having a rear wheel minimum compression of 225 lbs per lineal inch. Refer to subparagraph B.3 immediately above for other requirements.
6. Motion of roller shall be slow enough to avoid displacement of the surface rolled.
7. Keep roller wheels moistened with water to prevent adhesion of the materials to wheels, but without use of excessive amount. Use of any liquids other than water for this purpose is prohibited.
8. If the operation of laying materials is interrupted, the end of the laid material shall be left unrolled until the work is resumed so that there will be no joints in the topping.
9. If it is necessary to pass the roller over or to permit traffic to pass over such temporary end, thus consolidating it, cut back the material before recommencing laying operations in order to present a fresh clean surface for contact with the newly placed material.
10. Make joints between old and new pavements, or between successive days' work, to ensure continuous bond between adjoining work. Construct joints to have same texture, density and smoothness as other sections of the asphaltic concrete course. Clean contact surfaces and apply tack coat.

11. The use of liquid bitumen or hot smoothing irons in finishing such joints is prohibited.
12. At locations adjacent to curbing and gutters inaccessible to rollers, compression shall be effected with iron tampers weighing not less than 25 lbs, having a maximum bearing area of 48in<sup>2</sup>.
13. Any surfacing material (ie. sealer, paint, wearing surface, etc.) to be placed on the asphaltic concrete surface shall only be done after the asphaltic concrete has cured and the oils have dissipated. Consult with the product manufacturer for their exact requirements.
14. Where asphaltic concrete abuts concrete walls, existing asphalt pavement or concrete pavements apply asphalt joint sealant. Neatly tape all sides of joints, including vertical surfaces where existing) to prevent damage and smearing of material on surfaces and protect until cured.

### 3.6 FINISH

- A. The rolled finish surface shall be free from porosity, fissures, or blemishes, true to crown and grade; free from depression, waves, bunches, or unevenness so as to allow complete runoff.
- B. Should defects in composition compactness or surface finish appear in the completed work, remove defective areas to full depth of the course and replace with thickness and finish specified.
- C. With permission of the Commissioner, minor surface defects may be restored with approved sealing compound.
- D. Cracking, blistering, running, or deviation from requirements specified above that occur during the guarantee period are considered defects under the warranty conditions of the Contract.

### 3.7 PATCHING

- A. Remove and replace paving areas mixed with foreign materials and defective areas in a manner acceptable to the Commissioner. Cut-out such areas and fill with fresh, hot, asphaltic concrete. Compact by rolling to maximum surface density and smoothness.

### 3.8 PAVEMENT SEALER APPLICATION

- A. Do not apply pavement sealer on pavements covered with other materials, ie. unit pavers, resilient surfacing. Apply on all other pavements.
- B. After asphaltic concrete surface course has been tested and approved for allowable tolerances and the surface is hardened to a degree acceptable to the sealer manufacturer (a minimum of 30 days), apply the sealer in accordance with the manufacturer's instructions.
- C. Sweep or mechanically clean surfaces thoroughly free of dust, dirt and foreign materials; remove oil and grease spots with household detergent. Flush entire surface with water; remove all remaining water puddles. Apply primer if recommended by the manufacturer.
- D. Dampen pavement as recommended by the manufacturer; pour sealer mix in spots or ribbons, then spread evenly with push broom or squeegee. Mechanical applicators may be used, and mix must be periodically agitated for uniformity. Two coats shall be applied, allowing for complete drying, tack free, between coats. Surface shall be uniform, with no holidays or pinholes.
- E. Allow sealer to dry about 24 hours minimum depending on weather conditions before opening surface to traffic. Temperature for drying conditions shall not be less than 50°F for 48 hours after application.

- F. Apply at a minimum rate per coat of 1.10 gallons of sealer concentrate for every 100 sq ft of surface, or more concentrate if required by the sealer manufacturer. Concentrate shall be mixed with water and clean, dry, silica sand in quantities recommended by the manufacturer. Typical sand content is 5 pounds per gallon of concentrate, and shall meet fineness rating recommended by manufacturer. Maximum water content is 15% of undiluted concentrate volume.
- G. Apply Line Markings per manufacturer's recommendations.

### 3.9 TOLERANCES

- A. The thickness of the plant-mix and surface course shall not vary by more than 1/2".
- B. The finish elevation for the plant-mix shall not vary from plan grade by more than 1/2", the surface course by more than 1/4".
- C. The smoothness tolerance for the plant-mix is 1/4", the surface course 1/8", when measured as described under "Field Quality Control".

### 3.10 FIELD QUALITY CONTROL

- A. Testing and Inspection:
  - 1. The City of New York's inspector will take samples of the asphaltic concrete to check conformance with the design mix and will verify the in-place density.
  - 2. Pay for any tests such as cores required by the Commissioner when such tests show non-conformance with the Drawings and Specifications.
  - 3. Test finished surface of each asphaltic concrete course for smoothness, using 10-foot straightedge applied parallel with, and at right angles to, centerline of paved area.
  - 4. Check the final surface for depressions by applying water in the presence of the Commissioner. Water should not pond and should flow to all catch basins and trench drains.
- B. Survey: Provide a survey showing elevation of finished surface on 25 foot intervals.

### 3.11 CLEANING

- A. After completion of paving operations, clean surfaces of excess or spilled asphalt materials to the satisfaction of Commissioner.

### 3.12 PROTECTION

- A. After final rolling, do not permit vehicular traffic on asphaltic concrete pavement until it has cooled and hardened so as not to be marked and in no case sooner than 6 hours.
- B. Provide barricades and warning devices as required to protect pavement and the general public.
- C. Cover openings of structures in the area of paving until permanent coverings are placed.

**END OF SECTION 32 12 16**

THIS PAGE LEFT INTENTIONALLY BLANK

**SECTION 32 13 15****CONCRTE CURBS AND PAVEMENT****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 32 12 16 - Asphaltic Paving

**1.2 SUMMARY**

- A. Section includes:
  - 1. Furnish material, equipment, labor, services required to provide for concrete curbs, pavements and footings. Work includes the installation of formwork, reinforcement, expansion joints and other items listed herein within the site. Provide special formwork or form liners for concrete with smooth finishes. Allow ample time and facility for the Work of other Divisions to be installed.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 SUBMITTALS**

- A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:
  - 1. Material Certificates
  - 2. Product Warranty
  - 3. Product Data
  - 4. Manufacturer's Certificate

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements".
- B. Regulatory Requirements:
  - 1. 2014 New York City Building Code: Work of this Section shall conform to all requirements of the 2014 NYC Building Code and all applicable regulations including safety, health, noise, and anti-pollution regulations. Where more severe requirements than those contained in the 2014 NYC Building Code are given in this Section, the requirements of this Section shall govern.
  - 2. Industry Standards: The ACI Standards listed under references apply to Work of this Section. Where more severe requirements than those contained in the Standards are given in this Section or the 2014 New York City Building Code, requirements of this Section or the Building Code shall govern. The Contractor shall keep a copy of ACI SP-15 - "Field Reference Manual" at the site.
- C. Certifications:
  - 1. Acquire cement and aggregate from same source for all work. If a change in suppliers is required, a new mix submittal must be produced with the new material and submitted for approval.
- D. Coordination:
  - 1. Coordinate this work with the work of other Divisions so that items to be installed are done so correctly and in proper sequence.

**1.8 REFERENCES**

- A. References and industry standards listed in this Section are applicable to the Work. Unless more restrictive criteria or differing requirements are explicitly stated in the Specifications, or mandated by 2014 New York City Building Code, the recommendations, suggestions, and requirements described in the referenced standards shall be deemed mandatory and applicable to the Work.
- B. American Society of Testing and Materials (ASTM) standards, latest editions.
- C. American Concrete Institute (ACI) standards, latest editions.
- D. "Placing Reinforcing Bars - CRSI-WCRSI Recommended Practices", latest edition. Concrete Reinforcing Steel Institute.

**1.9 DEFINITIONS****A. Exposed to view:**

1. Situated so that it can be seen from eye level from a public location. A public location is that which is accessible to persons not responsible for operation or maintenance of the building.

**1.10 DESIGN REQUIREMENTS:****A. Performance Characteristics:**

1. Curbs: Normal weight concrete with a minimum compressive strength of 3500 psi, air entrained, and a maximum water to cement ratio of 0.45.
2. Exterior slabs on grade (pavements, stairs, etc): Normal weight concrete with a minimum compressive strength of 3500 psi, air entrained, and a maximum water to cement ratio of 0.40.

- B. Mix design for concrete with smooth form is to contain a high-range water reducer (super plasticizer).

**PART 2 - PRODUCTS****2.1 MATERIALS**

- A. Rough Formwork: Shall be Commercial Douglas Fir, DFPA: 5/8" thick minimum.

- B. Overlaid Plyform Formwork: Basis-of-Design Product: Subject to compliance with requirements provide B-Matte Formguard by Simpson Timber Company or comparable product by one of the following:

1. Dayton Richmond Concrete Accessories
2. Forest Products Supply Co.,
3. Or approved equal.

- C. Smooth Form Finish Formliner: Basis-of-Design Product: Subject to compliance with requirements provide #340 Smooth Face by Greenstreak or comparable product by one of the following:

1. Architectural Polymers
2. Sika
3. Or approved equal.

- D. Release Agent: Basis-of-Design Product: Subject to compliance with requirements provide VOC compliant material such as those of the Cresset Chemical Company for coating forms or comparable product by one of the following:

1. W.R. Meadows
2. TK Products
3. Or approved equal

- E. Form Ties: Wire ties not permitted. Form ties for exposed concrete shall be adjustable, leave no metal closer than 1 1/2" to the surface, and free of devices which leave holes or depressions larger than 7/8" back of exposed surface.
- F. Reinforcing Bars: All reinforcing bars shall be of deformed type of new billet steel conforming to current requirements of ASTM A615 Grade 60. No rail or re-rolled steel will be permitted. All bars shall be epoxy coated in accordance with ASTM A775.
- G. Welded Steel Wire Fabric: Wire Fabric shall conform to the requirements of ASTM A185. All wire mesh shall be epoxy coated in accordance with ASTM A884.
- H. Supports for Reinforcement: Support for reinforcement supported by ground shall be coated wire bar supports or bar supports made of dielectric material or other acceptable materials or precast concrete block, 4" square minimum, having a compressive strength equal to that of the concrete being placed. Wire bar supports shall be coated with dielectric material for a minimum distance of 2" from the point of contact with the epoxy-coated reinforcing bars.
- I. Cement: Shall conform to ASTM C150 Type II and shall be of the non air-entrained type.
- J. Admixtures:
  - 1. The use of admixtures shall comply with the requirements of Section BC 1903.6 of the 2014 NYC Building Code. The final soluble chloride content in concrete, percent by weight of cement, due to the addition of admixtures and other ingredients shall not exceed 0.05 at 28 days.
  - 2. Air-entraining admixtures shall conform to ASTM C260.
  - 3. Chemical admixtures shall conform to ASTM C494.
  - 4. Slag cement: ASTM C989, Grade 100 or 120. Basis-of-Design Product: Subject to compliance with requirements provide GranCem slag cement as manufactured by the St. Lawrence Cement Company or comparable product by one of the following:
    - a. Lehigh Cement Company
    - b. LafargeHolcim
    - c. Or approved equal
  - 5. The amount of cement required by the 2014 NYC Building Code may be reduced by 8% with the use of slag cement that has been reviewed and approved by the Commissioner.
- K. Water: Shall be clean potable water free of injurious foreign matter conforming to the requirements of Section BC 1903.4 of the 2014 New York City Building Code.
- L. Aggregate: Aggregate shall conform to ASTM C33, No.57, No.67 or No.8. Maximum size of coarse aggregate shall conform to paragraph 3.3.2 of ACI 318.
- M. Curing Compounds:
  - 1. Clear Curing and Sealing Compound (A.I.M. Regulations - VOC Compliant, 350 g/l): Liquid type membrane forming curing compound, clear styrene acrylate type, complying with ASTM C1315, Type I, Class A, 25% solids content minimum. Moisture loss shall be not more than 0.40 Kg/m<sup>2</sup> when applied at 300 sq. ft./gal. Manufacturer's certification is required.
  - 2. Curing Compounds: Basis-of-Design Product: Subject to compliance with requirements provide "Super Diamond Clear VOX" by The Euclid Chemical Company or comparable product by one of the following:

- a. Master Builders
- b. W.R. Meadows
- c. Or approved equal

**N. Bonding Agent:**

1. Epoxy/acrylic resin that will not form a vapor barrier with the concrete with the following properties:
  - a. Bond strength of 1800 psi in 2 hours when tested in accordance with ASTM C882.
  - b. Flexural strength of 2000 psi in 28 days when tested in accordance with ASTM C78.
  - c. Tensile strength of 600 psi in 28 days when tested in accordance with ASTM C496.
2. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. "CR246 Sto Bonding and Anti-corrosion Agent" by Sto Concrete Restoration Division
  - b. Armatec 110 by Sika Corp.
  - c. Euclid Chemical
  - d. Or approved equal

**O. Expansion Joint Filler: Closed-Cell Polyurethane or Closed-Cell Expanded polyethylene Joint Filler - Resilient, compressible, semi-rigid**

1. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. W.R. Meadow's Ceramar
  - b. A.C. Horn's Closed Cell Plastic Foam Filler, Code 5401
  - c. Sonneborn's Sonoflex F
  - d. Or approved equal.

**P. Expansion Joint Sealant: Type 1A Sealant**

1. For Horizontal Joints: Two-part, self-leveling polyurethane sealant for traffic bearing construction. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. Mameco's Vulkem 255
  - b. Pecora's Urexpan NR-200
  - c. Bostik's Chem-Calk 550 or Products Research & Chemical's RC-2SL
  - d. Or approved equal.
2. For Vertical Joints: Two-part, non-sag polyurethane sealant. Subject to compliance with requirements, products that may be incorporated into the Work include the following:
  - a. Mameco's Vulkem 227
  - b. Pecora's Dynatrol II
  - c. Bostik's Chem-Calk 500 or Products Research & Chemical's RC-2
  - d. Or approved equal.

## 2.2 MIXES

- A. General: Concrete for all parts of the Work shall be of the specified quality capable of being placed without excessive segregation and, when hardened, of developing all characteristics required by the Specifications and Drawings.
- B. Strength: Strength requirements given in Section 1.9 of this Specification are based on 28-day compressive strength, unless high early strength is specified, in which case required strengths are based on 7-day compressive strength.
- C. Method of Proportioning:
  - 1. Proportion concrete mix of strength listed in B above in accordance with the requirements of Section BC 1905.2.3 of the 2014 NYC Building Code. The Testing Laboratory and the Commissioner will review the design mix.
  - 2. Mix designs are specific to material used, concrete producer, and method of placement. Each mix design must be reviewed and accepted by the Commissioner.
  - 3. Proportion and produce normal weight concrete to have a maximum slump of 4" or less. A tolerance of up to 1" above the indicated maximum shall be allowed for individual batches provided the average for all batches or the most recent 10 batches tested, whichever is fewer, does not exceed the maximum limit. The slump shall be determined by ASTM C143. Concrete containing High Range Water Reducer shall have a slump not exceeding 9", unless otherwise approved by the Commissioner. The concrete shall arrive at the job site at a slump of 2" to 3", be verified by the Commissioner, and the HRWR admixture added to increase the slump to the approved level.
- D. Concrete shall be air-entrained with an air content for the grading size of coarse aggregate as follows:
  - 1. No.8.....7 1/2%
  - 2. No.57 or 67.....6%
  - 3. Tolerance on air content as delivered shall be +1.5%.

## 2.3 SOURCE QUALITY CONTROL

- A. Tests:
  - 1. The Commissioner will review the proposed materials for compliance with the Specifications prior to construction.
  - 2. The Testing Laboratory will perform field tests as work progresses as listed in "Field Quality Control".
- B. Inspection:
  - 1. Testing Laboratory:
    - a. Concrete work is subject to Quality Control Inspection.
    - b. The Commissioner will assign a licensed concrete testing laboratory to perform the required field testing. The Testing Laboratory will review the mix design, perform field testing, and inspect the work as it progresses. The listing of services to be performed by the testing Laboratory are given in Section 1.6 of ACI 301.
    - c. The Testing Laboratory must be present when the concrete is being placed. The Commissioner may elect to have the laboratory present at the plant to witness the batching and mixing of the concrete.

2. Notification

- a. Notify the Commissioner in writing at least forty-eight hours in advance of each concrete placement.
- b. During the placement of the concrete, notify the Commissioner immediately of any delay at the concrete plant or at the job site. Do not mix concrete or add admixtures unless the Commissioner and Testing Agency Technician are present.

3. Contractors Responsibility for Quality Control

- a. The Commissioner and the Testing Laboratory shall receive the producer's Computer Batch Ticket for each truck.
- b. The tests and inspections, as provided in the 2014 New York City Building Code, do not in any way relieve the Contractor of responsibility to construct the Work in accordance with the Drawings and Specifications and to use safe, standard methods of construction at all times, safeguarding the public, workmen, and structure. The Contractor shall be solely responsible for the physical control of the materials and concrete mixes, and shall see that such mix designs, tests, and controls are in accordance with the 2014 New York City Building Code and Specifications. The Contractor's superintendent shall attest that the work was installed in accordance with the documents.

## PART 3 - EXECUTION

### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

### 3.2 EXAMINATION

- A. Prior to placement of concrete, verify that the concrete cover over the reinforcement is that specified on Drawings.
- B. Verify that reinforcement and all other embedded items are provided and held securely, positioned accurately, and will not be a detriment to concrete placement.
- C. Examine all adjoining work on which this Work is in anyway dependent for proper installation and workmanship. Report to the Commissioner any condition that prevents the performance of this Work.

### 3.3 PROTECTION

- A. Protect concrete members on grade and the subgrade from freezing before and after installation. Provide blankets and other items necessary.
- B. Protect adjacent finish materials and previously poured concrete against spatter during concrete placement.
- C. Provide and maintain barricades and safeguards around openings, etc. to protect workmen from injury and to comply with the 2014 New York City Building Code and OSHA regulations.

### 3.4 FORMWORK

- A. Provide formwork wherever necessary to confine concrete to the required shapes shown on Drawings. Follow all procedures of Section 2 of ACI 301, ACI 347, and Section BC 1906 of the 2014 NYC Building Code. Formwork, reinforcement, and embedded items shall be clean of all accumulated mortar from previous concreting and other foreign material. Restore or replace any formwork as required.
- B. Cover the surfaces of the rough or overlaid plyform formwork (when used) with an approved form release agent that will effectively prevent absorption of moisture, prevent bond with the concrete, and which will not stain the concrete surfaces. Do not apply oil or release agents on formwork for concrete to receive additional concrete (such as at construction joints). Apply at a rate that will help achieve the finish specified below. Follow manufacture's recommendations.
- C. Adequately support and substantially brace formwork to hold lines and shape. Securely brace forms against lateral deflection. Formwork shall be tight jointed to prevent leakage of concrete.
- D. Place chamfer strips in the corners of forms to produce beveled edges (chamfers) on permanently exposed surfaces.
- E. Provide "Rough Form Finish" for surfaces not exposed to view. Use plywood or metal forms coated with a release agent.
- F. Provide "Smooth Form Finish" for surfaces exposed to view and the elements. Use dress, square-edged lumber with form liner or overlaid plyform forms with applicable release agent. Do not exceed manufacture's recommendations for number of re-uses for the form liner or overlaid plyform. Arrange the forms or form liner in an orderly and symmetrical fashion, keeping the number of seams to a practical minimum.
- G. Remove forms in such a manner as to assure the complete safety of the structure as required by Section BC 1906.5 of the 2014 NYC Building Code. Formwork not supporting the weight of the concrete may be removed as soon as the concrete has hardened sufficiently to resist damage from removal operations and as required by H below.
- H. When restoration of surface defects or finishing is required at an early age, remove forms as soon as the concrete has hardened sufficiently to resist damage from removal operations.

### 3.5 REINFORCEMENT

- A. Place reinforcement in accordance with CRSI "Placing Reinforcement Bars", Section 3 of ACI 301, and Section BC 1907.5 of the 2014 NYC Building Code.
- B. Unless otherwise permitted, welding of crossing bars (tack welding) for assembly of reinforcement is prohibited.
- C. Support and fasten together all reinforcement to prevent displacement by construction loads or placing of concrete.
- D. Lifting of bars and welded wire fabric into position during placement of concrete is not permitted.
- E. Where the concrete surface will be exposed to the weather in the finished structure, the portions of all accessories within 1/2" of the concrete surface shall be non-corrosive or protected against corrosion.

- F. Provide minimum protective cover given in Section BC 1907.7 of the 2014 NYC Building Code if not indicated on Drawings.
- G. All splices not shown on the Project Drawings shall be shown on the shop drawings and approved by the Commissioner.
- H. All embedment lengths not shown on the Project Drawings shall be shown on the shop drawings and approved by the Commissioner.

### 3.6 PREPARATION

- A. Remove ice, excess water, trash, and rubbish from forms.
- B. Remove hardened concrete from inner surfaces of conveying equipment and all formwork, reinforcement, and dowels.
- C. Prepare previously placed concrete to be in contact with new concrete in the manner described under "Construction Joints".
- D. Prepare existing concrete to be in contact with new concrete by roughening and cleaning the surface and applying a bonding agent. Surface must be free of laitance. Concrete must be placed after agent cures and within 24 hours of applying bonding agent in accordance with the directions of the manufacturer.
- E. Do not place concrete on frozen ground.

### 3.7 JOINTS AND EMBEDDED ITEMS

- A. Construction Joints:
  - 1. Make joints not shown on Drawings at locations that will least impair the strength of the structure and comply with requirements of Section BC 1906.8 of the 2014 NYC Building Code. Such location is subject to the approval of the Commissioner.
  - 2. Continue reinforcement across joints. Provide longitudinal keys at least 1 1/2" deep in walls and provide other keys as required.
  - 3. Thoroughly clean concrete surface of oil, grease, and other contaminants and remove all laitance prior to placement of adjoining concrete. Roughen surface of the concrete in an approved manner that will expose the aggregate uniformly and will not leave laitance, loosened particles of aggregate, or damaged concrete at the surface. Dampen surface immediately prior to placement.
- B. Expansion Joints:
  - 1. Do not extend reinforcement or other embedded metal items bonded to concrete continuously through expansion joint. Provide smooth dowels greased on one end at the joints or insert into pvc sleeve of length greater than the dowel length by .75" minimum.
  - 2. Provide expansion joint filler at the joint of the sizes indicated on the Drawings or specified herein.
- C. Embedded items:
  - 1. Place all fence sleeves, shoes, and other embedded items required for the Work of other Divisions or for their support prior to concreting.

2. Provide ample notice and opportunity for items of other Division to be introduced and/or furnished for installation before concrete is placed. Coordinate the Work of the other Divisions so all items are placed in their proper location.
3. Set metal pipe sleeves, sockets, shoes, etc. into concrete to receive fence posts or any other items, all as indicated on details.

### 3.8 MIXING AND PLACING CONCRETE

#### A. General:

1. Notify Commissioner at least 48 hours in advance of each concrete placement. Do not place concrete without approval of the Commissioner.
2. Do not allow rainwater to increase mixing water nor damage surface finish.
3. When placing concrete in cold weather (below 40oF), concrete shall have an accelerating admixture added.
4. Production of concrete, including batching and mixing, shall be done in accordance with the requirements of Section 4 of ACI 301 and Section BC 1905.8 of the 2014 New York City Building Code.
5. Placement of concrete shall be done in accordance with the requirements of Section 5 of ACI 301 and Sections BC 1905.9 through 1905.13 of the 2014 New York City Building Code. All consolidation shall be done by vibration.

#### B. Mixing:

1. Batch, mix, and transport ready-mixed concrete in accordance with the appropriate sections of ASTM C94 and Section BC 1905.8.2 of the 2014 NYC Building Code. Truck mixers and agitators shall meet the requirements of the Truck Mixers Manufacturer's Bureau or shall comply with Section 8.1.2 of ASTM C94 and shall be NYSDOT approved. All trucks shall have working revolution counters and site gages.
2. Batch and mix other concrete in accordance with subsection 4.3.1 of ACI 301.
3. Use of chemical admixtures must be approved by the Commissioner.
4. Unless otherwise approved by the Commissioner, concrete shall be deposited within 1 1/2 hours or 300 revolutions of the mixing drum, whichever comes first, after introduction of water to the cement or cement to the aggregate. When the ambient temperature rises above 90oF, the time shall be decreased to 1 hour.
5. Tempering and control of mixing water
  - a. Mix concrete only in quantities for immediate use. Concrete which has started to set shall not be retempered, but shall be discarded. Water shall not be added at the site.
  - b. For concrete containing HRWR (Superplasticizer), if loss of slump occurs, HRWR may be redosed at the site as long as a "flash set" has not occurred. Redosage procedures must be discussed and approved by the Commissioner and the admixture manufacturer.

#### C. Placing: Place concrete in accordance with ACI 304R, ACI 318, and Sections BC 1905.9 and BC 1905.10 of the 2014 NYC Building Code.

1. Consolidate all concrete by vibration so that the concrete is thoroughly worked around the reinforcement, around embedded items and into corners of forms, eliminating all air or stone pocket or weakness. Internal vibrators shall be the largest size and most powerful that can be used in the Work, as described in Table 5.1.5 of ACI 309R, with a minimum frequency of 7000 revolutions per minute and shall be operated by competent workmen. Over-vibrating and use of vibrators to transport concrete within forms is not permitted.

Insert and withdraw vibrators at many points, from 18" to 30" apart. At each insertion, the duration shall be sufficient to consolidate the concrete but not sufficient to cause segregation, generally from 5 to 15 sec duration. Keep a spare vibrator on the job site during all concrete placing operations.

2. Cold Weather Concrete Protection: When the mean daily temperature of the atmosphere is less than 40oF during concreting, or within 24 hours thereafter, follow the procedures outlined in ACI 306R to protect the concrete. Temperature of the plastic concrete shall be no lower than 55oF. Heat all forms, reinforcing steel, and surfaces to receive concrete above the freezing point and keep them completely free of frost, snow, and ice.
3. Hot Weather Protection: When the mean daily temperature of the atmosphere is over 90oF during concreting, follow the procedures outlined in ACI 305R to protect the concrete.

### 3.9 FINISHING OF FORMED SURFACES AND RESTORATION OF SURFACE DEFECTS

#### A. General:

1. Remove forms as soon as practicable.
2. Restore surface defects, including tie holes and cracks, immediately after form removal. Patches shall be of quality to match the specified finish.
3. Remove oil, grease, compounds, and other contaminants from surfaces and areas to be restored.
4. Provide finishes specified below immediately after form removal.
5. Provide curing and protection.

#### B. Restoration of Surface Defects:

1. Restore surface defects in accordance with subsection 5.3.6 of ACI 301. At the Commissioner's discretion, repair mortars and coatings shall be employed to rectify defects. Materials shall be as selected by the Commissioner.

#### C. Tie Holes and Other Restorations:

1. Remove ties, nails, and other form accessories below the concrete surface when the surface is exposed to view and/or the elements. For surfaces not exposed to view or the above mentioned conditions, remove metal to the surface.
2. Undercut surfaces of holes. After cleaning and thoroughly dampening the holes, fill them solid with the patching mortar. The mortar shall match the color of the existing concrete for concrete exposed to view as specified in paragraph B above.

#### D. Formed Finishes:

1. Rough Form Finish: Provide for concrete not exposed to view.
  - a. Restore concrete surface as indicated above.
  - b. Chip or rub off fins exceeding 1/4" in height.
2. Smooth Form Finish: Provide for concrete exposed to view. Provide for concrete exposed to view. Concrete shall have a CS 3 or better finish as defined by the Cresset Chemical Company standards and shall have been placed without the need for patching or removal of fins, etc.
  - a. Restore concrete surfaces as indicated above.
  - b. Chip or rub off fins completely and grind smooth.
  - c. Provide smooth rubbed finish as follows:

- 1) Produce on newly hardened concrete no later than the day following form removal.
- 2) Wet the surfaces and rub with a No. 16 carborundum brick or other equal abrasive to obtain a smooth, even surface of uniform appearance without applying any cement or other coating.
- 3) Obtain the final finish by thoroughly rubbing with a No. 30 carborundum brick. The surface shall be wet for a period of 3 days. The Commissioner shall be the sole judge if the finish is proper.

E. Acceptance of Concrete Finish:

1. If the finish produced is not acceptable to the Commissioner, the Contractor shall be responsible for all expenses incurred to produce an acceptable finish by whatever means determined by the Commissioner. Remove stains, rust, efflorescence, and other surface deposits to the satisfaction of the Commissioner.

3.10 PAVEMENTS AND SLABS

A. General:

1. Mixing and placing shall be carefully coordinated with finishing. Do not place concrete more rapidly than it can be spread, straightedged, and darried or bull floated. Provide leveling, floating, troweling, etc. at the correct time interval after pouring to prevent dusting and a non-durable surface as specified in ACI 302.1R. These operations must be performed before bleeding water has an opportunity to collect on the surface.
2. To obtain good surfaces and avoid cold joints, the size of finishing crews shall be planned with due regard for the effects of concrete temperature and atmospheric conditions on the rate of hardening of the concrete.

B. Finishing:

1. Slope pavements uniformly toward drains. If pitch or elevations are not shown on Drawings, provide a minimum of 1/8" per foot.
2. Finish pavement surface to a true smooth plane and texture with a toothed roller or float with a wood float. Score concrete pavement in squares of approximately 5'-0" and/or as shown on Drawings. Each rectangular slab shall have all edges neatly rounded with proper tools and be bounded on all sides by a troweled border about 1" in width.
3. Level ramp, step and driveway surfaces with wood float and follow with a broom finish perpendicular to direction of traffic.

C. Placement:

1. General:

- a. Aggregate base material and preparation is given in Section 31 00 00 - Earthwork.
- b. Where pavements to remain are damaged or destroyed as a result of the Work, patch, restore, or replace as required. Color to match existing.
- c. Subgrade and/or aggregate base shall be free of frost before concrete placing begins.
- d. Control Joints:

- 1) Primary Method: Soff-Cut System method, by Soff-Cut International, Corona, CA (800)776-3328. Finisher must have documented successful experience in the use of this method prior to this project. Install cuts within 2 hours after

final finish at each saw cut location. Use 1/8 inch thick blade, cutting 1 1/4 inch into slab.

- 2) Optional Method (Where Soff-Cut System Method Equipment is Not Available): Properly time cutting with the set of the concrete. Saw-cut control joints within 12 hours after finishing. Start cutting as soon as the concrete has hardened sufficiently to prevent aggregates being dislodged by the saw. Complete cutting before shrinkage stresses become sufficient to produce cracking. Use 1/4-inch-thick blade, cutting 1/4 slab depth.

- e. Dampen subgrade or aggregate base immediately prior to placement of concrete.
- f. Pour slab to required thickness after installation of reinforcement.

## 2. Pavements

- a. Provide 4" thick concrete slab unless otherwise indicated.
- b. Provide 6x6-W2.9xW2.9 WWF placed 1 1/2" from top surface.

## 3. Driveways

- a. Provide 7" thick concrete slab.
- b. Provide 4x4-W4xW4 placed 2" from top surface.

## 4. Expansion joints

- a. Provide expansion joints for all exterior concrete pavement, slabs under asphalt, driveways, etc. specified under this Section. Expansion joints shall occur at intervals not to exceed 20' in each direction or as indicated on Drawings.
- b. Provide continuous expansion joints at the following locations: Driveways and other concrete pavements abutting area walls, buildings, retaining or any other walls, check pieces, steps, curbs.
- c. Expansion joint shall be 1/2" wide, full depth minus 1/4" to allow for the poured joint sealer.

### 3.11 MISCELLANEOUS CONCRETE WORK

- A. Provide curbs, footings, walls, ramps, and other miscellaneous concrete work.

### 3.12 PATCHING AND BONDING TO EXISTING CONCRETE

- A. Provide bonding agent whenever new concrete is to be poured against existing concrete, whenever the time between concrete pours is longer than that allowed for proper bond, and wherever bonding agent is indicated on the Drawings to be applied.
- B. Remove loose concrete from surface to be bonded with new concrete and clean. Remove rust from reinforcement and structural steel by power chipping and power driven brushes.
- C. Apply bonding agent in accordance with manufacturer's specifications. Pour concrete as soon as bonding agent has cured and within 24 hours after placement. If the 24-hour period has elapsed, then the bonding agent must be reapplied.

### 3.13 CURING AND PROTECTION

- A. General:

1. Begin curing concrete immediately after placement and finishing. Protect all freshly deposited concrete from premature drying and excessively hot or cold temperatures and maintain it with minimal moisture loss at a relatively constant temperature for the period of time necessary for the hydration of the cement and proper hardening of the concrete. Detailed procedures are given in ACI 308.
2. Do not apply curing compounds to surfaces receiving additional concrete. Provide only wet curing.

**B. Procedure:**

1. Concrete surfaces not in contact with forms:
  - a. Ponding or continuous non-manual sprinkling.
  - b. Absorptive mat or fabric, sand, or other covering kept continuously wet.
  - c. Curing compounds conforming to ASTM C1315.
2. Concrete surfaces in contact with forms:
  - a. Minimize moisture loss from forms exposed to heating by the sun by keeping forms wet until they are removed.
  - b. After form removal, cure with one of the methods listed in 1 above.
3. Continue curing until a total of 7 days has elapsed during which the temperature of the air in contact with concrete has remained above 50oF. Prevent rapid drying during and at the end of the curing period.
4. Remove all curing compounds with cleaners recommended by curing compound manufacturer.

**C. Cold Weather Curing:**

1. Concrete must be protected from water loss. This shall be accomplished by the application as soon as possible without harm to the concrete surfaces of either (a) exhaust steam, or vapor-resistant paper or polyethylene film, or (b) curing compounds. In all other respects, curing shall conform to applicable provisions of this Section. Concrete temperature shall be maintained between 50oF and 70oF.

**D. Hot Weather Curing:**

1. During the period June 1 to October 1 or when hot weather conditions require it, maintain continuous water curing for a minimum period of twenty-four hours. Provide for wind breaks, shading, and other necessary provisions.
2. After 24 hours, curing shall be by one of the methods specified under B above. In all other respects, curing shall conform to applicable provisions of this Specification. Upon termination of the specified moist curing, every effort should be made to reduce the rate of drying by avoiding air circulation.

- E. Protection from mechanical injury:** Protect concrete from mechanical disturbances during curing period as described under "Protection and Cleaning".

**3.14 TOLERANCES**

- A. Construct formwork so that concrete surfaces will conform to the tolerance limits listed in ACI 117.**

- B. Establish and maintain in an undisturbed condition and until final completion and acceptance of the project sufficient control points and bench marks to be used for reference purposes to check tolerances.
- C. Place reinforcing bars in accordance with the tolerances given in Section BC 1907.5.2 of the 2014 NYC Building Code.
- D. Move bars as necessary to avoid interference with other reinforcement, conduits, or imbedded items. If bars are moved more than one bar diameter, or enough to exceed the above tolerances, the resulting arrangements are subject to approval by the Commissioner.
- E. Place concrete to meet tolerances specified in ACI 117, unless specified otherwise herein.

### 3.15 FIELD QUALITY CONTROL

- A. Tests - Tests to be performed by the Testing Laboratory during construction are as follows:
  - 1. Compliance of materials to Specifications tested from production samples.
  - 2. Determination of the slump of the concrete for each sample taken and whenever consistency of the concrete appears to vary using ASTM C143. The Testing Laboratory will reject any concrete that does not meet the slump requirements.
  - 3. Determination of water content of freshly mixed concrete utilizing the procedure of AASHTO TP23. Concrete that does not meet the maximum water to cement ratio or the proportions given in the approved design mix will be immediately rejected regardless of slump.
  - 4. Strength tests: The frequency of conducting strength tests of concrete shall be in accordance with Section BC 1905.6.2 of the 2014 NYC Building Code, with additional cylinders taken for an additional strength test and one cylinder for a 7 day break. Strength tests shall be performed for each 50 cubic yards, or portions thereof, of concrete placed in any one day's concreting. Specimens will be stored at the site in the insulated curing box provided by the Contractor. Each group of specimens is considered one strength test. One cylinder will be broken at 7 days for information. Strength test shall be at 28 days for acceptance. The cylinders for the additional strength test will be utilized for either a strength test or other types of testing only if the 28-day breaks are low or durability of the concrete is in question. If one specimen in a test manifests evidence of improper sampling, molding, or testing, it shall be discarded and the average strength of the remaining cylinders shall be considered the test result. Should all specimens in a test show any of the above defects, the entire test shall be discarded.
  - 5. Determination of air content and unit weight of concrete sample for each strength test in accordance with ASTM C173 or C231 and ASTM C138.
  - 6. Determination of temperature of concrete sample for each strength test.
  - 7. Determination of water soluble chloride content in the concrete, percent by weight of cement, of each sample.
- B. Inspection:
  - 1. Refer to "Source Quality Control" for responsibility and procedure.
  - 2. The lab will inspect placement of reinforcement and thickness of members prior to placement.
  - 3. Keep a record of all inspections, the name of the persons making them, and the name of the foreman in charge of formwork at the site. Submit to the Commissioner a copy of the inspection records prior to each concrete placement.
  - 4. Cooperate in the making of all tests by the Laboratory Technician by:

- a. Providing an insulated curing box of sufficient size and strength to contain all specimens made in any four consecutive working days. Furnish an outlet to provide the necessary temperature in the storage box, pending delivery to the Laboratory of the test cylinders.
- b. Providing a buggy for transporting the concrete taken from the mixer (and/or point of placement) to the location of the curing box for testing and the preparation of specimens.
- c. Protecting the property of the Laboratory and keeping test specimens free from vibration and other disturbances.
- d. Providing a microwave of the size specified in AASHTO TP23 and a portable generator.

**C. Evaluation and Acceptance of Concrete:**

1. Strength tests on concrete will be evaluated according to Section BC 1905.6.3.3 of the 2014 NYC Building Code by the Commissioner. If the tests fail, the adequacy of the concrete will be checked according to the requirements of Section BC 1905.6.5 of the 2014 NYC Building Code. Concrete exposed to the elements with indications of poor durability will be rejected regardless of strength and will be subject to petrographic examination.
2. Pay for additional expense of labor and materials required at the job for all damages resulting from testing. Remove and replace concrete work that is not of adequate strength or weather resistance and cannot be made to work by remedial methods acceptable to the Commissioner at own expense. The Contractor shall be held responsible for all delays and damages to the work of other Divisions that occur as a result of non-conformance.
3. Pay for all expenses borne by the City of New York resulting from low strength test procedures or evidence of poor durability (such as high slump) specified above.

**3.16 PROTECTION AND CLEANING**

- A. During the curing period, and thereafter as conditions may require, protect the concrete from damaging mechanical disturbances, particularly excessive load stresses, heavy shock, and excess vibration. Protect all finished concrete surfaces from damage caused by construction equipment, materials or methods, and by rain or running water.

**3.17 ACCEPTANCE OF CONCRETE WORK**

- A. The provisions of Subchapter 1.6 of ACI 301 apply to the acceptance of the concrete work.
- B. Concrete work judged inadequate by structural analysis, core test, results of load test or deemed unacceptable due to appearance or durability concerns shall be restored, reinforced with additional construction if so directed by the Commissioner, or be replaced if so directed by the Commissioner at the Contractor's expense.

**END OF SECTION 32 13 15**

**SECTION 32 14 13****PRECAST CONCRETE UNIT PAVING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes:

1. Precast concrete unit pavers set on aggregate setting beds.
2. Aluminum edge restraints.
3. Filter Fabric.
4. 1/2" Drainage Mat.
5. Protection Board.
6. Mortar Setting Bed Beneath Pavers Adjacent to Drain Cover

B. Related Sections:

1. Section 32 05 16 "Aggregate Materials"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 REFERENCES:**

- A. American Society of Testing and Materials (ASTM) (latest edition):

1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

1.7 SUBMITTALS

- A. Product Data: Submit characteristics of paver unit, dimensions, special shapes, and materials, including but not limited to:
1. Pavers
  2. Setting Materials
  3. Joint filler
  4. Edge Restraints
- B. Shop Drawing: Provide pattern description.
- C. Samples:
1. Paver: Submit two samples of each color of each type of paver, illustrating style, size, color range and surface texture of units being provided.
  2. Edge Restraints: Submit two section samples of metal edging and ground spike fastener system.

1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Every effort shall be made to maximize postindustrial/post-consumer recycled content. Certification of recycled content shall be in accordance with the Submittal Requirements herein.
- C. Mockups: Build mockups to verify selection made under sample submittals and to demonstrate aesthetic effect, patterns, and set quality standards for material and execution.

## 1.9 DELIVERY, STORAGE, AND HANDLING

- A. Store pavers on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied.
- B. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
- C. Store liquids in tightly closed containers protected from freezing.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Concrete Unit Paver in Plaza: Solid interlocking paving units complying with ASTM C 936 and resistant to freezing and thawing when tested according to ASTM C 67.
  - 1. Basis-of-design Product: Subject to compliance with requirements provided: Hanover Parallelogram Prest Brick, Hanover Architectural Products 5000 Hanover Road, Hanover, PA17331, (717) 637-0500, or comparable product by one of the following:
    - a. QCP, 731 Parkridge Avenue, Norco, CA 92860, 1-866-703-3434; Product: Qline Jogline Paver
    - b. Techo-Bloc, 5255, Albert-Millichamp, St-Hubert, QC J3Y 8Z8, 1-877-832-4625; Product: Diamond Granitex
    - c. Or approved equal.
  - 2. Dimension:
    - a. 5 7/8" x 16 9/16" x 3" thick
  - 3. Color:
    - a. 50/50 mix of Limestone Gray and Charcoal
  - 4. Finish:
    - a. Tutor, or a comparable finish as selected by the Commissioner for the manufacturer's standard range.
- B. Concrete Unit Paver at Building Façade:
  - 1. Basis-of-design Product: Subject to compliance with requirements provided: Unilock Series Paver, Unilock, 51 International Boulevard, Brewster, NY 10509, 201 264-5763, or approved equal or comparable product by one of the following:
    - a. Wausau Tile Inc., PO Box 1520 Wausau, WI 54402-1520, 715-359-3121
    - b. Hanover Architectural Products 5000 Hanover Road, Hanover, PA17331, (717) 637-0500
    - c. Or approved equal.
  - 2. Dimension

- a. 11.75" x 11.75" x 2.75" thick
- 3. Color:
  - a. Ice Gray, or a comparable color as selected by the Commissioner for the manufacturer's standard range.

**C. Steel Edge with Steel Stake**

- 1. Basis-of-design: 1/4" thick x 5" deep steel edging, painted black finish, secured with 12" steel ground stakes or comparable product by one of the following
  - a. Permaloc CleanLine XL, Permaloc Corporation, 13505 Barry Street, Holland, MI 49242, 1.800.356.9660,
  - b. Sure-Loc, 310 E. 64<sup>th</sup> Street Holland, MI 49423, 616-392-3209
  - c. Colmet
  - d. Or approved equal.
- 2. Dimension:
  - a. 1/4" x 5"
- 3. Finish:
  - a. Painted Matte Black, or a comparable color as selected by the Commissioner for the manufacturer's standard range.

**2.2 Filter Fabric.**

- A. Material: Drainage Geotextile: Nonwoven needle-punched geotextile, manufactured for subsurface drainage applications, made from polyolefins or polyesters; with elongation greater than 50 percent; complying with AASHTO M 288 and the following, measured according to test methods referenced:
  - 1. Survivability: Class 2; AASHTO M 288.
  - 2. Apparent Opening Size: No. 40 sieve, maximum; ASTM D 4751
  - 3. Permittivity: 0.5 per second, minimum; ASTM D 4491
  - 4. UV Stability: 50 percent after 500 hours exposure; ASTM D 4355

**2.3 1/2" Drainage Mat**

- A. Material: Rigid, dimple-core composite with non-woven geotextile filter fabric affixed on both sides.
  - 1. Thickness: 0.40 inches
  - 2. Compressive Strength: 11,000 psf
  - 3. Core flow: 18g/min/sq. ft.
  - 4. Fabric Flow: 140g/min/sq. ft.
  - 5. Fabric Puncture: 250 lbs
  - 6. AOS: 70 US Sieve
  - 7. Grab Tensile: 100 lbs

2.4 Protection Board.

- A. Material: Non-woven polyester, scanned for metal
  - 1. Dry weight: 28 oz per square yard (ASTM D5261)
  - 2. Static Puncture: 1120 lb (ASTM D6241)
  - 3. Water Storage: 0.1 gal/ft<sup>2</sup> (ASTM E2398)
  - 4. Capillary Rise: 6.5 in (conductivity probe)

2.5 Mortar Setting Bed

- A. Mortar Setting Bed: Shall be type “S” mortar.

2.6 Aggregate setting bed

- A. See Section 32 05 16 “Aggregate Materials”

**PART 3 - EXECUTION**

3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

3.2 INSTALLATION

- A. Concrete Unit Pavers:
  - 1. Do not use unit pavers with chips, cracks, voids, discolorations, or other defects that might be visible or cause staining in finished work.
  - 2. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
  - 3. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.
    - a. For concrete pavers, a block splitter may be used.
  - 4. Prepare subgrade in accordance with Section 32 05 16 – Aggregate Materials.
  - 5. Place 5” sub-base of compacted broken stone in accordance with Section 32 05 16 – Aggregate Materials.
  - 6. Unit Pavers shall be carefully laid on setting bed according to the patterns and grades shown on the plans.
  - 7. The surface shall be tested with a ten-foot straight edge laid parallel with the centerline and any depression exceeding one-quarter inch (1/4") shall be corrected and brought to the proper grade.
  - 8. Joints shall be filled with polymeric sand and wiped clean.
- B. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.
  - 1. Install edge restraints to comply with manufacturer's written instructions. Install stakes at intervals required to hold edge restraints in place during and after unit paver installation.
  - 2. For metal edge restraints with top edge exposed, drive stakes at least 1 inch (25 mm) below top edge.

**3.3 QUALITY CONTROL**

- A. Final surface elevations should not vary more than 3/8" under a 10-foot straightedge, unless otherwise stated. The top of the pavers should be 1/8" to 1/4" above the final elevations to compensate for possible minor settling.
- B. Remove and replace pavers which are loose, chipped, broken, stained or otherwise damaged, or if units do not match adjoining units as intended. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment to eliminate evidence of replacement.
- C. Cleaning: Remove mortar stains and all other types of soiling from exposed paver surfaces, wash and scrub clean.
- D. Provide final protection and maintain conditions in a manner acceptable to installer, which ensures paver work being without damage or deterioration at time of substantial completion.

**3.4 WASTE MANAGEMENT**

- A. Separate and dispose of waste in accordance with the DDC General Conditions.

**END OF SECTION 32 14 13**

**SECTION 32 17 23****WHITE PAVEMENT MARKINGS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Work includes:
1. Cleaning and priming the pavement surface in preparation of new pavement markings.
  2. Furnishing and application of hot extruded reflectorized white thermoplastic pavement markings in specified constant widths and at locations indicated on the plans, or as ordered by the Commissioner.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 SUBMITTALS**

- A. The Contractor must provide the following submittals to the Commissioner for all work in this section:
  - 1. Product Data
  - 2. Layout Drawings

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”

**PART 2 - PRODUCTS****2.1 MATERIALS**

- A. Painted markings shall be a reflectorized thermoplastic pavement striping material, hereinafter referred to as “composition,” of a type that is applied to the pavement surface in a molten state by mechanical means with surface application of glass beads and which, upon cooling to normal pavement temperature, produces an adherent reflectorized stripe of a specified constant width and of a uniform cross-section, between 1/8” and 3/16” in thickness, and is capable of resisting deformation.

**2.2 EQUIPMENT**

- A. Maintain striping equipment in satisfactory operating condition and correct breakdowns in a manner that will not delay or be detrimental to progress of striping / marking operations.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 CLEANING / REMOVAL OF OLD MARKINGS**

- A. At locations of existing striping to be removed, remove all existing pavement markings without compromising asphalt integrity or surface finish.

**3.3 INSTALLATION OF NEW MARKINGS**

- A. Install thermoplastic markings in accordance with approved manufacturer’s recommendations.

**3.4 FIELD QUALITY CONTROL**

- A. Lay out the striping and receive approval from the Commissioner on the installation prior to installing the markings.

**END OF SECTION 32 17 23**

**SECTION 32 31 19****DECORATIVE METAL FENCES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:
1. 3'-0" HT aluminum fence on top of CIP concrete wall and CIP concrete security wall
- B. Refer to related sections:
1. Section 03 30 00 "Cast-in-Place Concrete"
  2. Section 03 33 00 "Architectural Concrete"
  3. Section 32 05 16 "Aggregate Materials"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.
1. Recycled Content: Metal materials, products, anchors, framing, and accessories shall contain a minimum of 35% (75% for structural and reinforcing steel) combined pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification of recycled content shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

## 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

## 1.6 SUBMITTALS

- A. Product Data: Submit characteristics of metal members, dimensions, and special shapes.
- B. Shop Drawings: Submit manufacturer's shop drawings stamped by engineer licensed in the State of New York, including plans, elevations, sections, and details, indicating dimensions, tolerances, materials, components, fabrication, fasteners, hardware, finish, options, and accessories.
- C. Samples:
  - 1. Submit color samples for each finish, (1) total, illustrating style, thickness, and finish.
    - a. Polyester powder coat finish.
  - 2. Infill panel: minimum of two (2) pieces at 24 inches long.
- D. Manufacturer's Installation Instructions: Submit substrate requirements, installation methods, and material analysis.
- E. Manufacturer's Certification: Submit manufacturer's certification that materials comply with specified requirements.

## 1.7 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”
- B. Special Experience
  - 1. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
  - 2. The manufacturer providing the material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material equipment similar in type to that required for this Project. Such similar material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Every effort shall be made to maximize post-industrial/post-consumer recycled content.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Basis-of-design Product: Subject to compliance with requirements provide; Ametco “Galaxy” Fence Infill, Ametco Manufacturing Corp. 4326 Hamann Parkway Willoughby, OH 44096 (800) 321-7042 or Comparable product by one of the following:
  - 1. Ameristar | ASSA ABLOY 1555 N. Mingo Road, Tulsa, OK 74116 (888) 333-3422,
  - 2. FE Industries (914) 668-4500

3. Or approved equal.
- B. 3'-0" HT aluminum fence on CIP concrete wall.
1. Post Sleeve: 2-1/2" square x 3'-0" tall hot-dipped galvanized steel
  2. Post: 1/8" thick x 2-1/4" square x 9" tall hot dipped galvanized steel welded to base plate
  3. Base Plate: 1/2" thick x 6" square hot dip galvanized steel
  4. Infill Panels: Open mesh aluminum fencing, 1/2" x 2" extruded aluminum tubes on 3-1/2" centers.
  5. Color/Finish: Black Polyester Powder Coat, or a comparable color and finish as selected by the Commissioner for the manufacturer's standard range.
  6. Mount: Surface mounted to concrete wall
  7. Fasteners: Per manufacturer's specification

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for site clearing, earthwork, cast-in-place concrete curbs and walls, pavement work, and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.3 PREPARATION

- A. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet or line of sight between stakes. Indicate locations of utilities, underground structures, benchmarks, and property monuments.

#### 3.4 INSTALLATION

- A. Install fencing in accordance with manufacturer's installation instructions and reviewed shop drawings.
- B. Install fencing on established boundary lines inside property line.
- C. Post Setting: Set posts on concrete curb/wall as indicated on drawings. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during placement and finishing operations
- D. Secure fencing infill panels with standard stainless fasteners to fence posts after posts have been set on curbs/walls.
- E. Do not install bent, bowed, or otherwise damaged components. Remove damaged components from site and replace.
- F. Hang infill panels using hardware provided by manufacturer for each fence.

3.5 WASTE MANAGEMENT

- A. Separate and dispose of waste in accordance with the DDC General Conditions.

**END OF SECTION 32 31 19**

**SECTION 32 91 13****PLANTING SOILS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes:

1. Planting soils for all at-grade conditions

B. Related Sections:

1. Section 32 05 16 "Aggregate Material"
2. Section 32 91 19 "Landscape Grading"

## 1.2 DEFINITIONS

A. Subgrade: Soil material and levels resulting from the approved rough grading work. Subgrade soil shall be existing soil or other materials which are either undisturbed or have been placed resulting from the approved rough grading work. Loosening of all subgrade areas prior to placement of Planting Soils is included in this Section.

B. Planting Soils: Planting Soils are composed of a blend of three base components: base loam, organic material and sand. The quality of the blend depends on the quality of the original components. Contractor is responsible for locating and obtaining approval of sources for base loam, organic material and sand that meet the Specification requirements. Contractor is then responsible for mixing the components. Approximate mixing ratios are provided, but may require adjustment, depending on the final materials and with the approval of the Commissioner, in order to meet Specification requirements for each blend.

## 1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

#### 1.4 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

#### 1.6 SUBMITTALS

- A. At least 30 days prior to ordering materials, submit to the Commissioner samples, certifications, manufacturer's product data and certified test results for materials as specified below for approval in conformance with the requirements of this Specification. No materials shall be ordered or delivered until the required submittals have been reviewed and approved by the Commissioner. Delivered materials shall closely match the approved samples. Approval shall not constitute final acceptance. The Commissioner reserves the right to reject, on or after delivery, material that does not meet these Specifications.
- B. Product Data: Submit most recent printed information from manufacturer.
  1. Organic Material: identify the material(s) from of which is it composed and identify the location where material was composted.
  2. Fertilizers
  3. Ground Limestone
  4. Superphosphate
- C. Samples: Submit 1 gallon planting soil samples in two phases. Submit samples concurrent with horticultural soil test reports in both phases. Submit as phase one, planting soil base components for approval. Only after approval of phase one components, submit as phase two, soil blend mixes / mediums for approval. Each sample shall be a composite of a minimum of ten (10) individual samples taken from representative portions of a pile or source combined, thoroughly mixed and bagged. In addition to providing samples in quantities as required by testing agencies, submit one gallon split-samples of Base Components and Planting Soils to the Commissioner for review. Do not order materials until Commissioner's approval has been obtained. Delivered materials shall closely match the approved samples.
  1. Phase One Submittals of Planting Soil Base Components:
    - a. Base Loam
    - b. Organic Material
    - c. Sand
  2. Phase Two Submittals of Planting Mediums: mixing and batching of mediums to be prepared in the same manner as bulk soils will be prepared prior to delivery to site.
    - a. Horticultural Subsoil
    - b. High Use Lawn Soil
    - c. Planting Bed Soil

3. Phase Three Submittals of Planting Mediums: After Planting Soil test batches have been accepted, mix and amend as necessary in production, batches of up to 500 cubic yards for each soil type listed in 1.6.C.2. Each batch must be sampled, tested for gradation and organic content, and approved prior to delivery to the job site.
- D. Sources for Soil Components and Soil Mixes: Submit information identifying sources for all soil components and the firm responsible for mixing of soil mixes.
  1. Commissioner shall have the right to reject any soil supplier.
  2. Submit certification that accepted supplier is able to provide sufficient quantities of materials and mixes for the entire project.
- E. Horticultural Soil Test Reports: Submit reports in two phases. Submit reports concurrent with samples in both phases. Submit as phase one, reports for planting soil base components above for approval. Only after approval of phase one components, submit as phase two, reports for soil blend mixes /mediums for approval. Test results must be less than 60 days old and represent materials that are available for delivery to the site in the quantity required.
- F. Submit reports for each of the above samples: Submit sample from each proposed source for testing and approval. Deliver samples to both the testing laboratory and the project soil scientist and pay expenses. Send report directly to Commissioner.
  1. Testing for Base Loam, Plant Bed Soil, Sand-Based Structural Soil, High Use lawn Soil, Meadow Soil, Wetland Soil, Bio-infiltration Soil, and Horticultural Subsoil.
    - a. Inform testing agency soil test is for both tree and shrub planting and lawn applications.
    - b. Mechanical and chemical analysis shall be conducted by a public extension service agency or a certified private testing laboratory in accordance with the current “standards” of the American Society of Agronomy.
    - c. Gradation tests shall be by combined hydrometer and wet sieving in compliance with ASTM D422 after destruction of organic matter by ignition.
    - d. Test for agricultural suitability analysis including:
      - 1) particle size and characteristics
      - 2) soil pH by water pH and buffer (smp) pH tests.
      - 3) percentage organic content
      - 4) nitrate nitrogen
      - 5) ammonium nitrogen
      - 6) phosphorus
      - 7) potassium
      - 8) calcium
      - 9) aluminum
      - 10) magnesium
      - 11) manganese
      - 12) Micronutrients
      - 13) Toxins including but not limited to lead, cadmium, arsenic and mercury.
    - e. Test results: test data and recommendations for soil amendments including but not limited to: nitrogen, phosphorus, potassium and limestone.
  2. Testing for Organic Amendment Materials
    - a. Tests shall be by combined hydrometer and wet sieving in compliance with ASTM D422 after destruction of organic matter by ignition.

- b. Test for agricultural suitability analysis as defined in Article 2.02 – Organic Amendment Materials (Compost).
  - 3. Testing for Sand
    - a. Test for particle size gradation and pH

## 1.7 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”
- B. Special Experience
  - 1. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
  - 2. The manufacturer providing the material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material equipment similar in type to that required for this Project. Such similar material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Qualifications for Inspecting and Testing Horticultural Materials: Qualifications of Contractor’s Agricultural Chemist / Testing Laboratory / Agency shall be submitted to and approved by Commissioner prior to start of procurement of soil materials, placing or amending planting soil materials, and planting operations on Project.
  - 1. Agricultural Chemist: Employed by public or private soils testing laboratory, qualified and capable of performing tests, making soil recommendations, and issuing reports as specified herein.
  - 2. Soils Testing Laboratory: An independent laboratory with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein.
    - a. Soil and Compost Materials Testing Laboratories:
      - 1) Physical and Chemical Testing of Soils: Hummel & Company, Inc.  
35 King Street, P.O. Box 606, Trumansburg, NY 14886  
Phone 607 387 5694, Fax 607 837 9499.
      - 2) Soil Testing Laboratory  
Rutgers, The State University  
ASB II  
57 US Highway 1 South  
New Brunswick, NJ 08901-8554
      - 3) Physical and Chemical Testing of Soils or Compost: University of  
Massachusetts West Experiment Station, Amherst Massachusetts, 01003  
Phone 413-545-2311, Fax 413-545-1931.
      - 4) Physical and Chemical Testing of Soils or Compost: Woods End Research  
Laboratory, PO Box 297, Mt. Vernon, Maine 04352  
(207) 293 2457 – phone, (207) 293 2488.

- 5) Agricultural Analytical Services Lab; compost testing  
111 Ag Analytical Svcs Lab  
University Park, PA 16802  
814-863-0841 – phone, 814-863-4540
  - 6) Or approved equal.
- D. Pre-Installation Conference: A pre-installation conference shall be held prior to commencement of field operations to establish procedures to maintain optimum working conditions, to coordinate requirements for testing, and to coordinate this Work with related and adjacent work.
- E. Inspections and Testing of Horticultural Soil Materials: The following conditions and requirements shall apply:
1. Material Testing, General: Engage and pay for the services of a qualified Agricultural Chemist / Soils Testing Laboratory / Agency to perform all materials testing and inspections of Project-related Base Components and Planting Soils, as well as any other material testing and soil mix material testing required in this Section or additionally required by the Commissioner.
    - a. Cooperate in obtaining samples and performing tests of in-place materials and shall furnish incidental field labor in connection with any tests to be performed by Contractor's Testing Laboratory / Agency.
  2. Construction Monitoring:
    - a. During landscape construction operations, Commissioner may be present at the site to observe and monitor placing and amending soil material operations and shall be permitted free and unrestricted access to the site and work.
    - b. Commissioner reserves the right to take and analyze at any time such additional samples of horticultural soil and soil amendment materials as deemed necessary for verification of conformance with the Contract Documents. Furnish samples for this purpose upon request and shall perform material testing as requested. The Commissioner may, at their discretion, take additional tests or order additional tests made by the Testing Laboratory/Agency respective to conditions.
    - c. Based on observations and evaluation of quality control tests, the Contractor's or Testing Laboratory/Agency shall make recommendations to the Commissioner regarding conformance of the soil material and placing operations to Contract Documents and compatibility of actual subsurface conditions to required subsurface conditions.
    - d. Commissioner will evaluate the recommendations of the Contractor's Testing Laboratory/Agency and will judge the compliance of the work with Contract Documents, issue any changes or revisions required to Contract Documents to accommodate subsurface conditions which differ from design assumptions, or direct remedial work where the completed work does not comply with Contract Documents.
    - e. Planting Soils and/or other components delivered to the site may be periodically sampled and tested for compliance at the request of the Commissioner. Materials not matching the approved previously submitted Samples shall be removed from site at no additional expense to the City of New York.
  3. Materials in question shall not be used, pending test results of conformance to specified requirements.

## 1.8 DELIVERY, STORAGE AND HANDLING

- A. Packing and Shipping: deliver materials in unopened containers bearing manufacturer's name and guaranteed statement of analysis. Transport materials without damage. Protect finishes from abrasion, dirt, oils, grease, and chemicals. Pack materials to protect from weather.
- B. Base Components and Planting Soils shall not be handled, hauled, or placed when wet, during or immediately after a heavy rainfall, or frozen. Soil should be handled only when the moisture content is less than or equal to the optimum water content as determined for the Standard Proctor test. The Commissioner shall be consulted to determine if the soil is too wet to handle.
- C. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, injury and theft.
- D. Sequence deliveries to avoid delay. On-site storage space is permissible only with written notice from Commissioner. Deliver materials only after preparations for placement of planting soil have been completed.
- E. Prohibit vehicular and pedestrian traffic on or around stockpiled planting soil.
- F. Soil that is to be stockpiled longer than two weeks, whether on- or off-site, shall not be placed in mounds greater than six feet high. Provide all means and methods required to prevent anaerobic conditions at no additional expense to the City of New York.
- G. Vehicular access to the site is restricted. Before construction, submit for approval a plan showing proposed routing for deliveries and site access.
- H. Work and Protection Plans
  - 1. On-Site Soil Storage: Submit proposed locations and means and methods for storage/stockpiling of soil materials on-site.
  - 2. Soil Placement, and Settlement Plans: Submit a plan of implementation with a schedule describing the proposed methods intended for placing horticultural planting soils and for allowing natural settling of installed soils.
- I. Data Submitted for Information and Reference:
  - 1. Copies of permits necessary to transport materials off site.
  - 2. Location of legal disposal sites for waste materials from this work of Project, if any.

## 1.9 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: do not deliver or handle soils when dry, wet, or frozen.
  - 1. No planting Soil shall be trucked, placed, compacted or otherwise handled when its moisture content is greater than optimum as determined by ASTM 698. In addition, no soil shall be compacted if its moisture content is sufficiently high that its saturated hydraulic conductivity falls below its minimum rate as specified below. Normally, but not always, this requirement will be met when the moisture content is at or below optimum. Conduct moisture content tests using the Speedy Moisture Test or other approved Equipment as necessary to ensure conformation with maximum allowable moisture contents. Coordinate procedures to allow for drying of planting soils that exceed maximum allowable moisture contents.
  - 2. Additional Field Tests

- a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
- b. If the soil will not retain shape it is too dry and should not be worked.
- c. If the soil retains shape and will not crumble, it is too wet and should not be worked.
- d. If the soil glistens or free water is present after lightly patting the sample, the soil is too wet and should not be worked

## PART 2 - PRODUCTS

### 2.1 BASE LOAM

- A. Base Loam shall be imported and shall be free of subsoil, large stones, earth clods, sticks, stumps, clay lumps, roots or other objectionable, extraneous matter or debris. Base Loam shall also be free of quack-grass rhizomes, Agropyron Repens, and the nut-like tubers of nutgrass, Cyperus Esculentus, and all other primary noxious weeds. Base Loam shall not be delivered or mixed while in a frozen or muddy condition. Base Loam for mixing shall conform to the following grain size distribution for material passing the #10 sieve:

U.S. Sieve Size Number	Percent Passing	
	Minimum	Maximum
10	---	100
18	85	100
35	70	95
60	50	85
140	36	57
270	32	60
0.002mm	3	15

- B. Base loam with more than 46% passing the 270 sieve or with more than 6 percent clay must have a well developed and stable crumb (ped) structure as determined by an agricultural chemist.
- C. Maximum size shall be one inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.
- D. The organic content shall be between 4.0 and 8.0 percent.
- E. The pH shall be 7.2 or less.

### 2.2 ORGANIC MATERIAL (COMPOST)

- A. Organic Material (Compost) as Amendment For Soil Mediums:
  1. Organic Material (Compost) for amending planting medium: stable, humus-like material produced from the aerobic decomposition of organic residues consisting of Leaf or Yard Waste Compost which shall have been composted for a minimum of one year (12

months). Compost shall be free of debris such as plastics, metal, concrete or other debris and stones larger than 1/2", larger branches and roots and wood chips over 1/2" in length or diameter. Compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management applicable, with no visible free water or dust, with no unpleasant odor, and meeting the following criteria as reported by laboratory tests.

- a. The ratio of carbon to nitrogen shall be in the range of 12:1 to 25:1.
- b. Stability shall be assessed by the Solvita procedure. Protocols are specified by the Solvita manual (version 4.0). The compost must achieve a maturity index of 6 or more as measured by the Solvita scale.
- c. Pathogens/Metals/Vector Attraction reduction shall meet all State of New York requirements for applications to soils with human activity.
- d. Organic Content: at least 20 percent (dry weight). One hundred percent of the material shall pass a 3/8-inch (or smaller) screen. Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed one percent dry weight. Organic content shall be determined by weight loss on ignition or H<sub>2</sub>O<sub>2</sub> for particles passing a Number 10 sieve according to procedures performed by the West Experiment Station at the University of Massachusetts, Amherst or equal. For loss by ignition, a 50-cc sub-sample of the screened and mixed compost is ground to pass the number 60 sieve. Two to three grams ( $\pm 0.001g$ ) of ground sample, dried to a constant weight at 105 degrees C is placed into a muffle furnace. The temperature is slowly raised (5C/minute) to 450C and maintained for three hours. The sample is removed to an oven to equilibrate at 105C and the weight is taken. Organic matter is calculated as loss on ignition.
- e. pH: between 6.5 to 7.2 as determined from a 1:1 soil-distilled water suspension using a glass electrode pH meter American Society of Agronomy *Methods of Soil Analysis*, Part 2, 1986.
- f. Salinity: Electrical conductivity of a one to five soil to water ratio extract shall not exceed 2.0 mmhos/cm (dS/m).
- g. Compost: screened to 1/2 inch maximum particle size and shall contain not more than 3 percent material finer than 0.002mm as determined by hydrometer test on ashed material.
- h. Nutrient content: determined by the University of Massachusetts Soil Testing Laboratory or equivalent laboratory and utilized to evaluate soil required amendments for the mixed soils. Chemical analysis shall be undertaken for Nitrate Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Aluminum, Magnesium, Chromium, Iron, Manganese, Lead, Soluble Salts, Cation Exchange Capacity, soil reaction (pH), buffer pH, and micronutrients.

## 2.3 SAND

### A. Sand as Amendment for Soil Mediums

1. Sand shall be uniformly graded medium to coarse sand consisting of clean, inert, rounded grains of quartz or other durable rock and free from loam or clay, surface coatings, mica, other deleterious materials with the following gradation

U.S. Sieve Size Number	Percent Passing	
	Minimum	Maximum
10	100	-
18	65	90
35	35	60
60	15	30
140	0	8
270	0	3
0.002mm	0	0.5

2. Maximum size shall be one inch largest dimension. The maximum retained on the #10 sieve shall be 15% by weight of the total sample.
3. The ratio of the particle size for 70% passing (D70) to the particle size for 20% passing (D20) shall be 3.0 or less. (D70/D20 <3.0)
4. Saturated hydraulic conductivity of the sand shall be not less than 30 inches per hour, according to ASTM D5856-95 (2000), when compacted to a minimum of 90% Standard Proctor, ASTM 698.
5. The pH shall be less than 7.5

#### 2.4 PLANTING BED SOIL

- A. Base Loam, Sand and Compost, each as specified above, shall be combined in an approximate mix ratio of one part by volume Sand to one part by volume Base Loam to one part by volume Compost (1S:1.0L:1C) to create a uniform blend which meets the following requirements.
- B. Gradation for Material Passing the Number 10 Sieve:

U.S. Sieve Size Number	Percent Passing	
	Minimum	Maximum
10	100	-
18	73	90
35	54	74
60	33	53
140	22	34
270	18	24
0.002mm	2.5	6

1. Maximum size shall be one inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.

2. Ratio of the particle size for 80% passing (D<sub>80</sub>) to the particle size for 30% passing (D<sub>30</sub>) shall be 8 or less. (D<sub>80</sub>/D<sub>30</sub> <8)
3. Saturated hydraulic conductivity of the mix: not less than 2 inches per hour according to ASTM D5856-95 (2000) when compacted to a minimum of 86% Standard Proctor, ASTM 698.
4. Organic content: between 5.0 and 7.0 percent by weight.

## 2.5 HORTICULTURAL SUBSOIL

- A. Base Loam, Sand and Compost, each as specified above, shall be combined in an approximate mix ratio of three parts by volume Sand to three parts by volume Base Loam to 1.0 part by volume Compost (3.0S:3.0L:1.0 Compost) to create a uniform blend which meets the following requirements.
- B. Gradation for Material Passing the Number 10 Sieve:

U.S. Sieve Size Number	Percent Passing	
	Minimum	Maximum
10	100	-
18	70	90
35	50	74
60	27	48
140	18	28
270	16	22
0.002mm	2	6

1. Maximum size shall be one inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.
2. Ratio of the particle size for 80% passing (D<sub>80</sub>) to the particle size for 30% passing (D<sub>30</sub>) shall be 6.5 or less. (D<sub>80</sub>/D<sub>30</sub> <6.5)
3. Saturated hydraulic conductivity of the mix: not less than 3 inches per hour according to ASTM D5856-95 (2000) when compacted to a minimum of 86% Standard Proctor, ASTM 698.
4. Organic content: between 2.0 and 3.5 percent by weight.

## 2.6 LOW MOW TURF SOIL

- A. Base Loam, Sand and Compost, each as specified above, shall be combined in an approximate mix ratio of two parts by volume Sand to one part by volume Base Loam to one part by volume Compost (2S:1.0L:1C) to create a uniform blend which meets the following requirements.
- B. Gradation for Material Passing the Number 10 Sieve:

U.S. Sieve Size Number	Percent Passing	
	Minimum	Maximum
10	100	-
18	70	90
35	45	72
60	26	40
140	15	22
270	11	14
0.002mm	2	5

1. Maximum size shall be one inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.
2. Ratio of the particle size for 70% passing (D<sub>70</sub>) to the particle size for 30% passing (D<sub>20</sub>) shall be 5.0 or less. (D<sub>70</sub>/D<sub>20</sub> <5.0)
3. Saturated hydraulic conductivity of the mix: not less than 4 inches per hour according to ASTM D5856-95 (2000) when compacted to a minimum of 88% Standard Proctor, ASTM 698.
4. Organic content: between 4.0 and 5.0 percent by weight.

## 2.7 PRE-PLANT FERTILIZER

- A. Complete, fertilizer made from all-natural ingredients complying with State and Federal fertilizer laws. Fertilizer shall contain the following available plant food by weight, unless soils test indicate a need for different composition:

	Nitrogen	Phosphorus	Potash
Deciduous Trees and Shrubs	2%	3%	3%
Evergreen Trees and Shrubs	2%	3%	3%

- B. Fertilizer: Pro Start 2-3-3 as manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277; Earth Emulsion 2-3-3 as manufactured by Grower's Secret, 5143 Port Chicago Highway, Suite A, Concord, CA 94520, ph# (888) 467-9426, 2-3-3 All Natural Organic Rich Humus Soil Builder as Manufactured by Sustane Natural Fertilizers & Soil Builders, 31 East Elm Avenue, Staatsburg, New York 12580, ph# (914) 474-1198 or approved equal.
- C. Fertilizer to be delivered in original unopened standard size bags showing weigh, analysis ingredients and manufacturer's name.

## 2.8 SOIL AMENDMENTS

- A. Superphosphate: finely ground phosphate rock, commonly used for agricultural purposes and shall contain not less than 20 percent available phosphoric acid.
- B. Ground Limestone: dolomitic limestone and contain not less than 50 percent of total carbonates and 25 percent total magnesium with a neutralizing value of at least 100 percent. Material shall

be ground to such fineness that 40 percent will pass 100 mesh U.S. standard sieve and 98 percent will pass through 20 mesh U.S. standard sieve.

## 2.9 EQUIPMENT

- A. Chisel Plow or disk harrow or bucket of backhoe: for subsoil cultivation.
- B. Rotovator or disk harrow: for planting mixture/soil cultivation.

## 2.10 WATER

- A. Water: furnished by Contractor, unless otherwise specified, and suitable for irrigation and free from ingredients harmful to plant life. Hose and other watering equipment furnished by Contractor.

## 2.11 EROSION CONTROL MAT

- A. Subject to compliance with requirements, provide GEOCOIR / DeKoWe 400 as manufactured by Belton industries (Basis of Design), or an equivalent product by one of the following approved manufacturers:
  - 1. GEI Works
  - 2. ACF Environmental
  - 3. Or approved equal.

# PART 3 - EXECUTION

## 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

## 3.2 EXAMINATION

- A. Verification of Conditions: in the event field conditions are not as shown on Drawings and outlined in the Specifications, notify Commissioner in writing.
  - 1. Spot and Invert Elevations: verify field elevations of site improvements such as drainage and utility fixtures, pavements, existing plantings, and subsurface piping conform to drawings.
- B. Rough grade: verify specified elevations and prior earthwork operations have shaped, trimmed, and finished rough grade.

## 3.3 PREPARATION

- A. Contractor to clear working areas with Dig Safely New York prior to doing excavation on site. If work is to be done around underground utilities, appropriate utility must be notified of impending work. Hand excavate areas adjacent to utilities. Contractor shall be responsible for damages done by himself or his installers to existing utilities, which shall be restored by Contractor.

- B. Prior to installation field locate and protect from damage site improvements such as drainage and utility fixtures, pavements, and existing plantings.
- C. Dust Control: upon acceptance of finish grade provide dust control.
- D. Erosion Control: upon acceptance of finish grade provide erosion control.
- E. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

### 3.4 PREPARATION OF PLANTING MEDIUM FOR PLANTING BEDS

- A. Correct deficiencies in soil as directed by soil test results. Thoroughly incorporate amendments into planting mixture to ensure even distribution.
- B. Incorporate pre plant fertilizer at a rate of 30 pounds per cubic yard of planting bed medium. Amendment rate will be 6 times square foot application rate per cubic yard of planting mixture.

### 3.5 SUBGRADE INSPECTION AND PERCOLATION TESTING

- A. For off-structure areas, after subgrade levels have been reached, the Commissioner shall inspect soil conditions to evaluate subsurface drainage conditions. Carry out up to 20 standard septic percolation tests in locations identified by the Commissioner. Locations where percolation rates are less than 0.5 inches per hour shall be evaluated for possible installation of subsurface drainage or deep decompaction.

### 3.6 DECOMPACTION OF PLANTING AREAS

- A. After subgrade levels have been inspected and tested, and immediately prior to placing Planting Soils, loosen the entire subgrade area to a minimum depth of four inches utilizing the bucket of a backhoe or equivalent equipment.
- B. Using a wide-track bulldozer size D-5 or smaller, compact the scarified subgrade to approximately 84% - 86% compaction ASTM 698 Standard Proctor. Provide shovel dug test pits to the full depth of the decompaction, where located per the direction of Commissioner, in order for Commissioner to review whether the work has been completed. Backfill the pits after the review(s).
- C. After the soils have been loosened, inspected and written approval has been provided, Planting Soils may be spread by using a wide-track bulldozer size D-5 or smaller or may be dumped and spread with the bucket of a backhoe from the edge of the loosened area. No rubber-tired equipment or heavy equipment except for a small bulldozer shall pass over the subsoils (subgrade) after they have been loosened. If Contractor plans to utilize such areas for use of heavy equipment, this work should be carried out prior to beginning the process of loosening soils or filling in that area, or it will have to be rescarified and meet this specification requirement.

### 3.7 PREPARATION OF TREE PITS

- A. After tree planting pits have been excavated to the dimensions shown on the plans, the entire bottom area of the pit shall be loosened to a minimum depth of four inches utilizing the bucket of a backhoe or equivalent equipment. The entire loosened area shall then be compressed lightly with the bucket of the backhoe. The central portion of the pit, beneath the rootball, shall be compressed adequately to support the rootball and prevent settlement.

### 3.8 PLACEMENT OF HORTICULTURAL SUBSOIL

- A. In lawn areas place and spread Horticultural Subsoil in lifts not greater than twelve inches and compact to a density between 84 and 87 percent Standard Proctor Maximum Dry Density. In plant bed and meadow areas place and spread Horticultural Subsoil in lifts not greater than twelve inches and compact to a density between 82 and 85 percent Standard Proctor Maximum Dry Density. The surface area of each lift, including the subgrade after it has been compacted, shall be scarified by raking prior to placing the next lift.
- B. Place and spread horticultural subsoil to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
- C. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter and dispose of legally off site.

### 3.9 PLACEMENT OF PLANT BED SOIL

- A. Over Horticultural Subsoil Layer, place and spread Planting Bed Medium in lifts not greater than twelve inches and compact to a density between 80 and 83 percent Standard Proctor Maximum Dry Density. The surface area of each lift, including the subgrade after it has been compacted, shall be scarified by raking prior to placing the next lift.
- B. Place and spread planting medium to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
- C. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter and dispose of legally off site.

### 3.10 PLACEMENT OF LOW MOW TURF SOIL

- A. Place and spread High Use Lawn Soil one lift not greater than twelve inches and compact to a density between 85 and 88 percent Standard Proctor Maximum Dry Density. The surface area of each lift, including the subgrade after it has been compacted, shall be scarified by raking prior to placing the next lift.
- B. Place and spread planting medium to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
- C. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter and dispose of legally off site.

### 3.11 FIELD QUALITY CONTROL

- A. Tests: after soil preparation operations are complete and prior to planting, take soil sample for testing and recommendations as established in Article 1.6 - Submittals.
- B. Confirm that the subgrade is at the proper elevation and that no further earthwork is required to bring the subgrade to proper elevations. Subgrade layer elevations shall slope parallel to the finished grade as shown on the Contract Documents. Provide a written report to the Commissioner that the subgrade has been adjusted to the required elevations to provide a uniform thickness of planting media across the area. Perform no work of placing and spreading

soil until elevations have been confirmed and written report has been accepted by the Commissioner.

- C. As provided in Article 1.9 – Project / Site Conditions, No Base Materials or Soil Medium shall be handled, planted, or seeded in any way if it is in a wet or frozen condition. A moist Soil Medium is desirable for planting.
- D. Observation: Commissioner to review in the field soil preparation operations:
  - 1. Preparation of Planting Mixtures

### 3.12 CLEANING

- A. Clean up debris generated under work of this section.
- B. Site Improvements
  - 1. Wash and sweep clean site improvements such as drainage and utility fixtures, pavements, existing plantings, and site furnishings.
  - 2. Clean site furnishings of grout, adhesives, concrete, and other debris.

### 3.13 PROTECTION

- A. Protect work of this section until Final Acceptance.
- B. Select equipment and otherwise phase the installation of the Soil Medium to ensure that wheeled equipment does not travel over prepared subsoil, placed fills or ordinary borrow or already installed soil. Movement of tracked equipment over said soils will be reviewed and considered for approval by the Commissioner. If it is determined by the Commissioner that wheeled equipment must travel over already installed soil, provide a written description of sequencing of work that ensures that compacted soil is loosened and uncompacted as the work progresses or place one-inch (25 mm) thick steel plate ballast (or equivalent ballast approved by the Commissioner) over the length and width of any travel way to cover Soil Medium to protect it from compaction.
- C. Disturbed areas outside the limit of work shall be protected and as required, graded smooth and spread with Soil Medium to meet finished grades.
- D. Soil Mediums delivered to the site shall be protected from erosion. Materials shall be spread immediately. Otherwise, materials that set on site for more than 24 hours shall be covered with tarpaulin or other soil erosion system acceptable to Commissioner and surrounded by silt fence

### 3.14 ACCEPTANCE

- A. Confirm that the final grade of the Soil Mediums is at the proper finish grade elevations. Adjust grade as required to meet the contours and spot elevations noted on the Plans. Request the presence of the Commissioner to inspect final grade. Do not proceed with the remaining work of this Contract until the Commissioner has given his/her written approval of the final grade.

**END OF SECTION 32 91 13**

**SECTION 32 91 19****LANDSCAPE GRADING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:

- 1. Topsoil placement and establishment of finish grade for final landscape planting and seeding.

- B. Related Sections:

- 1. Section 32 05 16 "Aggregate Materials"
  - 2. Section 32 91 13 "Planting Soils"
  - 3. Section 32 93 00 "Landscape Planting"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

- B. Refer to the following sections:

- 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

- B. Confirm grades.

- C. Confirm positive water drainage

**PART 2 - PRODUCTS****2.1 MATERIALS**

- A. Planting Soils: Refer to Section 32 91 13 – Planting Soils
- B. Aggregates: Refer to Section 32 05 16 – Aggregate Materials

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Verify earthwork and site grading has been completed and inspected.
- B. Verify sub-grade has been contoured and compacted.

**3.3 SUBGRADE PREPARATION**

- A. Eliminate uneven areas and low spots.
- B. Remove debris, roots, branches, stones, in excess of 1/2 inch in size. Remove subsoil contaminated with petroleum products.
- C. Scarify surface to depth of 3 inches where topsoil is scheduled. Scarify in areas where equipment used for hauling and spreading topsoil has compacted subsoil.

**3.4 PLACING TOPSOIL**

- A. Place topsoil in areas where seeding and landscaping is required to the following compacted thickness:
  - 1. Groundcover – 18 inches.
  - 2. Tree Planting – 36 inches
  - 3. Place topsoil during dry weather.
  - 4. Fine grade topsoil to eliminate rough or low areas. Maintain profiles and contour of sub-grade.
  - 5. Remove roots, weeds, rocks, and foreign material while spreading.
  - 6. Manually spread topsoil close to existing vegetation to prevent plant damage.
  - 7. Leave stockpile area and site clean and raked, ready to receive seeding.

**3.5 TOLERANCES**

- A. Top of Topsoil: Plus or minus ½ inch.

**3.6 PROTECTION**

- A. Protect landscaping and other features remaining as final work.

- B. Protect existing structures, fences, sidewalks and other site features.

3.7 CLEAN-UP

- A. Remove all excess materials and debris from the site.

**END OF SECTION 32 91 19**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 32 93 00**

**LANDSCAPE PLANTING**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

- A. Section Includes:

1. All landscape planting
2. Staking and guying, including necessary hardware as specified or shown
3. Erosion control mat
4. Pruning
5. Pest and disease control
6. Root Barriers
7. Maintenance under contract and guarantee

- B. Related Sections:

1. Section 32 91 13 "Planting Soils"
2. Section 32 91 19 "Landscape Grading"
3. Section 32 94 50 "Cellular Tree Planting System"

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.

- B. Refer to the following sections:

1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

## 1.5 REFERENCES

- A. Tree and shrub transplanting manual, latest edition, International Society of Arboriculture (I.S.A.).
- B. American Standard for Nursery Stock, latest edition, American Association of Nurserymen, Inc.

## C. ABBREVIATIONS

- 1. Cal. Indicates the caliper of the trunk of the tree.
- 2. B & B Indicates tree or shrub to be balled and burlapped.
- 3. B.R. Indicates a tree or shrub to be delivered "bare root".
- 4. Cont. Indicates tree or shrub to be container grown (size per industry standard).
- 5. O.C. Indicates "on center" or spacing between plants in all directions.
- 6. HT. Indicates overall height of tree.

## D. DEFINITIONS:

- 1. Backfill: Soils used to replace or the act of replacing earth in an excavation.
- 2. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.
- 3. Balled and Potted Stock: Plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required.
- 4. Bare-Root Stock: Plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than minimum root spread according to ANSI Z60.1 for type and size of plant required.
- 5. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.
- 6. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.
- 7. Fabric Bag-Grown Stock: Healthy, vigorous, well-rooted plants established and grown in-ground in a porous fabric bag with well-established root system reaching sides of fabric bag. Fabric bag size is not less than diameter, depth, and volume required by ANSI Z60.1 for type and size of plant.
- 8. Finish Grade: Elevation of finished surface of planting soil.
- 9. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.
- 10. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.
- 11. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
- 12. Planting Area: Areas to be planted.

13. Planting Soils: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth. See Section 32 91 00 Planting Soils.
14. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, perennials, bulbs, corms, tubers, or herbaceous vegetation.
15. Root Flare: Also called "trunk flare." The area at the base of the plant's stem (trunk) where the stem broadens to form roots; the area of transition between the root system and the stem or trunk.
16. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees at or below the soil surface or within the root ball or container, which will, over time, constrain healthy plant growth and the long term viability of the tree.
17. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.
18. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.
19. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 SUBMITTALS

- A. Nursery Stock, ANSI Z60.1 Compliant. Notice of intent to perform work shall be submitted to the Commissioner at least 14 calendar days prior to planting.
  1. Submit to Commissioner invoices or certificates of deposit from nursery(ies) guaranteeing timely delivery of all specified and tagged plant materials. If any plant materials are unavailable at the time of submittal, contact Commissioner to determine acceptable alternatives. Indicate the following:
    - a. Confirmed size and grade of materials to be planted.
    - b. Source of origin and health of plant materials, each type.
  2. Submit a schedule itemizing the landscape planting work to be performed to the Commissioner. This schedule shall be submitted within fifteen (15) calendar days after Contract Notice to Proceed.
    - a. Include in this schedule, anticipated dates for commencement and sequencing of landscape planting work, including, but not limited to, selections and tagging, layouts and layout approval, placement of trees, and commencement of the maintenance period.
- B. Product Data:
  1. Submit to Commissioner technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer's product testing and analysis and installation instructions for manufactured or processed items and materials.

2. Submit to Commissioner a list of sources clearly stating plant material, size, form, and quantities available at that nursery for inspections. Verify and inspect the source prior to scheduling the Commissioner inspection and tagging trip and that the plant material meets the requirements of the specifications and drawings.
3. Submit to Commissioner locations of soil material sources.

**C. Plant Material:**

1. Plant Sources: Submit to Commissioner a list of sources clearly stating plant material species, cultivar, size, form, and quantities available at each nursery.
2. Photographic Documentation Prior to Nursery Visit: Provide digital photographs for each required species, cultivar showing size and condition for review by the Commissioner to determine that the plant material meets the requirements of the specifications and drawings.
  - a. Take photographs from an angle depicting true size and condition of the typical plant to be furnished.
  - b. Include a scale rod or other measuring device in each photograph. For species where more than 20 plants are required, include a minimum of three photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished.
  - c. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.

**D. Certificates:**

1. Furnish to Commissioner certification that each tree is true to name and in conformance with these Specifications. In addition, furnish to Commissioner certificates of inspection as may be required by New York City Department of Environmental Protection, the Environmental Protection Agency, and New York State Department of Environmental Conservation that plant material is free of disease or hazardous insects.
2. Furnish to Commissioner certificates/cultivars by supplying nursery.
3. Prior to the use on site of any chemical insect or disease control materials, submit to Commissioner a list of the control materials and quantities intended for use in controlling insects and disease prevalent and expected on the site. Submittal shall include data demonstrating the compatibility of the control materials and methods of installation or application with the specified planting types and varieties. The use of any chemical insect or disease control materials shall not be allowed except by written approval and consent of Commissioner.
4. If any chemical insect or disease control materials are to be used, they must be applied prior to the tree's delivery to the site. No chemical insect or disease control materials are to be applied on-site.

**E. Samples for Verification: For each of the following:**

1. Shredded Bark Mulch: 1 Quart volume of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.

**F. Soil Tests: Where planting is to occur in existing soils provide soil test for each identifiable soil type on the project site, as designated on the plans. Test results should identify soil characteristics and include recommendations for amendments suitable for proposed plantings.**

**1.8 INFORMATIONAL SUBMITTALS**

- A. Maintenance Plan: Schedule of routine maintenance activities to be carried out by Contractor during the guarantee period. Submit before start of required maintenance periods.

**QUALITY ASSURANCE**

- B. Qualifications:

1. The contractor or subcontractor performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope and type to the required work.
2. It shall be the responsibility of the Contractor to see that the specifications are being adhered to. Failure of the Commissioner to immediately reject unsatisfactory workmanship or to notify the Contractor of his/her deviation from the specifications shall not relieve the Contractor of his/her responsibility to restore and/or replace unsatisfactory work.

**1.9 REGULATORY REQUIREMENTS**

- A. Procure and pay for permits and licenses required for work of this section.

**1.10 PROJECT/SITE CONDITIONS**

- A. Work shall be scheduled and conducted in a cooperative manner in order to give the least possible interference or annoyance to the City of New York staff working on the site and occupants of properties adjacent to the site.
- B. Construction Sequencing: Planting shall take place only after the installation of concrete pavement materials.
- C. The Contractor shall be responsible for pedestrian and vehicular safety and control within the work site. He/she shall provide the necessary warning devices and signalers needed to give safety, warning and protection to persons and vehicular traffic within the area.
- D. During site preparation, planting and after care, the Contractor shall be responsible for all damage to existing features above and below ground (benches, utility lines, irrigation pipes, lampposts, path surfaces, existing vegetation) incurred as a result of work operations. Restorations and/or replacements shall be made to the satisfaction of the Commissioner.
- E. Environmental Requirements and Planting Schedule:
1. Plant only within the following dates, weather permitting. Do not plant when the ground is frozen, excessively wet, or the soil is otherwise in an unsatisfactory condition for planting:
    - a. The Spring Season for all planting materials shall be that period from March 1 through May 15.
    - b. The Fall Season is divided into two parts, made necessary by the handling characteristics of two plant types.
      - 1) September 1 through October 15 shall be the fall planting season for deciduous and evergreen materials.

- 2) October 15 through December 1 shall be the fall planting season for deciduous materials only.

F. Environmental Requirements for Soils:

1. Soil mixes shall not be handled, hauled or placed during rain or wet weather or when near or above field capacity.

1.11 PLANT MATERIAL INSPECTION

- A. Plants shall be subject to inspection and approval by Commissioner at the place of growth and again upon delivery and prior to planting for conformity to specification requirements as to quality, size and variety. Such approval shall not impair the right of rejection due to damage suffered in handling, transportation and/or planting. Rejected plants shall be removed immediately from the site. Contractor shall be present at all inspections.
- B. Written requests for inspection of plant material at their place of growth shall be submitted to the Commissioner at least 14 days prior to digging. The Commissioner may refuse inspection if in his/her judgment an insufficient quantity of plants is available for inspection. The Contractor shall, at his expense, supply the Commissioner with such labor and assistance as may be necessary in the handling of material for proper inspection.
- C. Inspection of plant materials for spring planting shall occur during the previous fall season, or at a time prior to planting when sufficient plant growth has occurred to assess and evaluate plant species, size, and condition.
- D. Tagging of trees shall be as follows: if such quantities exist, for every 20 trees planted, 22 trees will be tagged assuring appropriate replacement for (a) trees damaged prior to transplanting and (b) trees requiring replacement under terms of the one-year guarantee.

1.12 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Packaged Materials: Deliver packaged materials in unopened bags or containers, each clearly bearing the name, guarantee, and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the material.
- B. Inspection
  1. Plants shall be subject to inspection and approval by Commissioner at the place of growth and again upon delivery and prior to planting for conformity to specification requirements as to quality, size and variety. Such approval shall not impair the right of rejection due to damage suffered in handling, transportation and/or planting. Rejected plants shall be removed immediately from the site. Contractor shall be present at all inspections.
    - a. Written requests for inspection of plant material at their place of growth shall be submitted to the Commissioner at least 14 days prior to digging. The Commissioner may refuse inspection if in his/her judgment a sufficient quantity of plants is not available for inspection. The Contractor shall, at his expense, supply the Commissioner with such labor and assistance as may be necessary in the handling of material for proper inspection.

2. Tagging of trees shall be as follows: if such quantities exist, for every 20 trees planted, 22 trees will be tagged assuring appropriate replacement for (a) trees damaged prior to transplanting and (b) trees requiring replacement under terms of the two-year guarantee.

C. Plant Material, Conditions of Moving and Delivery:

1. The use of an anti-desiccant shall not be allowed except by written approval and consent by Commissioner.
  - a. If approved, spray deciduous plants with an anti-desiccant, immediately before moving plant material from its source, applying an adequate film over trunks, branches, twigs, and foliage.
  - b. Approval shall be required for any subsequent instance of use.
2. Dig and handle plants with care to prevent injury to trunks, branches and roots.
3. Do not prune prior to delivery. Do not bend or bind-tie trees in such manner as to damage bark, break branches or destroy natural shape. Pack and ship in order to ensure arrival at the site in good condition. Provide protective covering during delivery. No plants will be accepted if the rootball is cracked or broken, or trunks scarred, or branches broken.
4. Plant Materials:
  - a. Deliver after preparations of planting areas have been completed and approved and place plants immediately.
  - b. If planting is delayed more than 24 hours after delivery, set balled and burlapped plants on the ground in a "shade house", erected by Contractor, with rootballs well protected with soil, wet peat, or other acceptable material. Protect balls and roots from freezing, sun, drying winds, and/or mechanical damage. Water as necessary until planted.

1.13 GUARANTEE PERIOD AND REPLACEMENTS

- A. The guarantee period for all new Landscape Plantings shall begin on the date of substantial completion.
- B. All plant material shall be guaranteed by the Contractor to be in good, healthy and flourishing condition, for a period of two (2) years from the date of substantial completion.
- C. Service for plant establishment period: Maintain temporary irrigation for a period of two (2) years from the date of substantial completion with the intent of establishing the planting.
- D. Replace, as soon as weather conditions permit, and within a specified planting period, all plants determined dead and/or dying by the Commissioner during and at the end of the guarantee period.
  1. Plants shall be free of dead or dying branches and shall bear foliage of normal density, size and color.
  2. Trees having lost their central leader or exhibit crown dieback at the end of the one-year guarantee shall be replaced.
  3. Replacements shall match the adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this specification. Labor and all materials needed for the installation of replacements shall be included in the guarantee.

- E. Make periodic inspections, during the guarantee period to determine what changes, if any, should be made in the care of the plants. Any recommended changes shall be submitted in writing to the Commissioner.

## PART 2 - PRODUCTS

### 2.1 PLANT MATERIAL

#### A. General Requirements:

1. Furnish and plant all plants as specified and in the quantities listed.
2. All plants shall be nursery grown.
3. Plants shall be true to species and cultivar specified. Certification of cultivars by supplying nursery must be supplied in writing to Commissioner.
4. Plants shall be in accordance with the American Nurserymen Association Standards in all ways, unless otherwise specified in writing by Commissioner.
5. All plants shall be of specimen quality, symmetrical, so trained or favored in development and appearance as to be unquestionably and outstandingly superior in forms and compactness. They shall indicate vigorous growth, be well branched and densely foliated when in leaf, free of disease, insects, eggs, larvae and shall have well developed root systems.
6. Trees with multiple leaders will not be accepted. Trees with a damaged or crooked leader, bark or abrasions, sun-scald, disfiguring knots, insect damage will not be accepted.
7. The depth of planting must be checked for all trees being tagged at the nursery. If the root/trunk flare (the intersection of the trunk and the buttress roots), is not visible, it must be located. Any tree with significant adventitious root growth or evidence of girdling roots shall be subject to rejection by the Commissioner, on a case-by-case basis. Any soil above the root/trunk flare shall be removed prior to digging (see root ball preparation detail drawing). Following the removal of any excess soil above the root/trunk flare, the tree shall be hand dug and drum laced. Machine digging shall be grounds for rejection of the tree. The rootball size shall be determined from the elevation of the root/trunk flare in accordance with the American standard for nursery stock for the caliper size of the tree.
8. Size:
  - a. Caliper measurement shall be taken on the trunk at DBH. (Approximately 5'0" above the natural ground line. Height and spread dimensions refer to the main body of the plant and not from branch tip to tip. If a range of size is given, no plant shall be less than the minimum size and not less than 50% of the plants shall be as large as the maximum size specified. Plants that meet measurements but do not possess a normal balance between height and spread shall be rejected.
  - b. Plants larger than specified may be used only if approved by Commissioner. If larger plants are approved, the root ball shall be increased in proportion to the size of the plant, in accordance with the American standard for nursery stock.

#### B. PLANT SIZES AND DIMENSIONS

1. Measurements: Measure according to ANSI Z60.1. Do not prune to obtain required sizes.
2. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container grown stock. Measure main body of tree or shrub for height and spread; do not

- measure branches or roots tip to tip. Take caliper measurements 6 inches above the root flare for trees up to 4-inch caliper size, and 12 inches above the root flare for larger sizes.
3. Height and spread dimensions refer to the main body of the plant and not from branch tip to tip. If a range of size is given, no plant shall be less than the minimum size and not less than 50% of the plants shall be as large as the maximum size specified. Plants that meet measurements but do not possess a normal balance between height and spread shall be rejected.
  4. Plants larger than specified may be used only if approved by Commissioner. If larger plants are approved, the root ball shall be increased in proportion to the size of the plant, in accordance with the American standard for nursery stock.
  5. Stock furnished shall be a fair average of the minimum and maximum sizes specified. Larger plants cut back to sizes specified will not be accepted.
  6. Container grown herbaceous plants, groundcover, and vines shall be well rooted in the container size indicated on the Plant Schedule, grown in the container at least one year prior to planting. Bulbs, corms, tubers and rhizomes shall be Top Size, or as indicated on the Plant Schedule. Annual flowering plants shall be vigorous, well rooted, with no indications of disease or stress.

**C. QUALITY**

1. All plants shall be typical of their species or variety. They shall have normal, well-developed branches and vigorous fibrous root systems. They shall be sound, healthy, vigorous plants free from defects, disfiguring knots, sun scald injuries, dead or broken branches, abrasions of the bark, plant diseases, insect eggs, borers, and all forms of infestation.
2. Trees: All trees shall be B&B, major trees branched 6-7' from the ground, minor trees as specified. Sizes shall be as indicated. Rootball size shall correspond to American Association of Nurserymen Standards for the corresponding caliper size. Well-branched top and fibrous root system essential.
3. Shrubs: Sizes shall be as indicated. Rootball or container sizes shall correspond to A.A.N. Standards for the corresponding shrub height. Heavy root system, all shrubs shall be well branched to the ground. Sizes shall be as indicated.
4. Vines, Groundcover, And Herbaceous Plants: Container size shall be as indicated on the plans. All plants shall have vigorous root systems and have grown in the container for at least one year prior to planting.
5. Plugs: Plugs shall have vigorous root systems.
6. Annuals: Annual flowering plants shall be vigorous, well rooted, with no indications of disease or stress.
7. Bulbs, Corms, Tubers And Rhizomes: All bulbs, corms, tubers and rhizomes shall be top size, firm, and non-desiccated.

**D. SOURCES**

1. All plants shall be sourced from reputable nurseries and be either field or container grown. All trees and shrubs shall have been growing under similar climatic conditions as the project site two (2) years prior to the date of the contract. Plants held in storage will be rejected if they show signs of growth during storage. Collected material shall not be accepted.
2. Plant material subject to availability and adherence to the requirements of this specification, may be purchased, or, time permitting, contract grown, from:
  - a. Halka Nurseries, Millstone Twp, NJ;
  - b. LP Statile Inc., Springfield Twp, NJ
  - c. Weston Nurseries, Chelmsford, MA

- d. Hardscrabble Farms, North Salem, NY
- e. Rosedale, Nursery, Hawthorne, NY
- f. North Creek Nursery, Landenburg, PA;
- g. Talmage Farm, Riverhead, NY;
- h. The Plantage, Cutchogue, NY;
- i. Kurt Bluemel, Inc., Baldwin, MD
- j. Greenbelt Native Plant Center, Staten Island, NY
- k. Pineland Nursery, Columbus, NJ
- l. Wild Earth, Freehold, NJ
- m. Sylva Native, New Freedom, PA
- n. or approved equal nurseries.

**E. NATIVE PLANTS, where indicated**

- 1. Native plant material must be derived from the local genotypes of the native Plants specified. For purposes of this native plant material paragraph, "local" shall mean within 150 miles from the planting site.
- 2. All plants must have been grown in a hardiness zone no warmer than Zone 7 or colder than Zone 6 as determined by the USDA Agricultural Research Service, Plant Hardiness Zone Map. Plant quality shall be typical of their species. Plant material should exhibit the range of variation typical of local genotypes of the species. They shall have normal branching and vigorous fibrous root systems. They shall be sound, healthy plants, free from sunscald injuries, or other mechanical injury, plant diseases, insect eggs, borers and all forms of infestations. Except as may otherwise be specified, all other sections of this Landscape Planting Specification shall also apply to the Native Plants.
- 3. All plants shall be nursery grown unless otherwise stated. Collected material will not be accepted.

**F. PLANT MATERIAL ORDERING**

- 1. Notify the Commissioner of the unavailability of any tree, shrub, herbaceous plant, or bulb species designated in the contract documents.
- 2. Schedule permitting, and with the Commissioner's approval, plant materials may be contract grown or pre-purchased provided the species, cultivar, size, quantities and other characteristics outlined in the Plant Schedule are satisfied at the time of planting.

**2.2 SOIL AMMENDMENTS**

**A. MYCORRHIZAL FUNGI INNOCULANT**

- 1. Three ounce (3 oz.) premeasured dry formulation packet, such as Mycor Tree Saver Transplant, as manufactured by Plant Health Care, Inc., Pittsburgh, PA. Rhizanova Tree Transplant, as manufactured by Becker Underwood, Inc., Ames, IA. MycoApply, as manufactured by Mycorrhizal Applications, Grants Pass, OR., or approved equal.
- 2. Packets shall contain, as a minimum: one thousand (1000) live spores of Vesicular-Arbuscular fungi, including: Entrophosphora columbiana, Glomus clarum, Glomus etunicatum, and Glomus sp.; seventeen million five hundred thousand (17,500,000) live spores of Ectomycorrhizal fungi (Pisolithus tinctorius); Biostimulant ingredients including Yucca schidigera extract; soluble sea kelp extract derived from Ascophylum nodosum; humic acids; and acrylamide copolymer gel as a water absorbent medium.

**B. WATER RETENTION ADDITIVE**

1. Water Retention Additives shall be a granular polyacrylamide polymer of a potassium base and not a sodium base that slowly releases moisture into the root zone such as Terra Sorb, as manufactured by Plant Health Care, Inc., Pittsburgh, Pa., SoilMoist, as manufactured by JRM Chemical, Inc., Cleveland, OH., Geohumus as manufactured by Geohumus International GMBH, Germany, or approved equal.

#### C. INORGANIC SOIL AMENDMENTS

1. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
2. Class: T, with a minimum of 99 percent passing through No. 8 sieve and a minimum of 75 percent passing through No. 60 sieve.
3. Class: O, with a minimum of 95 percent passing through No. 8 sieve and a minimum of 55 percent passing through No. 60 sieve.
4. Provide lime in form of ground dolomitic limestone or mollusk shells
5. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent sulfur, with a minimum of 99 percent passing through No. 6 sieve and a maximum of 10 percent passing through No. 40 sieve.
6. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.
7. Aluminum Sulfate: Commercial grade, unadulterated.
8. Perlite: Horticultural perlite, soil amendment grade.
9. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 sieve.
10. Sand: Clean, washed, natural or manufactured, and free of toxic materials.
11. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.
12. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

#### D. ORGANIC SOIL AMENDMENTS

1. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
2. Organic Matter Content: 50 to 60 percent of dry weight.
3. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.
4. Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or granular texture, with a pH range of 3.4 to 4.8.
5. Muck Peat: Partially decomposed moss peat, native peat, or reed-sedge peat, finely divided or of granular texture, with a pH range of 6 to 7.5, and having a water-absorbing capacity of 1100 to 2000 percent.
6. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.
7. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, debris, and material harmful to plant growth.

#### E. FERTILIZERS

1. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of 4 percent nitrogen and 20 percent phosphoric acid.

2. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.
3. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
4. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.
5. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.
6. Planting Tablets: Tightly compressed chip type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.
7. Size: 21-gram tablets.
8. Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.
9. Chelated Iron: Commercial-grade FeEDDHA for dicots and woody plants, and commercial-grade FeDTPA for ornamental grasses and monocots.

### 2.3 TREE STABILIZATION

- A. 2" Diameter X 8'L cedar stakes. Guy as indicated on drawings.

### 2.4 Root Barrier

- A. Root Barriers in plant beds: mechanical guides that redirect tree roots down and away from utilities while preserving a trees health.
  1. Basis-of-design Product: Subject to compliance with requirements provided: DeepRoot linear root barrier UB 36-2, DeepRoot Green Infrastructure, LLC 101 Montgomery Street, Suite 2850, San Francisco, CA 94104, (415) 781-9700 or comparable product by one of the following:
    - a. GreenBlue Urban, 4405 Anderson Road, Knoxville, TN 37918 (866) 282-2743; Product: ReRoot
    - b. Citygreen USA, 515 S. Flower Street, 36<sup>th</sup> Floor, Los Angeles, CA 90071 (888) 999-3990; Product: RootStop
    - c. Or approved equal.

### 2.5 MISCELANEOUS MATERIALS

- A. Erosion Control Blanket
- B. Biodegradable jute blanket and staples. Install as per manufacturer's requirements.
- C. Weed-Control Barriers – Not Used.
- D. Pesticides – Where Called For or Required. Commissioner's permission for use required. Notify within 7 days of proposed use.
- E. General: Pesticide registered and approved by EPA, acceptable to the regulations of the New York City Department of Environmental Protection, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by the Commissioner after having advised the Commissioner explicitly of their restricted nature.

- F. Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
- G. Post-Emergent Herbicide (Selective and Non-Selective): Effective for controlling weed growth that has already germinated.
- H. Landscape Edging – Not Used.
- I. Tree Grates – Not Used.
- J. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.
- K. Burlap: Non-synthetic, biodegradable.
- L. Landscape Fabric: Shall be a one hundred percent (100%) continuous monofilament polypropylene spun bond fabric with UV inhibitors. The landscape fabric shall prevent weed germination and reduce maintenance while allowing water, herbicides, and fertilizers to pass through. The fabric shall demonstrate the following minimum characteristics:
  - 1. Area Weight (ASTM 5261): 4.0 oz/yard
  - 2. Tensile Strength (ASTM D 4595): 48.57 lbs./ inch
  - 3. Strength @ 5% Elongation: 22.86 lbs./ inch
  - 4. Energy Absorption: 22 lbs./ inch
  - 5. Grab Strength (ASTM D 4632): 167.42 psi
  - 6. Burst Strength (ASTM D 3786) 166.79 psi
  - 7. Tear Strength (ASTM D 4533): 83.15 lbs.
  - 8. Puncture (ASTM D 4833): 56.18 lbs.
  - 9. Hydraulic Properties: opening size (ASTM D 4751) 210 microns, US Sieve 70
  - 10. Staples shall be a least six (6") inches in length and made of a rust-resistant material, such as aluminum, galvanized steel, or approved equal that will adequately secure the landscape fabric to the planting bed.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 PLANTING OPERATION

- A. The Commissioner reserves the right to be on site to direct the installation of all plantings. No plants shall be installed until their location has sited them to his/her satisfaction. The Commissioner will make every effort to expedite the work in a timely manner.
- B. For the purpose of inspection, the Commissioner shall have free access to all parts of work involved in planting operation. No work shall be covered or concealed prior to inspection.
- C. Plants shall be protected at all times from sun or drying winds. Plants that cannot be planted immediately upon delivery shall be kept in the shade and well watered by the Contractor. Plants shall not remain unplanted for longer than one day after delivery.

### 3.3 EXAMINATION

- A. Prior to work at planting and areas, ascertain the location of all electric cables, conduits, under drainage systems and utility lines. Take proper precautions so as not to disturb or damage sub-surface elements. Contractor failing to take these precautions shall be responsible for making requisite restorations to damaged utilities at Contractor's own expense.
- B. Verify that required underground utilities are available, in proper location, and ready for use. Coordinate with other trades as necessary.
- C. Examine areas to receive plants for compliance with requirements and conditions affecting installation and performance.
- D. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
- E. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Commissioner and replace with new planting soil.
- F. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
- G. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
- H. Uniformly moisten excessively dry soil that is not workable and which is too dusty.
- I. Verify that all work requiring access through or adjacent to areas where plants are to be placed has been completed and no further access will be required. In the event that access will be required, this must be coordinated with the Commissioner.
- J. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.4 PREPARATION

- A. The Commissioner reserves the right to direct the installation of all plantings. No plants shall be installed until their location has sited them to the Commissioner's satisfaction.
- B. For the purpose of inspection, the Commissioner shall have free access to all parts of work involved in planting operation. No work shall be covered or concealed prior to inspection.
- C. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.
- D. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.
- E. Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Commissioner's acceptance of layout before excavating or planting. Make minor adjustments as required.
- F. Lay out plants at locations directed by Commissioner. Stake locations of individual trees and shrubs and outline areas for multiple plantings.

- G. Apply antidesiccant if approved to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.
- H. If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.
- I. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.
- J. Plants shall be protected at all times from sun or drying winds. Plants that cannot be planted immediately upon delivery shall be kept in the shade and well watered by the Contractor. Plants shall not remain unplanted for longer than one day after delivery.

### 3.5 PLANT AREA ESTABLISHMENT

- A. Planting Soil and Landscape Grading sections.
- B. Confirm Finish Grading has been accepted. Restore areas if eroded, or settled beyond designated Finish Grades.
- C. Erosion Control Fabric: Place after tree planting, but prior to shrub, perennial, groundcover and vines.
- D. Landscape Fabric:
  - 1. Place landscape fabric across the entire area of each tree, shrub, mineral mulch area (do not use landscape fabric at grass and perennial planting areas) so that it lays loosely on the soil and in contact with the soil at all points.
  - 2. Remove any large sharp stones from the planting bed, along with invasive perennial weeds, such as mugwort, or hedge garlic, which may be treated with herbicide.
  - 3. Vertically anchor the edge of the fabric into the ground utilizing a small overlap and a blunt shovel along the perimeter of the bed to a depth of six inches (6").
  - 4. Landscape Fabric must be secured into the soil with staples placed at eighteen (18") inch intervals along the edges of the fabric, through both layers, or as directed by the Commissioner.
  - 5. Mark the fabric with chalk or paint to lay out the locations of specific plants and then cut a cross shape into the fabric no larger than the size of the root ball or container of the plant.
  - 6. Fold the corners under the fabric and dig a planting hole, reserve the soil for another use, place the plant, and reset the folds of the fabric to their original position, water the area thoroughly, and place mulch over the fabric as directed under the Item "Plant Material".

### 3.6 EXCAVATION FOR TREE PLANTING

- A. No plant pits shall be dug until the proposed locations have been staked on the ground by the Contractor and approved by the Commissioner.
- B. Planting Pits and Trenches: Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.

- C. Excavate approximately three times as wide as ball diameter for stock.
- D. Excavate at least 12 inches wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
- E. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
- F. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
- G. Maintain required angles of repose of adjacent materials as shown on the Drawings. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
- H. Structural Soil When the depth of the rootball exceeds the depth to the filter fabric underlying the Structural Soil installation, score the filter fabric in an 'X' and excavate sufficiently to permit the top of the ball to rest at finished grade.
- I. Maintain supervision of excavations during working hours.
- J. Keep excavations covered or otherwise protected when unattended.
- K. If drain tile is shown on Drawings or required under planting areas, excavate to top of porous backfill over tile.
- L. Obstructions: Notify Commissioner if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
- M. Drainage: Notify Commissioner if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.
- N. Fill excavations with water and allow to percolate away before positioning trees and shrubs.
- O. Planting beds for Shrubs, Vines, Herbaceous, and Groundcover plants shall be excavated to the dimensions and depths indicated on the plans and backfilled with approved topsoil. Bulbs, Corms, Tubers, Rhizomes and Annuals shall be planted in the existing unamended soil or prepared planting beds with improved soil and/or a water absorbent medium, as designated on the drawings.

### 3.7 TREE, SHRUB AND VINE PLANTING

- A. Before planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.
- B. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.
- C. ORIENTATION: Where possible, orient trees in the same cardinal direction as grown in the field in order to minimize damage to the bark of the trunk.

- D. Set balled and burlapped stock plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades. Set the tree or shrub straight and in the center of the pit, with the most desirable side facing toward the predominant view. Care shall be exercised in setting the plants plumb.
1. Topsoil removed from excavations may be used as planting soil if so directed by the Commissioner. Soil amendments should be added based on soil test recommendations. Subsoil excavated from the planting pit should be removed from the project site.
  2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops and sides of root balls. Do not remove burlap, rope and wire baskets from below root balls. Remove pallets, if any, before setting. All plastic or synthetic fabric must be removed from the ball at the time of planting. Wire must not be galvanized or aluminum wire.
  3. All ropes, stones, etc. shall be removed from the pit before backfilling.
  4. Do not use planting stock if root ball is cracked or broken before or during planting operation.
  5. Soil for backfill shall be loose and friable and not frozen or compacted.
  6. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
  7. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside the root ball about 1 inch from root tips; do not place tablets in bottom of the hole.
- E. Continue backfilling process. Water again after placing and tamping final layer of soil.
1. Set container-grown stock plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades. Set the tree or shrub straight and in the center of the pit, with the most desirable side facing toward the predominant view. Care shall be exercised in setting the plants plumb.
  2. Topsoil removed from excavations may be used as planting soil if so directed by the Commissioner. Soil amendments should be added based on soil test recommendations. Subsoil excavated from the planting pit should be removed from the project site.
  3. Carefully remove root ball from container without damaging root ball or plant.
  4. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
  5. Soil for backfill shall be loose and friable and not frozen or compacted.
  6. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside the root ball about 1 inch from root tips; do not place tablets in bottom of the hole.
  7. Continue backfilling process. Water again after placing and tamping final layer of soil.
- F. Set and support bare-root stock in center of planting pit or trench with root flare 1 inch above adjacent finish grade. Set the tree or shrub straight and in the center of the pit, with the most desirable side facing toward the predominant view. Care shall be exercised in setting the plants plumb.
1. Topsoil removed from excavations may be used as planting soil if so directed by the Commissioner. Soil amendments should be added based on soil test recommendations. Subsoil excavated from the planting pit should be removed from the project site.
  2. Spread roots without tangling or turning toward surface, and carefully work backfill around roots by hand. Puddle with water until backfill layers are completely saturated. Plumb before backfilling, and maintain plumb while working backfill around roots and placing layers above roots.

3. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside soil-covered roots about 1 inch from root tips; do not place tablets in bottom of the hole or touching the roots.
  4. Continue backfilling process. Water again after placing and tamping final layer of soil.
- G. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.
- H. Vine, Perennial, and Groundcover plants shall be carefully removed from containers or flats immediately prior to planting and set to the same depths as they were grown in the nursery bed or container, to the correct spacing indicated on the plans.
1. Roots shall be arranged in their natural position and topsoil worked in among them, taking care to avoid bruising or damaging the roots, and fertilizer tablets added to the top four inches (4") of backfill soil in the correct proportion for the respective pot size.
  2. No later than one hour after planting, all plants shall be thoroughly settled in with water.
  3. Climbing Vines shall be unfurled and tied to and/or woven through adjacent supporting wires, fences, trellis, etc.
- I. Annual flowering plants shall be carefully removed from the flats or cell-packs to avoid damaging roots or stems and planted in prepared planting beds at the same depth they were growing in the containers. Soil shall be thoroughly firmed around each crown, and plants thoroughly watered in no longer than one hour after planting.
- J. Bulbs shall be planted in the locations indicated on the plans and to the depths and spacing indicated on the Plant Schedule. Spring Flowering Bulbs, Corms, Tubers, and Rhizomes shall be planted in late September or October, no more than six (6) weeks before frost. Summer and Fall Flowering Bulbs, Corms, Tubers, Rhizomes and Plugs shall be planted in spring, after the last killing frost, or as directed by the Engineer. All of the above shall be planted according to best horticultural practice. Prior to planting, bulbs shall be stored in a cool, dry, well-ventilated location for no longer than two (2) weeks before planting.

### 3.8 SOIL AMENDMENTS

- A. Mycorrhizal fungi inoculants shall be added to the top six to eight inches (6-8") of backfill soil in each planting pit and thoroughly mixed to distribute the inoculants. The material shall be applied according to the following chart:

Size of rootball or container	Ounces per plant
1 gallon	1
2 gal.	2
3 gal.	3
5 gal.	3
7 gal.	3
10 gal.	3
15 gal.	3
20" B&B	6
24" B&B	9
30" B&B	9
36" B&B	12

42" B&amp;B

12

1. After mixing, the plants shall then be thoroughly settled in with water. Care shall be taken to avoid bruising or breaking the roots when tamping the soil. All large and fleshy roots that are bruised or broken shall be pruned, making a clean cut before planting.

### 3.9 PLANTING DEPTH

- A. Plants shall be placed on firmed final planting mix soil. Trees must be planted at the depth where roots spread from trunk as shown in diagram. The root flair shall be visible and at finished grade.
- B. All ropes and strings must be cut, non-biodegradable material must be removed, and the top 1/3 of the burlap folded back from the top of the ball. When tree root balls arrive on site in wire cages, after final placement has been approved, cut and remove the top half of the wire cage.
- C. When placement of the trees has been approved by the Commissioner, and only at that time, backfill soil shall be placed in all excavated areas. Soil must be firmed at six (6) inch intervals and thoroughly settled with water. Trees shall stand plumb after installation. See figure 1.1 depicting proper planting depth:

Figure 1.1

- D. Staking, Guying, and Wrapping:
  1. One (1) Rootball Kit with Tensioning Ratchet Straps, 3/4" (19mm) round, 4' (1.2m) long hand drive steel with large striking head, or deadman anchor, or anchor plate is to be installed per tree as per manufacturer installation method. Duckbill Rootball Kits as manufactured by Duckbill Earth Anchors, Foresight Products, LLC, Commerce City, CO, ArborGuy as manufactured by GreenBlue Urban, Knoxville, TN, Platipus Tree Anchoring as manufactured by Platipus Earth Anchoring Systems, Raleigh, NC, or approved equal.
  2. There shall be no tree wrapping left on tree after planting is complete.
- E. Pruning:

1. All on-site pruning shall be supervised by the Commissioner.
2. Each cut should be made carefully, at the correct location, leaving a smooth surface with no jagged edges or torn bark. The correct anatomical location is just beyond the branch collar. (See figures 1.2 and 1.3, taken from the I.S.A. certification study manual).
3. Large or heavy limbs should be removed using three cuts. The first cut undercuts the limb one or two feet from the parent trunk or branch. The second cut is the top cut which is made slightly further out on the limb than the undercut. The third cut is to remove the stub.

**Figure 1.2**

**Figure 1.3**

4. The natural character of the plant shall be preserved.
5. All deadwood, suckers, broken, or badly bruised branches shall be removed.
6. Pruning at the time of planting shall be avoided. Trees shall not be pruned to compensate for the loss of root mass due to digging.
7. Pruning shall be done with clean, sharp tools. No leaders shall be cut.
8. Evergreen plants shall not be pruned except to remove dead or broken branches.

### 3.10 WARRANTY MAINTENANCE OF TREES AND SHRUBS AFTER PLANTING

- A. Warranty maintenance shall begin immediately after each plant is planted, and shall continue until acceptance.
- B. Warranty maintenance Establishment Period begins from the date of substantial completion for a period of two (2) years with the intent of establishing the planting.

- C. Warranty maintenance shall consist of watering, mulching, tightening, and restoration of staking systems, resetting plants to proper grade and application of horticultural oils during dormant season.
- D. Maintain temporary irrigation with the intent of establishing the plant material, providing water to new trees and plant beds twice a month beginning each year on the first day of April and lasting until the last day of October. Warranty Maintenance shall include but is not limited to:
  - 1. Watering all trees and plant beds using soaker hoses or sprinklers connected to spigots on the 116 Precinct Station House and 105<sup>th</sup> Precinct Annex house
  - 2. The use of water trucks
  - 3. Using best practices
- E. Contractor must notify Commissioner when pest control is to take place.

### 3.11 ACCEPTANCE

- A. The Commissioner shall inspect all work for acceptance upon written request of the Contractor. The request shall be received at least fourteen (14) calendar days before the anticipated date of inspection.
- B. Upon completion and re-inspection of all restorations or renewals necessary, the Commissioner shall certify in writing as to the acceptance of the work.

### 3.12 FINAL INSPECTION AND FINAL ACCEPTANCE

- A. At the end of the guarantee period, the Commissioner will inspect all guaranteed work at the written request of the Contractor. The request shall be received fourteen (14) calendar days before the anticipated date for final inspection. Upon completion and re-inspection of all restorations or renewals necessary, the Commissioner shall certify in writing as to the final acceptance of the project.

### 3.13 WASTE MANAGEMENT

- A. Separate and dispose of waste in accordance with the DDC General Conditions.

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 32 94 50**

**CELLULAR TREE PLANTING SYSTEM**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].

**1.2 SUMMARY**

A. Section Includes

1. Provisions of Rigid Plastic Cellular Soil Cell Matrix and related materials.
2. Provisions of Rigid Plastic Cellular Soil Cell Matrix accessories including but are not limited to, Soil Cell Matrix Body, Soil Cell Matrix Top, Soil Cell Matrix Infill, Infill Material, Geocomposites, Root Barrier, Moisture Barrier, Filter Fabric, and Lateral Aeration Piping.

B. Related Sections:

1. Section 32 91 13 "Planting Soil"
2. Section 32 91 19 "Landscape Grading"
3. Section 32 93 00 "Landscape Planting"

**1.3 DEFINITIONS**

- A. Soil Cell: Load bearing engineered plastic module with vertical and lateral interlocks designed to create void space beneath pavements in order to support tree root growth.
- B. Soil Cell Matrix: Assembled and interconnected volume of soil cell modules.
- C. Lateral Piping System: Perforated piping system for circulation of air and distribution of water and nutrients, connected to surface inlet.
- D. Vertical Piping System: Large diameter plastic pipe system for inspection, circulation of air and connected to surface inlet.
- E. Root and Moisture Barrier: Linear membrane to prevent root and moisture penetration.
- F. Root Barrier: Linear root barrier with vertical integral root training ribs.
- G. Filler Soil: Correctly balanced soil mix to provide optimum growth conditions for tree root systems within the soil cell matrix.
- H. Finish Grade: Elevation of the finished pavement or planting surface.
- I. Geocomposite / Geogrid with integrated non-woven Geotextile: High strength geogrid comprised of stretched monolithic polypropylene flat bars with welded junctions and a

mechanically bonded filter geotextile welded within the geogrid structure. Used for reinforcement of granular pavement base.

- J. Geotextile / Geofabric / Filter Fabric: A Fabric composed of high tenacity polypropylene or polyester fibers, woven into a network, inert to biological degradation and resistant to naturally encountered chemicals, alkalis, and acids.
- K. Geogrid: Net-shaped woven polyester fabric with PVC coating, uniaxial or biaxial geogrid, inert to biological degradation, resistant to naturally occurring chemicals, alkalis, and acids. Used for reinforcement of granular pavement base.
- L. Tree Pit Opening: The pavement opening within which a tree is planted.
- M. Granular Base Course: Compacted granular material to specified requirements.
- N. Tree Pit: Excavated space filled with appropriate soil media for tree planting.
- O. Reinforcing Collar: A trench between the soil cell matrix and surrounding soil, lined with geocomposite, filled with granular base course and compact.
- P. Backfill: Clean, native excavated soil, free from organic matter, frozen materials, stones larger than 3" (74mm) in diameter, debris and other foreign substances.
- Q. Compaction: The method of mechanically increasing the density of soil. Soil compaction is measured using the Proctor Test (ASTM D1557-91)
- R. Planting Soil: Soil as defined in Section 32 91 13 Planting Soils.
- S. Reinforcing Collar: A trench between the soil cell matrix and surrounding soil, lined with geocomposite, filled with granular base course and compacted.
- T. Ribbed Root Barrier: Linear Ribbed root barrier with vertical integral root training ribs.
- U. Rootball Anchor System: A below grade system comprised of cables, spearhead or deadman anchors and web strap used for anchoring a rootball into the ground.
- V. Sub-grade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill.

#### 1.4 SUSTAINABLE DESIGN REQUIREMENTS

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

1. Recycled Content: Metal materials, products, anchors, framing, and accessories shall contain a minimum of 35% combined pre-consumer/post-consumer recycled content (the percentage of recycled content is based on the weight of the component materials). Certification of recycled content shall be in accordance with the LEED Building Submittals requirements of this Section.

#### 1.5 LEED BUILDING SUBMITTALS:

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.7 SUBMITTALS

- A. Schedule: Prepare a schedule for the work of this section. Include a detailed activity list, start and finish dates, milestones and date of substantial completion. Provide Commissioner with a copy of proposed schedule and obtain Commissioner's acceptance of schedule.
- B. Shop Drawings: Shop drawings shall show all information needed to fabricate, supply and install soil cell system including aggregate sub-base, horizontal and vertical dimensions and elevations.
- C. Product Data: Submit manufacturer's product data for each type of product to be used. For soils and aggregates provide testing agency laboratory analysis.
- D. Qualification Data: Submit proof of qualifications of installer and installer's site supervisor.

#### 1.8 DESIGN

- A. Soil Cell Matrix:
  1. Structural Design: Design soil cell matrix, sub-grade and subsequent fill layers to resist dead, live, lateral and environmental loads, with settlement, deflection and displacement within design limits.
  2. Wheel Load Rating: AASHTO H-20.
  3. Matrix Void Space: Minimum 95% free volume.

#### 1.9 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"
- B. Pre-Installation Meeting: Convene a pre-installation site meeting at least 7 days prior to commencing work at site. Require attendance of parties directly affecting work of this section, including Commissioner and, if appointed, testing agency. Review work activities and schedule. Tour site and inspect and discuss site physical conditions. Review required inspections.
- C. Installer Qualifications: Work shall be performed by an experienced installer with a successful track record in performing work of the same scope and quality as required by these specifications. Installer shall be properly trained by manufacturer of soil cells.

- D. **Installer's Site Supervision:** Appoint an experienced full-time site supervisor to be responsible for site activities for duration of work. Do not change site supervisor without Commissioner's prior written approval.
- E. **Site Mock-Up:** Prior to installation of soil cells, construct on site a 9 square meter mock-up of the entire system including granular sub-base, placement of filler soil and granular base course. Materials and techniques used in construction of mock-up shall be acceptable to Commissioner who shall be present during mock-up construction. Mock-up may remain part of permanent installation if acceptable to Commissioner.
- F. **Manufacturer's Representative:** Arrange for a representative of the soil cell manufacturer to be available to visit site within 48 hours' notice.

#### 1.10 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle materials in strict accordance with manufacturer's instructions
- B. Make provision on site to properly receive, handle and store materials. Provide sheltered and weather-tight storage to protect materials from the elements.
- C. Store soil cell modules on pallets, with pallet wrap intact until required for installation. Position pallets on firm, level base.
- D. Protect geosynthetics from physical damage and from temperatures excess of 70 degrees C. Do not expose geosynthetics to direct sunlight for more than 7 days.
- E. Store and protect bulk materials by covering with tarpaulins and in a manner to prevent erosion.

#### 1.11 PROJECT/SITE CONDITIONS

- A. **Ambient Conditions:** Perform work on site when ambient conditions are conducive to proper performance and in accord with recommendations of soil cell manufacturer. Take all reasonable precautions to guard against effects of adverse weather conditions.
- B. **Site Information:** Before commencing work on site examine available documentation pertaining to site and determine nature and location of above ground and underground utilities. Report demonstrable and potential conflicts with work of this section to Commissioner.
- C. **Existing Soil Conditions:** Before proceeding with full scale excavation work, confirm nature of existing soil conditions and in particular the drainage characteristics of existing soil. Refer to clause 2.8 Source Quality Control.
- D. Abandoned utilities encountered during excavation shall be removed and their ends plugged.
- E. Active utilities encountered during excavation and not indicated in Contract Documents shall be reported immediately to Commissioner and utility owner who shall determine measures necessary to restore, relocate or remove utility.

## PART 2 - PRODUCTS

### 2.1 Manufacturer

- A. Basis-of-Design Product: Subject to compliance with requirements provided GreenBlue Urban, Knoxville, TN; RootSpace or comparable product by one of the following:
  - 1. SilvaCell as manufactured by DeepRoot Green Infrastructure, San Francisco, CA.
  - 2. Stratavault as manufactured by Citygreen Urban Landscape Solutions, Los Angeles, CA.
  - 3. Or approved equal.

### 2.2 Rigid Plastic Cellular Soil Cell Matrix

- A. Material:
  - 1. Soil Cell Matrix Structure, Soil Cell Matrix Top, and Soil Cell Matrix Infill Panels shall be reinforced with fiberglass, 100% recycled polypropylene.
- B. Form and Configuration: Engineered plastic modules designed to assemble together to create a matrix under pavements. Interconnected skeletal matrix shall provide void space of at least 95% to accommodate filling with soil media or storing storm water.
- C. Interlocking uprights and decks are assembled on-site to create modules which can be uniformly stacked in height, not to exceed 10' in height (per project design).
- D. The soil cell system shall have the ability to be assembled as a complete, interlocked unit or as independent modules.
- E. The system shall have the capability of accommodating utilities up to 16" (400 mm) within the system. Subject to site and engineering requirements.
- F. Dimensions of Modular Units: Injection molded, polypropylene with nominal dimensions as follows:
  - 1. Matrix Body Upright Structure Dimension
    - a. 24"H x 20"W x 4"D
    - b. Ultimate Load Strength:
      - 1) Matrix Body: 260kpa (37.7 psi)
      - 2) Matrix Top: 260kpa (37.7 psi)
      - 3) Matrix Infill: 260kpa (37.7 psi)
  - 2. Matrix Top Dimension
    - a. 3"H x 20"W x 20"L
  - 3. Matrix Infill Panel Dimension
    - a. 20.5"H x 13"W x 1.5"D

### 2.3 GEOSYNTHETICS

- A. Geocomposites:

1. Composition: Geogrid with integrated non-woven Geotextile.
2. Geogrid: Stretched monolithic polypropylene flat bars with welded junctions.
3. Geotextile: Mechanically bonded filter geotextile welded within geogrid structure
4. Color: White
5. Physical Properties:

a. Geogrid Physical Properties:

Property	Units	Value
Mass per unit area	g/m <sup>3</sup>	250
Max tensile strength ( <i>machine direction/cross machine direction</i> )	kN/m	≥ 40 / ≥ 40
Elongation at nominal strength ( <i>machine direction/cross machine direction</i> )	%	≤ 8 / ≤ 8

b. Geotextile Properties

Property	Units	Value
Mass per unit area	g/m <sup>3</sup>	150
Max tensile strength ( <i>machine direction/cross machine direction</i> )	kN/m	7.5 / 11
Elongation at nominal strength ( <i>machine direction/cross machine direction</i> )	%	40 / 30
Puncture Force (x-s)	N	1,670
Opening size	mm	0.13
Water Permeability – flow rate H50	l/sm <sup>2</sup>	110

B. Ribbed Root Barrier:

1. Material: High-density polyethylene.
2. Minimum Thickness: 1.00 mm.
3. Depth: 40”.
4. Form: Linear rolls with integral vertical ribs.
5. Length: 100’ sections
6. Seams shall be overlapping 8” and sealed on both sides with joint tape.
7. Form: Linear sheet with integral vertical ribs.

8. Color: Black.
  9. Physical Properties: As specified in Appendix 'A' of this section.
- C. Ribbed Root Barrier: Designed to redirect tree roots down and away from pavement surfaces. Ribbed Root Barriers shall be manufactured to meet the following requirements:
1. Material shall be 100% recycled high-density polyethylene (HDPE).
  2. Minimum Thickness: 0.04" (1.00 mm)
  3. Form: Linear Rolls with integral vertical ribs.
  4. Depth: 40"
  5. Length: 100'
  6. Color: Black
  7. Seams shall be overlapped 8" (200 mm) and sealed on both sides with joint tape.
- D. Root and Moisture Barrier: Designed to protecting building foundations and underground utilities from tree root growth and moisture intrusion. Root & Moisture Barrier shall be manufactured to meet the following requirements:
1. Material shall be 100% recycled high-density polyethylene (HDPE).
  2. Minimum Thickness: 1.00 mm.
  3. Form: Linear rolls.
  4. Depth: 40"
  5. Seams shall be overlapping 8" and sealed on both sides with joint tape.
  6. Color: Black.
  7. Physical Properties: As specified in Appendix 'A' of this section.
- E. Filter Fabric:
1. Description: Fabric of polypropylene or polyester fibers, nonwoven, needle-punched continuous filament in flat and sock form.
  2. Physical Properties: As specified in Appendix 'A' of this section.
  3. Cellular Tree Planting Products.

## 2.4 AERATION AND INSPECTION PIPING

- A. Lateral Aeration Piping System:
1. Lateral Pipe: Flexible, perforated, 60 mm in diameter.
  2. Vertical Riser: Flexible, perforated, 60 mm in diameter, connecting lateral piping to surface inlet.
  3. Connectors: Molded connectors to effect proper jointing.
  4. Material: 100% high density polyethylene.
  5. Configuration: Optimize oxygen exchange with tree pit soil, facilitate supplementary irrigation and nutrient dosing and, where applicable, distribution of harvested storm water.
- B. Vertical Drainage Inspection Pipe: 100mm diameter rigid 100% high density polyethylene.
- C. Vertical Soil Inspection Pipe: 150 mm diameter rigid 100% high density polyethylene.

## 2.5 BIORETENTION SOIL

- A. As specified in 32 91 13 "Planting Soils"

## 2.6 AGGREGATES

- A. Granular Base Course: ASTM D1241-07, Type 1, Gradation B consisting of stone, gravel or slag with natural or crushed sand and fine mineral particles passing a No. 200 sieve, graded as follows:

SIEVE	PERCENT PASSING
37.5 mm	100
25 mm	75-95
9.5 mm	40-75
4.75 mm	30-60
2.0 mm	20-45
425 um	15-30
75 um	5-15

## 2.7 ROOTBALL ANCHORING SYSTEM

- A. Rootball Guying & Tree Tie
1. Composite Anchor
    - a. Ratchet: Mild Steel/Polyester
    - b. Cable: Stainless Steel
    - c. Hardware: Mild Steel
    - d. Anchor: Composite Plastic/aluminum

## 2.8 SOURCE QUALITY CONTROL

- A. Provide testing agency with representative samples of existing, on-site soil and of each type of fill proposed for use.
- B. Testing agency shall perform the following laboratory tests on each soil and fill sample:
1. Sieve analysis
    - a. Particle size distribution
    - b. Liquid limit
    - c. Plastic limit
    - d. Plasticity index
    - e. Hydraulic conductivity
    - f. Compaction
- C. Compaction testing shall be in accordance with ASTM D698 – 07e1 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (Standard Proctor Density).

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 EXAMINATION**

- A. Examine area to receive cellular tree planting system to confirm area is ready to receive work. Coordinate with adjacent work by others.

**3.3 PREPARATION**

- A. Tree Pit Layout: Layout tree pit locations and dimensions using string lines, survey pegs and marking paint. Obtain Commissioner's approval of layout before proceeding with excavation.
- B. Tree Pit Depths: Confirm excavation depths with reference to finished pavement elevations. Allow for granular base course layer and, where applicable, drainage layer.

**3.4 TREE PIT EXCAVATION**

- A. Excavation: Accurately excavate to dimensions shown on Drawings. Allow 200 mm additional clearance in length and width. Excavation side walls shall be clean and straight, within 15 degrees of vertical. Measure and confirm that correct horizontal and vertical dimensions have been achieved.
- B. Reinforcing Collar: Further excavate top perimeter of tree pit to a depth of 300 mm and to a width of 200mm, sufficient to accommodate a narrow foot compacting plate. Excavated surfaces shall be clean and straight,
- C. Protect sub-grade from softening, undermining, washout, or damage by rain or water accumulation. Reroute surface water runoff from excavated areas and do not allow water to accumulate in excavations.

**3.5 SUB-GRADE PREPARATION**

- A. Remove unstable bottom material, including large stones, debris and compressible soils. Scarify and mix sub-grade surface and moisture condition as required. Accurately construct and fine grade the sub-grade to required lines and levels. Compact sub-grade to 95% Standard Proctor Density.
- B. Finished sub-grade shall be flat, uniform, dense, smooth, free from loose stones and foreign matter, and sloped to a grade of 5%.

**3.6 TREE PIT GRANULAR BASE COURSE**

- A. Install granular base course to depth shown on Drawings on sub-grade and under first layer of soil cell modules. Compact granular base course to minimum 95% Standard Proctor Density.

**3.7 SOIL CELL INSTALLATION**

- A. Prior to installation of soil cell modules, confirm tree pit dimensions and mark location of trees with surveyor pegs. Rectify discrepancies and errors.

- B. Install soil cell modules in strict accordance with manufacturer's written instructions and installation diagrams. Prior to placement, check each soil cell module for damage. Reject cracked, chipped and otherwise damaged modules. Ensure that modules in contact with granular base course are firmly seated, with no rocking. Ensure that modules are mechanically interconnected both horizontally and, in multiple layers, vertically.

### 3.8 AERATION AND INSPECTION PIPING

- A. Lateral Aeration Piping: Install piping within top layer of soil cell modules in a complete connected circuit, within 600 mm of outer edge of matrix. Fit junctions and risers at maximum spacing of 3.6 meters.
- B. Vertical Inspection Piping: Place vertical piping within central opening of soil cell module.
- C. Trim vertical pipes to 150 mm above finished pavement and support in vertical position by temporary staking. Seal open ends of pipes.

### 3.9 ROOT BARRIERS AND ROOT MOISTURE BARRIERS

- A. Install root barriers and root and moisture barriers as shown on Drawings. Overlap barrier joints 150 mm and tape both sides of joint. Top edge of barriers shall be level with adjacent construction. Ensure that earth surfaces in contact with barriers are flat and free of sharp debris and stones so as to avoid puncturing barriers. Install root barriers with ribs facing inward.

### 3.10 SOIL FILLING

- A. Obtain Commissioner's prior approval to load soil cell matrix with filler soil. Install filler soil after soil cell matrix is fully assembled and piping systems and barriers are in place.
- B. Except as shown otherwise on Drawings completely fill all void spaces with filler soil. Place filler soil using an excavator bucket and spread with rakes or shovels
- C. Keep outer trench free of filler soil.
- D. Vibrate matrix using plate vibration or needle vibration equipment to shake filler soil into voids.

### 3.11 GEOCOMPOSITE LAYER

- A. Install a single layer of geocomposite over the entire top area of soil cell matrix. At perimeter, extend geocomposite over upper side walls of soil cell matrix and over bottom of adjacent trench.
- B. Overlap geocomposite joints 150mm. Allow for pipe penetrations with two intersecting slits cut with a sharp knife.

### 3.12 GRANULAR REINFORCING COLLAR

- A. Fill collar trench with granular base course material so that the collar is level with top of soil cell matrix.
- B. Place granular base course in 150 mm lifts and compact each lift to 95% Standard Proctor density.
- C. Do not displace geocomposite from base of trench.

3.13 TREE PIT OPENINGS

- A. Confirm exact location of tree pit openings. Cut geocomposite layer and fold back to expose opening. Position perimeter formwork.
- B. Line opening with root barrier with ribs facing inward. Extend root barrier down to top of soil cell matrix and up to level of finished pavement. Lap root barrier joints 150 mm and tape both sides of joint.

3.14 GRANULAR BASE COURSE FOR PAVEMENT

- A. Place granular base course material over geocomposite to depth shown on drawings. Place granular base course in 100 mm lifts and compact each lift to 95% Standard Proctor Density.

3.15 UTILITIES WITHIN SOIL CELL MATRIX

- A. Up to 140 mm in diameter may be inserted within matrix if desired.
- B. Over 140 mm up to 180 mm in diameter will require special treatment.

3.16 SITE QUALITY CONTROL

- A. Compaction Tests: Testing agency shall perform compaction testing on sub-grade and on each layer of fill to determine compliance with specified compaction. Determine method and frequency of testing in consultation with Commissioner.

3.17 CLEANING

- A. Upon completion of work on site, clean areas within contract limits. Remove tools, equipment, debris, rubbish and excess materials. Leave site in broom clean condition.

3.18 SOIL CELL SCHEDULE

RootSpace SERIES	LOCATION
RootSpace 600 SERIES, or equivalent product by Silvacell, Stratavault, or approved equal.	AS NOTED ON PLAN

3.19 PROTECTION

- A. Protect installed work. Protect open holes and soil in anticipation of tree planting

**END OF SECTION 32 94 50**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 33 02 00****PROTECTION OF EXISTING UTILITIES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS:**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).
- B. Section 31 00 00 – Earthwork
- C. Section 31 10 00 – Site Clearing, Removals and Preparation

**1.2 SECTION INCLUDES:**

- A. Identification and field markout of all on-site utility lines to remain in operation during construction.
- B. Identification and field markout of all on-site utility lines to be removed and/or abandoned.
- C. Submission of procedures to be used to ensure the safety of the utility.
- D. Restoration from any damage during construction operations.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 PROJECT RECORD DOCUMENTS:**

- A. Accurately record actual locations of capped utilities and utility lines encountered during construction.

**1.6 REGULATORY REQUIREMENTS:**

- A. Notify affected utility companies before starting work and comply with their requirements.
- B. Contact the “Call Before You Dig” service for an official utility mark out prior to excavation.

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”

**PART 2 - PRODUCTS (NOT USED)****PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 IDENTIFICATION:**

- A. Locate all existing utilities which are to remain in service during construction as shown on the contract drawings.
- B. Any conditions found to differ from what is shown on the contract drawings shall be immediately brought to the attention of the Commissioner.

**3.3 PROTECTION:**

- A. Flag, barricade or suitably protect existing utilities during construction operations and equipment movement.

**3.4 LATERAL DISCONNECTION:**

- A. Where a utility line is to be disconnected from portions to remain following construction, the lateral pipes shall be cut and suitably plugged/capped in accordance with the contract documents and NYC DEP regulations.

**3.5 RESTORATIONS:**

- A. Any damage to existing, operational utilities by the Contractor during the on-going construction operation shall be immediately restored to operational standards at the contractor's expense.

**END OF SECTION 33 02 00**

**SECTION 33 10 00****WATER UTILITIES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS:**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).
- B. Section 31 00 00 - Earthwork
- C. Section 32 12 16 - Asphaltic Paving
- D. Section 32 13 15 - Concrete Curbs and Paving
- E. Section 33 02 00 - Protection of Existing Utilities

**1.2 SUMMARY**

- A. Work includes:
  - 1. Construction of the water systems. This shall include, but not be limited to the following: pipe and fittings for site water line including domestic water line and fire water line, valves, flexible connections, fire hydrants and hydrant fenders. Set lines, elevations, and grades for water distribution system work for duration of work including careful observation of benchmarks, property corners, monuments, or other reference points.
  - 2. This section does not include work within the building footprint.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.

- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

#### 1.5 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

#### 1.6 SUBMITTALS

- A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:
  - 1. Material Certificates
  - 2. Product Warranty
  - 3. Product Data
  - 4. Manufacturer's Certificate

#### 1.7 QUALITY ASSURANCE

- A. Refer to DDC General Conditions, Section 01 40 00 "Quality Requirements".
- B. Perform work in accordance with NYCDEP, utility company and NYCDOB requirements.
- C. Valves: Manufacturer's name and pressure rating must be marked on valve body.

#### 1.8 TESTING AGENCY

- A. Retain an independent testing agency to perform material testing as required. The Contractor shall provide any necessary assistance to the testing agency and provide the testing agency with the intended construction schedule at least one week prior to the start of construction.

#### 1.9 CONTRACTOR RESPONSIBILITIES

- A. Contractor is responsible for coordinating the work of this trade with other trades on-site.
- B. Identify and describe unexpected variations to subsoil conditions and the discovery of uncharted utilities.

#### 1.10 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, and handle materials as recommended by the manufacturer to protect from damage.

#### 1.11 PERMITS AND APPROVALS

- A. Contractor shall prepare and obtain all required permits prior to construction unless otherwise directed by The City of New York. Copies of all permits shall be supplied to the Commissioner prior to the commencement of work authorized by the permit.
- B. Connections with existing facilities shall be performed in accordance with the requirements of NYCDOB and NYCDEP. The Contractor shall be required to comply with all such requirements, including securing all permits, and payment of all permit and/or connection fees.

## 1.12 PROJECT RECORD DOCUMENTS

- A. Refer to the DDC General Conditions for project record drawings requirements
  - 1. Record drawings for work of this section shall include, but shall not be limited to, an as-built survey of all new water, sewer, electric and gas service lines.

## 1.13 REFERENCE STANDARDS

- A. Unless more restrictive criteria or differing requirements are explicitly stated in the Specifications, or mandated by 2014 New York City Building Code, the recommendations, suggestions, and requirements described in the referenced standards shall be deemed mandatory and applicable to the Work.
- B. The latest edition, as of the date of the executed construction contract, of referenced standards listed below applies to this contract.
  - 1. New York City Department of Environmental Protection Bureau of Water and Sewer Rules, Standard Details, and Specifications.
  - 2. American Society for Testing Materials (ASTM), American National Standards Institute (ANSI), and American Water Works Association (AWWA)
  - 3. ANSI/ASME B16.18 - Cast Copper Alloy Solder Joint Pressure Fittings.
  - 4. ANSI/ASME B16.22 - Wrought Copper and Copper Alloy Solder Joint Pressure Fittings.
  - 5. ASTM B88 - Seamless Copper Water Tube.
  - 6. ANSI/AWS A5.8 - Brazing Filler Metal.
  - 7. ANSI/AWWA C104 - Cement Mortar Lining for Ductile Iron Pipe and Fittings for Water.
  - 8. ANSI/AWWA C105 - Polyethylene Encasement for Ductile Iron Piping for Water and Other Liquids.
  - 9. ANSI/AWWA C111- Rubber-Gasket Joints for Ductile Iron and Grey Iron Pressure Pipe and Fittings.
  - 10. ANSI/AWWA C151 - Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand Lined Molds, for Water or Other Liquids
  - 11. ANSI/AWWA C500 - Gate Valves, 3 through 48 inches NPS, for Water and Sewage Systems.
  - 12. ANSI/AWWA C502 - Dry Barrel Fire Hydrants.
  - 13. ANSI/AWWA C504 - Rubber Seated Butterfly Valves.
  - 14. ANSI/AWWA C508 - Swing Check Valves for Waterworks Service, 2 inches through 24 inches NPS.
  - 15. ANSI/AWWA C509 - Resilient Seated Gate Valves 3 inches through 12 inches NPS, for Water and Sewage Systems.
  - 16. ANSI/AWWA C600 - Installation of Ductile Iron Water Mains and Appurtenances.
  - 17. ANSI/AWWA C606 - Grooved and Shouldered Type Joints.
  - 18. UL 246 - Hydrants for Fire - Protection Service.

## PART 2 - PRODUCTS SOIL

### 2.1 MATERIALS

- A. As required by NYC DEP for water main and building service work.

### 2.2 GEOTEXTILES AND GEOGRID MATERIALS

- A. As required by NYC DEP for water main and building service work.

## 2.3 WATER PIPE MATERIALS AND ACCESSORIES

- A. Ductile Iron Pipe: Cement-Lined, ANSI A21.10 (AWWA C-151) Class 56 for pipe 6 inch diameter and larger; Class 52 for smaller than 6 inch diameter:
  - 1. Fittings: Ductile iron, standard thickness.
  - 2. Joints: AWWA C151, mechanical joints.
  - 3. Cement mortar lining: AWWA C-104.
  - 4. Retainer glands: Ductile Iron, 350 psi pressure rating.
- B. Gate Valves – 3 inches (75 mm) and over
  - 1. Manually operated, inside non-rising stem, ductile iron body/bonnet/seal plate, non-packing, bronze seated, double disc, seating wedge mechanism gate valve; model and manufacturer as approved by the NYCDEP Bureau of Water and Sewer.

## 2.4 CONCRETE MATERIALS

- A. Concrete for Thrust Blocks: Place thrust blocking consisting of 3,000 psi concrete to provide sufficient bearing area to transmit unbalanced thrust from bends, tees, caps, or plugs to undisturbed soil without loading undisturbed soil in excess of 2,500 lbs/sq. ft. when water main pressure is 100 psi.

## 2.5 PRODUCTS

- A. All products shall be as approved by NYC DEP and Commissioner. No substitutions will be accepted without prior approval by NYC DEP and Commissioner.

# PART 3 - EXECUTION

## 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

## 3.2 EXAMINATION

- A. Obtain NYCDEP permit to perform the work.
- B. Contact NYCDEP for field inspection.
- C. Verify existing conditions.
- D. Verify building service connection points with plans.
- E. Verify that existing water main size, location, and invert are as indicated on the drawings.

## 3.3 PREPARATION

- A. Cut pipe ends square, ream pipe and tube ends to full pipe diameter, remove burrs.
- B. Remove scale and dirt on inside and outside before assembly.

- C. Prepare pipe connections to equipment with flanges or unions.
- D. Hydrants removed from site shall remain property of The City of New York, with relocation or disposal at the Commissioner's discretion.

### 3.4 CLEANING

- A. After the system has been cleaned, the Contractor shall thoroughly inspect the system and all restorations shown to be necessary shall be promptly made by the Contractor.
- B. All Work of cleaning and restoration as specified herein shall be performed at the Contractor's expense and to the complete satisfaction of Commissioner.
- C. Disinfection of Water Piping System
- D. Sterilize distribution system with a solution of not less than 50 parts per million of chlorine with water prior to domestic operation. Thoroughly flush lines before introduction of chlorinating materials and after the contact period of at least 24 hours. De-chlorinate water prior to flushing into storm sewer system.
- E. Open and close valves in lines being sterilized several times during contact period. System shall be flushed with clean water until residual chlorine content is less than 1.0 part per million.
- F. After sterilization, test water for bacterium in accordance with AWWA specifications. Do not place distribution system in service until approval is obtained from New York City Department of Environmental Protection.

### 3.5 BEDDING

- A. Excavate pipe trench in accordance with Section 31 00 00 "Earthwork".
- B. Form and place concrete for pipe thrust restraints at any change of pipe direction.
- C. Place bedding material at trench bottom.
- D. Backfill around sides and to top of pipe with cover fill, tamp in place and compact in accordance with Construction Documents.

### 3.6 INSTALLATION PIPE

- A. Maintain separation of water main from sanitary and storm sewer piping in accordance with NYCDEP, state, and 2014 New York City Building Code. Unless otherwise approved, water mains shall be separated from sanitary sewer pipes a minimum distance of 10 feet horizontal and 18 inches vertical.
- B. Install ductile iron piping and fittings to ANSI/AWWA C600.
- C. Route pipe in straight line.
- D. Install pipe to allow for expansion and contraction without stressing pipe or joints.
- E. Install access fittings to permit disinfection of water system performed under this section.

- F. Slope water pipe and position drains at low points.
- G. Form and place concrete for thrust restraints at each elbow or change of direction of pipe main.
- H. Coordinate with NYCDEP for new wet tap to existing main.
- I. Establish elevations of buried piping to ensure not less than 4 ft of cover over the top of pipe under proposed grading. Locations where shallow cover cannot be avoided must be brought to the attention of The City of New York for review.
- J. Backfill trench in accordance with Construction Documents.
- K. Connections with Existing Pipelines: Where connections are made between new work and existing piping, make connection using suitable fittings for conditions encountered. Make each on-site wet tap connection under conditions which least interfere with operation of existing pipeline. NYCDEP will provide wet tap to their main.

### 3.7 INSTALLATION – VALVES

- A. Install gate valves as indicated on Drawings, supported on concrete pads with the valve stem vertical. Install valve boxes in a manner that will not transmit loads, stress, or shock to valve body. Center valve box over operating nut of valve vertical and plumb. Securely fit valve box together leaving cover flush with finished grade Form and place cast in place concrete base pad, with provision for storm sewer pipe end sections, or place precast reinforced concrete pad at the location and elevation specified on the plans.

### 3.8 INTERFACE WITH EXISTING FACILITIES

- A. Construct water service lines to within 5 feet of the building entry point.

### 3.9 CONSTRUCTION WITHIN THE PUBLIC RIGHT-OF-WAY

- A. Construction within the public right-of-way shall conform to all requirements of the City of New York, NYCDOB, NYCDEP, and NYCDOT.

### 3.10 FIELD QUALITY CONTROL

- A. Water line installation and testing shall be certified to the NYCDOB by a plumber licensed in the State of New York. The Contractor shall cooperate with the Commissioner as required to facilitate testing and inspection of the work.
- B. Test water distribution system installed below grade and outside the building in accordance with NYCDEP and NYCDOB and the following procedures:
  - 1. All pipework shall be tested at a hydrostatic pressure equal to 150 psi. The pipe work shall maintain said pressure for not less than two hours.
  - 2. Furnish, install, and operate the necessary connections, pumps, meters, and gauges. Leakage shall not exceed that permitted by AWWA Specifications C600 64 for mechanical joint and push on joint pipe. Prior to running any field test, a meter shall be tested, sealed, and approved by NYCDEP and NYCDOB at Contractor's expense.
  - 3. Locate and restore any leaks. Repeat testing until process results are satisfactory and in compliance with this section.
  - 4. Furnish a copy of the results of the meter test and the hydrostatic pressure test to the Commissioner upon completion of water distribution system backfilling operations

- C. Contractor shall call for NYCDEP inspection of all waterline work and shall be responsible for obtaining all NYCDEP signoffs, including but not limited to tap release letters and meter release letters.
- D. All waterline work, including but not limited to meters, taps, and backflow prevention device shall be constructed in accordance with the latest version of RCNY Title 15 Chapter 20 Rules Governing and Restricting the Use and Supply of Water.

**3.11 INSPECTION AND TESTING**

- A. Final Inspection: Upon completion of the Work and before backfill is placed and final acceptance by the Commissioner, the entire drainage system shall be subject to a final inspection in the presence of the Commissioner. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, and workmanship have been completed to the satisfaction of the Commissioner.

**END OF SECTION 33 10 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 33 31 00****SANITARY SEWER SYSTEM****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 31 00 00 – Earthwork
- C. Section 33 02 00 – Protection of Existing Utilities
- D. Section 33 49 00 – Storm and Sanitary Structures

**1.2 SUMMARY**

- A. Section includes:
  - 1. Sanitary sewerage piping, fittings, accessories and bedding.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 REFERENCES**

- A. ASTM A746-03 – Ductile Iron Gravity Sewer Pipe
- B. ANSI/AWWA C111/A21.11 – Rubber Gasket Joints for Ductile-Iron Pressure Pipe and Fittings

- C. ASTM D1785-15 – Standard Specification for Poly(Vinyl Chloride) Plastic Pipe, Schedules 40, 80, and 120

## 1.6 SUBMITTAL PROCEDURES

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

## 1.7 SUBMITTALS

- A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:
  - 1. Material Certificates
  - 2. Product Warranty
  - 3. Product Data
  - 4. Manufacturer's Certificate

## 1.8 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”

## 1.9 COORDINATION

- A. Coordinate the Work with the building sanitary sewer connection point shown by the plumbing plans, and connection to the on-site sewer system.

## 1.10 PROJECT RECORD DOCUMENTS

- A. Refer to the DDC General Conditions for project record drawing requirements.
- B. Accurately record actual locations of pipe runs, connections, outlet structures, headwalls, and invert elevations.
- C. Identify and describe unexpected variations to subsoil conditions and the discovery of uncharted utilities.

## 1.11 PERMITS AND APPROVALS

- A. Obtain street opening permit, and all permits and inspections for the sanitary sewer system construction as required by New York City Department of Environmental Protection (NYCDEP), New York State Department of Environmental Conservation (NYSDEC), New York City Department of Transportation (NYCDOT), and New York State Department of Transportation (NYSDOT).

# PART 2 - PRODUCTS

## 2.1 SEWER PIPE MATERIALS

- A. Ductile Iron Sanitary Sewer
  - 1. Class 56 type, inside nominal diameter of as specified on plans, bell and spigot end.
  - 2. All piping shall be in accordance with the 2014 New York City Building Code.

**B. Polyvinyl Chloride (PVC) Sanitary Sewer**

1. All PVC Sanitary pipe shall meet the requirements of AWWA C900.
2. Nominal outside diameters and wall thicknesses of PVC pipe shall conform to the requirements of AWWA C900. Integral bell joint pipe shall be furnished in 4", 6", 8", 10", and 12" sizes, in Class 200(DR14). Pipe shall be furnished in lengths of 20 feet.
3. Pipe shall incorporate a formed bell complete with a single rubber gasket conforming to ASTM F477. Joints shall be designed to meet the zero leakage test requirements of ASTM D 3139.
4. Pipe shall be homogenous throughout and free from voids, cracks, inclusions and other defects, and shall be as uniform as commercially practicable in color, density and other physical characteristics.
5. Every pipe shall pass the AWWA C900 hydrostatic proof test requirements of 4 times the pressure class for 5 seconds.

**2.2 PIPE ACCESSORIES**

- A. Fittings: Same material as pipe molded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps and other configurations required.
- B. PVC Fittings and couplings shall conform to the requirements of the PVC pipe for classification and size. Rubber gaskets for elastomeric joints shall conform to ANSI/ASTM F477. Lubricant for the joints shall be furnished by the pipe manufacturer. The rubber gaskets shall be factory installed in the bell of the pipe, fittings, and couplings. The plain end of the pipe shall be marked by the manufacturer to show the depth of penetration into the bell or coupling.

**2.3 CLEANOUTS**

- A. Lid and Frame: Heavy Duty cast iron construction, H20 rated.
- B. Shaft Construction: Cast Iron shaft of internal diameter as specified on plans with 4,000 psi concrete collar for cleanouts located in paved areas.
- C. Base Pad: Cast in place concrete, 4,000 psi leveled top surface to receive cast iron shaft sections, sleeved to receive sanitary sewer pipe sections.

**PART 3 - EXECUTION****3.1 EXECUTION REQUIREMENTS**

- A. Refer to DDC General Conditions for execution requirements.

**3.2 PREPARATION**

- A. Hand trim excavations to required elevations.
- B. Remove large stones or other hard matter, which could damage pipe or impede consistent backfilling or compaction.

**3.3 BEDDING**

- A. Excavate pipe trench in accordance with Section 31 00 00 – Earthwork for work in this Section.

- B. Place and compact bedding material at trench bottom. Hand trim bedding for accurate placement of pipe to elevations indicated.
- C. Maintain moisture content of bedding material between 1% below and 3% above optimum during compaction.

### 3.4 INSTALLATION - PIPE

- A. Install pipe, fittings, and accessories in accordance with ANSI/ASTM or AWWA requirements or manufacturer's instructions. Seal joints shall be watertight.
- B. Lay pipe to slope gradients noted on Construction Drawings.
- C. Lay pipe beginning at low point of system, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream.
- D. Refer to Section 31 00 00 for trenching requirements. Do not displace or damage pipe when compacting.
- E. Refer to Section 33 49 00 for manhole requirements.
- F. Connect to building sanitary sewer outlet within New York City public sewer systems.
- G. Pipe shall be installed in accordance with AWWA C605.

### 3.5 INSTALLATION - CLEANOUTS

- A. Form bottom of excavation clean and smooth to correct elevation.
- B. Form and place cast in place concrete base pad, with provision for sanitary sewer pipe end sections.
- C. Mount lid and frame level in grout, to finished grade elevation indicated on plan.

### 3.6 INTERFACE WITH EXISTING FACILITIES

- A. Requirements: Make all required connections of the proposed drainage facilities into existing facilities, where and as shown on the Drawings in accordance with the Suffolk County Department of Public Works.
- B. Compliance with The City of New York Requirements: Connections made into existing facilities shall be performed in accordance with the requirements of the New York City Department of Buildings (NYCDOB), New York City Department of Environmental Protection (NYCDEP), and New York City Department of Transportation (NYCDOT). The Contractor will be required to comply with all such requirements, including securing of all required permits, and expenses thereof. The expense of making the connections in accordance with all such requirements shall be included in the Contract Sum.

### 3.7 CONSTRUCTION WITHIN THE PUBLIC RIGHT-OF-WAY

- A. Construction within the public right-of-way shall conform to all requirements of the New York City Department of Environmental Protection (NYCDEP), and New York City Department of Transportation (NYSDOT).

### 3.8 MODIFICATIONS OF EXISTING STRUCTURES

- A. General: Alter, reconstruct, or convert existing structures where and as shown on the Drawings, or as approved by the Commissioner. In general, alterations shall be performed with the same type of material used in the original construction unless otherwise indicated on the Drawings or approved by the Commissioner.
- B. Damage to Existing Installations: Exercise extreme care during such alteration, reconstruction or conversions so as not to damage any portions of the structure or pipe shown to remain. Any such damage shall be restored by the Contractor at his own expense and to the satisfaction of The City of New York.

### 3.9 LATERALS

- A. General: Make all required lateral connections from the building to the on-site sewer system as shown on the Drawings or approved by the Commissioner. Work shall include making the connections into the on-site system, furnishing and installing all lateral pipe from the on-site sanitary sewer system to points located five (5) feet outside of the proposed building lines and properly sealing the ends with watertight plugs.
- B. Coordinate trades and the exact location and elevation of the utility point of entry into the building. For laterals not immediately connected to building utility, stake and mark end of lateral as per Section 31 00 00 - Earthwork.

### 3.10 FIELD QUALITY CONTROL

- A. Backfill placement and quantity control will be performed in accordance with Section 31 00 00 "Earthwork".
- B. If tests indicate work does not meet specified requirements, remove work, replace and retest at no additional expense to The City of New York.
- C. Inspection and Testing - Cooperate with the Commissioner to facilitate testing and inspection of the work. Clean and "Lamp" the lines in the presence of the Commissioner before final acceptance of the work. Infiltration and Exfiltration Testing shall be determined by the Commissioner and shall meet New York City Department of Building and New York City Department of Environmental Protection standards.
  - 1. The complete sanitary sewer system, including all mains, lateral sewers and manholes shall be tested for both infiltration and exfiltration. Provide all materials equipment and services as necessary to perform the tests as described herein except as noted.
  - 2. Infiltration Testing - The ends of any service sewers shall be securely plugged and the sewer main plugged at the manhole at the low end. The uppermost manhole shall be filled with water to a level of 4 feet above the top of the sewer or 4 feet above the groundwater level. The water shall stand for 2 hours to allow the sewer system to reach its maximum absorption. Subsequently, the uppermost manhole shall be refilled to the original 4 feet height.
    - a. Rate of infiltration shall be determined by means of V-notch weirs or other approved measuring devices in an approved manner and at such times and locations as may be directed by the Commissioner. The maximum leakage limit shall be 100 gallons per inch of diameter, per day, per mile.

- b. For shorter stretches, less than 500 feet in length, rate of 100 percent in total excess of the above figures may be permitted, providing the total infiltration is in excess of the maximum allowable, the leaking joints shall be re-laid if necessary, or other remedial construction shall be performed by and at the expense of the Contractor. The section of sewer shall then be re-tested after restorations are completed to determine compliance with the specifications.
3. Low Pressure Air Exfiltration Testing - The sewer mains or laterals shall be tested for leakage by the use of low-pressure air as specified hereinafter and as approved by the Commissioner. Provide test plugs, air compressor, and installers properly instructed by the manufacturer for conducting the test. The test length shall not exceed one (1) interval of pipe between two (2) manholes. Take all necessary precautions to prevent blowouts.
4. After the pipe has been backfilled and cleaned, pneumatic plugs shall be placed in the line at each manhole and inflated to 25 psi. Low-pressure air shall be introduced into this sealed line until the internal air pressure reaches 4 psi greater than the average back pressure of any groundwater that may be over the pipe. At least two (2) minutes shall be allowed for the air pressure to stabilize.
5. After the stabilization period (3.5 psi minimum pressure in the pipe), the portion of line being tested shall be acceptable if the time required in minutes for the pressure to decrease from 3.5 to 3.0 psi (greater than the average back pressure of any groundwater that may be over the pipe) is not less than the time indicated in the following table:

Pipe Size (in.)	Time (Min.)
4	2.5
6	4
8	5
10	6.5
12	7.5
15	9.5

- D. Correction of Defective Work - If leakage exceeds the specified amount, the Contractor shall at their own expense make the necessary restorations or replacements required to permanently reduce the leakage to within the specified limit and the tests shall be repeated until the leakage requirement is met.
  1. Any defects found in the system are to be restored at the expense of the Contractor so to conform strictly to the Specifications and to the satisfaction of the Commissioner. All restorations shown necessary by the tests are to be made, broken or cracked pipe replaced, all deposits removed, and sanitary sewer left true to line and grade and entirely clean, free from lumps of cement, protruding gaskets, bulkheads, etc., and ready for use before final acceptance by the Commissioner.
- E. Pipe to Manhole Connections - Connections of pipe to manholes shall be water tight. Connections of polyvinyl chloride sewer pipe to the manholes shall be made using a flexible compression gasket that meets or exceeds ASTM C-478, ASTM C-923 and ASTM F-2510.

**END OF SECTION 33 31 00**

**SECTION 33 40 00****STORM DRAINAGE UTILITIES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract].
- B. Section 31 00 00 – Earthwork
- C. Section 33 49 00 – Storm and Sanitary Structures

**1.2 SUMMARY**

- A. Section includes:
  - 1. Site storm sewerage drainage piping, fittings and accessories, and bedding.
  - 2. Catch basins, paved area drainage and site surface drainage.
  - 3. Building storm drainage lateral construction.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures".

**1.6 SUBMITTALS**

- A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:
  - 1. Material Certificates
  - 2. Product Warranty
  - 3. Product Data
  - 4. Manufacturer's Certificate

**1.7 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

**1.8 REFERENCES**

- A. 2014 New York City Building Code.
- B. NYCDEP Bureau of Water and Sewer Rules and Specifications, latest revision.
- C. ANSI/ASTM C14 Concrete Sewer, Storm Drain, and Culvert Pipe.
- D. ANSI/ASTM C76 Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
- E. ANSI/ASTM C443 Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.
- F. ASTM C507 Reinforced Concrete Elliptical Culvert, Storm Drain and Sewer Pipe.
- G. ASTM D1248 - Polyethylene Plastics Molding and Extrusion Materials
- H. ASTM C478 – Precast Reinforced Concrete Manhole Sections
- I. ASTM D3350 - Polyethylene Plastics Pipe and Fittings Materials
- J. ASTM D3212 – Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals
- K. ASTM A536 – Ductile Iron Castings
- L. ANSI C150 – Ductile Iron Pipe (DIP) Class 56, Ceramic Epoxy lined Tyton Joints
- M. ANSI C151 – Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for water or other liquids.
- N. AASHTO M294 and M252 – Corrugated polyethylene pipe, smooth interior

**1.9 DEFINITIONS**

- A. Bedding: Fill placed under, beside and around pipe, prior to subsequent backfill operations.

**1.10 PROJECT RECORD DOCUMENTS**

- A. Accurately record actual locations of pipe runs, connections, catch basins, and invert elevations.

- B. Identify and describe unexpected variations to subsoil conditions and the discovery of uncharted utilities.

## 1.11 COORDINATION

- A. Coordinate the Work with the roof drain connection locations from the buildings.

## PART 2 - PRODUCTS

### 2.1 SEWER PIPE MATERIALS AND ACCESSORIES

- A. Ductile Iron Pipe: Comply with requirements of AWWA C104 Cement Mortar Lining, AWWA C110 Ductile Iron Fittings, AWWA C111 Joints and Fittings, AWWA C150 Thickness, AWWA C151 Ductile Iron Pipe. All buried Ductile Iron Pipe (DIP) shall be mechanical joint unless otherwise shown on the drawings, specified herein, or directed by the Commissioner. Mechanical Joint DIP and fittings shall be minimum Class 52, unless otherwise specified.
- B. High-Density Polyethylene Pipe: Comply with requirements of ASTM D1248, Type III, Category 4, grade P33, Class C or ASTM D3350 Cell Classification 324420C. All High Density Polyethylene (HDPE) pipe shall be N-12 Sure Lock pipe, watertight, and manufactured by ADS or approved equal and shall have NYCDOB MEA Approval. HDPE pipe is permitted in lieu of RCP for pipes sizes 30 inches and smaller, except for underground detention basins, where 36-inch and 60-inch diameter HDPE shall be used.
- C. Reinforced Concrete Pipe: Comply with requirements of ASTM C 76 installed with flexible plastic (Bitumen) gaskets at all joints. Gaskets shall comply with ASTM C443, and shall be installed in strict accordance with pipe manufacturer's recommendations. For all pipe installations with cover less than two (2) feet, Class IV RCP shall be used.

### 2.2 CATCH BASINS AND AREA DRAINS

- A. Precast Catch Basins: 4,000 psi concrete reinforce for H20-16 loading in accordance with ASTM C478 of size, shape and depth as indicated on the Drawings.
- B. Base Pad: Cast-in-place or precast reinforced concrete pad.
- C. Lid and Frame: Shall be ADA compliant, H-20 rated, and be fitted with vandal resistant bolts. The basis of design is IronSmith 'ADA' 9031DR-24, 24" Square, 1/4" Slots, Gray Cast Iron, Raw Natural Finish, H20 rated. Alternatives include:
  - 1. Iron Age: 'Regular Joe', 24" Square, Gray Cast Iron, Raw Natural Finish, H20 rated.
  - 2. Urban Accessories: 'Standard ADA', 24" Square, 1/4" openings, Manufacturer's Frame, Ductile Cast Iron with Baked on Oil Finish, H20 rated.
  - 3. Or approved equal.
- D. Hood: Standard cast iron hood and hook. The basis of design is Campbell Foundry Cast Iron Trap. Alternatives include:
  - 1. General Foundries Inc., USF 5500 Hood
  - 2. Neenah Foundry, R-3711
  - 3. Or approved equal.
- E. Steps: Per details shown on plans or approved equal.

## 2.3 TRENCH DRAIN

- A. Subject to compliance with requirements, trench drain shall be model Z812 manufactured by Zurn Drains (Basis-of-Design) or approved equivalent product from one of the following:
  - 1. Josam
  - 2. NDS
  - 3. Or approved equal.
- B. Grate: Shall be ADA compliant, H-20 rated, and be fitted with vandal resistant bolts. The basis of design is IronSmith 'ADA' 9032, 11-1/2" Custom Width, 1/4" Slots, Gray Cast Iron, Raw Natural Finish, H20 rated. Alternates include:
  - 1. Iron Age 'Regular Joe', 1/4" Slots, Gray Cast Iron, Raw Natural Finish, H20 rated
  - 2. Urban Accessories: 'Jamison', 1/4" Slots, Manufacturer's Frame, Ductile Cast Iron with Baked on Oil Finish, H20 rated
  - 3. Or approved equal.

## 2.4 CLEAN OUTS

- A. Lid and Frame: Subject to compliance with requirements, cleanout lid and frame shall be heavy-duty, H20 rated, cast iron construction manufactured by Neenah Foundry (Basis-of-Design), or approved equivalent product from one of the following:
  - 1. General Foundries Inc.
  - 2. Campbell Foundry
  - 3. Or approved equal.
- B. Shaft Construction: HDPE shaft of internal diameter as specified on the plans.
- C. Concrete Collar: Cast-in-place concrete, 3,000-psi level top surface.

## 2.5 INLINE CHECK VALVE

- A. Check valves are to be all rubber and the flow operated check type with slip-in cuff connection. The entire check valve shall be ply reinforced throughout the body, saddle and bill, which is cured and vulcanized into a one-piece unibody construction. A separate valve body or pipe used as the housing is not acceptable. The valve shall be manufactured with no metal, mechanical hinges or fasteners, which would be used to secure any component of the valve to a valve housing. The port area of the saddle shall contour into a circumferential sealing area (the "bill") that is concentric with the pipe which shall allow passage of flow in one direction while preventing reverse flow. The entire valve shall fit within the pipe inside diameter. The saddle area of the valve must be flat, not conical, and integral with the rubber body above centerline in order to not produce any areas or voids that can collect or trap debris. The valve must be easily installed in pipes with poor end condition without the need to modify or utilize the headwall or structure to seal and anchor the valve. Once installed, the valve shall not protrude beyond the face of the structure or end of the pipe.
- B. The check valve shall incorporate multiple concave grooves molded integrally into the flat saddle wall thickness extending longitudinally a minimum of 80% of the length of the saddle to reduce opening resistance and reduce head loss.

- C. The check valve shall incorporate a custom shaped notch in the end of the bill to reduce cracking pressure. The notch shall be at the invert/bottom of the bill and symmetrical about the valve centerline. The longitudinal length of the notch shall be no greater than half the length of the bill.
- D. The outside diameter of the upstream and downstream sections of the check valve must be circumferentially in contact with the inside diameter of the pipe.
- E. Slip-in style check valves will be furnished with a set of stainless steel 304 expansion clamps. The clamps, which will secure the valve in place, shall be installed in the upstream or downstream cuff of the valve, depending on installation orientation, and shall expand outwards by means of a turnbuckle. Each band shall be pre-drilled allowing for the valve to be pinned and secured into position in accordance with the manufacturer's installation instructions.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Verify the trench cut and excavation base to be hard, smooth, and dry.
- B. Verify excavation location, dimensions and elevation with contract drawings.

#### 3.3 PREPARATION

- A. Set all lines, elevations, and grades for utility work and maintain for the duration of work. Provide careful maintenance of bench marks, property corners, monuments, or other reference points.
- B. Protect and maintain in operating condition, existing utilities encountered during utility installation. Restore any damage to surface or subsurface improvements shown on the drawings.
- C. Coordinate structure placement with inlet and outlet pipe or duct sleeve locations and inverts required by other sections.
- D. Coordinate all building sewer connection locations and elevations with civil and plumbing plans. Comply with 2014 New York City Construction Codes.
- E. Hand trim excavations to required elevations and thoroughly compact as per DDC General Conditions.
- F. Install dewatering systems that will be required to construct the proposed utilities to the design elevations and using the methods described herein. Water pumped out of excavations shall be disposed of per NYCDEP and DDC General Conditions, and will not be discharged directly to the City's storm drainage system without prior approval of NYCDEP.
- G. Remove large stones or other hard matter which may damage piping or impede consistent backfilling or compaction.
- H. Subgrade areas identified by the Commissioner as unsuitable shall be excavated to suitable material or a maximum of two additional feet, backfill with bedding material and compact as specified in Section 31 00 00 "Earthwork".

### 3.4 BEDDING

- A. Excavate pipe trench in accordance with Section 31 00 00 “Earthwork” for work of this section.
- B. Place and compact bedding material at trench bottom. Hand trim bedding for accurate placement of pipe to elevations indicated.
- C. Maintain moisture content of bedding material between 1% below and 3% above the optimum.

### 3.5 INSTALLATION – PIPE

- A. Place pipe on minimum 6-inch-deep bed of compacted bedding aggregate.
- B. Install pipe, fittings, and accessories in accordance with ASTM C12, ASTM D2321, manufacturer's instructions and/or 2014 New York City Construction Codes. Seal joints to be watertight.
- C. Lay pipe to slope gradients noted on civil drawings; with maximum variation from true slope of 1/8 inch in 10 feet.
- D. Place and compact bedding aggregate at sides and to the springline of the pipe as per Section 31 00 00.
- E. All sewer pipe joints installed within ground water or partially submerged within ground water shall be installed with water tight joints.
- F. Pipe joints shall not be installed within the leachate collection stone trench.
- G. Refer to Section 31 00 00 “Earthwork” for trenching and backfill requirements. Do not displace or damage pipe when compacting.
- H. Refer to Section 33 49 00 “Storm and Sanitary Manholes” for manhole requirements.

### 3.6 INSTALLATION CATCH BASINS & AREA DRAINS

- A. Form bottom of excavation clean and smooth and to correct elevation. Place minimum of 6" compacted bedding aggregate.
- B. Form and place cast-in-place concrete base pad, with provision for storm sewer pipe end sections, or place precast reinforced concrete pad at the location and elevation specified on the plans.
- C. Level top surface of base pad to receive concrete shaft sections, sleeved to receive storm sewer pipe sections.
- D. Establish elevations and pipe inverts for inlets and outlets as indicated.
- E. Mount lid and frame level in grout, secured to top cone section to elevation indicated.
- F. Outlet structures shall be constructed in accordance with the section and elevations shown on the Contract Drawings.

**3.7 INSTALLATION – CLEANOUTS**

- A. Form bottom of excavation clean and smooth to correct elevation.
- B. Form and place cast-in-place concrete collar, with provision for storm pipe end sections.
- C. Mount lid and frame level in grout to elevation indicated on plans.

**3.8 INSTALLATION – INLINE CHECK VALVE**

- A. Valve shall be installed in accordance with manufacturer's written Installation and Operation Manual and approved submittals.

**3.9 FIELD QUALITY CONTROL**

- A. Clean the entire drainage system of all debris and obstructions. This shall include, but not be limited to, removal of all formwork from structures, concrete and mortar droppings, construction debris and dirt. Thoroughly flush the system clean and furnish all necessary hose, pumps, pipe and other equipment that may be required for this purpose. Do not flush debris into existing storm drains or streams; remove all debris from the system. Perform all removals and disposal in accordance with Contract Specifications for Construction Waste Management & Disposal.
- B. After the system has been cleaned, thoroughly inspect the system. Promptly make restorations as necessary.
- C. Perform all work of cleaning and restore as specified herein at own expense and to the complete satisfaction of the Commissioner.
- D. It shall be the Contractor's responsibility to comply with all regulations of the New York City Department of Environmental Protection (NYCDEP), New York City Department of Buildings (NYCDOB), and New York City Department of Transportation (NYCDOT).
- E. The inline check valve shall be tested for verification of the manufacturer's hydraulic testing, backpressure, and cracking pressure limits.

**3.10 FINAL INSPECTION**

- A. Upon completion of the Work and before backfill is placed and final acceptance by the Commissioner, the drainage system shall be subject to a final inspection in the presence of the Commissioner. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, and workmanship have been completed to the satisfaction of the Commissioner.

**END OF SECTION 33 40 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 33 49 00****STORM AND SANITARY STRUCTURES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract [City of New York Standard Construction Contract]. Section 31 00 00 – Earthwork
- B. Section 33 31 00 – Sanitary Sewer System
- C. Section 33 40 00 – Storm Drainage Utilities
- D. Geotechnical Report prepared by Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C., dated October 15, 2018.

**1.2 SUMMARY**

- A. Section includes:
  - 1. Monolithic concrete manholes with masonry transition to lid frame, covers, anchorage and accessories.
  - 2. Modular precast concrete manhole sections with tongue and groove joints with masonry transition to lid frame, covers, anchorage and accessories.
  - 3. Storm water treatment device.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 SUBMITTAL PROCEDURES**

- A. Refer to DDC General Conditions Section 01 33 00 “Submittal Procedures”.

**1.6 SUBMITTALS****1.7 The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:**

- A. Shop Drawings: Indicate manholes locations, elevations, invert elevations, piping, sizes and elevations of penetrations.
- B. Product Data: Provide manhole covers, component construction, features, configuration, and dimensions.

**1.8 QUALITY ASSURANCE**

- A. Refer to DDC General Conditions Section 01 40 00 “Quality Requirements”.

**1.9 REFERENCES**

- A. ANSI/ASTM C55 Concrete Building Brick.
- B. ASTM A48 Gray Iron Castings.
- C. ASTM C478 Standard Specification for Precast Reinforced Concrete Manhole Sections.
- D. ASTM C857 – Standard Practice for Minimum Structural Design Loading for Underground Precast Concrete Utility Structures
- E. ASTM C858 – Standard Specification for Underground Precast Concrete Utility Structures
- F. ASTM C891 – Standard Specification for Installation of Underground Precast Concrete Utility Structures
- G. ASTM C923 Resilient Connectors Between Reinforced Concrete Manhole Structures and Pipes.
- H. ASTM C990 – Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants
- I. ASTM D4101 - Standard Specification for Copolymer steps construction
- J. ASTM D4097 - Standard Specification for Contact-Molded Glass - Fiber-Reinforced Thermoset Resin Corrosion - Resistant
- K. International Masonry Industry All Weather Council (IMIAC): Recommended Practices and Guide Specification for Cold Weather Masonry Construction.
- L. New York City Department of Environmental Protection (NYCDEP) Specifications and applicable 2014 New York City Building Code requirements.

## PART 2 - PRODUCTS

### 2.1 MANHOLE

- A. Manhole Sections: Reinforced precast concrete.
  - 1. 4,000 psi concrete reinforced for H20-16 loading or greater in accordance with ASTM C478 with self-sealing butyl gaskets in accordance with ASTM C923.
  - 2. Construct manholes of precast concrete sections as required by Drawings to size, shape, and depth indicated.
- B. Manhole Sections: Reinforced cast-in-place concrete.
  - 1. Cast-in-place Manholes shall be constructed of 4,000 psi concrete reinforced for H20-16 loading or greater.
  - 2. Forms shall be accurately made of steel sheets and shapes of sufficient strength to form dense watertight walls to true dimensions.
  - 3. Concrete shall be deposited in evenly distributed layers of about 18 inches, with each layer vibrated to bond it to the preceding layer.
- C. Mortar and Grout
  - 1. Masonry cement used for laying up dimension masonry shall conform to the requirements of ASTM C91.
  - 2. Grouting material for use in grouting anchor bolts, flanges, dowels and other miscellaneous items in concrete shall be a non-metallic, non-shrink grout which when mixed with water, will harden rapidly to produce a permanent anchoring bond. It shall be free of any corrosion promoting agents.
- D. Reinforcement: Grade 60 deformed steel rebars with galvanized finish. Reinforcing shall conform to the latest revised edition of the AISC code.
- E. Bitumastic Coating: The entire exterior surface of all manholes shall be coated with two (2) coats of an approved bitumastic material to produce a dry film thickness of 0.07 inches (7 mils) per coat.
- F. Clear Inside Dimensions: 48 inch diameter or as indicated on plans.
- G. Design Depth: As indicated on plans.
- H. Clear Lid Opening: 24 inches diameter minimum.
- I. Pipe Entry: Provide openings as indicated
- J. Main and Lateral Pipes: Neatly cut off main and lateral pipes flush with inside of manhole or inlet where they enter structure walls, and point up irregularities and rough edges with non-shrink grout.
- K. Inverts: Shape inverts for smooth flow across structure floor as shown on Drawings. Use concrete and mortar to obtain proper grade and contour and finish surface with fine textured wood float. Provide benches in all sanitary sewer manholes.

### 2.2 MANHOLE CASTINGS

- A. Lid and Frame: Per details shown on plans or approved equal.

- B. Manhole Steps: Cast iron or approved equal.
- C. Base Pad: Precast reinforced concrete or cast-in-place concrete with leveled top surface.

### 2.3 STORM WATER TREATMENT DEVICE (SWTD)

- A. Precast Concrete Structure: Precast concrete components shall conform to applicable sections of ASTM C 478, ASTM C 857 and ASTM C 858 and the following:
  - 1. Concrete shall achieve a minimum 28-day compressive strength of 4,000 pounds per square-inch (psi);
  - 2. Unless otherwise noted, the precast concrete sections shall be designed to withstand lateral earth and AASHTO H-20 traffic loads;
  - 3. Cement shall be Type III Portland Cement conforming to ASTM C 150;
  - 4. Aggregates shall conform to ASTM C 33;
  - 5. Reinforcing steel shall be deformed billet-steel bars, welded steel wire or deformed welded steel wire conforming to ASTM A 615, A 185, or A 497.
  - 6. Joints shall be sealed with preformed joint sealing compound conforming to ASTM C 990.
  - 7. Shipping of components shall not be initiated until a minimum compressive strength of 4,000 psi is attained or five (5) calendar days after fabrication has expired, whichever occurs first.
- B. Internal Components and appurtenances shall conform to the following:
  - 1. Screen and support structure shall be manufactured of Type 316 and 316L stainless steel conforming to ASTM F 1267-01;
  - 2. Hardware shall be manufactured of Type 316 stainless steel conforming to ASTM A 320;
  - 3. Fiberglass components shall conform to the ASTM D-4097
  - 4. Access system(s) conform to the following:
  - 5. Manhole castings shall be designed to withstand AASHTO H-20 loadings and manufactured of cast-iron conforming to ASTM A 48 Class 30.
- C. The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using a particle size distribution having a mean particle size (d50) of 125 microns unless otherwise stated.
- D. The SWTD shall be capable of capturing and retaining 100 percent of pollutants greater than or equal to 2.4 millimeters (mm) regardless of the pollutant's specific gravity (i.e.: floatable and neutrally buoyant materials) for flows up to the device's rated-treatment capacity. The SWTD shall be designed to retain all previously captured pollutants addressed by this subsection under all flow conditions. The SWTD shall be capable of capturing and retaining total petroleum hydrocarbons. The SWTD shall be capable of achieving a removal efficiency of 92 and 78 percent when the device is operating at 25 and 50 percent of its rated-treatment capacity. These removal efficiencies shall be based on independent third-party research for influent oil concentrations representative of storm water runoff ( $20 \pm 5$  mg/L). The SWTD shall be greater than 99 percent effective in controlling dry-weather accidental oil spills.
- E. The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table 1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. The sump chamber shall be separate from the treatment processing portion(s) of the SWTD to minimize the probability of fine particle

re-suspension. In order to not restrict the City of New York's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.

- F. The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.
- G. The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Commissioner. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All expenses associated with preparing and certifying this documentation shall be born solely by the Contractor.
- H. The SWTD shall have completed field tested following TARP Tier II protocol requirements.

### PART 3 - EXECUTION

#### 3.1 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

#### 3.2 EXAMINATION

- A. Verify items provided by other sections of work are properly sized and located.
- B. Verify that built in items are in proper location, and ready for roughing into Work.
- C. Verify excavation for manholes is to the correct depth and that the bottom is hard and smooth.

#### 3.3 PREPARATION

- A. Set all lines, elevations, and grades for utility and drainage system work and maintain for the duration of work. Provide careful maintenance of bench marks, property corners, monuments, or other reference points.
- B. Protect and maintain in operating condition, existing utilities encountered during utility installation. Restore any damage to surface or subsurface improvements shown on the drawings.
- C. Verify location, size, elevation, and other pertinent data required to make connections with existing sewer systems indicated on the Contract Drawings.
- D. Coordinate structure placement with inlet and outlet pipe or duct sleeve locations and inverts required by other sections.
- E. Coordinate all building utility connection locations and elevations with architectural, structural, and plumbing drawings.
- F. Install dewatering systems that will be required to construct the proposed utilities to the design elevations and using the methods described herein. Water pumped out of excavations shall be

disposed of on-site for sedimentation removal, and will not be discharged directly to the City's storm drainage system.

- G. Subgrade areas identified by the Commissioner as not being capable of supporting the proposed structure shall be excavated to suitable material or a maximum of two additional feet, backfill with bedding material and compact as specified.

### 3.4 INSTALLATION OF PRE-CAST MANHOLE SECTIONS

- A. Place granular base pad, trowel top surface level for placement of manhole barrel base section. Place manhole base plumb and level to correct elevation.
  - 1. Cast in place bases: After completion of excavation, setting of reinforcing steel and placing inlet and outlet pipes, but prior to placing concrete for invert slab, set concrete blocks on granular base pad to support first manhole barrel section which shall be lowered into excavation, grooved end first. Align and adjust to proper grade prior to placing invert slab, which shall be poured immediately after setting of first manhole barrel section.
- B. Prior to setting subsequent manhole barrel sections, apply primer to tongue and groove ends and allow to set in accordance with manufacturer recommendations. Place gasket on tongue end. Lower next section into position, and remove excess material from interior of structure. Add additional primer on exterior of joint, if necessary, for completely watertight joint.
- C. Castings belonging to reset/converted structures shall be salvaged and reused, if possible.
- D. Set cover frames and covers securely to correct line and grade elevations.
- E. Grout base of shaft sections to achieve slope to exit piping. Trowel smooth. Contour as required.
- F. Coordinate with other sections of work to provide correct size, shape, and location.

### 3.5 MASONRY CONSTRUCTION

- A. Maintain masonry courses to a uniform dimension. Form vertical and horizontal joints of uniform thickness.
- B. Lay masonry units in running bond.
- C. Form flush mortar joints.
- D. Lay masonry units in full bed of mortar, with full head joints, uniformly jointed with other work.
- E. Install joint reinforcement 16 inches on center.
- F. Place joint reinforcement in first and second horizontal joints above base pad and below lid frame opening.
- G. Set cover frames and covers securely to correct line and grade elevations.
- H. Grout base of shaft sections to achieve slope to exit piping. Trowel smooth. Contour as required.
- I. Coordinate with other sections of work to provide correct size, shape, and location.

**3.6 INSTALLATION OF STORM WATER TREATMENT DEVICE (SWTD)**

- A. Exercise care in the storage and handling of the SWTD components prior to and during installation. Any restoration or replacement expenses associated with events occurring after delivery is accepted and unloading has commenced shall be borne by the contractor.
- B. The SWTD shall be installed in accordance with the manufacturer's recommendations and related sections of the contract documents. The manufacturer shall provide the contractor installation instructions and offer on-site guidance during the important stages of the installation as identified by the manufacturer at no additional expense. A minimum of 72 hours' notice shall be provided to the manufacturer prior to their performance of the services included under this subsection
- C. Fill all voids associated with lifting provisions provided by the manufacturer. These voids shall be filled with non-shrinking grout providing a finished surface consistent with adjacent surfaces. Trim all protruding lifting provisions flush with the adjacent concrete surface in a manner, which leaves no sharp points or edges.
- D. Remove all loose material and pooling water from the SWTD prior to the transfer of operational responsibility to the City of New York.

**END OF SECTION 33 49 00**

THIS PAGE INTENTIONALLY LEFT BLANK

**SECTION 33 49 10****OTHER UTILITIES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS:**

- A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions, (4) the Addendum and (5) the Contract (City of New York Standard Construction Contract).
- B. Section 33 02 00 - Protection of Existing Utilities
- C. Section 31 00 00 – Earthwork

**1.2 SECTION INCLUDES:**

- A. Furnish labor, materials, services, equipment, and other necessary items required to excavate, install and backfill the piping, conduit, duct banks and manhole/pull box structures related to the on-site primary and secondary electrical service, site lighting, and telephone/data in accordance with the Contract Documents.

**1.3 SUSTAINABLE DESIGN REQUIREMENTS**

- A. This project is targeting the goal of LEED v4 Silver. The Contractor is required to follow the specified requirements and implement practices and procedures to meet the project's environmental performance goals.
- B. Refer to the following sections:
  - 1. Section 01 74 19 – CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
  - 2. Section 01 81 13 – SUSTAINABLE DESIGN REQUIREMENTS FOR LEED BUILDINGS
  - 3. Section 01 81 19 – INDOOR AIR QUALITY REQUIREMENTS FOR LEED BUILDINGS
- C. LEED BUILDING PERFORMANCE REQUIREMENTS: The following criteria are required for the products included in this section. Certification of these products shall be in accordance with the LEED Building Submittals requirements of this Section.

**1.4 LEED BUILDING SUBMITTALS:**

- A. The LEED BUILDING Submittal information shall be assembled into one package per specification section (or per trade) and sent to the Commissioner for review.
- B. Refer to DDC General Conditions for LEED BUILDING Submittal requirements.

**1.5 REFERENCES**

- A. The National Electric Code, Latest Edition
- B. New York City Fire Department Standard Details and Specifications, Latest Edition

- C. National Grid Specifications, Blue Book, 2015 Edition

#### 1.6 COORDINATION:

- A. All work in this Section shall be coordinated with the Commissioner and electric and telephone/data utility companies and shall comply with all requirements, details, regulations, etc. of said companies. Coordinate with each utility to define where his limit of work exists.

#### 1.7 SUBMITTAL PROCEDURES:

- A. Refer to DDC General Conditions Section 01 33 00 "Submittal Procedures"

#### 1.8 SUBMITTALS

- 1.9 A. The Contractor must provide the following submittals to the Commissioner for approval prior to purchase of materials:

- 1. Material Certificates
- 2. Product Warranty
- 3. Product Data
- 4. Manufacturer's Certificate

#### 1.10 QUALITY ASSURANCE

- A. Refer to DDC General Conditions Section 01 40 00 "Quality Requirements"

### PART 2 - PRODUCTS

#### 2.1 CONDUIT, FITTINGS AND CABLE:

- A. Electric and Telephone/Data: Refer to Division 26 and 27 of the Technical Specifications and the Contract Drawings.

#### 2.2 STRUCTURES:

- A. Manholes, pull boxes and junction boxes shall comply with all requirements, specifications, details, and recommendations of the governing utility company and as indicated on the Contract Drawings.

#### 2.3 BEDDING AND BACKFILL:

- A. Refer to Section 31 00 00 – Earthwork

#### 2.4 CONCRETE ENCASEMENT:

- A. Concrete for encasement of electric duct banks shall be 3,500 psi concrete.

### PART 3 - EXECUTION

#### 2.5 EXECUTION REQUIREMENTS

- A. Refer to DDC General Conditions for execution requirements.

**2.6 EXAMINATION**

- A. Verify existing conditions.
- B. Verify building service connection points with architectural plans.

**2.7 BEDDING**

- A. Excavate all utility trenches and place bedding in accordance with Specification Section 31 00 00 “Earthwork”.

**2.8 PREPARATION**

- A. Conduit:
  - 1. Remove scale and dirt, on inside and outside of conduit, prior to assembly.
  - 2. Prepare conduit in accordance with manufacturer's recommendations.

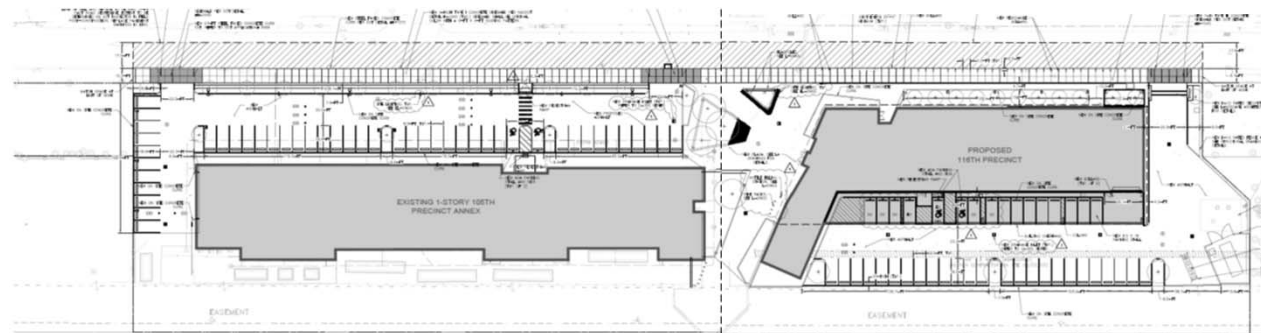

**2.9 INSTALLATION**

- A. Conduit:
  - 1. Maintain minimum conduit separation in accordance with 2014 New York City Construction Codes.
  - 2. Establish elevations of conduit in accordance with Section 31 00 00 – “Earthwork” and the Contract Drawings.
  - 3. Place forms for concrete encased duct banks. Install conduit to conserve space and to allow for expansion and contraction without stressing conduit or joints. Pour concrete and vibrate to ensure there are no voids.
  - 4. Backfill trench in accordance with Section 31 00 00 – “Earthwork”.
- B. Structures:
  - 1. Install manholes, handholes, junction boxes and/or pullboxes in accordance with Construction Drawings.
- C. Service Connections:
  - 1. Construct service lines to within 5 feet of the exterior building wall at the building entry point unless otherwise indicated on the Contract Drawings. Cap and stake ends of conduits.
  - 2. Connections with existing facilities shall be performed in accordance with the requirements of the Commissioner. The Contractor shall be required to comply with all such requirements, including securing all permits, and payment of all permit and/or connection fees related to this section.
  - 3. Any product, which is damaged or disturbed through any cause prior to acceptance of the Work, shall be restored, realigned, or replaced as directed by The Commissioner, at no expense to The City of New York.

## 116<sup>th</sup> PRECINCT HOUSE EXISTING CONDITION AND CONSTRUCTION PLAN

**Notes:**

- 1.) Construction Fence to Follow NYC Noise Control Code
- 2.) Street Closure, Curb Cuts and Sidewalk Closure Permits
- 3.) Signage diverting people around the construction site.
- 4.) Pedestrian path to be maintained as handicap with security separation from 105<sup>th</sup> Precinct Annex

# **116<sup>th</sup> PRECINCT HOUSE SITE LOGISTICS PLAN**

Construction Activities Impacting the Safety of Pedestrians on the North Access to LIRR should it remain open:

- Foundation Excavation along the west portion of the new 116<sup>th</sup> Precinct
- Excavation and Tie-in of utilities between the Existing 105<sup>th</sup> Annex and the new 116<sup>th</sup> Precinct
- Excavation/ Installation of large detention systems
- Active traffic during concrete foundation pour (Concrete Trucks), steel, building enclosure, equipment/ material deliveries, etc.
- Material staging and movement between the Existing 105<sup>th</sup> Annex and the new 116<sup>th</sup> Precinct
- Steel and Precast Erection hazards with the use of Mobile Crane

**Notes:**

- 1.) North access to LIRR underpass will remain open. • A 8'-0" walkway will be provided for pedestrians during construction of the 116th Precinct during the following activities:
  - Foundation excavation and installation
  - Installation and Tie-in of utilities
  - Excavation/ Installation of Detention System
  - Material Staging and Movement
  - Active Traffic: Concrete Foundation, Building Enclosure, Equipment & Material Deliveries
  - Mobile Crane: Steel and Precast Erection
- 2.) West pedestrian access to LIRR Rosedale Station to remain open.
- 3.) ADA access to LIRR Station via south entrance to underpass will remain open

**Legend:**

-  New Pedestrian Crosswalk
-  New Pattern
-  Access Points
-  Elevator/ Handicap Accessible

## **EXECUTIVE SUMMARY**

This Remedial Action Plan (RAP) was prepared on behalf of Dattner Architects for the proposed development at 244-04 North Conduit Avenue (Block 13265, Lot 30) in the Rosedale neighborhood of Queens, New York (the "Site"). The Site consists of the New York City Police Department (NYPD) 105<sup>th</sup> Precinct Satellite Office and associated driveways, parking lots, and landscaped areas along North Conduit Avenue. A site location map is shown on Figure 1. Pursuant to the January 12, 2018 City Environmental Quality Review (CEQR) No. 18NYP002Q Negative Declaration, RAP review and approval is required by the New York City Department of Environmental Protection (DEP). This RAP is consistent with the DEP requirement to remediate known and potential contamination that is encountered at the Site during the proposed development activities. The plan includes provisions for managing soil in accordance with applicable federal, state, and local requirements, and guidelines for temporary on-site stockpiling and off-site transportation and disposal of soil.

### Site Description

The Site is located at 244-04 North Conduit Avenue (New York City Tax Block 13265, Lot 30) in the Rosedale neighborhood of Queens. The eastern portion of the Site is used as a parking lot for the 105<sup>th</sup> Precinct Satellite Office, which is located on the western half of the Site. The surface of the Site, outside of the existing building footprint, is covered with asphalt, concrete and landscaped areas. The perimeter of the Site is surrounded by vegetation, landscaped areas, and paved sidewalks. The total extent of the Site encompasses about 127,000 square feet; the parking lot located on the eastern half of the Site encompasses about 60,000 square feet, the 105<sup>th</sup> Precinct Satellite Office located on the western half of the Site encompasses about 19,000 square feet, and the remainder of the western portion of the Site encompasses about 48,000 square feet.

The Site is bound by North Conduit Avenue to the north, vacant land to the east, the Long Island Rail Road (LIRR) to the south, and the Rosedale Municipal Parking Field beyond the 105<sup>th</sup> Precinct Satellite Office to the west. A site plan is provided as Figure 2. The surrounding area is occupied by residential, vacant lots, transportation/utilities and commercial uses. The properties located north of the Site beyond North Conduit Avenue consist of residential dwellings with vacant vegetated land to the east. The main line for the LIRR and the Rosedale Station, which are elevated, are located to the south. South Conduit Avenue and Route 27 are located south of the station and run parallel to the LIRR. Several commercial properties including three service stations and a tire repair shop are located beyond Route 27.

### Proposed Development

The proposed development includes construction of a 45,000-square-foot two-story building with a below-grade cellar level in the eastern portion of the Site. A new at-grade parking lot will border the new building to the south. The building will be occupied by the NYPD as their 116<sup>th</sup> Precinct Stationhouse in the Rosedale neighborhood of Queens, New York.

The cellar portion of the proposed building will be towards the northeast of the Site, with a small part of the first floor (without a cellar level) extending south. The cellar level will encompass about 15,200 square feet. The cellar will have a floor slab elevation of elevation (el.) 6.5 feet<sup>1</sup> requiring general excavation to about 14.5 feet below grade surface (bgs). Several features including an elevator pit within the cellar, footings outside of the cellar excavation footprint, stormwater retention structures, and fueling station will require additional excavation to about el. 17.5 to el. -1 or about 5.5 to 22 feet bgs, respectively. Construction excavation is anticipated to include dewatering to about 4 feet below the groundwater table.

Stormwater retention structures will be constructed south of the new NYPD 116<sup>th</sup> Precinct Stationhouse and adjacent to the existing NYPD 105<sup>th</sup> Precinct Satellite Office located in the western half of the Site. Excavation depths to support this construction will range from about el. 17.5 to el. 15 or about 5.5 to 6 feet bgs. A fueling station will be constructed within the southeastern part of the Site and will include a fueling station and a vault containing two fuel tanks: a 6,000-gallon regular grade gasoline tank and a 4,000-gallon diesel tank. Excavation for the fuel tank vault will extend to about el. 6.6, which is about 14.5 feet bgs. Excavation for the filling station will extend to about el. 12, which is about 9 feet bgs. A refuse building will also be constructed in the southeastern part of the Site and excavation in this area will extend to about el. 17, which is about 4 feet bgs. Isolated landscaped areas will be included along areas of the Site and building perimeter. An estimated 9,150 cubic yards of soil/fill is anticipated to be excavated from the Site as part of development. Support of excavation (SOE) construction will be implemented to facilitate excavation, as required. Excavation areas are presented in Figures 4 and 5.

The layout of the Site development is presented in Figures 6 and 7.

### Previous Reports

Previous reports reviewed as part of RAP preparation are included in Appendix A and include the following:

- August 21, 2017 Geophysical Engineering Survey Report, prepared by NOVA Geophysical Engineering on behalf of City of New York Department of Design and Construction (DDC)

---

<sup>1</sup> Elevation datum is North American Vertical Datum of 1988

- December 15, 2017 (reissued October 15, 2018) Geotechnical Engineering Report, prepared by Langan on behalf of Dattner Architects
- March 2018 Phase II Limited Site Investigation (LSI) Results Report, prepared by AECOM on behalf of New York City Police Department Capital Construction Unit
- May 9, 2018 Geotechnical Data Report, prepared by CDM Smith on behalf of City of New York Department of Design and Construction

Phase II LSI soil sample analytical results revealed pesticides, lead and mercury in shallow soil samples (0 to 2 feet bgs) at concentrations exceeding the New York State Department of Environmental Conservation (NYSDEC) Part 375 Unrestricted Use (UU) Soil Cleanup Objectives (SCOs). Two pesticides were identified in groundwater at concentrations exceeding NYSDEC's Ambient Water Quality Standards and Guidance Values (AWQSGVs).

Soil vapor sampling identified volatile organic compounds (VOCs) in the eastern portion of the Site. Although there is no standard for soil vapor sample result comparison, they were compared to the following for reference: 1) Upper Fence Background Indoor Air values from the New York State Department of Health's (NYSDOH) 2003 publication, Study of Volatile Organic Chemicals in Air of Fuel Oil Heated Homes; and 2) the 90<sup>th</sup> Percentile Background Indoor Air values as identified the United States Environmental Protection Agency's (USEPA) 2001 publication, Building Assessment and Survey Evaluation (BASE) Database for indoor air in office and commercial buildings. The Phase II LSI sample locations are shown on Figure 3.

#### Remediation Plan Summary

This RAP describes remedial activities to be implemented concurrently with the proposed building development. A Construction Health and Safety Plan (CHASP) is included in this RAP as Appendix B. The CHASP addresses site-specific hazards and safety requirements in relation to the identified and reasonably anticipated subsurface contaminants. The following is a summary of the remedial approach developed for the Site (details are provided in Section 4.0):

- General excavation to about el. 6.5 (about 14.5 feet bgs) within the cellar footprint
- Excavation to about el. 17.5 to el. -1 or about 5.5 to 22 feet bgs for the foundation, footings, sheeted pit excavations, fueling station, and refuse building
- Excavation and backfill to support site grading, stormwater retention structures, landscaped areas, a fueling station and a refuse building
- Dewatering to about 4 feet below the groundwater table to support excavation below the water table and to provide a satisfactory working surface for the foundation construction
- Characterization, handling, transportation, and disposal of excavated fill and native overburden in accordance with NYSDEC regulations Part 360: Solid Waste Management

Facilities and Part 364: Waste Transporter Permits, and other applicable local, state, and federal regulations

- If encountered, registering and removing any petroleum storage tanks in accordance with NYSDEC requirements, reporting spills as required to NYSDEC and remediating spill conditions in accordance with NYSDEC requirements
- Capping residual impacted soil that may remain at the Site with impervious surface cover (e.g., concrete) or a minimum of one foot of clean material (i.e., native crushed stone or soil meeting Title 6 of the New York Codes, Rules and Regulations [6 NYCRR] Part 360 and 6 NYCRR Part 375 Restricted Commercial Use SCOs)
- Installation of a waterproofing/vapor barrier system (with a minimum thickness of 20 mils) installed per manufacturer's specifications below the new building's cellar and at-grade first floor slab and along the subgrade foundation sidewalls to mitigate potential soil vapor intrusion into the building

## **1.0 INTRODUCTION**

This Remedial Action Plan (RAP) was prepared on behalf of Dattner Architects for the proposed development at 244-04 North Conduit Avenue (Block 13265, part of Lot 30) in the Rosedale neighborhood of Queens, New York (the "Site"). The Site consists of the New York City Police Department (NYPD) 105<sup>th</sup> Precinct Satellite Office and associated driveways, parking lots, and landscaped areas along North Conduit Avenue. A site location map is shown on Figure 1. Pursuant to the January 12, 2018 City Environmental Quality Review (CEQR) No. 18NYP002Q Negative Declaration, RAP review and approval is required by the New York City Department of Environmental Protection (DEP). This RAP is consistent with the DEP requirement to remediate known and potential contamination that is encountered at the Site during the proposed development activities. The plan includes provisions for managing soil in accordance with applicable federal, state, and local requirements, and guidelines for temporary on-site stockpiling and off-site transportation and disposal of soil.

## **2.0 SITE BACKGROUND**

### **2.1 Site Description**

The Site is located at 244-04 North Conduit Avenue (New York City Tax Block 13265, Lot 30) in the Rosedale neighborhood of Queens. The eastern portion of the Site is used as a parking lot for the 105<sup>th</sup> Precinct Satellite Office, which is located on the western half of the Site. The surface of the Site, outside of the existing building footprint, is covered with asphalt, concrete and landscaped areas. The perimeter of the Site is surrounded by vegetation, landscaped areas, and paved sidewalks. The total extent of the Site encompasses about 127,000 square feet; the parking lot located on the eastern half of the Site encompasses about 60,000 square feet, the 105<sup>th</sup> Precinct Satellite Office located on the western half of the Site encompasses about 19,000 square feet, and the remainder of the western portion of the Site encompasses about 48,000 square feet.

### **2.2 Historic and Current Use of Site and Surrounding Area**

The eastern portion of the Site was vacant until about 1902 when the northern portion along North Conduit Avenue was occupied by the New York and Long Island Traction Company to operate a trolley line. The line remained active until about 1926. The eastern portion of the Site was utilized for automobile parking for Long Island Rail Road (LIRR) commuters around 1954. The eastern portion of the Site remained a commuter parking lot until about the mid-2000s when the Site was converted into a parking lot for the 105<sup>th</sup> Precinct Satellite Office, which is located in the western portion of the Site.

The Site is bound by North Conduit Avenue to the north, vacant land to the east, the LIRR to the south, and the Rosedale Municipal Parking Field beyond the 105<sup>th</sup> Precinct Satellite Office to the west. A site plan is provided as Figure 2. The surrounding area is occupied by residential, vacant

lots, transportation/utilities and commercial uses. The properties located north of the Site beyond North Conduit Avenue consist of residential dwellings with vacant vegetated land to the east. The main line for the LIRR and the Rosedale Station, which are elevated, are located to the south. South Conduit Avenue and Route 27 are located south of the station and run parallel to the LIRR. Several commercial properties including three service stations and a tire repair shop are located beyond Route 27. Sidewalk elevations in front of the Site along North Conduit Avenue gently slope from about elevation<sup>2</sup> (el.) 22.5 (east) to el. 21.5 (west), as referenced to the North American Vertical Datum of 1988 (NAVD88).

## **2.3 Proposed Development**

The proposed development includes construction of a 45,000-square-foot two-story building with a below-grade cellar level. A new at-grade parking lot will border the new building to the south. The building will be occupied by the NYPD as their 116<sup>th</sup> Precinct Stationhouse in the Rosedale neighborhood of Queens, New York.

The cellar portion of the proposed building will be towards the northeast of the Site, with a small part of the first floor (without a cellar level) extending south. The cellar level will encompass about 15,200 square feet. The cellar will have a floor slab elevation of el. 6.5 feet requiring general excavation to about 14.5 feet below grade surface (bgs). Several features including an elevator pit within the cellar, footings outside of the cellar excavation footprint, stormwater retention structures, and fueling station will require additional excavation to about el. 17.5 to el. -1 or about 5.5 to 22 feet bgs, respectively. Construction excavation is anticipated to include dewatering to about 4 feet below the groundwater table.

Stormwater retention structures will be constructed south of the new NYPD 116<sup>th</sup> Precinct Stationhouse and adjacent to the existing NYPD 105<sup>th</sup> Precinct Satellite Office located in the western half of the Site. Excavation depths to support this construction will range from about el. 17.5 to el. 15 or about 5.5 to 6 feet bgs. A fueling station will be constructed within the southeastern part of the Site and will include a fueling station and a vault containing two fuel tanks; a 6,000-gallon regular grade gasoline tank and a 4,000-gallon diesel tank. Excavation for the fuel tank vault will extend to about el. 6.6, which is about 14.5 feet bgs. Excavation for the filling station will extend to about el. 12, which is about 9 feet bgs. A refuse building will also be constructed in the southeastern part of the Site and excavation in this area will extend to about el. 17, which is about 4 feet bgs. Isolated landscaped areas will be included along areas of the Site and building perimeter. An estimated 9,150 cubic yards of soil/fill is anticipated to be excavated from the Site as part of development. Support of excavation (SOE) construction will be implemented to facilitate excavation, as required. Excavation areas are presented in Figures 4 and 5. The layout of the Site development is presented in Figures 6 and 7.

---

<sup>2</sup> Elevation datum is North American Vertical Datum of 1988

### **3.0 SITE ENVIRONMENTAL CONDITIONS**

The following environmental reports were available for review:

- August 21, 2017 Geophysical Engineering Survey Report, prepared by NOVA Geophysical Engineering on behalf of City of New York Department of Design and Construction
- December 15, 2017 (reissued October 15, 2018) Geotechnical Engineering Report, prepared by Langan on behalf of Dattner Architects
- March 2018 Phase II Limited Site Investigation (LSI) Results Report, prepared by AECOM on behalf of New York City Police Department Capital Construction Unit
- May 9, 2018 Geotechnical Data Report, prepared by CDM Smith on behalf of City of New York Department of Design and Construction (DDC)

These reports are summarized in the following subsections and provided in Appendix A.

#### **3.1 Geophysical Engineering Survey Report (August 21, 2017)**

NOVA performed a geophysical engineering survey (GES) consisting of a ground penetrating radar (GPR) survey at the Site. The purpose of this survey was to locate and identify underground storage tanks (USTs), anomalies, utilities and other subgrade structures and to clear and mark proposed boring locations. The results of the GES identified the following at the Site:

- The GES identified scattered anomalies throughout the Site. Based on their rates and proximity, these anomalies were inconsistent with USTs
- Several utilities (sewer, water, gas, telecommunications and electrical) were located on the Site
- Two large linear anomalies were located along the southeast region of the Site at a depth of about 7 to 10 feet bgs and were orientated east to west

#### **3.2 Geotechnical Engineering Report (December 15, 2017 [reissued October 15, 2018])**

The Geotechnical Engineering Report included data from 11 soil borings and eight shallow probes, three observation wells, and two test pits. The borings were drilled to about 37 to 102 feet bgs and bedrock was not encountered. This report revealed that the general stratigraphy at the Site consists of a layer of uncontrolled fill to depths ranging from 5 to 6 feet bgs. The fill was underlain by interbedded layers of sand, silt, and clay. The static groundwater level was measured to be at el. 7.5, which is about 13.5 feet bgs. The design groundwater elevation was reported at el. 11.

### **3.3 Phase II Limited Site Investigation Results Report (March 2018)**

The March 2018 Phase II LSI included a geophysical survey and soil, groundwater and soil vapor sampling. AECOM advanced eight soil borings and collected 17 soil, three groundwater and four soil vapor samples throughout the eastern half of the Site.

Soil sample results were compared to the New York State Department of Environmental Conservation (NYSDEC) Part 375 Unrestricted Use (UU), Residential and Commercial Soil Cleanup Objectives (SCOs) and were analyzed for:

- Volatile Organic Compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260
- Semivolatile Organic Compounds (SVOCs) by USEPA Method 8270
- Pesticides/Polychlorinated Biphenyls (PCBs) by USEPA Method 8081/8082, and
- Target Analyte List (TAL) Metals by USEPA Methods 6610 and 7471

Groundwater sample results were compared to NYSDC's Ambient Water Quality Standards and Guidance Values (AWQSGVs) and were analyzed for:

- VOCs by USEPA Method 8260
- SVOCs by USEPA Method 8270
- Pesticides/PCBs by USEPA Method 8081/8082
- Filtered and unfiltered TAL Metals by USEPA Methods 6010 and 7471, and
- Total Cyanide by USEPA Method 9010C

Soil vapor sample results were analyzed for VOCs by USEPA Method TO-15. Since New York State does not have any standards, criteria or guidance values for the concentrations of VOCs in subsurface vapors, the results were compared to the following for reference: 1) Upper Fence Background Indoor Air Values from the New York State Department of Health's (NYSDOH) 2003 publication, Study of Volatile Organic Chemicals in Air of Fuel Oil Heated Homes; and 2) the 90<sup>th</sup> Percentile Background Indoor Air values as identified in the USEPA 2001 publication, Building Assessment and Survey Evaluation (BASE) Database for indoor air in office and commercial buildings.

The Phase II analytical results revealed the following with respect to soil, groundwater, and soil vapor quality beneath the Site:

#### Soil:

- Pesticides – 4'-DDE was detected above the UU SCO in shallow soil sample SB-5 (concentration of 0.0132 milligrams per kilogram [mg/kg]), collected from 0 to 2 feet bgs; 4,4'-DDT was detected above the UU SCO in shallow soil samples SB-5 and SB-2,

collected from 0 to 2 feet bgs (maximum concentration of 0.0143 mg/kg); and alpha-chlordane was detected above the UU SCO in shallow soil samples SB-1, SB-2, SB-3, and SB-5, collected from 0 to 2 feet bgs (maximum concentration of 0.1250 mg/kg).

- Metals - Lead (maximum concentration of 105 mg/kg at SB-1) and mercury (maximum concentration of 0.210 mg/kg at SB-3) were detected above the UU SCOs in the shallow soil samples (0 to 2 feet bgs) collected from SB-1 and SB-3, respectively.
- No VOCs, SVOCs or PCBs were detected above the UU SCOs.

Groundwater: The analytical results revealed that the pesticide dieldrin (maximum concentration of 0.129 micrograms per liter [µg/L]) was detected above the AWQSGV in groundwater samples GW-1, its duplicate sample GW-1(DUP) and GW-3. In addition, the pesticide chlordane (maximum concentration of 0.692 µg/L) was detected above the AWQSGV in groundwater sample GW-1 and its duplicate sample GW-1(DUP).

Soil Vapor: Total VOCs in soil vapor samples ranged from 220.3 micrograms per cubic meter (µg/m<sup>3</sup>) in SV-2 to 434.61 µg/m<sup>3</sup> in SV-3 (excluding acetone, which is a common laboratory contaminant). Total VOCs in the outdoor ambient air samples ranged from 61.48 µg/m<sup>3</sup> in AMB-1 to 161.0 µg/m<sup>3</sup> in AMB-4. The following VOCs in soil vapor and ambient air samples exceeded both NYSDOH 2003 Background Indoor Air Values Upper Fence and USEPA 2001 Background Indoor Air Values 90<sup>th</sup> Percentile:

- Acetone
- 1,3-Dichlorobenzene
- cis-1,2-Dichloroethene
- Methyl Ethyl Ketone
- Methyl methacrylate
- Methylene Chloride
- Tetrahydrofuran
- Trichloroethene (TCE)

Tetrachloroethene (PCE) was detected in soil vapor sample SV-1 at a concentration of 2.3 µg/m<sup>3</sup>. PCE's daughter product, TCE was detected in soil vapor samples ranging from 0.19 µg/m<sup>3</sup> in SV-3 to 0.64 µg/m<sup>3</sup> in SV-1. Cis-1,2-dichloroethene was detected in soil vapor sample SV-1 at a concentration of 0.50 µg/m<sup>3</sup>. Vinyl chloride concentrations detected in soil vapor samples ranged from about 0.099 µg/m<sup>3</sup> in SV-1 to 0.28 µg/m<sup>3</sup> in SV-2. Petroleum-related compounds including benzene, toluene, ethylbenzene, and total xylenes (BTEX) were detected in soil vapor samples in concentrations ranging from 3.10 µg/m<sup>3</sup> in SV-1 to 36.90 µg/m<sup>3</sup> in SV-2; BTEX compounds were

detected in ambient air samples at concentrations ranging from about 2.60 µg/m<sup>3</sup> in AMB-3 to 11.40 µg/m<sup>3</sup> in AMB-2.

The Phase II LSI report recommended installation of a vapor barrier membrane under the new building concrete slab as a mitigation measure.

### **3.4 Geotechnical Data Report (May 9, 2018)**

The Geotechnical Data Report provided data for the subsurface investigation performed from April 19 to 24, 2018 along the eastern part of the Site. The report included the advancement of 22 geotechnical borings, three observation wells, and five test pits. The geotechnical borings were drilled to about 12 to 102 feet bgs and bedrock was not encountered. Groundwater was encountered between el. 7.5 and 7.6 (about 13.5 to 13.6 feet bgs). The general stratigraphy at the Site typically consists of a layer of fill including sand, clayey silt, asphalt, glass fragments, roots, and cobbles varying between 5 and 6 feet in thickness, underlain by interbedded layers of sand, silt, clayey silt, and trace of gravel and organics.

## **4.0 PROPOSED SITE REMEDIATION**

This section describes remedial actions to achieve the Site's Remedial Action Objectives (RAO). This plan includes appropriate actions to protect human health and the environment, and highlights the provisions necessary to protect against contact with impacted material at the Site. Remedial measures will be performed in accordance with applicable federal, state, and city regulations and the Construction Health and Safety Plan ([CHASP] see Appendix B). The CHASP addresses potential worker and community exposure issues in relation to identified and reasonably anticipated contaminants during remedial activities. The DEP will be notified one week prior to commencing remediation at the Site, and remediation will be performed under Langan observation.

### **4.1 Remedial Action Objectives**

RAOs have been established through the remedy selection process stated in the NYSDEC Division of Environmental Remediation (DER)-10 / Technical Guidance for Site Investigation and Remediation (May 2010). At a minimum, the remedy selected must eliminate or mitigate all significant threats to public health and/or the environment presented by VOCs, pesticides, and metal impacts at the Site through the proper application of scientific and engineering principles. The remediation goal for this Site is to reduce, to the extent practicable, site soil contamination through removal and mitigate any subsequent exposure through long-term engineering controls.

## **4.2 Remediation Activities**

### *4.2.1 Soil Excavation and Removal*

Within the cellar footprint, the proposed excavation is anticipated to extend to el. 6.5 (about 14.5 feet bgs). However, deeper excavation within the cellar is required for the elevator pit area, which will extend to el. -1 (about 22 feet bgs). Outside of the cellar footprint, there will be several additional features that will require excavation, including footings which will extend to about el. 12 (about 9 feet bgs), stormwater retention structures which range from about el. 17.5 to 15 (about 5.5 to 6 feet bgs), a fueling station with tank vault which will extend to about el. 12 (about 9 feet bgs) and el. 6.6 (about 14.5 feet bgs), and a refuse building which will extend to about el. 17 (about 4 bgs). To support excavation below the water table, dewatering will be required to lower the groundwater table to about 4 feet below the excavation bottom.

Soil analytical data will be submitted to the proposed disposal facilities to assist in meeting disposal facility analytical requirements for material acceptance. Additional waste characterization sampling will be performed for off-site disposal in a manner suitable to the receiving facility and in conformance with applicable permits. All soil removal operations will be conducted in accordance with Title 6 of the New York Codes, Rules and Regulations (6 NYCRR) Part 360: Solid Waste Facilities and Part 364: Waste Transporter Permits.

Langan will observe and document the excavation and load-out of regulated fill and soil. Prior to loading dump trucks, Langan will field screen excavated soil for evidence of environmental impacts and document that waste types are segregated as necessary. Once container, dump truck, or trailer loading is complete, the material will be transported to off-site permitted or registered disposal and/or recycling facilities. Where required, transport of materials will be performed by licensed haulers under appropriate regulatory permits (6 NYCRR Part 364 Waste Transporter Permits in New York State) and in accordance with appropriate local, state, and federal regulations. Loaded vehicles leaving the Site will be appropriately lined, securely covered, manifested, and placarded in accordance with all applicable transportation requirements. Egress points for truck and equipment transport from the Site will be cleaned of dirt and other materials during Site remediation and development, as required.

### *4.2.2 Soil Stockpiling*

If necessary, stockpile areas will be constructed for staging of fill and soil, pending loading, or characterization testing. Separate stockpile areas will be constructed to avoid comingling of different material types. Stockpile areas will meet the following minimum requirements:

- Suspect impacted soil will be placed onto a minimum 8-mil-thick layer of a polyethylene sheeting or equivalent to protect surface soil
- Different material types will be stockpiled separately and will not be comingled

- Stockpiles will be covered with 8-mil sheeting, which will be securely anchored to the ground or floor surface, upon reaching their capacity. Active stockpiles that have not reached their capacity will be covered at the end of each work day
- Each stockpile area will be encircled with silt fences and hay bales, as needed, to contain and filter particulates from rainwater that has drained off the soils, and to mitigate the potential for surface water infiltration
- The stockpile areas will be inspected daily and noted deficiencies, including broken sheeting covers, will be promptly addressed

#### *4.2.3 Miscellaneous Debris and Liquids Removal*

Miscellaneous debris will be removed and disposed or recycled, as per applicable federal, state, and local regulations. Containers of liquids will be characterized, removed and disposed at permitted landfills or recycling facilities.

#### *4.2.4 Contingencies*

##### *Potential Underground Storage Tanks*

If any USTs are encountered during remedial activities, these USTs will be decommissioned and removed in accordance with NYSDEC UST closure requirements. The NYSDEC Petroleum Bulk Storage (PBS) registration forms will be completed as required. In addition to the waste characterization testing required by the disposal facility, the contents of any USTs will be tested for fingerprint analysis (if a spill condition exists) as well as full characterization testing for disposal, if appropriate. Following removal the tank grave, the tank and surrounding soil will be inspected and screened for evidence of potential impacts. Endpoint soil samples will be collected in accordance with the protocols provided in DER-10.

##### *Grossly-Impacted Soil*

If encountered, grossly-impacted soil (e.g., petroleum) will be removed in accordance with NYSDEC Commissioner Policy (CP) 51 policy and NYSDEC spill reporting will be completed. Impacted soils within the development excavation will be excavated to the greatest extent practical for off-site disposal at an appropriate facility. Post-excavation soil samples will be collected per NYSDEC DER-10 requirements.

#### *4.2.5 Groundwater Management*

Dewatering is anticipated where excavation is required below the water table in order to provide a satisfactory working surface for the foundation construction.

The contractor's dewatering engineer will design the dewatering system to properly support excavation to the required development depths. Disposal of dewatering effluent will be performed in accordance with all applicable local and federal regulations. A wellpoint system will likely be required to fully dewater the Site and limit the vertical flow of groundwater into the Site.

Prior to discharge to a New York City sewer, the contractor will obtain the appropriate permit (e.g., DEP Groundwater Discharge Permit). As an alternative to discharge to the sanitary sewer, the contractor may elect to collect the groundwater for characterization and off-site disposal.

#### *4.2.6 Air Monitoring*

Air monitoring will be performed during excavation, handling and load-out of regulated fill and soil with exceedances of the SCOs. Observations of dust generation will trigger additional dust control measures to mitigate dust conditions. Preventative measures for dust generation will include wetting surfaces, construction of an engineered Site entrance, truck wash area(s), covering potentially contaminated soil stockpiles, and limiting Site vehicle speeds. Organic vapors and particulate matter will be monitored at two air monitoring stations (one up-wind and one down-wind) during excavation activities in soil with SCO exceedances in accordance with the CHASP. Nuisance odors will also be monitored for and, if observed, mitigated.

#### *4.2.7 Site Cap and Import Material*

The planned development includes a 45,000-square-foot two-story building with a one below-grade cellar level and several other site features including concrete and asphalt impervious cover, stormwater retention structures, landscaped areas, a fueling station and a refuse building. Material import is anticipated to consist of general backfill beneath site cover to support grading and installation of the other site features. Material import is also anticipated in the landscaped areas.

##### *Pervious Site Cover*

The top one-foot layer of pervious areas, which will include landscaped or covered with grass (not capped with concrete/asphalt), will have a minimum of one foot of DEP-approved clean fill/topsoil (i.e., native crushed stone or soil meeting 6 NYCRR Part 360 and 6 NYCRR Part 375 Restricted Commercial Use SCOs). The clean fill/topsoil will be imported from an approved facility/source and graded across all landscaped/grass covered areas of the Site that are not capped with concrete/asphalt. The clean fill/topsoil will be segregated at the source/facility, and will be sampled by a qualified environmental professional at a minimum frequency of one sample for every 250 cubic yards. The samples will be analyzed for 6 NYCRR Part 375 list TCL VOCs per USEPA Method 8260, SVOCs per USEPA Method 8270, pesticides per USEPA Method 8081, PCBs per USEPA Method 8082, and TAL metals per USEPA Methods 6610/7000 series by a NYSDOH ELAP-certified laboratory.

Upon completion of the clean fill/topsoil investigation activities, a clean soil report will be submitted to DEP for review and approval prior to importation and placement on-site. The report will include, at a minimum, an executive summary, narrative of the field activities, laboratory data, and comparison of soil analytical results (i.e., 6 NYCRR Part 360 and 6 NYCRR Part 375 Restricted Commercial Use SCOs). Clean fill will not be allowed to be brought onto the Site before being approved by the DEP, and will be free of organic matter, wood, trash, etc. that cannot be properly

compacted or is subject to biodegradation. The clean fill/top soil should not be comprised of any construction and demolition debris.

#### *General Backfill beneath Cover*

General backfill beneath the site cover that is imported to the Site will comply with 6 NYCRR Part 360, meet the 6 NYCRR Part 375 Restricted Commercial Use SCOs, be free of organic, frozen, and other deleterious material, and will have a maximum particle size no greater than 4 inches. Material excavated from within the Site during construction of pile caps footings will be reused provided impacts are not observed, rock fragments greater than 4 inches and deleterious material are removed, and reuse complies with 6 NYCRR Part 360.

Recycled concrete aggregate (RCA) imported to the Site is acceptable and will be from facilities permitted or registered by NYSDEC, provided that its use complies with 6 NYCRR Part 360. The contractor is responsible to ensure that the facility is compliant with 6 NYCRR Part 360 registration and permitting requirements for the period of acquisition of RCA. RCA material is not acceptable for, and will not be used as cover material. RCA imported to the Site must be derived from recognizable and uncontaminated concrete, contain no deleterious debris, and contain no more than 5% by weight asphalt or brick.

#### *Source Screening and Testing*

Inspection of imported fill material will include visual and olfactory screening for evidence of contamination. Materials imported to the Site will be subject to inspection, as follows:

- Trucks with imported fill material will be in compliance with applicable laws and regulations and will enter the Site at designated locations
- The contractor is responsible to ensure that every truckload of imported material is inspected for evidence of contamination, and
- Fill material will be free of solid waste including pavement materials, debris, stumps, roots, and other organic matter, as well as ashes, oil, perishables or foreign matter

Imported fill will be sampled in accordance with Table 5.4(e)10 of NYSDEC DER-10 and at a minimum frequency of one sample for every 250 cubic yards. The samples will be analyzed for the following: 6 NYCRR Part 375 list TCL VOCs per USEPA Method 8260, TCL SVOCs per USEPA Method 8270, PCBs per USEPA Method 8082, pesticides per USEPA Method 8081, and TAL metals per USEPA Method 6010/7000 series. The results will be compared to applicable 6 NYCRR Part 360 criteria and Part 375 Restricted Commercial Use SCOs. The results will be submitted to DEP for review and approval prior to importation and placement on-site.

Virgin gravel, rock or stone a permitted mine or quarry is excluded from analytical testing requirements if it contains less than 10% by weight of material that passes through a size 80 sieve. RCA imported from compliant facilities will not require chemical testing if it contains less than 10% by weight of material that passes through a size 80 sieve, unless required by NYSDEC

under its terms for operation of the facility. RCA must conform to Section 304 of the New York State Department of Transportation Standard Specifications Construction and Materials Volume 1 (2002).

#### *4.2.8 Waterproofing Vapor Barrier System*

A waterproofing/vapor barrier system (minimum 20 mils thick) will be installed between the new building concrete cellar slab and underlying sub-grade layer, and extend along the sidewalls of the cellar from the base of excavation to surface grade. A continuous vapor barrier will also extend along the bottom of the at-grade portion of the new building and will connect to the waterproofing/vapor barrier to form a continuous vapor barrier in accordance with manufacturer's specifications. Utility and foundation penetration and incidental punctures will be appropriately sealed in accordance with manufacturer's specifications. A waterproofing/vapor barrier product has not been selected. When information on the proposed product becomes available, the manufacturer's specifications will be submitted to DEP for review and approval prior to installation. The vapor barrier plan is provided as Figure 8.

As-built waterproofing/vapor barrier system drawings will be submitted with the NYS Professional Engineer-certified Remedial Closure Report (RCR). The NYS Professional Engineer-certified RCR will include photographs of the installation process, a copy of a Professional Engineer/Registered Architect (PE/RA)-certified letter (on company letterhead) from the contractor responsible for installation oversight and field inspections, and a copy of the manufacturer's certificate of warranty.

### **4.3 Remedial Closure Report**

Upon completion of the remediation, the owner will provide the DEP with a NYS Professional Engineer-certified RCR for review and approval. The RCR will include a description of the remediation, photographs of remedial activities, sample data collected during remedy implementation, soil disposal records, a drawing showing the extent of excavation, and documentation of the waterproofing/vapor barrier installation. The PE-certified RCR will indicate that all remedial requirements have been implemented and document deviations where appropriate.

Re: Geophysical Engineering Survey (GES) Report

116<sup>th</sup> Precinct

244-04 North Conduit Avenue

Queens, New York 11422

Dear Mr. Au:

Nova Geophysical Services (NOVA) is pleased to provide findings of the geophysical engineering survey (GES) at the above referenced project site: 116<sup>th</sup> Precinct, 244-04 North Conduit Avenue, Queens, New York (the "Site"). Please see attached Site Location and Geophysical Survey maps for more details.

## INTRODUCTION TO GEOPHYSICAL ENGINEERING SURVEY (GES)

NOVA performed a Geophysical engineering surveys (GES) consisting of a Ground Penetrating Radar (GPR) survey at the site. The purpose of this survey is to locate and identify USTs, anomalies, utilities and other substructures and to clear and mark proposed boring areas on August 15, 2017.

The equipment selected for this investigation was Noggin's 250 MHz ground penetrating radar (GPR) shielded antenna and 3M DYNATL.

A GPR system consists of a radar control unit, control cable and a transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulses into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

GPR, Magnetics, Electromagnetics, Seismic, Resistivity, Utility Location, Borehole Logging & Camera

## GEOPHYSICAL METHODS

---

The project site was screened using the GPR to search the areas of interest and inspected for reflections, which could be indicative of major anomalies and substructures. Borehole locations were then individually cleared.

GPR data profiles were collected for the areas of the Site specified by the client. The surveyed areas consisted of grass, asphalt and concrete surfaces.

## DATA PROCESSING

In order to improve the quality of the results and to better identify subsurface anomalies NOVA processed the collected data. The processes flow is briefly described at this section.

**Step 1.** Import raw RAMAC data to standard processing format

**Step 2.** Remove instrument noise (*dewow*)

**Step 3.** Correct for attenuation losses (*energy decay function*)

**Step 4.** Remove static from bottom of profile (*time cut*)

**Step 5.** Mute horizontal ringing/noise (*subtracting average*)

The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and describes the subsurface anomalies more accurately.

---

## PHYSICAL SETTINGS

---

Nova observed following physical conditions at the time of the survey:

**The weather:** Overcast/Light Rain

**Temp:** 80 Degrees (F).

**Surface:** Grass, asphalt and concrete surfaces

**Geophysical Noise Level (GNL):** Geophysical Noise Level (GNL) was very high at the site. The noise was a result of the site being located in an urban environment and close proximity to train tracks.

---

## RESULTS

---

The results of the geophysical engineering survey (GES) identified following at the project Site:

- GES survey identified scattered anomalies located throughout the project site. Based on their rates and proximity, these anomalies were inconsistent with any USTs. These areas were indicated on the on-site markout.
- Several utilities (sewer, water, gas, telecommunications and electrical) were located on the site. These utilities were indicated on the survey map.
- Two large, linear anomalies were located on the site located approximately 7 to 10 feet below ground surface at the project site. These are indicated both on-site and on the survey map.
- Geophysical Survey Plan portrays the areas investigated during the geophysical survey.

If you have any questions please do not hesitate to contact the undersigned.

Sincerely,

**NOVA Geophysical Services**

Levent Eskicakit, P.G., E.P.  
Project Engineer

## **EXECUTIVE SUMMARY**

This report presents the results of the geotechnical investigation for the proposed Precinct Station House in the Rosedale neighborhood of Queens, New York.

The proposed development is a new 116th Police Precinct building, which has a footprint of about 15,200 square feet, for the New York Police Department (NYPD). According to the site scope plan, this proposed development includes excavating in the open-air parking lot to construct a two-story building with a below-grade level. This building will incorporate all the required programs and functions per the RFP for Project No. PO 002116. The development shares the same lot with the existing 105th Precinct Satellite Facility (west of the lot), which was completed in 2007.

A subsurface investigation consisted of drilling 11 borings and 8 shallow probes, installing 3 groundwater observation wells, and excavating 2 test pits. Subsurface conditions generally consist of a layer of uncontrolled fill underlain by interbedded layers of sand, silt, and clay. Bedrock was not encountered during this investigation. The static groundwater level was measured to be at el 7.5, which is about 13.5 feet below the ground surface (bgs). The design groundwater elevation is at el 11. The general excavation along the cellar extents will be at about to el 4, which is about 17 feet bgs and 3.5 feet below the measured groundwater level.

Two test pits, identified as TP-1 and TP-2, were excavated to determine extents, condition, and depths of the existing water conduit along the south side of the site. TP-1 was excavated in the eastern part of the conduit to about 18 feet bgs (about el 2.5). TP-2 was excavated in the western part of the conduit to about 13 feet bgs (about el 7.5).

The site is classified as Site Class D, and the Seismic Design Category (for Risk Category IV) is C. Liquefaction need not be considered in the foundation design.

We recommend a shallow foundation system consist of conventional spread or wall footings bearing on native Class 3b material, which has an allowable bearing capacity of 3 tons per square foot (tsf).

## **INTRODUCTION**

This report summarizes the subsurface investigation results and provides recommendations for foundation design and construction. All services were performed in general accordance with our agreement (30 October 2017), and recommendations are in accordance with the 2014 New York City Building Code.

Our understanding of the project is based on the site scope plan (dated 13 September 2017) prepared by DDC; our site visit; results of the subsurface investigation supervised and inspected by CDM Smith; and the information provided by the project architect (Dattner Architects).

Elevations in this report are from the topographical survey (dated 8 December 2017) prepared by the Division of Program Management at DDC and are referenced to the North American Vertical Datum of 1988 (NAVD88).

## **SITE DESCRIPTION**

The site is in the western part of the city block 1325, which is bordered by North Conduit Avenue on the north, Hook Creek Boulevard on the east, Sunrise Highway on the south, and Francis Lewis Boulevard on the west. The proposed 116th Precinct building is in the eastern portion of Lot 30, which has an area of about 45,000 square feet (sf). The western portion of this lot is occupied by an existing one-story building with no cellar level (105th Precinct Satellite Facility) and is located about 40 feet to the west of the proposed 116th Precinct building.

City-owned vacant lots border this lot on the east (Lots 50, 216, 60, and 70) and the west (Lots 20 and 16). Sidewalk elevations in front of the site along North Conduit Avenue gently slope from about el 22.5 (east) to el 21.5 (west).

A site location map is presented as Figure No. 1.

### **Adjacent Long Island Rail Road**

The Long Island Rail Road (LIRR) Rosedale Station and tracks border the site on the south. An embankment within Lot 30 and the easement for LIRR on the south has a slope of about 1V:2H with the top and bottom of the embankment at about el 37 and el 22, respectively. The width of the embankment is about 30 feet. The LIRR tracks are on the top of the embankment.

### Regional Geology

The New York State Museum and Science Service "Geologic Map of New York" indicates that the underlying geology of the site is predominantly coastal plain deposits, specifically the Monmouth Group, Matawan Group, and Magothy Formation. These formations consist of silty

clay, glauconitic (a micaceous iron potassium silicate) sandy clay sand, and gravel. Bedrock is known to be deeper than 100 feet in the vicinity of the site.

A surficial geology map is presented as Figure No. 2.

## **Flood Hazard**

We have reviewed the National Flood Insurance Rate Map for the City of New York published by the Federal Emergency Management Agency (FEMA), Community Panel No. 3604970261G; effective 5 December 2013. According to the FIRM's for the City of New York, Community-Panel Number 261, the site is outside of any Special Flood Hazard Area. The relevant part of the FEMA Flood Insurance Rate Map (FIRM) is presented as Figure No. 3.

## **PROPOSED DEVELOPMENT**

According to the site scope plan, the proposed development includes excavating in the open-air parking lot to construct a two-story building with a below-grade level.

The proposed building with cellar will be towards the north of the site, with a small part of the first floor (without a cellar level) extending toward the south. An on-grade parking lot borders this building to the south. The proposed first floor on the south will be offset about 14 feet from the toe of the LIRR embankment. The general excavation along the cellar extent will be about to el 4, which is about 17 feet bgs and about 3.5 feet below the measured groundwater level.

The preliminary structural column loads provided by the project structural engineer (Thornton Tomasetti) are as follows:

- Exterior column loads on the parking side (on the south) are about 325 tons.
- Exterior column loads on the street side (on the north) are about 70 tons.
- Interior column loads are about 120 tons.

## **SUBSURFACE INVESTIGATION**

Our understanding of the subsurface conditions is based on a review of available geologic information and the results of the geotechnical investigation provided by CDM Smith. The investigation performed by Aquifer Drilling & Testing, Inc. included drilling 11 borings (B-1 through B-11) and 8 shallow probes (PB-1 through PB-8), and installing 3 groundwater observation wells. Two test pits were excavated investigate the extents and the layout of the existing conduit towards the south of the site. A subsurface investigation plan is presented as Figure No. 4.

## **Geophysical Engineering Survey**

Nova Geophysical Services conducted (hired by others) Geophysical Engineering Surveys to mark out the locations for current and former utilities and clear the boring and probe locations. The geophysical report is included as Appendix A.

## **Borings and Probes**

Eleven borings were drilled to about 37 to 102 feet bgs using mud-rotary drilling techniques with a tri-cone roller bit and drilling fluid consisting of a mixture of bentonite and water. Eight probes were drilled to about 12 to 37 feet bgs the same method as the borings.

Before drilling, borings and probes were cleared for utilities using a hand-operated auger for the top 6 feet. Temporary flush-joint steel casings were used to support soil when necessary. Standard Penetration Tests (SPT)<sup>1</sup> were performed in the soil layers using an automatic hammer and a standard split spoon sampler (ASTM D1586). N-values were recorded, and soil samples were obtained continuously from 6 to 12 feet and at 5-foot intervals after that to the termination depth of the borings and probes. Two undisturbed soil samples were obtained in the clay layers by Shelby Tube in general accordance with ASTM D1587. Recovered soil samples were visually examined and classified in the field according to the Unified Soil Classification System (USCS), and assigned classification numbers in accordance with the New York City Building Code.

A boring location plan and logs by CDM Smith are presented in Appendix B.

## **Observation Wells**

Three groundwater observation wells were installed as part of the subsurface investigation in B-4(OW), B-6(OW), and B-8(OW). Each consisted of 2-inch-diameter PVC pipes installed to 35 feet bgs.

## **Test Pits**

Two test pits, identified as TP-1 and TP-2, were excavated along the existing water conduit along the south side of the site. The results of both test pits provided us the location, depths, and type of the existing water conduit. The sketches and photographs are presented in Appendix C.

---

<sup>1</sup> The Standard Penetration Test is a measure of the soil density and consistency. The SPT N-value is defined as the number of blows required to drive a 2-inch-outer-diameter split-barrel sampler 12 inches using a 140-lb hammer falling freely for 30 inches (ASTM D1586).

## **SUBSURFACE CONDITIONS**

The subsurface conditions generally consist of uncontrolled fill underlain by loose to dense sand with pockets of silts and soft to stiff clays. The subsurface profiles are included as Figure Nos. 5 through 7. Detailed descriptions of each subsurface stratum are given in the order of increasing depth.

### **Fill [Class 7]<sup>2</sup>**

A layer of uncontrolled fill consisting of gray and brown sand, silt, and gravel with various debris was encountered immediately below the surficial asphalt in all borings. The fill extended to the top of native sand deposits at about 6 feet bgs throughout the site, corresponding to about el 15. The N-values in the fill layer was not available because the soil was excavated using a hand-operated auger.

The fill, considered loose to medium-dense, is designated as Building Code Class 7 material, Uncontrolled Fill.

### **Sand [Classes 3a, 3b, and 6]**

Brown and gray fine to medium sand (with varying proportions of fine gravel, silt, and clay) was encountered beneath the fill to the terminations of all borings. The sand was loose to dense with N-values ranging between 2 and 60 blows per foot (bpf), averaging about 16 bpf. Peat, silt, and clay layers (to be discussed in the following sections) with thicknesses between about 2 and 7 feet was encountered at about 65 feet below grade.

Mechanical grain-size analyses were performed on 29 representative samples in this stratum. The material passing the No. 200 sieve ranged typically ranged from 1 to 5 percent (averaging 3 percent). The samples are classified as poorly-graded sand (SP), poorly-graded sand with silt (SP-SM), Silty Sand (SM), and Silty, clayey sand (SC-SM) in accordance with Unified Soil Classification System (USCS).

Two Atterberg-limit tests were performed on the silty and clayey sand samples in boring B-5. The liquid limit (LL) ranged between 17 and 19 percent, plastic limit (PL) ranged between 13 and 14 percent, and plasticity index (PI) ranged between 4 and 5 percent. The natural water content and organic content was found to be about 20 and 2 percent, respectively.

---

<sup>2</sup> Numbers in brackets indicate classification of material in accordance with the 2014 New York City Building Code

An isotropically-consolidated triaxial test was performed on one undisturbed sample in B-5 that was collected in the silty, clayey sand stratum. The major and minor effective stresses were 16.6 and 4.1 pounds per square inch (psi), respectively. The undrained compressive strength is about 6 psi.

The sand stratum is designated as Building Code Classes 3a, 3b, and 6 material, Dense to Medium-Dense to Loose Sand.

### **Peat [Class 6]**

A thin peat layer of about 2-foot thick with varying amount of sand, silt, and clay were encountered within the sand layer with the top of the layer at about 67 feet bgs, corresponding to el -46.

One undisturbed sample was collected at B-6 from this layer. Atterberg-limits was performed on this sample. The natural water content and organic content were about 187 and 80 percent, respectively. The compression ratio ( $C_c$ ) and recompression ratio ( $C_R$ ) were about 0.26 and 0.03, respectively. The over-consolidation ratio (OCR) is about 1.5.

The peat is designated as Building Code Class 6 material, Peats.

### **Silt [Classes 5a, 5b, and 6]**

Gray to brown silt of about 2- to 7-foot thick with varying amount of fine sand and clay was found within the sand layer with the top of the silt at about 65 to 75 feet bgs, corresponding to el -42 and -54. The silt has N-values ranging between 4 and 33 bpf, averaging about 19 bpf.

Natural water content and organic content tests were performed for one representative sample from boring B-6. The moisture content was about 47 percent, and organic content was about 3 percent. The samples are classified as Silt and Clay or Clayey Silt (ML) in accordance with USCS.

The silt stratum is designated as Building Code Classes 5a, 5b, and 6 materials, Dense to Medium-Dense to Varved Silt.

### **Clay [Class 4b, 4c, and 6]**

Lenses of clay with varying amount of silt and sand were encountered within the sand layer at about 65 feet bgs, corresponding to el -44. The clay has N-values ranging between 4 and 9 bpf.

Atterberg-limits tests were performed on two representative samples in B-6 and B-7. The liquid limit (LL) was about 56 percent, plastic limit (PL) was about 28 percent, and plasticity index (PI)

was about 28 percent. The natural water content ranged from between 37 and 44 percent, respectively.

The clay stratum is designated as Building Code Class 4b, 4c, and 6 material, Stiff to Soft Clay.

## **Groundwater**

The static groundwater levels from the observation wells were measured to be at about 13.5 to 14 feet bgs, corresponding to about el 7.5. Groundwater in TP-1 was measured to about el 7.5, which is consistent with the measurements from the observation wells. The groundwater elevation readings are summarized in Appendix B.

## **SEISMIC EVALUATION**

This section presents the results of our seismic evaluation for the site about the provisions outlined in the 2014 New York City Building Code. The following subsections provide recommended parameters for use in the seismic design of the proposed structure. These seismic parameters will require further evaluations following any additional borings required by the Building Code.

### **NYC Building Code Seismic Design Parameters**

The recommended Building Code seismic parameters are based on the average N-value of the soil. The N-values show a generally linear increase with depth. The soil profile below the foundation level is consistent with Site Class D "Stiff Soil Profile," and we assumed that the structure is in Structural Occupancy/Risk Category IV. Therefore, the design spectral accelerations result in Seismic Design Category (SDC) C. The seismic design parameters are presented in Table 1.

Table 1 – Seismic Design Parameters

Description	Parameter	Recommended Value	Building Code Reference
Mapped Spectral Acceleration for short periods:	$S_s$	0.281 g	Section 1613.5.1
Mapped Spectral Acceleration for 1-sec period:	$S_1$	0.073 g	
Site Class	Stiff Soil Profile <b>D</b>		Table 1613.5.2
Site Coefficient:	$F_a$	1.57	Table 1613.5.3(1)
Site Coefficient:	$F_v$	2.40	Table 1613.5.3(2)
5 percent damped design spectral response acceleration at short periods:	SDS	0.294 g	Section 1613.5.4
5 percent damped design spectral response acceleration at 1-sec period:	SD1	0.117 g	
Structural Occupancy	<b>IV</b>		Table 1604.5
Seismic Design Category (SDC)	<b>C</b>		Table 1613.5.6

## Liquefaction Evaluation

Soil liquefaction is a phenomenon primarily associated with saturated, loose, cohesionless soils near the ground surface (depths within 50 feet). As these soils are shaken, pore water pressure may develop that will temporarily force the soil particles apart such that the soil will temporarily behave more like a liquid than a granular mass. The liquefaction potential was evaluated using both the 2014 Building Code and the Youd et al. analysis (2001).

### 2014 NYC Building Code Liquefaction Evaluation

In accordance with the 2014 Building Code screening process, N-values versus depth is plotted on the Building Code Liquefaction Assessment Diagram presented as Figure No. 8. Nearly half of the N-value points fall within the “Liquefaction Evaluation Required” category, requiring the following liquefaction analysis.

### Youd et al. (2001) Liquefaction Analysis

The potential for soil liquefaction was evaluated further using the procedure outlined by Youd et al. (2001). The Youd et al. evaluation is based on the procedure for liquefaction evaluation

developed by Seed and Idriss (1982) and is considered to be the state-of-practice, as recommended by the National Earthquake Hazard Reduction Program. This evaluation presents an empirical relationship between the earthquake demand, represented by the Cyclic Stress Ratio (CSR), and the soil's resistance to dynamic loading, represented by the Cyclic Resistance Ratio (CRR). The CSR is related to the Peak Ground Acceleration (PGA) of the design earthquake and the in situ soil stresses. The CRR is related to SPT N-values obtained in the field. The field-measured N-values are normalized to  $N_{60,cs}$  values by applying correction factors to such variables as soil overburden pressure, hammer energy, and fines content.

Our analysis included a magnitude 5.73 earthquake and a peak ground acceleration of 0.24g (Site Class D). A plot of the calculated factor of safety versus depth using the Youd et al. (2001) procedure for each boring is presented as Figure No. 9. One of the about 90 data points has a factor of safety less than 1.0, and we considered this point to be an anomaly. Therefore, in our judgment, there is an adequate margin of safety against liquefaction for the site. Ground settlements resulting from the design earthquake are estimated to be at 1 inch or less. These settlements will occur within the site and its surrounding areas (i.e., sidewalk, roadway, neighboring buildings).

## **FOUNDATION RECOMMENDATIONS**

We recommend that the proposed structure bear on a shallow foundation system consisting of spread footings constructed on the native sand.

### **Shallow Foundation**

The Building Code Class 3b sand is a satisfactory bearing material, which is typically about 6 to 8 feet bgs, can be used to support the building. The recommended allowable bearing capacity is 3 tsf. We recommend that the proposed structure bear on shallow foundation system (i.e., spread or wall footings). The footings should not exert any significant lateral load to the existing water conduit to the south.

Individual spread footings should have a minimum size of 9 sf, and wall footings should have a minimum width of 2 feet. All footings should be protected from frost by extending a minimum of 4 feet below the lowest adjacent permanent exposed grade.

### **Settlements**

Gross settlements are estimated to be about  $\frac{3}{4}$  inch for exterior footings and  $\frac{1}{2}$  inch for interior footings. The majority of the settlements will occur during construction. Angular rotations are estimated to be less than 1/500.

### Subgrade Preparation and Protection

Foundation bearing surfaces should be level and clear of debris, standing or frozen water, and other deleterious materials. Soils should be excavated with care to avoid disturbance below the bearing elevation. Soil subgrades should be compacted using a vibratory trench roller, and vibratory plate or jumping-jack compactors should only be used where directed by the special inspector. The foundation subgrade should be inspected and approved by a professional geotechnical engineer, licensed in New York state, to ensure that the subgrade material is adequate to provide the recommended allowable bearing pressure. Approved subgrade surface should be protected until the footing construction is completed if concrete is not placed within 24 hours. Methods of protection include sealing with lean concrete (mud slab).

### Lateral Resistance

The proposed shallow footings can resist lateral loads through frictional resistance between the concrete and the soil subgrade and passive earth pressures. The recommended sliding friction coefficient with a factor of safety of 1.5, is 0.2 for waterproofed surfaces and 0.4 for concrete cast on the native soil. The recommended passive resistance is a triangular pattern with 300 pounds per one foot of depth.

## **Permanent Groundwater Control**

### Design Groundwater Elevation

We recommend a design groundwater level of el 11, which is about 3.5 feet above the highest measured groundwater elevation during the subsurface investigation. The design groundwater level will account for periods of prolonged precipitation or utility breaks.

### Pressure Slab

The cellar-floor slabs should be a structural pressure slab integrated with the foundations. The slab should be designed to withstand the dead and live loads. Additionally, the pressure slab must be designed to resist the hydrostatic uplift pressures resulting from design groundwater elevation at el 11, which is about 6 feet above the assumed bottom of the proposed cellar slab (at el 5).

### Soil Anchors

Soil anchors are drilled-in elements that resist uplift forces through friction bond with the soil. For preliminary design, we recommend using a minimum 5-inch-diameter drill hole with a single

1.25-inch-diameter, double-corrosion-protected, high-strength threaded bar set in 4,000 psi cement grout. The anchor should have a 30-foot bonded zone and a 15-foot un-bonded zone. An allowable tension resistance of 40 kips can be achieved on a single anchor. At least 10 percent of anchors should be performance-tested in accordance with PTI standards, and the remaining anchors should all be proof tested. Group effects must also be evaluated to determine appropriate anchor spacing and the length of the bond zone.

### Waterproofing

Since the observed groundwater was encountered at a depth higher than the proposed cellar level, waterproofing will be necessary. The foundation should be waterproofed with a membrane-type waterproofing such as the Preprufe and Bituthene products, and post-injectable waterstop by Grace Construction Products. For additional protection, we strongly recommend a waterproofing admixture product (such as Hycrete) could be added to the concrete used for below-grade foundation slab and walls. The use of bentonite waterproofing or negative-side crystalline waterproofing is not recommended. A 3-inch-thick concrete mud slab should be prepared below all slab surfaces.

For all waterproofing applications, diligent oversight during and after the installation of waterproofing materials is critical, especially during the placement of reinforcements for slabs, walls, and foundations. Only certified installers should be used to perform the work. Detailed daily observations should be performed to document any non-conformance or damage resulting from the contractor's activities.

### **First Floor Slab-on-Grade**

The slab-on-grade can bear on the fill layer excavating to at least 12 inches below the bottom of the slab. The subgrade should be compacted, and a 12-inch-thick layer of gravel should be placed and compacted before the slab-on-grade placement. The recommended subgrade modulus is about 150 psi per inch.

### **Below-Grade Walls**

Below-grade walls will be subjected to lateral pressures caused by soil and surcharge loads. Lateral pressures from earth and surcharge loads should be considered. Dynamic lateral loads need not be considered because the site is Seismic Design Category C (Building Code Section 1802.2). Our recommended lateral earth-pressure diagram is presented in Figure No. 10.

## **OTHER GEOTECHNICAL RECOMMENDATIONS**

### **Excavation**

The proposed excavation spread footings will require excavations to about 6 to 17 feet bgs. Site excavation can likely be performed using conventional earth-moving equipment (e.g., backhoes, excavators, etc.). All excavation operations should be performed in accordance with the Occupational Safety and Health Administration (OSHA) requirements.

The contractor must take appropriate measures to stabilize the work area and prevent lateral movement of the adjacent areas during the excavation. The excavation can be achieved by soil benching using a 1 (vertical) to 1.5 (horizontal) slope. The Occupational Safety and Health Administration (OSHA) indicates that an excavation must be protected from cave-ins by an adequate protective system (e.g., sloping of excavations, braced excavation systems).

### **Temporary Groundwater Control**

Lowering the water table to a minimum of 2 feet below the excavation bottom within the groundwater barrier will be necessary to provide a satisfactory working surface for the foundation construction. The general excavation is about 17 feet bgs, which is about 5 feet below the measured groundwater level.

Dewatering systems must be designed and installed by a specialty contractor with proven experience in this area. The contractor's dewatering engineer should design the dewatering system to properly address the various locations and depths of the excavations within the site. Disposal of pumped groundwater should be performed in accordance with all applicable local and federal regulations. A wellpoint system will likely be required to fully dewater the site and limit the vertical flow of groundwater into the site.

### **Fill Materials, Placement, and Compaction**

Structural fill beneath foundations, floor slabs, or behind walls should consist of a well-graded granular material having a maximum particle size of 4 inches in any dimension, and no more than 10 percent fines passing the No. 200 sieve. All fill should be free of trash, debris, roots, vegetation, peat, or other deleterious materials and should be approved by the geotechnical engineer before placement. Lean concrete or controlled low-strength material (CLSM) may be substituted for structural fill. Fill should not be placed on subgrades not inspected and approved by the inspecting geotechnical engineer.

## **ADDITIONAL RECOMMENDATIONS**

The following sections provide recommendations for LIRR submission and preconstruction conditions documentation at adjacent structures.

### **LIRR Review**

The proposed excavation for first-floor footings is about 14 feet away from the toe of the LIRR embankment. Also, the construction sequence involves dewatering to lower the groundwater table by 4 feet. Considering the proximity to the embankment and the effects of groundwater drawdown and excavation, the foundation drawings should be submitted to LIRR for review and approval.

### **Preconstruction Conditions Documentation**

We recommend that a comprehensive preconstruction conditions documentation of the adjacent 105th Precinct (on the west) and LIRR tracks and station (on the south) be undertaken before commencing excavation. The purpose of the observation is to provide a photographic or video-documentation representation (or both) of the existing general conditions and to identify obvious visual deficiencies. The preconstruction-conditions documentation should also identify areas requiring specific monitoring during construction, including optical surveying and vibration monitoring. The structural integrity of the structure is not commonly addressed in such documentation. This documentation could help protect the owner from potential claims of construction-induced damage.

The contractor must use prudent measures to monitor, support and protect the adjacent structures during all work. The contractor's engineer should examine all nearby buildings before the start of earthwork to develop a protection plan.

## **SERVICES DURING DESIGN, CONSTRUCTION DOCUMENTS, AND CONSTRUCTION QUALITY ASSURANCE**

During final design, we should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design Figures should incorporate Langan's recommendations. When authorized, Langan will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, ground improvement, shallow foundations, backfill and excavation support. Langan should also, when authorized, review the project plans — as well as contractor submissions relating to materials and construction procedures for geotechnical work — to confirm the designs incorporate the intent of our recommendations.

Langan has investigated and interpreted the site subsurface conditions and developed the foundation design recommendations contained here and is, therefore, best suited to perform quality-assurance observation and testing of geotechnical-related work during construction. The work requiring quality-assurance confirmation or special inspections per the Building Code includes, but is not limited to, earthwork, backfill, ground improvement, shallow and deep foundations, and excavation support.

Recognizing that construction observation is the final stage of geotechnical design, quality-assurance observation during construction by Langan is necessary to confirm the design assumptions and design elements, to maintain our continuity of responsibility on this project, and to allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended here are predicated upon Langan assisting with the final design and providing construction observation services for the owner. If Langan is not retained for these services, we cannot assume the role of the geotechnical engineer of record, and the entity is providing the final design and construction observation services must serve as the engineer of record.

## **OWNER AND CONTRACTOR RESPONSIBILITIES**

The contractor is responsible for construction quality control, which includes satisfactorily constructing the foundation system and any associated temporary works to achieve the design intent while not adversely impacting or causing loss of support to neighboring property, structures, utilities, roadways, etc. Construction activities that can alter the existing ground conditions such as excavation, fill placement, foundation construction, ground improvement, and related activities, can also induce stresses, vibrations, and movements in nearby structures and utilities, and disturb occupants. Contractors are solely responsible for ensuring that their activities will not adversely affect the structures and utilities, and will not disturb occupants. Contractors must also take all necessary measures to protect the existing structures, utilities, etc. during construction. By using this report, the owner agrees that Langan will not be held responsible for any damage to adjacent structures, utilities, etc.

The preparation and use of this report is based on the condition that the project construction contract between the owner and their contractors will include (1) Langan being added to the project wrap and contractor's general liability insurance as an additional insured, and (2) language specifically stating that the foundation contractor will defend, indemnify, and hold harmless the owner and Langan against all claims related to disturbance or damage to adjacent structures, utilities, or properties.

## **LIMITATIONS**

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings performed by others, and from architectural information prepared by Dattner Architects. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another, and no recommendation should be followed independently of the others.

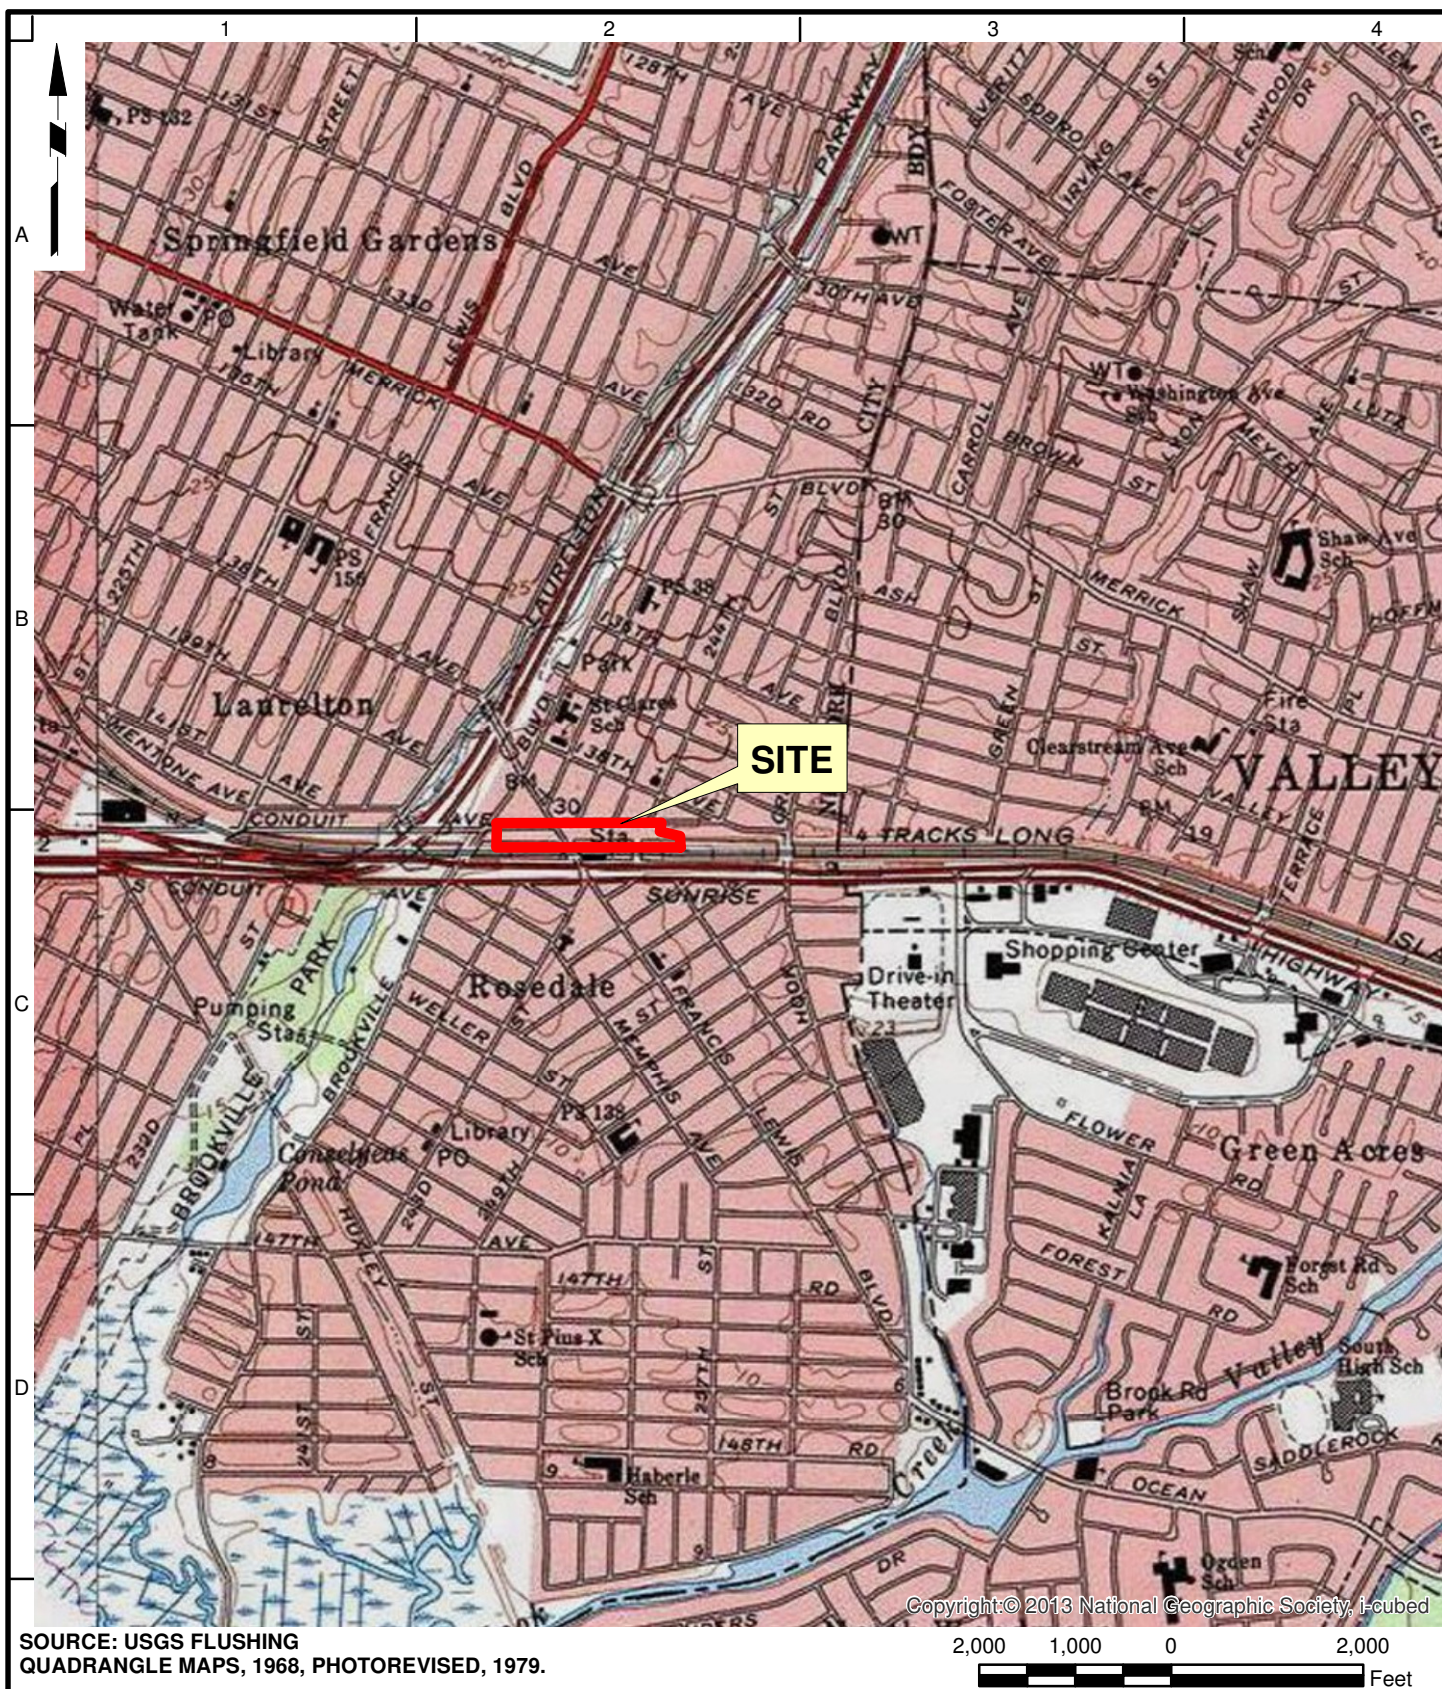

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of the investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, because they may affect our recommendations.

This report has been prepared to assist the owner, architect, and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be used or depended on by engineers or contractors who are involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties beyond the limits of that which is the specific subject of this report.

Environmental issues (such as permitting or potentially contaminated soil and groundwater) are outside the scope of this study and should be addressed in a separate evaluation.

**GENERAL NOTES:**

1. BACKGROUND SURVEY WAS TAKEN FROM THE DRAWING TITLED "TOPOGRAPHICAL AND PROPERTY LINE MAP", PREPARED BY THE NEW YORK CITY DEPARTMENT OF DESIGN AND CONSTRUCTION (NYC DDC), DIVISION OF PROGRAM MANAGEMENT, OFFICE OF SITE ENGINEERING, FOR THE 116TH POLICE PRECINCT DATED 11 SEPTEMBER 2018.
2. THE EXTENTS OF THE CELLAR AND FIRST-FLOOR LEVELS WERE DELINEATED FROM DRAWING NO. SK101-C1, "OPTION 2C ALT1-ENLARGED SITE PLAN", PREPARED BY DATNER ARCHITECTS, DATED 20 OCTOBER 2017.
3. ALL ELEVATIONS SHOWN HERE REFER TO THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88).
4. ALL BORINGS AND PROBES WERE PERFORMED BY OTHERS UNDER THE INSPECTION OF CDM SMITH BETWEEN 16 AUGUST AND 8 SEPTEMBER 2017.
5. TEST PITS WERE PERFORMED BY TEST PIT CORP. UNDER THE INSPECTION OF LANGAN BETWEEN 27 AUGUST AND 11 SEPTEMBER 2018.

Re: Geophysical Engineering Survey (GES) Report

116<sup>th</sup> Precinct

244-04 North Conduit Avenue

Queens, New York 11422

Dear Mr. Au:

Nova Geophysical Services (NOVA) is pleased to provide findings of the geophysical engineering survey (GES) at the above referenced project site: 116<sup>th</sup> Precinct, 244-04 North Conduit Avenue, Queens, New York (the "Site"). Please see attached Site Location and Geophysical Survey maps for more details.

## INTRODUCTION TO GEOPHYSICAL ENGINEERING SURVEY (GES)

NOVA performed a Geophysical engineering surveys (GES) consisting of a Ground Penetrating Radar (GPR) survey at the site. The purpose of this survey is to locate and identify USTs, anomalies, utilities and other substructures and to clear and mark proposed boring areas on August 15, 2017.

The equipment selected for this investigation was Noggin's 250 MHz ground penetrating radar (GPR) shielded antenna and 3M DYNATL.

A GPR system consists of a radar control unit, control cable and a transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulses into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

GPR, Magnetics, Electromagnetics, Seismic, Resistivity, Utility Location, Borehole Logging & Camera

## GEOPHYSICAL METHODS

---

The project site was screened using the GPR to search the areas of interest and inspected for reflections, which could be indicative of major anomalies and substructures. Borehole locations were then individually cleared.

GPR data profiles were collected for the areas of the Site specified by the client. The surveyed areas consisted of grass, asphalt and concrete surfaces.

## DATA PROCESSING

In order to improve the quality of the results and to better identify subsurface anomalies NOVA processed the collected data. The processes flow is briefly described at this section.

**Step 1.** Import raw RAMAC data to standard processing format

**Step 2.** Remove instrument noise (*dewow*)

**Step 3.** Correct for attenuation losses (*energy decay function*)

**Step 4.** Remove static from bottom of profile (*time cut*)

**Step 5.** Mute horizontal ringing/noise (*subtracting average*)

The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and describes the subsurface anomalies more accurately.

---

## PHYSICAL SETTINGS

---

Nova observed following physical conditions at the time of the survey:

**The weather:** Overcast/Light Rain

**Temp:** 80 Degrees (F).

**Surface:** Grass, asphalt and concrete surfaces

**Geophysical Noise Level (GNL):** Geophysical Noise Level (GNL) was very high at the site. The noise was a result of the site being located in an urban environment and close proximity to train tracks.

---

## RESULTS

---

The results of the geophysical engineering survey (GES) identified following at the project Site:

- GES survey identified scattered anomalies located throughout the project site. Based on their rates and proximity, these anomalies were inconsistent with any USTs. These areas were indicated on the on-site markout.
- Several utilities (sewer, water, gas, telecommunications and electrical) were located on the site. These utilities were indicated on the survey map.
- Two large, linear anomalies were located on the site located approximately 7 to 10 feet below ground surface at the project site. These are indicated both on-site and on the survey map.
- Geophysical Survey Plan portrays the areas investigated during the geophysical survey.

If you have any questions please do not hesitate to contact the undersigned.

Sincerely,

**NOVA Geophysical Services**

Levent Eskicakit, P.G., E.P.  
Project Engineer

This data report was developed as the final deliverable for the subsurface investigation at the New NYPD 116<sup>th</sup> Precinct, Borough of Queens project, performed from August 16, 2017 to September 8, 2017. This report contains the following data:

- Record of Borings for B-1 through B-11 and PB-1 through PB-8;
- Boring as-drilled location coordinates;
- Geotechnical Laboratory Test Results for samples collected at B-1 through B-11, and PB-1 through PB-8; and
- Typical observation well construction sketch.

## Geotechnical Engineering Laboratory

### Standard Test Method for Moisture, Ash, and Organic Matter of Peat and Other Organic Soils (ASTM D2974)

Client: NYC DDC  
Project Name: New NYPD 116th Precinct  
Project Location: Queens, NY  
Project Number: 117520-221791  
Boring Number: B-5  
Sample Number: U-1  
Sample Depth (ft): 67-69'  
Sample Date: 9/7/2017

Tested By: MP  
Test Date: 9/18/2017

Procedure: C  
Temperature: 440° C

AS RECEIVED MOISTURE CONTENT	
Tin Mass (g)	126.66
Wet Mass of Sample & Tin (g)	190.44
Dry Mass of Sample & Tin (g)	178.92
Mass of Water (g)	11.52
Mass of Dry Soil (g)	52.26
<b>Moisture Content (%)</b>	<b>22.0</b>

ASH CONTENT	
Porcelain Dish Mass (g)	126.66
Porcelain Dish + Oven Dried Soil (g)	178.92
Mass of Oven Dried Soil (g)	52.26
Mass of Dish & Burned Soil (g)	177.77
Mass of Burned Soil (g)	51.11
Mass of Organic Material (g)	1.15
Ash Content (%)	97.8
<b>Organic Content (%)</b>	<b>2.2</b>

## Geotechnical Engineering Laboratory

### ISOTROPICALLY CONSOLIDATED UNDRAINED TRIAXIAL TEST SUMMARY - ASTM D4767

**Client:** NYC DDC  
**Project:** New NYPD 116th Precinct  
**Location:** Queens, NY  
**Project No:** 117520-221791

**Test Date:** 9/20/2017  
**Exploration No:** B-5  
**Sample No:** U-1  
**Depth (ft):** 67-69

**LL :** 19  
**PL :** 14  
**PI :** 5  
**USCS:** SC-SM

#### Initial

Moisture Content (%):	20.2%
Dry Unit Weight (pcf):	111.4
Diameter (in):	2.867
Height (in):	5.604
Void Ratio (-):	0.54
Saturation (%):	102.8
Moisture Content (Trim.%):	20.2%
Cross Sectional Area (in <sup>2</sup> ):	6.456

#### Final

Moisture Content (%):	16.7%
Dry Unit Weight (pcf):	113.8
Height (in):	4.589
Void Ratio (-):	0.507
Saturation (%):	90.2
